| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See <a href="#">Table 254 on page 3091</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local AS</b>                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Age</b>                                           | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>AIGP</b>                                          | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metricn</b>                                       | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>MED-plus-IGP</b>            | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>TTL-Action</b>              | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.<br><br>For sample output, see <a href="#">show route table</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Task</b>                    | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>       | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AS path</b>                 | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>VC Label</b>                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>MTU</b>                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>VLAN ID</b>                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Prefixes bound to route</b> | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Communities</b>             | Community path attribute for the route. See <a href="#">Table 255 on page 3093</a> for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Layer2-info: encaps</b>     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 252: show route detail Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>control flags</b>             | Control flags: <b>none</b> or <b>Site Down</b> .                                                                                                                       |
| <b>mtu</b>                       | Maximum transmission unit (MTU) information.                                                                                                                           |
| <b>Label-Base, range</b>         | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device. |
| <b>status vector</b>             | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                    |
| <b>Accepted Multipath</b>        | Current active path when BGP multipath is configured.                                                                                                                  |
| <b>Accepted MultipathContrib</b> | Path currently contributing to BGP multipath.                                                                                                                          |
| <b>Localpref</b>                 | Local preference value included in the route.                                                                                                                          |
| <b>Router ID</b>                 | BGP router ID as advertised by the neighbor in the open message.                                                                                                       |
| <b>Primary Routing Table</b>     | In a routing table group, the name of the primary routing table in which the route resides.                                                                            |
| <b>Secondary Tables</b>          | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                         |

[Table 253 on page 3089](#) describes all possible values for the **Next-hop Types** output field.

Table 253: Next-hop Types Output Field Values

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast (bcast)</b> | Broadcast next hop.                                                                                                                                                                                                                                                            |
| <b>Deny</b>              | Deny next hop.                                                                                                                                                                                                                                                                 |
| <b>Discard</b>           | Discard next hop.                                                                                                                                                                                                                                                              |
| <b>Flood</b>             | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| <b>Hold</b>              | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                           |
| <b>Indexed (idxd)</b>    | Indexed next hop.                                                                                                                                                                                                                                                              |

Table 253: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the <b>router</b> next hop, the <b>interface</b> next hop does not reference any specific node on the network.                                                                                                                                                                                                                                 |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Router</b>                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Unicast (ucst)</b>           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Unilist (ulst)</b>           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

Table 254 on page 3091 describes all possible values for the **State** output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 254: State Output Field Values

| Value                                       | Description                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accounting                                  | Route needs accounting.                                                                                                                                                              |
| Active                                      | Route is active.                                                                                                                                                                     |
| Always Compare MED                          | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| AS path                                     | Shorter AS path is available.                                                                                                                                                        |
| Cisco Non-deterministic MED selection       | Cisco nondeterministic MED is enabled, and a path with a lower MED is available.                                                                                                     |
| Clone                                       | Route is a clone.                                                                                                                                                                    |
| Cluster list length                         | Length of cluster list sent by the route reflector.                                                                                                                                  |
| Delete                                      | Route has been deleted.                                                                                                                                                              |
| Ex                                          | Exterior route.                                                                                                                                                                      |
| Ext                                         | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                                    | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                      | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                                     | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                                  | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                             | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                                     | Route being added.                                                                                                                                                                   |
| Int                                         | Interior route.                                                                                                                                                                      |
| Int Ext                                     | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |
| Local Preference                            | Path with a higher local preference value is available.                                                                                                                              |
| Martian                                     | Route is a martian (ignored because it is obviously invalid).                                                                                                                        |

Table 254: State Output Field Values (*continued*)

| Value                                 | Description                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MartianOK</b>                      | Route exempt from martian filtering.                                                                                                                                                                                              |
| <b>Next hop address</b>               | Path with lower metric next hop is available.                                                                                                                                                                                     |
| <b>No difference</b>                  | Path from neighbor with lower IP address is available.                                                                                                                                                                            |
| <b>NoReadvrt</b>                      | Route not to be advertised.                                                                                                                                                                                                       |
| <b>NotBest</b>                        | Route not chosen because it does not have the lowest MED.                                                                                                                                                                         |
| <b>Not Best in its group</b>          | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                                                                         |
| <b>NotInstall</b>                     | Route not to be installed in the forwarding table.                                                                                                                                                                                |
| <b>Number of gateways</b>             | Path with a greater number of next hops is available.                                                                                                                                                                             |
| <b>Origin</b>                         | Path with a lower origin code is available.                                                                                                                                                                                       |
| <b>Pending</b>                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| <b>Release</b>                        | Route scheduled for release.                                                                                                                                                                                                      |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| <b>Route Preference</b>               | Route with lower preference value is available                                                                                                                                                                                    |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| <b>Secondary</b>                      | Route not a primary route.                                                                                                                                                                                                        |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 255 on page 3093 describes the possible values for the **Communities** output field.

Table 255: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is <b>0</b> . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                                  |
| <i>bandwidth: local AS number:link-bandwidth-number</i> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.                   |
| <i>domain-id</i>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                                             |
| <i>domain-id-vendor</i>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                                     |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from <b>0</b> through <b>4,294,967,295</b> (bytes per second).                                                                                                                                                                                                                   |
| <i>local AS number</i>                                  | Local AS number: from <b>1</b> through <b>65,535</b> .                                                                                                                                                                                                                                                  |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <i>origin</i>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |
| <i>route-type-vendor</i>                                | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <i>rte-type</i>                                         | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <i>target</i>                                           | Defines which VPN the route participates in; <b>target</b> has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.                                                                                                                                                          |
| <i>unknown IANA</i>                                     | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                        |
| <i>unknown OSPF vendor community</i>                    | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                                         |

| <b>Output Fields</b>               | Table 256 on page 3102 lists the output fields for the <b>show route export</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 256: show route export Output Fields

| Field Name                        | Field Description                                                                                                                                           | Level of Output   |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Table</b> or <b>table-name</b> | Name of the routing tables that either import or export routes.                                                                                             | All levels        |
| <b>Routes</b>                     | Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one. | <b>brief</b> none |
| <b>Export</b>                     | Whether the table is currently exporting routes to other tables: <b>Y</b> or <b>N</b> (Yes or No).                                                          | <b>brief</b> none |

Table 256: show route export Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                           | Level of Output |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Import</b>        | Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)                                                                                                                                                                                                                                                  | <b>detail</b>   |
| <b>Flags</b>         | ( <b>instance</b> keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> <li><b>config auto-policy</b>—The policy was deduced from the configured IGP export policies.</li> <li><b>cleanup</b>—Configuration information for this instance is no longer valid.</li> <li><b>config</b>—The instance was explicitly configured.</li> </ul> | <b>detail</b>   |
| <b>Options</b>       | ( <b>instance</b> keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> <li><b>unicast</b>—Indicates <i>instance.inet.0</i>.</li> <li><b>multicast</b>—Indicates <i>instance.inet.2</i>.</li> <li><b>unicast multicast</b>—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>.</li> </ul>    | <b>detail</b>   |
| <b>Import policy</b> | ( <b>instance</b> keyword only) Policy that <b>route export</b> uses to construct the import-export matrix. Not displayed if the instance type is <b>vrf</b> .                                                                                                                                                                                                              | <b>detail</b>   |
| <b>Instance</b>      | ( <b>instance</b> keyword only) Name of the routing instance.                                                                                                                                                                                                                                                                                                               | <b>detail</b>   |
| <b>Type</b>          | ( <b>instance</b> keyword only) Type of routing instance: <b>forwarding</b> , <b>non-forwarding</b> , or <b>vrf</b> .                                                                                                                                                                                                                                                       | <b>detail</b>   |

## Sample Output

### show route export

```

user@host> show route export
Table Export Routes
inet.0 N 0
black.inet.0 Y 3
red.inet.0 Y 4

```

### show route export detail

```

user@host> show route export detail
inet.0 Routes: 0
black.inet.0 Routes: 3
 Import: [inet.0]
red.inet.0 Routes: 4
 Import: [inet.0]

```

### show route export instance detail

```

user@host> show route export instance detail
Instance: master Type: forwarding
Flags: <config auto-policy> Options: <unicast multicast>
Import policy: [(ospf-master-from-red || isis-master-from-black)]

```

Instance: black  
Instance: red

Type: non-forwarding  
Type: non-forwarding

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                       |

Table 257: show route extensive Output Fields

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                   |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                            |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active).</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li><b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |

Table 257: show route extensive Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-destination</b><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</li> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                  |
| <b>Level</b>                                   | <p>(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Route Distinguisher</b>                     | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 257: show route extensive Output Fields (*continued*)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path <i>lsp-path-name</i></b>      | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>label-operation</i></b>                        | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Indirect next hops</b>                            | When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 257: show route extensive Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Session ID</b>      | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Inactive reason</b> | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGP path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| <b>Local AS</b>        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Age</b>             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>AIGP</b>            | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Metric</b>          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MED-plus-IGP</b>    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Layer2-info: encaps</b>   | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                       |
| <b>control flags</b>         | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                         |
| <b>mtu</b>                   | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                     |
| <b>Label-Base, range</b>     | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                           |
| <b>status vector</b>         | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| <b>Localpref</b>             | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| <b>Router ID</b>             | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| <b>Primary Routing Table</b> | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| <b>Secondary Tables</b>      | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| <b>Originating RIB</b>       | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| <b>Node path count</b>       | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding nexthops</b>   | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                            |

## Sample Output

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | *bridge-domain-name*)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc *interface-name***—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination *destination-prefix***—(Optional) Destination prefix.

**family *family***—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name *interface-name***—(Optional) Display routing table entries for the specified interface.

**label *name***—(Optional) Display route entries for the specified label.

**lcc *number***—(Routing Matrix only) (Optional) On a routing matrix composed of a TX Matrix Plus router and T640 routers configured in the routing matrix, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 routers configured in the routing matrix, display information for the specified T1600 router (or line-card chassis) connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**learning-vlan-id *learning-vlan-id***—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching *matching***—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* |

*routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level** view

**Output Fields** [Table 258 on page 3122](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 258: show route forwarding-table Output Fields**

| Field Name     | Field Description                                                                                                                                                                                            | Level of Output                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| Logical system | Name of the logical system. This field is displayed if you specify the <b>table</b> <i>logical-system-name/routing-instance-name</i> option on a device that is configured for and supports logical systems. | All levels                     |
| Routing table  | Name of the routing table (for example, inet, inet6, mpls).                                                                                                                                                  | All levels                     |
| Address family | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).                                                                                                                                                 | All levels                     |
| Destination    | Destination of the route.                                                                                                                                                                                    | <b>detail</b> <b>extensive</b> |

Table 258: show route forwarding-table Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output         |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Route Type (Type)</b>       | How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> <li>• <b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li>• <b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li>• <b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li>• <b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li>• <b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li>• <b>ignore (ignr)</b>—Ignore this route.</li> <li>• <b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li>• <b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li>• <b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul> | All levels              |
| <b>Route Reference (RtRef)</b> | Number of routes to reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

| <b>Next hop</b>                | IP address of the next hop to the destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

Table 258: show route forwarding-table Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Next hop Type (Type)</b>       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b>—Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| <b>Index</b>                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| <b>Route interface-index</b>      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>extensive</b>             |
| <b>Reference (NhRef)</b>          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |
| <b>Next-hop interface (Netif)</b> | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Weight</b>                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b>             |
| <b>Balance</b>                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>extensive</b>             |
| <b>RPF interface</b>              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>             |

## Sample Output

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
 unit 0 {
 family inet {
 rpf-check;
 address 15.95.1.2/30;
 }
 }
}

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
```

```

Destination: 15.95.1.3/32
Route type: destination
Route reference: 0
Flags: sent to PFE
Next-hop type: broadcast
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
Route interface-index: 67
Index: 328
Reference: 1

```

| <b>Output Fields</b>               | Table 260 on page 3170 describes the output fields for the <b>show route receive-protocol</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |

Table 260: show route receive-protocol Output Fields

| Field Name                 | Field Description                                                       | Level of Output |
|----------------------------|-------------------------------------------------------------------------|-----------------|
| <i>routing-table-name</i>  | Name of the routing table—for example, inet.0.                          | All levels      |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. | All levels      |

Table 260: show route receive-protocol Output Fields (*continued*)

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                        | Level of Output         |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> | All levels              |
| <b>Prefix</b>                                | Destination prefix.                                                                                                                                                                                                                                                                                                                      | none <b>brief</b>       |
| <b>MED</b>                                   | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                 | none <b>brief</b>       |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                    | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                   | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Label-Base, range</b>                     | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                   | <b>detail extensive</b> |
| <b>VPN Label</b>                             | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                    | <b>detail extensive</b> |
| <b>Next hop</b>                              | Next hop to the destination. An angle bracket ( > ) indicates that the route is the selected route.                                                                                                                                                                                                                                      | All levels              |
| <b>Localpref or Lclpref</b>                  | Local preference value included in the route.                                                                                                                                                                                                                                                                                            | All levels              |

Table 260: show route receive-protocol Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output         |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>AS path</b>             | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels              |
| <b>Cluster list</b>        | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Originator ID</b>       | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Communities</b>         | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>AIGP</b>                | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Attrset AS</b>          | Number, local preference, and path of the AS that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |

Output fields are listed in the approximate order in which they appear.                                                                             |

Table 261: show route terse Output Fields

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 261: show route terse Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route key</i>   | Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>                                                                                                                                                                                                                |
| <b>A</b>           | Active route. An asterisk (*) indicates this is the active route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>V</b>           | Validation status of the route: <ul style="list-style-type: none"> <li>• <b>?</b>—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• <b>I</b>—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>N</b>—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>V</b>—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| <b>Destination</b> | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>P</b>           | Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>                                                                                                                                                                                     |
| <b>Prf</b>         | Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.                                                                                              |
| <b>Metric 1</b>    | First metric value in the route. For routes learned from BGP, this is the MED metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Metric 2</b>    | Second metric value in the route. For routes learned from BGP, this is the IGP metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 261: show route terse Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Next hop</b> | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                          |
| <b>AS path</b>  | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>I—IGP.</li> <li>E—EGP.</li> <li>?—Incomplete; typically, the AS path was aggregated.</li> </ul> |

| <b>Description</b>              | Test a policy configuration to determine which prefixes match routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <i>policy-name</i> —Name of a policy.<br><i>prefix</i> —Destination prefix to match.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Additional Information</b>   | All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the <b>from</b> clause in the specified policy. All prefixes accepted by the policy are displayed. The <b>test policy</b> command evaluates a policy differently from the BGP import process. When testing a policy that contains an <b>interface</b> match condition in the <b>from</b> clause, the <b>test policy</b> command uses the match condition. In contrast, BGP does not use the <b>interface</b> match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

##### ***Protocol-Independent Routing Properties Overview***

In Junos OS, routing capabilities and features that are not specific to any particular routing protocol are collectively called protocol-independent routing properties. These features often interact with routing protocols. In many cases, you combine protocol-independent properties and routing policy to achieve a goal. For example, you define a static route using protocol-independent properties, and then, using a routing policy, you can redistribute the static route into a routing protocol, such as BGP, OSPF, or IS-IS.

Protocol-independent routing properties include:

- Static, aggregate, and generated routes
- Bidirectional Forwarding Detection on static routes
- Global preference
- Martian routes
- Routing tables and routing information base (RIB) groups

### **Understanding BFD for Static Routes**

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the static route failure detection mechanisms, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

By default, BFD is supported on single-hop static routes. In Junos OS Release 8.2 and later, BFD also supports multihop static routes.

To enable failure detection, include the **bfd-liveness-detection** statement in the static route configuration.

In Junos OS Release 9.1 and later, the BFD protocol is supported for IPv6 static routes. Global unicast and link-local IPv6 addresses are supported for static routes. The BFD protocol is not supported on multicast or anycast IPv6 addresses. For IPv6, the BFD protocol supports only static routes and only in Junos OS Release 9.3 and later. IPv6 for BFD is not supported for any other protocol.

To configure the BFD protocol for IPv6 static routes, include the **bfd-liveness-detection** statement at the **[edit routing-options rib inet6.0 static route destination-prefix]** hierarchy level.

In Junos OS Release 8.5 and later, you can configure a hold-down interval to specify how long the BFD session must remain up before a state change notification is sent.

To specify the hold-down interval, include the **holddown-interval** statement in the BFD configuration.

You can configure a number in the range from 0 through 255,000 milliseconds. The default is 0. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**NOTE:** If a single BFD session includes multiple static routes, the hold-down interval with the highest value is used.

To specify the minimum transmit and receive intervals for failure detection, include the **minimum-interval** statement in the BFD configuration.

This value represents both the minimum interval after which the local routing device transmits hello packets and the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

**NOTE:** SRX Series devices do not support distributed BFD.

To specify the minimum receive interval for failure detection, include the **minimum-receive-interval** statement in the BFD configuration. This value represents the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you

can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the number of hello packets not received by the neighbor that causes the originating interface to be declared down, include the **multiplier** statement in the BFD configuration.

The default value is 3. You can configure a number in the range from 1 through 255.

To specify a threshold for detecting the adaptation of the detection time, include the **threshold** statement in the BFD configuration.

When the BFD session detection time adapts to a value equal to or higher than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the **minimum-interval** or the **minimum-receive-interval** value. The threshold must be a higher value than the multiplier for either of these configured values. For example if the **minimum-receive-interval** is 300 ms and the **multiplier** is 3, the total detection time is 900 ms. Therefore, the detection time threshold must have a value higher than 900.

To specify the minimum transmit interval for failure detection, include the **transmit-interval** **minimum-interval** statement in the BFD configuration.

This value represents the minimum interval after which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the threshold for the adaptation of the transmit interval, include the **transmit-interval threshold** statement in the BFD configuration.

The threshold value must be greater than the transmit interval. When the BFD session transmit time adapts to a value greater than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the value for the **minimum-interval** or the **minimum-receive-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level. The threshold must be a higher value than the multiplier for either of these configured values.

To specify the BFD version, include the **version** statement in the BFD configuration. The default is to have the version detected automatically.

To include an IP address for the next hop of the BFD session, include the **neighbor** statement in the BFD configuration.

**NOTE:** You must configure the **neighbor** statement if the next hop specified is an interface name. If you specify an IP address as the next hop, that address is used as the neighbor address for the BFD session.

---

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions.

To disable BFD adaptation, include the **no-adaptation** statement in the BFD configuration.

**NOTE:** We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation in your network.

**NOTE:** If BFD is configured only on one end of a static route, the route is removed from the routing table. BFD establishes a session when BFD is configured on both ends of the static route.

BFD is not supported on ISO address families in static routes. BFD does support IS-IS.

If you configure graceful Routing Engine switchover (GRES) at the same time as BFD, GRES does not preserve the BFD state information during a failover.

Junos OS also supports BFD over multihop static routes. For example, you can configure BFD over a Layer 3 path to provide path integrity over that path. You can limit the number of hops by specifying the time to live (TTL).

To configure BFD over multihop static routes, include the following statements:

```
static route destination-prefix {
 bfd-liveness-detection {
 local-address ip-address;
 minimum-receive-ttl number;
 }
}
```

To specify the source address for the multihop static route and to enable multihop BFD support, include the **local-address** statement.

To specify the number of hops, include the **minimum-receive-ttl** statement. You must configure this statement for a multihop BFD session. You can configure a value in the range from 1 through 255. It is optional for a single-hop BFD session. If you configure the **minimum-receive-ttl** statement for a single-hop session, the value must be 255.

#### **Example: Configuring BFD for Static Routes**

This example shows how to configure Bidirectional Forwarding Detection (BFD) for static routes.

- [Requirements on page 3198](#)
- [Overview on page 3198](#)
- [Configuration on page 3198](#)
- [Verification on page 3201](#)

### Requirements

In this example, no special configuration beyond device initialization is required.

### Overview

There are many practical applications for static routes. Static routing is often used at the network edge to support attachment to stub networks, which, given their single point of entry and egress, are well suited to the simplicity of a static route. In Junos OS, static routes have a global preference of 5. Static routes are activated if the specified next hop is reachable.

In this example, you configure the static route 192.168.47.0/24 from the provider network to the customer network, using the next-hop address of 172.16.1.2. You also configure a static default route of 0.0.0.0/0 from the customer network to the provider network, using a next-hop address of 172.16.1.1.

For demonstration purposes, some loopback interfaces are configured on Device B and Device D. These loopback interfaces provide addresses to ping and thus verify that the static routes are working.

Figure 46 on page 3198 shows the sample network.

**Figure 46: Customer Routes Connected to a Service Provider**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device B

```
set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
```

```

set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
 1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

**Device D**

```

set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.
 

```

[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24
user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32

```
2. On Device B, create a static route and set the next-hop address.
 

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2

```
3. On Device B, configure BFD for the static route.
 

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
 1000

```
4. On Device B, configure tracing operations for BFD.
 

```

[edit protocols]
user@B# set bfd traceoptions file bfd-trace
user@B# set bfd traceoptions flag all

```
5. If you are done configuring Device B, commit the configuration.
 

```

[edit]
user@B# commit

```
6. On Device D, configure the interfaces.
 

```

[edit interfaces]
user@D# set ge-1/2/0 unit 1 description D->B
user@D# set ge-1/2/0 unit 1 family inet address 172.16.1.2/24
user@D# set lo0 unit 2 family inet address 192.168.47.5/32
user@D# set lo0 unit 2 family inet address 192.168.47.6/32

```

7. On Device D, create a static route and set the next-hop address.  
[edit routing-options]  
user@D# set static route 0.0.0.0/0 next-hop 172.16.1.1
8. On Device D, configure BFD for the static route.  
[edit routing-options]  
user@D# set static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
9. On Device D, configure tracing operations for BFD.  
[edit protocols]  
user@D# set bfd traceoptions file bfd-trace  
user@D# set bfd traceoptions flag all
10. If you are done configuring Device D, commit the configuration.  
[edit]  
user@D# commit

### Results

Confirm your configuration by issuing the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
 unit 0 {
 description B->D;
 family inet {
 address 172.16.1.1/24;
 }
 }
}
lo0 {
 unit 57 {
 family inet {
 address 10.0.0.1/32;
 address 10.0.0.2/32;
 }
 }
}

user@D# show protocols
bfd {
 traceoptions {
 file bfd-trace;
 flag all;
 }
}

user@B# show routing-options
static {
 route 192.168.47.0/24 {
 next-hop 172.16.1.2;
 bfd-liveness-detection {
```

```

 minimum-interval 1000;
 }
}
}

Device D user@D# show interfaces
ge-1/2/0 {
 unit 1 {
 description D->B;
 family inet {
 address 172.16.1.2/24;
 }
 }
}
lo0 {
 unit 2 {
 family inet {
 address 192.168.47.5/32;
 address 192.168.47.6/32;
 }
 }
}

user@D# show routing-options
static {
 route 0.0.0.0/0 {
 next-hop 172.16.1.1;
 bfd-liveness-detection {
 minimum-interval 1000;
 }
 }
}
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 3201](#)
- [Viewing Detailed BFD Events on page 3202](#)

### Verifying That BFD Sessions Are Up

**Purpose** Verify that the BFD sessions are up, and view details about the BFD sessions.

**Action** From operational mode, enter the `show bfd session extensive` command.

```

user@B> show bfd session extensive

```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | lt-1/2/0.0 | 3.000       | 1.000             | 3          |

```

Client Static, TX interval 1.000, RX interval 1.000
Session up time 00:14:30
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Replicated, routing table index 172
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000

```

```

Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 2, remote discriminator 1
Echo mode disabled/inactive

```

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

```
user@D> show bfd session extensive
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.1 | Up    | lt-1/2/0.1 | 3.000       | 1.000             | 3          |

```

Client Static, TX interval 1.000, RX interval 1.000
Session up time 00:14:35
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Replicated, routing table index 170
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 1, remote discriminator 2
Echo mode disabled/inactive

```

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

**Meaning** The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

### Viewing Detailed BFD Events

**Purpose** View the contents of the BFD trace file to assist in troubleshooting, if needed.

**Action** From operational mode, enter the **file show /var/log/bfd-trace** command.

```

user@B> file show /var/log/bfd-trace
Nov 23 14:26:55 Data (9) len 35: (hex) 42 46 44 20 70 65 72 69 6f 64 69 63 20

```

**Meaning** BFD messages are being written to the trace file.

**Example: Enabling BFD on Qualified Next Hops in Static Routes**

This example shows how to configure a static route with multiple possible next hops. Each next hop has Bidirectional Forwarding Detection (BFD) enabled.

- [Requirements on page 3203](#)
- [Overview on page 3203](#)
- [Configuration on page 3203](#)
- [Verification on page 3206](#)

**Requirements**

In this example, no special configuration beyond device initialization is required.

**Overview**

In this example, Device B has the static route **192.168.47.0/24** with two possible next hops. The two next hops are defined using two **qualified-next-hop** statements. Each next hop has BFD enabled.

BFD is also enabled on Device D because BFD must be enabled on both ends of the connection.

A next hop is included in the routing table if the BFD session is up. The next hop is removed from the routing table if the BFD session is down.

See [Figure 47 on page 3203](#).

**Figure 47: BFD Enabled on Qualified Next Hops**

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device B**

```
set interfaces fe-0/1/0 unit 2 description secondary-B->D
set interfaces fe-0/1/0 unit 2 family inet address 192.168.2.1/24
set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set routing-options static route 192.168.47.0/24 qualified-next-hop 192.168.2.2
 bfd-liveness-detection minimum-interval 60
set routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2
 bfd-liveness-detection minimum-interval 60
```

**Device D**

```
set interfaces fe-0/1/0 unit 3 description secondary-D->B
set interfaces fe-0/1/0 unit 3 family inet address 192.168.2.2/24
set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set routing-options static route 0.0.0.0/0 qualified-next-hop 192.168.2.1
set routing-options static route 0.0.0.0/0 qualified-next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 60
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure a static route with two possible next hops, both with BFD enabled:

1. On Device B, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@B# set unit 2 description secondary-B->D
user@B# set unit 2 family inet address 192.168.2.1/24

[edit interfaces ge-1/2/0]
user@B# set unit 0 description B->D
user@B# set unit 0 family inet address 172.16.1.1/24
```
2. On Device B, configure the static route with two next hops, both with BFD enabled.

```
[edit routing-options static route 192.168.47.0/24]
user@B# set qualified-next-hop 192.168.2.2 bfd-liveness-detection minimum-interval
60
user@B# set qualified-next-hop 172.16.1.2 bfd-liveness-detection minimum-interval
60
```
3. On Device D, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@D# set unit 3 description secondary-D->B
user@D# set unit 3 family inet address 192.168.2.2/24

[edit interfaces ge-1/2/0]
user@D# set unit 1 description D->B
user@D# set unit 1 family inet address 172.16.1.2/24
```
4. On Device D, configure a BFD-enabled default static route with two next hops to the provider network.

In this case, BFD is enabled on the route, not on the next hops.

```
[edit routing-options static route 0.0.0.0/0]
user@D# set qualified-next-hop 192.168.2.1
user@D# set qualified-next-hop 172.16.1.1
user@D# set bfd-liveness-detection minimum-interval 60
```

**Results** Confirm your configuration by issuing the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/1/0 {
 unit 2 {
 description secondary-B->D;
 family inet {
 address 192.168.2.1/24;
 }
 }
}
ge-1/2/0 {
 unit 0 {
 description B->D;
 family inet {
 address 172.16.1.1/24;
 }
 }
}

user@B# show routing-options
static {
 route 192.168.47.0/24 {
 qualified-next-hop 192.168.2.2 {
 bfd-liveness-detection {
 minimum-interval 60;
 }
 }
 qualified-next-hop 172.16.1.2 {
 bfd-liveness-detection {
 minimum-interval 60;
 }
 }
 }
}

user@D# show interfaces
fe-0/1/0 {
 unit 3 {
 description secondary-D->B;
 family inet {
 address 192.168.2.2/24;
 }
 }
}
ge-1/2/0 {
 unit 1 {
```

```
description D->B;
family inet {
 address 172.16.1.2/24;
}
}
}

user@D# show routing-options
static {
 route 0.0.0.0/0 {
 qualified-next-hop 192.168.2.1;
 qualified-next-hop 172.16.1.1;
 bfd-liveness-detection {
 minimum-interval 60;
 }
 }
}
```

If you are done configuring the devices, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Routing Tables on page 3206](#)
- [Verifying the BFD Sessions on page 3207](#)
- [Removing BFD from Device D on page 3207](#)
- [Removing BFD from One Next Hop on page 3207](#)

### **Checking the Routing Tables**

**Purpose** Make sure that the static route appears in the routing table on Device B with two possible next hops.

**Action**

```
user@B> show route 192.168.47.0 extensive
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
192.168.47.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 192.168.47.0/24 -> {192.168.2.2}
 *Static Preference: 5
 Next hop type: Router
 Address: 0x9334010
 Next-hop reference count: 1
 Next hop: 172.16.1.2 via ge-1/2/0.0
 Next hop: 192.168.2.2 via fe-0/1/0.2, selected
 State: <Active Int Ext>
 Age: 9
 Task: RT
 Announcement bits (1): 3-KRT
 AS path: I
```

**Meaning** Both next hops are listed. The next hop 192.168.2.2 is the selected route.

**Verifying the BFD Sessions**

**Purpose** Make sure that the BFD sessions are up.

**Action** user@B> show bfd session

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2  | Up    | ge-1/2/0.0 | 0.720       | 0.240             | 3          |
| 192.168.2.2 | Up    | fe-0/1/0.2 | 0.720       | 0.240             | 3          |

2 sessions, 2 clients

Cumulative transmit rate 8.3 pps, cumulative receive rate 8.3 pps

**Meaning** The output shows that the BFD sessions are up.

**Removing BFD from Device D**

**Purpose** Demonstrate what happens when the BFD session is down for both next hops.

**Action** 1. Deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Rerun the **show bfd session** command on Device B.

user@B> show bfd session

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2  | Down  | ge-1/2/0.0 | 3.000       | 1.000             | 3          |
| 192.168.2.2 | Down  | fe-0/1/0.2 | 3.000       | 1.000             | 3          |

2 sessions, 2 clients

Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

3. Rerun the **show route 192.168.47.0** command on Device B.

user@B> show route 192.168.47.0

**Meaning** As expected, when the BFD sessions are down, the static route is removed from the routing table.

**Removing BFD from One Next Hop**

**Purpose** Demonstrate what happens when only one next hop has BFD enabled.

**Action** 1. If it is not already deactivated, deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Deactivate BFD on one of the next hops on Device B.

```
[edit routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2]
user@B# deactivate bfd-liveness-detection
user@B# commit
```

3. Rerun the **show bfd session** command on Device B.

```
user@B> show bfd session
```

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 192.168.2.2 | Down  | fe-0/1/0.2 | 3.000       | 1.000             | 3          |

4. Rerun the **show route 192.168.47.0 extensive** command on Device B.

```
user@B> show route 192.168.47.0 extensive
```

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
192.168.47.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 192.168.47.0/24 -> {172.16.1.2}
 *Static Preference: 5
 Next hop type: Router, Next hop index: 624
 Address: 0x92f0178
 Next-hop reference count: 3
 Next hop: 172.16.1.2 via ge-1/2/0.0, selected
 State: <Active Int Ext>
 Age: 2:36
 Task: RT
 Announcement bits (1): 3-KRT
 AS path: I
```

**Meaning** As expected, the BFD session is down for the 192.168.2.2 next hop. The 172.16.1.2 next hop remains in the routing table, and the route remains active, because BFD is not a condition for this next hop to remain valid.

#### **Understanding BFD Authentication for Static Routes**

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant.

**NOTE:** We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels.

Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over IPv4 and IPv6 static routes. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3209](#)
- [Security Authentication Keychains on page 3210](#)
- [Strict Versus Loose Authentication on page 3210](#)

#### ***BFD Authentication Algorithms***

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with

every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

---

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### **Strict Versus Loose Authentication**

By default, strict authentication is enabled, and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Example: Configuring BFD Authentication for Static Routes**

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for static routes.

- [Requirements on page 3210](#)
- [Overview on page 3211](#)
- [Configuration on page 3211](#)
- [Verification on page 3215](#)

### **Requirements**

Junos OS Release 9.6 or later (Canda and United States version).

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

### Overview

You can configure authentication for BFD sessions running over IPv4 and IPv6 static routes. Routing instances and logical systems are also supported.

The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the static route.
2. Associate the authentication keychain with the static route.
3. Configure the related security authentication keychain. This must be configured on the main router.

**TIP:** We recommend that you specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

[edit]

```
user@host> set routing-options static route ipv4 bfd-liveness-detection
authentication loose-check
```

Figure 48 on page 3211 shows the sample network.

**Figure 48: Customer Routes Connected to a Service Provider**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device B set interfaces ge-1/2/0 unit 0 description B->D
Device B set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
```

```
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
 1000
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication
 key-chain bfd-kc4
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication
 algorithm keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
 "9JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIeyMWxSrlKvM-dbs2a
 DkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
 "2011-1-1.12:00:00 -0800"
```

Device D

```
set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication key-chain
 bfd-kc4
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication algorithm
 keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
 "9JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIeyMWxSrlKvM-dbs2a
 DkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
 "2011-1-1.12:00:00 -0800"
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.

```
[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24

user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32
```

2. On Device B, create a static route and set the next-hop address.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2
```

3. On Device B, configure BFD for the static route.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
 1000
```

4. On Device B, specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on the static route.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
algorithm keyed-sha-1
```

**NOTE:** Nonstop active routing (NSR) is not supported with the **meticulous-keyed-md5** and **meticulous-keyed-sha-1** authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

5. On Device B, specify the keychain to be used to associate BFD sessions on the specified route with the unique security authentication keychain attributes.

This should match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
key-chain bfd-kc4
```

6. On Device B, specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 5.
- At least one key, a unique integer between **0** and **63**. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-kc4]
user@B# set key 5 secret
"9JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
DkP5Ft0IQFclev7N"
user@B# set key 5 start-time "2011-1-1.12:00:00 -0800"
```

7. If you are done configuring Device B, commit the configuration.

```
[edit]
user@B# commit
```

8. Repeat the configuration on Device D.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

### Results

Confirm your configuration by issuing the **show interfaces**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
 unit 0 {
 description B->D;
 family inet {
 address 172.16.1.1/24;
 }
 }
}
lo0 {
 unit 57 {
 family inet {
 address 10.0.0.1/32;
 address 10.0.0.2/32;
 }
 }
}

user@B# show routing-options
static {
 route 192.168.47.0/24 {
 next-hop 172.16.1.2;
 bfd-liveness-detection {
 minimum-interval 1000;
 authentication {
 key-chain bfd-kc4;
 algorithm keyed-sha-1;
 }
 }
 }
}

user@B# show security
authentication-key-chains {
 key-chain bfd-kc4 {
 key 5 {
 secret
 "9JhZHmn6Ap0ln/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIeyMWxSrlKvM-dbs2a
 DkP5FtOIQFclev7N"; ## SECRET-DATA
 start-time "2011-1-1.12:00:00 -0800";
 }
 }
}
```

**Verification**

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 3215](#)
- [Viewing Details About the BFD Session on page 3215](#)
- [Viewing Extensive BFD Session Information on page 3215](#)

**Verifying That BFD Sessions Are Up**

**Purpose** Verify that the BFD sessions are up.

**Action** From operational mode, enter the `show bfd session` command.

```
user@B> show bfd session
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000       | 1.000             | 3          |

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

**Meaning** The command output shows that the BFD session is up.

**Viewing Details About the BFD Session**

**Purpose** View details about the BFD sessions and make sure that authentication is configured.

**Action** From operational mode, enter the `show bfd session detail` command.

```
user@B> show bfd session detail
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000       | 1.000             | 3          |

```
Client Static, TX interval 1.000, RX interval 1.000, Authenticate
Session up time 00:53:58
Local diagnostic NbrSignal, remote diagnostic None
Remote state Up, version 1
Logical system 9, routing table index 22
```

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

**Meaning** In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured.

**Viewing Extensive BFD Session Information**

**Purpose** View more detailed information about the BFD sessions.

**Action** From operational mode, enter the `show bfd session extensive` command.

```
user@B> show bfd session extensive
```

| Address    | State | Interface  | Time  | Interval | Multiplier |
|------------|-------|------------|-------|----------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000 | 1.000    | 3          |

```
Client Static, TX interval 1.000, RX interval 1.000, Authenticate
```

```
keychain bfd-kc4, algo keyed-sha-1, mode strict
Session up time 01:39:45
Local diagnostic NbrSignal, remote diagnostic None
Remote state Up, version 1
Logical system 9, routing table index 22
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 3, remote discriminator 4
Echo mode disabled/inactive
Authentication enabled/active, keychain bfd-kc4, algo keyed-sha-1, mode strict

1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

**Meaning** In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured. The output for the **extensive** command provides the keychain name, the authentication algorithm, and the mode for each client in the session.

### Configuration Statements

- [\[edit routing-options\] Hierarchy Level on page 3216](#)

#### *[edit routing-options] Hierarchy Level*

Several statements in the **[edit routing-options]** hierarchy are valid at numerous locations within the hierarchy. To make the complete hierarchy easier to read, the repeated statements are listed in “[Common Routing Options](#)” on page 412 and that section is referenced at the appropriate locations in “[Complete \[edit routing-options\] Hierarchy](#)” on page 413.

- [Common Routing Options on page 3216](#)
- [Complete \[edit routing-options\] Hierarchy on page 3218](#)

#### *Common Routing Options*

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit routing-options\] Hierarchy](#)” on page 413 instead of the statements being repeated.

- **[edit routing-options aggregate defaults]**
- **[edit routing-options aggregate route *ip-prefix* </prefix-length>]**
- **[edit routing-options generate defaults]**
- **[edit routing-options generate route *ip-prefix* </prefix-length>]**
- **[edit routing-options static defaults]**
- **[edit routing-options static route *ip-prefix* </prefix-length>]**

The common routing options are as follows:

```
(active | passive);
as-path {
 aggregator as-number address;
 atomic-aggregate;
 origin (egp | igp | incomplete);
 path path-identifier;
}
color metric <type metric-type>;
color2 metric <type metric-type>;
community [community-id no-advertise no-export no-export-subconfed];
metric metric <type metric-type>;
metric2 metric <type metric-type>;
metric3 metric <type metric-type>;
metric4 metric <type metric-type>;
passive;
preference preference-value <type metric-type>;
preference2 preference-value <type metric-type>;
tag metric <type metric-type>;
tag2 metric <type metric-type>;
```

### ***Complete [edit routing-options] Hierarchy***

The statement hierarchy in this section can also be included at the [edit logical-systems *logical-system-name*] hierarchy level.

```

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>         | Configure trace options for Bidirectional Forwarding Protocol (BFD) traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>             | If you do not include this statement, no BFD tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the BFD tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the <b>/var/log</b> directory. We recommend that you place global routing protocol tracing output in the <b>routing-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. These are the BFD protocol tracing options:</p> <ul style="list-style-type: none"> <li>• <b>adjacency</b>—Trace adjacency messages.</li> <li>• <b>all</b>—Trace all options for BFD.</li> <li>• <b>error</b>—Trace all errors.</li> <li>• <b>event</b>—Trace all events.</li> <li>• <b>issu</b>—Trace in-service software upgrade (ISSU) packet activity.</li> </ul> |

- **nsr-packet**—Trace non-stop-routing (NSR) packet activity.
- **nsr-synchronization**—Trace NSR synchronization events.
- **packet**—Trace all packets.
- **pipe**—Trace pipe messages.
- **pipe-detail**—Trace pipe messages in detail.
- **ppm-packet**—Trace packet activity by periodic packet management (PPM).
- **state**—Trace state transitions.
- **timer**—Trace timer processing.

**match *regular-expression***—(Optional) Regular expression for lines to be logged.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the trace file again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

|                                 |                                                                                                                           |

## bfd-liveness-detection (Routing Options Static Route)

**Syntax**

```

bfd-liveness-detection {
 authentication {
 algorithm algorithm-name;
 key-chain key-chain-name;
 loose-check;
 }
 detection-time {
 threshold milliseconds;
 }
 holddown-interval milliseconds;
 local-address ip-address;
 minimum-interval milliseconds;
 minimum-receive-interval milliseconds;
 minimum-receive-ttl number;
 multiplier number;
 neighbor address;
 no-adaptation;
 transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }
 version (1 | automatic);
}

```

**Hierarchy Level**

```

```

[edit routing-options static route *destination-prefix* qualified-next-hop (*interface-name* | *address*)]

- Release Information** Statement introduced before Junos OS Release 7.4.  
**detection-time threshold** and **transmit-interval threshold** options introduced in Junos OS Release 8.2.  
**local-address** statement introduced in Junos OS Release 8.2.  
**minimum-receive-ttl** statement introduced in Junos OS Release 8.2.  
Support for logical routers introduced in Junos OS Release 8.3.  
**holddown-interval** statement introduced in Junos OS Release 8.5.  
**no-adaptation** statement introduced in Junos OS Release 9.0.  
Support for IPv6 static routes introduced in Junos OS Release 9.1.  
**authentication algorithm**, **authentication key-chain**, and **authentication loose-check** statements introduced in Junos OS Release 9.6.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
- Description** Configure bidirectional failure detection timers and authentication criteria for static routes.

- Options** **authentication algorithm** *algorithm-name*—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.
- authentication key-chain** *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.
- authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.
- detection-time threshold** *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.
- holddown-interval** *milliseconds*—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.  
**Range:** 0 through 255,000  
**Default:** 0
- local-address** *ip-address*—Enable a multihop BFD session and configure the source address for the BFD session.
- minimum-interval** *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval** **minimum-interval** and **minimum-receive-interval** statements.  
**Range:** 1 through 255,000
- minimum-receive-interval** *milliseconds*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.  
**Range:** 1 through 255,000
- minimum-receive-ttl** *number*—Configure the time to live (TTL) for the multihop BFD session.  
**Range:** 1 through 255  
**Default:** 255
- multiplier** *number*—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.  
**Range:** 1 through 255  
**Default:** 3

**neighbor address**—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

**no-adaptation**—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold milliseconds**—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295

**transmit-interval minimum-interval milliseconds**—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Clear adaptation for Bidirectional Forwarding Detection (BFD) sessions. BFD is a simple hello mechanism that detects failures in a network. Configured BFD interval timers can change, adapting to network situations. Use this command to return BFD interval timers to their configured values.</p> <p>The <b>clear bfd adaptation</b> command is hitless, meaning that the command does not affect traffic flow on the routing device.</p> |
| <b>Options</b>                  | <p><b>none</b>—Clear adaptation for all BFD sessions.</p> <p><b>address session-address</b>—(Optional) Clear adaptation for all BFD sessions matching the specified address.</p> <p><b>discriminator discr-number</b>—(Optional) Clear adaptation for the local BFD session matching the specified discriminator.</p>                                                                                                                            |
| <b>Additional Information</b>   | For more information, see the description of the <b>bfd-liveness-detection</b> configuration statement in the <i>Junos Routing Protocols Configuration Guide</i> .                                                                                                                                                                                                                                                                               |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Output Fields** [Table 263 on page 3237](#) describes the output fields for the **show bfd session** command. Output fields are listed in the approximate order in which they appear.

**Table 263: show bfd session Output Fields**

| Field Name               | Field Description                                                                                                                                                                                                                                                                               | Level of Output                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| <b>Address</b>           | Address on which the BFD session is active.                                                                                                                                                                                                                                                     | <b>brief detail extensive</b><br>none |
| <b>State</b>             | State of the BFD session: <b>Up</b> , <b>Down</b> , <b>Init</b> (initializing), or <b>Failing</b> .                                                                                                                                                                                             | <b>brief detail extensive</b><br>none |
| <b>Interface</b>         | Interface on which the BFD session is active.                                                                                                                                                                                                                                                   | <b>brief detail extensive</b><br>none |
| <b>Detect Time</b>       | Negotiated time interval, in seconds, used to detect BFD control packets.                                                                                                                                                                                                                       | <b>brief detail extensive</b><br>none |
| <b>Transmit Interval</b> | Time interval, in seconds, used by the transmitting system to send BFD control packets.                                                                                                                                                                                                         | <b>brief detail extensive</b><br>none |
| <b>Multiplier</b>        | Negotiated multiplier by which the time interval is multiplied to determine the detection time for the transmitting system.                                                                                                                                                                     | <b>detail extensive</b>               |
| <b>Session up time</b>   | How long a BFD session has been established.                                                                                                                                                                                                                                                    | <b>detail extensive</b>               |
| <b>Client</b>            | Protocol for which the BFD session is active: <b>ISIS</b> , <b>OSPF</b> , or <b>Static</b> .                                                                                                                                                                                                    | <b>detail extensive</b>               |
| <b>TX interval</b>       | Time interval, in seconds, used by the host system to transmit BFD control packets.                                                                                                                                                                                                             | <b>brief detail extensive</b><br>none |
| <b>RX interval</b>       | Time interval, in seconds, used by the host system to receive BFD control packets.                                                                                                                                                                                                              | <b>brief detail extensive</b><br>none |
| <b>Authenticate</b>      | Indicates that BFD authentication is configured.                                                                                                                                                                                                                                                | <b>detail extensive</b>               |
| <b>keychain</b>          | Name of the security authentication keychain being used by a specific client.<br><br>BFD authentication information for a client is provided in a single line and includes the <b>keychain</b> , <b>algo</b> , and <b>mode</b> parameters. Multiple clients can be configured on a BFD session. | <b>extensive</b>                      |

Table 263: show bfd session Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output         |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>algo</b>                       | <p>BFD authentication algorithm being used for a specific client: <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>, or <b>simple-password</b>.</p> <p>BFD authentication information for a client is provided in a single line and includes the <b>keychain</b>, <b>algo</b>, and <b>mode</b> parameters. Multiple clients can be configured on a BFD session.</p>                                                                                                           | <b>extensive</b>        |
| <b>mode</b>                       | <p>Level of BFD authentication enforcement being used by a specific client: <b>strict</b> or <b>loose</b>. Strict enforcement indicates that authentication is configured at both ends of the session (the default). Loose enforcement indicates that one end of the session might not be authenticated.</p> <p>BFD authentication information for a client is provided in a single line and includes the <b>keychain</b>, <b>algo</b>, and <b>mode</b> parameters. Multiple clients can be configured on a BFD session.</p> | <b>extensive</b>        |
| <b>Local diagnostic</b>           | Local diagnostic information about failing BFD sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Remote diagnostic</b>          | Remote diagnostic information about failing BFD sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Remote state</b>               | Reports whether the remote system's BFD packets have been received and whether the remote system is receiving transmitted control packets.                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Version</b>                    | BFD version: <b>0</b> or <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>extensive</b>        |
| <b>Replicated</b>                 | The <b>replicated</b> flag appears when nonstop routing or graceful Routing Engine switchover is configured and the BFD session has been replicated to the backup Routing Engine.                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Min async interval</b>         | Minimum amount of time, in seconds, between asynchronous control packet transmissions across the BFD session.                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>        |
| <b>Min slow interval</b>          | Minimum amount of time, in seconds, between synchronous control packet transmissions across the BFD session.                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b>        |
| <b>Adaptive async TX interval</b> | Transmission interval being used because of adaptation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>        |
| <b>RX interval</b>                | Minimum required receive interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>extensive</b>        |
| <b>Local min TX interval</b>      | Minimum amount of time, in seconds, between control packet transmissions on the local system.                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>        |
| <b>Local min RX interval</b>      | Minimum amount of time, in seconds, between control packet detections on the local system.                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>        |
| <b>Remote min TX interval</b>     | Minimum amount of time, in seconds, between control packet transmissions on the remote system.                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>extensive</b>        |
| <b>Remote min RX interval</b>     | Minimum amount of time, in seconds, between control packet detections on the remote system.                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b>        |

Table 263: show bfd session Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output  |

| Prefix                              | LDP FEC address associated with the BFD session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels       |
| Egress, Destination                 | Displays the LDP FEC destination address. This field is displayed only on a router at the egress of an LDP FEC, where the BFD session has an LDP Operation, Administration, and Maintenance (OAM) client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels       |
| Remote is control-plane independent | <p>The BFD session on the remote peer is running on its Packet Forwarding Engine. In this case, when the remote node undergoes a graceful restart, the local peer can help the remote peer with the graceful restart.</p> <p>The following BFD sessions are not distributed to the Packet Forwarding Engine: multihop sessions, tunnel-encapsulated sessions, and sessions over aggregated Ethernet and integrated routing and bridging (IRB) interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | extensive        |
| Authentication                      | <p>Summary status of BFD authentication:</p> <ul style="list-style-type: none"> <li>• <b>status</b>—<b>enabled/active</b> indicates authentication is configured and active. <b>enabled/inactive</b> indicates authentication is configured but not active. This only occurs when the remote end of the session does not support authentication and loose checking is configured.</li> <li>• <b>keychain</b>—Name of the security authentication keychain associated with the specified BFD session.</li> <li>• <b>algo</b>—BFD authentication algorithm being used: <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>, or <b>simple-password</b>.</li> <li>• <b>mode</b>—Level of BFD authentication enforcement: <b>strict</b> or <b>loose</b>. Strict enforcement indicates authentication is configured at both ends of the session (the default). Loose enforcement indicates that one end of the session might not be authenticated.</li> </ul> <p>This information is only shown if BFD authentication is configured.</p> | extensive        |
| Session ID                          | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail extensive |
| sessions                            | Total number of active BFD sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels       |
| clients                             | Total number of clients that are hosting active BFD sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels       |

Table 263: show bfd session Output Fields (*continued*)

| Field Name                      | Field Description                                                                  | Level of Output  |
|---------------------------------|------------------------------------------------------------------------------------|------------------|
| <b>Cumulative transmit rate</b> | Total number of BFD control packets transmitted per second on all active sessions. | All levels       |
| <b>Cumulative receive rate</b>  | Total number of BFD control packets received per second on all active sessions.    | All levels       |
| <b>Multi-hop, min-recv-TTL</b>  | Minimum time to live (TTL) accepted if the session is configured for multihop.     | <b>extensive</b> |
| <b>route table</b>              | Route table used if the session is configured for multihop.                        | <b>extensive</b> |
| <b>local address</b>            | Local address of the source used if the session is configured for multihop.        | <b>extensive</b> |

## Sample Output

### show bfd session

```

user@host> show bfd session

Address State Interface Detect Time Transmit
10.9.1.33 Up so-7/1/0.0 0.600 Interval 0.200 Multiplier 3
10.9.1.29 Up ge-4/0/0.0 0.600 Interval 0.200 Multiplier 3

2 sessions, 2 clients
Cumulative transmit rate 10.0 pps, cumulative receive rate 10.0 pps

```

### show bfd session brief

The output for the **show bfd session brief** command is identical to that for the **show bfd session** command. For sample output, see [show bfd session on page 3240](#).

### show bfd session detail

```

user@host> show bfd session detail

Address State Interface Detect Time Transmit
10.9.1.33 Up so-7/1/0.0 0.600 Interval 0.200 Multiplier 3
Client OSPF, TX interval 0.200, RX interval 0.200, multiplier 3
Session up time 3d 00:34
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Replicated
10.9.1.29 Up ge-4/0/0.0 0.600 Interval 0.200 Multiplier 3
Client ISIS L2, TX interval 0.200, RX interval 0.200, multiplier 3
Session up time 3d 00:29, previous down time 00:00:01
Local diagnostic NbrSignal, remote diagnostic AdminDown
Remote state Up, version 1

2 sessions, 2 clients
Cumulative transmit rate 10.0 pps, cumulative receive rate 10.0 pps

```

**show bfd session detail (with Authentication)**

```

user@host> show bfd session detail

```

| Address                                                                              | State | Interface  | Detect Time | Transmit Interval | Multiplier |

## CHAPTER 12

# LLDP

- [Overview on page 3243](#)
- [Configuration on page 3244](#)
- [Administration on page 3257](#)

## Overview

---

- [LLDP on page 3243](#)

## LLDP

- [LLDP Overview on page 3243](#)

### LLDP Overview

---

The Link Layer Discovery Protocol (LLDP) is an industry-standard, vendor-neutral method to allow networked devices to advertise capabilities, identity, and other information onto a LAN. The Layer 2 protocol, detailed in IEEE 802.1AB-2005, replaces several proprietary protocols implemented by individual vendors for their equipment.

LLDP allows network devices that operate at the lower layers of a protocol stack (such as Layer 2 bridges and switches) to learn some of the capabilities and characteristics of LAN devices available to higher layer protocols, such as IP addresses. The information gathered through LLDP operation is stored in a network device and is queried with SNMP. Topology information can also be gathered from this database.

Some of the information that can be gathered by LLDP (only minimal information is mandatory) is:

- System name and description
- Port name and description
- VLAN name and identifier
- IP network management address
- Capabilities of the device (for example, switch, router, or server)
- MAC address and physical layer information

- Power information
- Link aggregation information

**NOTE:** LLDP media endpoint discovery (LLDP-MED) is not supported on T Series routers.

LLDP frames are sent at fixed intervals on each port that runs LLDP. LLDP protocol data units (LLDP PDUs) are sent inside Ethernet frames and identified by their destination Media Access Control (MAC) address (**01:80:C2:00:00:0E**) and Ethertype (**0x88CC**). Mandatory information supplied by LLDP is chassis ID, port ID, and a time-to-live value for this information.

LLDP is a powerful way to allow Layer 2 devices to gather details about other network-attached devices.

## Configuration

- [Configuration Examples on page 3244](#)
- [Configuration Tasks on page 3245](#)
- [Configuration Statements on page 3249](#)

### Configuration Examples

- [Example: Configuring LLDP on page 3244](#)

---

#### Example: Configuring LLDP

The following example configures LLDP on interface **ge-1/1/1** but disables LLDP on all other interfaces, explicitly configures the default values for all automatically enabled features, and configures a value of 30 seconds for the LLDP configuration notification interval and a value of 30 seconds for the physical topology trap interval.

```
[edit]
protocols {
 lldp {
 advertisement-interval 30;
 hold-multiplier 4;
 interface all {
 disable;
 }
 interface ge-1/1/1;
 lldp-configuration-notification-interval 30;
 ptopo-configuration-maximum-hold-time 300;
```

```

 ptopo-configuration-trap-interval 30;
 transmit-delay 2;
 }
}

```

You verify operation of LLDP with several show commands:

- **show lldp <detail>**
- **show lldp neighbors *interface-name***
- **show lldp statistics *interface-name***
- **show lldp local-information**
- **show lldp remote-global-statistics**

You can clear LLDP neighbor information or statistics globally or on an interface:

- **clear lldp neighbors *interface-name***
- **clear lldp statistics *interface-name***

You can display basic information about LLDP with the **show lldp detail** command:

```

user@host> show lldp detail
LLDP : Enabled
Advertisement interval : 30 Second(s)
Transmit delay : 2 Second(s)
Hold timer : 4 Second(s)
Notification interval : 30 Second(s)
Config Trap Interval : 300 Second(s)
Connection Hold timer : 60 Second(s)

```

```

Interface LLDP Neighbor count
ge-1/1/1 Enabled 0

```

LLDP basic TLVs supported:

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

LLDP 802 TLVs supported:

Link aggregation, Maximum frame size, MAC/PHY Configuration/Status, Port VLAN ID, Port VLAN name.

For more details about the output of these commands, see the *Junos OS Operational Mode Commands*.

- [LLDP Operational Mode Commands](#)

## Configuration Tasks

- [Configuring LLDP on page 3246](#)

## Configuring LLDP

---

You configure LLDP by including the **lldp** statement and associated parameters at the **[edit protocols]** hierarchy level. The complete set of LLDP statements follows:

```
lldp {
 advertisement-interval seconds;
 disable;
 hold-multiplier number;
 interface (all | interface-name) {
 disable;
 }
 lldp-configuration-notification-interval seconds;
 port-id-subtype {
 interface-name;
 locally-assigned;
 }
 ptopo-configuration-maximum-hold-time seconds;
 ptopo-configuration-trap-interval seconds;
 traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag <flag-modifier> <disable>;
 }
 transmit-delay seconds
}
```

The following statements have default values:

- **advertisement-interval**—The default value is 30 seconds. The allowable range is from 5 through 32768 seconds.
- **hold-multiplier**—The default values is 4. The allowable range is from 2 through 10.
- **ptopo-configuration-maximum-hold-time**—The default value is 300 seconds. The allowable range is from 1 through 2147483647 seconds.
- **transmit-delay**—The default values is 2 seconds. The allowable range is from 1 through 8192 seconds.

The following statements must be explicitly configured:

- **lldp-configuration-notification-interval**—The allowable range is from 0 through 3600 seconds. There is no default value.
- **ptopo-configuration-trap-interval**—The allowable range is from 1 through 2147483647 seconds. There is no default value.

To disable LLDP on all or a particular interface, include the **interfaces** statement at the **[edit protocols lldp]** hierarchy level:

```
interface (all | interface-name) {
 disable;
}
```

To disable LLDP on all interfaces, use the **all** option. To disable LLDP on a particular interface, include the **disable** statement with the interface name.

To configure LLDP on a T Series router within a TX Matrix, you must specify the interface name in the LLDP configuration for the TX Matrix. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

**NOTE:** The interface-name must be the physical interface (for example, **ge-1/0/0**) and not a logical interface (unit).

The advertisement interval determines the frequency that an LLDP interface sends LLDP advertisement frames. The default value is 30 seconds. The allowable range is from 5 through 32768 seconds. You adjust this parameter by including the **advertisement-interval** statement at the **[edit protocols lldp]** hierarchy level.

The hold multiplier determines the multiplier to apply to the advertisement interval. The resulting value in seconds is used to cache learned LLDP information before discard. The default value is 4. When used with the default advertisement interval value of 30 seconds, this makes the default cache lifetime 120 seconds. The allowable range of the hold multiplier is from 2 through 10. You adjust this parameter by including the **hold-multiplier** statement at the **[edit protocols lldp]** hierarchy level.

The transmit delay determines the delay between any two consecutive LLDP advertisement frames. The default value is 2 seconds. The allowable range is from 1 through 8192 seconds. You adjust this parameter by including the **transmit-delay** statement at the **[edit protocols lldp]** hierarchy level.

The physical topology configuration maximum hold time determines the time interval for which an agent device maintains physical topology database entries. The default value is 300 seconds. The allowable range is from 1 through 2147483647 seconds. You adjust this parameter by including the **ptopo-configuration-maximum-hold-time** statement at the **[edit protocols lldp]** hierarchy level.

The LLDP configuration notification interval determines the period for which trap notifications are sent to the SNMP Master Agent when changes occur in the database of LLDP information. This capability is disabled by default. The allowable range is from 0 (disabled) through 3600 seconds. You adjust this parameter by including the **lldp-configuration-notification-interval** statement at the **[edit protocols lldp]** hierarchy level.

The physical topology configuration trap interval determines the period for which trap notifications are sent to the SNMP Master Agent when changes occur in the global physical topology statistics. This capability is disabled by default. The allowable range is from 0 (disabled) through 3600 seconds. The LLDP agent sends traps to the SNMP Master Agent if this interval has a value greater than 0 and there is any change during the **lldp-configuration-notification-interval** trap interval. You adjust this parameter by including the **ptopo-configuration-trap-interval** statement at the **[edit protocols lldp]** hierarchy level.

By default, LLDP generates the SNMP index of the interface for the port ID Type, Length, and Value (TLV). Starting with Junos OS Release 12.3R1, you can generate the interface

name as the port ID TLV by including the **interface-name** statement at the **[edit protocols lldp port-id-subtype]** hierarchy level. When configure the **interface-name** statement on the remote LLDP neighbor, the **show lldp neighbors** command displays the interface name in the **Port ID** field rather than the SNMP index of the interface, which is displayed by default. If you change the default behavior of generating the SNMP index of the interface as the Port ID TLV, you can reenable the default behavior by including the **locally-assigned** statement at the **[edit protocols lldp port-id-subtype]** hierarchy level.

| <b>Description</b>              | <p>For MX Series and T Series routers and EX Series switches, configure an interval for LLDP advertisement.</p> <p>For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.</p> <p>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration.</p> <div><p><b>NOTE:</b> The default value of <b>transmit-delay</b> is 2 seconds. If you configure the <b>advertisement-interval</b> as less than 8 seconds and you do not configure a value for <b>transmit-delay</b>, the default value of <b>transmit-delay</b> is automatically changed to 1 second in order to satisfy the requirement that the <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value.</p></div> |
| <b>Default</b>                  | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | Set LLDP protocol-level tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>             | The default LLDP protocol-level trace options are inherited from the global <b>traceoptions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place spanning-tree protocol tracing output in the file <code>/var/log/stp-log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following are the LLDP-specific tracing options:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>config</b>—Log configuration events.</li> <li>• <b>interface</b>—Trace interface update events.</li> <li>• <b>protocol</b>—Trace protocol information.</li> <li>• <b>rtsock</b>—Trace socket events.</li> <li>• <b>vlan</b>—Trace vlan update events.</li> </ul> |

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-world-readable**—(Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

**size maximum-file-size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege  
Level**

routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## Routine Monitoring

- [Tracing LLDP Operations on page 3257](#)

### Tracing LLDP Operations

To trace LLDP operational traffic, you can specify options in the global **traceoptions** statement included at the [edit **routing-options**] hierarchy level, and you can specify LLDP-specific options by including the **traceoptions** statement:

```
traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag <flag-modifier> <disable>;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols [lldp](#)]
- [edit routing-instances *routing-instance-name* protocols [lldp](#)]

You can specify the following LLDP-specific options in the LLDP **traceoptions** statement:

- **all**—Trace all operations.
- **config**—Log configuration events.
- **interface**—Trace interface update events.

- **protocol**—Trace protocol information.
- **rtsock**—Trace real-time socket events.
- **vlan**—Trace VLAN update events.

**NOTE:** Use the trace flag all with caution. This flag may cause the CPU to become very busy.

For general information about tracing and global tracing options, see the statement summary for the global **traceoptions** statement in the *Junos OS Routing Protocols Configuration Guide*.

#### Introduction to Logical Systems

---

For many years, engineers have combined power supplies, routing hardware and software, forwarding hardware and software, and physical interfaces into a networking device known as a router. Networking vendors have created large routers and small routers, but all routers have been placed into service as individual devices. As a result, the router has been considered a single physical device for most of its history.

The concept of logical systems breaks with this tradition. With the Junos<sup>®</sup> operating system (Junos OS), you can partition a single router into multiple logical devices that perform independent routing tasks. Because logical systems perform a subset of the tasks once handled by the main router, logical systems offer an effective way to maximize the use of a single routing or switching platform.

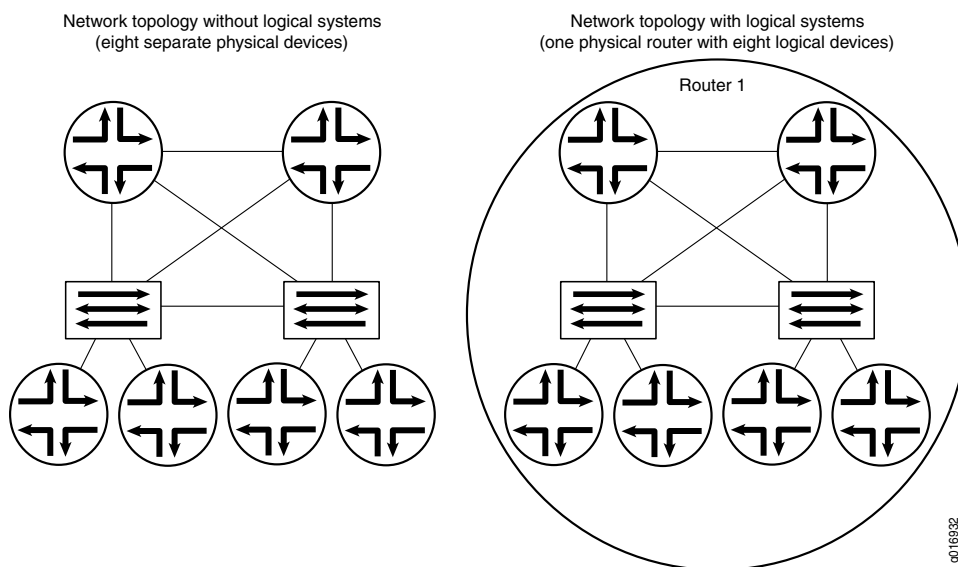

**NOTE:** Beginning with Junos OS Release 9.3, the logical router feature has been renamed logical system.

All configuration statements, operational commands, show command output, error messages, log messages, and SNMP MIB objects that contain the string `logical-router` have been changed to `logical-system`.

Traditionally, service provider network design requires multiple layers of switches and routers. These devices transport packet traffic between customers. As seen on the left side of [Figure 49 on page 3260](#), access devices are connected to edge devices, which are in turn connected to core devices.

However, this complexity can lead to challenges in maintenance, configuration, and operation. To reduce such complexity, Juniper Networks supports logical systems. Logical systems perform a subset of the actions of the main router and have their own unique routing tables, interfaces, policies, and routing instances. As shown on the right side of [Figure 49 on page 3260](#), a set of logical systems within a single router can handle the functions previously performed by several small routers.

**Figure 49: Logical Systems Concepts**

[Figure 50 on page 3261](#) shows the Junos OS architecture without logical systems configured. [Figure 51 on page 3261](#) shows the Junos OS architecture when logical systems are configured. Note that each logical system runs its own routing protocol process (`rpd`).

- [Junos OS Features That Are Supported on Logical Systems on page 3262](#)

### Junos OS Features That Are Supported on Logical Systems

---

The following protocols and functions are supported on logical systems:

- Open Shortest Path First (OSPF), Intermediate System-to-Intermediate System (IS-IS), Routing Information Protocol (RIP), RIP next generation (RIPng), Border Gateway Protocol (BGP), Resource Reservation Protocol (RSVP), Label Distribution Protocol (LDP), static routes, and Internet Protocol version 4 (IPv4) and version 6 (IPv6).
- Multiprotocol Label Switching (MPLS) provider edge (PE) and core provider router functions, such as Layer 2 virtual private networks (VPNs), Layer 3 VPNs, circuit cross-connect (CCC), Layer 2 circuits, and virtual private LAN service (VPLS).
- Resource Reservation Protocol (RSVP) point-to-multipoint label-switched paths (LSPs).
- Multicast protocols, such as Protocol Independent Multicast (PIM), Distance Vector Multicast Routing Protocol (DVMRP), rendezvous point (RP), and source designated router (DR).
- All policy-related statements available at the **[edit policy-options]** hierarchy level.
- Most routing options statements available at the **[edit routing-options]** hierarchy level.
- Graceful Routing Engine switchover (GRES). Configure graceful Routing Engine switchover on the main router with the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level.
- Graceful restart. Include the **graceful-restart** statement at the **[edit logical-systems logical-system-name routing-options]** hierarchy level.
- You can assign most interface types to a logical system. For a list of unsupported PICs, see [“Logical Systems Operations and Restrictions” on page 3263](#).
- Flow aggregation in logical systems is supported starting in Junos OS Release 11.4. In the logical system, sampling based on the Routing Engine is not supported. Only PIC-based sampling is supported. Logical systems support only cflowd version 9. Currently, cflowd version 5 and cflowd version 8 are not supported in logical systems. Flow aggregation in logical systems is slightly different from flow aggregation on the main router in that when you configure flow aggregation in logical systems, the **route-record** statement is not required.
- Port mirroring, source class usage, destination class usage, unicast reverse-path forwarding, class of service, firewall filters, class-based forwarding, and policy-based accounting work with logical systems when you configure these features on the main router.
- The Simple Network Management Protocol (SNMP) has been extended to support logical systems and routing instances. A network management system receives instance-aware information in the following format:

***logical-system-name/routing-instance@community***

As a result, a network manager can gather statistics for a specific community within a routing instance within a logical system. The SNMP manager for a routing instance can request and manage SNMP data only for that routing instance and other routing

instances in the same logical system. By default, the SNMP manager for the default routing instance in the main router (**inet.0**) can access SNMP data from all routing instances. To restrict that manager's access to the default routing instance only, include the **routing-instance-access** statement at the **[edit snmp]** hierarchy level.

- For SRX platforms only, support for system logging at the **[edit logical-system logical-system-name system syslog]** hierarchy level is introduced in Junos OS Release 11.4.

- [Logical Systems Operations and Restrictions on page 3263](#)

---

### Logical Systems Operations and Restrictions

Logical systems have the following operations and restrictions:

- You can configure a maximum of 15 logical systems plus the master logical system on a routing device. When a configuration session is in use, users who are tied to the same logical system cannot commit configuration changes.
- The routing device has only one running configuration database, which contains configuration information for the main routing device and all associated logical systems. When configuring a logical system, a user has his own candidate configuration database, which does not become part of the running configuration database until the user issues the **commit** command.
- Configuring the out-of-band management interface, such as **em0** or **fxp0**, in a logical system is not supported.
- Some high availability features are not supported on logical systems. These features include non-stop routing (NSR), non-stop bridging (NSB), and unified in-service software upgrade (unified ISSU). Graceful restart is supported. For a logical system, include the graceful-restart statement at the **[edit logical-systems logical-system-name routing-options]** hierarchy level.
- The following guidelines describe how firewall filters affect the main routing device, logical systems, and virtual routers. The "default loopback interface" refers to **lo0.0** (associated with the default routing table), the "loopback interface in a logical system" refers to **lo0.n** configured in the logical system, and the "loopback interface in the virtual router" refers to **lo0.n** configured in the virtual router.

If you configure Filter A on the default loopback interface in the main routing device but do not configure a filter on the loopback interface in a logical system, the logical system does not use a filter.

If you configure Filter A on the default loopback interface in the main routing device but do not configure a loopback interface in a logical system, the logical system uses Filter A.

If you configure Filter A on the default loopback interface on the main routing device and Filter B on the loopback interface in a logical system, the logical system uses Filter

B. In a special case of this rule, when you also configure a routing instance of type **virtual-router** on the logical system, the following rules apply:

- If you configure Filter C on the loopback interface in the virtual router, traffic belonging to the virtual router uses Filter C.
- If you do not configure a filter on the loopback interface in the virtual router, traffic belonging to the virtual router does not use a filter.
- If you do not configure a loopback interface in the virtual router, traffic belonging to the virtual router uses Filter A.
- If a logical system experiences an interruption of its routing protocol process (**rpd**), the core dump output is placed in **/var/tmp/** in a file called **rpd\_logical-system-name.core-tarball.number.tgz**. Likewise, if you issue the **restart routing** command in a logical system, only the routing protocol process (**rpd**) for the logical system is restarted.
- If you configure trace options for a logical system, the output log file is stored in the following location: **/var/log/logical-system-name**. To monitor a log file within a logical system, issue the **monitor start logical-system-name/filename** command.
- The following PICs are not supported with logical systems: Adaptive Services, Multiservices, ES, Monitoring Services, and Monitoring Services II.
- The Multiservices Dense Port Concentrator (MS-DPC) is not supported with logical systems.
- Generalized MPLS (GMPLS), IP Security (IPsec), and sampling are not supported.
- Class of service (CoS) on a logical tunnel (**lt**) or virtual loopback tunnel (**vt**) interface in a logical system is not supported.
- You cannot include the **vrf-table-label** statement on multiple logical systems if the core-facing interfaces are channelized or configured with multiple logical interfaces (Frame Relay DLCIs or Ethernet VLANs).
- The master administrator must configure global interface properties and physical interface properties at the **[edit interfaces]** hierarchy level. Logical system administrators can only configure and verify configurations for the logical systems to which they are assigned.
- You can configure only Frame Relay interface encapsulation on a logical tunnel interface (**lt-**) when it is configured with an IPv6 address.
- IPv6 tunneling is not supported with point-to-multipoint label-switched paths (LSPs) configured on logical systems.
- IGMP snooping is not supported.
- In a VPLS multihoming scenario in which a logical tunnel interface (**lt-**) is used for connecting the dual-home VPLS, Junos OS creates a unique static MAC address for every logical tunnel interface configured. This MAC address is not flushed when a CCC down event occurs on the link and when traffic is switched from the primary link to the backup link (or the reverse). As a result, any traffic that is destined for hosts behind the logical tunnel MAC address does not take the new path.

Comparing Junos OS Device Virtualization Technologies

The Junos OS supports multiple device virtualization technologies. The technologies have similar names, which can lead to confusion.

The Junos OS device virtualization technologies are:

- Logical systems—Offer routing and management separation. Management separation means multiple user access. Each logical system has its own routing tables.  
  
Logical routers is the old name for logical systems. Beginning with Junos OS Release 9.3, the logical router feature has been renamed logical system. All configuration statements, operational commands, **show** command output, error messages, log messages, and SNMP MIB objects that contain the string logical-router have been changed to logical-system.
- Virtual routers—Offer scalable routing separation. A virtual router does not have the same capabilities as a logical system. A virtual router is a type of simplified routing instance that has a single routing table. By contrast, a logical system is a partition of the main routing device and can contain multiple routing instances.
- VRF-Lite—Offers routing separation. The functionality of VRF-Lite is similar to virtual routers, but VRF-Lite is for smaller environments.
- Virtual switches—Offer scalable switching separation.

[Table 264 on page 3265](#) summarizes the benefits of virtual routers, VRF-Lite, and logical systems.

Table 264: Benefits of Virtual Routers, VRF-Lite, and Logical Systems

| Benefits                                     | Virtual Router | VRF-Lite | Logical Systems |
|----------------------------------------------|----------------|----------|-----------------|
| Logical platform partitioning                | Yes            | Yes      | Yes             |
| Fault isolation on the routing plane         | No             | No       | Yes             |
| Multiple user access (management separation) | No             | No       | Yes             |
| Scalable routing separation                  | Yes            | No       | Yes             |

## Logical Systems Applications

Logical systems are discrete contexts that virtually divide a supported device into multiple devices, isolating one from another and protecting them from faulty conditions outside their own contexts.

The logical systems functionality enables you to partition the device and assign private logical systems to groups or organizations. Logical systems are defined largely by the resources allocated to them, features enabled for the logical context, their routing configurations, and their logical interface assignments. Logical systems segment a physical routing device to be configured and operated as multiple independent routing devices within a platform. This isolates routing protocols and interfaces among up to 16 logical systems (including the master logical system). User permissions and access are defined separately for each logical system, enabling different groups to manage the same physical device. Logical systems enable the use of large routing devices in small routing device roles and provide flexible segmentation of routing by service type. Multiple service capabilities bring improved asset optimization by consolidating services into one device.

For example, logical systems enable the following services on a single routing device platform:

- Internet BGP peering
- Core transit
- Edge aggregation and dedicated access
- MPLS provider edge (PE) and provider (P) VPN label-switched routing routers (LSRs)

Figure 52 on page 3266 shows how logical systems can be used for horizontal consolidation, vertical consolidation, and managed services. Horizontal consolidation occurs when you combine routing device functions of the same layer into a single routing device. Vertical consolidation occurs when you collapse routing device functions of different layers into a single routing device. With managed services, each logical system is a customer routing device.

### Logical Systems Requirements

---

To implement logical systems, your system must meet these minimum requirements:

- Junos OS Release 8.5 or later for logical system administrator support
- Junos OS Release 8.4 or later for SNMP enhancements and limits
- Junos OS Release 8.3 or later for Bidirectional Forwarding Detection (BFD) on logical systems
- Junos OS Release 8.2 or later for support on MX Series routers
- Junos OS Release 7.5 or later for SNMP support within a logical system
- Junos OS Release 7.4 or later for multicast protocol RP and source designated router functionality within a logical system
- Junos OS Release 7.0 or later to implement a logical tunnel (**lt**) interface on an integrated Adaptive Services Module in an M7i router
- Junos OS Release 6.1 or later, a Tunnel Services PIC, and an Enhanced FPC on M Series or T Series routers to implement a logical tunnel (**lt**) interface
- Junos OS Release 6.0 or later for basic logical system functionality
- One or more M Series, MX Series, or T Series routers
- On M Series and T Series routers, a variety of PICs to assign interfaces to each logical system
- One or more EX Series switches

#### **Example: Configuring User Access for Logical Systems**

---

- [Understanding Junos OS Access Privilege Levels on page 3268](#)
- [Example: Configuring Logical System Administrators on page 3272](#)

##### ***Understanding Junos OS Access Privilege Levels***

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 3268](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 3272](#)

##### ***Junos OS Login Class Permission Flags***

The **permissions** statement specifies one or more of the permission flags listed in [Table 40 on page 124](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure**

to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

Table 40 on page 124 lists the Junos<sup>®</sup> operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

**Table 265: Login Class Permission Flags**

| Permission Flag         | Description                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access</b>           | Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.                      |
| <b>access-control</b>   | Can view and configure access information at the <b>[edit access]</b> hierarchy level.                                                        |
| <b>admin</b>            | Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.                      |
| <b>admin-control</b>    | Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.                                                  |
| <b>all-control</b>      | Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels. |
| <b>clear</b>            | Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.       |
| <b>configure</b>        | Can enter configuration mode by using the <b>configure</b> command.                                                                           |
| <b>control</b>          | Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.                                 |
| <b>field</b>            | Can view field debug commands. Reserved for debugging support.                                                                                |
| <b>firewall</b>         | Can view the firewall filter configuration in configuration mode.                                                                             |
| <b>firewall-control</b> | Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.                                             |
| <b>floppy</b>           | Can read from and write to the removable media.                                                                                               |
| <b>flow-tap</b>         | Can view the flow-tap configuration in configuration mode.                                                                                    |

Table 265: Login Class Permission Flags (*continued*)

| Permission Flag                       | Description                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>flow-tap-control</b>               | Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.                                                                                                                                                                                                                                        |
| <b>flow-tap-operation</b>             | Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have <b>flow-tap-operation</b> permission.<br><br><b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.                                       |
| <b>idp-profiler-operation</b>         | Can view profiler data.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>interface</b>                      | Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.                                                                                                                                                                                                                                                                                   |
| <b>interface-control</b>              | Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul> |
| <b>maintenance</b>                    | Can perform system maintenance, including starting a local shell on the router or switch and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router or switch by using the <b>request system</b> commands.                                                                                                                                               |
| <b>network</b>                        | Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.                                                                                                                                                                                                                                                                                                |
| <b>pgcp-session-mirroring</b>         | Can view the <b>pgcp</b> session mirroring configuration.                                                                                                                                                                                                                                                                                                                                                     |
| <b>pgcp-session-mirroring-control</b> | Can modify the <b>pgcp</b> session mirroring configuration.                                                                                                                                                                                                                                                                                                                                                   |
| <b>reset</b>                          | Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.                                                                                                                                                                                                                |
| <b>rollback</b>                       | Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.                                                                                                                                                                                                                                                                             |
| <b>routing</b>                        | Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.                                                                                                                                                                                                                                                                              |

Table 265: Login Class Permission Flags (*continued*)

| Permission Flag           | Description                                                                                                                                                                                                                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>routing-control</b>    | Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level. |
| <b>secret</b>             | Can view passwords and other authentication keys in the configuration.                                                                                                                                                                                                                                                     |
| <b>secret-control</b>     | Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.                                                                                                                                                                                                           |
| <b>security</b>           | Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.                                                                                                                                                                                                     |
| <b>security-control</b>   | Can view and configure security information at the <b>[edit security]</b> hierarchy level.                                                                                                                                                                                                                                 |
| <b>shell</b>              | Can start a local shell on the router or switch by using the <b>start shell</b> command.                                                                                                                                                                                                                                   |
| <b>snmp</b>               | Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.                                                                                                                                                                                                       |
| <b>snmp-control</b>       | Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.                                                                                                                                                                                                       |
| <b>system</b>             | Can view system-level information in configuration and operational modes.                                                                                                                                                                                                                                                  |
| <b>system-control</b>     | Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.                                                                                                                                                                                                              |
| <b>trace</b>              | Can view trace file settings and configure trace file properties.                                                                                                                                                                                                                                                          |
| <b>trace-control</b>      | Can modify trace file settings and configure trace file properties.                                                                                                                                                                                                                                                        |
| <b>view</b>               | Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.                                                                                                                                                                 |
| <b>view-configuration</b> | Can view all of the configuration excluding secrets, system scripts, and event options.<br><br><b>NOTE:</b> Only users with the <b>maintenance</b> permission can view commit script, op script, or event script configuration.                                                                                            |

### *Allowing or Denying Individual Commands for Junos OS Login Classes*

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration** and **deny-configuration**, **allow-commands** and **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

### *Example: Configuring Logical System Administrators*

This example shows how to configure logical system administrators.

- [Requirements on page 3273](#)
- [Overview on page 3273](#)

- [Configuration on page 3273](#)
- [Verification on page 3274](#)

### Requirements

You must be the master administrator to assign system administrators to logical systems.

### Overview

The master administrator can assign one or more system administrators to each logical system. Logical system administrators are confined to the context of the logical system to which they are assigned. This means that logical system administrators cannot access any global configuration statements. This also means that command output is restricted to the context to which the logical system administrators are assigned.

Configuring a user account for each logical system helps in navigating the CLI. This enables you to log in to each logical system and be positioned within the root of that logical system as if you were in the root of a physical routing device.

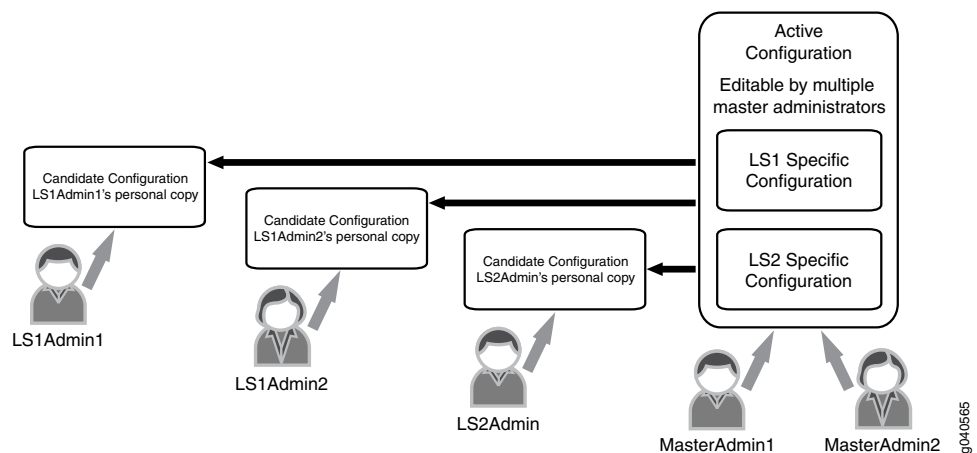

In this example, **LS1Admin** has full permissions on Logical System LS1.

In this example, **LS2Admin** has the ability to view Logical System LS2 but not to change the configuration.

### Diagram

[Figure 53 on page 3273](#) shows how logical system administration works.

**Figure 53: Logical System Administrators**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set logical-systems LS1
set logical-systems LS2
set system login class admin1 logical-system LS1

```

```
set system login class admin2 logical-system LS2
set system login class admin1 permissions all
set system login class admin2 permissions view
set system login user LS1Admin class admin1
set system login user LS2Admin class admin2
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To assign logical system administrators to a logical systems:

1. Configure the logical systems.

```
[edit]
user@host# set logical-systems LS1
user@host# set logical-systems LS2
```

2. Create the login classes and assign logical systems to the classes.

```
[edit]
user@host# set system login class admin1 logical-system LS1
user@host# set system login class admin2 logical-system LS2
```

3. Assign permissions to the login classes.

```
[edit]
user@host# set system login class admin1 permissions all
user@host# set system login class admin2 permissions view
```

4. Assign users to the login classes.

```
[edit]
user@host# set system login user LS1Admin class admin1
user@host# set system login user LS2Admin class admin2
```

5. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Verification**

To verify that the configuration is working properly, issue the [show cli authorization](#) command to view permissions for the current user.

- [Example: Connecting Logical Systems Within the Same Router Using Logical Tunnel Interfaces on MX Series Routers on page 3283](#)

### **Understanding Interfaces**

Interfaces act as a doorway through which traffic enters and exits a device. Juniper Networks devices support a variety of interface types:

- Network interfaces—Networking interfaces primarily provide traffic connectivity.
- Services interfaces—Services interfaces manipulate traffic before it is delivered to its destination.
- Special interfaces—Special interfaces include management interfaces, the loopback interface, and the discard interface.

Each type of interface uses a particular medium to transmit data. The physical wires and Data Link Layer protocols used by a medium determine how traffic is sent. To configure and monitor interfaces, you need to understand their media characteristics, as well as physical and logical properties such as IP addressing, link-layer protocols, and link encapsulation.

**NOTE:** Most interfaces are configurable, but some internally generated interfaces are not configurable.

### **Example: Creating an Interface on a Logical System**

This example shows how to create an interface on a logical system.

- [Requirements on page 3275](#)
- [Overview on page 3275](#)
- [Configuration on page 3276](#)
- [Verification on page 3277](#)

#### **Requirements**

For the interface on the logical system to have connectivity, the corresponding physical interface must be administratively up, and the physical link must be up. You can verify the status of the physical interface by running the **show interfaces terse** command.

#### **Overview**

In logical systems, you must treat each interface like a point-to-point connection because you can only connect one logical tunnel interface to another at any given time. Also, you must select an interface encapsulation type, specify a DLCI number or VLAN identifier, configure a corresponding protocol family, and set the logical interface unit number of the peering **lt** interface.

To configure the interface encapsulation type, include the **dlci**, **encapsulation**, **family**, **peer-unit**, and **vlan-id** statements at the following hierarchy levels:

- M Series, MX Series, or T Series router (master administrator only)—[edit interfaces *lt-fpc/pic/0* unit *unit-number*]
- Logical system—[edit logical-systems *logical-system-name* interfaces *lt-fpc/pic/0* unit *unit-number*]

```
[edit]
logical-systems logical-system-name {
 interfaces {
 lt-fpc/pic/0 {
 unit unit-number {
 encapsulation (ethernet | ethernet-ccc | ethernet-vpls | frame-relay |
 frame-relay-ccc | vlan | vlan-ccc | vlan-vpls);
 peer-unit number; # The logical unit number of the peering lt interface.
 dlci dlci-number;
 vlan-id vlan-number;
 family (ccc | inet | inet6 | iso | mpls | tcc);
 }
 }
 }
}
```

**NOTE:** When you configure IPv6 addresses on a logical tunnel interface, you must configure unique IPv6 link-local addresses for any logical interfaces that peer with one another. To configure a link-local address, you must be the master administrator. Include a second IPv6 address with the address statement at the [edit interfaces *lt-fpc/pic/port* unit *unit-number* family inet6] hierarchy level. Link-local addresses typically begin with the numbers fe80 (such as fe80::1111:1/64).

In this example, you create the **fe-1/1/3** physical interface on the main router. You can also add values for properties that you need to configure on the physical interface, such as physical encapsulation, VLAN tagging (enabling), and link speed.

The example then shows how to assign logical interfaces to a logical system. Once you do this, the logical interfaces are considered part of the logical system.

Any logical interface unit can only be assigned to one system, including the main router. For example, if you configure logical unit 3 in the main router, you cannot configure logical unit 3 in a logical system.

In this example, you create logical unit 0 on Logical System LS1. You can also add values for properties that you need to configure on the logical interface, such as logical interface encapsulation, VLAN ID number, and protocol family.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces fe-1/1/3 description "main router interface"
set logical-systems LS1 interfaces fe-1/1/3 unit 0 description "LS1 interface"
set logical-systems LS1 interfaces fe-1/1/3 unit 0 family inet address 10.11.2.2/24
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure an interface on a logical system:

1. As the master administrator, configure the physical interface on the main router.  
  

```
[edit]
user@host# set interfaces fe-1/1/3 description "main router interface"
```
2. Create the logical system interface on the logical unit.  
  

```
[edit]
user@host# set logical-systems LS1 interfaces fe-1/1/3 unit 0 description "LS1 interface"
user@host# set logical-systems LS1 interfaces fe-1/1/3 unit 0 family inet address 10.11.2.2/24
```
3. If you are done configuring the device, commit the configuration.  
  

```
[edit]
user@host# commit
```

#### Verification

To verify that the configuration is working properly, issue the **show interfaces** command.

#### Example: Connecting a Logical System to a Physical Router

This example shows how to configure an interface on a logical system to connect to a separate router. The separate router can be a physical router or a logical system on a physical router.

- [Requirements on page 3277](#)
- [Overview on page 3277](#)
- [Configuration on page 3278](#)
- [Verification on page 3279](#)

#### Requirements

PICs must be installed on the two routers.

#### Overview

In this example, Logical System LS1 is configured on Router R1. The Logical System LS1 has a direct connection to Router R2.

[Figure 54 on page 3278](#) shows the topology used in this example.

Figure 54: Logical System Connected to a Physical Router

**Configuration****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Router R1**      **set interfaces so-0/0/2 description "main router interface to R2"**  
**set logical-systems LS1 interfaces so-0/0/2 unit 0 description LS1->R2**  
**set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet address 10.0.45.2/30**

**Device R2**      **set interfaces so-0/0/2 description R2->LS1**  
**set interfaces so-0/0/2 unit 0 family inet address 10.0.45.1/30**

**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To connect a logical system to a physical router:

1. On Router R1, configure the interface.  

```
[edit]
user@R1# set interfaces so-0/0/2 description "main router interface to R2"
```
2. On Router R1, configure the Logical System LS1 interface.  

```
[edit]
user@R1# set logical-systems LS1 interfaces so-0/0/2 unit 0 description LS1->R2
user@R1# set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet address 10.0.45.2/30
```
3. On Device R2, configure the interface to Logical System LS1.  

```
[edit]
user@R2# set interfaces so-0/0/2 description R2->LS1
user@R2# set interfaces so-0/0/2 unit 0 family inet address 10.0.45.1/30
```

- If you are done configuring the devices, commit the configurations.

```
[edit]
user@host# commit
```

### Verification

Confirm that the configuration is working properly.

### Verifying Connectivity

**Purpose** Make sure that the devices can ping each other.

**Action** user@R2> ping 10.0.45.2  
 PING 10.0.45.2 (10.0.45.2): 56 data bytes  
 64 bytes from 10.0.45.2: icmp\_seq=0 ttl=64 time=3.910 ms  
 64 bytes from 10.0.45.2: icmp\_seq=1 ttl=64 time=3.559 ms  
 64 bytes from 10.0.45.2: icmp\_seq=2 ttl=64 time=3.503 ms

```
user@R1> set cli logical-system LS1
Logical system: LS1
```

```
user@R1:LS1> ping 10.0.45.1
PING 10.0.45.1 (10.0.45.1): 56 data bytes
64 bytes from 10.0.45.1: icmp_seq=0 ttl=64 time=1.217 ms
64 bytes from 10.0.45.1: icmp_seq=1 ttl=64 time=1.183 ms
64 bytes from 10.0.45.1: icmp_seq=2 ttl=64 time=1.121 ms
```

### Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches

This example shows how to configure logical tunnel interfaces to connect two logical systems that are configured in a single router.

- [Requirements on page 3279](#)
- [Overview on page 3280](#)
- [Configuration on page 3281](#)
- [Verification on page 3282](#)

### Requirements

On M Series and T Series routers, you can create a logical tunnel interface if you have a Tunnel Services PIC installed on an Enhanced FPC in your routing platform.

On M40e routers, you can create a logical tunnel interface if you have a Tunnel Services PIC. (An Enhanced FPC is not required.)

On an M7i router, logical tunnel interfaces can be created by using the integrated Adaptive Services Module.

On an MX Series router, the master administrator can configure logical tunnel interfaces by including the **tunnel-services** statement at the **[edit chassis fpc slot-number pic number]** hierarchy level.

### Overview

To connect two logical systems, you configure a logical tunnel interface on both logical systems. Then you configure a peer relationship between the logical tunnel interfaces, thus creating a point-to-point connection. Logical tunnel interfaces behave like regular interfaces. You can configure them with Ethernet, Frame Relay, or another encapsulation type. You can also configure routing protocols across them. In effect, the logical tunnel (lt) interfaces connect two logical systems within the same router. The two logical systems do not share routing tables. This means that you can run dynamic routing protocols between different logical systems within the same router.

You must treat each interface like a point-to-point connection because you can only connect one logical tunnel interface to another at any given time. Also, you must select an interface encapsulation type, configure a corresponding protocol family, and set the logical interface unit number of the peering lt interface.

In this example, the logical tunnel interfaces are configured to behave as Ethernet interfaces with the **encapsulation ethernet** statement. The IS-IS Protocol is enabled on the logical tunnel interfaces with the **family iso** statement.

When configuring logical tunnel interfaces, note the following:

- The peering logical interfaces must have the same physical lt interface name. For example, a logical unit on lt-0/1/0 cannot peer with a logical unit on lt-0/0/10. The FPC, PIC, and port numbers must match.
- The peering logical interfaces must be derived from the same PIC or module.
- You can configure only one peer unit for each logical interface. For example, unit 0 cannot peer with both unit 1 and unit 2.
- Logical tunnels are not supported with Adaptive Services, MultiServices, or Link Services PICs, but they are supported on the Adaptive Services Module on M7i routers.

Figure 55 on page 3280 shows the topology used in this example.

**Figure 55: Connecting Two Logical Systems**

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS1 interfaces lt-0/1/0 unit 0 description LS1->LS2
set logical-systems LS1 interfaces lt-0/1/0 unit 0 encapsulation ethernet
set logical-systems LS1 interfaces lt-0/1/0 unit 0 peer-unit 1
set logical-systems LS1 interfaces lt-0/1/0 unit 0 family inet address 10.0.8.13/30
set logical-systems LS1 interfaces lt-0/1/0 unit 0 family iso
set logical-systems LS2 interfaces lt-0/1/0 unit 1 description LS2->LS1
set logical-systems LS2 interfaces lt-0/1/0 unit 1 encapsulation ethernet
set logical-systems LS2 interfaces lt-0/1/0 unit 1 peer-unit 0
set logical-systems LS2 interfaces lt-0/1/0 unit 1 family inet address 10.0.8.14/30
set logical-systems LS2 interfaces lt-0/1/0 unit 1 family iso
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To connect logical system interfaces:

1. Run the **show interfaces terse** command to verify that the router has a logical tunnel (lt) interface.

```
user@host> show interfaces terse
Interface Admin Link Proto Local Remote
so-0/0/0 up down
so-0/0/1 up down
so-0/0/2 up down
so-0/0/3 up down
gr-0/1/0 up up
ip-0/1/0 up up
lt-0/1/0 up up
...
```

2. Configure the logical tunnel interface on Logical System LS1.

```
[edit]
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 description LS1->LS2
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 encapsulation ethernet
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 peer-unit 1
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 family inet address
10.0.8.13/30
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 family iso
```

3. Configure the logical tunnel interface on Logical System LS2.

```
[edit]
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 description LS2->LS1
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 encapsulation ethernet
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 peer-unit 0
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 family inet address
10.0.8.14/30
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 family iso
```

4. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### ***Verification***

Confirm that the configuration is working properly.

- [Verifying That the Logical Systems Are Up on page 3282](#)
- [Verifying Connectivity Between the Logical Systems on page 3282](#)

### ***Verifying That the Logical Systems Are Up***

**Purpose** Make sure that the interfaces are properly configured.

```
Action user@host> show interfaces terse
```

| Interface  | Admin | Link | Proto | Local        | Remote |
|------------|-------|------|-------|--------------|--------|
| so-0/0/0   | up    | down |       |              |        |
| so-0/0/1   | up    | down |       |              |        |
| so-0/0/2   | up    | down |       |              |        |
| so-0/0/3   | up    | down |       |              |        |
| gr-0/1/0   | up    | up   |       |              |        |
| ip-0/1/0   | up    | up   |       |              |        |
| lt-0/1/0   | up    | up   |       |              |        |
| lt-0/1/0.0 | up    | up   | inet  | 10.0.8.13/30 |        |
|            |       |      | iso   |              |        |
| lt-0/1/0.1 | up    | up   | inet  | 10.0.8.14/30 |        |
|            |       |      | iso   |              |        |
| ...        |       |      |       |              |        |

### ***Verifying Connectivity Between the Logical Systems***

**Purpose** Make sure that the network address appears as directly connected.

```

Action user@host> show route logical-system all
logical-system: LS1

inet.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.8.12/30 *[Direct/0] 00:00:34
 > via lt-0/1/0.0
10.0.8.13/32 *[Local/0] 00:00:34
 Local via lt-0/1/0.0

logical-system: LS2

inet.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.8.12/30 *[Direct/0] 00:00:34
 > via lt-0/1/0.1
10.0.8.14/32 *[Local/0] 00:00:34
 Local via lt-0/1/0.1
...

```

***Example: Connecting Logical Systems Within the Same Router Using Logical Tunnel Interfaces on MX Series Routers***

This example shows how to configure logical tunnel interfaces to connect two logical systems that are configured in a single MX Series 3D Universal Edge Router.

- [Requirements on page 3283](#)
- [Overview on page 3284](#)
- [Configuration on page 3284](#)
- [Verification on page 3286](#)

***Requirements***

The MX Series router chassis must have a DPC, MPC, or MIC installed and in the online state.

### Overview

To connect two logical systems, you configure a logical tunnel interface on both logical systems. Then you configure a peer relationship between the logical tunnel interfaces, thus creating a point-to-point connection. Logical tunnel interfaces behave like regular interfaces. You can configure them with Ethernet, Frame Relay, or another encapsulation type. You can also configure routing protocols across them. In effect, the logical tunnel (lt) interfaces connect two logical systems within the same router. The two logical systems do not share routing tables. This means that you can run dynamic routing protocols between different logical systems within the same router.

You must treat each interface like a point-to-point connection because you can only connect one logical tunnel interface to another at any given time. Also, you must select an interface encapsulation type, configure a corresponding protocol family, and set the logical interface unit number of the peering lt interface.

In this example, the logical tunnel interfaces are configured to behave as Ethernet interfaces with the **encapsulation ethernet** statement. The IS-IS Protocol is enabled on the logical tunnel interfaces with the **family iso** statement.

When configuring logical tunnel interfaces, note the following:

- The peering logical interfaces must have the same lt interface name. For example, a logical unit on lt-0/1/0.0 cannot peer with a logical unit on lt-0/0/10. The FPC (DPC, MPC, or MIC), PIC, and port numbers must match.
- The peering logical interfaces must be derived from the same module.
- You can configure only one peer unit for each logical interface. For example, unit 0 cannot peer with both unit 1 and unit 2.

Figure 56 on page 3284 shows the topology used in this example.

**Figure 56: Connecting Two Logical Systems**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis fpc 0 pic 1 tunnel-services bandwidth 1g
set logical-systems LS1 interfaces lt-0/1/0 unit 0 description LS1->LS2
set logical-systems LS1 interfaces lt-0/1/0 unit 0 encapsulation ethernet
set logical-systems LS1 interfaces lt-0/1/0 unit 0 peer-unit 1
set logical-systems LS1 interfaces lt-0/1/0 unit 0 family inet address 10.0.8.13/30
set logical-systems LS1 interfaces lt-0/1/0 unit 0 family iso
set logical-systems LS2 interfaces lt-0/1/0 unit 1 description LS2->LS1
set logical-systems LS2 interfaces lt-0/1/0 unit 1 encapsulation ethernet
set logical-systems LS2 interfaces lt-0/1/0 unit 1 peer-unit 0
set logical-systems LS2 interfaces lt-0/1/0 unit 1 family inet address 10.0.8.14/30
set logical-systems LS2 interfaces lt-0/1/0 unit 1 family iso
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To connect logical system interfaces:

1. Run the **show chassis fpc** command to verify that the router has a DPC, MPC, or MIC installed and is in the online state.

```
user@host> show chassis fpc
```

| Slot | State  | Temp (C) | CPU Total | Utilization (%) Interrupt | Memory DRAM (MB) | Utilization (%) Heap | Buffer |
|------|--------|----------|-----------|---------------------------|------------------|----------------------|--------|
| 0    | Online | 31       | 4         | 0                         | 1024             | 14                   | 21     |
| 1    | Empty  |          |           |                           |                  |                      |        |
| 2    | Empty  |          |           |                           |                  |                      |        |

This output shows that slot 1 and slot 2 are empty. Slot 0 is online.

2. Configure FPC slot 0 to support logical tunnel (lt) interfaces.

```
[edit]
user@host# set chassis fpc 0 pic 1 tunnel-services bandwidth 1g
```

This command creates several tunnel interface types, including **gr**, **ip**, and **lt**. For this example, the important one is the logical tunnel (lt) interface.

3. Commit the configuration.

```
[edit]
user@host# commit
```

4. Run the **show interfaces terse** command to verify that the router has a logical tunnel (lt) interface.

```
user@host> show interfaces terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| ...       |       |      |       |       |        |
| gr-0/1/0  | up    | up   |       |       |        |
| ip-0/1/0  | up    | up   |       |       |        |
| lt-0/1/0  | up    | up   |       |       |        |

- Configure the logical tunnel interface on Logical System LS1.

```
[edit]
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 description LS1->LS2
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 encapsulation ethernet
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 peer-unit 1
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 family inet address
10.0.8.13/30
user@host# set logical-systems LS1 interfaces lt-0/1/0 unit 0 family iso
```

- Configure the logical tunnel interface on Logical System LS2.

```
[edit]
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 description LS2->LS1
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 encapsulation ethernet
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 peer-unit 0
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 family inet address
10.0.8.14/30
user@host# set logical-systems LS2 interfaces lt-0/1/0 unit 1 family iso
```

- If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Logical Systems Are Up on page 3286](#)
- [Verifying Connectivity Between the Logical Systems on page 3286](#)

### Verifying That the Logical Systems Are Up

**Purpose** Make sure that the interfaces are properly configured.

```
Action user@host> show interfaces terse
```

| Interface  | Admin | Link | Proto | Local        | Remote |
|------------|-------|------|-------|--------------|--------|
| so-0/0/0   | up    | down |       |              |        |
| so-0/0/1   | up    | down |       |              |        |
| so-0/0/2   | up    | down |       |              |        |
| so-0/0/3   | up    | down |       |              |        |
| ge-0/1/0   | up    | up   |       |              |        |
| ip-0/1/0   | up    | up   |       |              |        |

| ...        |       |      |       |              |        |

### Verifying Connectivity Between the Logical Systems

**Purpose** Make sure that the network address appears as directly connected.

```

Action user@host> show route logical-system all
logical-system: LS1

inet.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.8.12/30 *[Direct/0] 00:00:34
 > via lt-0/1/0.0
10.0.8.13/32 *[Local/0] 00:00:34
 Local via lt-0/1/0.0

logical-system: LS2

inet.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.8.12/30 *[Direct/0] 00:00:34
 > via lt-0/1/0.1
10.0.8.14/32 *[Local/0] 00:00:34
 Local via lt-0/1/0.1
...

```

### Example: Configuring Static Routing on Logical Systems

- [Understanding Basic Static Routing on page 3287](#)
- [Example: Configuring Static Routes Between Logical Systems Within the Same Router on page 3287](#)

#### *Understanding Basic Static Routing*

Routes that are permanent fixtures in the routing and forwarding tables are often configured as static routes. These routes generally do not change, and often include only one or very few paths to the destination.

To create a static route in the routing table, you must, at minimum, define the route as static and associate a next-hop address with it. The static route in the routing table is inserted into the forwarding table when the next-hop address is reachable. All traffic destined for the static route is transmitted to the next-hop address for transit.

You can specify options that define additional information about static routes that is included with the route when it is installed in the routing table. All static options are optional.

#### *Example: Configuring Static Routes Between Logical Systems Within the Same Router*

This example shows how to configure static routes between logical systems. The logical systems are configured in a single physical router and are connected by logical tunnel interfaces.

- [Requirements on page 3288](#)
- [Overview on page 3288](#)

- [Configuration on page 3288](#)
- [Verification on page 3292](#)

### Requirements

You must connect the logical systems by using logical tunnel (lt) interfaces. See “[Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches](#)” on page 3279.

### Overview

A static route is a hard-coded path in the device that specifies how the route gets to a certain subnet by using a certain path. Routers that are connected to stub networks are often configured to use static routes. A *stub network* is a network with no knowledge of other networks. Stub networks send non-local traffic by way of a single path, with the network aware only of a default route to non-local destinations. In this example, you configure Logical System LS1 with a static route to the 10.10.10.0/30 network and define the next-hop address as 192.168.10.2. You also configure Logical System LS1 with a static route to the 192.168.10.0/30 network and define a next-hop address of 10.10.10.1.

[Figure 57 on page 3288](#) shows the sample network.

**Figure 57: Static Routes Between Logical Systems**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set logical-systems LS1 interfaces lt-1/2/0 unit 0 description LS1->LS2
set logical-systems LS1 interfaces lt-1/2/0 unit 0 encapsulation ethernet
set logical-systems LS1 interfaces lt-1/2/0 unit 0 peer-unit 1
set logical-systems LS1 interfaces lt-1/2/0 unit 0 family inet address 192.168.10.1/30
set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 0
set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address 192.168.10.2/30
set logical-systems LS2 interfaces lt-1/2/0 unit 9 description LS2->LS3
set logical-systems LS2 interfaces lt-1/2/0 unit 9 encapsulation ethernet
set logical-systems LS2 interfaces lt-1/2/0 unit 9 peer-unit 10
set logical-systems LS2 interfaces lt-1/2/0 unit 9 family inet address 10.10.10.1/30
set logical-systems LS3 interfaces lt-1/2/0 unit 10 description LS3->LS2
set logical-systems LS3 interfaces lt-1/2/0 unit 10 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 10 peer-unit 9
set logical-systems LS3 interfaces lt-1/2/0 unit 10 family inet address 10.10.10.2/30
set logical-systems LS1 routing-options static route 10.10.10.0/30 next-hop 192.168.10.2
set logical-systems LS3 routing-options static route 192.168.10.0/30 next-hop 10.10.10.1

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure static routes between logical systems:

1. Run the **show interfaces terse** command to verify that the router has a logical tunnel (lt) interface.

```

user@host> show interfaces terse
Interface Admin Link Proto Local Remote
so-0/0/0 up down
so-0/0/1 up down
so-0/0/2 up down
so-0/0/3 up down
gr-1/2/0 up up
ip-1/2/0 up up
lt-1/2/0 up up
...

```

2. Configure the logical tunnel interface on Logical System LS1 connecting to Logical System LS2.

```

[edit]
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 description LS1->LS2
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 encapsulation ethernet
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 peer-unit 1
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 family inet address
192.168.10.1/30

```

3. Configure the logical tunnel interface on Logical System LS2 connecting to Logical System LS1.

```

[edit]
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 0
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address
192.168.10.2/30

```

4. Configure the logical tunnel interface on Logical System LS2 connecting to Logical System LS3.

```
[edit]
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 9 description LS2->LS3
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 9 encapsulation ethernet
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 9 peer-unit 10
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 9 family inet address
10.10.10.1/30
```

5. Configure the logical tunnel interface on Logical System LS3 connecting to Logical System LS2.

```
[edit]
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 10 description LS3->LS2
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 10 encapsulation
ethernet
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 10 peer-unit 9
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 10 family inet address
10.10.10.2/30
```

6. Configure the static route on Logical System LS1 connecting to the 10.10.10.0/30 network.

```
[edit]
user@host# set logical-systems LS1 routing-options static route 10.10.10.0/30
next-hop 192.168.10.2
```

7. Configure the static route on Logical System LS3 connecting to the 192.168.10.0/30 network.

```
[edit]
user@host# set logical-systems LS3 routing-options static route 192.168.10.0/30
next-hop 10.10.10.1
```

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### **Results**

Confirm your configuration by issuing the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show logical-systems
LS1 {
 interfaces {
 lt-1/2/0 {
 unit 0 {
 description LS1->LS2;
 encapsulation ethernet;
 peer-unit 1;
 family inet {
 address 192.168.10.1/30;
 }
 }
 }
 }
}
```

```
 }
 }
 routing-options {
 static {
 route 10.10.10.0/30 next-hop 192.168.10.2;
 }
 }
}
LS2 {
 interfaces {
 lt-1/2/0 {
 unit 1 {
 description LS2->LS1;
 encapsulation ethernet;
 peer-unit 0;
 family inet {
 address 192.168.10.2/30;
 }
 }
 }
 unit 9 {
 description LS2->LS3;
 encapsulation ethernet;
 peer-unit 10;
 family inet {
 address 10.10.10.1/30;
 }
 }
 }
}
LS3 {
 interfaces {
 lt-1/2/0 {
 unit 10 {
 description LS3->LS2;
 encapsulation ethernet;
 peer-unit 9;
 family inet {
 address 10.10.10.2/30;
 }
 }
 }
 }
 routing-options {
 static {
 route 192.168.10.0/30 next-hop 10.10.10.1;
 }
 }
}
```

**Verification**

Confirm that the configuration is working properly.

- [Verifying That the Logical Systems Are Up on page 3292](#)
- [Verifying Connectivity Between the Logical Systems on page 3292](#)

**Verifying That the Logical Systems Are Up**

**Purpose** Make sure that the interfaces are properly configured.

**Action** user@host> show interfaces terse

| Interface   | Admin | Link | Proto | Local           | Remote |
|-------------|-------|------|-------|-----------------|--------|
| ...         |       |      |       |                 |        |
| lt-1/2/0    | up    | up   |       |                 |        |
| lt-1/2/0.0  | up    | up   | inet  | 192.168.10.1/30 |        |
| lt-1/2/0.1  | up    | up   | inet  | 192.168.10.2/30 |        |
| lt-1/2/0.9  | up    | up   | inet  | 10.10.10.1/30   |        |
| lt-1/2/0.10 | up    | up   | inet  | 10.10.10.2/30   |        |
| ...         |       |      |       |                 |        |

**Verifying Connectivity Between the Logical Systems**

**Purpose** Make sure that the static routes appear in the routing tables of Logical Systems LS1 and LS3. Also, make sure that the logical systems can ping each other.

```

Action user@host> show route logical-system LS1
inet.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.0/30 *[Static/5] 18:43:25
 > to 192.168.10.2 via lt-1/2/0.0
192.168.10.0/30 *[Direct/0] 18:43:25
 > via lt-1/2/0.0
192.168.10.1/32 *[Local/0] 18:43:25
 Local via lt-1/2/0.0

user@host> show route logical-system LS3
inet.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.0/30 *[Direct/0] 23:11:21
 > via lt-1/2/0.10
10.10.10.2/32 *[Local/0] 23:11:21
 Local via lt-1/2/0.10
192.168.10.0/30 *[Static/5] 00:23:31
 > to 10.10.10.1 via lt-1/2/0.10

```

#### From LS1, Ping LS3

```

user@host> set cli logical-system LS1

user@host:LS1> ping 10.10.10.2
PING 10.10.10.2 (10.10.10.2): 56 data bytes
64 bytes from 10.10.10.2: icmp_seq=0 ttl=63 time=1.263 ms
64 bytes from 10.10.10.2: icmp_seq=1 ttl=63 time=1.086 ms
64 bytes from 10.10.10.2: icmp_seq=2 ttl=63 time=1.077 ms

```

#### From LS3, Ping LS1

```

user@host> set cli logical-system LS3

user@host:LS3> ping 192.168.10.1
PING 192.168.10.1 (192.168.10.1): 56 data bytes
64 bytes from 192.168.10.1: icmp_seq=0 ttl=63 time=10.781 ms
64 bytes from 192.168.10.1: icmp_seq=1 ttl=63 time=1.167 ms
64 bytes from 192.168.10.1: icmp_seq=2 ttl=63 time=1.152 ms

```

#### Examples: Configuring Standard Firewall Filters on Logical Systems

- [Understanding How to Use Standard Firewall Filters on page 3293](#)
- [Example: Configuring a Stateless Firewall Filter to Protect a Logical System Against ICMP Floods on page 3295](#)
- [Example: Configuring Filter-Based Forwarding on Logical Systems on page 3298](#)

#### ***Understanding How to Use Standard Firewall Filters***

This topic covers the following information:

- [Using Standard Firewall Filters to Affect Local Packets on page 3294](#)
- [Using Standard Firewall Filters to Affect Data Packets on page 3294](#)

### ***Using Standard Firewall Filters to Affect Local Packets***

On a router (or switch), you can configure one physical loopback interface, **lo0**, and one or more addresses on the interface. The loopback interface is the interface to the Routing Engine, which runs and monitors all the control protocols. The loopback interface carries local packets only. Standard firewall filters applied to the loopback interface affect the local packets destined for or transmitted from the Routing Engine.

**NOTE:** When you create an additional loopback interface, it is important to apply a filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface, you include the **apply-groups** statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including lo0 and other loopback interfaces.

### ***Trusted Sources***

The typical use of a standard stateless firewall filter is to protect the Routing Engine processes and resources from malicious or untrusted packets. To protect the processes and resources owned by the Routing Engine, you can use a standard stateless firewall filter that specifies which protocols and services, or applications, are allowed to reach the Routing Engine. Applying this type of filter to the loopback interface ensures that the local packets are from a trusted source and protects the processes running on the Routing Engine from an external attack.

### ***Flood Prevention***

You can create standard stateless firewall filters that limit certain TCP and ICMP traffic destined for the Routing Engine. A router (or switch) without this kind of protection is vulnerable to TCP and ICMP flood attacks, which are also called denial-of-service (DoS) attacks. For example:

- A TCP flood attack of SYN packets initiating connection requests can overwhelm the device until it can no longer process legitimate connection requests, resulting in denial of service.
- An ICMP flood can overload the device with so many echo requests (ping requests) that it expends all its resources responding and can no longer process valid network traffic, also resulting in denial of service.

Applying the appropriate firewall filters to the Routing Engine protects against these types of attacks.

### ***Using Standard Firewall Filters to Affect Data Packets***

Standard firewall filters that you apply to your router's (or switch's) transit interfaces evaluate only the user data packets that transit the router (or switch) from one interface directly to another as they are being forwarded from a source to a destination. To protect the network as a whole from unauthorized access and other threats at specific interfaces, you can apply firewall filters router (or switch) transit interfaces .

### Example: Configuring a Stateless Firewall Filter to Protect a Logical System Against ICMP Floods

This example shows how to configure a stateless firewall filter that protects against ICMP denial-of-service attacks on a logical system.

- [Requirements on page 3295](#)
- [Overview on page 3295](#)
- [Configuration on page 3295](#)
- [Verification on page 3297](#)

#### Requirements

In this example, no special configuration beyond device initialization is required.

#### Overview

This example shows a stateless firewall filter called **protect-RE** that polices ICMP packets. The **icmp-policer** limits the traffic rate of the ICMP packets to 1,000,000 bps and the burst size to 15,000 bytes. Packets that exceed the traffic rate are discarded.

The policer is incorporated into the action of a filter term called **icmp-term**.

In this example, a ping is sent from a directly connected physical router to the interface configured on the logical system. The logical system accepts the ICMP packets if they are received at a rate of up to 1 Mbps (bandwidth-limit). The logical system drops all ICMP packets when this rate is exceeded. The **burst-size-limit** statement accepts traffic bursts up to 15 Kbps. If bursts exceed this limit, all packets are dropped. When the flow rate subsides, ICMP packets are again accepted.

[Figure 58 on page 3295](#) shows the topology used in this example.

**Figure 58: Logical System with a Stateless Firewall**

#### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet policer input icmp-policer
set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet address 10.0.45.2/30
set logical-systems LS1 firewall family inet filter protect-RE term icmp-term from protocol
icmp
set logical-systems LS1 firewall family inet filter protect-RE term icmp-term then policer
icmp-policer
set logical-systems LS1 firewall family inet filter protect-RE term icmp-term then accept
set logical-systems LS1 firewall policer icmp-policer if-exceeding bandwidth-limit 1m
set logical-systems LS1 firewall policer icmp-policer if-exceeding burst-size-limit 15k
set logical-systems LS1 firewall policer icmp-policer then discard
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure an ICMP firewall filter on a logical system:

1. Configure the interface on the logical system.

```
[edit]
user@host# set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet address
10.0.45.2/30
```

2. Explicitly enable ICMP packets to be received on the interface.

```
[edit]
user@host# set logical-systems LS1 firewall family inet filter protect-RE term
icmp-term from protocol icmp
user@host# set logical-systems LS1 firewall family inet filter protect-RE term
icmp-term then accept
```

3. Create the policer.

```
[edit]
user@host# set logical-systems LS1 firewall policer icmp-policer if-exceeding
bandwidth-limit 1m
user@host# set logical-systems LS1 firewall policer icmp-policer if-exceeding
burst-size-limit 15k
user@host# set logical-systems LS1 firewall policer icmp-policer then discard
```

4. Apply the policer to a filter term.

```
[edit]
user@host# set logical-systems LS1 firewall family inet filter protect-RE term
icmp-term then policer icmp-policer
```

5. Apply the policer to the logical system interface.

```
[edit]
user@host# set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet policer
input icmp-policer
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
```

```
user@host# commit
```

### Results

Confirm your configuration by issuing the **show logical-systems LS1** command.

```
user@host# show logical-systems LS1
interfaces {
 so-0/0/2 {
 unit 0 {
 family inet {
 policer {
 input icmp-policer;
 }
 address 10.0.45.2/30;
 }
 }
 }
}
firewall {
 family inet {
 filter protect-RE {
 term icmp-term {
 from {
 protocol icmp;
 }
 then {
 policer icmp-policer;
 accept;
 }
 }
 }
 }
}
policer icmp-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 15k;
 }
 then discard;
}
}
```

### Verification

Confirm that the configuration is working properly.

#### Verifying That Ping Works Unless the Limits Are Exceeded

**Purpose** Make sure that the logical system interface is protected against ICMP-based DoS attacks.

**Action** Log in to a system that has connectivity to the logical system and run the **ping** command.

```
user@R2> ping 10.0.45.2
PING 10.0.45.2 (10.0.45.2): 56 data bytes
64 bytes from 10.0.45.2: icmp_seq=0 ttl=64 time=1.316 ms
64 bytes from 10.0.45.2: icmp_seq=1 ttl=64 time=1.277 ms
64 bytes from 10.0.45.2: icmp_seq=2 ttl=64 time=1.269 ms
```

```
user@R2> ping 10.0.45.2 size 20000
PING 10.0.45.2 (10.0.45.2): 20000 data bytes
^C
--- 10.0.45.2 ping statistics ---
4 packets transmitted, 0 packets received, 100% packet loss
```

**Meaning** When you send a normal ping, the packet is accepted. When you send a ping packet that exceeds the filter limit, the packet is discarded.

### ***Example: Configuring Filter-Based Forwarding on Logical Systems***

This example shows how to configure filter-based forwarding within a logical system. The filter classifies packets to determine their forwarding path within the ingress routing device.

- [Requirements on page 3298](#)
- [Overview on page 3298](#)
- [Configuration on page 3300](#)
- [Verification on page 3306](#)

### ***Requirements***

In this example, no special configuration beyond device initialization is required.

### ***Overview***

Filter-based forwarding is supported for IP version 4 (IPv4) and IP version 6 (IPv6).

Use filter-based forwarding for service provider selection when customers have Internet connectivity provided by different ISPs yet share a common access layer. When a shared media (such as a cable modem) is used, a mechanism on the common access layer looks at Layer 2 or Layer 3 addresses and distinguishes between customers. You can use filter-based forwarding when the common access layer is implemented using a combination of Layer 2 switches and a single router.

With filter-based forwarding, all packets received on an interface are considered. Each packet passes through a filter that has match conditions. If the match conditions are met for a filter and you have created a routing instance, filter-based forwarding is applied to a packet. The packet is forwarded based on the next hop specified in the routing instance. For static routes, the next hop can be a specific LSP.

**NOTE:** Source-class usage filter matching and unicast reverse-path forwarding checks are not supported on an interface configured with filter-based forwarding (FBF).

---

To configure filter-based forwarding, perform the following tasks:

- Create a match filter on an ingress router or switch. To specify a match filter, include the **filter filter-name** statement at the **[edit firewall]** hierarchy level. A packet that passes through the filter is compared against a set of rules to classify it and to determine its

membership in a set. Once classified, the packet is forwarded to a routing table specified in the accept action in the filter description language. The routing table then forwards the packet to the next hop that corresponds to the destination address entry in the table.

- Create routing instances that specify the routing table(s) to which a packet is forwarded, and the destination to which the packet is forwarded at the **[edit routing-instances]** or **[edit logical-systems *logical-system-name* routing-instances]** hierarchy level. For example:

```
[edit]
routing-instances {
 routing-table-name1 {
 instance-type forwarding;
 routing-options {
 static {
 route 0.0.0.0/0 nexthop 10.0.0.1;
 }
 }
 }
 routing-table-name2 {
 instance-type forwarding;
 routing-options {
 static {
 route 0.0.0.0/0 nexthop 10.0.0.2;
 }
 }
 }
}
```

- Create a routing table group that adds interface routes to the forwarding routing instances used in filter-based forwarding (FBF), as well as to the default routing instance **inet.0**. This part of the configuration resolves the routes installed in the routing instances to directly connected next hops on that interface. Create the routing table group at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level.

**NOTE:** Specify **inet.0** as one of the routing instances that the interface routes are imported into. If the default instance **inet.0** is not specified, interface routes are not imported into the default routing instance.

This example shows a packet filter that directs customer traffic to a next-hop router in the domains, SP 1 or SP 2, based on the packet's source address.

If the packet has a source address assigned to an SP 1 customer, destination-based forwarding occurs using the **sp1-route-table.inet.0** routing table. If the packet has a source address assigned to an SP 2 customer, destination-based forwarding occurs using the **sp2-route-table.inet.0** routing table. If a packet does not match either of these conditions, the filter accepts the packet, and destination-based forwarding occurs using the standard **inet.0** routing table.

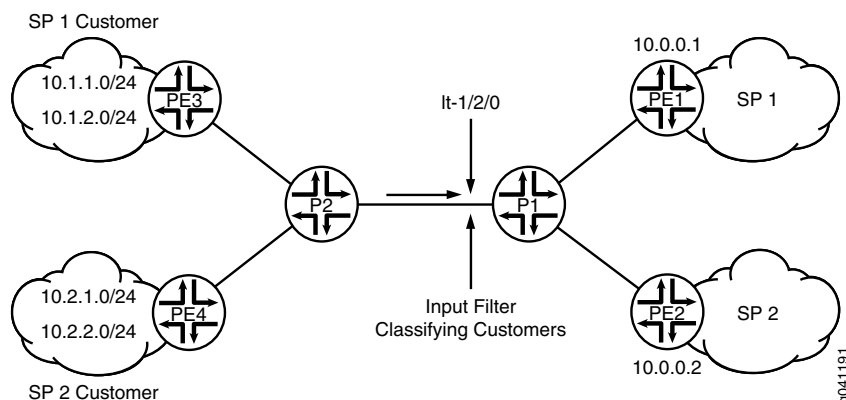

One way to make filter-based forwarding work within a logical system is to configure the firewall filter on the logical system that receives the packets. Another way is to configure the firewall filter on the main router or switch and then reference the logical system in the firewall filter. This example uses the second approach. The specific routing instances are configured within the logical system. Because each routing instance has its own routing table, you have to reference the routing instances in the firewall filter, as well. The syntax looks as follows:

```
[edit firewall filter filter-name term term-name]
user@host# set then logical-system logical-system-name routing-instance
routing-instance-name
```

Figure 59 on page 3300 shows the topology used in this example.

On Logical System P1, an input filter classifies packets received from Logical System PE3 and Logical System PE4. The packets are routed based on the source addresses. Packets with source addresses in the 10.1.1.0/24 and 10.1.2.0/24 networks are routed to Logical System PE1. Packets with source addresses in the 10.2.1.0/24 and 10.2.2.0/24 networks are routed to Logical System PE2.

**Figure 59: Logical Systems with Filter-Based Forwarding**

To establish connectivity, OSPF is configured on all of the interfaces. For demonstration purposes, loopback interface addresses are configured on the routing devices to represent networks in the clouds.

The “CLI Quick Configuration” on page 3300 section shows the entire configuration for all of the devices in the topology. The “Configuring the Routing Instances on the Logical System P1” on page 3303 and “Configuring the Firewall Filter on the Main Router” on page 3302 sections shows the step-by-step configuration of the ingress routing device, Logical System P1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall filter classify-customers term sp1-customers from source-address 10.1.1.0/24
```

```

set firewall filter classify-customers term sp1-customers from source-address 10.1.2.0/24
set firewall filter classify-customers term sp1-customers then log
set firewall filter classify-customers term sp1-customers then logical-system P1
 routing-instance sp1-route-table
set firewall filter classify-customers term sp2-customers from source-address 10.2.1.0/24
set firewall filter classify-customers term sp2-customers from source-address 10.2.2.0/24
set firewall filter classify-customers term sp2-customers then log
set firewall filter classify-customers term sp2-customers then logical-system P1
 routing-instance sp2-route-table
set firewall filter classify-customers term default then accept

```

### *Configuring the Firewall Filter on the Main Router*

#### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the firewall filter on the main router or switch:

1. Configure the source addresses for SP1 customers.  

```

[edit firewall filter classify-customers term sp1-customers]
user@host# set from source-address 10.1.1.0/24
user@host# set from source-address 10.1.2.0/24

```
2. Configure the actions that are taken when packets are received with the specified source addresses.

To track the action of the firewall filter, a log action is configured. The sp1-route-table.inet.0 routing table on Logical System P1 routes the packets.

```

[edit firewall filter classify-customers term sp1-customers]
user@host# set then log
user@host# set then logical-system P1 routing-instance sp1-route-table

```

3. Configure the source addresses for SP2 customers.  

```

[edit firewall filter classify-customers term sp2-customers]
user@host# set from source-address 10.2.1.0/24
user@host# set from source-address 10.2.2.0/24

```
4. Configure the actions that are taken when packets are received with the specified source addresses.

To track the action of the firewall filter, a log action is configured. The sp2-route-table.inet.0 routing table on Logical System P1 routes the packet.

```

[edit firewall filter classify-customers term sp2-customers]
user@host# set then log
user@host# set then logical-system P1 routing-instance sp2-route-table

```

5. Configure the action to take when packets are received from any other source address.

All of these packets are simply accepted and routed using the default IPv4 unicast routing table, inet.0.

```
[edit firewall filter classify-customers term default]
user@host# set then accept
```

### *Configuring the Routing Instances on the Logical System P1*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the routing instances on a logical system:

1. Configure the interfaces on the logical system.

```
[edit logical-systems P1 interfaces lt-1/2/0]
user@host# set unit 10 encapsulation ethernet
user@host# set unit 10 peer-unit 9
user@host# set unit 10 family inet address 172.16.0.10/30
```

```
user@host# set unit 13 encapsulation ethernet
user@host# set unit 13 peer-unit 14
user@host# set unit 13 family inet address 172.16.0.13/30
```

```
user@host# set unit 17 encapsulation ethernet
user@host# set unit 17 peer-unit 18
user@host# set unit 17 family inet address 172.16.0.17/30
```

2. Assign the **classify-customers** firewall filter to router interface lt-1/2/0.10 as an input packet filter.

```
[edit logical-systems P1 interfaces lt-1/2/0]
user@host# set unit 10 family inet filter input classify-customers
```

3. Configure connectivity, using either a routing protocol or static routing.

As a best practice, disable routing on the management interface.

```
[edit logical-systems P1 protocols ospf area 0.0.0.0]
user@host# set interface all
user@host# set interface fxp0.0 disable
```

4. Create the routing instances.

These routing instances are referenced in the **classify-customers** firewall filter.

The forwarding instance type provides support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance, in this case Logical System P1.

```
[edit logical-systems P1 routing-instances]
user@host# set sp1-route-table instance-type forwarding

user@host# set sp2-route-table instance-type forwarding
```

5. Resolve the routes installed in the routing instances to directly connected next hops.

```
[edit logical-systems P1 routing-instances]
user@host# set sp1-route-table routing-options static route 0.0.0.0/0 next-hop
172.16.0.13
```

```
user@host# set sp2-route-table routing-options static route 0.0.0.0/0 next-hop
172.16.0.17
```

6. Group together the routing tables to form a routing table group.

The first routing table, inet.0, is the primary routing table, and the additional routing tables are the secondary routing tables.

The primary routing table determines the address family of the routing table group, in this case IPv4.

```
[edit logical-systems P1 routing-options]
user@host# set rib-groups fbf-group import-rib inet.0
user@host# set rib-groups fbf-group import-rib sp1-route-table.inet.0
user@host# set rib-groups fbf-group import-rib sp2-route-table.inet.0
```

7. Apply the routing table group to OSPF.

This causes the OSPF routes to be installed into all the routing tables in the group.

```
[edit logical-systems P1 protocols ospf]
user@host# set rib-group fbf-group
```

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

## Results

Confirm your configuration by issuing the **show firewall** and **show logical-systems P1** commands.

```
user@host# show firewall
filter classify-customers {
 term sp1-customers {
 from {
 source-address {
 10.1.1.0/24;
 10.1.2.0/24;
 }
 }
 then {
 log;
 logical-system P1 routing-instance sp1-route-table;
 }
 }
}
term sp2-customers {
 from {
 source-address {
 10.2.1.0/24;
 10.2.2.0/24;
 }
 }
}
```

```

 }
 }
 then {
 log;
 logical-system P1 routing-instance sp2-route-table;
 }
}
term default {
 then accept;
}
}

user@host# show logical-systems P1
interfaces {
 lt-1/2/0 {
 unit 10 {
 encapsulation ethernet;
 peer-unit 9;
 family inet {
 filter {

 route 0.0.0.0/0 next-hop 172.16.0.17;
 }
 }
 }
}
routing-options {
 rib-groups {
 fbf-group {
 import-rib [inet.0 sp1-route-table.inet.0 sp2-route-table.inet.0];
 }
 }
}
```

### **Verification**

Confirm that the configuration is working properly.

### **Pinging with Specified Source Addresses**

**Purpose** Send some ICMP packets across the network to test the firewall filter.

**Action** 1. Log in to Logical System PE3.

```
user@host> set cli logical-system PE3
Logical system: PE3
```

2. Run the **ping** command, pinging the lo0.3 interface on Logical System PE1.

The address configured on this interface is 1.1.1.1.

Specify the source address 10.1.2.1, which is the address configured on the lo0.1 interface on Logical System PE3.

```
user@host:PE3> ping 1.1.1.1 source 10.1.2.1
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=62 time=1.444 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=62 time=2.094 ms
^C
--- 1.1.1.1 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.444/1.769/2.094/0.325 ms
```

3. Log in to Logical System PE4.

```
user@host:PE3> set cli logical-system PE4
Logical system: PE4
```

4. Run the **ping** command, pinging the lo0.4 interface on Logical System PE2.

The address configured on this interface is 2.2.2.2.

Specify the source address 10.2.1.1, which is the address configured on the lo0.2 interface on Logical System PE4.

```
user@host:PE4> ping 2.2.2.2 source 10.2.1.1
PING 2.2.2.2 (2.2.2.2): 56 data bytes
64 bytes from 2.2.2.2: icmp_seq=0 ttl=62 time=1.473 ms
64 bytes from 2.2.2.2: icmp_seq=1 ttl=62 time=1.407 ms
^C
--- 2.2.2.2 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.407/1.440/1.473/0.033 ms
```

**Meaning** Sending these pings activates the firewall filter actions.

### *Verifying the Firewall Filter*

**Purpose** Make sure the firewall filter actions take effect.

**Action** 1. Log in to Logical System P1.

```
user@host> set cli logical-system P1
Logical system: P1
```

2. Run the **show firewall log** command on Logical System P1.

```
user@host:P1> show firewall log
Log :
Time Filter Action Interface Protocol Src Addr
Dest Addr
13:52:20 pfe A 1t-1/2/0.10 ICMP 10.2.1.1
2.2.2.2
13:52:19 pfe A 1t-1/2/0.10 ICMP 10.2.1.1
2.2.2.2
13:51:53 pfe A 1t-1/2/0.10 ICMP 10.1.2.1
1.1.1.1
13:51:52 pfe A 1t-1/2/0.10 ICMP 10.1.2.1
1.1.1.1
```

### Example: Configuring OSPF on Logical Systems

- [OSPF Overview on page 3308](#)
- [Example: Configuring OSPF on Logical Systems Within the Same Router on page 3312](#)

## *OSPF Overview*

OSPF is an interior gateway protocol (IGP) that routes packets within a single autonomous system (AS). OSPF uses link-state information to make routing decisions, making route calculations using the shortest-path-first (SPF) algorithm (also referred to as the Dijkstra algorithm). Each router running OSPF floods link-state advertisements throughout the AS or area that contain information about that router's attached interfaces and routing metrics. Each router uses the information in these link-state advertisements to calculate the least cost path to each network and create a routing table for the protocol.

Junos OS supports OSPF version 2 (OSPFv2) and OSPF version 3 (OSPFv3), including virtual links, stub areas, and for OSPFv2, authentication. Junos OS does not support type-of-service (ToS) routing.

OSPF was designed for the Transmission Control Protocol/Internet Protocol (TCP/IP) environment and as a result explicitly supports IP subnetting and the tagging of externally derived routing information. OSPF also provides for the authentication of routing updates.

OSPF routes IP packets based solely on the destination IP address contained in the IP packet header. OSPF quickly detects topological changes, such as when router interfaces become unavailable, and calculates new loop-free routes quickly and with a minimum of routing overhead traffic.

**NOTE:** On SRX Series devices, when only one link-protection is configured under the OSPF interface, the device does not install an alternative route in the forwarding table. When the per-packet load-balancing is enabled as a workaround, the device does not observe both the OSPF metric and sending the traffic through both the interfaces.

An OSPF AS can consist of a single area, or it can be subdivided into multiple areas. In a single-area OSPF network topology, each router maintains a database that describes the topology of the AS. Link-state information for each router is flooded throughout the AS. In a multiarea OSPF topology, each router maintains a database that describes the topology of its area, and link-state information for each router is flooded throughout that area. All routers maintain summarized topologies of other areas within an AS. Within each area, OSPF routers have identical topological databases. When the AS or area topology changes, OSPF ensures that the contents of all routers' topological databases converge quickly.

All OSPFv2 protocol exchanges can be authenticated. OSPFv3 relies on IPsec to provide this functionality. This means that only trusted routers can participate in the AS's routing. A variety of authentication schemes can be used. A single authentication scheme is configured for each area, which enables some areas to use stricter authentication than others.

Externally derived routing data (for example, routes learned from BGP) is passed transparently throughout the AS. This externally derived data is kept separate from the OSPF link-state data. Each external route can be tagged by the advertising router, enabling the passing of additional information between routers on the boundaries of the AS.

**NOTE:** By default, Junos OS is compatible with RFC 1583, *OSPF Version 2*. In Junos OS Release 8.5 and later, you can disable compatibility with RFC 1583 by including the `no-rfc-1583` statement. For more information, see *Example: Disabling OSPFv2 Compatibility with RFC 1583*.

This topic describes the following information:

- [OSPF Default Route Preference Values on page 3310](#)
- [OSPF Routing Algorithm on page 3310](#)
- [OSPF Three-Way Handshake on page 3311](#)
- [OSPF Version 3 on page 3312](#)

#### ***OSPF Default Route Preference Values***

The Junos OS routing protocol process assigns a default preference value to each route that the routing table receives. The default value depends on the source of the route. The preference value is from 0 through 4,294,967,295 (232 – 1), with a lower value indicating a more preferred route. [Table 266 on page 3310](#) lists the default preference values for OSPF.

**Table 266: Default Route Preference Values for OSPF**

| How Route Is Learned    | Default Preference | Statement to Modify Default Preference   |
|-------------------------|--------------------|------------------------------------------|
| OSPF internal route     | 10                 | OSPF <a href="#">preference</a>          |
| OSPF AS external routes | 150                | OSPF <a href="#">external-preference</a> |

#### ***OSPF Routing Algorithm***

OSPF uses the shortest-path-first (SPF) algorithm, also referred to as the Dijkstra algorithm, to determine the route to each destination. All routing devices in an area run this algorithm in parallel, storing the results in their individual topological databases. Routing devices with interfaces to multiple areas run multiple copies of the algorithm. This section provides a brief summary of how the SPF algorithm works.

When a routing device starts, it initializes OSPF and waits for indications from lower-level protocols that the router interfaces are functional. The routing device then uses the OSPF hello protocol to acquire neighbors, by sending hello packets to its neighbors and receiving their hello packets.

On broadcast or nonbroadcast multiaccess networks (physical networks that support the attachment of more than two routing devices), the OSPF hello protocol elects a designated router for the network. This routing device is responsible for sending *link-state advertisements* (LSAs) that describe the network, which reduces the amount of network traffic and the size of the routing devices' topological databases.

The routing device then attempts to form *adjacencies* with some of its newly acquired neighbors. (On multiaccess networks, only the designated router and backup designated router form adjacencies with other routing devices.) Adjacencies determine the distribution

of routing protocol packets. Routing protocol packets are sent and received only on adjacencies, and topological database updates are sent only along adjacencies. When adjacencies have been established, pairs of adjacent routers synchronize their topological databases.

A routing device sends LSA packets to advertise its state periodically and when its state changes. These packets include information about the routing device's adjacencies, which allows detection of nonoperational routing devices.

Using a reliable algorithm, the routing device floods LSAs throughout the area, which ensures that all routing devices in an area have exactly the same topological database. Each routing device uses the information in its topological database to calculate a shortest-path tree, with itself as the root. The routing device then uses this tree to route network traffic.

The description of the SPF algorithm up to this point has explained how the algorithm works within a single area (*intra-area routing*). For internal routers to be able to route to destinations outside the area (*interarea routing*), the area border routers must inject additional routing information into the area. Because the area border routers are connected to the backbone, they have access to complete topological data about the backbone. The area border routers use this information to calculate paths to all destinations outside its area and then advertise these paths to the area's internal routers.

Autonomous system (AS) boundary routers flood information about external autonomous systems throughout the AS, except to stub areas. Area border routers are responsible for advertising the paths to all AS boundary routers.

### OSPF Three-Way Handshake

OSPF creates a topology map by flooding LSAs across OSPF-enabled links. LSAs announce the presence of OSPF-enabled interfaces to adjacent OSPF interfaces. The exchange of LSAs establishes bidirectional connectivity between all adjacent OSPF interfaces (neighbors) using a three-way handshake, as shown in [Figure 60 on page 3311](#).

**Figure 60: OSPF Three-Way Handshake**

In [Figure 60 on page 3311](#), Router A sends hello packets out all its OSPF-enabled interfaces when it comes online. Router B receives the packet, which establishes that Router B can receive traffic from Router A. Router B generates a response to Router A to acknowledge receipt of the hello packet. When Router A receives the response, it establishes that Router B can receive traffic from Router A. Router A then generates a final response packet to inform Router B that Router A can receive traffic from Router B. This three-way handshake ensures bidirectional connectivity.

As new neighbors are added to the network or existing neighbors lose connectivity, the adjacencies in the topology map are modified accordingly through the exchange (or absence) of LSAs. These LSAs advertise only the incremental changes in the network, which helps minimize the amount of OSPF traffic on the network. The adjacencies are shared and used to create the network topology in the topological database.

### **OSPF Version 3**

OSPFv3 is a modified version of OSPF that supports IP version 6 (IPv6) addressing. OSPFv3 differs from OSPFv2 in the following ways:

- All neighbor ID information is based on a 32-bit router ID.
- The protocol runs per link rather than per subnet.
- Router and network link-state advertisements (LSAs) do not carry prefix information.
- Two new LSA types are included: link-LSA and intra-area-prefix-LSA.
- Flooding scopes are as follows:
  - Link-local
  - Area
  - AS
- Link-local addresses are used for all neighbor exchanges except virtual links.
- Authentication is removed. The IPv6 authentication header relies on the IP layer.
- The packet format has changed as follows:
  - Version number 2 is now version number 3.
  - The **db** option field has been expanded to 24 bits.
  - Authentication information has been removed.
  - Hello messages do not have address information.
  - Two new option bits are included: **R** and **V6**.
- Type 3 summary LSAs have been renamed *inter-area-prefix-LSAs*.
- Type 4 summary LSAs have been renamed *inter-area-router-LSAs*.

### **Example: Configuring OSPF on Logical Systems Within the Same Router**

This example shows how to configure an OSPF network using multiple logical systems that are running on a single physical router. The logical systems are connected by logical tunnel interfaces.

- [Requirements on page 3313](#)
- [Overview on page 3313](#)
- [Configuration on page 3313](#)
- [Verification on page 3317](#)

### Requirements

You must connect the logical systems by using logical tunnel (lt) interfaces. See “[Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches](#)” on page 3279.

### Overview

This example shows the configuration of a single OSPF area with three logical systems running on one physical router. Each logical system has its own routing table. The configuration enables the protocol on all logical system interfaces that participate in the OSPF domain and specifies the area that the interfaces are in.

[Figure 61 on page 3313](#) shows the sample network.

**Figure 61: OSPF on Logical Systems**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS1 interfaces lt-1/2/0 unit 0 description LS1->LS3
set logical-systems LS1 interfaces lt-1/2/0 unit 0 encapsulation ethernet
set logical-systems LS1 interfaces lt-1/2/0 unit 0 peer-unit 5
set logical-systems LS1 interfaces lt-1/2/0 unit 0 family inet address 10.0.1.2/30
set logical-systems LS1 interfaces lt-1/2/0 unit 2 description LS1->LS2
set logical-systems LS1 interfaces lt-1/2/0 unit 2 encapsulation ethernet
```

```
set logical-systems LS1 interfaces lt-1/2/0 unit 2 peer-unit 1
set logical-systems LS1 interfaces lt-1/2/0 unit 2 family inet address 10.0.0.1/30
set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.0
set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.2
set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 2
set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address 10.0.0.2/30
set logical-systems LS2 interfaces lt-1/2/0 unit 4 description LS2->LS3
set logical-systems LS2 interfaces lt-1/2/0 unit 4 encapsulation ethernet
set logical-systems LS2 interfaces lt-1/2/0 unit 4 peer-unit 3
set logical-systems LS2 interfaces lt-1/2/0 unit 4 family inet address 10.0.2.2/30
set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.1
set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.4
set logical-systems LS3 interfaces lt-1/2/0 unit 3 description LS3->LS2
set logical-systems LS3 interfaces lt-1/2/0 unit 3 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 3 peer-unit 4
set logical-systems LS3 interfaces lt-1/2/0 unit 3 family inet address 10.0.2.1/30
set logical-systems LS3 interfaces lt-1/2/0 unit 5 description LS3->LS1
set logical-systems LS3 interfaces lt-1/2/0 unit 5 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 5 peer-unit 0
set logical-systems LS3 interfaces lt-1/2/0 unit 5 family inet address 10.0.1.1/30
set logical-systems LS3 protocols ospf area 0.0.0.0 interface lt-1/2/0.5
set logical-systems LS3 protocols ospf area 0.0.0.0 interface lt-1/2/0.3
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure OSPF on logical systems:

1. Configure the logical tunnel interface on Logical System LS1 connecting to Logical System LS2.

```
[edit]
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 2 description LS1->LS2
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 2 encapsulation ethernet
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 2 peer-unit 1
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 2 family inet address
10.0.0.1/30
```

2. Configure the logical tunnel interface on Logical System LS1 connecting to Logical System LS3.

```
[edit]
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 description LS1->LS3
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 encapsulation ethernet
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 peer-unit 5
user@host# set logical-systems LS1 interfaces lt-1/2/0 unit 0 family inet address
10.0.1.2/30
```

3. Configure the logical tunnel interface on Logical System LS2 connecting to Logical System LS1.

```
[edit]
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
```

```

user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 2
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address
10.0.0.2/30

```

4. Configure the logical tunnel interface on Logical System LS2 connecting to Logical System LS3.

```

[edit]
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 4 description LS2->LS3
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 4 encapsulation ethernet
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 4 peer-unit 3
user@host# set logical-systems LS2 interfaces lt-1/2/0 unit 4 family inet address
10.0.2.2/30

```

5. Configure the logical tunnel interface on Logical System LS3 connecting to Logical System LS2.

```

[edit]
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 3 description LS3->LS2
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 3 encapsulation ethernet
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 3 peer-unit 4
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 3 family inet address
10.0.2.1/30

```

6. Configure the logical tunnel interface on Logical System LS3 connecting to Logical System LS1.

```

[edit]
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 5 description LS3->LS1
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 5 encapsulation ethernet
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 5 peer-unit 0
user@host# set logical-systems LS3 interfaces lt-1/2/0 unit 5 family inet address
10.0.1.1/30

```

7. Configure OSPF on all the interfaces.

```

[edit]
user@host# set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.0
user@host# set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.2
user@host# set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.1
user@host# set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.4
user@host# set logical-systems LS3 protocols ospf area 0.0.0.0 interface lt-1/2/0.5
user@host# set logical-systems LS3 protocols ospf area 0.0.0.0 interface lt-1/2/0.3

```

8. If you are done configuring the device, commit the configuration.

```

[edit]
user@host# commit

```

### Results

Confirm your configuration by issuing the **show logical-systems** command.

```

show logical-systems
LS1 {
 interfaces {
 lt-1/2/0 {
 unit 0 {

```

```
 description LS1->LS3;
 encapsulation ethernet;
 peer-unit 5;
 family inet {
 address 10.0.1.2/30;
 }
 }
 unit 2 {
 description LS1->LS2;
 encapsulation ethernet;
 peer-unit 1;
 family inet {
 address 10.0.0.1/30;
 }
 }
}
protocols {
 ospf {
 area 0.0.0.0 {
 interface lt-1/2/0.0;
 interface lt-1/2/0.2;
 }
 }
}
}
LS2 {
 interfaces {
 lt-1/2/0 {
 unit 1 {
 description LS2->LS1;
 encapsulation ethernet;
 peer-unit 2;
 family inet {
 address 10.0.0.2/30;
 }
 }
 unit 4 {
 description LS2->LS3;
 encapsulation ethernet;

 }
 }
}
```

**Verification**

Confirm that the configuration is working properly.

- [Verifying That the Logical Systems Are Up on page 3317](#)
- [Verifying Connectivity Between the Logical Systems on page 3318](#)

**Verifying That the Logical Systems Are Up**

**Purpose** Make sure that the interfaces are properly configured.

**Action** user@host> show interfaces terse

| Interface  | Admin | Link | Proto | Local       | Remote |
|------------|-------|------|-------|-------------|--------|
| ...        |       |      |       |             |        |
| lt-1/2/0   | up    | up   |       |             |        |
| lt-1/2/0.0 | up    | up   | inet  | 10.0.1.2/30 |        |
| lt-1/2/0.1 | up    | up   | inet  | 10.0.0.2/30 |        |
| lt-1/2/0.2 | up    | up   | inet  | 10.0.0.1/30 |        |
| lt-1/2/0.3 | up    | up   | inet  | 10.0.2.1/30 |        |
| lt-1/2/0.4 | up    | up   | inet  | 10.0.2.2/30 |        |
| lt-1/2/0.5 | up    | up   | inet  | 10.0.1.1/30 |        |
| ...        |       |      |       |             |        |

#### ***Verifying Connectivity Between the Logical Systems***

**Purpose** Make sure that the OSPF adjacencies are established by checking the OSPF neighbor tables, checking the routing tables, and pinging the logical systems.

```

Action user@host> show ospf neighbor logical-system LS1

### Examples: Configuring OSPF Routing Policy on Logical Systems

---

- [Understanding OSPF Routing Policy on page 3320](#)
- [Example: Configuring an OSPF Default Route Policy on Logical Systems on page 3322](#)
- [Example: Configuring a Conditional OSPF Default Route Policy on Logical Systems on page 3327](#)
- [Example: Configuring an OSPF Import Policy on Logical Systems on page 3334](#)

#### ***Understanding OSPF Routing Policy***

Each routing policy is identified by a policy name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks. Each routing policy name must be unique within a configuration. Once a policy is created and named, it must be applied before it is active.

In the **import** statement, you list the name of the routing policy used to filter OSPF external routes from being installed into the routing tables of OSPF neighbors. You can filter the routes, but not link-state address (LSA) flooding. An external route is a route that is outside the OSPF Autonomous System (AS). The import policy does not impact the OSPF database. This means that the import policy has no impact on the link-state advertisements.

In the **export** statement, you list the name of the routing policy to be evaluated when routes are being exported from the routing table into OSPF.

By default, if a routing device has multiple OSPF areas, learned routes from other areas are automatically installed into area 0 of the routing table.

To specify more than one policy and create a policy chain, you list the policies using a space as a separator. If multiple policies are specified, the policies are evaluated in the order in which they are specified. As soon as an accept or reject action is executed, the policy chain evaluation ends.

This topic describes the following information:

- [Routing Policy Terms on page 3321](#)
- [Routing Policy Match Conditions on page 3321](#)
- [Routing Policy Actions on page 3322](#)

### ***Routing Policy Terms***

Routing policies are made up of one or more terms. A term is a named structure in which match conditions and actions are defined. You can define one or more terms. The name can contain letters, numbers, and hyphens ( - ) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

### ***Routing Policy Match Conditions***

A match condition defines the criteria that a route must match for an action to take place. You can define one or more match conditions for each term. If a route matches all of the match conditions for a particular term, the actions defined for that term are processed.

Each term can include two statements, **from** and **to**, that define the match conditions:

- In the **from** statement, you define the criteria that an incoming route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The **from** statement is optional. If you omit the **from** and the **to** statements, all routes are considered to match.

**NOTE:** In export policies, omitting the **from** statement from a routing policy term might lead to unexpected results. For more information, see *Applying Routing Policies and Policy Chains to Routing Protocols* in the *Routing Policy Configuration Guide*.

- In the **to** statement, you define the criteria that an outgoing route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The order of the match conditions in a term is not important because a route must match all match conditions in a term for an action to be taken.

For a complete list of match conditions, see *Configuring Match Conditions in Routing Policy Terms* in the *Routing Policy Configuration Guide*.

### ***Routing Policy Actions***

An action defines what the routing device does with the route when the route matches all the match conditions in the **from** and **to** statements for a particular term. If a term does not have **from** and **to** statements, all routes are considered to match and the actions apply to all routes.

Each term can have one or more of the following types of actions. The actions are configured under the **then** statement.

- Flow control actions, which affect whether to accept or reject the route and whether to evaluate the next term or routing policy.
- Actions that manipulate route characteristics.
- Trace action, which logs route matches.

The **then** statement is optional. If you omit it, one of the following occurs:

- The next term in the routing policy, if one exists, is evaluated.
- If the routing policy has no more terms, the next routing policy, if one exists, is evaluated.
- If there are no more terms or routing policies, the **accept** or **reject** action specified by the default policy is executed.

For a complete list of routing policy actions, see *Configuring Actions in Routing Policy Terms* in the *Routing Policy Configuration Guide*.

### ***Example: Configuring an OSPF Default Route Policy on Logical Systems***

This example shows how to configure a default route on one logical system and inject the default route into OSPF area 0. In this example, OSPF area 0 contains three logical systems that are configured on a single physical router.

- [Requirements on page 3323](#)
- [Overview on page 3323](#)
- [Configuration on page 3323](#)
- [Verification on page 3325](#)

### Requirements

Before you begin:

- Connect the logical systems by using logical tunnel (lt) interfaces. See [“Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches”](#) on page 3279.
- Enable OSPF on the interfaces. See [“Example: Configuring OSPF on Logical Systems Within the Same Router”](#) on page 3312.

### Overview

This example shows a logical system redistributing a default route to other logical systems. All logical systems are running OSPF. A common reason for a default route is to provide a path for sending traffic destined outside the OSPF domain.

In this example, the default route is not used for forwarding traffic. The **no-install** statement prevents the route from being installed in the forwarding table of Logical System LS3. If you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols. The **discard** statement silently drops packets without notice.

[Figure 62 on page 3323](#) shows the sample network.

**Figure 62: OSPF with a Default Route to an ISP**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS3 routing-options static route 0.0.0.0/0 discard
set logical-systems LS3 routing-options static route 0.0.0.0/0 no-install
set logical-systems LS3 policy-options policy-statement ospf-default from protocol
 static
set logical-systems LS3 policy-options policy-statement ospf-default from route-filter
 0.0.0.0/0 exact
set logical-systems LS3 policy-options policy-statement ospf-default then accept
set logical-systems LS3 protocols ospf export ospf-default
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure an OSPF default route policy on logical systems:

1. Change the context to Logical System LS3.

```
[edit]
user@host> set cli logical-system LS3
```

2. Configure the default route on Logical System LS3.

```
[edit]
user@host:LS3# set routing-options static route 0.0.0.0/0 discard
user@host:LS3# set routing-options static route 0.0.0.0/0 no-install
```

3. Configure the policy on Logical System LS3.

```
[edit]
user@host:LS3# set policy-options policy-statement ospf-default from protocol
 static
user@host:LS3# set policy-options policy-statement ospf-default from route-filter
 0.0.0.0/0 exact
user@host:LS3# set policy-options policy-statement ospf-default then accept
```

4. Apply the export policy to OSPF on Logical System LS3.

```
[edit]
user@host:LS3# set protocols ospf export ospf-default
```

5. If you are done configuring the device, commit the configuration.

```
[edit]
user@host:LS3# commit
```

#### Results

Confirm your configuration by issuing the **show logical-systems LS3** command.

```
show logical-systems LS3
interfaces {
 lt-1/2/0 {
 unit 3 {
 description LS3->LS2;
 encapsulation ethernet;
```

```
 peer-unit 4;
 family inet {
 address 10.0.2.1/30;
 }
 }
 unit 5 {
 description LS3->LS1;
 encapsulation ethernet;
 peer-unit 0;
 family inet {
 address 10.0.1.1/30;
 }
 }
}
protocols {
 ospf {
 export ospf-default;
 area 0.0.0.0 {
 interface lt-1/2/0.5;
 interface lt-1/2/0.3;
 }
 }
}
policy-options {
 policy-statement ospf-default {
 from {
 protocol static;
 route-filter 0.0.0.0/0 exact;
 }
 then accept;
 }
}
routing-options {
 static {
 route 0.0.0.0/0 {
 discard;
 no-install;
 }
 }
}
```

**Verification**

Confirm that the configuration is working properly.

**Verifying That the Static Route Is Redistributed**

**Purpose** Make sure that the OSPF policy is working by checking the routing tables.

**Action** user@host> show route logical-system LS3  
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```

```

**Meaning** The routing table on Logical System LS3 contains the default 0.0.0.0/0 route from protocol **Static**. The routing tables on Logical System LS1 and Logical System LS2 contain the default 0.0.0.0/0 route from protocol **OSPF**. If Logical System LS1 and Logical System LS2 receive packets destined for networks not specified in their routing tables, those packets will be sent to Logical System LS3 for further processing. This configuration assumes that Logical System LS3 has a connection to an ISP or another external network.

***Example: Configuring a Conditional OSPF Default Route Policy on Logical Systems***

This example shows how to configure a conditional default route on one logical system and inject the default route into OSPF area 0.

- [Requirements on page 3327](#)
- [Overview on page 3327](#)
- [Configuration on page 3328](#)
- [Verification on page 3332](#)

***Requirements***

Before you begin:

- Connect the logical systems by using logical tunnel (lt) interfaces. See “[Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches](#)” on page 3279.
- Enable OSPF on the interfaces. See “[Example: Configuring OSPF on Logical Systems Within the Same Router](#)” on page 3312.

***Overview***

In this example, OSPF area 0 contains three logical systems that are configured on a single physical router. Logical System LS3 has a BGP session with an external peer, for example, an ISP.

The ISP injects a default static route into BGP, which provides the customer network with a default static route to reach external networks. Logical System LS3 exports the default route into OSPF. The route policy on Logical System LS3 is conditional such that if the connection to the external peer goes down, the default route is no longer active in the routing tables of the logical systems in area 0. This policy prevents blackholing of traffic. Blackholing occurs when packets are dropped without notification.

[Figure 63 on page 3328](#) shows the sample network.

Figure 63: OSPF with a Conditional Default Route to an ISP

**Configuration****CLI Quick  
Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device LS1**

```

set logical-systems LS1 interfaces lt-1/2/0 unit 0 description LS1->LS3
set logical-systems LS1 interfaces lt-1/2/0 unit 0 encapsulation ethernet
set logical-systems LS1 interfaces lt-1/2/0 unit 0 peer-unit 5
set logical-systems LS1 interfaces lt-1/2/0 unit 0 family inet address 10.0.1.2/30
set logical-systems LS1 interfaces lt-1/2/0 unit 2 description LS1->LS2
set logical-systems LS1 interfaces lt-1/2/0 unit 2 encapsulation ethernet
set logical-systems LS1 interfaces lt-1/2/0 unit 2 peer-unit 1
set logical-systems LS1 interfaces lt-1/2/0 unit 2 family inet address 10.0.0.1/30
set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.0
set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.2

```

**Device LS2**

```

set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 2
set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address 10.0.0.2/30
set logical-systems LS2 interfaces lt-1/2/0 unit 4 description LS2->LS3
set logical-systems LS2 interfaces lt-1/2/0 unit 4 encapsulation ethernet
set logical-systems LS2 interfaces lt-1/2/0 unit 4 peer-unit 3
set logical-systems LS2 interfaces lt-1/2/0 unit 4 family inet address 10.0.2.2/30
set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.1
set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.4

```

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode”](#) on page 4704 in the *CLI User Guide*.

To configure a conditional default route:

1. Configure the interfaces.

```

[edit logical-systems LS3 interfaces]
user@R3# set lt-1/2/0 unit 3 description LS3->LS2
user@R3# set lt-1/2/0 unit 3 encapsulation ethernet
user@R3# set lt-1/2/0 unit 3 peer-unit 4
user@R3# set lt-1/2/0 unit 3 family inet address 10.0.2.1/30

```

```
user@R3# set lt-1/2/0 unit 5 description LS3->LS1
user@R3# set lt-1/2/0 unit 5 encapsulation ethernet
user@R3# set lt-1/2/0 unit 5 peer-unit 0
user@R3# set lt-1/2/0 unit 5 family inet address 10.0.1.1/30
user@R3# set so-0/0/2 unit 0 description LS3->ISP
user@R3# set so-0/0/2 unit 0 encapsulation ethernet
user@R3# set so-0/0/2 unit 0 peer-unit 7
user@R3# set so-0/0/2 unit 0 family inet address 10.0.45.2/30
```

2. Configure the autonomous system (AS) number.

```
[edit logical-systems LS3 routing-options]
user@R3# set autonomous-system 65001
```

3. Configure the BGP session with the ISP device.

```
[edit logical-systems LS3 protocols bgp group ext]
user@R3# set type external
user@R3# set peer-as 65000
user@R3# set neighbor 10.0.45.1
```

4. Configure OSPF.

```
[edit logical-systems LS3 protocols ospf area 0.0.0.0]
user@R3# set interface lt-1/2/0.5
user@R3# set interface lt-1/2/0.3
```

5. Configure the routing policy.

```
[edit logical-systems LS3 policy-options policy-statement gendefault]
user@R3# set term upstreamroutes from protocol bgp
user@R3# set term upstreamroutes from as-path upstream
user@R3# set term upstreamroutes from route-filter 0.0.0.0/0 upto /16
user@R3# set term upstreamroutes then next-hop 10.0.45.1
user@R3# set term upstreamroutes then accept
```

```
user@R3# set term end then reject
```

```
[edit logical-systems LS3 policy-options]
user@R3# set as-path upstream "^65000 "
```

6. Configure the generated route.

```
[edit logical-systems LS3 routing-options]
user@R3# set generate route 0.0.0.0/0 policy gendefault
```

7. Apply the export policy to OSPF.

```
[edit logical-systems LS3 protocols ospf]
user@R3# set export gendefault
```

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@R3# commit
```

### **Results**

Confirm your configuration by issuing the **show logical-systems LS3** command.

```
show logical-systems LS3
interfaces {
 lt-1/2/0 {
 unit 3 {
 description LS3->LS2;
 encapsulation ethernet;
 peer-unit 4;
 family inet {
 address 10.0.2.1/30;
 }
 }
 unit 5 {
 description LS3->LS1;
 encapsulation ethernet;
 peer-unit 0;
 family inet {
 address 10.0.1.1/30;
 }
 }
 unit 6 {
 description LS3->ISP;
 encapsulation ethernet;
 peer-unit 7;
 family inet {
 address 10.0.45.2/30;
 }
 }
 }
}
protocols {
 bgp {
 group ext {
 type external;
 peer-as 65000;
 neighbor 10.0.45.1;
 }
 }
 ospf {
 export gendefault;
 area 0.0.0.0 {
 interface lt-1/2/0.5;
 interface lt-1/2/0.3;
 }
 }
}
policy-options {
 policy-statement gendefault {
 term upstreamroutes {
 from {
 protocol bgp;
 as-path upstream;
 route-filter 0.0.0.0/0 upto /16;
 }
 then {
 next-hop 10.0.45.1;
 accept;
 }
 }
 }
}
```

```
 }
 }
 term end {
 then reject;
 }
}
as-path upstream "~65000";
}
routing-options {
 generate {
 route 0.0.0.0/0 policy gendefault;
 }
 autonomous-system 65001;
}
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying that the Route to the ISP Is Working on page 3332](#)
- [Verifying That the Static Route Is Redistributed on page 3332](#)
- [Testing the Policy Condition on page 3333](#)

### **Verifying that the Route to the ISP Is Working**

**Purpose** Make sure connectivity is established between Logical System LS3 and the ISP's router.

**Action**

```
user@host>set cli logical-system LS3
Logical system: LS3

user@host:LS3>ping 10.0.45.1
PING 10.0.45.1 (10.0.45.1): 56 data bytes
64 bytes from 10.0.45.1: icmp_seq=0 ttl=64 time=1.185 ms
64 bytes from 10.0.45.1: icmp_seq=1 ttl=64 time=1.199 ms
64 bytes from 10.0.45.1: icmp_seq=2 ttl=64 time=1.186 ms
```

**Meaning** The ping command confirms reachability.

### **Verifying That the Static Route Is Redistributed**

**Purpose** Make sure that the BGP policy is redistributing the static route into Logical System LS3's routing table. Also make sure that the OSPF policy is redistributing the static route into the routing tables of Logical System LS1 and Logical System LS2.

**Action** user@host> show route logical-system LS3 protocol bgp

```
inet.0: 9 destinations, 10 routes (9 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0 *[BGP/170] 00:00:25, localpref 100
 AS path: 65000 I
 > to 10.0.45.1 via so-0/0/2.0
```

user@host> show route logical-system LS1 protocol ospf

```
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0 *[OSPF/150] 00:03:58, metric 0, tag 0
 > to 10.0.1.1 via lt-1/2/0.0
10.0.2.0/30 *[OSPF/10] 03:37:45, metric 2
 to 10.0.1.1 via lt-1/2/0.0
 > to 10.0.0.2 via lt-1/2/0.2
224.0.0.5/32 *[OSPF/10] 03:38:41, metric 1
 MultiRecv
```

user@host> show route logical-system LS2 protocol ospf

```
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0 *[OSPF/150] 00:04:04, metric 0, tag 0
 > to 10.0.2.1 via lt-1/2/0.4
10.0.1.0/30 *[OSPF/10] 03:37:46, metric 2
 to 10.0.0.1 via lt-1/2/0.1
 > to 10.0.2.1 via lt-1/2/0.4
224.0.0.5/32 *[OSPF/10] 03:38:47, metric 1
 MultiRecv
```

**Meaning** The routing tables contain the default 0.0.0.0/0 route. If Logical System LS1 and Logical System LS2 receive packets destined for networks not specified in their routing tables, those packets will be sent to Logical System LS3 for further processing. If Logical System LS3 receives packets destined for networks not specified in its routing table, those packets will be sent to the ISP for further processing.

#### *Testing the Policy Condition*

**Purpose** Deactivate the interface to make sure that the route is removed from the routing tables if the external network becomes unreachable.

**Action** user@host> deactivate logical-systems LS3 interfaces so-0/0/2 unit 0 family inet address 10.0.45.2/30

user@host> commit

user@host> show route logical-system LS1 protocol ospf

inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.2.0/30 *[OSPF/10] 03:41:48, metric 2
 to 10.0.1.1 via lt-1/2/0.0
 > to 10.0.0.2 via lt-1/2/0.2
224.0.0.5/32 *[OSPF/10] 03:42:44, metric 1
 MultiRecv
```

user@host> show route logical-system LS2 protocol ospf

inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.1.0/30 *[OSPF/10] 03:42:10, metric 2
 to 10.0.0.1 via lt-1/2/0.1
 > to 10.0.2.1 via lt-1/2/0.4
224.0.0.5/32 *[OSPF/10] 03:43:11, metric 1
 MultiRecv
```

**Meaning** The routing tables on Logical System LS1 and Logical System LS2 do not contain the default 0.0.0.0/0. This verifies that the default route is no longer present in the OSPF domain. To reactivate the **so-0/0/2.0** interface, issue the **activate logical-systems LS3 interfaces so-0/0/2 unit 0 family inet address 10.0.45.2/30** configuration-mode command.

### *Example: Configuring an OSPF Import Policy on Logical Systems*

This example shows how to configure an OSPF import policy on logical systems. OSPF import policies apply to external routes only. An external route is a route that is outside the OSPF AS.

- [Requirements on page 3334](#)
- [Overview on page 3334](#)
- [Configuration on page 3336](#)
- [Verification on page 3340](#)

#### **Requirements**

This example shows logical systems that are configured within a single physical router. The logical systems connect to each other by using logical tunnel (lt) interfaces. See [“Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches” on page 3279](#). Alternatively, you can use multiple physical routers.

#### **Overview**

External routes are learned by Autonomous System Border Routers (ASBRs). External routes can be advertised throughout the OSPF domain if you configure the ASBR to redistribute the route into OSPF. An external route might be learned by the ASBR from

a routing protocol other than OSPF, or the external route might be a static route that you configure on the ASBR.

OSPF import policy allows you to prevent external routes from being added to the routing tables of OSPF neighbors. The import policy does not impact the OSPF database. This means that the import policy has no impact on the link-state advertisements.

OSPF import policies have practical applications. Suppose, for example, that you are using OSPF to advertise a static route to the devices in your datacenter because you want some of the devices in the datacenter to use the static route. However, you want other devices in the datacenter to ignore the static route. So, you apply the OSPF import policy on the devices that you want to ignore the static route. The filtering is done only on external routes in OSPF. The intra-area and inter-area routes are not considered for filtering. The default action is to accept the route when the route does not match the policy.

Figure 64 on page 3335 shows the sample network.

**Figure 64: OSPF Import Policy on Logical Systems**

In this example, the logical systems operate as follows:

1. **LS3**—Logical System LS3 has a static route to the 10.0.16.0/30 network. The next hop for the static route is 10.0.60.1. LS3 has an OSPF export policy configured. The export policy redistributes static routes from LS3's routing table into LS3's OSPF database. Because the static route is in LS3's OSPF database, the route is advertised in a link state advertisement (LSA) to LS3's OSPF neighbor. LS3's OSPF neighbor is Logical System LS2.
2. **LS2**—Logical System LS2 receives the route advertisement from LS3. LS2 then installs the route into LS2's OSPF database. LS2 has an OSPF import policy configured that matches the static route to the 10.0.16.0/30 network and prevents the static route from being installed in LS2's routing table. However, because the route is in LS2's OSPF database, LS2 advertises the route to its OSPF neighbor, Logical System LS1.

3. LS1—Logical System LS1 receives the route advertisement from LS2. LS1 then installs the route into LS1's OSPF database. LS1 does not have an OSPF import policy configured that matches the static route to the 10.0.16.0/30 network. Therefore, the route gets installed in LS1's routing table.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

LS3 set logical-systems LS3 interfaces so-0/0/0 unit 0 family inet address 10.0.60.2/30
 set logical-systems LS3 interfaces lt-1/2/0 unit 3 description LS3->LS2
 set logical-systems LS3 interfaces lt-1/2/0 unit 3 encapsulation ethernet
 set logical-systems LS3 interfaces lt-1/2/0 unit 3 peer-unit 4
 set logical-systems LS3 interfaces lt-1/2/0 unit 3 family inet address 10.0.2.1/30
 set logical-systems LS3 protocols ospf export export_static
 set logical-systems LS3 protocols ospf area 0.0.0.0 interface lt-1/2/0.3
 set logical-systems LS3 policy-options policy-statement export_static from protocol
 static
 set logical-systems LS3 policy-options policy-statement export_static then accept
 set logical-systems LS3 routing-options static route 10.0.16.0/30 next-hop 10.0.60.1

LS2 set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
 set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
 set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 2
 set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address 10.0.0.2/30
 set logical-systems LS2 interfaces lt-1/2/0 unit 4 description LS2->LS3
 set logical-systems LS2 interfaces lt-1/2/0 unit 4 encapsulation ethernet
 set logical-systems LS2 interfaces lt-1/2/0 unit 4 peer-unit 3
 set logical-systems LS2 interfaces lt-1/2/0 unit 4 family inet address 10.0.2.2/30
 set logical-systems LS2 protocols ospf import filter_routes
 set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.1
 set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.4
 set logical-systems LS2 policy-options policy-statement filter_routes from route-filter
 10.0.16.0/30 exact
 set logical-systems LS2 policy-options policy-statement filter_routes then reject

LS1 set logical-systems LS1 interfaces lt-1/2/0 unit 2 description LS1->LS2
 set logical-systems LS1 interfaces lt-1/2/0 unit 2 encapsulation ethernet
 set logical-systems LS1 interfaces lt-1/2/0 unit 2 peer-unit 1
 set logical-systems LS1 interfaces lt-1/2/0 unit 2 family inet address 10.0.0.1/30
 set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.2

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure an OSPF import policy on logical systems:

1. Configure the interfaces.

[edit]

```

user@R1# set logical-systems LS3 interfaces so-0/0/0 unit 0 family inet address
10.0.60.2/30
user@R1# set logical-systems LS3 interfaces lt-1/2/0 unit 3 description LS3->LS2
user@R1# set logical-systems LS3 interfaces lt-1/2/0 unit 3 encapsulation ethernet
user@R1# set logical-systems LS3 interfaces lt-1/2/0 unit 3 peer-unit 4
user@R1# set logical-systems LS3 interfaces lt-1/2/0 unit 3 family inet address
10.0.2.1/30
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 1 description LS2->LS1
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 1 encapsulation ethernet
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 1 peer-unit 2
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 1 family inet address
10.0.0.2/30
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 4 description LS2->LS3
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 4 encapsulation ethernet
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 4 peer-unit 3
user@R1# set logical-systems LS2 interfaces lt-1/2/0 unit 4 family inet address
10.0.2.2/30
user@R1# set logical-systems LS1 interfaces lt-1/2/0 unit 2 description LS1->LS2
user@R1# set logical-systems LS1 interfaces lt-1/2/0 unit 2 encapsulation ethernet
user@R1# set logical-systems LS1 interfaces lt-1/2/0 unit 2 peer-unit 1
user@R1# set logical-systems LS1 interfaces lt-1/2/0 unit 2 family inet address
10.0.0.1/30

```

2. Enable OSPF on the interfaces.

```

[edit]
user@R1# set logical-systems LS3 protocols ospf area 0.0.0.0 interface lt-1/2/0.3
user@R1# set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.1
user@R1# set logical-systems LS2 protocols ospf area 0.0.0.0 interface lt-1/2/0.4
user@R1# set logical-systems LS1 protocols ospf area 0.0.0.0 interface lt-1/2/0.2

```

3. Configure the static route on Logical System LS3.

```

[edit]
user@R1# set logical-systems LS3 routing-options static route 10.0.16.0/30 next-hop
10.0.60.1

```

4. On Logical System LS3, redistribute the static route into OSPF.

```

[edit]
user@R1# set logical-systems LS3 protocols ospf export export_static
user@R1# set logical-systems LS3 policy-options policy-statement export_static
from protocol static
user@R1# set logical-systems LS3 policy-options policy-statement export_static
then accept

```

5. On Logical System LS2, configure the OSPF import policy.

```

[edit]
user@R1# set logical-systems LS2 protocols ospf import filter_routes
user@R1# set logical-systems LS2 policy-options policy-statement filter_routes
from route-filter 10.0.16.0/30 exact
user@R1# set logical-systems LS2 policy-options policy-statement filter_routes
then reject

```

6. If you are done configuring the device, commit the configuration.

```

[edit]
user@R1# commit

```

## Results

Confirm your configuration by issuing the **show logical-systems** command.

```
user@R1# show logical-systems
LS1 {
 interfaces {
 lt-1/2/0 {
 unit 2 {
 description LS1->LS2;
 encapsulation ethernet;
 peer-unit 1;
 family inet {
 address 10.0.0.1/30;
 }
 }
 }
 }
 protocols {
 ospf {
 area 0.0.0.0 {
 interface lt-1/2/0.2;
 }
 }
 }
}
LS2 {

 MultiRecv
```

**Meaning** The route to 10.0.16.0/30 is not installed in Logical System LS2's routing table. The route to 10.0.16.0/30 is installed in Logical System LS1's routing table as a route learned from OSPF. Because it is an OSPF external route, it has a preference value of 150 (instead of 10). By default, routes resulting from OSPF external LSAs are installed with a preference

value of 150. The route to 10.0.16.0/30 is installed in Logical System LS3's routing table as a static route.

#### IS-IS Overview

The IS-IS protocol is an interior gateway protocol (IGP) that uses link-state information to make routing decisions.

IS-IS is a link-state IGP that uses the shortest-path-first (SPF) algorithm to determine routes. IS-IS evaluates the topology changes and determines whether to perform a full SPF recalculation or a partial route calculation (PRC). This protocol originally was developed for routing International Organization for Standardization (ISO) Connectionless Network Protocol (CLNP) packets.

Like OSPF routing, IS-IS uses hello packets that allow network convergence to occur quickly when network changes are detected. IS-IS uses the SPF algorithm to determine routes. Using SPF, IS-IS evaluates network topology changes and determines if a full or partial route calculation is required.

**NOTE:** Because IS-IS uses ISO addresses, the configuration of IP version 6 (IPv6) and IP version 4 (IPv4) implementations of IS-IS is identical.

This section discusses the following topics:

- [IS-IS Terminology on page 3343](#)
- [ISO Network Addresses on page 3344](#)
- [IS-IS Packets on page 3345](#)

- [Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels on page 3347](#)

#### IS-IS Terminology

An IS-IS network is a single autonomous system (AS), also called a *routing domain*, that consists of *end systems* and *intermediate systems*. End systems are network entities that send and receive packets. Intermediate systems send and receive packets and relay (forward) packets. (Intermediate system is the Open System Interconnection [OSI] term for a router.) ISO packets are called network PDUs.

In IS-IS, a single AS can be divided into smaller groups called *areas*. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring *Level 1* and *Level 2* intermediate systems. Level 1 systems route within an area; when the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs. No IS-IS area functions strictly as a backbone.

Level 1 routers share intra-area routing information, and Level 2 routers share interarea information about IP addresses available within each area. Uniquely, IS-IS routers can act as both Level 1 and Level 2 routers, sharing intra-area routes with other Level 1 routers and interarea routes with other Level 2 routers.

The propagation of link-state updates is determined by the level boundaries. All routers within a level maintain a complete link-state database of all other routers in the same level. Each router then uses the Dijkstra algorithm to determine the shortest path from the local router to other routers in the link-state database.

### **ISO Network Addresses**

IS-IS uses ISO network addresses. Each address identifies a point of connection to the network, such as a router interface, and is called a *network service access point (NSAP)*.

IS-IS supports multiple NSAP addresses on the loopback lo0 interface.

An end system can have multiple NSAP addresses, in which case the addresses differ only by the last byte (called the *n-selector*). Each NSAP represents a service that is available at that node. In addition to having multiple services, a single node can belong to multiple areas.

Each network entity also has a special network address called a *network entity title (NET)*. Structurally, an NET is identical to an NSAP address but has an n-selector of 00. Most end systems and intermediate systems have one NET. Intermediate systems that participate in multiple areas can have multiple NETs.

The following ISO addresses illustrate the IS-IS address format:

```
49.0001.00a0.c96b.c490.00
49.0001.2081.9716.9018.00
```

NETs take several forms, depending on your network requirements. NET addresses are hexadecimal and range from 8 octets to 20 octets in length. Generally, the format consists of an authority and format Identifier (AFI), a domain ID, an area ID, a system identifier, and a selector. The simplest format omits the domain ID and is 10 octets long. For example, the NET address 49.0001.1921.6800.1001.00 consists of the following parts:

- 49—AFI
- 0001—Area ID
- 1921.6800.1001—System identifier
- 00—Selector

The system identifier must be unique within the network. For an IP-only network, we recommend using the IP address of an interface on the router. Configuring a loopback

NET address with the IP address is helpful when troubleshooting is required on the network.

The first portion of the address is the area number, which is a variable number from 1 through 13 bytes. The first byte of the area number (49) is the authority and format indicator (AFI). The next bytes are the assigned domain (area) identifier, which can be from 0 through 12 bytes. In the examples above, the area identifier is 0001.

The next six bytes form the system identifier. The system identifier can be any six bytes that are unique throughout the entire domain. The system identifier commonly is the media access control (MAC) address (as in the first example, 00a0.c96b.c490) or the IP address expressed in binary-coded decimal (BCD) (as in the second example, 2081.9716.9018, which corresponds to IP address 208.197.169.18). The last byte (00) is the n-selector.

**NOTE:** The system identifier cannot be 0000.0000.0000. All 0s is an illegal setting, and the adjacency is not formed with this setting.

To provide help with IS-IS debugging, the Junos<sup>®</sup> operating system (Junos OS) supports dynamic mapping of ISO system identifiers to the hostname. Each system can be configured with a hostname, which allows the system identifier-to-hostname mapping to be carried in a dynamic hostname type, length, and value (TLV) tuple in IS-IS link-state PDUs. This enables intermediate systems in the routing domain to learn about the ISO system identifier of a particular intermediate system.

### ***IS-IS Packets***

Each IS-IS PDU shares a common header. IS-IS uses the following PDUs to exchange protocol information:

- IS-IS hello (IIH) PDUs—Broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.

IS-IS hello PDUs establish adjacencies with other routers and have three different formats: one for point-to-point hello packets, one for Level 1 broadcast links, and one for Level 2 broadcast links. Level 1 routers must share the same area address to form an adjacency, while Level 2 routers do not have this limitation. The request for adjacency is encoded in the Circuit type field of the PDU.

Hello PDUs have a preset length assigned to them. The IS-IS router does not resize any PDU to match the maximum transmission unit (MTU) on a router interface. Each interface supports the maximum IS-IS PDU of 1492 bytes, and hello PDUs are padded to meet the maximum value. When the hello is sent to a neighboring router, the connecting interface supports the maximum PDU size.

- Link-state PDUs—Contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.

Also included is metric and IS-IS neighbor information. Each link-state PDU must be refreshed periodically on the network and is acknowledged by information within a sequence number PDU.

On point-to-point links, each link-state PDU is acknowledged by a partial sequence number PDU (PSNP), but on broadcast links, a complete sequence number PDU (CSNP) is sent out over the network. Any router that finds newer link-state PDU information in the CSNP then purges the out-of-date entry and updates the link-state database.

Link-state PDUs support variable-length subnet mask addressing.

- Complete sequence number PDUs (CSNPs)—Contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.

Contained within the CSNP is a link-state PDU identifier, a lifetime, a sequence number, and a checksum for each entry in the database. Periodically, a CSNP is sent on both broadcast and point-to-point links to maintain a correct database. Also, the advertisement of CSNPs occurs when an adjacency is formed with another router. Like IS-IS hello PDUs, CSNPs come in two types: Level 1 and Level 2.

When a device receives a CSNP, it checks the database entries against its own local link-state database. If it detects missing information, the device requests specific link-state PDU details using a partial sequence number PDU (PSNP).

- Partial sequence number PDUs (PSNPs)—Sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.

A PSNP is used by an IS-IS router to request link-state PDU information from a neighboring router. A PSNP can also explicitly acknowledge the receipt of a link-state PDU on a point-to-point link. On a broadcast link, a CSNP is used as implicit knowledge. Like hello PDUs and CSNPs, the PSNP also has two types: Level 1 and Level 2.

When a device compares a CSNP to its local database and determines that a link-state PDU is missing, the router issues a PSNP for the missing link-state PDU, which is returned in a link-state PDU from the router sending the CSNP. The received link-state PDU is then stored in the local database, and an acknowledgment is sent back to the originating router.

### ***Persistent Route Reachability***

IPv4 and IPv6 route reachability information in IS-IS link-state PDUs is preserved when you commit a configuration. IP prefixes are preserved with their original packet fragment upon link-state PDU regeneration.

### ***IS-IS Support for Multipoint Network Clouds***

IS-IS does not support multipoint configurations. Therefore, when configuring Frame Relay or Asynchronous Transfer Mode (ATM) networks, you must configure them as collections of point-to-point links, not as multipoint clouds.

### ***Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels***

When a routing device that operates as both a Level 1 and Level 2 router (Router B) determines that it can reach at least one area other than its own (for example, in Area Y), it sets the ATTACHED bit in its Level 1 link-state PDU. Thereafter, the Level 1 router (Router A) introduces a default route pointing to the nearest attached routing device that operates as both a Level 1 and Level 2 router (Router B). See [Figure 65 on page 3347](#).

**Figure 65: Install Default Route to Nearest Routing Device That Operates at Both Level 1 and Level 2**

### ***Example: Configuring IS-IS on Logical Systems Within the Same Router***

This example shows how to configure an IS-IS network by using multiple logical systems that are running on a single physical router. The logical systems are connected by logical tunnel interfaces.

- [Requirements on page 3347](#)
- [Overview on page 3347](#)
- [Configuration on page 3348](#)
- [Verification on page 3353](#)

#### ***Requirements***

You must connect the logical systems by using logical tunnel (lt) interfaces. See [“Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches” on page 3279](#).

#### ***Overview***

This example shows an IS-IS configuration with three logical systems running on one physical router. Each logical system has its own routing table. The configuration enables the protocol on all logical tunnel interfaces that participate in the IS-IS domain.

[Figure 66 on page 3348](#) shows the sample network.

Figure 66: IS-IS on Logical Systems

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS1 interfaces lt-0/1/0 unit 2 description LS1->LS2
set logical-systems LS1 interfaces lt-0/1/0 unit 2 encapsulation ethernet
set logical-systems LS1 interfaces lt-0/1/0 unit 2 peer-unit 1
set logical-systems LS1 interfaces lt-0/1/0 unit 2 family inet address 10.0.0.1/30

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure IS-IS on logical systems:

1. Configure the logical tunnel interface on Logical System LS1 connecting to Logical System LS2.

```

[edit logical-systems LS1]
user@host# set interfaces lt-0/1/0 unit 2 description LS1->LS2
user@host# set interfaces lt-0/1/0 unit 2 encapsulation ethernet
user@host# set interfaces lt-0/1/0 unit 2 peer-unit 1
user@host# set interfaces lt-0/1/0 unit 2 family inet address 10.0.0.1/30
user@host# set interfaces lt-0/1/0 unit 2 family iso

```

2. Configure the logical tunnel interface on Logical System LS1 connecting to Logical System LS3.

```

[edit logical-systems LS1]
user@host# set interfaces lt-0/1/0 unit 0 description LS1->LS3
user@host# set interfaces lt-0/1/0 unit 0 encapsulation ethernet
user@host# set interfaces lt-0/1/0 unit 0 peer-unit 5
user@host# set interfaces lt-0/1/0 unit 0 family inet address 10.0.1.2/30
user@host# set interfaces lt-0/1/0 unit 0 family iso

```

3. Configure the logical tunnel interface on Logical System LS2 connecting to Logical System LS1.

```

[edit logical-systems LS2]
user@host# set interfaces lt-0/1/0 unit 1 description LS2->LS1
user@host# set interfaces lt-0/1/0 unit 1 encapsulation ethernet
user@host# set interfaces lt-0/1/0 unit 1 peer-unit 2
user@host# set interfaces lt-0/1/0 unit 1 family inet address 10.0.0.2/30
user@host# set interfaces lt-0/1/0 unit 1 family iso

```

4. Configure the logical tunnel interface on Logical System LS2 connecting to Logical System LS3.

```
[edit logical-systems LS2]
user@host# set interfaces lt-0/1/0 unit 4 description LS2->LS3
user@host# set interfaces lt-0/1/0 unit 4 encapsulation ethernet
user@host# set interfaces lt-0/1/0 unit 4 peer-unit 3
user@host# set interfaces lt-0/1/0 unit 4 family inet address 10.0.2.2/30
user@host# set interfaces lt-0/1/0 unit 4 family iso
```

5. Configure the logical tunnel interface on Logical System LS3 connecting to Logical System LS2.

```
[edit logical-systems LS3]
user@host# set interfaces lt-0/1/0 unit 3 description LS3->LS2
user@host# set interfaces lt-0/1/0 unit 3 encapsulation ethernet
user@host# set interfaces lt-0/1/0 unit 3 peer-unit 4
user@host# set interfaces lt-0/1/0 unit 3 family inet address 10.0.2.1/30
user@host# set interfaces lt-0/1/0 unit 3 family iso
```

6. Configure the logical tunnel interface on Logical System LS3 connecting to Logical System LS1.

```
[edit logical-systems LS3]
user@host# set interfaces lt-0/1/0 unit 5 description LS3->LS1
user@host# set interfaces lt-0/1/0 unit 5 encapsulation ethernet
user@host# set interfaces lt-0/1/0 unit 5 peer-unit 0
user@host# set interfaces lt-0/1/0 unit 5 family inet address 10.0.1.1/30
user@host# set interfaces lt-0/1/0 unit 5 family iso
```

7. Configure the ISO address on the loopback interface for the three logical systems.

```
[edit logical-systems LS1]
user@host# set interfaces lo0 unit 1 family iso address 49.0001.1720.1600.1001.00
user@host# set protocols isis interface lo0.1 passive
```

```
[edit logical-systems LS2]
user@host# set interfaces lo0 unit 2 family iso address 49.0001.1720.1600.2002.00
user@host# set protocols isis interface lo0.2 passive
```

```
[edit logical-systems LS3]
user@host# set interfaces lo0 unit 3 family iso address 49.0001.1234.1600.2231.00
user@host# set protocols isis interface lo0.3 passive
```

8. Configure IS-IS on all the interfaces.

```
[edit logical-systems LS1 protocols isis]
user@host# set interface lt-0/1/0.0
user@host# set interface lt-0/1/0.2
```

```
[edit logical-systems LS2 protocols isis]
user@host# set interface lt-0/1/0.1
user@host# set interface lt-0/1/0.4
```

```
[edit logical-systems LS3 protocols isis]
user@host# set interface lt-0/1/0.5
user@host# set interface lt-0/1/0.3
```

9. If you are done configuring the device, commit the configuration.

```
[edit]
```

```
user@host# commit
```

### Results

From configuration mode, confirm your configuration by issuing the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show logical-systems

64 bytes from 10.0.0.2: icmp_seq=0 ttl=64 time=1.240 ms
64 bytes from 10.0.0.2: icmp_seq=1 ttl=64 time=1.217 ms
^C
--- 10.0.0.2 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.217/1.228/1.240/0.012 ms
```

#### *Example: Configuring an IS-IS Default Route Policy on Logical Systems*

This example shows logical systems configured on a single physical router and explains how to configure a default route on one logical system.

- [Requirements on page 3356](#)
- [Overview on page 3356](#)
- [Configuration on page 3357](#)
- [Verification on page 3360](#)

#### **Requirements**

No special configuration beyond device initialization is required before configuring this example.

#### **Overview**

This example shows a logical system redistributing a default route to other logical systems. All logical systems are running IS-IS. A common reason for a default route is to provide a path for sending traffic destined outside the IS-IS domain.

In this example, the default route is not used for forwarding traffic. The **no-install** statement prevents the route from being installed in the forwarding table of Logical System LS3. If you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols. The **discard** statement silently drops packets without notice.

[Figure 67 on page 3357](#) shows the sample network.

Figure 67: IS-IS with a Default Route to an ISP

g040918

**Configuration****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```

set logical-systems LS3 interfaces lt-1/2/0 unit 3 description LS3->LS2
set logical-systems LS3 interfaces lt-1/2/0 unit 3 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 3 peer-unit 4
set logical-systems LS3 interfaces lt-1/2/0 unit 3 family inet address 10.0.2.1/30
set logical-systems LS3 interfaces lt-1/2/0 unit 3 family iso
set logical-systems LS3 interfaces lt-1/2/0 unit 5 description LS3->LS1
set logical-systems LS3 interfaces lt-1/2/0 unit 5 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 5 peer-unit 0
set logical-systems LS3 interfaces lt-1/2/0 unit 5 family inet address 10.0.1.1/30
set logical-systems LS3 interfaces lt-1/2/0 unit 5 family iso
set logical-systems LS3 interfaces lo0 unit 3 family iso address 49.0001.1234.1600.2231.00
set logical-systems LS3 protocols isis export isis-default
set logical-systems LS3 protocols isis interface lt-1/2/0.3
set logical-systems LS3 protocols isis interface lt-1/2/0.5
set logical-systems LS3 protocols isis interface lo0.3 passive
set logical-systems LS3 routing-options static route 0.0.0.0/0 discard
set logical-systems LS3 routing-options static route 0.0.0.0/0 no-install
set logical-systems LS3 policy-options policy-statement isis-default from protocol static
set logical-systems LS3 policy-options policy-statement isis-default from route-filter
 0.0.0.0/0 exact
set logical-systems LS3 policy-options policy-statement isis-default then accept

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure an IS-IS default route policy on logical systems:

1. Configure the logical tunnel interfaces.  

```
[edit logical-systems LS3 interfaces lt-1/2/0]
user@R1# set unit 3 description LS3->LS2
user@R1# set unit 3 encapsulation ethernet
user@R1# set unit 3 peer-unit 4
user@R1# set unit 3 family inet address 10.0.2.1/30
user@R1# set unit 3 family iso
user@R1# set unit 5 description LS3->LS1
user@R1# set unit 5 encapsulation ethernet
user@R1# set unit 5 peer-unit 0
user@R1# set unit 5 family inet address 10.0.1.1/30
user@R1# set unit 5 family iso
[edit logical-systems LS3 interfaces lo0 unit 3]
user@R1# set family iso address 49.0001.1234.1600.2231.00
```
2. Enable IS-IS on the interfaces.  

```
[edit logical-systems LS3 protocols isis]
user@R1# set interface lt-1/2/0.3
user@R1# set interface lt-1/2/0.5
user@R1# set interface lo0.3 passive
```
3. Configure the default route on Logical System LS3.  

```
[edit logical-systems LS3 routing-options]
user@R1# set static route 0.0.0.0/0 discard
user@R1# set static route 0.0.0.0/0 no-install
```
4. Configure the default route policy on Logical System LS3.  

```
[edit logical-systems LS3 policy-options]
user@R1# set policy-statement isis-default from protocol static
user@R1# set policy-statement isis-default from route-filter 0.0.0.0/0 exact
user@R1# set policy-statement isis-default then accept
```
5. Apply the export policy to IS-IS on Logical System LS3.  

```
[edit logical-systems LS3 protocols isis]
user@R1# set export isis-default
```
6. If you are done configuring the device, commit the configuration.  

```
[edit]
user@R1# commit
```

### Results

From configuration mode, confirm your configuration by issuing the **show logical-systems LS3** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show logical-systems LS3
interfaces {
 lt-1/2/0 {
 unit 3 {
 description LS3->LS2;
 encapsulation ethernet;
 peer-unit 4;
 family inet {
 address 10.0.2.1/30;
 }
 family iso;
 }
 unit 5 {
 description LS3->LS1;
 encapsulation ethernet;
 peer-unit 0;
 family inet {
 address 10.0.1.1/30;
 }
 family iso;
 }
 }
 lo0 {
 unit 3 {
 family iso {
 address 49.0001.1234.1600.2231.00;
 }
 }
 }
}
protocols {
 isis {
 export isis-default;
 interface lt-1/2/0.3;
 interface lt-1/2/0.5;
 interface lo0.3 {
 passive;
 }
 }
}
policy-options {
 policy-statement isis-default {
 from {
 protocol static;
 route-filter 0.0.0.0/0 exact;
 }
 then accept;
 }
}
routing-options {
 static {
 route 0.0.0.0/0 {
 discard;
 no-install;
 }
 }
}
```

```
}
}
```

### ***Verification***

Confirm that the configuration is working properly.

### ***Verifying That the Static Route Is Redistributed***

**Purpose** Make sure that the IS-IS policy is working by checking the routing tables.

```

Action user@R1> show route logical-system LS3
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

```

**Meaning** The routing table on Logical System LS3 contains the default 0.0.0.0/0 route from protocol **IS-IS**. The routing tables on Logical System LS1 and Logical System LS2 contain the default 0.0.0.0/0 route from protocol **IS-IS**. If Logical System LS1 and Logical System LS2 receive packets destined for networks not specified in their routing tables, those packets will be sent to Logical System LS3 for further processing. This configuration assumes that Logical System LS3 has a connection to an ISP or another external network.

---

#### Examples: Configuring BGP on Logical Systems

- [Understanding BGP on page 3363](#)
- [Example: Configuring Internal BGP Peering Sessions on Logical Systems on page 3365](#)
- [Example: Configuring External BGP on Logical Systems with IPv6 Interfaces on page 3375](#)
- [Example: Configuring BFD on Internal BGP Peer Sessions on page 3390](#)
- [Example: Configuring EBGP Multihop Sessions on Logical Systems on page 3398](#)

### ***Understanding BGP***

BGP is an exterior gateway protocol (EGP) that is used to exchange routing information among routing devices in different autonomous systems (ASs). BGP routing information includes the complete route to each destination. BGP uses the routing information to maintain a database of network reachability information, which it exchanges with other BGP systems. BGP uses the network reachability information to construct a graph of AS connectivity, which enables BGP to remove routing loops and enforce policy decisions at the AS level.

Multiprotocol BGP (MBGP) extensions enable BGP to support IP version 6 (IPv6). MBGP defines the attributes `MP_REACH_NLRI` and `MP_UNREACH_NLRI`, which are used to carry IPv6 reachability information. Network layer reachability information (NLRI) update messages carry IPv6 address prefixes of feasible routes.

BGP allows for policy-based routing. You can use routing policies to choose among multiple paths to a destination and to control the redistribution of routing information.

BGP uses TCP as its transport protocol, using port 179 for establishing connections. Running over a reliable transport protocol eliminates the need for BGP to implement update fragmentation, retransmission, acknowledgment, and sequencing.

The Junos OS routing protocol software supports BGP version 4. This version of BGP adds support for Classless Interdomain Routing (CIDR), which eliminates the concept of network classes. Instead of assuming which bits of an address represent the network by looking at the first octet, CIDR allows you to explicitly specify the number of bits in the network address, thus providing a means to decrease the size of the routing tables. BGP version 4 also supports aggregation of routes, including the aggregation of AS paths.

This section discusses the following topics:

- [Autonomous Systems on page 3363](#)
- [AS Paths and Attributes on page 3363](#)
- [External and Internal BGP on page 3364](#)
- [Multiple Instances of BGP on page 3364](#)

### ***Autonomous Systems***

An *autonomous system* (AS) is a set of routing devices that are under a single technical administration and normally use a single interior gateway protocol and a common set of metrics to propagate routing information within the set of routing devices. To other ASs, an AS appears to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it.

### ***AS Paths and Attributes***

The routing information that BGP systems exchange includes the complete route to each destination, as well as additional information about the route. The route to each destination is called the *AS path*, and the additional route information is included in *path attributes*. BGP uses the AS path and the path attributes to completely determine the network topology. Once BGP understands the topology, it can detect and eliminate

routing loops and select among groups of routes to enforce administrative preferences and routing policy decisions.

### External and Internal BGP

BGP supports two types of exchanges of routing information: exchanges among different ASs and exchanges within a single AS. When used among ASs, BGP is called *external BGP* (EBGP) and BGP sessions perform *inter-AS routing*. When used within an AS, BGP is called *internal BGP* (IBGP) and BGP sessions perform *intra-AS routing*.

Figure 68 on page 3364 illustrates ASs, IBGP, and EBGP.

Figure 68: ASs, EBGP, and IBGP

A BGP system shares network reachability information with adjacent BGP systems, which are referred to as *neighbors* or *peers*.

BGP systems are arranged into *groups*. In an IBGP group, all peers in the group—called *internal peers*—are in the same AS. Internal peers can be anywhere in the local AS and do not have to be directly connected to one another. Internal groups use routes from an IGP to resolve forwarding addresses. They also propagate external routes among all other internal routing devices running IBGP, computing the next hop by taking the BGP next hop received with the route and resolving it using information from one of the interior gateway protocols.

In an EBGP group, the peers in the group—called *external peers*—are in different ASs and normally share a subnet. In an external group, the next hop is computed with respect to the interface that is shared between the external peer and the local routing device.

### Multiple Instances of BGP

You can configure multiple instances of BGP at the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

Multiple instances of BGP are primarily used for Layer 3 VPN support.

IGP peers and external BGP (EBGP) peers (both nonmultihop and multihop) are all supported for routing instances. BGP peering is established over one of the interfaces configured under the **routing-instances** hierarchy.

**NOTE:** When a BGP neighbor sends BGP messages to the local routing device, the incoming interface on which these messages are received must be configured in the same routing instance that the BGP neighbor configuration exists in. This is true for neighbors that are a single hop away or multiple hops away.

Routes learned from the BGP peer are added to the **instance-name.inet.0** table by default. You can configure import and export policies to control the flow of information into and out of the instance routing table.

For Layer 3 VPN support, configure BGP on the provider edge (PE) router to receive routes from the customer edge (CE) router and to send the instances' routes to the CE router if necessary. You can use multiple instances of BGP to maintain separate per-site forwarding tables for keeping VPN traffic separate on the PE router.

You can configure import and export policies that allow the service provider to control and rate-limit traffic to and from the customer.

You can configure an EBGP multihop session for a VRF routing instance. Also, you can set up the EBGP peer between the PE and CE routers by using the loopback address of the CE router instead of the interface addresses.

### ***Example: Configuring Internal BGP Peering Sessions on Logical Systems***

This example shows how to configure internal BGP peer sessions on logical systems.

- [Requirements on page 3365](#)
- [Overview on page 3365](#)
- [Configuration on page 3366](#)
- [Verification on page 3372](#)

#### ***Requirements***

In this example, no special configuration beyond device initialization is required.

#### ***Overview***

In this example, you configure internal BGP (IBGP) peering sessions.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

[Figure 69 on page 3366](#) shows a typical network with internal peer sessions.

Figure 69: Typical Network with IBGP Sessions

**Configuration****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set logical-systems A interfaces lt-0/1/0 unit 1 description to-B
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation ethernet

```

#### Device A

##### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.

```

[edit logical-systems A interfaces lt-0/1/0 unit 1]
user@R1# set description to-B
user@R1# set encapsulation ethernet
user@R1# set peer-unit 2
user@R1# set family inet address 10.10.10.1/30
user@R1# set family inet address 192.168.6.5/32
user@R1# up
user@R1# up
[edit logical-systems A interfaces]
user@R1# set lo0 unit 1 family inet address 192.168.6.5/32
user@R1# exit
[edit]
user@R1# edit logical-systems B interfaces lt-0/1/0
[edit logical-systems B interfaces lt-0/1/0]
user@R1# set unit 2 description to-A
user@R1# set unit 2 encapsulation ethernet
user@R1# set unit 2 peer-unit 1
user@R1# set unit 2 family inet address 10.10.10.2/30
user@R1# set unit 5 description to-C
user@R1# set unit 5 encapsulation ethernet
user@R1# set unit 5 peer-unit 6

```

```
user@R1# set family inet address 10.10.10.5/30
user@R1# up
[edit logical-systems B interfaces]
user@R1# set lo0 unit 2 family inet address 192.163.6.4/32
user@R1# exit
[edit]
user@R1# edit logical-systems C interfaces lt-0/1/0 unit 6
[edit logical-systems C interfaces lt-0/1/0 unit 6]
set description to-B
set encapsulation ethernet
set peer-unit 5
set family inet address 10.10.10.6/30
user@R1# up
user@R1# up
[edit logical-systems C interfaces]
set lo0 unit 3 family inet address 192.168.40.4/32
```

2. Configure BGP.

On Logical System A, the **neighbor** statements are included for both Device B and Device C, even though Logical System A is not directly connected to Device C.

```
[edit logical-systems A protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.6.5
user@R1# set export send-direct
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.40.4
```

```
[edit logical-systems B protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.163.6.4
user@R1# set export send-direct
user@R1# set neighbor 192.168.40.4
user@R1# set neighbor 192.168.6.5
```

```
[edit logical-systems C protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.40.4
user@R1# set export send-direct
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface lt-0/1/0.1
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.2 passive
user@R1# set interface lt-0/1/0.2
user@R1# set interface lt-0/1/0.5
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.3 passive
```

```
user@R1# set interface lt-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit logical-systems A policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems B policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems C policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit logical-systems A routing-options]
user@R1# set router-id 192.168.6.5
user@R1# set autonomous-system 17
```

```
[edit logical-systems B routing-options]
user@R1# set router-id 192.163.6.4
user@R1# set autonomous-system 17
```

```
[edit logical-systems C routing-options]
user@R1# set router-id 192.168.40.4
user@R1# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show logical-systems

```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3372](#)
- [Verifying BGP Groups on page 3374](#)
- [Verifying BGP Summary Information on page 3374](#)
- [Verifying That BGP Routes Are Installed in the Routing Table on page 3374](#)

### **Verifying BGP Neighbors**

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From the operational mode, enter the **show bgp neighbor** command.

```

user@R1> show bgp neighbor logical-system A

```

#### *Example: Configuring External BGP on Logical Systems with IPv6 Interfaces*

This example shows how to configure external BGP (EBGP) point-to-point peer sessions on logical systems with IPv6 interfaces.

- [Requirements on page 3375](#)
- [Overview on page 3375](#)
- [Configuration on page 3376](#)
- [Verification on page 3385](#)

#### **Requirements**

In this example, no special configuration beyond device initialization is required.

#### **Overview**

Junos OS supports EBGP peer sessions by means of IPv6 addresses. An IPv6 peer session can be configured when an IPv6 address is specified in the **neighbor** statement. This example uses EUI-64 to generate IPv6 addresses that are automatically applied to the interfaces. An EUI-64 address is an IPv6 address that uses the IEEE EUI-64 format for the interface identifier portion of the address (the last 64 bits).

**NOTE:** Alternatively, you can configure EBGP sessions using manually assigned 128-bit IPv6 addresses.

If you use 128-bit link-local addresses for the interfaces, you must include the **local-interface** statement. This statement is valid only for 128-bit IPv6 link-local addresses and is mandatory for configuring an IPv6 EBGP link-local peer session.

Configuring EBGP peering using link-local addresses is only applicable for directly connected interfaces. There is no support for multihop peering.

After your interfaces are up, you can use the **show interfaces terse** command to view the EUI-64-generated IPv6 addresses on the interfaces. You must use these generated addresses in the BGP **neighbor** statements. This example demonstrates the full end-to-end procedure.

In this example, Frame Relay interface encapsulation is applied to the logical tunnel (**lt**) interfaces. This is a requirement because only Frame Relay encapsulation is supported when IPv6 addresses are configured on the **lt** interfaces.

Figure 70 on page 3376 shows a network with BGP peer sessions. In the sample network, Router R1 has five logical systems configured. Device E in autonomous system (AS) 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22. This example shows the step-by-step configuration on Logical System A and Logical System E.

Figure 70: Typical Network with BGP Peer Sessions

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device A      **set logical-systems A interfaces lt-0/1/0 unit 1 description to-E**

```

set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation frame-relay
set logical-systems A interfaces lt-0/1/0 unit 1 dlci 1
set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 25
set logical-systems A interfaces lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64
 eui-64
set logical-systems A interfaces lo0 unit 1 family inet6 address 2001:db8::1/128
set logical-systems A protocols bgp group external-peers type external

 set logical-systems E routing-options autonomous-system 17

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Run the **show interfaces terse** command to verify that the physical router has a logical tunnel (lt) interface.
 

```

user@R1> show interfaces terse
Interface Admin Link Proto Local Remote
...
lt-0/1/0 up up
...

```
2. On Logical System A, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System E.

```

user@R1> set cli logical-system A
Logical system: A
[edit]
user@R1:A> edit
Entering configuration mode
[edit]
user@R1:A# edit interfaces
[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 encapsulation frame-relay
user@R1:A# set lt-0/1/0 unit 1 dlci 1
user@R1:A# set lt-0/1/0 unit 1 peer-unit 25

```

3. On Logical System A, configure the network address for the link to Peer E, and configure a loopback interface.

```

[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 description to-E
user@R1:A# set lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:A# set lo0 unit 1 family inet6 address 2001:db8::1/128

```

4. On Logical System E, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System A.

```

user@R1> set cli logical-system E
Logical system: E
[edit]
user@R1:E> edit
Entering configuration mode
[edit]
user@R1:E# edit interfaces
[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 encapsulation frame-relay
user@R1:E# set lt-0/1/0 unit 25 dlci 1
user@R1:E# set lt-0/1/0 unit 25 peer-unit 1

```

5. On Logical System E, configure the network address for the link to Peer A, and configure a loopback interface.

```

[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 description to-A
user@R1:E# set lt-0/1/0 unit 25 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:E# set lo0 unit 5 family inet6 address 2001:db8::5/128

```

6. Run the **show interfaces terse** command to see the IPv6 addresses that are generated by EUI-64.

The 2001 addresses are used in this example in the BGP **neighbor** statements.

**NOTE:** The fe80 addresses are link-local addresses and are not used in this example.

```

user@R1:A> show interfaces terse
Interface Admin Link Proto Local Remote
Logical system: A

betsy@tp8:A> show interfaces terse

```

```

Interface Admin Link Proto Local Remote
1t-0/1/0
1t-0/1/0.1 up up inet6 2001:db8:0:1:2a0:a502:0:1da/64
 fe80::2a0:a502:0:1da/64

1o0
1o0.1 up up inet6 2001:db8::1
 fe80::2a0:a50f:fc56:1da

user@R1:E> show interfaces terse
Interface Admin Link Proto Local Remote
1t-0/1/0
1t-0/1/0.25 up up inet6 2001:db8:0:1:2a0:a502:0:19da/64
 fe80::2a0:a502:0:19da/64

1o0
1o0.5 up up inet6 2001:db8::5
 fe80::2a0:a50f:fc56:1da

```

7. Repeat the interface configuration on the other logical systems.

### Configuring the External BGP Sessions

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the BGP peer sessions:

1. On Logical System A, create the BGP group, and add the external neighbor address.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set neighbor 2001:db8:0:1:2a0:a502:0:19da
```
2. On Logical System E, create the BGP group, and add the external neighbor address.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set neighbor 2001:db8:0:1:2a0:a502:0:1da
```
3. On Logical System A, specify the autonomous system (AS) number of the external AS.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set peer-as 17
```
4. On Logical System E, specify the autonomous system (AS) number of the external AS.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set peer-as 22
```
5. On Logical System A, set the peer type to EBGp.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set type external
```
6. On Logical System E, set the peer type to EBGp.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set type external
```
7. On Logical System A, set the autonomous system (AS) number and router ID.

```
[edit routing-options]
user@R1:A# set router-id 1.1.1.1
user@R1:A# set autonomous-system 22
```

8. On Logical System E, set the AS number and router ID.

```
[edit routing-options]
user@R1:E# set router-id 5.5.5.5
user@R1:E# set autonomous-system 17
```

9. Repeat these steps for Peers A, B, C, and D.

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show logical-systems

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3385](#)
- [Verifying BGP Groups on page 3388](#)
- [Verifying BGP Summary Information on page 3388](#)
- [Checking the Routing Table on page 3389](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From operational mode, run the **show bgp neighbor** command.

```

user@R1:E> show bgp neighbor
Peer: 2001:db8:0:1:2a0:a502:0:1da+54987 AS 22 Local:

```

**Meaning** The Down peers: 0 output shows that the BGP peers are in the established state.

### Checking the Routing Table

**Purpose** Verify that the inet6.0 routing table is populated with local and direct routes.

**Action** From operational mode, run the **show route** command.

```
user@R1:E> show route
inet6.0: 15 destinations, 18 routes (15 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

2001:db8::5/128 *[Direct/0] 12:41:18
 > via lo0.5

 > via lo0.5
```

**Meaning** The inet6.0 routing table contains local and direct routes. To populate the routing table with other types of routes, you must configure routing policies.

### **Example: Configuring BFD on Internal BGP Peer Sessions**

This example shows how to configure internal BGP (IBGP) peer sessions with the Bidirectional Forwarding Detection (BFD) protocol to detect failures in a network.

- [Requirements on page 3390](#)
- [Overview on page 3390](#)
- [Configuration on page 3391](#)
- [Verification on page 3395](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

The minimum configuration to enable BFD on IBGP sessions is to include the [bfd-liveness-detection minimum-interval](#) statement in the BGP configuration of all neighbors participating in the BFD session. The **minimum-interval** statement specifies the minimum transmit and receive intervals for failure detection. Specifically, this value represents the minimum interval after which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value from 1 through 255,000 milliseconds.

Optionally, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements. For information about these and other optional BFD configuration statements, see [bfd-liveness-detection](#).

.....  
**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD less than 100 ms for Routing Engine-based sessions and less than 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
  - For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
  - For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.
- .....

BFD is supported on the default routing instance (the main router), routing instances, and logical systems. This example shows BFD on logical systems.

Figure 71 on page 3391 shows a typical network with internal peer sessions.

**Figure 71: Typical Network with IBGP Sessions**

#### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device A**

```

set logical-systems A interfaces lt-1/2/0 unit 1 description to-B
set logical-systems A interfaces lt-1/2/0 unit 1 encapsulation ethernet

### Configuring Device A

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure Device A:

1. Set the CLI to Logical System A.  

```
user@host> set cli logical-system A
```
2. Configure the interfaces.  

```
[edit interfaces lt-1/2/0 unit 1]
user@host:A# set description to-B
user@host:A# set encapsulation ethernet
```

```
user@host:A# set peer-unit 2
user@host:A# set family inet address 10.10.10.1/30
```

```
[edit interfaces lo0 unit 1]
user@host:A# set family inet address 192.168.6.5/32
```

3. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@host:A# set type internal
user@host:A# set local-address 192.168.6.5
user@host:A# set export send-direct
user@host:A# set neighbor 192.163.6.4
user@host:A# set neighbor 192.168.40.4
```

4. Configure BFD.

```
[edit protocols bgp group internal-peers]
user@host:A# set bfd-liveness-detection minimum-interval 1000
```

You must configure the same minimum interval on the connecting peer.

5. (Optional) Configure BFD tracing.

```
[edit protocols bgp group internal-peers]
user@host:A# set traceoptions file bgp-bfd
user@host:A# set traceoptions flag bfd detail
```

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@host:A# set interface lo0.1 passive
user@host:A# set interface lt-1/2/0.1
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@host:A# set from protocol direct
user@host:A# set then accept
```

8. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:A# set router-id 192.168.6.5
user@host:A# set autonomous-system 17
```

9. If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps to configure Device B and Device C.

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:A# show interfaces
lt-1/2/0 {
 unit 1 {
 description to-B;
 encapsulation ethernet;
 peer-unit 2;
 family inet {
 address 10.10.10.1/30;
 }
 }
}
lo0 {
 unit 1 {
 family inet {
 address 192.168.6.5/32;
 }
 }
}

user@host:A# show policy-options
policy-statement send-direct {
 term 2 {
 from protocol direct;
 then accept;
 }
}

user@host:A# show protocols
bgp {
 group internal-peers {
 type internal;
 traceoptions {
 file bgp-bfd;
 flag bfd detail;
 }
 local-address 192.168.6.5;
 export send-direct;
 bfd-liveness-detection {
 minimum-interval 1000;
 }
 neighbor 192.163.6.4;
 neighbor 192.168.40.4;
 }
}
ospf {
 area 0.0.0.0 {
 interface lo0.1 {
 passive;
 }
 interface lt-1/2/0.1;
 }
}

user@host:A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;
```

**Verification**

Confirm that the configuration is working properly.

- [Verifying That BFD Is Enabled on page 3395](#)
- [Verifying That BFD Sessions Are Up on page 3395](#)
- [Viewing Detailed BFD Events on page 3396](#)
- [Viewing Detailed BFD Events After Deactivating and Reactivating a Loopback Interface on page 3397](#)

**Verifying That BFD Is Enabled**

**Purpose** Verify that BFD is enabled between the IBGP peers.

**Action** From operational mode, enter the **show bgp neighbor** command. You can use the **| match bfd** filter to narrow the output.

```
user@host:A> show bgp neighbor | match bfd
Options: <BfdEnabled>
 BFD: enabled, up
 Trace file: /var/log/A/bgp-bfd size 131072 files 10
Options: <BfdEnabled>
 BFD: enabled, up
 Trace file: /var/log/A/bgp-bfd size 131072 files 10
```

**Meaning** The output shows that Logical System A has two neighbors with BFD enabled. When BFD is not enabled, the output displays **BFD: disabled, down**, and the **<BfdEnabled>** option is absent. If BFD is enabled and the session is down, the output displays **BFD: enabled, down**. The output also shows that BFD-related events are being written to a log file because trace operations are configured.

**Verifying That BFD Sessions Are Up**

**Purpose** Verify that the BFD sessions are up, and view details about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@host:A> show bfd session extensive
```

| Address     | State | Interface | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|-----------|-------------|-------------------|------------|
| 192.163.6.4 | Up    |           | 3.000       | 1.000             | 3          |

```
Client BGP, TX interval 1.000, RX interval 1.000
Session up time 00:54:40
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Logical system 12, routing table index 25
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 10, remote discriminator 9
Echo mode disabled/inactive
Multi-hop route table 25, local-address 192.168.6.5
```

|  | Detect | Transmit |
|--|--------|----------|
|--|--------|----------|

```

Address State Interface Time Interval Multiplier
192.168.40.4 Up Up 3.000 1.000 3
Client BGP, TX interval 1.000, RX interval 1.000
Session up time 00:48:03
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Logical system 12, routing table index 25
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 14, remote discriminator 13
Echo mode disabled/inactive
Multi-hop route table 25, local-address 192.168.6.5

2 sessions, 2 clients
Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

```

**Meaning** The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

#### *Viewing Detailed BFD Events*

**Purpose** View the contents of the BFD trace file to assist in troubleshooting, if needed.

**Action** From operational mode, enter the **file show /var/log/A/bgp-bfd** command.

```

user@host:A> file show /var/log/A/bgp-bfd

```

**Meaning** Before the routes are established, the **No route to host** message appears in the output. After the routes are established, the last two lines show that both BFD sessions come up.

### *Viewing Detailed BFD Events After Deactivating and Reactivating a Loopback Interface*

**Purpose** Check to see what happens after bringing down a router or switch and then bringing it back up. To simulate bringing down a router or switch, deactivate the loopback interface on Logical System B.

**Action** 1. From configuration mode, enter the **deactivate logical-systems B interfaces lo0 unit 2 family inet** command.

```

user@host:A# deactivate logical-systems B interfaces lo0 unit 2 family inet
user@host:A# commit

```

2. From operational mode, enter the **file show /var/log/A/bgp-bfd** command.

```

user@host:A> file show /var/log/A/bgp-bfd
...

### **Example: Configuring EBGMP Multihop Sessions on Logical Systems**

This example shows how to configure an external BGP (EBGP) peer that is more than one hop away from the local router. This type of session is called a *multihop* EBGMP session.

- [Requirements on page 3398](#)
- [Overview on page 3398](#)
- [Configuration on page 3399](#)
- [Verification on page 3406](#)

#### **Requirements**

In this example, no special configuration beyond device initialization is required.

#### **Overview**

When EBGMP peers are not directly connected to each other, they must cross one or more non-BGP routing devices to reach each other. Configuring multihop EBGMP enables the peers to pass through the other routing devices to form peer relationships and exchange update messages. This type of configuration is typically used when a Juniper Networks routing device needs to run EBGMP with a third-party routing device that does not allow direct connection of the two EBGMP peers. EBGMP multihop enables a neighbor connection between two EBGMP peers that do not have a direct connection.

The configuration to enable multihop EBGMP sessions requires connectivity between the two EBGMP peers. This example uses static routes to provide connectivity between the devices.

For directly connected EBGMP sessions, physical addresses are typically used in the **neighbor** statements. For multihop EBGMP, you must use loopback interface addresses, and specify the loopback interface address of the indirectly connected peer. In the use of loopback interfaces addresses, EBGMP multihop is similar to internal BGP (IBGP).

Finally, you must add the **multihop** statement. Optionally, you can set a maximum time-to-live (TTL) value with the **ttl** statement. The TTL is carried in the IP header of BGP packets. If you do not specify a TTL value, the system's default maximum TTL value is used. The default TTL value is 64 for multihop EBGMP sessions. Another option is to retain the BGP next-hop value for route advertisements by including the **no-nexthop-change** statement.

[Figure 72 on page 3399](#) shows a typical EBGMP multihop network.

Device C and Device E have an established EBGMP session. Device D is not a BGP-enabled device. All of the devices have connectivity via static routes.

Figure 72: Typical Network with EBGP Multihop Sessions

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device C**

```

set logical-systems C interfaces lt-1/2/0 unit 9 description to-D
set logical-systems C interfaces lt-1/2/0 unit 9 encapsulation ethernet
set logical-systems C interfaces lt-1/2/0 unit 9 peer-unit 10
set logical-systems C interfaces lt-1/2/0 unit 9 family inet address 10.10.10.9/30
set logical-systems C interfaces lo0 unit 3 family inet address 192.168.40.4/32
set logical-systems C protocols bgp group external-peers type external
set logical-systems C protocols bgp group external-peers multihop ttl 2
set logical-systems C protocols bgp group external-peers local-address 192.168.40.4
set logical-systems C protocols bgp group external-peers export send-static
set logical-systems C protocols bgp group external-peers peer-as 18
set logical-systems C protocols bgp group external-peers neighbor 192.168.6.7
set logical-systems C policy-options policy-statement send-static term 1 from protocol static
set logical-systems C policy-options policy-statement send-static term 1 then accept
set logical-systems C routing-options static route 10.10.10.14/32 next-hop 10.10.10.10
set logical-systems C routing-options static route 192.168.6.7/32 next-hop 10.10.10.10
set logical-systems C routing-options router-id 192.168.40.4
set logical-systems C routing-options autonomous-system 17

```

**Device D**

```

set logical-systems D interfaces lt-1/2/0 unit 10 description to-C
set logical-systems D interfaces lt-1/2/0 unit 10 encapsulation ethernet
set logical-systems D interfaces lt-1/2/0 unit 10 peer-unit 9
set logical-systems D interfaces lt-1/2/0 unit 10 family inet address 10.10.10.10/30
set logical-systems D interfaces lt-1/2/0 unit 13 description to-E
set logical-systems D interfaces lt-1/2/0 unit 13 encapsulation ethernet
set logical-systems D interfaces lt-1/2/0 unit 13 peer-unit 14
set logical-systems D interfaces lt-1/2/0 unit 13 family inet address 10.10.10.13/30
set logical-systems D interfaces lo0 unit 4 family inet address 192.168.6.6/32
set logical-systems D routing-options static route 192.168.40.4/32 next-hop 10.10.10.9
set logical-systems D routing-options static route 192.168.6.7/32 next-hop 10.10.10.14
set logical-systems D routing-options router-id 192.168.6.6

```

**Device E**

```

set logical-systems E interfaces lt-1/2/0 unit 14 description to-D
set logical-systems E interfaces lt-1/2/0 unit 14 encapsulation ethernet
set logical-systems E interfaces lt-1/2/0 unit 14 peer-unit 13

```

```
set logical-systems E interfaces lt-1/2/0 unit 14 family inet address 10.10.10.14/30
set logical-systems E interfaces lo0 unit 5 family inet address 192.168.6.7/32
set logical-systems E protocols bgp group external-peers multihop ttl 2
set logical-systems E protocols bgp group external-peers local-address 192.168.6.7
set logical-systems E protocols bgp group external-peers export send-static
set logical-systems E protocols bgp group external-peers peer-as 17
set logical-systems E protocols bgp group external-peers neighbor 192.168.40.4
set logical-systems E policy-options policy-statement send-static term 1 from protocol
static
set logical-systems E policy-options policy-statement send-static term 1 then accept
set logical-systems E routing-options static route 10.10.10.8/30 next-hop 10.10.10.13
set logical-systems E routing-options static route 192.168.40.4/32 next-hop 10.10.10.13
set logical-systems E routing-options router-id 192.168.6.7
set logical-systems E routing-options autonomous-system 18
```

### *Device C*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure Device C:

1. Set the CLI to Logical System C.  

```
user@host> set cli logical-system C
```
2. Configure the interface to the directly-connected device (to-D), and configure the loopback interface.  

```
[edit interfaces lt-1/2/0 unit 9]
user@host:C# set description to-D
user@host:C# set encapsulation ethernet
user@host:C# set peer-unit 10
user@host:C# set family inet address 10.10.10.9/30
```

```
[edit interfaces lo0 unit 3]
user@host:C# set family inet address 192.168.40.4/32
```

3. Configure an EBGp session with Logical System E.

The **neighbor** statement points to the loopback interface on Logical System E.

```
[edit protocols bgp group external-peers]
user@host:C# set type external
user@host:C# set local-address 192.168.40.4
user@host:C# set export send-static
user@host:C# set peer-as 18
user@host:C# set neighbor 192.168.6.7
```

4. Configure the multihop statement to enable Logical System C and Logical System E to become EBGp peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```
[edit protocols bgp group external-peers]
user@host:C# set multihop ttl 2
```

5. Configure connectivity to Logical System E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```
[edit logical-systems C routing-options]
user@host:C# set static route 10.10.10.14/32 next-hop 10.10.10.10
user@host:C# set static route 192.168.6.7/32 next-hop 10.10.10.10
```

6. Configure the local router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:C# set router-id 192.168.40.4
user@host:C# set autonomous-system 17
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-static term 1]
user@host:C# set from protocol static
user@host:C# set then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:C# show interfaces
lt-1/2/0 {
 unit 9 {
 description to-D;
 encapsulation ethernet;
 peer-unit 10;
 family inet {
 address 10.10.10.9/30;
 }
 }
}
lo0 {
 unit 3 {
 family inet {
 address 192.168.40.4/32;
 }
 }
}

user@host:C# show protocols
bgp {
 group external-peers {
 type external;
 multihop {
 ttl 2;
 }
 local-address 192.168.40.4;
 export send-static;
```

```
 peer-as 18;
 neighbor 192.168.6.7;
 }
}

user@host:C# show policy-options
policy-statement send-static {
 term 1 {
 from protocol static;
 then accept;
 }
}

user@host:C# show routing-options
static {
 route 10.10.10.14/32 next-hop 10.10.10.10;
 route 192.168.6.7/32 next-hop 10.10.10.10;
}
router-id 192.168.40.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps for all BFD sessions in the topology.

#### **Device D**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure Device D:

1. Set the CLI to Logical System D.  

```
user@host> set cli logical-system D
```
2. Configure the interfaces to the directly-connected devices, and configure a loopback interface.  

```
[edit interfaces lt-1/2/0 unit 10]
user@host:D# set description to-C
user@host:D# set encapsulation ethernet
user@host:D# set peer-unit 9
user@host:D# set family inet address 10.10.10.30

[edit interfaces lt-1/2/0 unit 13]
user@host:D# set description to-E
user@host:D# set encapsulation ethernet
user@host:D# set peer-unit 14
user@host:D# set family inet address 10.10.10.13/30

[edit interfaces lo0 unit 4]
user@host:D# set family inet address 192.168.6.6/32
```
3. Configure connectivity to the other devices using a static routes to the loopback interface addresses.

On Logical System D, you do not need static routes to the physical addresses because Logical System D is directly connected to Logical System C and Logical System E.

```
[edit routing-options]
user@host:D# set static route 192.168.40.4/32 next-hop 10.10.10.9
user@host:D# set static route 192.168.6.7/32 next-hop 10.10.10.14
```

4. Configure the local router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:D# set router-id 192.168.6.6
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:D# show interfaces
lt-1/2/0 {
 unit 10 {
 description to-C;
 encapsulation ethernet;
 peer-unit 9;
 family inet {
 address 10.10.10.10/30;
 }
 }
 unit 13 {
 description to-E;
 encapsulation ethernet;
 peer-unit 14;
 family inet {
 address 10.10.10.13/30;
 }
 }
}
lo0 {
 unit 4 {
 family inet {
 address 192.168.6.6/32;
 }
 }
}

user@host:D# show protocols

user@host:D# show routing-options
static {
 route 192.168.40.4/32 next-hop 10.10.10.9;
 route 192.168.6.7/32 next-hop 10.10.10.14;
}
router-id 192.168.6.6;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps for all BFD sessions in the topology.

### Device E

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure Device E:

1. Set the CLI to Logical System E.

```
user@host> set cli logical-system E
```

2. Configure the interface to the directly-connected device (to-D), and configure the loopback interface.

```
[edit interfaces lt-1/2/0 unit 14]
user@host:E# set description to-D
user@host:E# set encapsulation ethernet
user@host:E# set peer-unit 13
user@host:E# set family inet address 10.10.10.14/30
```

```
[edit interfaces lo0 unit 5]
user@host:E# set family inet address 192.168.6.7/32
```

3. Configure an EBGp session with Logical System E.

The **neighbor** statement points to the loopback interface on Logical System C.

```
[edit protocols bgp group external-peers]
user@host:E# set local-address 192.168.6.7
user@host:E# set export send-static
user@host:E# set peer-as 17
user@host:E# set neighbor 192.168.40.4
```

4. Configure the **multihop** statement to enable Logical System C and Logical System E to become EBGp peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```
[edit protocols bgp group external-peers]
user@host:E# set multihop ttl 2
```

5. Configure connectivity to Logical System E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```
[edit routing-options]
user@host:E# set static route 10.10.10.8/30 next-hop 10.10.10.13
user@host:E# set static route 192.168.40.4/32 next-hop 10.10.10.13
```

6. Configure the local router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:E# set router-id 192.168.6.7
user@host:E# set autonomous-system 18
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-static term 1]
user@host:E# set from protocol static
user@host:E# set send-static then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:E# show interfaces
lt-1/2/0 {
 unit 14 {
 description to-D;
 encapsulation ethernet;
 peer-unit 13;
 family inet {
 address 10.10.10.14/30;
 }
 }
}
lo0 {
 unit 5 {
 family inet {
 address 192.168.6.7/32;
 }
 }
}

user@host:E# show protocols
bgp {
 group external-peers {
 multihop {
 ttl 2;
 }
 local-address 192.168.6.7;
 export send-static;
 peer-as 17;
 neighbor 192.168.40.4;
 }
}

user@host:E# show policy-options
policy-statement send-static {
 term 1 {
 from protocol static;
 then accept;
 }
}

user@host:E# show routing-options
static {
 route 10.10.10.8/30 next-hop 10.10.10.13;
 route 192.168.40.4/32 next-hop 10.10.10.13;
```

```
}
router-id 192.168.6.7;
autonomous-system 18;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Connectivity on page 3406](#)
- [Verifying the BGP Sessions Are Established on page 3406](#)
- [Viewing Advertised Routes on page 3407](#)

### **Verifying Connectivity**

**Purpose** Make sure that Device C can ping Device E, specifying the loopback interface address as the source of the ping request.

The loopback interface address is the source address that BGP will be using.

**Action** From operational mode, enter the **ping 10.10.10.14 source 192.168.40.4** command from Logical System C, and enter the **ping 10.10.10.9 source 192.168.6.7** command from Logical System E.

```
user@host:C> ping 10.10.10.14 source 192.168.40.4
```

```
PING 10.10.10.14 (10.10.10.14): 56 data bytes
64 bytes from 10.10.10.14: icmp_seq=0 ttl=63 time=1.262 ms
64 bytes from 10.10.10.14: icmp_seq=1 ttl=63 time=1.202 ms
^C
--- 10.10.10.14 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.202/1.232/1.262/0.030 ms
```

```
user@host:E> ping 10.10.10.9 source 192.168.6.7
```

```
PING 10.10.10.9 (10.10.10.9): 56 data bytes
64 bytes from 10.10.10.9: icmp_seq=0 ttl=63 time=1.255 ms
64 bytes from 10.10.10.9: icmp_seq=1 ttl=63 time=1.158 ms
^C
--- 10.10.10.9 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.158/1.206/1.255/0.049 ms
```

**Meaning** The static routes are working if the pings work.

### **Verifying the BGP Sessions Are Established**

**Purpose** Verify that the BGP sessions are up.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@host:C> show bgp summary
```

```
Groups: 1 Peers: 1 Down peers: 0
```

```

Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 2 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.6.7 18 147 147 0 1 1:04:27
0/2/2/0 0/0/0/0

```

```
user@host:E> show bgp summary
```

```

Groups: 1 Peers: 1 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 2 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.40.4 17 202 202 0 1 1:02:18
0/2/2/0 0/0/0/0

```

**Meaning** The output shows that both devices have one peer each. No peers are down.

### Viewing Advertised Routes

**Purpose** Checking to make sure that routes are being advertised by BGP.

**Action** From operational mode, enter the `show route advertising-protocol bgp neighbor` command.

```
user@host:C> show route advertising-protocol bgp 192.168.6.7
```

```

inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
 Prefix Nexthop MED Lclpref AS path
* 10.10.10.14/32 Self 0
* 192.168.6.7/32 Self 0

```

```
user@host:E> show route advertising-protocol bgp 192.168.40.4
```

```

inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
 Prefix Nexthop MED Lclpref AS path
* 10.10.10.8/30 Self 0
* 192.168.40.4/32 Self 0

```

**Meaning** The `send-static` routing policy is exporting the static routes from the routing table into BGP. BGP is advertising these routes between the peers because the BGP peer session is established.

### Example: Configuring RSVP-Signaled Point-to-Multipoint LSPs on Logical Systems

- [Point-to-Multipoint LSPs Overview on page 3407](#)
- [Example: Configuring an RSVP-Signaled Point-to-Multipoint LSP on Logical Systems on page 3409](#)

### Point-to-Multipoint LSPs Overview

A point-to-multipoint MPLS LSP is an LSP with a single source and multiple destinations. By taking advantage of the MPLS packet replication capability of the network,

point-to-multipoint LSPs avoid unnecessary packet replication at the ingress router. Packet replication takes place only when packets are forwarded to two or more different destinations requiring different network paths.

This process is illustrated in [Figure 73 on page 3408](#). Router PE1 is configured with a point-to-multipoint LSP to Routers PE2, PE3, and PE4. When Router PE1 sends a packet on the point-to-multipoint LSP to Routers P1 and P2, Router P1 replicates the packet and forwards it to Routers PE2 and PE3. Router P2 sends the packet to Router PE4.

This feature is described in detail in the Internet drafts [draft-raggarwa-mpls-p2mp-te-02.txt](#) (expired February 2004), *Establishing Point to Multipoint MPLS TE LSPs*, [draft-ietf-mpls-rsvp-te-p2mp-02.txt](#), *Extensions to Resource Reservation Protocol-Traffic Engineering (RSVP-TE) for Point-to-Multipoint TE Label-Switched Paths (LSPs)*, and [draft-ietf-mpls-ldp-p2mp-10.txt](#), *Label Distribution Protocol Extensions for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths*.

**Figure 73: Point-to-Multipoint LSPs**

The following are some of the properties of point-to-multipoint LSPs:

- A point-to-multipoint LSP enables you to use MPLS for point-to-multipoint data distribution. This functionality is similar to that provided by IP multicast.
- You can add and remove branch LSPs from a main point-to-multipoint LSP without disrupting traffic. The unaffected parts of the point-to-multipoint LSP continue to function normally.

- You can configure a node to be both a transit and an egress router for different branch LSPs of the same point-to-multipoint LSP.
- You can enable link protection on a point-to-multipoint LSP. Link protection can provide a bypass LSP for each of the branch LSPs that make up the point-to-multipoint LSP. If any of the primary paths fail, traffic can be quickly switched to the bypass.
- You can configure branch LSPs either statically, dynamically, or as a combination of static and dynamic LSPs.
- You can enable graceful Routing Engine switchover (GRES) and graceful restart for point-to-multipoint LSPs at ingress and egress routers. The point-to-multipoint LSPs must be configured using either static routes or circuit cross-connect (CCC). GRES and graceful restart allow the traffic to be forwarded at the Packet Forwarding Engine based on the old state while the control plane recovers. Feature parity for GRES and graceful restart for MPLS point-to-multipoint LSPs on the Junos Trio chipset is supported in Junos OS Releases 11.1R2, 11.2R2, and 11.4.

***Example: Configuring an RSVP-Signaled Point-to-Multipoint LSP on Logical Systems***

In this example, multiple logical systems in a physical routing device act as a collection of paths for an RSVP-signaled point-to-multipoint LSP. The logical systems are chained together and connected internally over a series of logical tunnel (**lt**) interfaces.

- [Requirements on page 3409](#)
- [Overview on page 3410](#)
- [Configuration on page 3411](#)
- [Verification on page 3429](#)

***Requirements***

This example uses the following hardware and software components:

- One MX Series router running logical systems. You do not need to use an MX Series router for the logical systems. You can use any Juniper Networks router that supports logical systems.
- On the MX Series router, the logical systems are connected using logical tunnel (**lt**) interfaces. For more information, see [“Example: Connecting Logical Systems Within the Same Router Using Logical Tunnel Interfaces on MX Series Routers” on page 3283](#) and [“Example: Connecting Logical Systems Within the Same Device Using Logical Tunnel Interfaces on MX Series Routers and EX Series Switches” on page 3279](#). An alternative to using **lt** interfaces is to create external back-to-back interconnections between ports on the router.
- Four customer-edge (CE) devices running in separate physical devices. You do not need to use routers for the CE devices. For example, the CE devices can be EX Series Ethernet Switches.
- Junos OS Release 12.1 or later running on the MX Series router.

On M Series Multiservice Edge and T Series Core Routers, you can create an **lt** interface if you have a Tunnel Services PIC installed on an Enhanced FPC in your routing platform.

On M40e routers, you can create an **lt** interface if you have a Tunnel Services PIC. (An Enhanced FPC is not required.)

On an M7i router, **lt** interfaces can be created by using the integrated Adaptive Services Module.

On an MX Series router, as is shown in this example, the master administrator can configure **lt** interfaces by including the **tunnel-services** statement at the **[edit chassis fpc slot-number pic number]** hierarchy level.

### **Overview**

In this example, the logical systems serve as the transit, branch, and leaf nodes of a single point-to-multipoint LSP. Logical system LS1 is the ingress node. The branches go from LS1 to LS5, LS1 to LS7, and LS1 to LS4. Static unicast routes on the ingress node (LS1) point to the egress nodes.

The following topologies are supported:

- A single logical system in a physical router. The logical system is one node in an RSVP-signaled point-to-multipoint LSP.
- Multiple logical systems in a physical router, with each logical system acting as a label-switched router (LSR). The multiple logical systems can be unconnected, connected to each other internally with **lt** interfaces, or connected to each other externally with back-to-back connections.
- One RSVP-signaled point-to-multipoint LSP, with some nodes being logical systems and other nodes being physical routers.

### **Topology Diagram**

[Figure 74 on page 3411](#) shows the topology used in this example.

Figure 74: RSVP-Signaled Point-to-Multipoint LSP on Logical Systems

### Configuring the MX Series Router to Support Logical Tunnel Interfaces

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

This procedure is required for MX Series routers only. If you have an M Series or T Series router, skip this procedure.

To enable **lt** interfaces on the MX Series router:

1. Run the **show chassis fpc** command to verify that the router has a DPC, MPC, or MIC installed and is in the online state.

```
user@host> show chassis fpc
```

| Slot | State  | Temp (C) | CPU Total | Utilization (%) Interrupt | Memory DRAM (MB) | Utilization (%) Heap | Utilization (%) Buffer |
|------|--------|----------|-----------|---------------------------|------------------|----------------------|------------------------|
| 0    | Empty  |          |           |                           |                  |                      |                        |
| 1    | Empty  |          |           |                           |                  |                      |                        |
| 2    | Online | 31       | 3         | 0                         | 1024             | 14                   | 21                     |

This output shows that slot 0 and slot 1 are empty. Slot 2 is online.

2. Configure FPC slot 2 to support **lt** interfaces.

[edit]

```
user@host# set chassis fpc 2 pic 0 tunnel-services bandwidth 1g
```

This command creates several tunnel interface types, including **gr**, **ip**, and **lt**. For this example, the important one is the **lt** interface.

3. Commit the configuration.

[edit]

```
user@host# commit
```

```
user@host# exit
```

4. Run the **show interfaces terse** command to verify that the router has an **lt** interface.

```
user@host> show interfaces terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| ...       |       |      |       |       |        |
| gr-2/0/10 | up    | up   |       |       |        |
| ip-2/0/10 | up    | up   |       |       |        |
| lt-2/0/10 | up    | up   |       |       |        |
| ...       |       |      |       |       |        |

### Configuring the Ingress LSR (Logical System LS1)

#### Step-by-Step Procedure

To configure Logical System LS1:

1. From the main router, configure the logical system.

[edit]

```
user@R1# set logical-systems LS1
```

2. Commit the configuration.

[edit]

```
user@R1# commit
user@R1# exit
```

3. Set the CLI to view the logical system.

```
user@R1> set cli logical-system LS1
Logical system: LS1
```

```
user@R1:LS1>
```

4. Configure the interfaces, interface encapsulation, and protocol families.

```
[edit]
user@R1:LS1# edit interfaces
[edit interfaces]
user@R1:LS1# set ge-2/0/2 unit 0 description R1-to-CE1
user@R1:LS1# set ge-2/0/2 unit 0 family inet address 10.0.244.10/30
user@R1:LS1# set lt-2/0/10 unit 1 description LS1-to-LS2
user@R1:LS1# set lt-2/0/10 unit 1 encapsulation ethernet
user@R1:LS1# set lt-2/0/10 unit 1 peer-unit 2
user@R1:LS1# set lt-2/0/10 unit 1 family inet address 2.2.2.1/24
user@R1:LS1# set lt-2/0/10 unit 1 family mpls
user@R1:LS1# set lt-2/0/10 unit 8 description LS1-to-LS6
user@R1:LS1# set lt-2/0/10 unit 8 encapsulation ethernet
user@R1:LS1# set lt-2/0/10 unit 8 peer-unit 6
user@R1:LS1# set lt-2/0/10 unit 8 family inet address 6.6.6.1/24
user@R1:LS1# set lt-2/0/10 unit 8 family mpls
user@R1:LS1# set lt-2/0/10 unit 9 description LS1-to-LS3
user@R1:LS1# set lt-2/0/10 unit 9 encapsulation ethernet
user@R1:LS1# set lt-2/0/10 unit 9 peer-unit 3
user@R1:LS1# set lt-2/0/10 unit 9 family inet address 3.3.3.1/24
user@R1:LS1# set lt-2/0/10 unit 9 family mpls
user@R1:LS1# set lo0 unit 1 family inet address 100.10.10.10/32
user@R1:LS1# exit
```

5. Enable RSVP, MPLS, and OSPF on the interfaces.

```
[edit]
user@R1:LS1# edit protocols
[edit protocols]
user@R1:LS1# set rsvp interface lt-2/0/10.1
user@R1:LS1# set rsvp interface lt-2/0/10.8
user@R1:LS1# set rsvp interface lt-2/0/10.9
user@R1:LS1# set rsvp interface lo0.1
user@R1:LS1# set mpls interface lt-2/0/10.1
user@R1:LS1# set mpls interface lt-2/0/10.8
user@R1:LS1# set mpls interface lt-2/0/10.9
user@R1:LS1# set mpls interface lo0.1
user@R1:LS1# set ospf area 0.0.0.0 interface ge-2/0/2.0
user@R1:LS1# set ospf area 0.0.0.0 interface lt-2/0/10.1
user@R1:LS1# set ospf area 0.0.0.0 interface lt-2/0/10.8
user@R1:LS1# set ospf area 0.0.0.0 interface lt-2/0/10.9
user@R1:LS1# set ospf area 0.0.0.0 interface lo0.1
```

6. Configure the MPLS point-to-multipoint LSPs.

```
[edit protocols]
user@R1:LS1# set mpls label-switched-path LS1-LS5 to 100.50.50.50
user@R1:LS1# set mpls label-switched-path LS1-LS5 p2mp p2mp1
```

```

user@R1:LS1# set mpls label-switched-path LS1-LS7 to 100.70.70.70
user@R1:LS1# set mpls label-switched-path LS1-LS7 p2mp p2mp1
user@R1:LS1# set mpls label-switched-path LS1-LS4 to 100.40.40.40
user@R1:LS1# set mpls label-switched-path LS1-LS4 p2mp p2mp1

```

7. Enable MPLS to perform traffic engineering for OSPF.

```

[edit protocols]
user@R1:LS1# set mpls traffic-engineering bgp-igp
user@R1:LS1# exit

```

This causes the ingress routes to be installed in the `inet.0` routing table. By default, MPLS performs traffic engineering for BGP only. You need to enable MPLS traffic engineering on the ingress LSR only.

8. Enable traffic engineering for OSPF.

```

[edit protocols]
user@R1:LS1# set ospf traffic-engineering
user@R1:LS1# exit

```

This causes the shortest-path first (SPF) algorithm to take into account the LSPs configured under MPLS.

9. Configure the router ID.

```

[edit]
user@R1:LS1# edit routing-options
[edit routing-options]
user@R1:LS1# set router-id 100.10.10.10

```

10. Configure static IP unicast routes with the point-to-multipoint LSP name as the next hop for each route.

```

[edit routing-options]
user@R1:LS1# set static route 5.5.5.0/24 p2mp-lsp-next-hop p2mp1
user@R1:LS1# set static route 7.7.7.0/24 p2mp-lsp-next-hop p2mp1
user@R1:LS1# set static route 4.4.4.0/24 p2mp-lsp-next-hop p2mp1
user@R1:LS1# exit

```

11. If you are done configuring the device, commit the configuration.

```

[edit]
user@R1:LS1# commit

```

### *Configuring the Transit and Egress LSRs (Logical Systems LS2, LS3, LS4, LS5, LS6, and LS7)*

#### **Step-by-Step Procedure**

To configure the transit and egress LSRs:

1. Configure the interfaces, interface encapsulation, and protocol families.

```

[edit]
user@R1# edit logical-systems
[edit logical-systems]
user@R1# set LS2 interfaces lt-2/0/10 unit 2 description LS2-to-LS1
user@R1# set LS2 interfaces lt-2/0/10 unit 2 encapsulation ethernet
user@R1# set LS2 interfaces lt-2/0/10 unit 2 peer-unit 1
user@R1# set LS2 interfaces lt-2/0/10 unit 2 family inet address 2.2.2.2/24

```

```
user@R1# set LS2 interfaces lt-2/0/10 unit 2 family mpls
user@R1# set LS2 interfaces lt-2/0/10 unit 10 description LS2-to-LS5
user@R1# set LS2 interfaces lt-2/0/10 unit 10 encapsulation ethernet
user@R1# set LS2 interfaces lt-2/0/10 unit 10 peer-unit 5

```

3. Enable traffic engineering for OSPF.

```
[edit logical-systems]
user@R1# set LS2 protocols ospf traffic-engineering
user@R1# set LS3 protocols ospf traffic-engineering
user@R1# set LS4 protocols ospf traffic-engineering
user@R1# set LS5 protocols ospf traffic-engineering
user@R1# set LS6 protocols ospf traffic-engineering
user@R1# set LS7 protocols ospf traffic-engineering
```

This causes the SPF algorithm to take into account the LSPs configured under MPLS.

4. Configure the router IDs.

```
[edit logical-systems]
user@R1# set LS2 routing-options router-id 100.20.20.20
user@R1# set LS3 routing-options router-id 100.30.30.30
user@R1# set LS4 routing-options router-id 100.40.40.40
user@R1# set LS5 routing-options router-id 100.50.50.50
user@R1# set LS6 routing-options router-id 100.60.60.60
user@R1# set LS7 routing-options router-id 100.70.70.70
```

5. If you are done configuring the device, commit the configuration.

```
[edit logical-systems]
user@R1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show logical-systems

### *Configuring Device CE1*

#### **Step-by-Step Procedure**

To configure Device CE1:

1. Configure an interface to Logical System LS1.

```
[edit]
user@CE1# edit interfaces
[edit interfaces]
user@CE1# set ge-1/3/2 unit 0 family inet address 10.0.244.9/30
user@CE1# set ge-1/3/2 unit 0 description CE1-to-LS1
user@CE1# exit
```

2. Configure static routes from Device CE1 to the three other customer networks, with Logical System LS1 as the next hop.

```
[edit]
user@CE1# edit routing-options
[edit routing-options]
set static route 10.0.104.8/30 next-hop 10.0.244.10
set static route 10.0.134.8/30 next-hop 10.0.244.10
set static route 10.0.224.8/30 next-hop 10.0.244.10
user@CE1# exit
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@CE1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@CE1# show interfaces
interfaces {
 ge-1/3/2 {
 unit 0 {
 family inet {
 address 10.0.244.9/30;
 description CE1-to-LS1;
 }
 }
 }
}

user@CE1# show routing-options
routing-options {
 static {
 route 10.0.104.8/30 next-hop 10.0.244.10;
 route 10.0.134.8/30 next-hop 10.0.244.10;
 route 10.0.224.8/30 next-hop 10.0.244.10;
 }
}
```

**Configuring Device CE2****Step-by-Step Procedure**

To configure Device CE2:

1. Configure an interface to Logical System LS5.

```
[edit]
user@CE2# edit interfaces
[edit interfaces]
user@CE2# set ge-1/3/3 unit 0 family inet address 10.0.224.9/30
user@CE2# set ge-1/3/3 unit 0 description CE2-to-LS5
user@CE2# exit
```

2. Configure a static route from Device CE2 to CE1, with Logical System LS5 as the next hop.

```
[edit]
user@CE2# edit routing-options
[edit routing-options]
user@CE2# set static route 10.0.244.8/30 next-hop 10.0.224.10
user@CE2# exit
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@CE2# commit
```

**Results**

From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@CE2# show interfaces
interfaces {
 ge-1/3/3 {
 unit 0 {
 family inet {
 address 10.0.224.9/30;
 description CE2-to-LS5;
 }
 }
 }
}

user@CE2# show routing-options
routing-options {
 static {
 route 10.0.244.8/30 next-hop 10.0.224.10;
 }
}
```

**Configuring Device CE3****Step-by-Step Procedure**

To configure Device CE3:

1. Configure an interface to Logical System LS7.

```
[edit]
```

```
user@CE3# edit interfaces
[edit interfaces]
user@CE3# set ge-2/0/1 unit 0 family inet address 10.0.134.9/30
user@CE3# set ge-2/0/1 unit 0 description CE3-to-LS7
user@CE3# exit
```

2. Configure a static route from Device CE3 to CE1, with Logical System LS7 as the next hop.

```
[edit]
user@CE3# edit routing-options
[edit routing-options]
user@CE3# set static route 10.0.244.8/30 next-hop 10.0.134.10
user@CE3# exit
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@CE3# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@CE3# show interfaces
interfaces {
 ge-2/0/1 {
 unit 0 {
 family inet {
 address 10.0.134.9/30;
 description CE3-to-LS7;
 }
 }
 }
}

user@CE3# show routing-options
routing-options {
 static {
 route 10.0.244.8/30 next-hop 10.0.134.10;
 }
}
```

#### *Configuring Device CE4*

**Step-by-Step Procedure** To configure Device CE4:

1. Configure an interface to Logical System LS4.

```
[edit]
user@CE4# edit interfaces
[edit interfaces]
user@CE4# set ge-3/1/3 unit 0 family inet address 10.0.104.10/30
user@CE4# set ge-3/1/3 unit 0 description CE4-to-LS4
```

2. Configure a static route from Device CE4 to CE1, with Logical System LS4 as the next hop.

```
[edit]
user@CE4# edit routing-options
[edit routing-options]
user@CE4# set static route 10.0.244.8/30 next-hop 10.0.104.9
user@CE4# exit
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@CE4# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@CE4# show interfaces
interfaces {
 ge-3/1/3 {
 unit 0 {
 family inet {
 address 10.0.104.10/30;
 description CE4-to-LS4;
 }
 }
 }
}

user@CE4# show routing-options
routing-options {
 static {
 route 10.0.244.8/30 next-hop 10.0.104.9;
 }
}
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Connectivity on page 3429](#)
- [Verifying the State of the Point-to-Multipoint LSP on page 3430](#)
- [Checking the Forwarding Table on page 3431](#)

### **Verifying Connectivity**

**Purpose** Make sure that the devices can ping each other.

**Action** Run the **ping** command from CE1 to the interface on CE2 connecting to LS5.

```
user@CE1> ping 10.0.224.9
PING 10.0.224.9 (10.0.224.9): 56 data bytes
64 bytes from 10.0.224.9: icmp_seq=0 ttl=61 time=1.387 ms
64 bytes from 10.0.224.9: icmp_seq=1 ttl=61 time=1.394 ms
64 bytes from 10.0.224.9: icmp_seq=2 ttl=61 time=1.506 ms
^C
--- 10.0.224.9 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.387/1.429/1.506/0.055 ms
```

Run the **ping** command from CE1 to the interface on CE3 connecting to LS7.

```
user@CE1> ping 10.0.134.9
PING 10.0.134.9 (10.0.134.9): 56 data bytes
64 bytes from 10.0.134.9: icmp_seq=0 ttl=61 time=1.068 ms

#### *Verifying the State of the Point-to-Multipoint LSP*

**Purpose** Make sure that the ingress, transit, and egress LSRs are in the Up state.

.....  
**NOTE:** For this example, the **show rsvp session** command displays the same output as the **show mpls lsp p2mp** command.  
.....

**Action** Run the `show mpls lsp p2mp` command on all of the LSRs. Only the ingress LSR is shown here.

```
user@R1> set cli logical-system LS1
Logical system: LS1

user@R1:LS1> show mpls lsp p2mp
Ingress LSP: 1 sessions
P2MP name: p2mp1, P2MP branch count: 3
To From State Rt P ActivePath LSPname
100.40.40.40 100.10.10.10 Up 0 * LS1-LS4
100.70.70.70 100.10.10.10 Up 0 * LS1-LS7
100.50.50.50 100.10.10.10 Up 0 * LS1-LS5
Total 3 displayed, Up 3, Down 0
...
```

### Checking the Forwarding Table

**Purpose** Make sure that the routes are set up as expected by running the `show route forwarding-table` command. Only the routes to the remote customer networks are shown here.

**Action**

```
user@R1:LS1> show route forwarding-table
Routing table: default.inet
Internet:
Destination Type RtRef Next hop Type Index NhRef Netif

### Example: Configuring VPNs and VPLS on Logical Systems

- [Layer 3 VPN Introduction on page 3431](#)
- [Introduction to VPLS on page 3432](#)
- [Example: Using Logical Systems to Configure Provider Edge and Provider Routers in a Layer 3 VPN and VPLS Scenario on page 3432](#)

#### Layer 3 VPN Introduction

In Junos OS, Layer 3 VPNs are based on RFC 4364. RFC 4364 defines a mechanism by which service providers can use their IP backbones to provide VPN services to their customers. A Layer 3 VPN is a set of sites that share common routing information and whose connectivity is controlled by a collection of policies. The sites that make up a Layer 3 VPN are connected over a provider's existing public Internet backbone.

RFC 4364 VPNs are also known as BGP/MPLS VPNs because BGP is used to distribute VPN routing information across the provider's backbone, and MPLS is used to forward VPN traffic across the backbone to remote VPN sites.

Customer networks, because they are private, can use either public addresses or private addresses, as defined in RFC 1918, *Address Allocation for Private Internets*. When customer networks that use private addresses connect to the public Internet infrastructure, the

private addresses might overlap with the same private addresses used by other network users. MPLS/BGP VPNs solve this problem by adding a VPN identifier prefix to each address from a particular VPN site, thereby creating an address that is unique both within the VPN and within the public Internet. In addition, each VPN has its own VPN-specific routing table that contains the routing information for that VPN only.

### ***Introduction to VPLS***

VPLS is an Ethernet-based point-to-multipoint Layer 2 VPN. It allows you to connect geographically dispersed Ethernet local area networks (LAN) sites to each other across an MPLS backbone. For customers who implement VPLS, all sites appear to be in the same Ethernet LAN even though traffic travels across the service provider's network.

VPLS, in its implementation and configuration, has much in common with a Layer 2 VPN. In VPLS, a packet originating within a service provider customer's network is sent first to a customer edge (CE) device (for example, a router or Ethernet switch). It is then sent to a provider edge (PE) router within the service provider's network. The packet traverses the service provider's network over a MPLS label-switched path (LSP). It arrives at the egress PE router, which then forwards the traffic to the CE device at the destination customer site.

**NOTE:** In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

---

The difference is that for VPLS, packets can traverse the service provider's network in point-to-multipoint fashion, meaning that a packet originating from a CE device can be broadcast to all the PE routers participating in a VPLS routing instance. In contrast, a Layer 2 VPN forwards packets in point-to-point fashion only.

The paths carrying VPLS traffic between each PE router participating in a routing instance are called pseudowires. The pseudowires are signaled using either BGP or LDP.

### ***Example: Using Logical Systems to Configure Provider Edge and Provider Routers in a Layer 3 VPN and VPLS Scenario***

This example provides step-by-step procedures to configure provider edge (PE) and provider (P) routers in a VPN and VPLS scenario using logical systems.

- [Requirements on page 3433](#)
- [Overview on page 3433](#)
- [Configuration on page 3435](#)
- [Verification on page 3462](#)

**Requirements**

In this example, no special configuration beyond device initialization is required.

**Overview**

In this example, VPNs are used to separate customer traffic across a provider backbone.

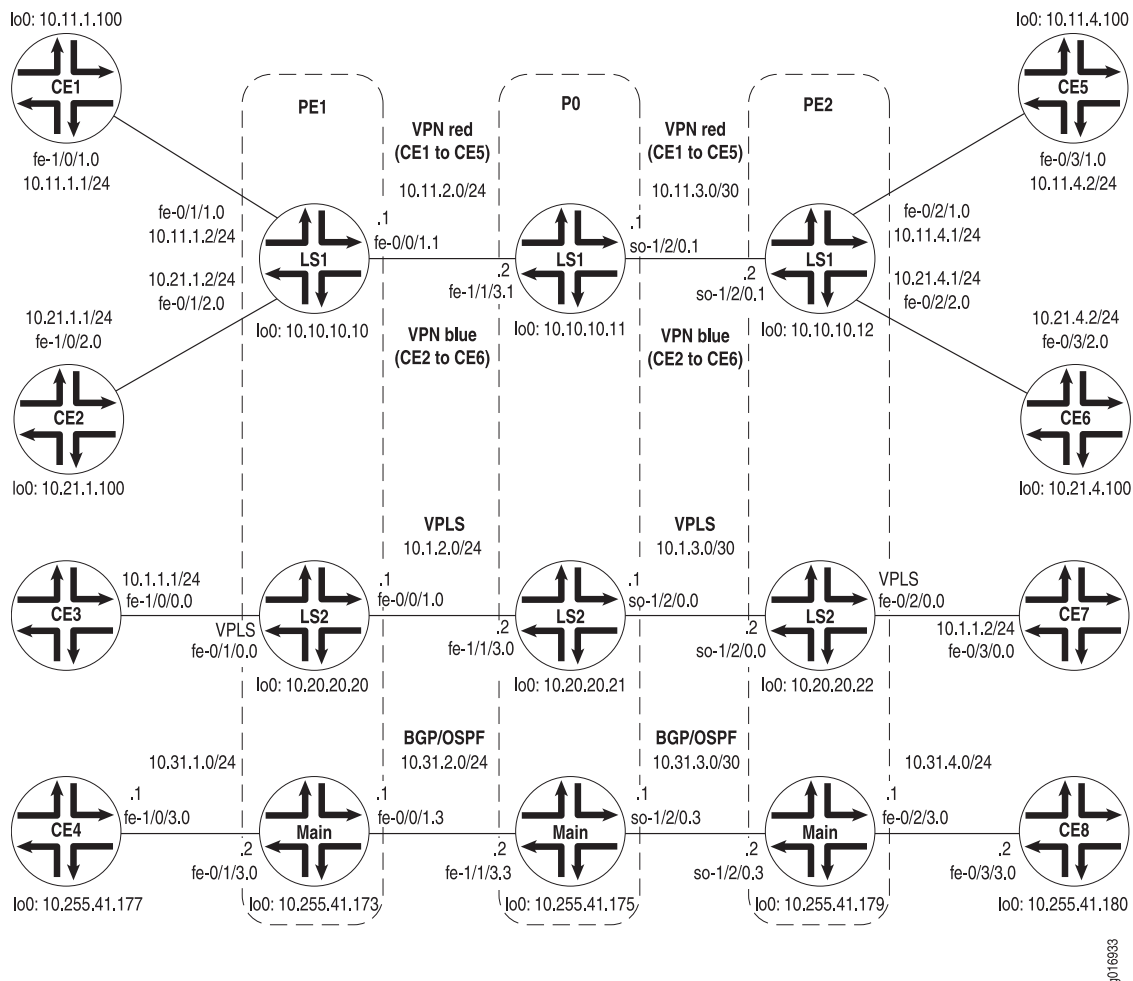

**Topology**

[Figure 75 on page 3434](#) shows four pairs of CE routers that are connected across an MPLS backbone:

- Routers CE1 and CE5 are part of the red VPN.
- Routers CE2 and CE6 are in the blue VPN.
- Routers CE3 and CE7 belong to a VPLS domain.
- Routers CE4 and CE8 are connected with standard protocols.

Two logical systems are configured on PE routers PE1 and PE2 and provider core Router P0. Each of these three routers has two logical systems: LS1 and LS2. To illustrate the concept of a logical system, both VPNs are part of Logical System LS1, the VPLS instance belongs to Logical System LS2, and the remaining routers use the main router portion of routers PE1, P0, and PE2.

### Figure 75: Provider Edge and Provider Logical System Topology Diagram

On Router PE1, two VPN routing and forwarding (VRF) routing instances are created in Logical System LS1. The routing instances are called red and blue. The example configures the customer edge (CE)-facing logical interfaces so that traffic from Router CE1 is placed in the red VPN, and traffic from Router CE2 is placed in the blue VPN. A logical interface at **fe-0/0/1.1** connects to Logical System LS1 on Router P0. A VPLS routing instance is in Logical System LS2. The logical interface is configured so that traffic from Router CE3 is sent into the VPLS domain. This logical interface connects to Logical System LS2 on Router P0. The example also contains an administrator for Logical System LS1. The logical system administrator is responsible for the maintenance of this logical system. Finally, the example shows how to configure a logical interface to interconnect Router CE4 with the main router portion of Router PE1.

Router PE2 has the two VRF routing instances in Logical System LS1: red and blue. The CE-facing logical interfaces enable traffic from Router CE5 to be placed in the red VPN, and traffic from Router CE6 in the blue VPN. One logical interface on **so-1/2/0.1** connects to Logical System LS1 on Router P0. The VPLS routing instance is configured in Logical System LS2. A logical interface enables traffic from Router CE7 to be sent into the VPLS domain and connects to Logical System LS2 on Router P0. The example shows how to

configure a logical interface to interconnect Router CE8 with the main router portion of Router P0. Finally, you can optionally create a logical system administrator that has configuration privileges for Logical System LS1 and viewing privileges for Logical System LS2.

On Router P0, the example shows how to configure Logical Systems LS1, LS2, and the main router. You must configure physical interface properties at the main router **[edit interfaces]** hierarchy level. Next, the example shows how to configure protocols (such as RSVP, MPLS, BGP, and IS-IS), routing options, and policy options for the logical systems. Last, the example shows how to configure the same administrator for Logical System LS1 that is configured on Router PE1. This system administrator for Logical System LS2 has permission to view the LS2 configuration, but not change the configuration for Logical System LS2.

Logical System LS1 transports traffic for the red VPN that exists between routers CE1 and CE5. Logical System LS1 also connects the blue VPN that exists between routers CE2 and CE6. Logical System LS2 transports VPLS traffic between routers CE3 and CE7. For the main router on Router P0, you can configure the router as usual. The main router transports traffic between routers CE4 and CE8. The example shows how to configure the interfaces and routing protocols (OSPF, BGP) to connect to the main router portion of routers PE1 and PE2.

### Configuration

To configure the PE and P routers in logical systems involves performing the following tasks:

- [Configuring Interfaces on the Customer Edge Devices on page 3435](#)
- [Configuring Router PE1 on page 3437](#)
- [Configuring Router PE2 on page 3440](#)
- [Configuring Router P0 on page 3442](#)
- [Results on page 3444](#)

### Configuring Interfaces on the Customer Edge Devices

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

1. On Router CE1, configure OSPF to connect to the red VPN in Logical System LS1 on Router PE1.
 

```

user@CE1# set interfaces fe-1/0/1 vlan-tagging
user@CE1# set interfaces fe-1/0/1 unit 0 description "routing-instance red CE"
user@CE1# set interfaces fe-1/0/1 unit 0 vlan-id 101
user@CE1# set interfaces fe-1/0/1 unit 0 family inet address 10.11.1.24
user@CE1# set interfaces lo0 unit 0 family inet address 10.11.1.100/32
user@CE1# set protocols ospf area 0.0.0.0 interface fe-1/0/1.0
user@CE1# set protocols ospf area 0.0.0.0 interface lo0.0

```
2. On Router CE2, configure BGP to connect to the blue VPN in Logical System LS1 on Router PE1.

```

user@CE2# set interfaces fe-1/0/2 vlan-tagging
user@CE2# set interfaces fe-1/0/2 unit 0 description "routing-instance blue CE"
user@CE2# set interfaces fe-1/0/2 unit 0 vlan-id 102
user@CE2# set interfaces fe-1/0/2 unit 0 family inet address 10.21.1.1/24
user@CE2# set interfaces lo0 unit 0 family inet address 10.21.1.100/32
user@CE2# set policy-options policy-statement export_loopback from route-filter
10.21.1.100/32 exact
user@CE2# set policy-options policy-statement export_loopback then accept
user@CE2# set protocols bgp export export_loopback
user@CE2# set protocols bgp group to_PE type external
user@CE2# set protocols bgp group to_PE local-address 10.21.1.1
user@CE2# set protocols bgp group to_PE peer-as 100
user@CE2# set protocols bgp group to_PE neighbor 10.21.1.2
user@CE2# set routing-options autonomous-system 200

```

3. On Router CE3, configure the Fast Ethernet interface in VLAN 600 to connect with the VPLS routing instance in Logical System LS2 on Router PE1.

```

user@CE3# set interfaces fe-1/0/0 vlan-tagging
user@CE3# set interfaces fe-1/0/0 unit 0 description "vpls interface"
user@CE3# set interfaces fe-1/0/0 unit 0 vlan-id 600
user@CE3# set interfaces fe-1/0/0 unit 0 family inet address 10.1.1.1/24

```

4. On Router CE4, configure the Fast Ethernet interface to connect with the main router at Router PE1.

```

user@CE4# set interfaces fe-1/0/3 vlan-tagging
user@CE4# set interfaces fe-1/0/3 unit 0 description "main router interface"
user@CE4# set interfaces fe-1/0/3 unit 0 vlan-id 103
user@CE4# set interfaces fe-1/0/3 unit 0 family inet address 10.31.1.1/24
user@CE4# set interfaces lo0 unit 0 family inet address 10.255.41.177/32

```

5. On Router CE5, configure OSPF to connect to the red VPN in Logical System LS1 on Router PE2.

```

user@CE5# set interfaces fe-0/3/1 vlan-tagging
user@CE5# set interfaces fe-0/3/1 unit 0 description "routing-instance red CE"
user@CE5# set interfaces fe-0/3/1 unit 0 vlan-id 101
user@CE5# set interfaces fe-0/3/1 unit 0 family inet address 10.11.4.2/24
user@CE5# set interfaces lo0 unit 0 family inet address 10.11.4.100/32
user@CE5# set protocols ospf area 0.0.0.0 interface fe-0/3/1.0
user@CE5# set protocols ospf area 0.0.0.0 interface lo0.0
user@CE5# set system login class LS1admin logical-system LS1
user@CE5# set system login class LS1admin permissions all
user@CE5# set system login class LS1onlooker logical-system LS2
user@CE5# set system login class LS1onlooker permissions view
user@CE5# set system login user LS1admin class LS1admin

```

6. On Router CE6, configure BGP to connect to the blue VPN in Logical System LS1 on Router PE2.

```

user@CE6# set interfaces fe-0/3/2 vlan-tagging
user@CE6# set interfaces fe-0/3/2 unit 0 description "routing-instance blue CE"
user@CE6# set interfaces fe-0/3/2 unit 0 vlan-id 102
user@CE6# set interfaces fe-0/3/2 unit 0 family inet address 10.21.4.2/24
user@CE6# set interfaces lo0 unit 0 family inet address 10.21.4.100/32
user@CE6# set routing-options autonomous-system 300
user@CE6# set protocols bgp export export_loopback

```

```

user@CE6# set protocols bgp group to_PE type external
user@CE6# set protocols bgp group to_PE local-address 10.21.4.2
user@CE6# set protocols bgp group to_PE peer-as 100
user@CE6# set protocols bgp group to_PE neighbor 10.21.4.1
user@CE6# set policy-options policy-statement export_loopback from route-filter
10.21.4.100/32 exact
user@CE6# set policy-options policy-statement export_loopback then accept

```

7. On Router CE7, configure the Fast Ethernet interface in VLAN 600 to connect with the VPLS routing instance in Logical System LS2 on Router PE2.

```

user@CE7# set interfaces fe-0/3/0 vlan-tagging
user@CE7# set interfaces fe-0/3/0 unit 0 description "vpls interface"
user@CE7# set interfaces fe-0/3/0 unit 0 vlan-id 600
user@CE7# set interfaces fe-0/3/0 unit 0 family inet address 10.1.1.2/24

```

8. On Router CE8, configure the Fast Ethernet interface to connect with the main router at Router PE2.

```

user@CE8# set interfaces fe-0/3/3 vlan-tagging
user@CE8# set interfaces fe-0/3/3 unit 0 description "main router interface"
user@CE8# set interfaces fe-0/3/3 unit 0 vlan-id 103
user@CE8# set interfaces fe-0/3/3 unit 0 family inet address 10.31.4.2/24
user@CE8# set interfaces lo0 unit 0 family inet address 10.255.41.180/32

```

### Configuring Router PE1

#### Step-by-Step Procedure

1. Configure the main router on Router PE1.

```

user@PE1# set interfaces fe-0/0/1 vlan-tagging
user@PE1# set interfaces fe-0/0/1 unit 3 description "main router to P0"
user@PE1# set interfaces fe-0/0/1 unit 3 vlan-id 103
user@PE1# set interfaces fe-0/0/1 unit 3 family inet address 10.31.2.1/24
user@PE1# set interfaces fe-0/0/1 unit 3 family iso
user@PE1# set interfaces fe-0/0/1 unit 3 family mpls
user@PE1# set interfaces fe-0/1/0 vlan-tagging
user@PE1# set interfaces fe-0/1/0 encapsulation vlan-vpls
user@PE1# set interfaces fe-0/1/1 vlan-tagging
user@PE1# set interfaces fe-0/1/2 vlan-tagging
user@PE1# set interfaces fe-0/1/3 vlan-tagging
user@PE1# set interfaces fe-0/1/3 unit 0 description "main router to CE4"
user@PE1# set interfaces fe-0/1/3 unit 0 vlan-id 103
user@PE1# set interfaces fe-0/1/3 unit 0 family inet address 10.31.1.2/24
user@PE1# set interfaces lo0 unit 0 description "main router loopback"
user@PE1# set interfaces lo0 unit 0 family inet address 10.255.41.173/32
user@PE1# set protocols bgp group to_main_ls type internal
user@PE1# set protocols bgp group to_main_ls local-address 10.255.41.173
user@PE1# set protocols bgp group to_main_ls export export_address
user@PE1# set protocols bgp group to_main_ls neighbor 10.255.41.179
user@PE1# set protocols bgp group to_main_ls neighbor 10.255.41.175
user@PE1# set protocols ospf area 0.0.0.0 interface lo0.0
user@PE1# set protocols ospf area 0.0.0.0 interface fe-0/0/1.3
user@PE1# set routing-options static route 10.255.41.177/32 next-hop 10.31.1.1
user@PE1# set routing-options autonomous-system 500
user@PE1# set policy-options policy-statement export_address from route-filter
10.255.41.177/32 exact
user@PE1# set policy-options policy-statement export_address then accept

```

```
user@PE1# set system login class LS1-admin logical-system LS1

### Configuring Router P0

#### Step-by-Step Procedure

1. Configure the main router on Router P0.

```

user@P0# set interfaces fe-1/1/3 vlan-tagging
user@P0# set interfaces fe-1/1/3 unit 3 description "connects to the main router on
pe1"
user@P0# set interfaces fe-1/1/3 unit 3 vlan-id 103
user@P0# set interfaces fe-1/1/3 unit 3 family inet address 10.31.2.2/24
user@P0# set interfaces fe-1/1/3 unit 3 family iso
user@P0# set interfaces fe-1/1/3 unit 3 family mpls
user@P0# set interfaces so-1/2/0 dce
user@P0# set interfaces so-1/2/0 encapsulation frame-relay
user@P0# set interfaces so-1/2/0 unit 3 description "connects to the main router
on pe2"
user@P0# set interfaces so-1/2/0 unit 3 dlci 103
user@P0# set interfaces so-1/2/0 unit 3 family inet address 10.31.3.1/24
user@P0# set interfaces so-1/2/0 unit 3 family iso
user@P0# set interfaces so-1/2/0 unit 3 family mpls
user@P0# set interfaces lo0 unit 0 description "main router loopback"
user@P0# set interfaces lo0 unit 0 family inet address 10.255.41.175/32
user@P0# set routing-options autonomous-system 500
user@P0# set protocols bgp group to_main_ls type internal

```

```

user@P0# set protocols bgp group to_main_ls local-address 10.255.41.175
user@P0# set protocols bgp group to_main_ls neighbor 10.255.41.179
user@P0# set protocols bgp group to_main_ls neighbor 10.255.41.173
user@P0# set protocols ospf area 0.0.0.0 interface lo0.0
user@P0# set protocols ospf area 0.0.0.0 interface fe-1/1/3.3
user@P0# set protocols ospf area 0.0.0.0 interface so-1/2/0.3
user@P0# set system login class LS1-admin logical-system LS1
user@P0# set system login class LS1-admin permissions all
user@P0# set system login class LS1-onlooker logical-system LS2
user@P0# set system login class LS1-onlooker permissions view
user@P0# set system login user LS1-admin class LS1-admin

```

2. Configure Logical System LS1 on Router P0.

```

user@P0# set logical-systems LS1 interfaces fe-1/1/3 unit 1 description "LS1 interface
connects to LS1 on pe1"
user@P0# set logical-systems LS1 interfaces fe-1/1/3 unit 1 vlan-id 101
user@P0# set logical-systems LS1 interfaces fe-1/1/3 unit 1 family inet address
10.11.2.2/24
user@P0# set logical-systems LS1 interfaces fe-1/1/3 unit 1 family iso
user@P0# set logical-systems LS1 interfaces fe-1/1/3 unit 1 family mpls
user@P0# set logical-systems LS1 interfaces so-1/2/0 unit 1 description "LS1
interface connects to LS1 on pe2"
user@P0# set logical-systems LS1 interfaces so-1/2/0 unit 1 dlci 101
user@P0# set logical-systems LS1 interfaces so-1/2/0 unit 1 family inet address
10.11.3.1/24
user@P0# set logical-systems LS1 interfaces so-1/2/0 unit 1 family iso
user@P0# set logical-systems LS1 interfaces so-1/2/0 unit 1 family mpls
user@P0# set logical-systems LS1 interfaces lo0 unit 1 description "LS1 loopback"
user@P0# set logical-systems LS1 interfaces lo0 unit 1 family inet address
10.10.10.11/32
user@P0# set logical-systems LS1 interfaces lo0 unit 1 family iso address
47.1111.1111.1111.1112.00
user@P0# set logical-systems LS1 protocols rsvp interface all
user@P0# set logical-systems LS1 protocols mpls interface all
user@P0# set logical-systems LS1 protocols isis interface all

```

3. Configure Logical System LS2 on Router P0.

```

user@P0# set logical-systems LS2 interfaces fe-1/1/3 unit 0 description "LS2
interface connects to LS2 on pe1"
user@P0# set logical-systems LS2 interfaces fe-1/1/3 unit 0 vlan-id 100
user@P0# set logical-systems LS2 interfaces fe-1/1/3 unit 0 family inet address
10.1.2.2/24
user@P0# set logical-systems LS2 interfaces fe-1/1/3 unit 0 family iso
user@P0# set logical-systems LS2 interfaces fe-1/1/3 unit 0 family mpls
user@P0# set logical-systems LS2 interfaces so-1/2/0 unit 0 description "LS2
interface connects to LS2 on pe2"
user@P0# set logical-systems LS2 interfaces so-1/2/0 unit 0 dlci 100
user@P0# set logical-systems LS2 interfaces so-1/2/0 unit 0 family inet address
10.1.3.1/24
user@P0# set logical-systems LS2 interfaces so-1/2/0 unit 0 family iso
user@P0# set logical-systems LS2 interfaces so-1/2/0 unit 0 family mpls
user@P0# set logical-systems LS2 interfaces lo0 unit 2 description "LS2 loopback"
user@P0# set logical-systems LS2 interfaces lo0 unit 2 family inet address
10.20.20.21/32

```

```
user@P0# set logical-systems LS2 interfaces lo0 unit 2 family iso address
47.2222.2222.2222.00
user@P0# set logical-systems LS2 protocols rsvp interface all
user@P0# set logical-systems LS2 protocols mpls interface all
user@P0# set logical-systems LS2 protocols isis interface fe-1/1/3.0
user@P0# set logical-systems LS2 protocols isis interface so-1/2/0.0
user@P0# set logical-systems LS2 protocols isis interface lo0.2
```

### Results

On Router CE1, configure OSPF to connect to the red VPN in Logical System LS1 on Router PE1:

```
Router CE1 [edit]
interfaces {
 fe-1/0/1 {
 vlan-tagging;
 unit 0 {
 description "routing-instance red CE";
 vlan-id 101;
 family inet {
 address 10.11.1.1/24;
 }
 }
 }
 lo0 {
 unit 0 {
 family inet {
 address 10.11.1.100/32;
 }
 }
 }
}
protocols {
 ospf {
 area 0.0.0.0 {
 interface fe-1/0/1.0;
 interface lo0.0;
 }
 }
}
```

On Router CE2, configure BGP to connect to the blue VPN in Logical System LS1 on Router PE1:

```
Router CE2 [edit]
interfaces {
 fe-1/0/2 {
 vlan-tagging;
 unit 0 {
 description "routing-instance blue CE";
 vlan-id 102;
 family inet {
 address 10.21.1.1/24;
 }
 }
 }
}
```

```

 }
 lo0 {
 unit 0 {
 family inet {
 address 10.21.1.100/32;
 }
 }
 }
}
routing-options {
 autonomous-system 200;
}
protocols {
 bgp {
 export export_loopback;
 group to_PE {
 type external;
 local-address 10.21.1.1;
 peer-as 100;
 neighbor 10.21.1.2;
 }
 }
}
policy-options {
 policy-statement export_loopback {
 from {
 route-filter 10.21.1.100/32 exact;
 }
 then accept;
 }
}

```

On Router CE3, configure the Fast Ethernet interface in VLAN 600 to connect with the VPLS routing instance in Logical System LS2 on Router PE1:

```

Router CE3 [edit]
interfaces {
 fe-1/0/0 {
 vlan-tagging;
 unit 0 {
 description "vpls interface";
 vlan-id 600;
 family inet {
 address 10.1.1.1/24;
 }
 }
 }
}

```

On Router CE4, configure the Fast Ethernet interface to connect with the main router at Router PE1:

```

Router CE4 [edit]
interfaces {
 fe-1/0/3 {
 vlan-tagging;
 }
}

```

```
 unit 0 {
 description "main router interface";
 vlan-id 103;
 family inet {
 address 10.31.1.1/24;
 }
 }
 }
 lo0 {
 unit 0 {
 family inet {
 address 10.255.41.177/32;
 }
 }
 }
}
```

On Router PE1, create two VPN routing and forwarding (VRF) routing instances in Logical System LS1: red and blue. Configure the CE-facing logical interfaces so that traffic from Router CE1 is placed in the red VPN, and traffic from Router CE2 is placed in the blue VPN. Next, create a logical interface at **fe-0/0/1.1** to connect to Logical System LS1 on Router P0.

Also on Router PE1, create a VPLS routing instance in Logical System LS2. Configure a logical interface so that traffic from Router CE3 is sent into the VPLS domain and connects to Logical System LS2 on Router P0.

Create an administrator for Logical System LS1. The logical system administrator can be responsible for the maintenance of this logical system.

Finally, configure a logical interface to interconnect Router CE4 with the main router portion of Router P0.

```
Router PE1 [edit]
logical-systems {
 LS1 { # The configuration for the first logical system begins here.
 interfaces {
 fe-0/0/1 {

 }
}
}

```

On Router P0, configure Logical Systems LS1, LS2, and the main router. For the logical system, you must configure physical interface properties at the main router **[edit interfaces]** hierarchy level and assign the logical interfaces to the logical systems. Next, you must configure protocols (such as RSVP, MPLS, BGP, and IS-IS), routing options, and policy options for the logical systems. Last, configure the same administrator for Logical System LS1 that you configured on Router PE1. Configure this same administrator for Logical System LS2 to have permission to view the LS2 configuration, but not change the configuration for LS2.

In this example, Logical System LS1 transports traffic for the red VPN that exists between routers CE1 and CE5. Logical System LS1 also connects the blue VPN that exists between routers CE2 and CE6. Logical System LS2 transports VPLS traffic between routers CE3 and CE7.

For the main router on Router P0, you can configure the router as usual. In this example, the main router transports traffic between routers CE4 and CE8. As a result, configure the interfaces and routing protocols (OSPF, BGP) to connect to the main router portion of routers PE1 and PE2.

```

Router P0 [edit]
logical-systems {
 LS1 { # The configuration for the first logical system begins here.

```

On Router PE2, create two VRF routing instances in Logical System LS1: red and blue. Configure the CE-facing logical interfaces so that traffic from Router CE5 is placed in the red VPN and traffic from Router CE6 is placed in the blue VPN. Next, create one logical interface on **so-1/2/0.1** to connect to Logical System LS1 on Router P0.

Also on Router PE2, create a VPLS routing instance in Logical System LS2. Configure a logical interface so that traffic from Router CE7 is sent into the VPLS domain and connects to Logical System LS2 on Router P0.

Configure a logical interface to interconnect Router CE8 with the main router portion of Router P0.

Finally, you can optionally create a logical system administrator that has configuration privileges for Logical System LS1 and viewing privileges for Logical System LS2.

```
Router PE2 [edit]
logical-systems {

 }
}
```

On Router CE5, configure OSPF to connect to the red VPN in Logical System LS1 on Router PE2:

```
Router CE5 [edit]
interfaces {
 fe-0/3/1 {
 vlan-tagging;
 unit 0 {
 description "routing-instance red CE";
 vlan-id 101;
 family inet {
 address 10.11.4.2/24;
 }
 }
 }
 lo0 {
 unit 0 {
 family inet {
 address 10.11.4.100/32;
 }
 }
 }
}
protocols {
 ospf {
 area 0.0.0.0 {
 interface fe-0/3/1.0;
 interface lo0.0;
 }
 }
}
system {
 login {
 class LS1-admin {
 permissions all;
 logical-system LS1;
 }
 class LS1-onlooker {
 permissions view;
 logical-system LS2;
 }
 }
}
```

```

 }
 user LS1-admin {
 class LS1-admin;
 }
}

```

On Router CE6, configure BGP to connect to the blue VPN in Logical System LS1 on Router PE2:

```

Router CE6 [edit]
interfaces {
 fe-0/3/2 {
 vlan-tagging;
 unit 0 {
 description "routing-instance blue CE";
 vlan-id 102;
 family inet {
 address 10.21.4.2/24;
 }
 }
 }
 lo0 {
 unit 0 {
 family inet {
 address 10.21.4.100/32;
 }
 }
 }
}
routing-options {
 autonomous-system 300;
}
protocols {
 bgp {
 export export_loopback;
 group to_PE {
 type external;
 local-address 10.21.4.2;
 peer-as 100;
 neighbor 10.21.4.1;
 }
 }
}
policy-options {
 policy-statement export_loopback {
 from {
 route-filter 10.21.4.100/32 exact;
 }
 then accept;
 }
}

```

On Router CE7, configure the Fast Ethernet interface in VLAN 600 to connect with the VPLS routing instance in Logical System LS2 on Router PE2:

```
Router CE7 [edit]
 interfaces {
 fe-0/3/0 {
 vlan-tagging;
 unit 0 {
 description "vpls interface";
 vlan-id 600;
 family inet {
 address 10.1.1.2/24;
 }
 }
 }
 }
```

On Router CE8, configure the Fast Ethernet interface to connect with the main router at Router PE2:

```
Router CE8 [edit]
 interfaces {
 fe-0/3/3 {
 vlan-tagging;
 unit 0 {
 description "main router interface";
 vlan-id 103;
 family inet {
 address 10.31.4.2/24;
 }
 }
 }
 }
 lo0 {
 unit 0 {
 family inet {
 address 10.255.41.180/32;
 }
 }
 }
 }
```

### Verification

Confirm that the configuration is working properly by running these commands:

- `show bgp summary` (logical-system *logical-system-name*)
- `show isis adjacency` (logical-system *logical-system-name*)
- `show mpls lsp` (logical-system *logical-system-name*)
- `show (ospf | ospf3) neighbor` (logical-system *logical-system-name*)
- `show route` (logical-system *logical-system-name*)
- `show route protocol` (logical-system *logical-system-name*)
- `show rsvp session` (logical-system *logical-system-name*)

The following sections show the output of commands used with the configuration example:

- [Router CE1 Status on page 3463](#)
- [Router CE2 Status on page 3463](#)
- [Router CE3 Status on page 3464](#)

#### ***Router CE7 Status***

**Purpose** Verify connectivity.

**Action** user@CE7> show route table

```
inet.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.0/24 *[Direct/0] 00:21:03
 > via fe-0/3/0.0
10.1.1.2/32 *[Local/0] 00:21:15
 Local via fe-0/3/0.0
```

### *Logical System Administrator Verification Output*

**Purpose** Because logical system administrators only have access to the configuration information of the logical systems to which they are assigned, the verification output is limited to these logical systems as well. The following output shows what the logical system administrator **LS1-admin** in this example configuration would see.

To verify that each pair of CE routers has end-to-end connectivity, issue the **ping** command on Routers CE1, CE2, and CE3:

**Action** From CE1, ping CE5 (the Red VPN).

From CE2, ping CE6 (the Blue VPN).

From CE3, ping CE7 (the VPLS).

```
user@CE1> ping 10.11.4.100
PING 10.11.4.100 (10.11.4.100): 56 data bytes
64 bytes from 10.11.4.100: icmp_seq=0 ttl=252 time=1.216 ms
64 bytes from 10.11.4.100: icmp_seq=1 ttl=252 time=1.052 ms
^C
--- 10.11.4.100 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.052/1.134/1.216/0.082 ms
```

```
user@CE2> ping 10.21.4.100
PING 10.21.4.100 (10.21.4.100): 56 data bytes
64 bytes from 10.21.4.100: icmp_seq=0 ttl=252 time=1.205 ms
64 bytes from 10.21.4.100: icmp_seq=1 ttl=252 time=1.021 ms
^C
--- 10.21.4.100 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.021/1.113/1.205/0.092 ms
```

```
user@CE3> ping 10.1.1.2
PING 10.1.1.2 (10.1.1.2): 56 data bytes
64 bytes from 10.1.1.2: icmp_seq=0 ttl=255 time=1.186 ms
64 bytes from 10.1.1.2: icmp_seq=1 ttl=255 time=1.091 ms
64 bytes from 10.1.1.2: icmp_seq=2 ttl=255 time=1.081 ms
^C
--- 10.1.1.2 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.081/1.119/1.186/0.047 ms
```

### **Example: Configuring a Virtualized Data Center**

---

- [Two-Tiered Virtualized Data Center Solution for Large Enterprise Networks on page 3478](#)
- [Requirements of a Two-Tiered Virtualized Data Center for Large Enterprise Networks on page 3479](#)
- [Example: Configuring a Two-Tiered Virtualized Data Center for Large Enterprise Networks on page 3481](#)

#### ***Two-Tiered Virtualized Data Center Solution for Large Enterprise Networks***

The following describes a Juniper Networks two-tiered, high-speed, multiservice virtualized data center (VDC). A two-tiered architecture meets the low latency requirements of a virtualized server environment and supports the overlying security mandate to maintain controlled segmentation between various business units.

#### ***Network Traffic Segmentation***

Juniper Networks VDC design uses virtualization technologies such as virtual LANs (VLANs), virtual routers, virtual route forwarders, inter-virtual route forwarding, and logical systems to provide flexible traffic isolation.

A fully redundant two-tiered data center design consists of Juniper Networks EX Series Ethernet Switches at the access layer for server connectivity, MX Series 3D Universal Edge Routers as a collapsed LAN aggregation/core layer, and clustered SRX Series Services Gateways to provide firewall security services across the data center trust boundaries.

#### ***Flexibility***

The Juniper Networks VDC design uses 802.1Q VLANs, MPLS, BGP, Virtual Router Redundancy Protocol (VRRP), Traffic Engineering, and Fast Reroute to provide design flexibility while maintaining a standards-based approach. The design can also support a virtual private LAN service (VPLS).

#### ***Security***

The Juniper Networks VDC design uses security zones to implement the policy enforcement points. The SRX cluster is responsible for all stateful packet inspection for traffic that crosses business unit trust boundaries as well as all ingress and egress traffic for the data center.

The Juniper Networks Junos operating system is configured with different administrator accounts for each logical system that supports confined access to network resources and can be customized for individual business units.

#### ***Access and Availability***

In the Juniper Networks VDC design, described in [“Example: Configuring a Two-Tiered Virtualized Data Center for Large Enterprise Networks” on page 3481](#), top-of-rack (TOR) EX Series switches provide access to the servers and provide redundancy.

All uplinks from the TOR switches are 802.1Q trunk links that are terminated directly into each of the MX Series devices that make up the Point of Delivery (POD) at the aggregation/core layer.

A VRRP instance is defined on each VLAN within the MX Series device to act as the default router for all server hosts in a given VLAN. To allow for VRRP to work properly, each bridge domain is extended between each MX Series device through an interconnection link. The MX Series device uses an integrated routing and bridging (IRB) interface as the Layer 3 interface for each bridge domain, with VRRP configured for redundancy.

A pair of 802.3ad aggregated Ethernet bundles are used between the MX Series devices. Each MX Series device is divided into a number of Logical Systems. Logical systems in the MX Series device are used to define logical trust boundaries within the data center itself and between respective business units.

A clustered pair of SRX Series devices acting as firewalls provide security services across the data center trust boundaries. Virtual routers on the SRX Series devices act as customer edge (CE) routers for each business unit.

A single redundancy group for the data plane is defined on the SRX Series Services Gateways with two redundant Ethernet interfaces as member interfaces. This redundancy group handles the data plane failover of the SRX Series firewall and is configured such that any loss of either northbound or southbound SRX Series interfaces forces a full failover to the secondary node. This failover is essentially a Layer 1 failover, which means that it occurs quickly and does not disrupt the routing topology above it.

### ***Cost-Effective Incremental Scaling***

The Juniper Networks VDC design supports incremental scaling of the network. This allows the VDC to be created with minimum cost to meet the current need.

The access layer can be expanded by adding EX Series switches at the top of rack.

The aggregation/core layer can be expanded by adding additional MX Series devices within a given POD.

The security services can be expanded by adding 4-port 10-Gigabit Ethernet I/O cards (IOCs) and services processing cards (SPCs) in the SRX Series devices. The addition of IOCs increases the 10-Gigabit Ethernet port density. The addition of each SPC card to the chassis adds another 10 Gbps (5 Gbps Internet mix (IMIX)), 2 million sessions, and 100,000 connections per second (CPS) up to a maximum rated capacity for the platform of 150 Gbps (47.5 Gbps IMIX), 10 million sessions, and 350,000 CPS (as measured in Junos OS Release 10.2).

### ***Orchestration and Automation***

The Juniper Networks VDC design uses the Juniper Networks Junos Space management platform. Junos Space includes a portfolio of applications for scaling services, simplifying network operations, and automating support for complex network environments.

In addition, the network devices are configured to support background Secure Copy Protocol (SCP) file transfers, commit scripts, and a file archive site.

### ***Requirements of a Two-Tiered Virtualized Data Center for Large Enterprise Networks***

Large enterprises have certain specific needs for the hosting environment that the design of their data center must meet. This section describes the requirements of a company that operates as a service provider to its individual business units (BUs).

One of the primary requirements of a virtualized data center (VDC) for a large enterprise is the ability to segment the network by business unit. This includes traffic segmentation and administrative control segmentation.

Other requirements include security controls between business units, security controls between the company and the outside world, flexibility to grow and adapt the network, and a robust and cost-effective way to manage the entire network.

### ***Network Traffic Segmentation***

The requirement described here is for network resources to be isolated in several ways. Traffic must be segmented by business units. Traffic flows between network segments must be prohibited except where specifically allowed. Traffic isolation must be controlled at designated policy enforcement points. Network resources must be dedicated to a segment, but the network must have the flexibility to change the allocation of resources.

Segmented resources must be logically grouped according to policies. For example, test traffic must be isolated from production traffic. Traffic must also be isolated according to business entities, contractual requirements, legal or regulatory requirements, risk rating, and corporate standards.

The network segmentation design must not be disruptive to the business, must be integrated with the larger data center and cloud network design, must allow business units to access network resources globally, and must support new business capabilities.

### ***Flexibility***

The network design must be flexible enough to react to business and environment changes with minimal design and re-engineering efforts. The VDC design must be flexible in terms of isolating business unit workloads from other business units and general data center services and applications. The network solution must ensure that the business is minimally impacted when network and segmentation changes take place.

The VDC must be flexible enough to be implemented:

- Within a single data center
- Within a data hall
- Across two or more data centers
- Across two or more data halls within or between data centers
- Between a data center and an external cloud service provider

### ***Security***

The network design must allow business units to be isolated within the hosting environment. In the event of a network security incident, business units must be isolated from the hosting environment and other business units.

Traffic flow between business unit segments must be denied by default and must be explicitly permitted only at policy enforcement points owned and controlled by the data center service provider.

The policy enforcement point must include access control capabilities and might include threat protection capabilities.

#### ***Access and Availability***

The VDC must provide access to common data center services such as computation, storage, security, traffic management, operations, and applications. The network must operate across multiple global service providers and must deliver optimal, predictable, and consistent performance across the network. The VDC must be implemented across data center business units.

The network solution must meet business unit availability requirements as defined in service-level agreements.

#### ***Cost-Effective Incremental Scaling***

The VDC design must be cost effective for the business to run and must enable new business capabilities. It must be possible to implement the network solution in an incremental manner with minimal impact to the business.

#### ***Orchestration and Automation***

The VDC design must include a management system that supports automation for provisioning, availability and workload monitoring, and reporting. Workload and availability reports must be available by business unit.

#### ***Example: Configuring a Two-Tiered Virtualized Data Center for Large Enterprise Networks***

This example provides a step-by-step procedure for configuring a two-tiered virtualized data center for large enterprise networks.

- [Requirements on page 3481](#)
- [Configuring a Two-Tiered Virtualized Data Center Overview on page 3481](#)
- [Configuring the Access Layer on page 3484](#)
- [Configuring the Aggregation Layer in the Trusted Logical Systems on page 3488](#)
- [Configuring the Core Layer in the Untrusted Logical Systems on page 3496](#)
- [Configuring the Security Device on page 3501](#)

#### ***Requirements***

This example uses the following hardware and software components:

- Two MX Series 3D Universal Edge Routers running Junos OS Release 10.2 or later
- Six EX Series Ethernet Switches running Junos OS Release 10.2 or later
- Two SRX Series Services Gateways running Junos OS Release 10.4 or later

#### ***Configuring a Two-Tiered Virtualized Data Center Overview***

This example provides a step-by-step procedure for configuring a two-tiered virtualized data center for large enterprises. The steps in the example follow the data path from an interface connected to a server in BU2 using VLAN 17, to Logical System Trust1, through Virtual Router MX-VR2, through Virtual Router SRX-VR2, through VRF2 in the Logical System Untrust, and out to the core network.

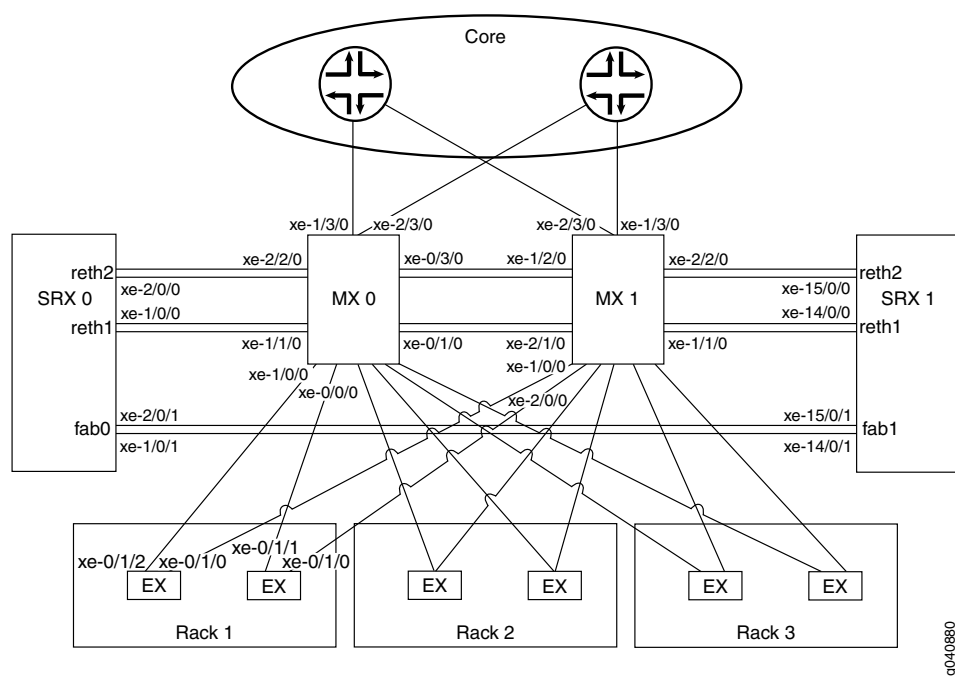

The core network in this example simultaneously supports IP-based routing and MPLS-based label switching. The virtual routers on the SRX Series device perform the functions of customer edge (CE) routers. The VPN routing and forwarding (VRF) routing instances on the MX Series devices perform the functions of service provider edge (PE) routers. The OSPF protocol serves as the interior gateway protocol to carry routes to the PE router loopback addresses that are used as the BGP next-hop address for the IP-based and MPLS-based networks supported by this example.

**NOTE:** The steps in this example are representative of the entire network configuration. The example does not show every step for every virtual device.

The physical connections used in this example are shown in [Figure 76 on page 3482](#).

**Figure 76: Virtualized Data Center Physical Topology**

The logical connections used in this example are shown in [Figure 77 on page 3483](#).

Figure 77: Virtualized Data Center Logical Topology

In the logical topology illustration:

- Users access the data center across the enterprise core network shown at the top.
- Virtual routers configured in Logical System Untrust on the MX Series devices forward the traffic to separate virtual routers configured in the Untrusted security zone on the SRX Series devices. These virtual routers act as edge routers for the various business units.
- Virtual routers configured on the active SRX Series device forward the traffic to the Trusted security zones.
- Virtual routers configured in separate logical systems on the MX Series devices forward the traffic to a bridge domain of VLANs configured on the EX Series devices.
- Business unit 1 requires additional separation. In this case, the virtual router (VR) configured on the SRX Series device forwards the traffic directly to the bridge domain on the EX Series devices.
- The EX Series devices switch the traffic to the data center server.

- The SRX Series devices apply security policy to all traffic traversing the untrust to trust boundary and all traffic forwarded between logical systems.
- The SRX Series devices are configured in an active/passive cluster so that only one node in the cluster is active on the data forwarding plane at a time.
- The SRX Series devices are configured with a single redundancy group for the data plane. The redundancy group uses two Ethernet interfaces (**reth1** and **reth2** in [Figure 76 on page 3482](#)) as member interfaces.

### **Configuring the Access Layer**

Configure the access layer by doing the following:

- [Configuring Interfaces on page 3484](#)
- [Configuring VLANs in the Access Layer on page 3485](#)
- [Configuring a Redundant Trunk Group and Disabling the Spanning Tree Protocol for the Trunk Interfaces on page 3486](#)
- [Configuring Management Automation on page 3487](#)

### **Configuring Interfaces**

#### **Step-by-Step Procedure**

This procedure explains how to configure the physical, logical, and network management interfaces for the access layer devices. This procedure shows a representative sample of the configuration. The example does not show the configuration for every interface.

1. Configure the access layer server-facing 10-Gigabit Ethernet interfaces.

This example configures the **ge-0/0/17** interface with VLAN ID 17.

Include the **member** statement and specify VLAN ID 17 at the **[edit interfaces ge-0/0/17 unit 0 family ethernet-switching vlan]** hierarchy level.

```
[edit interfaces ge-0/0/17 unit 0]
user@ex# set family ethernet-switching vlan members 17
```

Repeat this step for every server-facing interface by using the appropriate interface name and VLAN number.

2. Configure the 10-Gigabit Ethernet trunk interfaces from the EX Series device to the two MX Series devices.

This example configures the **xe-0/1/2** and **xe-0/1/0** interfaces.

Include the **port-mode** statement and specify the **trunk** option at the **[edit interfaces xe-0/1/2 unit 0 family ethernet-switching]** and **[edit interfaces xe-0/1/0 unit 0 family ethernet-switching]** hierarchy levels.

Include the **members** statement and specify the **all** option at the **[edit interfaces xe-0/1/2 unit 0 family ethernet-switching vlan]** and **[edit interfaces xe-0/1/0 unit 0 family ethernet-switching]** hierarchy levels.

```
[edit interfaces xe-0/1/2 unit 0]
user@ex# set family ethernet-switching port-mode trunk
user@ex# set family ethernet-switching vlan members all

[edit interfaces xe-0/1/0 unit 0]
```

```
user@ex# set family ethernet-switching port-mode trunk
user@ex# set family ethernet-switching vlan members all
```

Repeat this step for every 10-Gigabit Ethernet trunk interface by using the appropriate interface name.

3. Enable the IPv4 address family for the loopback logical interface.

Include the **family** statement and specify the **inet** option to enable IPv4 at the **[edit interfaces lo0 unit 0]** hierarchy level.

```
[edit interfaces lo0 unit 0]
user@ex# set family inet
```

Repeat this step for every EX Series device by using the appropriate address for that device.

4. Configure the EX Series device management Ethernet interface.

This example configures the **unit 0** logical interface.

Include the **family** statement and specify the **inet** option at the **[edit me0 unit 0]** hierarchy level.

Include the **address** statement and specify **10.8.108.19/24** as the IPv4 address at the **[edit interfaces me0 unit 0 family inet]** hierarchy level.

```
[edit interfaces me0 unit 0]
user@ex# set family inet address 10.8.108.19/24
```

Repeat this step for every EX Series device by using the appropriate management interface address for that device.

### *Configuring VLANs in the Access Layer*

#### **Step-by-Step Procedure**

This procedure explains how to configure the VLAN names and tag IDs and associate trunk interfaces with one of the access layer devices. This procedure shows a representative sample of the configuration. The example does not show the configuration for every VLAN.

1. Configure the VLAN name and tag ID (number) for each VLAN on the EX Series device.

This example configures a VLAN with the name **vlan17** and tag ID **17**.

Include the **vlan-id** statement and specify **17** as the VLAN tag ID at the **[edit vlans vlan17]** hierarchy level.

```
[edit vlans vlan17]
user@ex# set vlan-id 17
```

Repeat this step for every VLAN on each EX Series device by using the appropriate VLAN names and tag IDs.

2. Associate the logical trunk interfaces with each VLAN on the EX Series device.

This example associates logical interfaces **xe-0/1/0.0** and **xe-0/1/2.0** with **vlan17**.

Include the **interface** statement and specify **xe-0/1/0.0** at the **[edit vlans vlan17]** hierarchy level.

Include the **interface** statement and specify **xe-0/1/2.0** at the **[edit vlans vlan17]** hierarchy level.

```
[edit vlans vlan17]
user@ex# set interface xe-0/1/0.0
user@ex# set interface xe-0/1/2.0
```

Repeat this step for every VLAN on each EX Series device by using the appropriate trunk interface names.

### ***Configuring a Redundant Trunk Group and Disabling the Spanning Tree Protocol for the Trunk Interfaces***

**Step-by-Step Procedure** This procedure explains how to configure a redundant trunk group and disable the Rapid Spanning Tree Protocol (RSTP) on the trunk interfaces.

1. Configure the trunk interfaces as a redundant trunk group.

This example configures the **xe-0/1/0.0** and **xe-0/1/2.0** trunk interfaces in a redundant trunk group named **rtgroup1**.

Include the **interface** statement at the **[edit ethernet-switching-options redundant-trunk-group group rtgroup1]** hierarchy level and specify each trunk interface name.

Include the **primary** statement at the **[edit ethernet-switching-options redundant-trunk-group group rtgroup1 xe-0/1/2.0]** hierarchy level.

```
[edit ethernet-switching-options redundant-trunk-group group rtgroup1]
user@ex# set interface xe-0/1/0.0
user@ex# set interface xe-0/1/2.0 primary
```

Repeat this step for every redundant trunk group by using the appropriate interface names.

2. Disable RSTP on the trunk interfaces.

On an EX Series device, RSTP is enabled by default. RSTP cannot be enabled on the same interface as routing.

This example disables RSTP on the **xe-0/1/0.0** and **xe-0/1/2.0** trunk interfaces.

Include the **disable** statement at the **[edit protocols rstp interface xe-0/1/0.0]** and **[edit protocols rstp interface xe-0/1/2.0]** hierarchy levels.

```
[edit protocols rstp]
user@ex# set interface xe-0/1/0.0 disable
user@ex# set interface xe-0/1/2.0 disable
```

Repeat this step for every core-facing trunk interface by using the appropriate interface name.

### Configuring Management Automation

**Step-by-Step Procedure** This procedure explains how to configure static routes to the management network, a known host to support background Secure Copy Protocol (SCP) file transfers, a commit script, and an event archive site.

1. Configure static routes so the Ethernet management interface can reach the management network.

Include the **route** statement, and specify **10.8.0.0/16** as the IPv4 subnet address of the management network at the **[edit routing-options static]** hierarchy level.

Include the **next-hop** statement, and specify the IPv4 host address of the next-hop router at the **[edit routing-options static route 10.8.0.0/16]** hierarchy level.

```
[edit routing-options static]
user@ex# set route 10.8.0.0/16 next-hop 10.8.108.254
```

Repeat this step for every Ethernet management interface on the EX Series devices.

2. Configure an SSH known host.

Include the **host** statement, and specify the IPv4 address and RSA host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level. In this example, the RSA host key is truncated to make it easier to read.

```
[edit security ssh-known-hosts]
user@ex# set host 127.0.0.1 rsa-key AAAAB3NzaC1yc2
```

Repeat this step for every EX Series device.

3. Configure outbound SSH to support Juniper Message Bundle (JMB) transfers to Juniper Support Systems (JSS).

In this example, the client ID is configured as **00187D0B670D**.

Include the **client** statement, specify **00187D0B670D** as the client ID, and specify **10.8.7.32** as the IPv4 address at the **[edit system services outbound-ssh]** hierarchy level.

Include the **port** statement and specify **7804** as the TCP port at the **[edit system services outbound-ssh client 00187D0B670D 10.8.7.32]** hierarchy level.

Include the **device-id** statement and specify **FA022D** as the device ID at the **[edit system services outbound-ssh client 00187D0B670D]** hierarchy level.

Include the **secret** statement at the **[edit system services outbound-ssh client 00187D0B670D ]** hierarchy level.

Include the **services** statement and specify **netconf** as the available service at the **[edit system services outbound-ssh client 00187D0B670D ]** hierarchy level.

```
[edit system services outbound-ssh client 00187D0B670D]
user@ex# set 10.8.7.32 port 7804
user@ex# set device-id FA022D
user@ex# set secret "9-9w4aik.QznDj9A0BEhrlKMxN"
user@ex# set services netconf
```

Repeat this step for every EX Series device.

4. Configure a commit script.

In this example the script file name is **jais-activate-scripts.slax**.

Include the **allow-transients** statement at the **[edit system scripts commit]** hierarchy level.

Include the **optional** statement at the **[edit system scripts commit file jais-activate-scripts.slax]** hierarchy level.

```
[edit system scripts commit]
user@ex# set allow-transients
user@ex# set file jais-activate-scripts.slax optional
```

Repeat this step for every EX Series devices.

5. Configure an event archive site.

In this example, the archive URL is the local **/var/tmp/** directory, and the name given to the destination is **juniper-aim**.

Include the **archive-sites** statement and specify the archive URL at the **[edit event-options destinations juniper-aim]** hierarchy level.

```
[edit event-options destinations juniper-aim]
user@ex# set archive-sites "scp://admin@127.0.0.1:/var/tmp" password "12345"
```

Repeat this step for every EX Series device.

### ***Configuring the Aggregation Layer in the Trusted Logical Systems***

Configure the aggregation layer by doing the following:

- [Configuring Interfaces in the Trusted Logical Systems on page 3488](#)
- [Configuring VLANs in the Aggregation Layer on page 3491](#)
- [Configuring the Virtual Router Routing Instance on page 3492](#)
- [Configuring Management Interfaces on page 3493](#)
- [Configuring Logical System Administrator Accounts on page 3494](#)
- [Configuring Management Automation on page 3495](#)

### ***Configuring Interfaces in the Trusted Logical Systems***

#### **Step-by-Step Procedure**

This procedure explains how to configure the physical, logical, and Layer 3 routing interfaces for the logical system in the trusted security zone of the aggregation layer. This procedure shows a representative sample of the configuration. The example does not show the configuration for every interface.

1. Enable flexible VLAN tagging on the physical interfaces.

This example configures physical interface **xe-1/0/0**.

Include the **encapsulation** statement and specify the **flexible-ethernet-services** option at the **[edit interfaces xe-1/0/0]** hierarchy level.

Include the **flexible-vlan-tagging** statement at the **[edit interfaces xe-1/0/0]** hierarchy level.

```
[edit interfaces xe-1/0/0]
user@mx# set encapsulation flexible-ethernet-services
user@mx# set flexible-vlan-tagging
```

Repeat this step for every physical interface connected to the EX series, SRX Series, and MX Series devices using the appropriate interface name.

2. Configure the 10-Gigabit Ethernet interfaces connected to the EX Series access layer device.

This example configures logical interface 17 on the **xe-1/0/0** interface under the logical system named **Trust1**.

Include the **encapsulation** statement and specify the **vlan-bridge** option at the **[edit logical-systems Trust1 interfaces xe-1/0/0 unit 17]** hierarchy level.

Include the **vlan-id** statement and specify 17 as the VLAN ID at the **[edit logical-systems Trust1 interfaces xe-1/0/0 unit 17]** hierarchy level.

```
[edit logical-systems Trust1 interfaces xe-1/0/0 unit 17]
user@mx# set encapsulation vlan-bridge
user@mx# set vlan-id 17
```

Repeat this step for every interface connected to the access layer devices by using the appropriate interface name, logical interface number, VLAN ID, and logical system name.

3. Configure the 10-Gigabit Ethernet interfaces connected to the other MX Series device shown in [Figure 76 on page 3482](#).

This example configures logical interface 17 on the **xe-0/1/0** interface.

Include the **encapsulation** statement and specify the **vlan-bridge** option at the **[edit logical-systems Trust1 interfaces xe-0/1/0 unit 17]** hierarchy level.

Include the **vlan-id** statement and specify 17 as the VLAN tag ID at the **[edit logical-systems Trust1 interfaces xe-0/1/0 unit 17]** hierarchy level.

```
[edit logical-systems Trust1 interfaces xe-0/1/0 unit 17]
user@mx# set encapsulation vlan-bridge
user@mx# set vlan-id 17
```

Repeat this step for every interface connected to the other MX Series device shown in [Figure 76 on page 3482](#) by using the appropriate interface name, logical interface number, VLAN ID, and logical system name.

4. Configure the 10-Gigabit Ethernet interface connected to the SRX Series device.

This example configures logical interface 15 on the **xe-1/1/0** interface. Include the **encapsulation** statement and specify the **vlan-bridge** option at the **[edit logical-systems Trust1 interfaces xe-1/1/0 unit 15]** hierarchy level.

Include the **vlan-id** statement and specify 15 as the VLAN tag ID at the **[edit logical-systems Trust1 interfaces xe-1/1/0 unit 15]** hierarchy level.

```
[edit logical-systems Trust1 interfaces xe-1/1/0 unit 15]
user@mx# set encapsulation vlan-bridge
user@mx# set vlan-id 15
```

Repeat this step for every interface connected to the SRX Series device by using the appropriate interface name, logical interface number, VLAN ID, and logical system name.

5. Configure the Layer 3 integrated routing and bridging (IRB) interface address.

This example configures the **unit 17** logical interface with **10.17.2.2/24** as the IPv4 address under the logical system named **Trust1**. Include the **address** statement and specify **10.17.2.2/24** as the IPv4 address at the **[edit logical-systems Trust1 interfaces irb unit 17 family inet]** hierarchy level.

```
[edit logical-systems Trust1 interfaces irb unit 17 family inet]
user@mx# set address 10.17.2.2/24
```

Repeat this step for every Layer 3 IBR by using the appropriate logical interface name and IPv4 address.

6. Configure the IRB interface to participate in Virtual Router Redundancy Protocol (VRRP).

This example configures the **unit 17** logical interface with **17** as the VRRP group name.

Include the **virtual-address** statement and specify **10.17.2.1** as the IPv4 address of the virtual router at the **[edit logical-systems Trust1 interfaces irb unit 17 family inet address 10.17.2.2/24 vrrp-group 17]** hierarchy level.

Include the **accept-data** statement at the **[edit logical-systems Trust1 interfaces irb unit 17 family inet address 10.17.2.2/24 vrrp-group 17]** hierarchy level so the interface will accept packets destined for the virtual IP address.

Include the **priority** statement and specify **200** as the router's priority at the **[edit logical-systems Trust1 interfaces irb unit 17 family inet address 10.17.2.2/24 vrrp-group 17]** hierarchy level.

Include the **fast-interval** statement and specify **200** as the interval between VRRP advertisements at the **[edit logical-systems Trust1 interfaces irb unit 17 family inet address 10.17.2.2/24 vrrp-group 17]** hierarchy level.

Include the **preempt** statement at the **[edit logical-systems Trust1 interfaces irb unit 17 family inet address 10.17.2.2/24 vrrp-group 17]** hierarchy level.

```
[edit logical-systems Trust1 interfaces irb unit 17 family inet address 10.17.2.2/24
vrrp-group 17]
user@mx# set virtual-address 10.17.2.1
user@mx# set accept-data
user@mx# set priority 200
user@mx# set fast-interval 200
user@mx# set preempt
```

Repeat this step for every Layer 3 IBR interface by using the appropriate logical interface name, IPv4 address, VRRP group name, and priority.

### Configuring VLANs in the Aggregation Layer

**Step-by-Step Procedure** This procedure explains how to configure the VLAN names and tag IDs and associate trunk interfaces and Layer 3 routing interfaces with each VLAN. This procedure shows a representative sample of the configuration. The example does not show the configuration for every VLAN.

1. Configure the VLAN name and tag ID (number) for each VLAN on the MX Series device.

This example configures a VLAN with the name **vlan17** and tag ID **17** in the Logical System **Trust1**. Include the **vlan-id** statement and specify **17** as the VLAN ID at the **[edit logical-systems Trust1 bridge-domains vlan17]** hierarchy level.

```
[edit logical-systems Trust1 bridge-domains vlan17]
user@mx# set vlan-id 17
```

Repeat this step for every VLAN on each MX Series device by using the appropriate VLAN names and tag IDs.

2. Associate the logical trunk interfaces with each VLAN on the MX Series device.

This example associates logical interface **xe-1/0/0.17** that is connected to the EX Series device and logical interface **xe-0/1/0.17** that is connected to the other MX Series device with **vlan17**.

Include the **interface** statement and specify **xe-1/0/0.17** at the **[edit logical-systems Trust1 bridge-domains vlan17]** hierarchy level.

Include the **interface** statement and specify **xe-0/1/0.17** at the **[edit logical-systems Trust1 bridge-domains vlan17]** hierarchy level.

```
[edit logical-systems Trust1 bridge-domains vlan17]
user@mx# set interface xe-1/0/0.17
user@mx# set interface xe-0/1/0.17
```

Repeat this step for every server-facing VLAN on each MX Series device by using the appropriate trunk interface names.

3. Associate a Layer 3 interface with each VLAN on the MX Series device.

This example associates the **irb.17** interface with **vlan17**.

Include the **routing-interface** statement and specify **irb.17** at the **[edit logical-systems Trust1 bridge-domains vlan17]** hierarchy level.

```
[edit logical-systems Trust1 bridge-domains vlan17]
user@mx# set routing-interface irb.17
```

Repeat this step for every server-facing VLAN on each MX Series device by using the appropriate Layer 3 interface name.

4. Associate the logical interfaces with each interconnection VLAN on the MX Series device.

This example associates logical interface **xe-1/1/0.15** that is connected to the SRX Series device and logical interface **xe-0/1/0.15** that is connected to the other MX Series device with **vlan15**.

Include the **interface** statement and specify **xe-1/1/0.15** at the **[edit logical-systems Trust1 bridge-domains vlan15]** hierarchy level.

Include the **interface** statement and specify **xe-0/1/0.15** at the **[edit logical-systems Trust1 bridge-domains vlan15]** hierarchy level.

```
[edit logical-systems Trust1 bridge-domains vlan15]
user@mx# set interface xe-1/1/0.15
user@mx# set interface xe-0/1/0.15
```

Repeat this step for every interconnect VLAN on each MX Series device by using the appropriate interconnect interface names.

5. Associate a Layer 3 interface with each interconnection VLAN on the MX Series device to support active participation in the OSPF protocol.

This example associates the **irb.15** interface with **vlan15**.

Include the **routing-interface** statement and specify **irb.15** at the **[edit logical-systems Trust1 bridge-domains vlan15]** hierarchy level.

```
[edit logical-systems Trust1 bridge-domains vlan15]
user@mx# set routing-interface irb.15
```

Repeat this step for every server-facing VLAN on each MX Series device by using the appropriate Layer 3 interface name.

### ***Configuring the Virtual Router Routing Instance***

#### **Step-by-Step Procedure**

This procedure explains how to configure a single virtual router routing instance. This procedure shows a representative sample of the example configuration. The example does not show the configuration for every device.

1. Configure the routing instance type.

This example configures the routing instance with the name **MX-VR2**. Include the **instance-type** statement and specify **virtual-router** as the type at the **[edit logical-systems Trust1 routing-instances MX-VR2]** hierarchy level.

```
[edit logical-systems Trust1 routing-instances MX-VR2]
user@mx# set instance-type virtual-router
```

Repeat this step for every virtual router in each MX Series device by using the appropriate virtual router name.

2. Add the IRB interfaces used by the virtual router routing instance.

Include the **interface** statement and specify the name of each IRB interface at the **[edit routing-instances MX-VR2]** hierarchy level.

```
[edit logical-systems Trust1 routing-instances MX-VR2]
user@mx# set interface irb.15
user@mx# set interface irb.16
user@mx# set interface irb.17
user@mx# set interface irb.18
user@mx# set interface irb.1002
```

Repeat this step for every virtual router in each MX Series device by using the appropriate interface names.

3. Configure the IGP protocol active interface used by the virtual router routing instance so the routing tables can be populated with the routes to the servers.

This example configures one IRB interface to actively participate in the OSPF protocol area **0.0.0.0**.

Include the **interface** statement and specify the name of the IRB interface at the **[edit logical-systems Trust1 routing-instances MX-VR2 protocols ospf area 0.0.0.0]** hierarchy level.

```
[edit routing-instances MX-VR2 protocols ospf area 0.0.0.0]
user@mx# set interface irb.15
```

Repeat this step for every virtual router in each MX Series device by using the appropriate virtual router name.

4. Configure the interior gateway protocol passive interfaces that are associated with each VLAN within the virtual router routing instance.

This example configures the IRB interfaces to passively participate in the OSPF protocol area **0.0.0.0**.

Include the **passive** statement at the **[edit logical-systems Trust1 routing-instances MX-VR2 protocols ospf area 0.0.0.0 interface *irb-name*]** hierarchy level.

```
[edit logical-systems Trust1 routing-instances MX-VR2 protocols ospf area 0.0.0.0]
user@mx# set interface irb.16 passive
user@mx# set interface irb.17 passive
user@mx# set interface irb.18 passive
user@mx# set interface irb.1002 passive
```

Repeat this step for every virtual router in each MX Series device by using the appropriate virtual router name.

5. Configure the logical system router identifier.

Include the **router-id** statement and specify **10.200.11.101** as the router identifier at the **[edit logical-systems Trust1 routing-instances MX-VR2 routing-options]** hierarchy level.

```
[edit logical-systems Trust1 routing-instances MX-VR2 routing-options]
user@mx# set router-id 10.200.11.101
```

Repeat this step for every virtual router in each MX Series device by using the appropriate router identifier.

### *Configuring Management Interfaces*

#### **Step-by-Step Procedure**

This procedure explains how to configure static routes to the management network and the IPv4 address family for the loopback logical interface. This procedure shows a representative sample of the configuration. The example does not show the configuration for every interface.

1. Configure static routes so the Ethernet management interface can reach the management network.

Include the **route** statement and specify **10.0.0.0/8** as the IPv4 subnet address of the management network at the **[edit routing-options static]** hierarchy level.

Include the **next-hop** statement, and specify the IPv4 host address of the next-hop router at the **[edit routing-options static route 10.0.0.0/8]** hierarchy level.

Include the **retain** and **no-readvertise** statements at the **[edit routing-options static route 10.0.0.0/8]** hierarchy level.

```
[edit routing-options static]
user@mx# set route 10.0.0.0/8 next-hop 10.8.3.254
user@mx# set route 10.0.0.0/8 retain
user@mx# set route 10.0.0.0/8 no-readvertise
```

Repeat this step for every MX Series device.

2. Configure the MX Series device management Ethernet interface. This example configures the **unit 0** logical interface.

Include the **family** statement and specify the **inet** option at the **[edit fxp0 unit 0]** hierarchy level.

Include the **address** statement and specify **10.8.3.212/24** as the IPv4 address at the **[edit interfaces fxp0 unit 0]** hierarchy level.

```
[edit interfaces fxp0 unit 0]
user@mx# set family inet address 10.8.3.212/24
```

Repeat this step for every MX Series device by using the appropriate management interface address for that device.

3. Configure the loopback logical interface.

Include the **family** statement and specify the **inet** option at the **[edit interfaces lo0 unit 0]** hierarchy level.

```
[edit interfaces lo0 unit 0]
user@mx# set family inet
```

Repeat this step for every MX Series device.

### ***Configuring Logical System Administrator Accounts***

#### **Step-by-Step Procedure**

This procedure explains how to configure administrator account classes that are confined to the context of the logical system to which they are assigned and administrator accounts for each logical system.

1. Create administrator account classes.

In this example, the **trust1-admin** user class is created with **all** permissions for the **Trust1** logical system.

Include the **class** statement and specify **trust1-admin** as the class name at the **[edit system login]** hierarchy level.

Include the **logical-system** statement and specify **Trust1** as the logical system name at the **[edit system login class trust1-admin]** hierarchy level.

Include the **permissions** statement and specify the **all** option at the **[edit system login class trust1-admin]** hierarchy level.

```
[edit system]
```

```
user@mx# set login class trust1-admin logical-system Trust1
user@mx# set login class trust1-admin permissions all
```

Repeat this step for the trust2-admin and untrust-admin classes on each MX Series device by using the appropriate logical-system name.

2. Create administrator accounts that correspond to each logical system in the MX Series device.

In this example, the **trust1** user account is created and assigned the **trust1-admin** class.

Include the **class** statement and specify **trust1-admin** as the user class at the **[edit system login user trust1]** hierarchy level.

Include the **encrypted-password** statement and enter the encrypted password string at the **[edit system login user trust1 authentication]** hierarchy level.

```
[edit system]
user@mx# set login user trust1 class trust1-admin
user@mx# set login user trust1 authentication encrypted-password 12345
```

Repeat this step for the trust2 and untrust user accounts on each MX Series device.

### *Configuring Management Automation*

**Step-by-Step Procedure** This procedure explains how to configure a known host to support background SCP file transfers, a commit script, and an archive site.

1. Configure a commit script.

In this example, the script file name is **jais-activate-scripts.slax**.

Include the **allow-transients** statement at the **[edit system scripts commit]** hierarchy level.

Include the **optional** statement at the **[edit system scripts commit file jais-activate-scripts.slax]** hierarchy level.

```
[edit system scripts commit]
user@mx# set allow-transients
user@mx# set file jais-activate-scripts.slax optional
```

2. Configure an event archive site.

In this example the archive URL is the local **/var/tmp/** directory, and the name given to the destination is **juniper-aim**.

Include the **archive-sites** statement and specify the archive URL at the **[edit event-options destinations juniper-aim]** hierarchy level.

```
[edit event-options destinations juniper-aim]
user@mx# set archive-sites "scp://admin@127.0.0.1:/var/tmp" password "12345"
```

### ***Configuring the Core Layer in the Untrusted Logical Systems***

Configure the core layer by doing the following:

- [Configuring Interfaces in the Untrusted Logical Systems on page 3496](#)
- [Configuring VLANs in the Core Layer on page 3497](#)
- [Configuring Protocols in the Untrusted Logical System on page 3498](#)

### ***Configuring Interfaces in the Untrusted Logical Systems***

#### **Step-by-Step Procedure**

This procedure explains how to configure the physical, logical, and Layer 3 routing interfaces for the logical system in the untrusted security zone of the core layer. This procedure shows a representative sample of the configuration. The example does not show the configuration for every interface.

1. Configure the 10-Gigabit redundant Ethernet interfaces connected to the other MX Series device shown in [Figure 76 on page 3482](#).

This example configures logical interface **19** on the **xe-0/3/0** interface under the logical system named **Untrust** to participate in VLAN 19. Include the **encapsulation** statement and specify the **vlan-bridge** option at the **[edit logical-systems Untrust interfaces xe-0/3/0 unit 19]** hierarchy level.

Include the **vlan-id** statement and specify **19** as the VLAN tag ID at the **[edit logical-systems Untrust interfaces xe-0/3/0 unit 19]** hierarchy level.

```
[edit logical-systems Untrust interfaces xe-0/3/0 unit 19]
user@mx# set encapsulation vlan-bridge
user@mx# set vlan-id 19
```

Repeat this step for every redundant Ethernet interface connected to the other MX Series device by using the appropriate interface name, logical interface number, VLAN ID, and logical system name.

2. Configure the 10-Gigabit Ethernet interfaces connected to the SRX Series device.

This example configures logical interface **19** on the **xe-2/2/0** interface under the logical system named **Untrust** to participate in VLAN 19.

Include the **encapsulation** statement and specify the **vlan-bridge** option at the **[edit logical-systems Untrust interfaces xe-2/2/0 unit 19]** hierarchy level.

Include the **vlan-id** statement and specify **19** as the VLAN tag ID at the **[edit logical-systems Untrust interfaces xe-2/2/0 unit 19]** hierarchy level.

```
[edit logical-systems Untrust interfaces xe-2/2/0 unit 19]
user@mx# set encapsulation vlan-bridge
user@mx# set vlan-id 19
```

Repeat this step for every redundant Ethernet interface connected to the SRX Series device by using the appropriate interface name, logical interface number, VLAN ID, and logical system name.

3. Configure the 10-Gigabit Ethernet interfaces connected to the IP-based/MPLS-based core network.

This example configures logical interface **0** on the **xe-1/3/0** interface under the logical system named **Untrust**.

Include the **address** statement and specify **10.200.4.1/30** as the IPv4 address at the **[edit logical-systems Untrust interfaces xe-1/3/0 unit 0 family inet]** hierarchy level.

Include the **family** statement and specify the **mpls** option at the **[edit logical-systems Untrust interfaces xe-1/3/0 unit 0]** hierarchy level.

```
[edit logical-systems Untrust interfaces xe-1/3/0 unit 0]
user@mx# set family inet address 10.200.4.1/30
user@mx# set family mpls
```

Repeat this step for every 10-Gigabit Ethernet interface connected to the service provider network by using the appropriate interface name, logical interface number, IPv4 address, and logical system name.

4. Configure the Layer 3 IRB interface address.

This example configures the **unit 19** logical interface that participates in VLAN 19 with **10.19.2.1/24** as the IPv4 address under the logical system named **Untrust**.

Include the **address** statement and specify **10.19.2.1/24** as the IPv4 address at the **[edit logical-systems Untrust interfaces irb unit 19 family inet]** hierarchy level.

```
[edit logical-systems Untrust interfaces irb unit 19 family inet]
user@mx# set address 10.19.2.1/24
```

Repeat this step for every Layer 3 IRB interface by using the appropriate logical interface name and IPv4 address.

5. Configure an IP address for the loopback logical interface of the Logical System **Untrust**.

Include the **address** statement and specify **10.200.11.1/32** as the IPv4 address at the **[edit logical-systems Untrust interfaces lo0 unit 1 family inet]** hierarchy level.

```
[edit logical-systems Untrust interfaces lo0 unit 1 family inet]
user@mx# set address 10.200.11.1/32
```

Repeat this step for every MX Series device by using the appropriate IPv4 address.

### *Configuring VLANs in the Core Layer*

#### **Step-by-Step Procedure**

This procedure explains how to configure the VLAN names and tag IDs and associate interfaces and Layer 3 routing interfaces with each core interconnect VLAN. This procedure shows a representative sample of the configuration. The example does not show the configuration for every VLAN.

1. Configure the VLAN name and tag ID (number) for each core interconnect VLAN on the MX Series device.

This example configures a VLAN with the name **vlan14** and tag ID **14** in the Logical System **Untrust**.

Include the **vlan-id** statement and specify **14** as the VLAN ID at the **[edit logical-systems Untrust bridge-domains vlan14]** hierarchy level.

```
[edit logical-systems Untrust bridge-domains vlan14]
user@mx# set vlan-id 14
```

Repeat this step for every VLAN on each MX Series device by using the appropriate VLAN names and tag IDs.

2. Associate the logical interfaces with each VLAN on the MX Series device.

This example associates logical interface **xe-0/3/0.14** that is connected to the other MX Series device and **xe-2/2/0.14** that is connected to the SRX Series device with **vlan14**.

Include the **interface** statement and specify **xe-0/3/0.14** at the **[edit logical-systems Untrust bridge-domains vlan14]** hierarchy level.

Include the **interface** statement and specify **xe-2/2/0.14** at the **[edit logical-systems Untrust bridge-domains vlan14]** hierarchy level.

```
[edit logical-systems Untrust bridge-domains vlan14]
user@mx# set interface xe-0/3/0.14
user@mx# set interface xe-2/2/0.14
```

Repeat this step for every core interconnect VLAN on each MX Series device by using the appropriate interface names.

3. Associate a Layer 3 interface with each VLAN on the MX Series device.

This example associates the **irb.14** interface with **vlan14**.

Include the **routing-interface** statement and specify **irb.14** at the **[edit logical-systems Untrust bridge-domains vlan14]** hierarchy level.

```
[edit logical-systems Untrust bridge-domains vlan14]
user@mx# set routing-interface irb.14
```

Repeat this step for every core interconnect VLAN on each MX Series device by using the appropriate Layer 3 interface name.

### *Configuring Protocols in the Untrusted Logical System*

#### **Step-by-Step Procedure**

This procedure explains how to configure the BGP, MPLS, RSVP, and OSPF protocols for the Logical System Untrust. This procedure shows a representative sample of the configuration. The example does not show the configuration for every device.

1. Add interfaces to the OSPF protocol on the MX Series device.

This example adds logical interfaces **xe-1/3/0.0** and **lo0.1** to the OSPF protocol used in the core network.

Include the **interface** statement and specify the **xe-1/3/0.0** and **lo0.1** interfaces at the **[edit logical-systems Untrust protocols ospf area 0.0.0.0]** hierarchy level.

```
[edit logical-systems Untrust protocols ospf area 0.0.0.0]
user@mx# set interface xe-1/3/0.0
user@mx# set interface lo0.1
```

Repeat this step for every 10-Gigabit Ethernet interface connected to the core layer devices by using the appropriate interface name.

2. Configure the Generic Router Encapsulation (GRE) tunnel.

This example enables a dynamic GRE tunnel named **GRE1**.

Include the **gre** statement to specify the tunnel type at the **[edit logical-systems Untrust routing-options dynamic-tunnel GRE1]** hierarchy level.

Include the **source-address** statement and specify **10.200.11.1** as the IPv4 source address at the **[edit logical-systems Untrust routing-options dynamic-tunnel GRE1]** hierarchy level.

Include the **destination-networks** statement and specify **0.0.0.0/0** as the destination prefix at the **[edit logical-systems Untrust routing-options dynamic-tunnel GRE1]** hierarchy level.

```
[edit logical-systems Untrust routing-options dynamic-tunnel GRE1]
user@mx# set source-address 10.200.11.1
user@mx# set gre
user@mx# set destination-networks 0.0.0.0/0
```

Repeat this step for each MX Series device by using the appropriate source address.

3. Configure the Logical System local autonomous system number and router identifier.

Include the **autonomous-system** statement and specify **65000** as the autonomous system number at the **[edit logical-systems Untrust routing-options]** hierarchy level.

Include the **router-id** statement and specify **10.200.11.101** as the router identifier at the **[edit logical-systems Untrust routing-options]** hierarchy level.

```
[edit logical-systems Untrust]
user@mx# set routing-options autonomous-system 65000
user@mx# set routing-options router-id 10.200.11.101
```

Repeat this step for each MX Series device by using the appropriate router identifier and autonomous system number 65000.

4. Configure the internal BGP peer group.

Include the **type** statement and specify the **internal** option at the **[edit logical-systems Untrust protocols bgp group int]** hierarchy level.

Include the **local-address** statement and specify the router ID (10.200.11.1) of Logical System Untrust as the local address at the **[edit logical-systems Untrust protocols bgp group int]** hierarchy level.

Include the **unicast** statement at the **[edit logical-systems Untrust protocols bgp group int family inet]** and **[edit logical-systems Untrust protocols bgp group int family inet-vpn]** hierarchy levels.

Include the **local-as** statement and specify **65000** as the local autonomous system number at the **[edit logical-systems Untrust protocols bgp group int]** hierarchy level.

Include the **peer-as** statement and specify **65000** as the peer autonomous system number at the **[edit logical-systems Untrust protocols bgp group int]** hierarchy level.

Include the **neighbor** statement and specify the neighbor IPv4 addresses at the **[edit logical-systems Untrust protocols bgp group int]** hierarchy level.

The neighbor addresses are the router ID addresses of the other MX Series device in the local data center, MX Series devices in a remote data center, and routers located in the IP-based/MPLS-based core network.

```
[edit logical-systems Untrust protocols bgp group int]
user@mx# set type internal
user@mx# set local-address 10.200.11.1
user@mx# set family inet unicast
user@mx# set family inet-vpn unicast
user@mx# set local-as 65000
user@mx# set peer-as 65000
user@mx# set neighbor 10.200.11.2
user@mx# set neighbor 10.200.11.3
user@mx# set neighbor 10.200.11.4
```

Repeat this step for every MX Series device.

5. Add interfaces to the MPLS protocol used in the service provider core network.

This example adds the **xe-1/3/0.0** and **xe-2/3/0.0** interfaces that are connected to the service provider core network.

Include the **interface** statement and specify the **xe-1/3/0.0** and **xe-2/3/0.0** interfaces at the **[edit logical-systems Untrust protocols mpls]** hierarchy level.

```
[edit logical-systems Untrust protocols mpls]
user@mx# set interface xe-1/3/0.0
user@mx# set interface xe-2/3/0.0
```

Repeat this step for every MX Series device.

6. Create an MPLS LSP to the router that is located in the MPLS-based core network.

This example creates an LSP named **to-core-router**.

Include the **to** statement and specify **10.200.11.3** as the IPv4 address of the core router at the **[edit logical-systems Untrust protocols mpls label-switched-path to-core-router]** hierarchy level.

Include the **no-cspf** statement at the **[edit logical-systems Untrust protocols mpls]** hierarchy level.

```
[edit logical-systems Untrust protocols mpls]
user@mx# set label-switched-path to-core-router to 10.200.11.3
user@mx# set no-cspf
```

Repeat this step for every MX Series device.

7. Add interfaces to the RSVP protocol used in the MPLS-based core network.

Include the **interface** statement and specify the **xe-1/3/0.0** and **xe-2/3/0.0** interfaces at the **[edit logical-systems Untrust protocols rsvp]** hierarchy level.

```
[edit logical-systems Untrust protocols rsvp]
user@mx# set interface xe-1/3/0.0
user@mx# set interface xe-2/3/0.0
```

Repeat this step for every MX Series device.

### *Configuring the Security Device*

The following procedures explain how to configure the redundant Ethernet interfaces, node cluster, security zones, security policies, and routing policies for the trusted security zone of the access layer.

- [Configuring the Redundant Ethernet Interface Link Aggregation Group on page 3501](#)
- [Configuring the SRX Series Cluster on page 3502](#)
- [Creating Security Zones and Configuring the In-Bound Traffic Policy Action on page 3503](#)
- [Configuring the Security Zone Policies on page 3504](#)
- [Creating the Routing Policies on page 3506](#)
- [Configuring the Virtual Router Routing Instance on page 3508](#)
- [Results on page 3511](#)

### *Configuring the Redundant Ethernet Interface Link Aggregation Group*

#### **Step-by-Step Procedure**

This procedure explains how to configure the redundant Ethernet interface link aggregation group. This procedure shows a representative sample of the configuration. The example does not show the configuration for every interface.

1. Configure the number of aggregated Ethernet interfaces supported on the node.

This example enables support for two interfaces.

Include the **device-count** statement and specify **2** as the number of interfaces supported at the **[edit chassis aggregated-devices ethernet]** hierarchy level.

```
[edit chassis aggregated-devices ethernet]
user@srx# set device-count 2
```

Repeat this step for every SRX Series device by using the appropriate device count.

2. Assign 10-Gigabit Ethernet child interfaces to the redundant Ethernet (reth) parent interface.

This example assigns the **xe-1/0/0** 10-Gigabit Ethernet child interface to the **reth1** parent interface on Node0.

Include the **redundant-parent** statement and specify **reth1** as the parent interface at the **[edit interfaces xe-1/0/0 gigether-options]** hierarchy level.

```
[edit interfaces xe-1/0/0 gigether-options]
user@srx# set redundant-parent reth1
```

Repeat this step for every redundant Ethernet interface by using the appropriate interface name and redundant parent name.

3. Configure the redundant Ethernet parent interface options.

This example configures the **reth1** redundant parent interface.

Include the **redundancy-group** statement and specify **1** as the group number at the **[edit interfaces reth1 redundant-ether-options]** hierarchy level.

Include the **vlan-tagging** statement at the **[edit interfaces reth1]** hierarchy level.

```
[edit interfaces reth1]
user@srx# set redundant-ether-options redundancy-group 1
user@srx# set vlan-tagging
```

Repeat this step for every redundant parent interface by using the appropriate redundant parent name and redundancy group number.

4. Configure the redundant Ethernet parent logical interfaces.

This example configures the **unit 15** logical interface.

Include the **address** statement and specify **10.15.2.2/24** as the IPv4 address at the **[edit interfaces reth1 unit 15 family inet]** hierarchy level.

Include the **vlan-id** statement and specify **15** as the VLAN identifier at the **[edit interfaces reth1 unit 15]** hierarchy level.

```
[edit interfaces reth1 unit 15]
user@srx# set family inet address 10.15.2.2/24
user@srx# set vlan-id 15
```

Repeat this step for every redundant parent interface by using the appropriate redundant parent name, IPv4 address, and VLAN identifier.

### *Configuring the SRX Series Cluster*

#### **Step-by-Step Procedure**

This procedure explains how to configure fabric connections between the nodes in the cluster. This procedure shows a representative sample of the configuration. The example does not show the configuration for every interface.

1. Configure the 10-Gigabit Ethernet interface to serve as the fabric between the cluster nodes.

This example configures **xe-1/0/1** as the child fabric interface and **fab0** as the parent fabric interface. The connection is from SRX0 to SRX1.

Include the **member-interfaces** statement and specify the **xe-1/0/1** interface at the **[edit interfaces fab0 fabric-options]** hierarchy level.

```
[edit interfaces fab0 fabric-options]
user@srx# set member-interfaces xe-1/0/1
```

Repeat this step for every 10-Gigabit Ethernet interface that is part of the cluster fabric by using the appropriate child interface name and parent interface name.

2. Configure the number of redundant Ethernet interfaces that the cluster supports.

This example configures **4** as the number of interfaces.

Include the **reth-count** statement and specify **4** as the number of interfaces at the **[edit chassis cluster]** hierarchy level.

```
[edit chassis cluster]
user@srx# set reth-count 4
```

Repeat this step for every SRX Series device in the cluster.

3. Configure the node priority for the redundancy group to determine which node is primary and which is secondary.

This example configures **node 0** with a higher priority.

Include the **priority** statement and specify **200** at the **[edit chassis cluster redundancy-group 1 node 0]** hierarchy level.

Include the **priority** statement and specify **100** at the **[edit chassis cluster redundancy-group 1 node 1]** hierarchy level.

```
[edit chassis cluster redundancy-group 1]
user@srx# set node 0 priority 200
user@srx# set node 1 priority 100
```

Repeat this step for every redundancy group on every SRX Series device in the cluster.

4. Allow a node with a higher priority to initiate a failover to become the primary node for the redundancy group.

Include the **preempt** statement at the **[edit chassis cluster redundancy-group 1]** hierarchy level.

```
[edit chassis cluster redundancy-group 1]
user@srx# set preempt
```

Repeat this step for every redundancy group on every SRX Series device in the cluster.

5. Enable control link recovery to be done automatically.

Include the **control-link-recovery** statement at the **[edit chassis cluster]** hierarchy level.

```
[edit chassis cluster]
user@srx# set control-link-recovery
```

Repeat this step for every redundancy group on every SRX Series device in the cluster.

6. Enable interface monitoring to monitor the health of the interfaces and trigger redundancy group failover.

This example configures the **xe-1/0/0** interface with a weight of **255**.

Include the **weight** statement at the **[edit chassis cluster redundancy-group 1 interface-monitor xe-1/0/0]** hierarchy level.

```
[edit chassis cluster redundancy-group 1 interface-monitor xe-1/0/0]
user@srx# set weight 255
```

Repeat this step for every redundancy group interface on every SRX Series device in the cluster.

### ***Creating Security Zones and Configuring the In-Bound Traffic Policy Action***

#### **Step-by-Step Procedure**

This procedure explains how to configure the trusted and untrusted security zones on the SRX Series device. This procedure shows a representative sample of the configuration. The example does not show the configuration for every zone.

1. Assign a redundant Ethernet logical interface to a trusted zones.

This example assigns the **reth1.15** interface to the **Trust2** zone.

Include the **interfaces** statement and specify **reth1.15** as the interface in the zone at the **[edit security zones security-zone Trust2]** hierarchy level.

```
[edit security zones security-zone Trust2]
user@srx# set interfaces reth1.15
```

Repeat this step for every trusted security zone by using the appropriate zone name and redundant Ethernet logical interface name.

2. Assign a redundant Ethernet logical interface to the untrusted zones.

This example assigns the **reth2.19** interface to the **Untrust2** zone.

Include the **interfaces** statement and specify **reth2.19** as the interface in the zone at the **[edit security zones security-zone Untrust2]** hierarchy level.

```
[edit security zones security-zone Untrust2]
user@srx# set interfaces reth2.19
```

Repeat this step for every untrusted security zone by using the appropriate zone name and redundant Ethernet logical interface name.

3. Enable all inbound system services traffic in the trusted security zone.

This example enables all services for the **Trust2** zone.

Include the **system-services** statement and specify the **all** option at the **[edit security zones security-zone Trust2 host-inbound-traffic]** hierarchy level.

```
[edit security zones security-zone Trust2 host-inbound-traffic]
user@srx# set system-services all
```

Repeat this step for every security zone on the SRX Series device where system services are allowed.

4. Enable all protocols for inbound traffic in the trusted security zone.

This example enables all protocols for the **Trust2** zone.

Include the **protocols** statement and specify the **all** option at the **[edit security zones security-zone Trust2 host-inbound-traffic]** hierarchy level.

```
[edit security zones security-zone Trust2 host-inbound-traffic]
user@srx# set protocols all
```

Repeat this step for every security zone on the SRX Series device where all protocols are allowed for inbound traffic.

### ***Configuring the Security Zone Policies***

#### **Step-by-Step Procedure**

This procedure explains how to configure the security zone policies on the SRX Series device. This procedure shows a representative sample of the configuration. The example does not show the configuration for every policy.

1. Define which zone traffic is coming from and which zone traffic is going to for the policy being created.

This example defines the from zone as **Trust2** and the to zone as **Untrust2**.

On a single command line, include the **from-zone** statement and specify **Trust2**, include the **to-zone** statement and specify **Untrust2**, include the **policy** statement and specify **denyftp** as the policy name, and included the **match** statement at the **[edit security policies]** hierarchy level.

```
[edit security policies]
user@srx# set from-zone Trust2 to-zone Untrust2 policy denyftp match
```

Repeat this step for every policy that controls traffic between zones.

2. Configure the policy match criteria for denying traffic.

This example matches the Junos OS FTP application from any source to any destination address in a policy named **denyftp**.

Include the **source-address** statement and specify **any** as the IPv4 address at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy denyftp match]** hierarchy level.

Include the **destination-address** statement and specify **any** as the IPv4 address at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy denyftp match]** hierarchy level.

Include the **application** statement and specify **junos-ftp** as the application at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy denyftp match]** hierarchy level.

```
[edit security policies from-zone Trust2 to-zone Untrust2 policy denyftp match]
user@srx# set source-address any
user@srx# set destination-address any
user@srx# set application junos-ftp
```

Repeat this step for every protocol matching policy by using the correct protocol.

3. Block specific applications from passing from the Trust2 zone to the Untrust2 zone.

This example denies the Junos OS FTP application from the **Trust2** zone to the **Untrust2** zone.

Include the **deny** statement at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy denyftp then]** hierarchy level.

```
[edit security policies from-zone Trust2 to-zone Untrust2 policy denyftp then]
user@srx# set deny
```

Repeat this step for every deny policy.

4. Configure the policy match criteria for allowing traffic.

This example matches any application from any source to any destination address in a policy named **allow\_all**.

Include the **source-address** statement and specify **any** as the IPv4 address at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy allow\_all match]** hierarchy level.

Include the **destination-address** statement and specify **any** as the IPv4 address at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy allow\_all match]** hierarchy level.

Include the **application** statement and specify **any** as the application at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy allow\_all match]** hierarchy level.

```
[edit security policies from-zone Trust2 to-zone Untrust2 policy allow_all match]
user@srx# set source-address any
user@srx# set destination-address any
user@srx# set application any
```

Repeat this step for every application matching policy.

5. Permit any application traffic to pass from the Trust2 zone to the Untrust2 zone.

This example allows any application traffic from the **Trust2** zone to the **Untrust2** zone.

Include the **permit** statement at the **[edit security policies from-zone Trust2 to-zone Untrust2 policy allow\_all then]** hierarchy level.

```
[edit security policies from-zone Trust2 to-zone Untrust2 policy allow_all then]
user@srx# set permit
```

Repeat this step for every permit policy.

### *Creating the Routing Policies*

#### **Step-by-Step Procedure**

This procedure explains how to create the routing policies on the SRX Series device that can be applied to the appropriate routing instances. This procedure shows a representative sample of the configuration. The example does not show the configuration for every policy.

1. Create a policy to set the local preference for BGP routes to 120.

This example creates a policy named **local-pref-120** that sets the BGP local preference value for received routes advertised by BGP to 120.

Include the **protocol** statement and specify **bgp** as the value at the **[edit policy-options policy-statement local-pref-120 term term1 from]** hierarchy level.

Include the **local-preference** statement and specify **120** as the value at the **[edit policy-options policy-statement local-pref-120 term term1 then]** hierarchy level.

```
[edit policy-options policy-statement local-pref-120]
user@srx# set term term1 from protocol bgp
user@srx# set term term1 then local-preference 120
```

Repeat this step for each SRX Series device.

2. Configure the match criteria for a policy named **default-ospf** to accept all aggregate (generated) routes.

Include the **protocol** statement and specify **aggregate** as the protocol to match at the **[edit policy-options policy-statement default-ospf term term1 from]** hierarchy level.

Include the **route-filter** statement and specify **0.0.0.0/0 exact** as the match criteria at the **[edit policy-options policy-statement default-ospf term term1 from]** hierarchy level.

```
[edit policy-options policy-statement default-ospf term term1 from]
user@srx# set protocol aggregate
user@srx# set route-filter 0.0.0.0/0 exact
```

Repeat this step for each SRX Series device.

3. Configure the action for a policy to set the metric to **0**, and set the external route type to **1**.

This example configures a policy named **default-ospf** that sets the metric to **0**, sets the external route to type **1**, and accepts aggregate routes into the routing table.

Include the **metric** statement and specify **0** as the external type at the **[edit policy-options policy-statement default-ospf term term1 then]** hierarchy level.

Include the **type** statement and specify **1** as the external route type at the **[edit policy-options policy-statement default-ospf term term1 then external]** hierarchy level.

Include the **accept** statement at the **[edit policy-options policy-statement default-ospf term term1 then]** hierarchy level.

```
[edit policy-options policy-statement default-ospf term term1 then]
user@srx# set metric 0
user@srx# set external type 1
user@srx# set accept
```

Repeat this step for each SRX Series device.

4. Create a policy that accepts OSPF routes with specified prefixes.

This example creates a policy named **trust2-ebgp-out** that accepts OSPF routes with the route prefixes that correspond to the subnets for each trust VLAN.

Include the **protocol** statement and specify **ospf** as the protocol at the **[edit policy-options policy-statement trust2-ebgp-out term term1 from]** hierarchy level.

Include the **route-filter** statement and specify the VLAN subnet addresses and the **exact** match keyword at the **[edit policy-options policy-statement trust2-ebgp-out term term1 from]** hierarchy level.

Include the **accept** statement at the **[edit policy-options policy-statement trust2-ebgp-out term term1 then]** hierarchy level.

```
[edit policy-options policy-statement trust2-ebgp-out term term1]
user@srx# set from protocol ospf
user@srx# set from route-filter 10.16.2.0/24 exact
user@srx# set from route-filter 10.17.2.0/24 exact
user@srx# set from route-filter 10.18.2.0/24 exact
user@srx# set then accept
```

Repeat this step for each SRX Series device.

5. Create a policy that accepts BGP routes if the route type is external.

This example creates a policy named **check-bgp-routes** that accepts BGP routes only if the route type is external.

Include the **protocol** statement and specify **bgp** as the protocol at the **[edit policy-options policy-statement check-bgp-routes term term1 from]** hierarchy level.

Include the **route-type** statement and specify the **external** option at the **[edit policy-options policy-statement check-bgp-routes term term1 from]** hierarchy level.

Include the **accept** statement at the **[edit policy-options policy-statement check-bgp-routes term term1 then]** hierarchy level.

```
[edit policy-options policy-statement check-bgp-routes term term1]
user@srx# set from protocol bgp
user@srx# set from route-type external
user@srx# set then accept
```

Repeat this step for each SRX Series device.

6. Create a policy that accepts routes from other virtual router routing instances.

This example creates a policy named **from\_srx\_vr1** that accepts routes from routing instance **SRX-VR1**.

Include the **instance** statement and specify **SRX-VR1** as the routing instance name at the **[edit policy-options policy-statement from\_srx\_vr1 term term1 from]** hierarchy level.

Include the **accept** statement at the **[edit policy-options policy-statement from\_srx\_vr1 term term1 then]** hierarchy level.

```
[edit policy-options policy-statement from_srx_vr1 term term1]
user@srx# set from instance SRX-VR1
user@srx# set then accept
```

Repeat this step for each virtual router in each SRX Series device.

### *Configuring the Virtual Router Routing Instance*

#### **Step-by-Step Procedure**

This procedure explains how to configure a single virtual router routing instance. This procedure shows a representative sample of the example configuration. The example does not show the configuration for every virtual router routing instance.

1. Configure the routing instance type.

This example configures the routing instance with the name **SRX-VR2**.

Include the **instance-type** statement and specify **virtual-router** as the type at the **[edit routing-instances SRX-VR2]** hierarchy level.

```
[edit routing-instances SRX-VR2]
user@srx# set instance-type virtual-router
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name.

2. Add the redundant Ethernet interfaces used by the virtual router routing instance.

This example adds **reth1.15** and **reth2.19** interfaces to the **SRX-VR2** routing instance.

Include the **interface** statement and specify the name of the redundant Ethernet interface at the **[edit routing-instances SRX-VR2]** hierarchy level.

```
[edit routing-instances SRX-VR2]
user@srx# set interface reth1.15
```

```
user@srx# set interface reth2.19
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name and interface names.

3. Configure the routing options used by the virtual router routing instance.

This example configures the autonomous system number and enables the graceful restart feature on the **SRX-VR2** routing instance.

Include the **autonomous-system** statement and specify **65019** as the autonomous system number at the **[edit routing-instances SRX-VR2 routing-options]** hierarchy level.

Include the **graceful-restart** statement at the **[edit routing-instances SRX-VR2 routing-options]** hierarchy level.

```
[edit routing-instances SRX-VR2 routing-options]
user@srx# set autonomous-system 65019
user@srx# set graceful-restart
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name and interface names.

4. Apply the routing policy that accepts external BGP routes and uses them as generated routes for the routing instance.

This example applies the policy named **check-bgp-routes** to the **SRX-VR2** routing instance.

Include the **policy** statement and specify **check-bgp-routes** at the **[edit routing-instances SRX-VR2 routing-options generate route 0.0.0.0/0]** hierarchy level.

Include the **graceful-restart** statement at the **[edit routing-instances SRX-VR2 routing-options]** hierarchy level.

```
[edit routing-instances SRX-VR2 routing-options]
user@srx# set generate route 0.0.0.0/0 policy
user@srx# set graceful-restart
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name and interface names.

5. Apply the routing policy that accepts routes from other routing instances.

This example applies the policy named **from\_srx\_vr1** to the **SRX-VR2** routing instance.

Include the **instance-import** statement and specify **from\_srx\_vr1** at the **[edit routing-instances SRX-VR2 routing-options]** hierarchy level.

```
[edit routing-instances SRX-VR2 routing-options]
user@srx# set instance-import from_srx_vr1
```

Repeat this step for every virtual router in each SRX Series device except the **SRX-VR1** instance.

6. Configure the IGP protocol export policy used by the virtual router routing instance in the trusted security zone.

This example configures the **default-ospf** policy.

Include the **export** statement and specify **default-ospf** as the policy name at the **[edit routing-instances SRX-VR2 protocols ospf]** hierarchy level.

```
[edit routing-instances SRX-VR2 protocols ospf]
user@srx# set export default-ospf
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name and policy name.

7. Configure the IGP protocol active and passive interfaces used by the virtual router routing instance in the trusted security zone.

This example configures the **reth1.15** redundant Ethernet interface to actively participate in the OSPF protocol area 0.0.0.0, and the **reth2.19** redundant Ethernet interface to passively participate.

Include the **interface** statement and specify **reth1.15** at the **[edit routing-instances SRX-VR2 protocols ospf area 0.0.0.0]** hierarchy level.

Include the **interface** statement and specify **reth2.19** at the **[edit routing-instances SRX-VR2 protocols ospf area 0.0.0.0]** hierarchy level.

Include the **passive** statement at the **[edit routing-instances SRX-VR2 protocols ospf area 0.0.0.0 reth2.19]** hierarchy level.

```
[edit routing-instances SRX-VR2 protocols ospf area 0.0.0.0]
user@srx# set interface reth1.15
user@srx# set interface reth2.19 passive
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name and interface names.

8. Configure the BGP protocol peer groups used by the virtual router routing instance in the untrusted security zone.

Include the **type** statement and specify the **external** option at the **[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]** hierarchy level.

Include the **peer-as** statement and specify **65000** as the peer autonomous system number at the **[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]** hierarchy level.

Include the **neighbor** statement and specify **10.19.2.1** as the IPv4 neighbor address at the **[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]** hierarchy level. The neighbor address is the IRB Logical interface address of the VRF routing instance on the MX Series device.

```
[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]
user@srx# set type external
user@srx# set peer-as 65000
user@srx# set neighbor 10.19.2.1
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name, instance type, neighbor address, and peer AS number.

9. Configure the BGP protocol peer groups export and import policies used by the virtual router routing instance in the untrusted security zone.

Include the **export** statement and specify **trust2-ebgp-out** as the export policy name at the **[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]** hierarchy level.

Include the **import** statement and specify **local-pref-120** as the import policy name at the **[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]** hierarchy level.

```
[edit routing-instances SRX-VR2 protocols bgp group MX0-vrf]
user@srx# set export trust2-ebgp-out
user@srx# set import local-pref-120
```

Repeat this step for every virtual router in each SRX Series device by using the appropriate virtual router name, export policy, and import policy.

### Results

The configuration steps of this example have been completed. The following section is for your reference.

The relevant sample configuration for the EX Series device follows.

## Configuration Statements

- [\[edit logical-systems\] Hierarchy Level on page 3521](#)

### [\[edit logical-systems\] Hierarchy Level](#)

As indicated in the following hierarchy, you can include at this hierarchy level several of the hierarchies that can be included at the **[edit]** hierarchy level. However, some statements in a subhierarchy are not valid for logical systems. To learn which statements can be included under **[edit logical-systems *logical-system-name*]** on your device, issue the **set ?** command at the hierarchy level of interest.

```

logical-systems {
 logical-system-name {
 access {
 address-assignment {
 ... same statements as in the address-assignment subhierarchy in [edit access]
 Hierarchy Level ...
 }
 }
 }
}

```

```

}
access-profile profile-name;
bridge-domains {
 ... (MX Series only) same statements as in [edit bridge-domains] Hierarchy Level ...
}
bridge-domains {
 ... (MX Series only) same statements as in [edit bridge-domains] Hierarchy Level ...
}
firewall {
 ... same statements as in several subhierarchies in [edit firewall] Hierarchy Level ...
}
forwarding-options {
 ... same statements as in [edit forwarding-options dhcp-relay] Hierarchy Level ...
}
interfaces {
 interface-name {
 unit logical-unit-number {
 ... some of the statements in the unit subhierarchy in [edit interfaces] Hierarchy
 Level ...
 }
 }
}
policy-options {
 ... same statements as in [edit policy-options] Hierarchy Level on page 360 ...
}
protocols {
 ... same statements as in [edit protocols] Hierarchy Level ...
}
routing-instances {

#### ***Overview of Junos OS CLI Operational Mode Commands***

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 3523](#)
- [Commonly Used Operational Mode Commands on page 3524](#)

#### ***CLI Command Categories***

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- **Commands for controlling the CLI environment**—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- **Commands for monitoring and troubleshooting**—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.
  - **clear**—Clear statistics and protocol database information.
  - **mtrace**—Trace mtrace packets from source to receiver.
  - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
  - **ping**—Determine the reachability of a remote network host.
  - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
  - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
  - **traceroute**—Trace the route to a remote network host.

- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the *Junos OS Operational Mode Commands*.
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the *Junos OS Operational Mode Commands*.
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the *Junos OS Operational Mode Commands*.
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the *Junos OS Operational Mode Commands*.
- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the *Junos OS Operational Mode Commands*.
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see *Understanding Junos OS CLI Configuration Mode*.
- A command—**quit**—to exit the CLI. For information about this command, see the *Junos OS Operational Mode Commands*.
- For more information about the CLI operational mode commands, see the *Junos OS Operational Mode Commands* and the *Junos OS Operational Mode Commands*.

#### Commonly Used Operational Mode Commands

Table 267 on page 3524 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

Table 267: Commonly Used Operational Mode Commands

| Items to Check   | Description                                          | Command             |
|------------------|------------------------------------------------------|---------------------|
| Software version | Versions of software running on the router or switch | <b>show version</b> |
| Log files        | Contents of the log files                            | <b>monitor</b>      |
|                  | Log files and their contents and recent user logins  | <b>show log</b>     |

Table 267: Commonly Used Operational Mode Commands (*continued*)

| Items to Check               | Description                                                                               | Command                               |
|------------------------------|-------------------------------------------------------------------------------------------|---------------------------------------|
| Remote systems               | Host reachability and network connectivity                                                | <b>ping</b>                           |
|                              | Route to a network system                                                                 | <b>tracert</b>                        |
| Configuration                | Current system configuration                                                              | <b>show configuration</b>             |
| Manipulate files             | List of files and directories on the router or switch                                     | <b>file list</b>                      |
|                              | Contents of a file                                                                        | <b>file show</b>                      |
| Interface information        | Detailed information about interfaces                                                     | <b>show interfaces</b>                |
| Chassis                      | Chassis alarm status                                                                      | <b>show chassis alarms</b>            |
|                              | Information currently on craft display                                                    | <b>show chassis craft-interface</b>   |
|                              | Router or switch environment information                                                  | <b>show chassis environment</b>       |
|                              | Hardware inventory                                                                        | <b>show chassis hardware</b>          |
| Routing table information    | Information about entries in the routing tables                                           | <b>show route</b>                     |
| Forwarding table information | Information about data in the kernel's forwarding table                                   | <b>show route forwarding-table</b>    |
| IS-IS                        | Adjacent routers or switches                                                              | <b>show isis adjacency</b>            |
| OSPF                         | Display standard information about OSPF neighbors                                         | <b>show ospf neighbor</b>             |
| BGP                          | Display information about BGP neighbors                                                   | <b>show bgp neighbor</b>              |
| MPLS                         | Status of interfaces on which MPLS is running                                             | <b>show mpls interface</b>            |
|                              | Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs | <b>show mpls lsp</b>                  |
|                              | Routes that form a label-switched path                                                    | <b>show route label-switched-path</b> |
| RSVP                         | Status of interfaces on which RSVP is running                                             | <b>show rsvp interface</b>            |
|                              | Currently active RSVP sessions                                                            | <b>show rsvp session</b>              |
|                              | RSVP packet and error counters                                                            | <b>show rsvp statistics</b>           |

### **Example: Running Operational-Mode Commands on Logical Systems**

This example shows how to set the CLI to a specified logical system view, run operational-mode commands for the logical system, and then return to the main router view.

- [Requirements on page 3526](#)
- [Overview on page 3526](#)
- [Configuration on page 3526](#)

#### **Requirements**

You must have the **view** privilege for the logical system.

#### **Overview**

For some operational-mode commands, you can include a **logical-system** option to narrow the output of the command or to limit the operation of the command to the specified logical system. For example, the **show route** command has a **logical-system** option. To run this command on a logical system called LS3, you can use **show route logical-system LS3**. However, some commands, such as **show interfaces**, do not have a **logical-system** option. For commands like this, you need another approach.

You can place yourself into the context of a specific logical system. To configure a logical system context, issue the **set cli logical-system logical-system-name** command.

When the CLI is in logical system context mode and you enter an operational-mode command, the output of the command displays information related to the logical system only.

#### **Configuration**

##### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To set the CLI to a specific logical system context:

1. From the main router, configure the logical system.  

```
[edit]
user@host# set logical-systems LS3
```
2. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
user@host# exit
```
3. Set the CLI to view the logical system.  

```
user@host> set cli logical-system LS3
Logical system: LS3
user@host:LS3>
```
4. Run an operational-mode command.

```

user@host:LS3> show interfaces terse
Interface Admin Link Proto Local Remote
lt-1/2/0
lt-1/2/0.3 up up inet 10.0.2.1/30

```

5. Enter configuration mode to edit the logical system configuration.

```

user@host:LS3> edit
Entering configuration mode

user@host:LS3#

```

6. Exit configuration mode to return to operational mode.

```

user@host:LS3# exit
Exiting configuration mode

```

7. Clear the logical system view to return to the main router view.

```

user@host:LS3> clear cli logical-system
Cleared default logical system

user@host>

```

8. To achieve the same effect when using a Junos XML protocol client application, include the `<set-logical-system>` tag.

```

<rpc>
<set-logical-system>
<logical-system>LS1</logical-system>
</set-logical-system>
</rpc>

```

### **Example: Viewing BGP Trace Files on Logical Systems**

This example shows how to list and view files that are stored on a logical system.

- [Requirements on page 3527](#)
- [Overview on page 3528](#)
- [Configuration on page 3528](#)
- [Verification on page 3532](#)

### **Requirements**

- You must have the **view** privilege for the logical system.
- Configure a network, such as the BGP network shown in “[Example: Configuring Internal BGP Peering Sessions on Logical Systems](#)” on page 3365.

### Overview

Logical systems have their individual directory structure created in the `/var/logical-systems/logical-system-name` directory. It contains the following subdirectories:

- `/config`—Contains the active configuration specific to the logical system.
- `/log`—Contains system log and tracing files specific to the logical system.

To maintain backward compatibility for the log files with previous versions of Junos OS, a symbolic link (symlink) from the `/var/logs/logical-system-name` directory to the `/var/logical-systems/logical-system-name` directory is created when a logical system is configured.

- `/tmp`—Contains temporary files specific to the logical system.

The file system for each logical system enables logical system users to view trace logs and modify logical system files. Logical system administrators have full access to view and modify all files specific to the logical system.

Logical system users and administrators can save and load configuration files at the logical-system level using the **save** and **load** configuration mode commands. In addition, they can also issue the **show log**, **monitor**, and **file** operational mode commands at the logical-system level.

This example shows how to configure and view a BGP trace file on a logical system. The steps can be adapted to apply to trace operations for any Junos OS hierarchy level that supports trace operations.

**TIP:** To view a list of hierarchy levels that support tracing operations, enter the **help apropos traceoptions** command in configuration mode.

### Configuration

- [Configuring Trace Operations on page 3529](#)
- [Viewing the Trace File on page 3529](#)
- [Deactivating and Reactivating Trace Logging on page 3531](#)
- [Results on page 3532](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems A protocols bgp group internal-peers traceoptions file bgp-log
set logical-systems A protocols bgp group internal-peers traceoptions file size 10k
set logical-systems A protocols bgp group internal-peers traceoptions file files 2
set logical-systems A protocols bgp group internal-peers traceoptions flag update detail
```

### Configuring Trace Operations

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure the trace operations:

1. Configure trace operations on the logical system.  
  

```
[edit logical-systems A protocols bgp group internal-peers]
user@host# set traceoptions file bgp-log
user@host# set traceoptions file size 10k
user@host# set traceoptions file files 2
user@host# set traceoptions flag update detail
```
2. If you are done configuring the device, commit the configuration.  
  

```
[edit]
user@host# commit
```

### Viewing the Trace File

**Step-by-Step Procedure** To view the trace file:

1. In operational mode on the main router, list the directories on the logical system.  
  

```
user@host> file list /var/logical-systems/A
/var/logical-systems/A:
config/
log/
tmp/
```
2. In operational mode on the main router, list the log files on the logical system.  
  

```
user@host> file list /var/logical-systems/A/log/
/var/logical-systems/A/log:
bgp-log
```
3. View the contents of the **bgp-log** file.  
  

```
user@host> file show /var/logical-systems/A/log/bgp-log
Aug 10 17:12:01 trace_on: Tracing to "/var/log/A/bgp-log" started
Aug 10 17:14:22.826182 bgp_peer_mgmt_clear:5829: NOTIFICATION sent to

Aug 10 17:14:22.831999 BGP SEND Notification code 6 (Cease) subcode 4
(Administratively Reset)
...
```

4. Filter the output of the log file.

```
user@host> file show /var/logical-systems/A/log/bgp-log | match "flags 0x40"
Aug 10 17:14:54.867460 BGP SEND flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.867595 BGP SEND flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.867650 BGP SEND flags 0x40 code NextHop(3): 192.168.6.5
Aug 10 17:14:54.867692 BGP SEND flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.884529 BGP RECV flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.884581 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.884628 BGP RECV flags 0x40 code NextHop(3): 192.168.6.4
Aug 10 17:14:54.884667 BGP RECV flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.911377 BGP RECV flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.911422 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.911466 BGP RECV flags 0x40 code NextHop(3): 192.168.40.4
Aug 10 17:14:54.911507 BGP RECV flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.916008 BGP SEND flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.916054 BGP SEND flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.916100 BGP SEND flags 0x40 code NextHop(3): 192.168.6.5
Aug 10 17:14:54.916143 BGP SEND flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.920304 BGP RECV flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.920348 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.920393 BGP RECV flags 0x40 code NextHop(3): 10.0.0.10
Aug 10 17:14:54.920434 BGP RECV flags 0x40 code LocalPref(5): 100
```

5. View the tracing operations in real time.

```
user@host> clear bgp neighbor logical-system A
Cleared 2 connections
```

**CAUTION:** Clearing the BGP neighbor table is disruptive in a production environment.

6. Run the **monitor start** command with an optional **match** condition.

```
user@host> monitor start A/bgp-log | match 0.0.0.0/0
Aug 10 19:21:40.773467 BGP RECV 0.0.0.0/0
Aug 10 19:21:40.773685 bgp_rcv_nlrri: 0.0.0.0/0
Aug 10 19:21:40.773778 bgp_rcv_nlrri: 0.0.0.0/0 belongs to meshgroup
Aug 10 19:21:40.773832 bgp_rcv_nlrri: 0.0.0.0/0 qualified bnp->ribact 0x0
12afcb 0x0
```

7. Pause the **monitor** command by pressing Esc-Q.

To unpause the output, press Esc-Q again.

8. Halt the **monitor** command by pressing Enter and typing **monitor stop**.

[Enter]

```
user@host> monitor stop
```

9. When you are finished troubleshooting, consider deactivating trace logging to avoid any unnecessary impact to system resources.

```
[edit protocols bgp group internal-peers]
```

```
user@host:A# deactivate traceoptions
```

```
user@host:A# commit
```

When configuration is deactivated, it appears in the configuration with the **inactive** tag. To reactivate trace operations, use the **activate** configuration-mode statement.

```
[edit protocols bgp group internal-peers]
user@host:A# show

type internal;
inactive: traceoptions {
 file bgp-log size 10k files 2;
 flag update detail;
 flag all;
}
local-address 192.168.6.5;
export send-direct;
neighbor 192.163.6.4;
neighbor 192.168.40.4;
```

10. To reactivate trace operations, use the **activate** configuration-mode statement.

```
[edit protocols bgp group internal-peers]
user@host:A# activate traceoptions
user@host:A# commit
```

### *Deactivating and Reactivating Trace Logging*

#### **Step-by-Step Procedure**

To deactivate and reactivate the trace file:

1. When you are finished troubleshooting, consider deactivating trace logging to avoid an unnecessary impact to system resources.

```
[edit protocols bgp group internal-peers]
user@host:A# deactivate traceoptions
user@host:A# commit
```

When configuration is deactivated, the statement appears in the configuration with the **inactive** tag.

```
[edit protocols bgp group internal-peers]
user@host:A# show

type internal;
inactive: traceoptions {
 file bgp-log size 10k files 2;
 flag update detail;
 flag all;
}
local-address 192.168.6.5;
export send-direct;
neighbor 192.163.6.4;
neighbor 192.168.40.4;
```

2. To reactivate logging, use the **activate** configuration-mode statement.

```
[edit protocols bgp group internal-peers]
user@host:A# activate traceoptions
user@host:A# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show logical-systems A protocols bgp group internal-peers** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show logical-systems A protocols bgp group internal-peers
traceoptions {
 file bgp-log size 10k files 2;
 flag update detail;
}
```

### Verification

Confirm that the configuration is working properly.

#### *Verifying That the Trace Log File Is Operating*

**Purpose** Make sure that events are being written to the log file.

**Action** user@host:A> **show log bgp-log**  
Aug 12 11:20:57 trace\_on: Tracing to "/var/log/A/bgp-log" started

#### *Example: Configuring System Logging on Logical Systems*

This example shows how to configure system logging on logical systems and how to view the logs.

- [Requirements on page 3532](#)
- [Overview on page 3533](#)
- [Configuration on page 3533](#)
- [Verification on page 3534](#)

### Requirements

This example has the following requirements:

- You must have the **view** privilege for the logical system.
- Junos OS Release 11.4 or later.

### Overview

Each logical system has its individual directory structure created in the `/var/logical-systems/logical-system-name` directory. This directory contains the following subdirectories:

- `/config`—Contains the active configuration specific to the logical system.
- `/log`—Contains system log and tracing files specific to the logical system.

To maintain backward compatibility for the log files with previous versions of Junos OS, a symbolic link (symlink) from the `/var/log/logical-system-name` directory to the `/var/logical-systems/logical-system-name` directory is created when a logical system is configured.

- `/tmp`—Contains temporary files specific to the logical system.

The file system for each logical system enables logical system users to view trace logs and modify logical system files. Logical system administrators have full access to view and modify all files specific to the logical system.

Logical system users and administrators can save and load configuration files at the logical system level using the **save** and **load** configuration mode commands. In addition, they can issue the **show log**, **monitor**, and **file** operational mode commands at the logical system level.

This example shows how to configure system logging on a logical system.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems lsys1 system syslog host 10.209.10.69 ftp critical
set logical-systems lsys1 system syslog allow-duplicates
set logical-systems lsys1 system syslog file lsys1-file1 daemon error
set logical-systems lsys1 system syslog file lsys1-file1 firewall critical
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure system logging:

1. Configure trace operations on the logical system.

```
[edit logical-systems lsys1 system syslog]
user@host# set host 10.209.10.69 ftp critical
user@host# set allow-duplicates
user@host# set file lsys1-file1 daemon error
user@host# set file lsys1-file1 firewall critical
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
user@host# exit
```

### Results

From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show logical-systems
lsys1 {
 system {
 syslog {
 host 10.209.10.69 {
 ftp critical;
 }
 allow-duplicates;
 file lsys1-file1 {
 daemon error;
 firewall critical;
 }
 }
 }
}
```

### Verification

Confirm that the configuration is working properly.

#### Verifying That the System Log File Is Operating

**Purpose** Make sure that events are being written to the log file.

#### Action

**TIP:** To make entries in the system log, you can use the **start shell** command and then use the **logger** shell command. For example: **logger -e "firewall\_crit" -p firewall.crit -l lsys1 TEST**

```
user@host> show log lsys1/lsys1-file1
Sep 7 14:15:46 host clear-log[2752]: logfile cleared
Sep 7 14:19:04 host logger: % -: firewall_crit: TEST
...
```

```
user@host> file show /var/logical-systems/lsys1/log/lsys1-file1
Sep 7 14:19:04 host logger: % -: firewall_crit: TEST
...
```

#### LDP Introduction

---

The Label Distribution Protocol (LDP) is a protocol for distributing labels in non-traffic-engineered applications. LDP allows routers to establish label-switched paths (LSPs) through a network by mapping network-layer routing information directly to data link layer-switched paths.

These LSPs might have an endpoint at a directly attached neighbor (comparable to IP hop-by-hop forwarding), or at a network egress node, enabling switching through all intermediary nodes. LSPs established by LDP can also traverse traffic-engineered LSPs created by RSVP.

LDP associates a forwarding equivalence class (FEC) with each LSP it creates. The FEC associated with an LSP specifies which packets are mapped to that LSP. LSPs are extended through a network as each router chooses the label advertised by the next hop for the FEC and splices it to the label it advertises to all other routers. This process forms a tree of LSPs that converge on the egress router.

### Junos OS LDP Protocol Implementation

---

The Junos OS implementation of LDP supports LDP version 1. The Junos OS supports a simple mechanism for tunneling between routers in an interior gateway protocol (IGP), to eliminate the required distribution of external routes within the core. The Junos OS allows an MPLS tunnel next hop to all egress routers in the network, with only an IGP running in the core to distribute routes to egress routers. Edge routers run BGP but do not distribute external routes to the core. Instead, the recursive route lookup at the edge resolves to an LSP switched to the egress router. No external routes are necessary on the transit LDP routers.

### LDP Operation

---

You must configure LDP for each interface on which you want LDP to run. LDP creates LSP trees rooted at each egress router for the router ID address that is the subsequent BGP next hop. The ingress point is at every router running LDP. This process provides an inet.3 route to every egress router. If BGP is running, it will attempt to resolve next hops by using the inet.3 table first, which binds most, if not all, of the BGP routes to MPLS tunnel next hops.

Two adjacent routing devices running LDP become neighbors. If the routing devices are connected by more than one interface, they become neighbors on each interface. When LDP routing devices become neighbors, they establish an LDP session to exchange label information. If per-router labels are in use on both routing devices, only one LDP session is established between them, even if they are neighbors on multiple interfaces. For this reason, an LDP session is not related to a particular interface.

LDP operates in conjunction with a unicast routing protocol. LDP installs LSPs only when both LDP and the routing protocol are enabled. For this reason, you must enable both LDP and the routing protocol on the same set of interfaces. If this is not done, LSPs might not be established between each egress routing device and all ingress routing devices, which might result in loss of BGP-routed traffic.

You can apply policy filters to labels received from and distributed to other routing devices through LDP. Policy filters provide you with a mechanism to control the establishment of LSPs.

For LDP to run on an interface, MPLS must be enabled on a logical interface on that interface. For more information, see the *Junos® OS Network Interfaces*.

### Label Operations

---

Figure 78 on page 3537 depicts an LDP LSP being tunneled through an RSVP LSP. (For definitions of label operations, see *Label Description*.) The shaded inner oval represents the RSVP domain, whereas the outer oval depicts the LDP domain. RSVP establishes an LSP through routers B, C, D, and E, with the sequence of labels L3, L4. LDP establishes

an LSP through Routers A, B, E, F, and G, with the sequence of labels L1, L2, L5. LDP views the RSVP LSP between Routers B and E as a single hop.

When the packet arrives at Router A, it enters the LSP established by LDP, and a label (L1) is pushed onto the packet. When the packet arrives at Router B, the label (L1) is swapped with another label (L2). Because the packet is entering the traffic-engineered LSP established by RSVP, a second label (L3) is pushed onto the packet.

This outer label (L3) is swapped with a new label (L4) at the intermediate router (C) within the RSVP LSP tunnel, and when the penultimate router (D) is reached, the top label is popped. Router E swaps the label (L2) with a new label (L5), and the penultimate router for the LDP-established LSP (F) pops the last label.

**Figure 78: Swap and Push When LDP LSPs Are Tunneled Through RSVP LSPs**

[Figure 79 on page 3537](#) depicts a double push label operation (L1L2). A double push label operation is used when the ingress router (A) for both the LDP LSP and the RSVP LSP tunneled through it is the same device. Note that Router D is the penultimate hop for the LDP-established LSP, so L2 is popped from the packet by Router D.

**Figure 79: Double Push When LDP LSPs Are Tunneled Through RSVP LSPs**

## LDP Message Types

---

LDP uses the message types described in the following sections to establish and remove mappings and to report errors. All LDP messages have a common structure that uses a type, length, and value (TLV) encoding scheme.

- [Discovery Messages on page 3538](#)
- [Session Messages on page 3538](#)
- [Advertisement Messages on page 3538](#)
- [Notification Messages on page 3539](#)

## Discovery Messages

---

Discovery messages announce and maintain the presence of a router or switch in a network. They indicate their presence in a network by sending hello messages periodically. Hello messages are transmitted as UDP packets to the LDP port at the group multicast address for all routers on the subnet.

LDP uses the following discovery procedures:

- Basic discovery—A router or switch periodically sends LDP link hello messages through an interface. LDP link hello messages are sent as UDP packets addressed to the LDP discovery port. Receipt of an LDP link hello message on an interface identifies an adjacency with the LDP peer router or switch.
- Extended discovery—LDP sessions between routers or switches not directly connected are supported by LDP extended discovery. A router or switch periodically sends LDP targeted hello messages to a specific address. Targeted hello messages are sent as UDP packets addressed to the LDP discovery port at the specific address. The targeted router or switch decides whether to respond to or ignore the targeted hello message. A targeted router or switch that chooses to respond does so by periodically sending targeted hello messages to the initiating router or switch.

## Session Messages

---

Session messages establish, maintain, and terminate sessions between LDP peers. When a router or switch establishes a session with another router or switch learned through the hello message, it uses the LDP initialization procedure over TCP transport. When the initialization procedure is completed successfully, the two routers or switches are LDP peers and can exchange advertisement messages.

## Advertisement Messages

---

Advertisement messages create, change, and delete label mappings for forwarding equivalence classes (FECs). Requesting a label or advertising a label mapping to a peer is a decision made by the local router or switch. In general, the router or switch requests a label mapping from a neighboring router or switch when it needs one and advertises a label mapping to a neighboring router or switch when it wants the neighbor to use a label.

### Notification Messages

---

Notification messages provide advisory information and signal error information. LDP sends notification messages to report errors and other events of interest. There are two kinds of LDP notification messages:

- Error notifications, which signal fatal errors. If a router or switch receives an error notification from a peer for an LDP session, it terminates the LDP session by closing the TCP transport connection for the session and discarding all label mappings learned through the session.
- Advisory notifications, which pass information to a router or switch about the LDP session or the status of some previous message received from the peer.

### LDP Session Protection

---

LDP session protection is based on the LDP targeted hello functionality defined in RFC 5036, *LDP Specification*, and is supported by the Junos OS as well as the LDP implementations of most other vendors. It involves sending unicast User Datagram Protocol (UDP) hello packets to a remote neighbor address and receiving similar packets from the neighbor router.

If you configure LDP session protection on a router or switch, the LDP sessions are maintained as follows:

1. An LDP session is established between a router or switch and a remote neighboring router or switch.
2. If all of the direct links between the routers or switches go down, the LDP session remains up so long as there is IP connectivity between the routers based on another connection over the network.
3. When the direct link between the routers or switches is reestablished, the LDP session is not restarted. They simply exchange LDP hellos with each other over the direct link. They can then begin forwarding LDP-signaled MPLS packets using the original LDP session.

By default, LDP targeted hellos are set to the remote neighbor so long as the LDP session is up, even if there are no more link neighbors to that router or switch. You can also specify the duration you would like to maintain the remote neighbor connection in the absence of link neighbors. When the last link neighbor for a session goes down, the Junos OS starts an LDP session protection timer. If this timer expires before any of the link neighbors come back up, the remote neighbor connection is taken down and the LDP session is terminated. If you configure a different value for the timer while it is currently running, the Junos OS updates the timer to the specified value without disrupting the current state of the LDP session.

### LDP Graceful Restart

---

LDP graceful restart enables a router or switch whose LDP control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers

or switches. It also enables a router or switch on which helper mode is enabled to assist a neighboring router or switch that is attempting to restart LDP.

During session initialization, a router or switch advertises its ability to perform LDP graceful restart or to take advantage of a neighbor performing LDP graceful restart by sending the graceful restart TLV. This TLV contains two fields relevant to LDP graceful restart: the reconnect time and the recovery time. The values of the reconnect and recovery times indicate the graceful restart capabilities supported by the router or switch.

When a router or switch discovers that a neighboring router or switch is restarting, it waits until the end of the recovery time before attempting to reconnect. The recovery time is the length of time a router or switch waits for LDP to restart gracefully. The recovery time period begins when an initialization message is sent or received. This time period is also typically the length of time that a neighboring router or switch maintains its information about the restarting router or switch, allowing it to continue to forward traffic.

You can configure LDP graceful restart in both the master instance for the LDP protocol and for a specific routing instance. You can disable graceful restart at the global level for all protocols, at the protocol level for LDP only, and on a specific routing instance. LDP graceful restart is disabled by default, because at the global level, graceful restart is disabled by default. However, helper mode (the ability to assist a neighboring router or switch attempting a graceful restart) is enabled by default.

The following are some of the behaviors associated with LDP graceful restart:

- Outgoing labels are not maintained in restarts. New outgoing labels are allocated.
- When a router or switch is restarting, no label-map messages are sent to neighbors that support graceful restart until the restarting router or switch has stabilized (label-map messages are immediately sent to neighbors that do not support graceful restart). However, all other messages (keepalive, address-message, notification, and release) are sent as usual. Distributing these other messages prevents the router from distributing incomplete information.
- Helper mode and graceful restart are independent. You can disable graceful restart in the configuration, but still allow the router or switch to cooperate with a neighbor attempting to restart gracefully.

---

### Minimum LDP Configuration

To enable LDP on a single interface, include the **ldp** statement and specify the interface using the **interface** statement. This is the minimum LDP configuration. All other LDP configuration statements are optional.

```
ldp {
 interface interface-name;
}
```

To enable LDP on all interfaces, specify **all** for *interface-name*.

For a list of hierarchy levels at which you can include these statements, see the statement summary sections.

---

### Enabling and Disabling LDP

LDP is routing-instance-aware. To enable LDP on a specific interface, include the following statements:

```
ldp {
 interface interface-name;
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections.

To enable LDP on all interfaces, specify **all** for *interface-name*.

If you have configured interface properties on a group of interfaces and want to disable LDP on one of the interfaces, include the **interface** statement with the **disable** option:

```
interface interface-name {
 disable;
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section.

### Configuring the LDP Timer for Hello Messages

---

LDP hello messages enable LDP nodes to discover one another and to detect the failure of a neighbor or the link to the neighbor. Hello messages are sent periodically on all interfaces where LDP is enabled.

There are two types of LDP hello messages:

- Link hello messages—Sent through the LDP interface as UDP packets addressed to the LDP discovery port. Receipt of an LDP link hello message on an interface identifies an adjacency with the LDP peer router.
- Targeted hello messages—Sent as UDP packets addressed to the LDP discovery port at a specific address. Targeted hello messages are used to support LDP sessions between routers that are not directly connected. A targeted router determines whether to respond or ignore a targeted hello message. A targeted router that chooses to respond does so by periodically sending targeted hello messages back to the initiating router.

By default, LDP sends hello messages every 5 seconds for link hello messages and every 15 seconds for targeted hello messages. You can configure the LDP timer to alter how often both types of hello messages are sent. However, you cannot configure a time for the LDP timer that is greater than the LDP hold time. For more information, see [“Configuring the Delay Before LDP Neighbors Are Considered Down” on page 3543](#).

#### Configuring the LDP Timer for Link Hello Messages

To modify how often LDP sends link hello messages, specify a new link hello message interval for the LDP timer using the **hello-interval** statement:

```
hello-interval seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

#### Configuring the LDP Timer for Targeted Hello Messages

To modify how often LDP sends targeted hello messages, specify a new targeted hello message interval for the LDP timer by configuring the **hello-interval** statement as an option for the **targeted-hello** statement:

```
targeted-hello {
 hello-interval seconds;
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

### Configuring the Delay Before LDP Neighbors Are Considered Down

The hold time determines how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. The values sent by each neighbor do not have to match.

The hold time should normally be at least three times the hello interval. The default is 15 seconds for link hello messages and 45 seconds for targeted hello messages. However, it is possible to configure an LDP hold time that is close to the value for the hello interval.

**NOTE:** By configuring an LDP hold time close to the hello interval (less than three times the hello interval), LDP neighbor failures might be detected more quickly. However, this also increases the possibility that the router or switch might declare an LDP neighbor down that is still functioning normally. For more information, see [“Configuring the LDP Timer for Hello Messages” on page 3542](#).

The LDP hold time is also negotiated automatically between LDP peers. When two LDP peers advertise different LDP hold times to one another, the smaller value is used. If an LDP peer router or switch advertises a shorter hold time than the value you have configured, the peer router's or switch's advertised hold time is used. This negotiation can affect the LDP keepalive interval as well.

If the local LDP hold time is not shortened during LDP peer negotiation, the user-configured keepalive interval is left unchanged. However, if the local hold time is reduced during peer negotiation, the keepalive interval is recalculated. If the LDP hold time has been reduced during peer negotiation, the keepalive interval is reduced to one-third of the new hold time value. For example, if the new hold-time value is 45 seconds, the keepalive interval is set to 15 seconds.

This automated keepalive interval calculation can cause different keepalive intervals to be configured on each peer router or switch. This enables the routers or switches to be flexible in how often they send keepalive messages, because the LDP peer negotiation ensures they are sent more frequently than the LDP hold time.

When you reconfigure the hold-time interval, changes do not take effect until after the session is reset. The hold time is negotiated when the LDP peering session is initiated and cannot be renegotiated as long as the session is up (required by RFC 5036, *LDP Specification*). To manually force the LDP session to reset, issue the **clear ldp session** command.

### Configuring the LDP Hold Time for Link Hello Messages

To modify how long an LDP node should wait for a link hello message before declaring the neighbor down, specify a new time in seconds using the **hold-time** statement:

```
hold-time seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### ***Configuring the LDP Hold Time for Targeted Hello Messages***

To modify how long an LDP node should wait for a targeted hello message before declaring the neighbor down, specify a new time in seconds using the **hold-time** statement as an option for the **targeted-hello** statement:

```
targeted-hello {
 hold-time seconds;
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

---

### **Enabling Strict Targeted Hello Messages for LDP**

Use strict targeted hello messages to prevent LDP sessions from being established with remote neighbors that have not been specifically configured. If you configure the **strict-targeted-hellos** statement, an LDP peer does not respond to targeted hello messages coming from a source that is not one of its configured remote neighbors. Configured remote neighbors can include:

- Endpoints of RSVP tunnels for which LDP tunneling is configured
- Layer 2 circuit neighbors

If an unconfigured neighbor sends a hello message, the LDP peer ignores the message and logs an error (with the **error** trace flag) indicating the source. For example, if the LDP peer received a targeted hello from the Internet address 10.0.0.1 and no neighbor with this address is specifically configured, the following message is printed to the LDP log file:

```
LDP: Ignoring targeted hello from 10.0.0.1
```

To enable strict targeted hello messages, include the **strict-targeted-hellos** statement:

```
strict-targeted-hellos;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

---

### **Configuring the Interval for LDP Keepalive Messages**

The keepalive interval determines how often a message is sent over the session to ensure that the keepalive timeout is not exceeded. If no other LDP traffic is sent over the session in this much time, a keepalive message is sent. The default is 10 seconds. The minimum value is 1 second.

The value configured for the keepalive interval can be altered during LDP session negotiation if the value configured for the LDP hold time on the peer router or switch is lower than the value configured locally. For more information, see [“Configuring the Delay Before LDP Neighbors Are Considered Down” on page 3543](#).

To modify the keepalive interval, include the **keepalive-interval** statement:

**keepalive-interval** *seconds*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Configuring the LDP Keepalive Timeout

After an LDP session is established, messages must be exchanged periodically to ensure that the session is still working. The keepalive timeout defines the amount of time that the neighbor LDP node waits before deciding that the session has failed. This value is usually set to at least three times the keepalive interval. The default is 30 seconds.

To modify the keepalive interval, include the **keepalive-timeout** statement:

**keepalive-timeout** *seconds*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The value configured for the **keepalive-timeout** statement is displayed as the hold time when you issue the **show ldp session detail** command.

### Configuring LDP Route Preferences

When several protocols calculate routes to the same destination, route preferences are used to select which route is installed in the forwarding table. The route with the lowest preference value is selected. The preference value can be a number in the range 0 through 255. By default, LDP routes have a preference value of 9.

To modify the route preferences, include the **preference** statement:

**preference** *preference*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Configuring LDP Graceful Restart

When you alter the graceful restart configuration at either the **[edit routing-options graceful-restart]** or **[edit protocols ldp graceful-restart]** hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

By default, graceful restart helper mode is enabled, but graceful restart is disabled. Thus, the default behavior of a router or switch is to assist neighboring routers or switches attempting a graceful restart, but not to attempt a graceful restart itself.

To configure LDP graceful restart, see the following sections:

- [Enabling Graceful Restart on page 3546](#)
- [Disabling LDP Graceful Restart or Helper Mode on page 3546](#)
- [Configuring Reconnect Time on page 3547](#)
- [Configuring Recovery Time and Maximum Recovery Time on page 3547](#)

### **Enabling Graceful Restart**

To enable LDP graceful restart, you also need to enable graceful restart on the router or switch. To enable graceful restart, include the **graceful-restart** statement:

```
graceful-restart;
```

You can include this statement at the following hierarchy levels:

- [edit routing-options]
- [edit logical-systems *logical-system-name* routing-options]

The **graceful-restart** statement enables graceful restart for all protocols supporting this feature on the route or switch. For more information about graceful restart, see the *Junos OS Routing Protocols Configuration Guide*.

By default, LDP graceful restart is enabled when you enable graceful restart at both the LDP protocol level and on all the routing instances. However, you can disable both LDP graceful restart and LDP graceful restart helper mode.

### **Disabling LDP Graceful Restart or Helper Mode**

To disable LDP graceful restart and recovery, include the **disable** statement:

```
ldp {
 graceful-restart {
 disable;
 }
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

You can disable helper mode at the LDP protocols level only. You cannot disable helper mode for a specific routing instance. To disable LDP helper mode, include the **helper-disable** statement:

```
ldp {
 graceful-restart {
 helper-disable;
 }
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The following LDP graceful restart configurations are possible:

- LDP graceful restart and helper mode are both enabled.
- LDP graceful restart is disabled but helper mode is enabled. A router or switch configured in this way cannot restart gracefully but can help a restarting neighbor.
- LDP graceful restart and helper mode are both disabled. The router or switch does not use LDP graceful restart or the graceful restart type, length, and value (TLV) sent in

the initialization message. The router or switch behaves as a router or switch that cannot support LDP graceful restart.

A configuration error is issued if you attempt to enable graceful restart and disable helper mode.

### ***Configuring Reconnect Time***

After the LDP connection between neighbors fails, neighbors wait a certain amount of time for the gracefully restarting router or switch to resume sending LDP messages. After the wait period, the LDP session can be reestablished. You can configure the wait period in seconds. This value is included in the fault tolerant session TLV sent in LDP initialization messages when LDP graceful restart is enabled.

Suppose that Router A and Router B are LDP neighbors. Router A is the restarting Router. The reconnect time is the time that Router A tells Router B to wait after Router B detects that Router A restarted.

To configure the reconnect time, include the **reconnect-time** statement:

```
graceful-restart {
 reconnect-time seconds;
}
```

You can set the reconnect time to a value in the range from 30 through 300 seconds. By default, it is 60 seconds.

For a list of hierarchy levels at which you can configure these statements, see the statement summary sections for these statements.

### ***Configuring Recovery Time and Maximum Recovery Time***

The recovery time is the amount of time a router or switch waits for LDP to restart gracefully. The recovery time period begins when an initialization message is sent or received. This period is also typically the amount of time that a neighboring router maintains its information about the restarting router, allowing it to continue to forward traffic.

To prevent a neighboring router or switch from being adversely affected if it receives a false value for the recovery time from the restarting router or switch, you can configure the maximum recovery time on the neighboring router or switch. A neighboring router or switch maintains its state for the shorter of the two times. For example, Router A is performing an LDP graceful restart. It has sent a recovery time of 900 seconds to neighboring Router B. However, Router B has its maximum recovery time configured at 400 seconds. Router B will only wait for 400 seconds before it purges its LDP information from Router A.

To configure recovery time, include the **recovery-time** statement and the **maximum-neighbor-recovery-time** statement:

```
graceful-restart {
 maximum-neighbor-recovery-time seconds;
 recovery-time seconds;
}
```

For a list of hierarchy levels at which you can configure these statements, see the statement summary sections for these statements.

### Filtering Inbound LDP Label Bindings

You can filter received LDP label bindings, applying policies to accept or deny bindings advertised by neighboring routers. To configure received-label filtering, include the **import** statement:

```
import [policy-names];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The named policy (configured at the **[edit policy-options]** hierarchy level) is applied to all label bindings received from all LDP neighbors. All filtering is done with **from** statements. [Table 268 on page 3548](#) lists the only **from** operators that apply to LDP received-label filtering.

**Table 268: from Operators That Apply to LDP Received-Label Filtering**

| from Operator       | Description                                                                                |
|---------------------|--------------------------------------------------------------------------------------------|
| <b>interface</b>    | Matches on bindings received from a neighbor that is adjacent over the specified interface |
| <b>neighbor</b>     | Matches on bindings received from the specified LDP router ID                              |
| <b>next-hop</b>     | Matches on bindings received from a neighbor advertising the specified interface address   |
| <b>route-filter</b> | Matches on bindings with the specified prefix                                              |

If a binding is filtered, it still appears in the LDP database, but is not considered for installation as part of a label-switched path (LSP).

Generally, applying policies in LDP can be used only to block the establishment of LSPs, not to control their routing. This is because the path that an LSP follows is determined by unicast routing, and not by LDP. However, when there are multiple equal-cost paths to the destination through different neighbors, you can use LDP filtering to exclude some of the possible next hops from consideration. (Otherwise, LDP chooses one of the possible next hops at random.)

LDP sessions are not bound to interfaces or interface addresses. LDP advertises only per-router or per-switch (not per-interface) labels; so if multiple parallel links exist between two routers or switches, only one LDP session is established, and it is not bound to a single interface. When a router or switch has multiple adjacencies to the same neighbor, take care to ensure that the filter does what is expected. (Generally, using **next-hop** and **interface** is not appropriate in this case.)

If a label has been filtered (meaning that it has been rejected by the policy and is not used to construct an LSP), it is marked as filtered in the database:

```
user@host> show ldp database
Input label database, 10.10.255.1:0-10.10.255.6:0
Label Prefix
3 10.10.255.6/32 (Filtered)
Output label database, 10.10.255.1:0-10.10.255.6:0
Label Prefix
3 10.10.255.1/32 (Filtered)
```

For more information about how to configure policies for LDP, see the *Routing Policy Configuration Guide*.

### **Examples: Filtering Inbound LDP Label Bindings**

Accept only /32 prefixes from all neighbors:

```
[edit]
protocols {
 ldp {
 import only-32;
 ...
 }
}
policy-options {
 policy-statement only-32 {
 term first {
 from {
 route-filter 0.0.0.0/0 upto /31;
 }
 then reject;
 }
 then accept;
 }
}
```

Accept 131.108/16 or longer from router ID 10.10.255.2 and accept all prefixes from all other neighbors:

```
[edit]
protocols {
 ldp {
 import nosy-neighbor;
 ...
 }
}
policy-options {
 policy-statement nosy-neighbor {
 term first {
 from {
 neighbor 10.10.255.2;
 route-filter 131.108.0.0/16 orlonger accept;
 route-filter 0.0.0.0/0 orlonger reject;
 }
 }
 then accept;
 }
}
```

```
}
}
```

### Filtering Outbound LDP Label Bindings

You can configure export policies to filter LDP outbound labels. You can filter outbound label bindings by applying routing policies to block bindings from being advertised to neighboring routers or switches. To configure outbound label filtering, include the **export** statement:

```
export [policy-name];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The named export policy (configured at the **[edit policy-options]** hierarchy level) is applied to all label bindings transmitted to all LDP neighbors. The only **from** operator that applies to LDP outbound label filtering is **route-filter**, which matches bindings with the specified prefix. The only **to** operators that apply to outbound label filtering are the operators in [Table 269 on page 3550](#).

**Table 269: to Operators for LDP Outbound-Label Filtering**

| to Operator      | Description                                                                          |
|------------------|--------------------------------------------------------------------------------------|
| <b>interface</b> | Matches on bindings sent to a neighbor that is adjacent over the specified interface |
| <b>neighbor</b>  | Matches on bindings sent to the specified LDP router ID                              |
| <b>next-hop</b>  | Matches on bindings sent to a neighbor advertising the specified interface address   |

If a binding is filtered, the binding is not advertised to the neighboring router or switch, but it can be installed as part of an LSP on the local router or switch. You can apply policies in LDP to block the establishment of LSPs, but not to control their routing. The path an LSP follows is determined by unicast routing, not by LDP.

LDP sessions are not bound to interfaces or interface addresses. LDP advertises only per-router or per-switch (not per-interface) labels. If multiple parallel links exist between two routers or switches, only one LDP session is established, and it is not bound to a single interface.

Do not use the **next-hop** and **interface** operators when a router or switch has multiple adjacencies to the same neighbor.

Filtered labels are marked in the database:

```
user@host> show ldp database
Input label database, 10.10.255.1:0-10.10.255.3:0
Label Prefix
100007 10.10.255.2/32
3 10.10.255.3/32
Output label database, 10.10.255.1:0-10.10.255.3:0
Label Prefix
```

```
3 10.10.255.1/32
100001 10.10.255.6/32 (Filtered)
```

For more information about how to configure policies for LDP, see the *Routing Policy Configuration Guide*.

### **Examples: Filtering Outbound LDP Label Bindings**

Block transmission of the route for 10.10.255.6/32 to any neighbors:

```
[edit protocols]
ldp {
 export block-one;
}
policy-options {
 policy-statement block-one {
 term first {
 from {
 route-filter 10.10.255.6/32 exact;
 }
 then reject;
 }
 then accept;
 }
}
```

Send only 131.108/16 or longer to router ID 10.10.255.2, and send all prefixes to all other routers or switches:

```
[edit protocols]
ldp {
 export limit-lsps;
}
policy-options {
 policy-statement limit-lsps {
 term allow-one {
 from {
 route-filter 131.108.0.0/16 orlonger;
 }
 to {
 neighbor 10.10.255.2;
 }
 then accept;
 }
 term block-the-rest {
 to {
 neighbor 10.10.255.2;
 }
 then reject;
 }
 then accept;
 }
}
```

### Specifying the Transport Address Used by LDP

---

You can control the transport address used by LDP. The transport address is the address used for the TCP session over which LDP is running. To configure transport address control, include the **transport-address** statement:

**transport-address** (router-id | interface);

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify the **router-id** option, the address of the router or switch identifier is used as the transport address (unless otherwise configured, the router or switch identifier is typically the same as the loopback address). If you specify the **interface** option, the interface address is used as the transport address for any LDP sessions to neighbors that can be reached over that interface. Note that the identifier is used as the transport address by default.

You cannot specify the **interface** option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the **router-id** option.

### Configuring the Prefixes Advertised into LDP from the Routing Table

---

You can control the set of prefixes that are advertised into LDP and cause the router or switch to be the egress router or switch for those prefixes. By default, only the loopback address is advertised into LDP. To configure the set of prefixes from the routing table to be advertised into LDP, include the **egress-policy** statement:

**egress-policy** policy-name;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

**NOTE:** If you configure an egress policy for LDP that does not include the loopback address, it is no longer advertised in LDP. To continue to advertise the loopback address, you need to explicitly configure it as a part of the LDP egress policy.

---

The named policy (configured at the **[edit policy-options]** or **[edit logical-systems logical-system-name policy-options]** hierarchy level) is applied to all routes in the routing table. Those routes that match the policy are advertised into LDP. You can control the set of neighbors to which those prefixes are advertised by using the **export** statement. Only **from** operators are considered; you can use any valid **from** operator. For more information, see the *Junos OS Routing Protocols Configuration Guide*.

**Example: Configuring the Prefixes Advertised into LDP**

Advertise all connected routes into LDP:

```
[edit protocols]
ldp {
 egress-policy connected-only;
}
policy-options {
 policy-statement connected-only {
 from {
 protocol direct;
 }
 then accept;
 }
}
```

**Configuring FEC Deaggregation**

When an LDP egress router or switch advertises multiple prefixes, the prefixes are bound to a single label and aggregated into a single forwarding equivalence class (FEC). By default, LDP maintains this aggregation as the advertisement traverses the network.

Normally, because an LSP is not split across multiple next hops and the prefixes are bound into a single LSP, load-balancing across equal-cost paths does not occur. You can, however, load-balance across equal-cost paths if you configure a load-balancing policy and deaggregate the FECs.

Deaggregating the FECs causes each prefix to be bound to a separate label and become a separate LSP.

To configure deaggregated FECs, include the **deaggregate** statement:

```
deaggregate;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

For all LDP sessions, you can configure deaggregated FECs only globally.

Deaggregating a FEC allows the resulting multiple LSPs to be distributed across multiple equal-cost paths and distributes LSPs across the multiple next hops on the egress segments but installs only one next hop per LSP.

To aggregate FECs, include the **no-deaggregate** statement:

```
no-deaggregate;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

For all LDP sessions, you can configure aggregated FECs only globally.

### Configuring Policers for LDP FECs

---

You can configure the Junos OS to track and police traffic for LDP FECs. LDP FEC policers can be used to do any of the following:

- Track or police the ingress traffic for an LDP FEC.
- Track or police the transit traffic for an LDP FEC.
- Track or police LDP FEC traffic originating from a specific forwarding class.
- Track or police LDP FEC traffic originating from a specific virtual routing and forwarding (VRF) site.
- Discard false traffic bound for a specific LDP FEC.

To police traffic for an LDP FEC, you must first configure a filter. Specifically, you need to configure either the **interface** statement or the **interface-set** statement at the **[edit firewall family protocol-family filter filter-name term term-name from]** hierarchy level. The **interface** statement allows you to match the filter to a single interface. The **interface-set** statement allows you to match the filter to multiple interfaces.

For more information on how to configure the **interface** statement, the **interface-set** statement, and policers for LDP FECs, see the *Routing Policy Configuration Guide*.

Once you have configured the filters, you need to include them in the **policing** statement configuration for LDP. To configure policers for LDP FECs, include the **policing** statement:

```
policing {
 fec fec-address {
 ingress-traffic filter-name;
 transit-traffic filter-name;
 }
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The **policing** statement includes the following options:

- **fec**—Specify the FEC address for the LDP FEC you want to police.
- **ingress-filter**—Specify the name of the ingress traffic filter.
- **transit-traffic**—Specify the name of the transit traffic filter.

### Configuring LDP IPv4 FEC Filtering

---

By default, when a targeted LDP session is established, the Junos OS always exchanges both the IPv4 forwarding equivalence classes (FECs) and the Layer 2 circuit FECs over the targeted LDP session. For an LDP session to an indirectly connected neighbor, you

might only want to export Layer 2 circuit FECs to the neighbor if the session was specifically configured to support Layer 2 circuits or VPLS.

In a mixed vendor network where all non-BGP prefixes are advertised into LDP, the LDP database can become large. For this type of environment, it can be useful to prevent the advertisement of IPv4 FECs over LDP sessions formed because of Layer 2 circuit or LDP VPLS configuration. Similarly, it can be useful to filter any IPv4 FECs received in this sort of environment.

If all the LDP neighbors associated with an LDP session are Layer 2 only, you can configure the Junos OS to advertise only Layer 2 circuit FECs by configuring the **l2-smart-policy** statement. This feature also automatically filters out the IPv4 FECs received on this session. If you have configured an explicit export or import policy, this feature is disabled.

If one of the LDP session's neighbors is formed because of a discovered adjacency or if the adjacency is formed because of an LDP tunneling configuration on one or more RSVP LSPs, the IPv4 FECs are advertised and received using the default behavior.

To prevent LDP from exporting IPv4 FECs over LDP sessions with Layer 2 neighbors only and to filter out IPv4 FECs received over such sessions, include the **l2-smart-policy** statement:

```
l2-smart-policy;
```

For a list of hierarchy levels at which you can configure this statement, see the statement summary for this statement.

### Configuring BFD for LDP LSPs

You can configure Bidirectional Forwarding Detection (BFD) for LDP LSPs. The BFD protocol is a simple hello mechanism that detects failures in a network. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the router or switch stops receiving a reply after a specified interval. BFD works with a wide variety of network environments and topologies. The failure detection timers for BFD have shorter time limits than the failure detection mechanisms of static routes, providing faster detection.

An error is logged whenever a BFD session for a path fails. The following shows how BFD for LDP LSP log messages might appear:

```
RPD_LDP_BFD_UP: LDP BFD session for FEC 10.255.16.14/32 is up
RPD_LDP_BFD_DOWN: LDP BFD session for FEC 10.255.16.14/32 is down
```

You can also configure BFD for RSVP LSPs, as described in *Configuring BFD for MPLS IPv4 LSPs*.

The BFD failure detection timers are adaptive and can be adjusted to be more or less aggressive. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear**

**bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

To enable BFD for LDP LSPs, include the **oam** and **bfd-liveness-detection** statements:

```
oam {
 bfd-liveness-detection {
 detection-time threshold milliseconds;
 ecmp;
 failure-action {
 remove-nexthop;
 remove-route;
 }
 holddown-interval seconds;
 ingress-policy ingress-policy-name;
 minimum-interval milliseconds;
 minimum-receive-interval milliseconds;
 minimum-transmit-interval milliseconds;
 multiplier detection-time-multiplier;
 no-adaptation;
 transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }
 }
}
fec fec-address {
 bfd-liveness-detection {
 detection-time threshold milliseconds;
 ecmp;
 failure-action {
 remove-nexthop;
 remove-route;
 }
 holddown-interval milliseconds;
 ingress-policy ingress-policy-name;
 minimum-interval milliseconds;
 minimum-receive-interval milliseconds;
 minimum-transmit-interval milliseconds;
 multiplier detection-time-multiplier;
 no-adaptation;
 transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }
 }
 version (0 | 1 | automatic);
}
no-bfd-liveness-detection;
periodic-traceroute {
 disable;
 exp exp-value;
 fanout fanout-value;
 frequency minutes;
 paths number-of-paths;
 retries retry-attempts;
 source address;
```

```

 ttl ttl-value;
 wait seconds;
 }
}
lsp-ping-interval seconds;
periodic-traceroute {
 disable;
 exp exp-value;
 fanout fanout-value;
 frequency minutes;
 paths number-of-paths;
 retries retry-attempts;
 source address;
 ttl ttl-value;
 wait seconds;
}
}

```

You can enable BFD for the LDP LSPs associated with a specific forwarding equivalence class (FEC) by configuring the FEC address using the **fec** option at the **[edit protocols ldp]** hierarchy level. Alternatively, you can configure an Operation Administration and Management (OAM) ingress policy to enable BFD on a range of FEC addresses. For more information, see [“Configuring OAM Ingress Policies for LDP” on page 3559](#).

You cannot enable BFD LDP LSPs unless their equivalent FEC addresses are explicitly configured or OAM is enabled on the FECs using an OAM ingress policy. If BFD is not enabled for any FEC addresses, the BFD session will not come up.

You can configure the **oam** statement at the following hierarchy levels:

- **[edit protocols ldp]**
- **[edit logical-systems *logical-system-name* protocols ldp]**

The **oam** statement includes the following options:

- **fec**—Specify the FEC address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.
- **lsp-ping-interval**—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the **ping mpls ldp** command. For more information, see the *Junos OS Operational Mode Commands*.

The **bfd-liveness-detection** statement includes the following options:

- **ecmp**—Cause LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the **ecmp** option, you must also configure the **periodic-traceroute** statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the **periodic-traceroute** statement at the global hierarchy level (**[edit protocols ldp oam]**) while only configuring the **ecmp** option for a specific FEC (**[edit protocols ldp oam fec address bfd-liveness-detection]**).
- **holddown-interval**—Specify the duration the BFD session should remain up before adding the route or next hop. Specifying a time of 0 seconds causes the route or next hop to be added as soon as the BFD session comes back up.

- **minimum-interval**—Specify the minimum transmit and receive interval. If you configure the **minimum-interval** option, you do not need to configure the **minimum-receive-interval** option or the **minimum-transmit-interval** option.
- **minimum-receive-interval**—Specify the minimum receive interval. The range is from 1 through 255,000 milliseconds.
- **minimum-transmit-interval**—Specify the minimum transmit interval. The range is from 1 through 255,000 milliseconds.
- **multiplier**—Specify the detection time multiplier. The range is from 1 through 255.

---

### Configuring ECMP-Aware BFD for LDP LSPs

---

When you configure BFD for a FEC, a BFD session is established for only one active local next-hop for the router or switch. However, you can configure multiple BFD sessions, one for each FEC associated with a specific equal-cost multipath (ECMP) path. For this to function properly, you also need to configure LDP LSP periodic traceroute. (See [“Configuring LDP LSP Traceroute” on page 3560](#).) LDP LSP traceroute is used to discover ECMP paths. A BFD session is initiated for each ECMP path discovered. Whenever a BFD session for one of the ECMP paths fails, an error is logged.

LDP LSP traceroute is run periodically to check the integrity of the ECMP paths. The following might occur when a problem is discovered:

- If the latest LDP LSP traceroute for a FEC differs from the previous traceroute, the BFD sessions associated with that FEC (the BFD sessions for address ranges that have changed from previous run) are brought down and new BFD sessions are initiated for the destination addresses in the altered ranges.
- If the LDP LSP traceroute returns an error (for example, a timeout), all the BFD sessions associated with that FEC are torn down.

To configure LDP to establish BFD sessions for all ECMP paths configured for the specified FEC, include the **ecmp** statement.

**ecmp;**

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

Along with the **ecmp** statement, you must also include the **periodic-traceroute** statement, either in the global LDP OAM configuration (at the **[edit protocols ldp oam]** or **[edit logical-systems logical-system-name protocols ldp oam]** hierarchy level) or in the configuration for the specified FEC (at the **[edit protocols ldp oam fec address]** or **[edit logical-systems logical-system-name protocols ldp oam fec address]** hierarchy level). Otherwise, the commit operation fails.

---

### Configuring a Failure Action for the BFD Session on an LDP LSP

---

You can configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.

You can configure one of the following failure action options for the **failure-action** statement in the event of a BFD session failure on the LDP LSP:

- **remove-nexthop**—Removes the route corresponding to the next hop of the LSP's route at the ingress node when a BFD session failure event is detected.
- **remove-route**—Removes the route corresponding to the LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.

To configure a failure action in the event of a BFD session failure on an LDP LSP, include either the **remove-nexthop** option or the **remove-route** option for the **failure-action** statement:

```
failure-action {
 remove-nexthop;
 remove-route;
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Configuring the Holddown Interval for the BFD Session

You can specify the duration the BFD session should be up before adding a route or next hop by configuring the **holddown-interval** statement at either the **[edit protocols ldp oam bfd-liveness-detection]** hierarchy level or at the **[edit protocols ldp oam fec address bfd-liveness-detection]** hierarchy level. Specifying a time of 0 seconds causes the route or next hop to be added as soon as the BFD session comes back up.

```
holddown-interval seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Configuring OAM Ingress Policies for LDP

Using the **ingress-policy** statement, you can configure an Operation, Administration, and Management (OAM) policy to choose which forwarding equivalence classes (FECs) need to have OAM enabled. If the FEC passes through the policy or if the FEC is explicitly configured, OAM is enabled for a FEC. For FECs chosen using a policy, the BFD parameters configured under **[edit protocols ldp oam bfd-liveness-detection]** are applied.

You configure the OAM ingress policy at the **[edit policy-options]** hierarchy level. To configure an OAM ingress policy, include the **ingress-policy** statement:

```
ingress-policy ingress-policy-name;
```

You can configure this statement at the following hierarchy levels:

- **[edit protocols ldp oam]**
- **[edit logical-systems logical-system-name protocols ldp oam]**

## Configuring LDP LSP Traceroute

---

You can trace the route followed by an LDP-sigaled LSP. LDP LSP traceroute is based on RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*. This feature allows you to periodically trace all paths in a FEC. The FEC topology information is stored in a database accessible from the CLI.

A topology change does not automatically trigger a trace of an LDP LSP. However, you can manually initiate a traceroute. If the traceroute request is for an FEC that is currently in the database, the contents of the database are updated with the results.

The periodic traceroute feature applies to all FECs specified by the **oam** statement configured at the **[edit protocols ldp]** hierarchy level. To configure periodic LDP LSP traceroute, include the **periodic-traceroute** statement:

```
periodic-traceroute {
 disable;
 exp exp-value;
 fanout fanout-value;
 frequency minutes;
 paths number-of-paths;
 retries retry-attempts;
 source address;
 ttl ttl-value;
 wait seconds;
}
```

You can configure this statement at the following hierarchy levels:

- **[edit protocols ldp oam]**
- **[edit protocols ldp oam fec address]**

You can configure the **periodic-traceroute** statement by itself or with any of the following options:

- **exp**—Specify the class of service to use when sending probes.
- **fanout**—Specify the maximum number of next hops to search per node.
- **frequency**—Specify the interval between traceroute attempts.
- **paths**—Specify the maximum number of paths to search.
- **retries**—Specify the number of attempts to send a probe to a specific node before giving up.
- **source**—Specify the IPv4 source address to use when sending probes.
- **ttl**—Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.
- **wait**—Specify the wait interval before resending a probe packet.

## Collecting LDP Statistics

LDP traffic statistics show the volume of traffic that has passed through a particular FEC on a router.

When you configure the **traffic-statistics** statement at the **[edit protocols ldp]** hierarchy level, the LDP traffic statistics are gathered periodically and written to a file. You can configure how often statistics are collected (in seconds) by using the **interval** option. The default collection interval is 5 minutes. You must configure an LDP statistics file; otherwise, LDP traffic statistics are not gathered. If the LSP goes down, the LDP statistics are reset.

To collect LDP traffic statistics, include the **traffic-statistics** statement:

```
traffic-statistics {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 interval interval;
 no-penultimate-hop;
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

This section includes the following topics:

- [LDP Statistics Output on page 3561](#)
- [Disabling LDP Statistics on the Penultimate-Hop Router on page 3562](#)
- [LDP Statistics Limitations on page 3562](#)

### LDP Statistics Output

The following sample output is from an LDP statistics file:

| FEC               | Type    | Packets | Bytes | Shared |
|-------------------|---------|---------|-------|--------|
| 10.255.350.448/32 | Transit | 0       | 0     | No     |
|                   | Ingress | 0       | 0     | No     |
| 10.255.350.450/32 | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |
| 10.255.350.451/32 | Transit | 0       | 0     | No     |
|                   | Ingress | 0       | 0     | No     |
| 220.220.220.1/32  | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |
| 220.220.220.2/32  | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |
| 220.220.220.3/32  | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |

May 28 15:02:05, read 12 statistics in 00:00:00 seconds

The LDP statistics file includes the following columns of data:

- **Bytes**—Number of bytes of data passed by the FEC since its LSP came up.
- **FEC**—FEC for which LDP traffic statistics are collected.
- **Packets**—Number of packets passed by the FEC since its LSP came up.

- **read**—This number (which appears next to the date and time) might differ from the actual number of the statistics displayed. Some of the statistics are summarized before being displayed.
- **Shared**—A **Yes** value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.
- **Type**—Type of traffic originating from a router or switch, either **Ingress** (originating from this router or switch) or **Transit** (forwarded through this router or switch).

### *Disabling LDP Statistics on the Penultimate-Hop Router*

Gathering LDP traffic statistics at the penultimate-hop router or switch can consume excessive system resources, on next-hop routes in particular. This problem is exacerbated if you have configured the **deaggregate** statement in addition to the **traffic-statistics** statement. For routers or switches reaching their limit of next-hop route usage, we recommend configuring the **no-penultimate-hop** option for the **traffic-statistics** statement:

```
traffic-statistics {
 no-penultimate-hop;
}
```

For a list of hierarchy levels at which you can configure the **traffic-statistics** statement, see the statement summary section for this statement.

**NOTE:** When you configure the **no-penultimate-hop** option, no statistics are available for the FECs that are the penultimate hop for this router or switch.

Whenever you include or remove this option from the configuration, the LDP sessions are taken down and then restarted.

The following sample output is from an LDP statistics file showing routers or switches on which the **no-penultimate-hop** option is configured:

| FEC               | Type    | Packets             | Bytes | Shared |
|-------------------|---------|---------------------|-------|--------|
| 10.255.245.218/32 | Transit | 0                   | 0     | No     |
|                   | Ingress | 4                   | 246   | No     |
| 10.255.245.221/32 | Transit | statistics disabled |       |        |
|                   | Ingress | statistics disabled |       |        |
| 13.1.1.0/24       | Transit | statistics disabled |       |        |
|                   | Ingress | statistics disabled |       |        |
| 13.1.3.0/24       | Transit | statistics disabled |       |        |
|                   | Ingress | statistics disabled |       |        |

### *LDP Statistics Limitations*

The following are issues related to collecting LDP statistics by configuring the **traffic-statistics** statement:

- You cannot clear the LDP statistics.
- If you shorten the specified interval, a new LDP statistics request is issued only if the statistics timer expires later than the new interval.

- A new LDP statistics collection operation cannot start until the previous one has finished. If the interval is short or if the number of LDP statistics is large, the time gap between the two statistics collections might be longer than the interval.

When an LSP goes down, the LDP statistics are reset.

### Tracing LDP Protocol Traffic

The following sections describe how to configure the trace options to examine LDP protocol traffic:

- [Tracing LDP Protocol Traffic at the Protocol and Routing Instance Levels on page 3563](#)
- [Tracing LDP Protocol Traffic Within FECs on page 3564](#)
- [Examples: Tracing LDP Protocol Traffic on page 3564](#)

#### *Tracing LDP Protocol Traffic at the Protocol and Routing Instance Levels*

To trace LDP protocol traffic, you can specify options in the global **traceoptions** statement at the **[edit routing-options]** hierarchy level, and you can specify LDP-specific options by including the **traceoptions** statement:

```
traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag <flag-modifier> <disable>;
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

Use the **file** statement to specify the name of the file that receives the output of the tracing operation. All files are placed in the directory `/var/log`. We recommend that you place LDP-tracing output in the file **ldp-log**.

The following trace flags display the operations associated with the sending and receiving of various LDP messages. Each can carry one or more of the following modifiers:

- **address**—Trace the operation of address and address withdrawal messages.
- **binding**—Trace label-binding operations.
- **error**—Trace error conditions.
- **event**—Trace protocol events.
- **initialization**—Trace the operation of initialization messages.
- **label**—Trace the operation of label request, label map, label withdrawal, and label release messages.
- **notification**—Trace the operation of notification messages.
- **packets**—Trace the operation of address, address withdrawal, initialization, label request, label map, label withdrawal, label release, notification, and periodic messages. This modifier is equivalent to setting the **address**, **initialization**, **label**, **notification**, and **periodic** modifiers.

You can also configure the **filter** flag modifier with the **match-on address** sub-option for the **packets** flag. This allows you to trace based on the source and destination addresses of the packets.

- **path**—Trace label-switched path operations.
- **periodic**—Trace the operation of hello and keepalive messages.
- **route**—Trace the operation of route messages.
- **state**—Trace protocol state transitions.

### *Tracing LDP Protocol Traffic Within FECs*

LDP associates a forwarding equivalence class (FEC) with each LSP it creates. The FEC associated with an LSP specifies which packets are mapped to that LSP. LSPs are extended through a network as each router or switch chooses the label advertised by the next hop for the FEC and splices it to the label it advertises to all other routers or switches.

You can trace LDP protocol traffic within a specific FEC and filter LDP trace statements based on an FEC. This is useful when you want to trace or troubleshoot LDP protocol traffic associated with an FEC. The following trace flags are available for this purpose: **route**, **path**, and **binding**.

The following example illustrates how you might configure the LDP **traceoptions** statement to filter LDP trace statements based on an FEC:

```
[edit protocols ldp traceoptions]
set flag route filter match-on fec policy "filter-policy-for-ldp-fec";
```

This feature has the following limitations:

- The filtering capability is only available for FECs composed of IP version 4 (IPv4) prefixes.
- Layer 2 circuit FECs cannot be filtered.
- When you configure both route tracing and filtering, MPLS routes are not displayed (they are blocked by the filter).
- Filtering is determined by the policy and the configured value for the **match-on** option. When configuring the policy, be sure that the default behavior is always **reject**.
- The only **match-on** option is **fec**. Consequently, the only type of policy you should include is a route-filter policy.

### *Examples: Tracing LDP Protocol Traffic*

Trace LDP path messages in detail:

```
[edit]
protocols {
 ldp {
 traceoptions {
 file ldp size 10m files 5;
 flag path;
```

```

 }
 }
}

```

Trace all LDP outgoing messages:

```

[edit]
protocols {
 ldp {
 traceoptions {
 file ldp size 10m files 5;
 flag packets;
 }
 }
}

```

Trace all LDP error conditions:

```

[edit]
protocols {
 ldp {
 traceoptions {
 file ldp size 10m files 5;
 flag error;
 }
 }
}

```

Trace all LDP incoming messages and all label-binding operations:

```

[edit]
protocols {
 ldp {
 traceoptions {
 file ldp size 10m files 5 world-readable;
 flag packets receive;
 flag binding;
 }
 interface all {
 }
 }
}

```

Trace LDP protocol traffic for an FEC associated with the LSP:

```

[edit]
protocols {
 ldp {
 traceoptions {
 flag route filter match-on fec policy filter-policy-for-ldp-fec;
 }
 }
}

```

### Standard Firewall Filter Match Conditions for MPLS Traffic

You can configure a standard stateless firewall filter with match conditions for MPLS traffic (**family mpls**).

**NOTE:** The input-list *filter-names* and output-list *filter-names* statements for firewall filters for the mpls protocol family are supported on all interfaces with the exception of management interfaces and internal Ethernet interfaces (fxp or em0), loopback interfaces (lo0), and USB modem interfaces (umd).

Table 270 on page 3566 describes the *match-conditions* you can configure at the [edit firewall family mpls filter *filter-name* term *term-name* from] hierarchy level.

**Table 270: Standard Firewall Filter Match Conditions for MPLS Traffic**

| Match Condition                                | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>apply-groups</b>                            | Specify which groups to inherit configuration data from. You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups.                                                                                                                                                                   |
| <b>apply-groups-except</b>                     | Specify which groups not to inherit configuration data from. You can specify more than one group name.                                                                                                                                                                                                                                                                                                                 |
| <b>exp <i>number</i></b>                       | Experimental (EXP) bit number or range of bit numbers in the MPLS header. For <i>number</i> , you can specify one or more values from 0 through 7 in decimal, binary, or hexadecimal format.<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport switches.                                                                                                                        |
| <b>exp-except <i>number</i></b>                | Do not match on the EXP bit number or range of bit numbers in the MPLS header. For <i>number</i> , you can specify one or more values from 0 through 7.<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport switches.                                                                                                                                                             |
| <b>forwarding-class <i>class</i></b>           | Forwarding class. Specify <b>assured-forwarding</b> , <b>best-effort</b> , <b>expedited-forwarding</b> , or <b>network-control</b> .                                                                                                                                                                                                                                                                                   |
| <b>forwarding-class-except <i>class</i></b>    | Do not match on the forwarding class. Specify <b>assured-forwarding</b> , <b>best-effort</b> , <b>expedited-forwarding</b> , or <b>network-control</b> .                                                                                                                                                                                                                                                               |
| <b>interface <i>interface-name</i></b>         | Interface on which the packet was received. You can configure a match condition that matches packets based on the interface on which they were received.<br><br><b>NOTE:</b> If you configure this match condition with an interface that does not exist, the term does not match any packet.                                                                                                                          |
| <b>interface-set <i>interface-set-name</i></b> | Match the interface on which the packet was received to the specified interface set.<br><br>To define an interface set, include the <b>interface-set</b> statement at the [edit firewall] hierarchy level.<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport switches.<br><br>For more information, see “Filtering Packets Received on an Interface Set Overview” on page 4515. |
| <b>ip-version <i>number</i></b>                | (Interfaces on Enhanced Scaling flexible PIC concentrators [FPCs] on supported T Series routers only) Inner IP version. To match MPLS-tagged IPv4 packets, match on the text synonym <b>ipv4</b> .<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport switches.                                                                                                                  |

Table 270: Standard Firewall Filter Match Conditions for MPLS Traffic (*continued*)

| Match Condition                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loss-priority level</b>        | <p>Match the packet loss priority (PLP) level.</p> <p>Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers and EX Series switches.</p> <p>For IP traffic on M320, MX Series, T Series routers with Enhanced II Flexible PIC Concentrators (FPCs) and EX Series switches, you must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p>For information about the <b>tri-color</b> statement and for information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see the <i>Junos OS Class of Service Configuration Guide</i>.</p> |
| <b>loss-priority-except level</b> | <p>Do not match the PLP level. For details, see the <b>loss-priority</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuration Statements

- [\[edit protocols bgp\] Hierarchy Level on page 3567](#)
- [\[edit protocols ldp\] Hierarchy Level on page 3573](#)
- [\[edit protocols mpls\] Hierarchy Level on page 3575](#)

### [\[edit protocols bgp\] Hierarchy Level](#)

Several statements in the **[edit protocols mpls]** hierarchy are valid at numerous locations within it. To make the complete hierarchy easier to read, the repeated statements are listed in “[Common BGP Family Options](#)” on page 369 and that section is referenced at the appropriate locations in “[Complete \[edit protocols bgp\] Hierarchy](#)” on page 369.

- [Common BGP Family Options on page 3567](#)
- [Complete \[edit protocols bgp\] Hierarchy on page 3568](#)

### **Common BGP Family Options**

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit protocols bgp\] Hierarchy](#)” on page 369 instead of the statements being repeated.

- **[edit protocols bgp family inet (any | flow | labeled-unicast | multicast | unicast)]**
- **[edit protocols bgp family inet6 (any | labeled-unicast | multicast | unicast)]**

- [edit protocols bgp family (inet-mdt | inet-mvpn | inet6-mvpn | l2vpn) signaling]
- [edit protocols bgp family inet-vpn (any | flow | multicast | unicast)]
- [edit protocols bgp family inet6-vpn (any | multicast | unicast)]
- [edit protocols bgp family iso-vpn unicast]

The common BGP family options are as follows:

```
accepted-prefix-limit {
 maximum number;
 teardown <percentage> <idle-timeout (forever | minutes)>;
}
damping;
loops number;
prefix-limit {
 maximum number;
 teardown <percentage> <idle-timeout (forever | minutes)>;
}
rib-group group-name;
topology name {
 community {
 target identifier;
 }
}
```

#### **Complete [edit protocols bgp] Hierarchy**

The statement hierarchy listed in this section can also be included at the [edit logical-systems *logical-system-name*] hierarchy level.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                              |
| <b>Description</b>              | Ignore the LDP subnet check. For Junos OS Release 8.4 and later releases, an LDP source address subnet check was added for the neighbor establishment procedure. The source address in the LDP link hello packet is matched against the interface address. |
| <b>Default</b>                  | The source address in the LDP link hello packet is matched against the interface address.                                                                                                                                                                  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                        |

---

## deaggregate

---

**Syntax** deaggregate | no-deaggregate;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
[edit protocols ldp],  
[edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Control forwarding equivalence class (FEC) deaggregation on the router. The use of the **deaggregate** statement in LDP is a standard practice that we recommend for LDP deployments.

**Default** Deaggregation is disabled on the router or switch.

**Options** **deaggregate**—Deaggregate FECs.  
**no-deaggregate**—Aggregate FECs.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Allows LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the <b>ecmp</b> statement, you must also configure the <b>periodic-traceroute</b> statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the <b>periodic-traceroute</b> statement at the global hierarchy level ([edit protocols ldp oam]) while only configuring the <b>ecmp</b> statement for a specific FEC ([edit protocols ldp oam fec address bfd-liveness-detection]). |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.                                                                                                                            |
| <b>Options</b>                  | <p><b>remove-nexthop</b>—Remove a route corresponding to a next hop of the LSP's route at the ingress node when a BFD session failure event is detected.</p> <p><b>remove-route</b>—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                     |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring a Failure Action for the BFD Session on an LDP LSP on page 3558</a></li> </ul>                                                                                                                                                                                                                                                                                    |

**Release Information**    Statement introduced in Junos OS Release 8.5.  
                              Statement introduced in Junos OS Release 12.2 for EX Series switches.

**Description**    Allows you to configure BFD for a specific LDP forwarding equivalence class (FEC).

**Options**    *fec-address*—Specify the FEC address.  
  
              The other statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Support for LDP targeted hellos added in Junos OS Release 9.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Control the LDP timer that regulates how often hello messages are sent. You can control the rate both link hello messages and targeted hello messages are sent depending on the hierarchy level at which you configure the <b>hello-interval</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <b><i>seconds</i></b> —Length of time between transmission of hello packets.<br><b>Range:</b> 1 through 65,535 seconds<br><b>Default:</b> 5 seconds for link hello messages, 15 seconds for targeted hello messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Support for LDP targeted hellos added in Junos OS Release 9.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Specify how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. You can specify times for both link hello messages and targeted hello messages depending on the hierarchy level at which you configure the <b>hold-time</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for EX Series switches.

**Description** Enable LDP routing on the router or switch.

You must include the **ldp** statement in the configuration to enable LDP on the router or switch.

**Default** LDP is disabled on the router.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Configures make before break (MBB) for multicast LDP (MLDP) link protection to ensure minimum packet loss when attempting to signal a new label-switched path (LSP) before tearing down the old LSP path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>timeout <i>seconds</i></b>—Specify a value to change a make -before-break timeout for point-to-multipoint LSPs. Even if an MBB acknowledgment is not received for a point-to-multipoint LSP before the specified timeout period expires, the label-switching router (LSR) performs an MBB switchover from the old LSR to the new upstream LSR.</p> <p><b>Range:</b> 1 through 300 seconds</p> <p><b>Default:</b> 30 seconds</p> <p><b>switchover-delay <i>seconds</i></b>—Specify a value to change switchover delay for a point-to-multipoint LSP from the old LSR to the new upstream LSR. If an MBB acknowledgment is received on a point of local repair (PLR) router, the PLR waits for the specified seconds to switch its upstream LSR from the old LSR to the new LSR.</p> <p><b>Range:</b> 1 through 300 seconds</p> <p><b>Default:</b> 30 seconds</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

                  ttl *ttl-value*;  
                  wait *seconds*;  
              }  
          }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols ldp]  
                          [edit protocols ldp]

**Release Information**    Statement introduced in Junos OS Release 7.6.  
                          lsp-ping-interval option introduced in Junos OS Release 9.4.

**Description**    Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

**Options**    **fec *fec-address***—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

**lsp-ping-interval *seconds***—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the **ping mpls ldp** command.

**Default:** 60 seconds

**Range:** 30 through 3,600 seconds

The remaining statements are explained separately.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## p2mp (Protocols LDP)

**Syntax** p2mp;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
 [edit protocols ldp],  
 [edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced in Junos OS Release 11.2.

**Description** Enable point-to-multipoint MPLS LSPs in an LDP-signaled LSP.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>         | Enable tracing of forwarding equivalence classes (FECs) for LDP LSPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable tracing for a specific FEC. This option is available at the [edit protocols ldp oam fec <i>fec-address</i> periodic-traceroute] and [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>fec-address</i> periodic-traceroute] hierarchy levels only.</p> <p><b>exp <i>exp-value</i></b>—(Optional) Specify the class of service to use when sending probes.<br/><b>Default:</b> 7<br/><b>Range:</b> 0 through 7</p> <p><b>fanout <i>fanout-value</i></b>—(Optional) Specify the maximum number of next hops to search per node.<br/><b>Default:</b> 16<br/><b>Range:</b> 1 through 16</p> <p><b>frequency <i>minutes</i></b>—(Optional) Specify the interval between traceroute attempts.<br/><b>Default:</b> 60 minutes<br/><b>Range:</b> 15 through 120 minutes</p> <p><b>paths <i>number-of-paths</i></b>—(Optional) Specify the maximum number of paths to search.<br/><b>Default:</b> 3<br/><b>Range:</b> 1 through 255</p> |

**retries** *retry-attempts*—(Optional) Specify the number of attempts to send a probe to a specific node before giving up.

**Default:** 3

**Range:** 1 through 9

**source address**—(Optional) Specify the IPv4 source address to use when sending probes.

**ttl value**—(Optional) Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.

**Default:** 64

**Range:** 1 through 255

**wait seconds**—(Optional) Specify the wait interval before resending a probe packet.

**Default:** 10 seconds

**Range:** 5 though 15 seconds

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.<br/> <b>match-on address</b> option for the <b>filter</b> flag modifier added in Junos OS Release 10.4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>         | LDP protocol-level trace options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>             | The default LDP protocol-level trace options are inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>ldp-log</b>. We recommend that you place LDP tracing output in the file <b>ldp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000<br/> <b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"> <li>• <b>address</b>—Operation of address and address withdrawal messages</li> <li>• <b>binding</b>—Label-binding operations</li> <li>• <b>error</b>—Error conditions</li> <li>• <b>event</b>—Protocol events</li> <li>• <b>initialization</b>—Operation of initialization messages</li> </ul> |

- **label**—Operation of label request, label map, label withdrawal, and label release messages
- **notification**—Operation of notification messages
- **packets**—Equivalent to setting **address**, **initialization**, **label**, **notification**, and **periodic** flags (see also the **filter** flag modifier)
- **path**—Label-switched path operations
- **periodic**—Operation of hello and keepalive messages
- **route**—Operation of route messages
- **state**—Protocol state transitions

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable this trace flag.
- **filter**—Filter to apply to this flag. The **filter** flag modifier can be applied only to the **route**, **path**, and **binding** flags. This flag modifier has the following options:
  - **match-on**—Match on argument specified. The **match-on** option has the following suboptions:
    - **address**—Filter based on the source and destination addresses of packets. Available for the **packets** flag option only.
    - **fec**—Filter based on the FEC associated with the traced object.
  - **policy *policy-name***—Specify the filter policy.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## track-igp-metric

**Syntax** track-igp-metric;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
[edit protocols ldp],  
[edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | LDP traffic statistics display the amount of traffic passed through a router or switch for a particular FEC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the LDP statistics operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of LDP statistics files. When a statistics file named <b><i>ldp-stat</i></b> reaches its maximum size, it is renamed <b><i>ldp-stat.0</i></b>, then <b><i>ldp-stat.1</i></b>, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must include the <b>size</b> statement to specify the maximum file size.</p> <p><b>interval <i>seconds</i></b>—(Optional) Specify the interval at which the statistics are polled and written to the file.</p> <p><b>Default:</b> 300 seconds (5 minutes)</p> <p><b>no-penultimate-hop</b>—(Optional) Do not collect traffic statistics on the penultimate hop router.</p> <p><b>no-world-readable</b>—(Optional) Prevent all users from reading the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named <b><i>ldp-stat</i></b> reaches this size, it is renamed <b><i>ldp-stat.0</i></b>. When <b><i>ldp-stat</i></b> again reaches this size, <b><i>ldp-stat.0</i></b> is renamed <b><i>ldp-stat.1</i></b> and <b><i>ldp-stat</i></b> is renamed <b><i>ldp-stat.0</i></b>. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.</p> <p><b>Syntax:</b> <i>xk</i> to specify KB, <i>xm</i> to specify MB, or <i>xg</i> to specify GB</p> <p><b>Range:</b> 10 KB through the maximum file size supported on your system</p> <p><b>Default:</b> 1 MB</p> |

If you specify a maximum file size, you also must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## Operational Commands

## ping mpls ldp

---

**Syntax**    ping mpls ldp *fec*  
              <count *count*>  
              <destination *address*>  
              <detail>  
              <exp *forwarding-class*>  
              <instance *routing-instance-name*>  
              <logical-system (all | *logical-system-name*)>  
              <p2mp root-addr *ip-address* lsp-id *identifier*>  
              <size *bytes*>  
              <source *source-address*>  
              <sweep>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                          Command introduced in Junos OS Release 9.0 for EX Series switches.  
                          **size** and **sweep** options introduced in Junos OS Release 9.6.  
                          **instance** option introduced in Junos OS Release 10.0.  
                          **p2mp**, **root-address**, and **lsp-id** options introduced in Junos OS Release 11.2.

**Description**    Check the operability of MPLS LDP-signaled label-switched path (LSP) connections.  
                  Type Ctrl+c to interrupt a **ping mpls** command.

**Options**    **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through **1,000,000**. The default value is **5**.

**destination** *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**fec**—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

**instance** *routing-instance-name*—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**p2mp root-addr** *ip-address* **lsp-id** *identifier*—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

**size** *bytes*—(Optional) Size of the LSP ping request packet (**88** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *Junos OS MPLS Applications Configuration Guide*.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls ldp fec count on page 3619](#)  
[ping mpls ldp p2mp root-addr lsp-id on page 3619](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- 1sping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

### ping mpls ldp p2mp root-addr lsp-id

```
user@host> ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1

|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>State</b> | State of the label binding: <ul style="list-style-type: none"> <li>• <b>Active</b>—Label binding has been installed and distributed appropriately. A label binding is almost always in this state.</li> <li>• <b>New</b>—New label that has not yet been distributed. <ul style="list-style-type: none"> <li>• <b>MapRcv</b>—Waiting to receive a label mapping message.</li> <li>• <b>MapSend</b>—Waiting to send a label mapping message.</li> <li>• <b>RelRcv</b>—Waiting to receive a label release message.</li> <li>• <b>RelRsnd</b>—Waiting to receive a label release message before resending label mapping message.</li> <li>• <b>RelSend</b>—Waiting to send a label release message.</li> <li>• <b>ReqSend</b>—Waiting to send a label request message.</li> <li>• <b>W/dSend</b>—Waiting to send a label withdrawal message.</li> </ul> </li> </ul> | <b>detail</b>   |
| <b>Age</b>   | Time elapsed since the binding was created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>   |

## Sample Output

### show ldp database

```

user@host> show ldp database
Input label database, 10.255.245.222:0--10.255.245.221:0
 Label Prefix
 3 10.255.245.221/32 (Stale)
100018 10.255.245.222/32
100011 L2CKT FRAME RELAY VC 11
Output label database, 10.255.245.222:0--10.255.245.221:0
 Label Prefix
 3 10.255.245.221/32
100018 10.255.245.222/32
100011 L2CKT FRAME RELAY VC 1

```

### show ldp database l2circuit detail

```

user@host> show ldp database l2circuit detail
Input label database, 10.255.245.44:0--10.255.245.45:0
 Label Prefix
 100176 L2CKT CtrlWord ATM CELL (VC Mode) VC 100
 Cell bundle size: 80
 State: Active
 Age: 9:48
 100256 L2CKT CtrlWord FRAME RELAY VC 101
 MTU: 4470
 State: Active
 Age: 9:48

Output label database, 10.255.245.44:0--10.255.245.45:0
 Label Prefix
 100048 L2CKT CtrlWord ATM CELL (VC Mode) VC 100
 Cell bundle size: 80
 State: Active
 Age: 9:48
 100112 L2CKT CtrlWord FRAME RELAY VC 101

```

MTU: 4470  
State: Active  
Age: 9:48

#### show ldp database session

```
user@host> show ldp database session 10.1.1.195
Input label database, 10.0.0.194:0--10.1.1.195:0
 Label Prefix
100002 10.255.245.197/32
100003 10.255.245.196/32
100004 10.0.0.194/32
 3 10.1.1.195/32
100000 L2CKT NoCtrlWord FRAME RELAY VC 1
100001 L2CKT CtrlWord FRAME RELAY VC 2
Output label database, 10.0.0.194:0--10.1.1.195:0
 Label Prefix
100003 10.255.245.197/32
100004 10.1.1.195/32
100002 10.255.245.196/32
 3 10.0.0.194/32
100000 L2CKT CtrlWord FRAME RELAY VC 2
100001 L2CKT NoCtrlWord FRAME RELAY VC 1
```

## show ldp session

| <b>Description</b>              | Display Label Distribution Protocol (LDP) traffic statistics.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>none</b>—Display LDP traffic statistics for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display LDP traffic statistics for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>p2mp</b>—(Optional) Display only the data traffic statistics for a point-to-multipoint LSP.</p> |
| <b>Additional Information</b>   | To obtain output from this command, you must configure the <b>traffic-statistics</b> statement for the LDP protocol. For more information, see the <i>Junos MPLS Applications Configuration Guide</i> .                                                                                                                                                                                                                                                                       |

**Table 273: show ldp traffic-statistics Output Fields**

| Field Name   | Field Description                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message type | LDP message types.                                                                                                                                                                                     |
| FEC          | <p>Forwarding equivalence class (FEC) for which LDP traffic statistics are collected.</p> <p>For P2MP LSPs, FEC appears as a combination of root address and the LSP ID (<b>root_addr:lsp_id</b>).</p> |
| Type         | Type of traffic originating from a router, either <b>Ingress</b> (originating from this router) or <b>Transit</b> (forwarded through this router).                                                     |
| Packets      | Number of packets passed by the FEC since its LSP came up.                                                                                                                                             |

Table 273: show ldp traffic-statistics Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bytes</b>   | Number of bytes of data passed by the FEC since its LSP came up.                                                                                                                                                                                                                                                             |
| <b>Shared</b>  | Whether a label is shared by prefixes: <b>Yes</b> or <b>No</b> . A <b>Yes</b> value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such. |
| <b>Nexthop</b> | The next hop address for P2MP LSPs.                                                                                                                                                                                                                                                                                          |

## Sample Output

### show ldp traffic-statistics

```
user@host> show ldp traffic-statistics
```

| FEC               | Type    | Packets | Bytes | Shared |
|-------------------|---------|---------|-------|--------|
| 10.35.3.0/30      | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |
| 10.35.10.1/32     | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |
| 10.255.245.214/32 | Transit | 0       | 0     | No     |
|                   | Ingress | 11      | 752   | No     |
| 192.168.37.36/30  | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |

| FEC(root_addr:lsp_id)  | Nexthop      | Packets | Bytes    | Shared |
|------------------------|--------------|---------|----------|--------|
| 10.255.72.160:16777217 | 192.168.8.81 | 152056  | 14597376 | No     |
|                        | 192.168.8.1  | 152056  | 14597376 | No     |
|                        | 192.168.8.65 | 152056  | 14597376 | No     |

### show ldp traffic-statistics p2mp

```
user@host> show ldp traffic-statistics p2mp
```

| FEC(root_addr:lsp_id)  | Nexthop      | Packets | Bytes    | Shared |
|------------------------|--------------|---------|----------|--------|
| 10.255.72.160:16777217 | 192.168.8.81 | 152056  | 14597376 | No     |
|                        | 192.168.8.1  | 152056  | 14597376 | No     |
|                        | 192.168.8.65 | 152056  | 14597376 | No     |

## show ldp session

### Multicast Overview

---

IP has three fundamental types of addresses: unicast, broadcast, and multicast. A *unicast address* is used to send a packet to a single destination. A *broadcast address* is used to send a datagram to an entire subnetwork. A *multicast address* is used to send a datagram to a set of hosts that can be on different subnetworks and that are configured as members of a multicast group.

A multicast datagram is delivered to destination group members with the same best-effort reliability as a standard unicast IP datagram. This means that multicast datagrams are not guaranteed to reach all members of a group or to arrive in the same order in which they were transmitted. The only difference between a multicast IP packet and a unicast IP packet is the presence of a group address in the IP header destination address field. Multicast addresses use the Class D address format.

Individual hosts can join or leave a multicast group at any time. There are no restrictions on the physical location or the number of members in a multicast group. A host can be a member of more than one multicast group at any time. A host does not have to belong to a group to send packets to members of a group.

routing devices use a group membership protocol to learn about the presence of group members on directly attached subnetworks. When a host joins a multicast group, it transmits a group membership protocol message for the group or groups that it wants to receive and sets its IP process and network interface card to receive frames addressed to the multicast group.

### Comparing Multicast to Unicast

The Junos® operating system (Junos OS) routing protocol process supports a wide variety of routing protocols. These routing protocols carry network information among routing devices not only for *unicast* traffic streams sent between one pair of clients and servers, but also for *multicast* traffic streams containing video, audio, or both, between a single server source and many client receivers. The routing protocols used for multicast differ in many key ways from unicast routing protocols.

Information is delivered over a network by three basic methods: unicast, broadcast, and multicast.

The differences among unicast, broadcast, and multicast can be summarized as follows:

- Unicast: One-to-one, from one source to one destination.
- Broadcast: One-to-all, from one source to all possible destinations.
- Multicast: One-to-many, from one source to multiple destinations expressing an interest in receiving the traffic.

**NOTE:** This list does not include a special category for many-to-many applications, such as online gaming or videoconferencing, where there are many sources for the same receiver and where receivers often double as sources. Many-to-many is a service model that repeatedly employs one-to-many multicast and therefore requires no unique protocol. The original multicast specification, RFC 1112, supports both the any-source multicast (ASM) many-to-many model and the source-specific multicast (SSM) one-to-many model.

With unicast traffic, many streams of IP packets that travel across networks flow from a single source, such as a website server, to a single destination such as a client PC. Unicast traffic is still the most common form of information transfer on networks.

Broadcast traffic flows from a single source to all possible destinations reachable on the network, which is usually a LAN. Broadcasting is the easiest way to make sure traffic reaches its destinations.

Television networks use broadcasting to distribute video and audio. Even if the television network is a cable television (CATV) system, the source signal reaches all possible destinations, which is the main reason that some channels' content is scrambled. Broadcasting is not feasible on the Internet because of the enormous amount of unnecessary information that would constantly arrive at each end user's device, the complexities and impact of scrambling, and related privacy issues.

Multicast traffic lies between the extremes of unicast (one source, one destination) and broadcast (one source, all destinations). Multicast is a "one source, many destinations" method of traffic distribution, meaning only the destinations that explicitly indicate their need to receive the information from a particular source receive the traffic stream.

On an IP network, because destinations (clients) do not often communicate directly with sources (servers), the routing devices between source and destination must be able to determine the topology of the network from the unicast or multicast perspective to avoid routing traffic haphazardly. Multicast routing devices replicate packets received on one input interface and send the copies out on multiple output interfaces.

In IP multicast, the source and destination are almost always hosts and not routing devices. Multicast routing devices distribute the multicast traffic across the network from source to destinations. The multicast routing device must find multicast sources on the network, send out copies of packets on several interfaces, prevent routing loops, connect interested destinations with the proper source, and keep the flow of unwanted packets to a minimum. Standard multicast routing protocols provide most of these capabilities, but some router architectures cannot send multiple copies of packets and so do not support multicasting directly.

### ***IP Multicast Uses***

Multicast allows an IP network to support more than just the unicast model of data delivery that prevailed in the early stages of the Internet. Multicast, originally defined as a host extension in RFC 1112 in 1989, provides an efficient method for delivering traffic flows that can be characterized as one-to-many or many-to-many.

Unicast traffic is not strictly limited to data applications. Telephone conversations, wireless or not, contain digital audio samples and might contain digital photographs or even video and still flow from a single source to a single destination. In the same way, multicast traffic is not strictly limited to multimedia applications. In some data applications, the flow of traffic is from a single source to many destinations that require the packets, as in a news or stock ticker service delivered to many PCs. For this reason, the term *receiver* is preferred to *listener* for multicast destinations, although both terms are common.

Network applications that can function with unicast but are better suited for multicast include collaborative groupware, teleconferencing, periodic or “push” data delivery (stock quotes, sports scores, magazines, newspapers, and advertisements), server or website replication, and distributed interactive simulation (DIS) such as war simulations or virtual reality. Any IP network concerned with reducing network resource overhead for one-to-many or many-to-many data or multimedia applications with multiple receivers benefits from multicast.

If unicast were employed by radio or news ticker services, each radio or PC would have to have a separate traffic session for each listener or viewer at a PC (this is actually the method for some Web-based services). The processing load and bandwidth consumed by the server would increase linearly as more people “tune in” to the server. This is extremely inefficient when dealing with the global scale of the Internet. Unicast places the burden of packet duplication on the server and consumes more and more backbone bandwidth as the number of users grows.

If broadcast were employed instead, the source could generate a single IP packet stream using a broadcast destination address. Although broadcast eliminates the server packet duplication issue, this is not a good solution for IP because IP broadcasts can be sent only to a single subnetwork, and IP routing devices normally isolate IP subnetworks on

separate interfaces. Even if an IP packet stream could be addressed to literally go everywhere, and there were no need to “tune” to any source at all, broadcast would be extremely inefficient because of the bandwidth strain and need for uninterested hosts to discard large numbers of packets. Broadcast places the burden of packet rejection on each host and consumes the maximum amount of backbone bandwidth.

For radio station or news ticker traffic, multicast provides the most efficient and effective outcome, with none of the drawbacks and all of the advantages of the other methods. A single source of multicast packets finds its way to every *interested* receiver. As with broadcast, the transmitting host generates only a single stream of IP packets, so the load remains constant whether there is one receiver or one million. The network routing devices replicate the packets and deliver the packets to the proper receivers, but only the replication role is a new one for routing devices. The links leading to subnets consisting of entirely uninterested receivers carry no multicast traffic. Multicast minimizes the burden placed on sender, network, and receiver.

### ***IP Multicast Terminology***

Multicast has its own particular set of terms and acronyms that apply to IP multicast routing devices and networks. [Figure 80 on page 3641](#) depicts some of the terms commonly used in an IP multicast network.

In a multicast network, the key component is the *routing device*, which is able to replicate packets and is therefore multicast-capable. The routing devices in the IP multicast network, which has exactly the same topology as the unicast network it is based on, use a *multicast routing protocol* to build a *distribution tree* that connects receivers (preferred to the multimedia implications of listeners, but listeners is also used) to *sources*. In multicast terminology, the distribution tree is *rooted at the source* (the root of the distribution tree is the source). The interface on the routing device leading toward the source is the *upstream* interface, although the less precise terms *incoming* or *inbound* interface are used as well. To keep bandwidth use to a minimum, it is best for only one upstream interface on the routing device to receive multicast packets. The interface on the routing device leading toward the receivers is the *downstream* interface, although the less precise terms *outgoing* or *outbound* interface are used as well. There can be 0 to  $N-1$  downstream interfaces on a routing device, where  $N$  is the number of logical interfaces on the routing device. To prevent looping, the upstream interface must never receive copies of downstream multicast packets.

Figure 80: Multicast Terminology in an IP Network

Routing loops are disastrous in multicast networks because of the risk of repeatedly replicated packets. One of the complexities of modern multicast routing protocols is the need to avoid routing loops, packet by packet, much more rigorously than in unicast routing protocols. Three multicast strategies—reverse-path forwarding (RPF), shortest-path tree (SPT), and administrative scoping—help prevent routing loops by defining routing paths in different ways.

#### ***Reverse-Path Forwarding for Loop Prevention***

The routing device's multicast forwarding state runs more logically based on the reverse path, from the receiver back to the root of the distribution tree. In RPF, every multicast packet received must pass an RPF check before it can be replicated or forwarded on any interface. When it receives a multicast packet on an interface, the routing device verifies that the *source* address in the multicast IP packet is the *destination* address for a unicast IP packet back to the source.

If the outgoing interface found in the unicast routing table is the same interface that the multicast packet was received on, the packet passes the RPF check. Multicast packets that fail the RPF check are dropped, because the incoming interface is not on the shortest path back to the source. routing devices can build and maintain separate tables for RPF purposes.

#### ***Shortest-Path Tree for Loop Prevention***

The distribution tree used for multicast is rooted at the source and is the shortest-path tree (SPT), but this path can be long if the source is at the periphery of the network. Providing a *shared tree* on the backbone as the distribution tree locates the multicast source more centrally in the network. Shared distribution trees with roots in the core network are created and maintained by a multicast routing device operating as a rendezvous point (RP), a feature of sparse mode multicast protocols.

### ***Administrative Scoping for Loop Prevention***

Scoping limits the routing devices and interfaces that can forward a multicast packet. Multicast scoping is *administrative* in the sense that a range of multicast addresses is reserved for scoping purposes, as described in RFC 2365, *Administratively Scoped IP Multicast*. routing devices at the boundary must filter multicast packets and ensure that packets do not stray beyond the established limit.

### ***Multicast Leaf and Branch Terminology***

Each subnetwork with hosts on the routing device that has at least one interested receiver is a *leaf* on the distribution tree. routing devices can have multiple leaves on different interfaces and must send a copy of the IP multicast packet out on each interface with a leaf. When a new leaf subnetwork is added to the tree (that is, the interface to the host subnetwork previously received no copies of the multicast packets), a new *branch* is built, the leaf is joined to the tree, and replicated packets are sent out on the interface. The number of leaves on a particular interface does not affect the routing device. The action is the same for one leaf or a hundred.

**NOTE:** On Juniper Networks security devices, if the maximum number of leaves on a multicast distribution tree is exceeded, multicast sessions are created up to the maximum number of leaves, and any multicast sessions that exceed the maximum number of leaves are ignored. The maximum number of leaves on a multicast distribution tree is device specific.

---

When a branch contains no leaves because there are no interested hosts on the routing device interface leading to that IP subnetwork, the branch is *pruned* from the distribution tree, and no multicast packets are sent out that interface. Packets are replicated and sent out multiple interfaces only where the distribution tree branches at a routing device, and no link ever carries a duplicate flow of packets.

Collections of hosts all receiving the same stream of IP packets, usually from the same multicast source, are called *groups*. In IP multicast networks, traffic is delivered to multicast groups based on an IP multicast address, or *group address*. The groups determine the location of the leaves, and the leaves determine the branches on the multicast network.

### ***IP Multicast Addressing***

Multicast uses the Class D IP address range (224.0.0.0 through 239.255.255.255). Class D addresses are commonly referred to as *multicast addresses* because the entire classful address concept is obsolete. Multicast addresses can never appear as the source address in an IP packet and can only be the destination of a packet.

Multicast addresses usually have a prefix length of /32, although other prefix lengths are allowed. Multicast addresses represent logical groupings of receivers and not physical collections of devices. Blocks of multicast addresses can still be described in terms of prefix length in traditional notation, but only for convenience. For example, the multicast address range from 232.0.0.0 through 232.255.255.255 can be written as 232.0.0.0/8 or 232/8.

Internet service providers (ISPs) do not typically allocate multicast addresses to their customers because multicast addresses relate to content, not to physical devices. Receivers are not assigned their own multicast addresses, but need to know the multicast address of the content. Sources need to be assigned multicast addresses only to produce the content, not to identify their place in the network. Every source and receiver still needs an ordinary, unicast IP address.

Multicast addressing most often references the receivers, and the source of multicast content is usually not even a member of the multicast group for which it produces content. If the source needs to monitor the packets it produces, monitoring can be done locally, and there is no need to make the packets traverse the network.

Many applications have been assigned a range of multicast addresses for their own use. These applications assign multicast addresses to sessions created by that application. You do not usually need to statically assign a multicast address, but you can do so.

### ***Multicast Addresses***

Multicast host group addresses are defined to be the IP addresses whose high-order four bits are 1110, giving an address range from 224.0.0.0 through 239.255.255.255, or simply 224.0.0.0/4. (These addresses also are referred to as Class D addresses.)

The Internet Assigned Numbers Authority (IANA) maintains a list of registered IP multicast groups. The base address 224.0.0.0 is reserved and cannot be assigned to any group. The block of multicast addresses from 224.0.0.1 through 224.0.0.255 is reserved for local wire use. Groups in this range are assigned for various uses, including routing protocols and local discovery mechanisms.

The range from 239.0.0.0 through 239.255.255.255 is reserved for administratively scoped addresses. Because packets addressed to administratively scoped multicast addresses do not cross configured administrative boundaries, and because administratively scoped multicast addresses are locally assigned, these addresses do not need to be unique across administrative boundaries.

### ***Layer 2 Frames and IPv4 Multicast Addresses***

Multicasting on a LAN is a good place to start an investigation of multicasting at Layer 2. At Layer 2, multicast deals with media access control (MAC) frames and addresses instead of IPv4 or IPv6 packets and addresses. Consider a single LAN, without routing devices, with a multicast source sending to a certain group. The rest of the hosts are receivers interested in the multicast group's content. So the multicast source host generates packets with its unicast IP address as the source, and the multicast group address as the destination.

Which MAC addresses are used on the frame containing this packet? The packet source address—the unicast IP address of the host originating the multicast content—translates easily and directly to the MAC address of the source. But what about the packet's destination address? This is the IP multicast group address. Which destination MAC address for the frame corresponds to the packet's multicast group address?

One option is for LANs simply to use the LAN broadcast MAC address, which guarantees that the frame is processed by every station on the LAN. However, this procedure defeats

the whole purpose of multicast, which is to limit the circulation of packets and frames to interested hosts. Also, hosts might have access to many multicast groups, which multiplies the amount of traffic to noninterested destinations. Broadcasting frames at the LAN level to support multicast groups makes no sense.

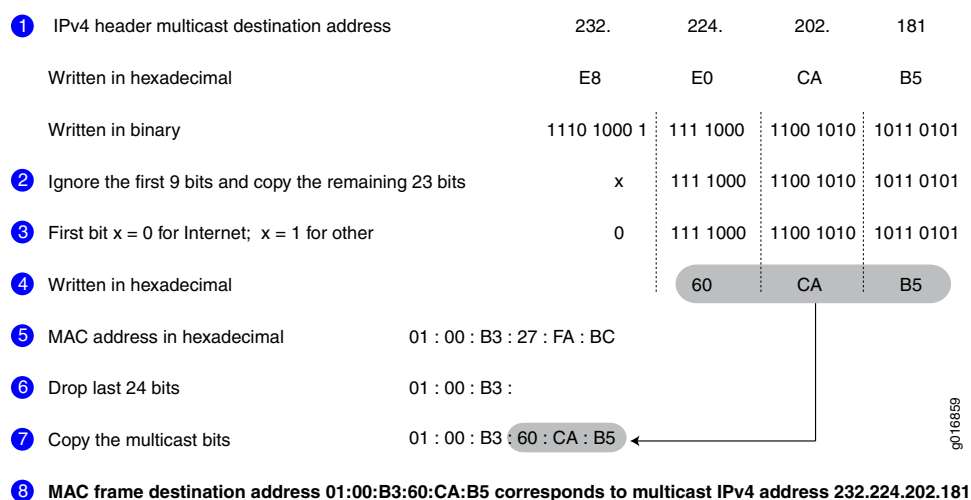

However, there is an easy way to effectively use Layer 2 frames for multicast purposes. The MAC address has a bit that is set to 0 for unicast (the LAN term is *individual address*) and set to 1 to indicate that this is a multicast address. Some of these addresses are reserved for multicast groups of specific vendors or MAC-level protocols. Internet multicast applications use the range 0x01-00-5E-00-00-00 to 0x01-00-5E-FF-FF-FF. Multicast receivers (hosts running TCP/IP) listen for frames with one of these addresses when the application joins a multicast group. The host stops listening when the application terminates or the host leaves the group at the packet layer (Layer 3).

This means that 3 bytes, or 24 bits, are available to map IPv4 multicast addresses at Layer 3 to MAC multicast addresses at Layer 2. However, all IPv4 addresses, including multicast addresses, are 32 bits long, leaving 8 IP address bits left over. Which method of mapping IPv4 multicast addresses to MAC multicast addresses minimizes the chance of “collisions” (that is, two different IP multicast groups at the packet layer mapping to the same MAC multicast address at the frame layer)?

First, it is important to realize that all IPv4 multicast addresses begin with the same 4 bits (1110), so there are really only 4 bits of concern, not 8. A LAN must not drop the last bits of the IPv4 address because these are almost guaranteed to be host bits, depending on the subnet mask. But the high-order bits, the leftmost address bits, are almost always network bits, and there is only one LAN (for now).

One other bit of the remaining 24 MAC address bits is reserved (an initial 0 indicates an Internet multicast address), so the 5 bits following the initial 1110 in the IPv4 address are dropped. The 23 remaining bits are mapped, one for one, into the last 23 bits of the MAC address. An example of this process is shown in [Figure 81 on page 3644](#).

**Figure 81: Converting MAC Addresses to Multicast Addresses**

Note that this process means that there are  $32 (2^5)$  IPv4 multicast addresses that could map to the same MAC multicast addresses. For example, multicast IPv4 addresses 224.8.7.6 and 229.136.7.6 translate to the same MAC address (0x01-00-5E-08-07-06). This is a real concern, and because the host could be interested in frames sent to both of the those multicast groups, the IP software must reject one or the other.

**NOTE:** This “collision” problem does not exist in IPv6 because of the way IPv6 handles multicast groups, but it is always a concern in IPv4. The procedure for placing IPv6 multicast packets inside multicast frames is nearly identical to that for IPv4, except for the MAC destination address 0x3333 prefix (and the lack of “collisions”).

Once the MAC address for the multicast group is determined, the host's operating system essentially orders the LAN interface card to join or leave the multicast group. Once joined to a multicast group, the host accepts frames sent to the multicast address as well as the host's unicast address and ignores other multicast group's frames. It is possible for a host to join and receive multicast content from more than one group at the same time, of course.

### ***Multicast Interface Lists***

To avoid multicast routing loops, every multicast routing device must always be aware of the interface that leads to the source of that multicast group content by the shortest path. This is the upstream (incoming) interface, and packets are never to be forwarded back toward a multicast source. All other interfaces are potential downstream (outgoing) interfaces, depending on the number of branches on the distribution tree.

routing devices closely monitor the status of the incoming and outgoing interfaces, a process that determines the *multicast forwarding state*. A routing device with a multicast forwarding state for a particular multicast group is essentially “turned on” for that group's content. Interfaces on the routing device's outgoing interface list send copies of the group's packets received on the incoming interface list for that group. The incoming and outgoing interface lists might be different for different multicast groups.

The multicast forwarding state in a routing device is usually written in either (S,G) or (\*,G) notation. These are pronounced “ess comma gee” and “star comma gee,” respectively. In (S,G), the S refers to the unicast IP address of the source for the multicast traffic, and the G refers to the particular multicast group IP address for which S is the source. All multicast packets sent from this source have S as the source address and G as the destination address.

The asterisk (\*) in the (\*,G) notation is a wildcard indicating that the state applies to any multicast application source sending to group G. So, if two sources are originating exactly the same content for multicast group 224.1.1.2, a routing device could use (\*,224.1.1.2) to represent the state of a routing device forwarding traffic from both sources to the group.

### ***Multicast Routing Protocols***

Multicast routing protocols enable a collection of multicast routing devices to build (join) distribution trees when a host on a directly attached subnet, typically a LAN, wants to

receive traffic from a certain multicast group, prune branches, locate sources and groups, and prevent routing loops.

There are several multicast routing protocols:

- **Distance Vector Multicast Routing Protocol (DVMRP)**—The first of the multicast routing protocols and hampered by a number of limitations that make this method unattractive for large-scale Internet use. DVMRP is a dense-mode-only protocol, and uses the flood-and-prune or implicit join method to deliver traffic everywhere and then determine where the uninterested receivers are. DVMRP uses source-based distribution trees in the form (S,G), and builds its own multicast routing tables for RPF checks.
- **Multicast OSPF (MOSPF)**—Extends OSPF for multicast use, but only for dense mode. However, MOSPF has an explicit join message, so routing devices do not have to flood their entire domain with multicast traffic from every source. MOSPF uses source-based distribution trees in the form (S,G).
- **Bidirectional PIM mode**—A variation of PIM. Bidirectional PIM builds bidirectional shared trees that are rooted at a rendezvous point (RP) address. Bidirectional traffic does not switch to shortest path trees as in PIM-SM and is therefore optimized for routing state size instead of path length. This means that the end-to-end latency might be longer compared to PIM sparse mode. Bidirectional PIM routes are always wildcard-source (\*G) routes. The protocol eliminates the need for (S,G) routes and data-triggered events. The bidirectional (\*G) group trees carry traffic both upstream from senders toward the RP, and downstream from the RP to receivers. As a consequence, the strict reverse path forwarding (RPF)-based rules found in other PIM modes do not apply to bidirectional PIM. Instead, bidirectional PIM (\*G) routes forward traffic from all sources and the RP. Bidirectional PIM routing devices must have the ability to accept traffic on many potential incoming interfaces. Bidirectional PIM scales well because it needs no source-specific (S,G) state. Bidirectional PIM is recommended in deployments with many dispersed sources and many dispersed receivers.
- **PIM dense mode**—In this mode of PIM, the assumption is that almost all possible subnets have at least one receiver wanting to receive the multicast traffic from a source, so the network is *flooded* with traffic on all possible branches, then pruned back when branches do not express an interest in receiving the packets, explicitly (by message) or implicitly (time-out silence). This is the *dense mode* of multicast operation. LANs are appropriate networks for dense-mode operation. Some multicast routing protocols, especially older ones, support only dense-mode operation, which makes them inappropriate for use on the Internet. In contrast to DVMRP and MOSPF, PIM dense mode allows a routing device to use any unicast routing protocol and performs RPF checks using the unicast routing table. PIM dense mode has an implicit join message, so routing devices use the flood-and-prune method to deliver traffic everywhere and then determine where the uninterested receivers are. PIM dense mode uses source-based distribution trees in the form (S,G), as do all dense-mode protocols. PIM also supports sparse-dense mode, with mixed sparse and dense groups, but there is no special notation for that operational mode. If *sparse-dense mode* is supported, the multicast routing protocol allows some multicast groups to be sparse and other groups to be dense.
- **PIM sparse mode**—In this mode of PIM, the assumption is that very few of the possible receivers want packets from each source, so the network establishes and sends packets

only on branches that have at least one leaf indicating (by message) an interest in the traffic. This multicast protocol allows a routing device to use any unicast routing protocol and performs reverse-path forwarding (RPF) checks using the unicast routing table. PIM sparse mode has an *explicit* join message, so routing devices determine where the interested receivers are and send join messages upstream to their neighbors, building trees from receivers to the rendezvous point (RP). PIM sparse mode uses an RP routing device as the initial source of multicast group traffic and therefore builds distribution trees in the form (\*G), as do all sparse-mode protocols. PIM sparse mode migrates to an (S,G) source-based tree if that path is shorter than through the RP for a particular multicast group's traffic. WANs are appropriate networks for sparse-mode operation, and indeed a common multicast guideline is not to run dense mode on a WAN under any circumstances.

- Core Based Trees (CBT)—Shares all of the characteristics of PIM sparse mode (sparse mode, explicit join, and shared (\*G) trees), but is said to be more efficient at finding sources than PIM sparse mode. CBT is rarely encountered outside academic discussions. There are no large-scale deployments of CBT, commercial or otherwise.
- PIM source-specific multicast (SSM)—Enhancement to PIM sparse mode that allows a client to receive multicast traffic directly from the source, without the help of an RP. Used with IGMPv3 to create a shortest-path tree between receiver and source.
- IGMPv1—The original protocol defined in RFC 1112, *Host Extensions for IP Multicasting*. IGMPv1 sends an explicit join message to the routing device, but uses a timeout to determine when hosts leave a group. Three versions of the Internet Group Management Protocol (IGMP) run between receiver hosts and routing devices.
- IGMPv2—Defined in RFC 2236, *Internet Group Management Protocol, Version 2*. Among other features, IGMPv2 adds an explicit leave message to the join message.
- IGMPv3—Defined in RFC 3376, *Internet Group Management Protocol, Version 3*. Among other features, IGMPv3 optimizes support for a single source of content for a multicast group, or source-specific multicast (SSM). Used with PIM SSM to create a shortest-path tree between receiver and source.
- Bootstrap Router (BSR) and Auto-Rendezvous Point (RP)—Allow sparse-mode routing protocols to find RPs within the routing domain (autonomous system, or AS). RP addresses can also be statically configured.
- Multicast Source Discovery Protocol (MSDP)—Allows groups located in one multicast routing domain to find RPs in other routing domains. MSDP is not used on an RP if all receivers and sources are located in the same routing domain. Typically runs on the same routing device as PIM sparse mode RP. Not appropriate if all receivers and sources are located in the same routing domain.
- Session Announcement Protocol (SAP) and Session Description Protocol (SDP)—Display multicast session names and correlate the names with multicast traffic. SDP is a session directory protocol that advertises multimedia conference sessions and communicates setup information to participants who want to join the session. A client commonly uses SDP to announce a conference session by periodically

multicasting an announcement packet to a well-known multicast address and port using SAP.

- **Pragmatic General Multicast (PGM)**—Special protocol layer for multicast traffic that can be used between the IP layer and the multicast application to add reliability to multicast traffic. PGM allows a receiver to detect missing information in all cases and request replacement information if the receiver application requires it.

The differences among the multicast routing protocols are summarized in [Table 275 on page 3648](#).

**Table 275: Multicast Routing Protocols Compared**

| Multicast Routing Protocol | Dense Mode | Sparse Mode | Implicit Join | Explicit Join | (S,G) SBT  | (*G) Shared Tree |
|----------------------------|------------|-------------|---------------|---------------|------------|------------------|
| DVMRP                      | Yes        | No          | Yes           | No            | Yes        | No               |
| MOSPF                      | Yes        | No          | No            | Yes           | Yes        | No               |
| PIM dense mode             | Yes        | No          | Yes           | No            | Yes        | No               |
| PIM sparse mode            | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |
| Bidirectional PIM          | No         | No          | No            | Yes           | No         | Yes              |
| CBT                        | No         | Yes         | No            | Yes           | No         | Yes              |
| SSM                        | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |
| IGMPv1                     | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |
| IGMPv2                     | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |
| IGMPv3                     | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |
| BSR and Auto-RP            | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |
| MSDP                       | No         | Yes         | No            | Yes           | Yes, maybe | Yes, initially   |

It is important to realize that retransmissions due to a high bit-error rate on a link or overloaded routing device can make multicast as inefficient as repeated unicast. Therefore, there is a trade-off in many multicast applications regarding the session support provided by the Transmission Control Protocol (TCP) (but TCP always resends missing segments), or the simple drop-and-continue strategy of the User Datagram Protocol (UDP) datagram service (but reordering can become an issue). Modern multicast uses UDP almost exclusively.

#### ***T Series Router Multicast Performance***

The Juniper Networks T Series Core Routers handle extreme multicast packet replication requirements with a minimum of router load. Each memory component replicates a

multicast packet twice at most. Even in the worst-case scenario involving maximum fan-out, when 1 input port and 63 output ports need a copy of the packet, the T Series routing platform copies a multicast packet only six times. Most multicast distribution trees are much sparser, so in many cases only two or three replications are necessary. In no case does the T Series architecture have an impact on multicast performance, even with the largest multicast fan-out requirements.

## Multicast Protocols Overview

- [Supported IP Multicast Protocol Standards on page 3649](#)
- [Understanding MLD on page 3650](#)
- [PIM Overview on page 3653](#)

### Supported IP Multicast Protocol Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP multicast protocols, including the Distance Vector Multicast Routing Protocol (DVMRP), Internet Group Management Protocol (IGMP), Multicast Listener Discovery (MLD), Multicast Source Discovery Protocol (MSDP), Pragmatic General Multicast (PGM), Protocol Independent Multicast (PIM), Session Announcement Protocol (SAP), and Session Description Protocol (SDP).

- RFC 1112, *Host Extensions for IP Multicasting* (defines IGMP Version 1)
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 2327, *SDP: Session Description Protocol*
- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3376, *Internet Group Management Protocol, Version 3*
- RFC 3590, *Source Address Selection for the Multicast Listener Discovery (MLD) Protocol*
- RFC 4601, *Protocol Independent Multicast – Sparse Mode (PIM-SM): Protocol Specification (Revised)*
- RFC 4607, *Source-Specific Multicast for IP*
- RFC 5015, *Bidirectional Protocol Independent Multicast (BIDIR-PIM)*
- *Using IGMPv3 and MLDv2 for Source-Specific Multicast*
- Internet draft draft-ietf-l3vpn-2547bis-mcast-10.txt, *Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-l3vpn-2547bis-mcast-bgp-08.txt, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-pim-sm-bsr-05.txt, *Bootstrap Router (BSR) Mechanism for PIM*

The scoping mechanism is not supported.

- Internet draft draft-raggarwa-l3vpn-2547-mvpn-00.txt, *Base Specification for Multicast in BGP/MPLS VPNs* (expires December 2004)

The following RFCs and Internet drafts do not define standards, but provide information about multicast protocols and related technologies. The IETF classifies them variously as “Best Current Practice,” “Experimental,” or “Informational.”

- RFC 1075, *Distance Vector Multicast Routing Protocol*
- RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification*
- RFC 2365, *Administratively Scoped IP Multicast*
- RFC 2547, *BGP/MPLS VPNs*
- RFC 2974, *Session Announcement Protocol*
- RFC 3208, *PGM Reliable Transport Protocol Specification*
- RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*
- RFC 3569, *An Overview of Source-Specific Multicast (SSM)*
- RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
- RFC 3973, *Protocol Independent Multicast – Dense Mode (PIM-DM): Protocol Specification (Revised)*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- Internet draft draft-ietf-idmr-dvmrp-v3-11.txt, *Distance Vector Multicast Routing Protocol*
- Internet draft draft-ietf-mboned-ssm232-08.txt, *Source-Specific Protocol Independent Multicast in 232/8*
- Internet draft draft-ietf-mmusic-sap-00.txt, *SAP: Session Announcement Protocol*
- Internet draft draft-rosen-vpn-mcast-07.txt, *Multicast in MPLS/BGP VPNs*

Only section 7, “Data MDT: Optimizing flooding,” is supported.

### **Understanding MLD**

The Multicast Listener Discovery (MLD) Protocol manages the membership of hosts and routers in multicast groups. IP version 6 (IPv6) multicast routers use MLD to learn, for each of their attached physical networks, which groups have interested listeners. Each routing device maintains a list of host multicast addresses that have listeners for each subnetwork, as well as a timer for each address. However, the routing device does not need to know the address of each listener—just the address of each host. The routing device provides addresses to the multicast routing protocol it uses, which ensures that multicast packets are delivered to all subnetworks where there are interested listeners.

In this way, MLD is used as the transport for the Protocol Independent Multicast (PIM) Protocol.

MLD is an integral part of IPv6 and must be enabled on all IPv6 routing devices and hosts that need to receive IP multicast traffic. The Junos OS supports MLD versions 1 and 2. Version 2 is supported for source-specific multicast (SSM) include and exclude modes.

In include mode, the receiver specifies the source or sources it is interested in receiving the multicast group traffic from. Exclude mode works the opposite of include mode. It allows the receiver to specify the source or sources it is not interested in receiving the multicast group traffic from.

For each attached network, a multicast routing device can be either a querier or a nonquerier. A querier routing device, usually one per subnet, solicits group membership information by transmitting MLD queries. When a host reports to the querier routing device that it has interested listeners, the querier routing device forwards the membership information to the rendezvous point (RP) routing device by means of the receiver's (host's) designated router (DR). This builds the rendezvous-point tree (RPT) connecting the host with interested listeners to the RP routing device. The RPT is the initial path used by the sender to transmit information to the interested listeners. Nonquerier routing devices do not transmit MLD queries on a subnet but can do so if the querier routing device fails.

All MLD-configured routing devices start as querier routing devices on each attached subnet (see [Figure 82 on page 3651](#)). The querier routing device on the right is the receiver's DR.

**Figure 82: Routing Devices Start Up on a Subnet**

To elect the querier routing device, the routing devices exchange query messages containing their IPv6 source addresses. If a routing device hears a query message whose IPv6 source address is numerically lower than its own selected address, it becomes a nonquerier. In [Figure 83 on page 3652](#), the routing device on the left has a source address numerically lower than the one on the right and therefore becomes the querier routing device.

**NOTE:** In the practical application of MLD, several routing devices on a subnet are nonqueriers. If the elected querier routing device fails, query messages are exchanged among the remaining routing devices. The routing device with the lowest IPv6 source address becomes the new querier routing device. The IPv6 Neighbor Discovery Protocol (NDP) implementation drops incoming Neighbor Announcement (NA) messages that have a broadcast or multicast address in the target link-layer address option. This behavior is recommended by RFC 2461.

**Figure 83: Querier Routing Device Is Determined**

The querier routing device sends general MLD queries on the **link-scope all-nodes** multicast address FF02::1 at short intervals to all attached subnets to solicit group membership information (see [Figure 84 on page 3652](#)). Within the query message is the *maximum response delay* value, specifying the maximum allowed delay for the host to respond with a report message.

**Figure 84: General Query Message Is Issued**

If interested listeners are attached to the host receiving the query, the host sends a report containing the host's IPv6 address to the routing device (see [Figure 85 on page 3652](#)). If the reported address is not yet in the routing device's list of multicast addresses with interested listeners, the address is added to the list and a timer is set for the address. If the address is already on the list, the timer is reset. The host's address is transmitted to the RP in the PIM domain.

**Figure 85: Reports Are Received by the Querier Routing Device**

If the host has no interested multicast listeners, it sends a done message to the querier routing device. On receipt, the querier routing device issues a multicast address-specific query containing the last **listener query interval** value to the multicast address of the host. If the routing device does not receive a report from the multicast address, it removes the multicast address from the list and notifies the RP in the PIM domain of its removal (see [Figure 86 on page 3653](#)).

**Figure 86: Host Has No Interested Receivers and Sends a Done Message to Routing Device**

If a done message is not received by the querier routing device, the querier routing device continues to send multicast address-specific queries. If the timer set for the address on receipt of the last report expires, the querier routing device assumes there are no longer interested listeners on that subnet, removes the multicast address from the list, and notifies the RP in the PIM domain of its removal (see [Figure 87 on page 3653](#)).

**Figure 87: Host Address Timer Expires and Address Is Removed from Multicast Address List**

## PIM Overview

The predominant multicast routing protocol in use on the Internet today is Protocol Independent Multicast, or PIM. The type of PIM used on the Internet is PIM sparse mode. PIM sparse mode is so accepted that when the simple term “PIM” is used in an Internet context, some form of sparse mode operation is assumed.

PIM emerged as an algorithm to overcome the limitations of dense-mode protocols such as the Distance Vector Multicast Routing Protocol (DVMRP), which was efficient for dense clusters of multicast receivers, but did not scale well for the larger, sparser, groups encountered on the Internet. The Core Based Trees (CBT) Protocol was intended to support sparse mode as well, but CBT, with its all-powerful core approach, made placement of the core critical, and large conference-type applications (many-to-many) resulted in bottlenecks in the core. PIM was designed to avoid the dense-mode scaling issues of DVMRP and the potential performance issues of CBT at the same time.

PIM is one of the most rapidly evolving specifications on the Internet today. Since its introduction in 1995, PIM has already seen two major revisions to its packet structure (PIM version 1 [PIMv1] and PIM version 2 [PIMv2]), two major RFCs (RFC 2362 obsoleted

RFC 2117), and numerous drafts describing major components of PIM, such as many-to-many trees and source-specific multicast (SSM). Long-lasting RFCs are not a feature of PIM, and virtually all of PIM must be researched, understood, and implemented directly from Internet drafts. In fact, no current RFC describes PIMv1 at all. The drafts have all expired, and PIMv1 was never issued as an official RFC.

PIM itself is not nonstandard or unstable, however. PIM has been a promising multicast routing protocol since its inception, especially PIM sparse mode, the first real sparse-mode multicast routing protocol. Work continues on PIM in a number of areas, from bidirectional trees to network management, and the rapid pace of development makes drafts essential for PIM.

PIMv1 and PIMv2 can coexist on the same routing device and even on the same interface. The main difference between PIMv1 and PIMv2 is the packet format. PIMv1 messages use Internet Group Management Protocol (IGMP) packets, whereas PIMv2 has its own IP protocol number (103) and packet structure. All routing devices connecting to an IP subnet such as a LAN must use the same PIM version. Some PIM implementations can recognize PIMv1 packets and automatically switch the routing device interface to PIMv1. Because the difference between PIMv1 and PIMv2 involves the message format, but not the meaning of the message or how the routing device processes the PIM message, a routing device can easily mix PIMv1 and PIMv2 interfaces.

PIM is used for efficient routing to multicast groups that might span wide-area and interdomain internetworks. It is called “protocol independent” because it does not depend on a particular unicast routing protocol. Junos OS supports bidirectional mode, sparse mode, dense mode, and sparse-dense mode.

PIM operates in several modes: bidirectional mode, sparse mode, dense mode, and sparse-dense mode. In sparse-dense mode, some multicast groups are configured as dense mode (flood-and-prune, [S,G] state) and others are configured as sparse mode (explicit join to rendezvous point [RP], [\*G] state).

PIM drafts also establish a mode known as PIM source-specific mode, or PIM SSM. In PIM SSM there is only one specific source for the content of a multicast group within a given domain.

Because the PIM mode you choose determines the PIM configuration properties, you first must decide whether PIM operates in bidirectional, sparse, dense, or sparse-dense mode in your network. Each mode has distinct operating advantages in different network environments.

- In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to a downstream routing device unless the downstream routing device has sent an explicit request (by means of a join message) to the rendezvous point (RP) routing device to receive this traffic. The RP serves as the root of the shared multicast delivery tree and is responsible for forwarding multicast data from different sources to the receivers.

Sparse mode is well suited to the Internet, where frequent interdomain join messages and prune messages are common.

- Bidirectional PIM is similar to sparse mode, and is especially suited to applications that must scale to support a large number of dispersed sources and receivers. In bidirectional PIM, routing devices build shared bidirectional trees and do not switch to a source-based tree. Bidirectional PIM scales well because it needs no source-specific (S,G) state. Instead, it builds only group-specific (\*,G) state.
- Unlike sparse mode and bidirectional mode, in which data is forwarded only to routing devices sending an explicit PIM join request, dense mode implements a *flood-and-prune* mechanism, similar to the Distance Vector Multicast Routing Protocol (DVMRP). In dense mode, a routing device receives the multicast data on the incoming interface, then forwards the traffic to the outgoing interface list. Flooding occurs periodically and is used to refresh state information, such as the source IP address and multicast group pair. If the routing device has no interested receivers for the data, and the outgoing interface list becomes empty, the routing device sends a PIM prune message upstream.

Dense mode works best in networks where few or no prunes occur. In such instances, dense mode is actually more efficient than sparse mode.

- Sparse-dense mode, as the name implies, allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as “dense” is not mapped to an RP. Instead, data packets destined for that group are forwarded by means of PIM dense mode rules. A group specified as “sparse” is mapped to an RP, and data packets are forwarded by means of PIM sparse-mode rules. Sparse-dense mode is useful in networks implementing auto-RP for PIM sparse mode.

### **Basic PIM Network Components**

PIM dense mode requires only a multicast source and series of multicast-enabled routing devices running PIM dense mode to allow receivers to obtain multicast content. Dense mode makes sure that all multicast traffic gets everywhere by periodically flooding the network with multicast traffic, and relies on prune messages to make sure that subnets where all receivers are uninterested in that particular multicast group stop receiving packets.

PIM sparse mode is more complicated and requires the establishment of special routing devices called *rendezvous points (RPs)* in the network core. These routing devices are where upstream join messages from interested receivers meet downstream traffic from

the source of the multicast group content. A network can have many RPs, but PIM sparse mode allows only one RP to be active for any multicast group.

If there is only one RP in a routing domain, the RP and adjacent links might become congested and form a single point of failure for all multicast traffic. Thus, multiple RPs are the rule, but the issue then becomes how other multicast routing devices find the RP that is the source of the multicast group the receiver is trying to join. This RP-to-group mapping is controlled by a special *bootstrap router (BSR)* running the PIM BSR mechanism. There can be more than one bootstrap router as well, also for single-point-of-failure reasons.

The bootstrap router does not have to be an RP itself, although this is a common implementation. The bootstrap router's main function is to manage the collection of RPs and allow interested receivers to find the source of their group's multicast traffic. PIM bootstrap messages are sourced from the loopback address, which is always up. The loopback address must be routable. If it is not routable, then the bootstrap router is unable to send bootstrap messages to update the RP domain members. The **show pim bootstrap** command displays only those bootstrap routers that have routable loopback addresses.

PIM SSM can be seen as a subset of a special case of PIM sparse mode and requires no specialized equipment other than that used for PIM sparse mode (and IGMP version 3).

Bidirectional PIM RPs, unlike RPs for PIM sparse mode, do not need to perform PIM Register tunneling or other specific protocol action. Bidirectional PIM RPs implement no specific functionality. RP addresses are simply a location in the network to rendezvous toward. In fact, for bidirectional PIM, RP addresses need not be loopback interface addresses or even be addresses configured on any routing device, as long as they are covered by a subnet that is connected to a bidirectional PIM-capable routing device and advertised to the network.

### ***Understanding Group Membership Protocols***

There is a big difference between the multicast protocols used between host and routing device and between the multicast routing devices themselves. Hosts on a given subnetwork need to inform their routing device only whether or not they are interested in receiving packets from a certain multicast group. The source host needs to inform its

routing devices only that it is the source of traffic for a particular multicast group. In other words, no detailed knowledge of the distribution tree is needed by any hosts; only a group membership protocol is needed to inform routing devices of their participation in a multicast group. Between adjacent routing devices, on the other hand, the multicast routing protocols must avoid loops as they build a detailed sense of the network topology and distribution tree from source to leaf. So, different multicast protocols are used for the host-router portion and the router-router portion of the multicast network.

Multicast group membership protocols enable a routing device to detect when a host on a directly attached subnet, typically a LAN, wants to receive traffic from a certain multicast group. Even if more than one host on the LAN wants to receive traffic for that multicast group, the routing device sends only one copy of each packet for that multicast group out on that interface, because of the inherent broadcast nature of LANs. When the multicast group membership protocol informs the routing device that there are no interested hosts on the subnet, the packets are withheld and that leaf is pruned from the distribution tree.

The Internet Group Management Protocol (IGMP) and the Multicast Listener Discovery (MLD) Protocol are the standard IP multicast group membership protocols: IGMP and MLD have several versions that are supported by hosts and routing devices:

- IGMPv1—The original protocol defined in RFC 1112. An explicit join message is sent to the routing device, but a timeout is used to determine when hosts leave a group. This process wastes processing cycles on the routing device, especially on older or smaller routing devices.
- IGMPv2—Defined in RFC 2236. Among other features, IGMPv2 adds an explicit leave message to the join message so that routing devices can more easily determine when a group has no interested listeners on a LAN.
- IGMPv3—Defined in RFC 3376. Among other features, IGMPv3 optimizes support for a single source of content for a multicast group, or *source-specific multicast (SSM)*.
- MLDv1—Defined in RFC 2710. MLDv1 is similar to IGMPv2.
- MLDv2—Defined in RFC 3810. MLDv2 similar to IGMPv3.

The various versions of IGMP and MLD are backward compatible. It is common for a routing device to run multiple versions of IGMP and MLD on LAN interfaces. Backward compatibility is achieved by dropping back to the most basic of all versions run on a LAN. For example, if one host is running IGMPv1, any routing device attached to the LAN running IGMPv2 can drop back to IGMPv1 operation, effectively eliminating the IGMPv2 advantages. Running multiple IGMP versions ensures that both IGMPv1 and IGMPv2 hosts find peers for their versions on the routing device.

### ***Understanding IGMP***

The Internet Group Management Protocol (IGMP) manages the membership of hosts and routing devices in multicast groups. IP hosts use IGMP to report their multicast group memberships to any immediately neighboring multicast routing devices. Multicast routing devices use IGMP to learn, for each of their attached physical networks, which groups have members.

IGMP is also used as the transport for several related multicast protocols (for example, Distance Vector Multicast Routing Protocol [DVMRP] and Protocol Independent Multicast version 1 [PIMv1]).

A routing device receives explicit join and prune messages from those neighboring routing devices that have downstream group members. When PIM is the multicast protocol in use, IGMP begins the process as follows:

1. To join a multicast group, G, a host conveys its membership information through IGMP.
2. The routing device then forwards data packets addressed to a multicast group G to only those interfaces on which explicit join messages have been received.
3. A designated router (DR) sends periodic join and prune messages toward a group-specific rendezvous point (RP) for each group for which it has active members. One or more routing devices are automatically or statically designated as the RP, and all routing devices must explicitly join through the RP.
4. Each routing device along the path toward the RP builds a wild card (any-source) state for the group and sends join and prune messages toward the RP.

The term *route entry* is used to refer to the state maintained in a routing device to represent the distribution tree.

A route entry can include such fields as:

- source address
- group address
- incoming interface from which packets are accepted
- list of outgoing interfaces to which packets are sent
- timers
- flag bits

The wild card route entry's incoming interface points toward the RP.

The outgoing interfaces point to the neighboring downstream routing devices that have sent join and prune messages toward the RP as well as the directly connected hosts that have requested membership to group G.

5. This state creates a shared, RP-centered, distribution tree that reaches all group members.

IGMP is an integral part of IP and must be enabled on all routing devices and hosts that need to receive IP multicast traffic.

For each attached network, a multicast routing device can be either a querier or a nonquerier. The querier routing device periodically sends general query messages to solicit group membership information. Hosts on the network that are members of a multicast group send report messages. When a host leaves a group, it sends a leave group message.

IGMP version 3 (IGMPv3) supports inclusion and exclusion lists. Inclusion lists enable you to specify which sources can send to a multicast group. This type of multicast group is called a source-specific multicast (SSM) group, and its multicast address is 232/8.

IGMPv3 provides support for source filtering. For example, a routing device can specify particular routing devices from which it accepts or rejects traffic. With IGMPv3, a multicast routing device can learn which sources are of interest to neighboring routing devices.

Exclusion mode works the opposite of an inclusion list. It allows any source but the ones listed to send to the SSM group.

IGMPv3 interoperates with versions 1 and 2 of the protocol. However, to remain compatible with older IGMP hosts and routing devices, IGMPv3 routing devices must also implement versions 1 and 2 of the protocol. IGMPv3 supports the following membership-report record types: mode is allowed, allow new sources, and block old sources.

### **Configuring IGMP**

Before you begin:

1. Determine whether the routing device is directly attached to any multicast sources. Receivers must be able to locate these sources.
2. Determine whether the routing device is directly attached to any multicast group receivers. If receivers are present, IGMP is needed.
3. Determine whether to configure multicast to use sparse, dense, or sparse-dense mode. Each mode has different configuration considerations.
4. Determine the address of the RP if sparse or sparse-dense mode is used.
5. Determine whether to locate the RP with the static configuration, BSR, or auto-RP method.
6. Determine whether to configure multicast to use its own RPF routing table when configuring PIM in sparse, dense, or sparse-dense mode.
7. Configure the SAP and SDP protocols to listen for multicast session announcements. See *Configuring the Session Announcement Protocol*.

To configure the Internet Group Management Protocol (IGMP), include the **igmp** statement:

```
igmp {
 accounting;
 interface interface-name {
 disable;
 (accounting | no-accounting);
 group-policy [policy-names];
 immediate-leave;
 oif-map map-name;
 promiscuous-mode;
 ssm-map ssm-map-name;
 static {
 group multicast-group-address {
 exclude;
```

```

 group-count number;
 group-increment increment;
 source ip-address {
 source-count number;
 source-increment increment;
 }
}
}
version version;
}
query-interval seconds;
query-last-member-interval seconds;
query-response-interval seconds;
robust-count number;
traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag <flag-modifier> <disable>;
}
}

```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit logical-systems *logical-system-name* protocols]

By default, IGMP is enabled on all interfaces on which you configure Protocol Independent Multicast (PIM), and on all broadcast interfaces on which you configure the Distance Vector Multicast Routing Protocol (DVMRP).

**NOTE:** You can configure IGMP on an interface without configuring PIM. PIM is generally not needed on IGMP downstream interfaces. Therefore, only one “pseudo PIM interface” is created to represent all IGMP downstream (IGMP-only) interfaces on the routing device. This reduces the amount of routing device resources, such as memory, that are consumed. You must configure PIM on upstream IGMP interfaces to enable multicast routing, perform reverse-path forwarding for multicast data packets, populate the multicast forwarding table for upstream interfaces, and in the case of bidirectional PIM and PIM sparse mode, to distribute IGMP group memberships into the multicast routing domain.

### Enabling IGMP

The Internet Group Management Protocol (IGMP) manages multicast groups by establishing, maintaining, and removing groups on a subnet. Multicast routing devices use IGMP to learn which groups have members on each of their attached physical networks. IGMP must be enabled for the routing device to receive IPv4 multicast packets. IGMP is only needed for IPv4 networks, because multicast is handled differently in IPv6 networks. IGMP is automatically enabled on all IPv4 interfaces on which you configure PIM and on all IPv4 broadcast interfaces when you configure DVMRP.

If IGMP is not running on an interface—either because PIM and DVMRP are not configured on the interface or because IGMP is explicitly disabled on the interface—you can explicitly enable IGMP.

To explicitly enable IGMP:

1. If PIM and DVMRP are not running on the interface, explicitly enable IGMP by including the interface name.

```
[edit protocols igmp]
user@host# set interface fe-0/0/0.0
```

2. See if IGMP is disabled on any interfaces. In the following example, IGMP is disabled on a Gigabit Ethernet interface.

```
[edit protocols igmp]
user@host# show
interface fe-0/0/0.0;
interface ge-1/0/0.0 {
 disable;
}
```

3. Enable IGMP on the interface by deleting the **disable** statement.

```
[edit protocols igmp]
delete interface ge-1/0/0.0 disable
```

4. Verify the configuration.

```
[edit protocols igmp]
user@host# show
interface fe-0/0/0.0;
interface ge-1/0/0.0;
```

5. Verify the operation of IGMP on the interfaces by checking the output of the **show igmp interface** command.

### ***Modifying the IGMP Host-Query Message Interval***

The objective of IGMP is to keep routing devices up to date with group membership of the entire subnet. Routing devices need not know who all the members are, only that members exist. Each host keeps track of which multicast groups are subscribed to. On each link, one routing device is elected the querier. The IGMP querier routing device periodically sends general host-query messages on each attached network to solicit membership information. The messages are sent to the all-systems multicast group address, 224.0.0.1.

The query interval, the response interval, and the robustness variable are related in that they are all variables that are used to calculate the group membership timeout. The group membership timeout is the number of seconds that must pass before a multicast routing device determines that no more members of a host group exist on a subnet. The group membership timeout is calculated as the (robustness variable x query-interval) + (query-response-interval). If no reports are received for a particular group before the group membership timeout has expired, the routing device stops forwarding remotely-originated multicast packets for that group onto the attached network.

By default, host-query messages are sent every 125 seconds. You can change this interval to change the number of IGMP messages sent on the subnet.

To modify the query interval:

1. Configure the interval.

```
[edit protocols igmp]
user@host# set query-interval 200
```

The value can be from 1 through 1024 seconds.

2. Verify the configuration by checking the IGMP Query Interval field in the output of the **show igmp interface** command.
3. Verify the operation of the query interval by checking the Membership Query field in the output of the **show igmp statistics** command.

### *Modifying the IGMP Query Response Interval*

The query response interval is the maximum amount of time that can elapse between when the querier routing device sends a host-query message and when it receives a response from a host. Configuring this interval allows you to adjust the burst peaks of IGMP messages on the subnet. Set a larger interval to make the traffic less bursty. Bursty traffic refers to an uneven pattern of data transmission: sometimes a very high data transmission rate, whereas at other times a very low data transmission rate.

The query response interval, the host-query interval, and the robustness variable are related in that they are all variables that are used to calculate the group membership timeout. The group membership timeout is the number of seconds that must pass before a multicast routing device determines that no more members of a host group exist on a subnet. The group membership timeout is calculated as the (robustness variable x query-interval) + (query-response-interval). If no reports are received for a particular group before the group membership timeout has expired, the routing device stops forwarding remotely originated multicast packets for that group onto the attached network.

The default query response interval is 10 seconds. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify the query response interval:

1. Configure the interval.

```
[edit protocols igmp]
user@host# set query-response-interval 0.4
```

2. Verify the configuration by checking the IGMP Query Response Interval field in the output of the **show igmp interface** command.
3. Verify the operation of the query interval by checking the Membership Query field in the output of the **show igmp statistics** command.

### ***Specifying Immediate-Leave Host Removal for IGMP***

The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.

The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.

When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.

To enable immediate leave on an interface:

1. Configure immediate leave on the IGMP interface.

```
[edit protocols IGMP]
user@host# set interface ge-0/0/0.1 immediate-leave
```

2. Verify the configuration by checking the Immediate Leave field in the output of the `show igmp interface` command.

### ***Filtering Unwanted IGMP Reports at the IGMP Interface Level***

Suppose you need to limit the subnets that can join a certain multicast group. The **group-policy** statement enables you to filter unwanted IGMP reports at the interface level. When this statement is enabled on a routing device running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), after the routing device receives an IGMP report, the routing device compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report if the policy matches the defined address or network).

You define the policy to match only IGMP group addresses (for IGMPv2) by using the policy's **route-filter** statement to match the group address. You define the policy to match IGMP (source, group) addresses (for IGMPv3) by using the policy's **route-filter** statement to match the group address and the policy's **source-address-filter** statement to match the source address.

To filter unwanted IGMP reports:

1. Configure an IGMPv2 policy.

```
[edit policy-statement reject_policy_v2]
user@host# set from route-filter 224.1.1.1/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set then reject
```

2. Configure an IGMPv3 policy.

```
[edit policy-statement reject_policy_v3]
user@host# set from route-filter 224.1.1.1/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set from source-address-filter 10.0.0.0/8 orlonger
user@host# set from source-address-filter 127.0.0.0/8 orlonger
user@host# set then reject
```

3. Apply the policies to the IGMP interfaces on which you prefer not to receive specific group or (source, group) reports. In this example, **ge-0/0/0.1** is running IGMPv2, and **ge-0/1/1.0** is running IGMPv3.

```
[edit protocols igmp]
user@host# set interface ge-0/0/0.1 group-policy reject_policy_v2
user@host# set interface ge-0/1/1.0 group-policy reject_policy_v3
```

4. Verify the operation of the filter by checking the Rejected Report field in the output of the **show igmp statistics** command.

### *Accepting IGMP Messages from Remote Subnetworks*

By default, IGMP interfaces accept IGMP messages only from the same subnet. Including the **promiscuous-mode** statement enables the routing device to accept IGMP messages from indirectly connected subnets.

**NOTE:** When you enable IGMP on an unnumbered Ethernet interface that uses a /32 loopback address as a donor address, you must configure IGMP promiscuous mode to accept the IGMP packets received on this interface.

**NOTE:** When enabling promiscuous-mode, all routing devices on the ethernet segment must be configured with the promiscuous mode statement. Otherwise, only the interface configured with lowest IPv4 address acts as the querier for IGMP for this Ethernet segment.

To enable IGMP promiscuous mode on an interface:

1. Configure the IGMP interface.

```
[edit protocols igmp]
user@host# set interface ge-0/1/1.0 promiscuous-mode
```

2. Verify the configuration by checking the Promiscuous Mode field in the output of the **show igmp interface** command.
3. Verify the operation of the filter by checking the Rx non-local field in the output of the **show igmp statistics** command.

### ***Modifying the IGMP Last-Member Query Interval***

The last-member query interval is the maximum amount of time between group-specific query messages, including those sent in response to leave-group messages. You can configure this interval to change the amount of time it takes a routing device to detect the loss of the last member of a group.

When the routing device that is serving as the querier receives a leave-group message from a host, the routing device sends multiple group-specific queries to the group being left. The querier sends a specific number of these queries at a specific interval. The number of queries sent is called the last-member query count. The interval at which the queries are sent is called the last-member query interval. Because both settings are configurable, you can adjust the leave latency. The IGMP leave latency is the time between a request to leave a multicast group and the receipt of the last byte of data for the multicast group.

The last-member query count x (times) the last-member query interval = (equals) the amount of time it takes a routing device to determine that the last member of a group has left the group and to stop forwarding group traffic.

The default last-member query interval is 1 second. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify this interval:

1. Configure the time (in seconds) that the routing device waits for a report in response to a group-specific query.

```
[edit protocols igmp]
user@host# set query-last-member-interval 0.1
```

2. Verify the configuration by checking the IGMP Last Member Query Interval field in the output of the **show igmp interfaces** command.

**NOTE:** You can configure the last-member query count by configuring the robustness variable. The two are always equal.

---

### *Modifying the IGMP Robustness Variable*

Fine-tune the IGMP robustness variable to allow for expected packet loss on a subnet. The robust count automatically changes certain IGMP message intervals for IGMPv2 and IGMPv3. Increasing the robust count allows for more packet loss but increases the leave latency of the subnetwork.

When the query routing device receives an IGMP leave message on a shared network running IGMPv2, the query routing device must send an IGMP group query message a specified number of times. The number of IGMP group query messages sent is determined by the robust count.

The value of the robustness variable is also used in calculating the following IGMP message intervals:

- Group member interval—Amount of time that must pass before a multicast routing device determines that there are no more members of a group on a network. This interval is calculated as follows: (robustness variable x query-interval) + (1 x query-response-interval).
- Other querier present interval—The robust count is used to calculate the amount of time that must pass before a multicast routing device determines that there is no longer another multicast routing device that is the querier. This interval is calculated as follows: (robustness variable x query-interval) + (0.5 x query-response-interval).
- Last-member query count—Number of group-specific queries sent before the routing device assumes there are no local members of a group. The number of queries is equal to the value of the robustness variable.

In IGMPv3, a change of interface state causes the system to immediately transmit a state-change report from that interface. In case the state-change report is missed by one or more multicast routing devices, it is retransmitted. The number of times it is retransmitted is the robust count minus one. In IGMPv3, the robust count is also a factor in determining the group membership interval, the older version querier interval, and the other querier present interval.

By default, the robustness variable is set to 2. You might want to increase this value if you expect a subnet to lose packets.

The number can be from 2 through 10.

To change the value of the robustness variable:

1. Configure the robust count.

When you set the robust count, you are in effect configuring the number of times the querier retries queries on the connected subnets.

```
[edit protocols igmp]
user@host# set robust-count 5
```

2. Verify the configuration by checking the IGMP Robustness Count field in the output of the **show igmp interfaces** command.

### ***Limiting the Maximum IGMP Message Rate***

This section describes how to change the limit for the maximum number of IGMP packets transmitted in 1 second by the routing device.

Increasing the maximum number of IGMP packets transmitted per second might be useful on a routing device with a large number of interfaces participating in IGMP.

To change the limit for the maximum number of IGMP packets the routing device can transmit in 1 second, include the **maximum-transmit-rate** statement and specify the maximum number of packets per second to be transmitted.

### ***Changing the IGMP Version***

By default, the routing device runs IGMPv2. Routing devices running different versions of IGMP determine the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version.

To enable source-specific multicast (SSM) functionality, you must configure version 3 on the host and the host's directly connected routing device. If a source address is specified in a multicast group that is statically configured, the version must be set to IGMPv3.

If a static multicast group is configured with the source address defined, and the IGMP version is configured to be version 2, the source is ignored and only the group is added. In this case, the join is treated as an IGMPv2 group join.

If you configure the IGMP version setting at the individual interface hierarchy level, it overrides the **interface all** statement.

If you have already configured the routing device to use IGMP version 1 (IGMPv1) and then configure it to use IGMPv2, the routing device continues to use IGMPv1 for up to 6 minutes and then uses IGMPv2.

To change to IGMPv3 for SSM functionality:

1. Configure the IGMP interface.

```
[edit protocols igmp]
user@host# set interface ge-0/0/0 version 3
```

2. Verify the configuration by checking the version field in the output of the **show igmp interfaces** command. The **show igmp statistics** command has version-specific output fields, such as V1 Membership Report, V2 Membership Report, and V3 Membership Report.

### ***Enabling IGMP Static Group Membership***

You can create IGMP static group membership to test multicast forwarding without a receiver host. When you enable IGMP static group membership, data is forwarded to an interface without that interface receiving membership reports from downstream hosts. The routing device on which you enable static IGMP group membership must be the designated router (DR) for the subnet. Otherwise, traffic does not flow downstream.

When enabling IGMP static group membership, you cannot configure multiple groups using the **group-count**, **group-increment**, **source-count**, and **source-increment** statements if the **all** option is specified as the IGMP interface.

Class-of-service (CoS) adjustment is not supported with IGMP static group membership.

In this example, you create static group 225.1.1.1.

1. On the DR, configure the static groups to be created by including the **static** statement and **group** statement and specifying which IP multicast address of the group to be created. When creating groups individually, you must specify a unique address for each group.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
 static {
 group 225.1.1.1 ;
 }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created.

```
user@host> show igmp group
Interface: fe-0/1/2
Group: 225.1.1.1
Source: 10.0.0.2
Last reported by: Local
Timeout: 0 Type: Static
```

**NOTE:** When you configure static IGMP group entries on point-to-point links that connect routing devices to a rendezvous point (RP), the static IGMP group entries do not generate join messages toward the RP.

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of static groups be automatically created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately.

In this example, you create three groups.

1. On the DR, configure the number of static groups to be created by including the **group-count** statement and specifying the number of groups to be created.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 group-count 3
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
 static {
 group 225.1.1.1 {
 group-count 3;
 }
 }
}
```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static groups 225.1.1.1, 225.1.1.2, and 225.1.1.3 have been created.

```
user@host> show igmp group
Interface: fe-0/1/2
 Group: 225.1.1.1
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.2
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.3
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can also configure the group address to be automatically incremented for each group created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately and when you do not want the group addresses to be sequential.

In this example, you create three groups and increase the group address by an increment of two for each group.

1. On the DR, configure the group address increment by including the **group-increment** statement and specifying the number by which the address should be incremented for each group. The increment is specified in dotted decimal notation similar to an IPv4 address.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 group-count 3 group-increment
0.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
 version 3;
 static {
```

```

 group 225.1.1.1 {
 group-increment 0.0.0.2;
 group-count 3;
 }
 }
}

```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static groups 225.1.1.1, 225.1.1.3, and 225.1.1.5 have been created.

```

user@host> show igmp group
Interface: fe-0/1/2
 Group: 225.1.1.1
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.3
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.5
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static

```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, and your network is operating in source-specific multicast (SSM) mode, you can also specify that the multicast source address be accepted. This is useful when you want to test forwarding to multicast receivers from a specific multicast source.

If you specify a group address in the SSM range, you must also specify a source.

If a source address is specified in a multicast group that is statically configured, the IGMP version on the interface must be set to IGMPv3. IGMPv2 is the default value.

In this example, you create group 225.1.1.1 and accept IP address 10.0.0.2 as the only source.

1. On the DR, configure the source address by including the **source** statement and specifying the IPv4 address of the source host.

```

[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2

```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```

user@host> show configuration protocol igmp
interface fe-0/1/2.0 {
 version 3;
 static {
 group 225.1.1.1 {
 source 10.0.0.2;
 }
 }
}

```

```
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that source 10.0.0.2 has been accepted.

```
user@host> show igmp group
Interface: fe-0/1/2
 Group: 225.1.1.1
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of multicast sources be automatically accepted. This is useful when you want to test forwarding to multicast receivers from more than one specified multicast source.

In this example, you create group 255.1.1.1 and accept addresses 10.0.0.2, 10.0.0.3, and 10.0.0.4 as the sources.

1. On the DR, configure the number of multicast source addresses to be accepted by including the **source-count** statement and specifying the number of sources to be accepted.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2 source-count
3
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
 version 3;
 static {
 group 225.1.1.1 {
 source 10.0.0.2 {
 source-count 3;
 }
 }
 }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that sources 10.0.0.2, 10.0.0.3, and 10.0.0.4 have been accepted.

```
user@host> show igmp group
Interface: fe-0/1/2
 Group: 225.1.1.1
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.1
 Source: 10.0.0.3
 Last reported by: Local
 Timeout: 0 Type: Static
```

```

Group: 225.1.1.1
Source: 10.0.0.4
Last reported by: Local
Timeout: 0 Type: Static

```

When you configure static groups on an interface on which you want to receive multicast traffic, and specify that a number of multicast sources be automatically accepted, you can also specify the number by which the address should be incremented for each source accepted. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately and you do not want the source addresses to be sequential.

In this example, you create group 225.1.1.1 and accept addresses 10.0.0.2, 10.0.0.4, and 10.0.0.6 as the sources.

1. Configure the multicast source address increment by including the **source-increment** statement and specifying the number by which the address should be incremented for each source. The increment is specified in dotted decimal notation similar to an IPv4 address.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2 source-count
3 source-increment 0.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
```

```

interface fe-0/1/2.0 {
 version 3;
 static {
 group 225.1.1.1 {
 source 10.0.0.2 {
 source-count 3;
 source-increment 0.0.0.2;
 }
 }
 }
}

```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that sources 10.0.0.2, 10.0.0.4, and 10.0.0.6 have been accepted.

```
user@host> show igmp group
```

```

Interface: fe-0/1/2
 Group: 225.1.1.1
 Source: 10.0.0.2
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.1
 Source: 10.0.0.4
 Last reported by: Local
 Timeout: 0 Type: Static
 Group: 225.1.1.1
 Source: 10.0.0.6

```

Last reported by: Local  
Timeout: 0 Type: Static

When you configure static groups on an interface on which you want to receive multicast traffic and your network is operating in source-specific multicast (SSM) mode, you can specify that certain multicast source addresses be excluded.

By default the multicast source address configured in a static group operates in include mode. In include mode the multicast traffic for the group is accepted from the source address configured. You can also configure the static group to operate in exclude mode. In exclude mode the multicast traffic for the group is accepted from any address other than the source address configured.

If a source address is specified in a multicast group that is statically configured, the IGMP version on the interface must be set to IGMPv3. IGMPv2 is the default value.

In this example, you exclude address 10.0.0.2 as a source for group 225.1.1.1.

1. On the DR, configure a multicast static group to operate in exclude mode by including the **exclude** statement and specifying which IPv4 source address to exclude.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 exclude source 10.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
 version 3;
 static {
 group 225.1.1.1 {
 exclude;
 source 10.0.0.2;
 }
 }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group detail** command to verify that static group 225.1.1.1 has been created and that the static group is operating in exclude mode.

```
user@host> show igmp group detail
Interface: fe-0/1/2
Group: 225.1.1.1
Group mode: Exclude
Source: 10.0.0.2
Last reported by: Local
Timeout: 0 Type: Static
```

### ***Recording IGMP Join and Leave Events***

To determine whether IGMP tuning is needed in a network, you can configure the routing device to record IGMP join and leave events. You can record events globally for the routing device or for individual interfaces.

Table 276 on page 3675 describes the recordable IGMP events.

**Table 276: IGMP Event Messages**

| ERRMSG Tag                  | Definition                                                     |
|-----------------------------|----------------------------------------------------------------|
| RPD_IGMP_JOIN               | Records IGMP join events.                                      |
| RPD_IGMP_LEAVE              | Records IGMP leave events.                                     |
| RPD_IGMP_ACCOUNTING_ON      | Records when IGMP accounting is enabled on an IGMP interface.  |
| RPD_IGMP_ACCOUNTING_OFF     | Records when IGMP accounting is disabled on an IGMP interface. |
| RPD_IGMP_MEMBERSHIP_TIMEOUT | Records IGMP membership timeout events.                        |

To enable IGMP accounting:

1. Enable accounting globally or on an IGMP interface. This example shows both options.

```
[edit protocols igmp]
user@host# set accounting
user@host# set interface fe-0/1/0.2 accounting
```

2. Configure the events to be recorded and filter the events to a system log file with a descriptive filename, such as **igmp-events**.

```
[edit system syslog file igmp-events]
user@host# set any info
user@host# set match ".*RPD_IGMP_JOIN.* | .*RPD_IGMP_LEAVE.* |
.*RPD_IGMP_ACCOUNTING.* | .*RPD_IGMP_MEMBERSHIP_TIMEOUT.*"
```

3. Periodically archive the log file.

This example rotates the file size when it reaches 100 KB and keeps three files.

```
[edit system syslog file igmp-events]
user@host# set archive size 100000
user@host# set archive files 3
user@host# set archive archive-sites "ftp://user@host1//var/tmp" password
"anonymous"
user@host# set archive archive-sites "ftp://user@host2//var/tmp" password "test"
user@host# set archive transfer-interval 24
user@host# set archive start-time 2011-01-07:12:30
```

4. You can monitor the system log file as entries are added to the file by running the **monitor start** and **monitor stop** commands.

```
user@host> monitor start igmp-events

*** igmp-events ***
Apr 16 13:08:23 host mgd[16416]: UI_CMDLINE_READ_LINE: User 'user', command
'run monitor start igmp-events '
monitor
```

### ***Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces***

The **group-limit** statement enables you to limit the number of IGMP multicast group joins for logical interfaces. When this statement is enabled on a routing device running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), the limit is applied upon receipt of the group report. Once the group limit is reached, subsequent join requests are rejected.

When configuring limits for IGMP multicast groups, keep the following in mind:

- Each any-source group (\*G) counts as one group toward the limit.
- Each source-specific group (S,G) counts as one group toward the limit.
- Groups in IGMPv3 exclude mode are counted toward the limit.
- Multiple source-specific groups count individually toward the group limit, even if they are for the same group. For example, (S1, G1) and (S2, G1) would count as two groups toward the configured limit.
- Combinations of any-source groups and source-specific groups count individually toward the group limit, even if they are for the same group. For example, (\*, G1) and (S, G1) would count as two groups toward the configured limit.
- Configuring and committing a group limit on a network that is lower than what already exists on the network results in the removal of all groups from the configuration. The groups must then request to rejoin the network (up to the newly configured group limit).
- You can dynamically limit multicast groups on IGMP logical interfaces using dynamic profiles.

Beginning with Junos OS 12.2, you can optionally configure a system log warning threshold for IGMP multicast group joins received on the logical interface. It is helpful to review the system log messages for troubleshooting purposes and to detect if an excessive amount of IGMP multicast group joins have been received on the interface. These log messages convey when the configured group limit has been exceeded, when the configured threshold has been exceeded, and when the number of groups drop below the configured threshold.

The **group-threshold** statement enables you to configure the threshold at which a warning message is logged. The range is 1 through 100 percent. The warning threshold is a percentage of the group limit, so you must configure the **group-limit** statement to configure a warning threshold. For instance, when the number of groups exceed the configured warning threshold, but remain below the configured group limit, multicast groups continue to be accepted, and the device logs the warning message. In addition, the device logs a warning message after the number of groups drop below the configured warning threshold. You can further specify the amount of time (in seconds) between the log messages by configuring the **log-interval** statement. The range is 6 through 32,767 seconds.

You might consider throttling log messages because every entry added after the configured threshold and every entry rejected after the configured limit causes a warning message to be logged. By configuring a log interval, you can throttle the amount of system log warning messages generated for IGMP multicast group joins.

To limit multicast group joins on an IGMP logical interface:

1. Access the logical interface at the IGMP protocol hierarchy level.

```
[edit]
user@host# edit protocols igmp interface interface-name
```

2. Specify the group limit for the interface.

```
[edit protocols igmp interface interface-name]
user@host# set group-limit limit
```

3. (Optional) Configure the threshold at which a warning message is logged.

```
[edit protocols igmp interface interface-name]
user@host# set group-threshold value
```

4. (Optional) Configure the amount of time between log messages.

```
[edit protocols igmp interface interface-name]
user@host# set log-interval seconds
```

To confirm your configuration, use the **show protocols igmp** command. To verify the operation of IGMP on the interface, including the configured group limit and the optional warning threshold and interval between log messages, use the **show igmp interface** command.

### Tracing IGMP Protocol Traffic

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

| Flag                       | Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------|
| <b>all</b>                 | Trace all operations.                                                             |
| <b>client-notification</b> | Trace notifications.                                                              |
| <b>general</b>             | Trace general flow.                                                               |
| <b>group</b>               | Trace group operations.                                                           |
| <b>host-notification</b>   | Trace host notifications.                                                         |
| <b>leave</b>               | Trace leave group messages (IGMPv2 only).                                         |
| <b>mtrace</b>              | Trace mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software. |
| <b>normal</b>              | Trace normal events.                                                              |
| <b>packets</b>             | Trace all IGMP packets.                                                           |
| <b>policy</b>              | Trace policy processing.                                                          |

| Flag          | Description                                                                         |
|---------------|-------------------------------------------------------------------------------------|
| <b>query</b>  | Trace IGMP membership query messages, including general and group-specific queries. |
| <b>report</b> | Trace membership report messages.                                                   |
| <b>route</b>  | Trace routing information.                                                          |
| <b>state</b>  | Trace state transitions.                                                            |
| <b>task</b>   | Trace task processing.                                                              |
| <b>timer</b>  | Trace timer processing.                                                             |

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on IGMP packets of a particular type. To configure tracing operations for IGMP:

1. (Optional) Configure tracing at the routing options level to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the IGMP trace file.

```
[edit protocols igmp traceoptions]
user@host# set file igmp-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols igmp traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols igmp traceoptions]
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols igmp traceoptions]
user@host# set file world-readable
```

6. Configure tracing flags. Suppose you are troubleshooting issues with a particular multicast group. The following example shows how to flag all events for packets associated with the group IP address.

```
[edit protocols igmp traceoptions]
user@host# set flag group | match 232.1.1.2
```

7. View the trace file.

```
user@host> file list /var/log
user@host> file show /var/log/igmp-trace
```

### Disabling IGMP

To disable IGMP on an interface, include the **disable** statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- [edit protocols igmp interface *interface-name*]
- [edit logical-systems *logical-system-name* protocols igmp interface *interface-name*]

### IGMP and Nonstop Active Routing

Nonstop active routing (NSR) configurations include two Routing Engines that share information so that routing is not interrupted during Routing Engine failover. These NSR configurations include passive support with IGMP in connection with PIM. The master Routing Engine uses IGMP to determine its PIM multicast state, and this IGMP-derived information is replicated on the backup Routing Engine. IGMP on the new master Routing Engine (after failover) relearns the state information quickly through IGMP operation. In the interim, the new master Routing Engine retains the IGMP-derived PIM state as received by the replication process from the old master Routing Engine. This state information times out unless refreshed by IGMP on the new master Routing Engine. No additional IGMP configuration is required.

- *Examples: Configuring MLD*

### Configuring Multiple Instances of MSDP

MSDP instances are supported only for VRF instance types. You can configure multiple instances of MSDP to support multicast over VPNs.

To configure multiple instances of MSDP, include the following statements:

```
routing-instances {
 routing-instance-name {
 interface interface-name;
 instance-type vrf;
 route-distinguisher (as-number:number | ip-address:number);
 vrf-import [policy-names];
 vrf-export [policy-names];
 protocols {
 msdp {
 ... msdp-configuration ...
 }
 }
 }
}
```

You can include the statements at the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

### *PIM Configuration Statements*

To configure Protocol Independent Multicast (PIM), include the **pim** statement:

```
pim {
 disable;
 default-vpn-source {
 interface-name interface-name;
 }
 assert-timeout seconds;
 dense-groups {
 addresses;
 }
 dr-election-on-p2p;
 export;
 graceful-restart {
 disable;
 no-bidirectional-mode;
 restart-duration seconds;
 }
 idle-standby-path-switchover-delay seconds;
 import [policy-names];
 interface interface-name {
 bidirectional {
 df-election {
 backoff-period milliseconds;
 offer-period milliseconds;
 robustness-count number;
 }
 }
 }
 import;
 hello-interval seconds;
 mode bidirectional-sparse | bidirectional-sparse-dense | (dense | sparse |
 sparse-dense);
 neighbor-policy [policy-names];
```

```

 override-interval milliseconds;
 priority number;
 propagation-delay milliseconds;
 reset-tracking-bit;
 version version;
}
join-load-balance {
 automatic;
}
join-prune-timeout;
nonstop-routing {
 disable;
}
override-interval milliseconds;
propagation-delay milliseconds;
reset-tracking-bit;
rib-group {
 inet group-name;
 inet6 group-name;
}
rp {
 auto-rp {
 (announce | discovery | mapping);
 (mapping-agent-election | no-mapping-agent-election);
 }
 bidirectional {
 address address {
 group-ranges {
 destination-ip-prefix</prefix-length>;
 }
 hold-time seconds;
 priority number;
 }
 }
 bootstrap {
 family (inet | inet6) {
 export [policy-names];
 import [policy-names];
 priority number;
 }
 }
 bootstrap-export [policy-names];
 bootstrap-import [policy-names];
 bootstrap-priority number;
 dr-register-policy [policy-names];
 embedded-rp {
 group-ranges {
 destination-ip-prefix</prefix-length>;
 }
 maximum-rps limit;
 }
}
local {
 family (inet | inet6) {
 address address;
 anycast-pim {
 rp-set {

```

```

 address address <forward-msdp-sa>;
 }
 local-address address;
}
disable;
group-ranges {
 destination-ip-prefix </prefix-length>;
}
hold-time seconds;
override;
priority number;
}
}
rp-register-policy [policy-names];
standby-path-creation-delay seconds;
static {
 address address {
 override;
 version version;
 group-ranges {
 destination-ip-prefix </prefix-length>;
 }
 spt-threshold {
 infinity [policy-names];
 }
 traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag <flag-modifier> <disable>;
 }
 }
}
}
}
}

```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

By default, PIM is disabled.

**NOTE:** You cannot configure PIM within a nonforwarding instance. If you try to do so, the routing device displays a commit check error and does not complete the configuration commit process.

### Changing the PIM Version

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default for rendezvous point (RP) mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults.

To configure the PIM version, include the **version** statement:

```
version (1 | 2);
```

### ***Modifying the PIM Hello Interval***

Routing devices send hello messages at a fixed interval on all PIM-enabled interfaces. By using hello messages, routing devices advertise their existence as PIM routing devices on the subnet. With all PIM-enabled routing devices advertised, a single designated router for the subnet is established.

When a routing device is configured for PIM, it sends a hello message at a 30-second default interval. The interval range is from 0 through 255. When the interval counts down to 0, the routing device sends another hello message, and the timer is reset. A routing device that receives no response from a neighbor in 3.5 times the interval value drops the neighbor. In the case of a 30-second interval, the amount of time a routing device waits for a response is 105 seconds.

If a PIM hello message contains the hold-time option, the neighbor timeout is set to the hold-time sent in the message. If a PIM hello message does not contain the hold-time option, the neighbor timeout is set to the default hello hold time.

To modify how often the routing device sends hello messages out of an interface:

1. This example shows the configuration for the routing instance. Configure the interface globally or in the routing instance.

```
[edit routing-instances PIM.master protocols pim interface fe-3/0/2.0]
user@host# set hello-interval 255
```

2. Verify the configuration by checking the **Hello Option Holdtime** field in the output of the **show pim neighbors detail** command.

```
user@host> show pim neighbors detail
Instance: PIM.master
Interface: fe-3/0/2.0
Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
Rx Join: Group Source Timeout
225.1.1.1 192.168.195.78 0
225.1.1.1 0

Interface: lo0.0
Address: 10.255.245.91, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

```
Interface: pd-6/0/0.32768
Address: 0.0.0.0, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 0
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

### ***Preserving Multicast Performance by Disabling Response to the ping Utility***

The ping utility uses ICMP Echo messages to verify connectivity to any device with an IP address. However, in the case of multicast applications, a single ping sent to a multicast address can degrade the performance of routing devices because the stream of packets is replicated multiple times.

You can disable the routing device's response to ping (ICMP Echo) packets sent to multicast addresses. The system responds normally to unicast ping packets.

To disable the routing device's response to ping packets sent to multicast addresses:

1. Include the **no-multicast-echo** statement:

```
[edit system]
user@host# set no-multicast-echo
```

2. Verify the configuration by checking the **echo drops with broadcast or multicast destination address** field in the output of the **show system statistics icmp** command.

```
user@host> show system statistics icmp

icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
echo reply: 21
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
100 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
echo: 21
21 message responses generated
```

### ***PIM on Aggregated Interfaces***

You can configure several Protocol Independent Multicast (PIM) features on an interface regardless of its PIM mode (bidirectional, sparse, dense, or sparse-dense mode).

If you configure PIM on an aggregated (**ae-** or **as-**) interface, each of the interfaces in the aggregate is included in the multicast output interface list and carries the single stream of replicated packets in a load-sharing fashion. The multicast aggregate interface is “expanded” into its constituent interfaces in the next-hop database.

### Configuring PIM Trace Options

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

| Flag                             | Description                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                       | Trace all operations.                                                                                                                                                    |
| <b>assert</b>                    | Trace assert messages, which are used to resolve which of the parallel routing devices connected to a multiaccess LAN is responsible for forwarding packets to the LAN.  |
| <b>autorp</b>                    | Trace bootstrap, RP, and auto-RP messages.                                                                                                                               |
| <b>bidirectional-df-election</b> | Trace bidirectional PIM designated-forwarder (DF) election events.                                                                                                       |
| <b>bootstrap</b>                 | Trace bootstrap messages, which are sent periodically by the PIM domain's bootstrap routing device and are forwarded, hop by hop, to all routing devices in that domain. |
| <b>general</b>                   | Trace general events.                                                                                                                                                    |
| <b>graft</b>                     | Trace graft and graft acknowledgment messages.                                                                                                                           |
| <b>hello</b>                     | Trace hello packets, which are sent so that neighboring routing devices can discover one another.                                                                        |
| <b>join</b>                      | Trace join messages, which are sent to join a branch onto the multicast distribution tree.                                                                               |
| <b>mdt</b>                       | Trace messages related to multicast data tunnels.                                                                                                                        |
| <b>normal</b>                    | Trace normal events.                                                                                                                                                     |
| <b>nsr-synchronization</b>       | Trace nonstop routing synchronization events                                                                                                                             |
| <b>packets</b>                   | Trace all PIM packets.                                                                                                                                                   |
| <b>policy</b>                    | Trace poison-route-reverse packets.                                                                                                                                      |
| <b>prune</b>                     | Trace prune messages, which are sent to prune a branch off the multicast distribution tree.                                                                              |
| <b>register</b>                  | Trace register and register-stop messages. Register messages are sent to the RP when a multicast source first starts sending to a group.                                 |

| Flag         | Description                        |
|--------------|------------------------------------|
| <b>route</b> | Trace routing information.         |
| <b>rp</b>    | Trace candidate RP advertisements. |
| <b>state</b> | Trace state transitions.           |
| <b>task</b>  | Trace task processing.             |
| <b>timer</b> | Trace timer processing.            |

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on PIM packets of a particular type.

To configure tracing operations for PIM:

1. (Optional) Configure tracing at the [**routing-options** hierarchy level to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the PIM trace file.

```
[edit protocols pim traceoptions]
user@host# set file pim-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols pim traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols pim traceoptions]
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols pim traceoptions]
user@host# set file world-readable
```

6. Configure tracing flags.

Suppose you are troubleshooting issues with PIM version 1 control packets that are received on an interface configured for PIM version 2. The following example shows how to trace messages associated with this problem.

```
[edit protocols pim traceoptions]
user@host# set flag packets | match "Rx V1 Require V2"
```

7. View the trace file.

```
user@host> file list /var/log
user@host> file show /var/log/pim-trace
```

### *Disabling PIM*

By default, when configured, the PIM protocol is enabled on all interfaces for all families. If desired, you can disable PIM at the protocol, interface, or family hierarchy levels.

The hierarchy in which you configure PIM is critical. In general, the most specific configuration takes precedence. However, if PIM is disabled at the protocol level, then any disable statements with respect to an interface or family are ignored.

For example, the order of precedence for disabling PIM on a particular interface family is:

1. If PIM is disabled at the **[edit protocols pim interface *interface-name* family]** hierarchy level, then PIM is disabled for that interface family.
2. If PIM is not configured at the **[edit protocols pim interface *interface-name* family]** hierarchy level, but is disabled at the **[edit protocols pim interface *interface-name*]** hierarchy level, then PIM is disabled for all families on the specified interface.
3. If PIM is not configured at either the **[edit protocols pim interface *interface-name* family]** hierarchy level or the **[edit protocols pim interface *interface-name*]** hierarchy level, but is disabled at the **[edit protocols pim]** hierarchy level, then the PIM protocol is disabled globally for all interfaces and all families.

The following sections describe how to disable PIM at the various hierarchy levels.

- [Disabling the PIM Protocol on page 3687](#)
- [Disabling PIM On an Interface on page 3688](#)
- [Disabling PIM for a Family on page 3688](#)
- [Disabling PIM for a Rendezvous Point on page 3689](#)

### *Disabling the PIM Protocol*

You can explicitly disable the PIM protocol. Disabling the PIM protocol disables the protocol for all interfaces and all families. This is accomplished at the **[edit protocols pim]** hierarchy level:

```
[edit protocols]
pim {
 disable;
}
```

To disable the PIM protocol:

1. Include the **disable** statement.  

```
user@host# set protocols pim disable
```
2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.  

```
user@host# run show protocols pim
```

### *Disabling PIM On an Interface*

You can disable the PIM protocol on a per-interface basis. This is accomplished at the **[edit protocols pim interface *interface-name*]** hierarchy level:

```
[edit protocols]
pim {
 interface interface-name {
 disable;
 }
}
```

To disable PIM on an interface:

1. Include the **disable** statement.

```
user@host# set protocols pim interface fe-0/1/0 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### *Disabling PIM for a Family*

You can disable the PIM protocol on a per-family basis. This is accomplished at the **[edit protocols pim family]** hierarchy level:

```
[edit protocols]
pim {
 family inet {
 disable;
 }
 family inet6 {
 disable;
 }
}
```

To disable PIM for a family:

1. Include the **disable** statement.

```
user@host# set protocols pim family inet disable
```

```
user@host# set protocols pim family inet6 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

**Disabling PIM for a Rendezvous Point**

You can disable the PIM protocol for a rendezvous point (RP) on a per-family basis. This is accomplished at the **[edit protocols pim rp local family]** hierarchy level:

```
[edit protocols]
pim {
 rp {
 local {
 family inet {
 disable;
 }
 family inet6 {
 disable;
 }
 }
 }
}
```

To disable PIM for an RP family:

1. Use the **disable** statement.
 

```
user@host# set protocols pim rp local family inet disable
user@host# set protocols pim rp local family inet6 disable
```
2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.
 

```
user@host# run show protocols pim
```

**Verifying a Multicast Configuration**

To verify a multicast configuration, perform these tasks:

- [Verifying SAP and SDP Addresses and Ports on page 3689](#)
- [Verifying the IGMP Version on page 3690](#)
- [Verifying the PIM Mode and Interface Configuration on page 3690](#)
- [Verifying the PIM RP Configuration on page 3691](#)
- [Verifying the RPF Routing Table Configuration on page 3691](#)

**Verifying SAP and SDP Addresses and Ports**

- Purpose** Verify that SAP and SDP are configured to listen on the correct group addresses and ports.
- Action** From the CLI, enter the **show sap listen** command.

**Sample Output**

```
user@host> show sap listen
Group Address Port
224.2.127.254 9875
```

- Meaning** The output shows a list of the group addresses and ports that SAP and SDP listen on. Verify the following information:

- Each group address configured, especially the default **224.2.127.254**, is listed.
- Each port configured, especially the default **9875**, is listed.

#### *Verifying the IGMP Version*

**Purpose** Verify that IGMP version 2 is configured on all applicable interfaces.

**Action** From the CLI, enter the **show igmp interface** command.

#### Sample Output

```
user@host> show igmp interface
Interface: ge-0/0/0.0
 Querier: 192.168.4.36
 State: Up Timeout: 197 Version: 2 Groups: 0

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

**Meaning** The output shows a list of the interfaces that are configured for IGMP. Verify the following information:

- Each interface on which IGMP is enabled is listed.
- Next to **Version**, the number 2 appears.

#### *Verifying the PIM Mode and Interface Configuration*

**Purpose** Verify that PIM sparse mode is configured on all applicable interfaces.

**Action** From the CLI, enter the **show pim interfaces** command.

#### Sample Output

```
user@host> show pim interfaces
Instance: PIM.master
Name Stat Mode IP V State Count DR address
1o0.0 Up Sparse 4 2 DR 0 127.0.0.1
pim.32769 Up Sparse 4 2 P2P 0
```

**Meaning** The output shows a list of the interfaces that are configured for PIM. Verify the following information:

- Each interface on which PIM is enabled is listed.
- The network management interface, either **ge-0/0/0** or **fe-0/0/0**, is *not* listed.
- Under **Mode**, the word **Sparse** appears.

**Verifying the PIM RP Configuration**

**Purpose** Verify that the PIM RP is statically configured with the correct IP address.

**Action** From the CLI, enter the **show pim rps** command.

**Sample Output**

```
user@host> show pim rps
Instance: PIM.master
Address family INET
RP address Type Holdtime Timeout Active groups Group prefixes
192.168.14.27 static 0 None 2 224.0.0.0/4
```

**Meaning** The output shows a list of the RP addresses that are configured for PIM. At least one RP must be configured. Verify the following information:

- The configured RP is listed with the proper IP address.
- Under **Type**, the word **static** appears.

**Verifying the RPF Routing Table Configuration**

**Purpose** Verify that the PIM RPF routing table is configured correctly.

**Action** From the CLI, enter the **show multicast rpf** command.

**Sample Output**

```
user@host> show multicast rpf
Multicast RPF table: inet.0 , 2 entries...
```

**Meaning** The output shows the multicast RPF table that is configured for PIM. If no multicast RPF routing table is configured, RPF checks use **inet.0**. Verify the following information:

- The configured multicast RPF routing table is **inet.0**.
- The **inet.0** table contains entries.

### Configuring Multiple Instances of PIM

PIM instances are supported only for VRF instance types. You can configure multiple instances of PIM to support multicast over VPNs.

To configure multiple instances of PIM, include the following statements:

```
routing-instances {
 routing-instance-name {
 interface interface-name;
 instance-type vrf;
 protocols {
 pim {
 ... pim-configuration ...
 }
 }
 }
}
```

You can include the statements at the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

### Configuring a Designated Router for PIM

- [Configuring Interface Priority for PIM Designated Router Selection on page 3692](#)
- [Configuring PIM Designated Router Election on Point-to-Point Links on page 3693](#)

#### **Configuring Interface Priority for PIM Designated Router Selection**

A designated router (DR) sends periodic join messages and prune messages toward a group-specific rendezvous point (RP) for each group for which it has active members. When a Protocol Independent Multicast (PIM) routing device learns about a source, it originates a Multicast Source Discovery Protocol (MSDP) source-address message if it is the DR on the upstream interface.

By default, every PIM interface has the lowest probability (priority 0) of being selected as the DR. Configuring the interface DR priority helps ensure that changing an IP address does not alter your forwarding model.

To configure the interface designated router priority:

1. This example shows the configuration for the routing instance. Configure the interface globally or in the routing instance.

```
[edit routing-instances PIM.master protocols pim interface ge-0/0/0.0 family inet]
user@host# set priority 5
```

2. Verify the configuration by checking the **Hello Option DR Priority** field in the output of the **show pim neighbors detail** command.

```
user@host> show pim neighbors detail

Instance: PIM.master
Interface: ge-0/0/0.0
Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 5
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
Rx Join: Group Source Timeout
225.1.1.1 192.168.195.78 0
225.1.1.1 0

Interface: lo0.0
Address: 10.255.245.91, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

Interface: pd-6/0/0.32768
Address: 0.0.0.0, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 0
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

### ***Configuring PIM Designated Router Election on Point-to-Point Links***

To comply with the latest PIM drafts, enable designated router (DR) election on all PIM interfaces, including point-to-point (P2P) interfaces. (DR election is enabled by default on all other interfaces.) One of the two routing devices might join a multicast group on its P2P link interface. The DR on that link is responsible for initiating the relevant join messages.

To enable DR election on point-to-point interfaces:

1. On both point-to-point link routing devices, configure the routing device globally or in the routing instance. This example shows the configuration for the routing instance.

```
[edit routing-instances PIM.master protocols pim]
user@host# set dr-election-on-p2p
```

2. Verify the configuration by checking the **State** field in the output of the **show pim interfaces** command. The possible values for the **State** field are DR, NotDR, and P2P. When a point-to-point link interface is elected to be the DR, the interface state becomes DR instead of P2P.

3. If the **show pim interfaces** command continues to report the P2P state, consider running the **restart routing** command on both routing devices on the point-to-point link. Then recheck the state.

**CAUTION:** Do not restart a software process unless specifically asked to do so by your Juniper Networks customer support representative. Restarting a software process during normal operation of a routing platform could cause interruption of packet forwarding and loss of data.

[edit]  
user@host# run restart routing

### Configuring Static RP

- [Understanding Static RP on page 3694](#)
- [Configuring Local PIM RPs on page 3695](#)
- [Example: Configuring PIM Sparse Mode and RP Static IP Addresses on page 3697](#)
- [Configuring the Static PIM RP Address on the Non-RP Routing Device on page 3699](#)

#### Understanding Static RP

Protocol Independent Multicast (PIM) sparse mode is the most common multicast protocol used on the Internet. PIM sparse mode is the default mode whenever PIM is configured on any interface of the device. However, because PIM must not be configured on the network management interface, you must disable it on that interface.

Each any-source multicast (ASM) group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) router is the root of this shared tree and receives the multicast traffic from the source. To receive multicast traffic from the groups served by the RP, the device must determine the IP address of the RP for the source.

You can configure a static rendezvous point (RP) configuration that is similar to static routes. A static configuration has the benefit of operating in PIM version 1 or version 2. When you configure the static RP, the RP address that you select for a particular group must be consistent across all routers in a multicast domain.

One common way for the device to locate RPs is by static configuration of the IP address of the RP. A static configuration is simple and convenient. However, if the statically defined RP router becomes unreachable, there is no automatic failover to another RP router. To remedy this problem, you can use anycast RP.

### **Configuring Local PIM RPs**

Local RP configuration makes the routing device a statically defined RP. Consider statically defining an RP if the network does not have many different RPs defined or if the RP assignment does not change very often. The Junos IPv6 PIM implementation supports only static RP configuration. Automatic RP announcement and bootstrap routers are not available with IPv6.

You can configure a local RP globally or for a routing instance. This example shows how to configure a local RP in a routing instance for IPv4 or IPv6.

To configure the routing device's RP properties:

1. Configure the routing instance as the local RP.

```
[routing-instances VPN-A protocols pim]
user@host# set rp local
```

2. Configure the IP protocol family and IP address.

IPv6 PIM hello messages are sent to every interface on which you configure **family inet6**, whether at the PIM level of the hierarchy or not. As a result, if you configure an interface with both **family inet** at the **[edit interface interface-name]** hierarchy level and **family inet6** at the **[edit protocols pim interface interface-name]** hierarchy level, PIM sends both IPv4 and IPv6 hellos to that interface.

By default, PIM operates in sparse mode on an interface. If you explicitly configure sparse mode, PIM uses this setting for all IPv6 multicast groups. However, if you configure sparse-dense mode, PIM does not accept IPv6 multicast groups as dense groups and operates in sparse mode over them.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set family inet6 address 2001:db8:85a3::8a2e:370:7334
user@host# set family inet address 10.1.2.254
```

3. (IPv4 only) Configure the routing device's RP priority.

**NOTE:** The priority statement is not supported for IPv6, but is included here for informational purposes. The routing device's priority value for becoming the RP is included in the bootstrap messages that the routing device sends. Use a smaller number to increase the likelihood that the routing device becomes the RP for local multicast groups. Each PIM routing device uses the priority value and other factors to determine the candidate RPs for a particular group range. After the set of candidate RPs is distributed, each routing device determines algorithmically the RP from the candidate RP set using a hash function. By default, the priority value is set to 1. If this value is set to 0, the bootstrap router can override the group range being advertised by the candidate RP.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set priority 5
```

4. Configure the groups for which the routing device is the RP.

By default, a routing device running PIM is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12). The following example limits the groups for which this routing device can be the RP.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set group-ranges fec0::/10
user@host# set group-ranges 10.1.2.0/24
```

5. (IPv4 only) Modify the local RP hold time.

If the local routing device is configured as an RP, it is considered a candidate RP for its local multicast groups. For candidate RPs, the hold time is used by the bootstrap router to time out RPs, and applies to the bootstrap RP-set mechanism. The RP hold time is part of the candidate RP advertisement message sent by the local routing device to the bootstrap router. If the bootstrap router does not receive a candidate RP advertisement from an RP within the hold time, it removes that routing device from its list of candidate RPs. The default hold time is 150 seconds.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set hold-time 200
```

6. (Optional) Override dynamic RP for the specified group address range.

If you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for the given static RP group range, and allow dynamic RP mapping for all other groups.

If you exclude this statement from the configuration and you use both static and dynamic RP mechanisms for different group ranges within the same routing instance, the dynamic RP mapping takes precedence over the static RP mapping, even if static RP is defined for a specific group range.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set override
```

7. Monitor the operation of PIM by running the **show pim** commands. Run **show pim ?** to display the supported commands.

**Example: Configuring PIM Sparse Mode and RP Static IP Addresses**

This example shows how to configure PIM sparse mode and RP static IP addresses.

- [Requirements on page 3697](#)
- [Overview on page 3697](#)
- [Configuration on page 3697](#)
- [Verification on page 3699](#)

**Requirements**

Before you begin:

1. Determine whether the router is directly attached to any multicast sources. Receivers must be able to locate these sources.
2. Determine whether the router is directly attached to any multicast group receivers. If receivers are present, IGMP is needed.
3. Determine whether to configure multicast to use sparse, dense, or sparse-dense mode. Each mode has different configuration considerations.
4. Determine the address of the RP if sparse or sparse-dense mode is used.
5. Determine whether to locate the RP with the static configuration, BSR, or auto-RP method.
6. Determine whether to configure multicast to use its own RPF routing table when configuring PIM in sparse, dense, or sparse-dense mode.
7. Configure the SAP and SDP protocols to listen for multicast session announcements.
8. Configure IGMP.

**Overview**

In this example, you set the interface value to **all** and disable the **ge-0/0/0** interface. Then you configure the IP address of the RP as **192.168.14.27**.

**Configuration****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols pim interface all
set protocols pim interface ge-0/0/0 disable
set protocols pim rp static address 192.168.14.27
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To configure PIM sparse mode and the RP static IP address:

1. Configure PIM.  

```
[edit]
user@host# edit protocols pim
```
2. Set the interface value.  

```
[edit protocols pim]
user@host# set pim interface all
```
3. Disable PIM on the network management interface.  

```
[edit protocols pim interface]
user@host# set pim interface ge-0/0/0 unit 0 disable
```
4. Configure RP.  

```
[edit]
user@host# edit protocols pim rp
```
5. Configure the IP address of the RP.  

```
[edit]
user@host# set static address 192.168.14.27
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show protocols
pim {
 rp {
 static {
 address 192.168.14.27;
 }
 }
}
interface all;
 interface ge-0/0/0.0 {
 disable;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

To confirm that the configuration is working properly, perform these tasks:

- [Verifying SAP and SDP Addresses and Ports on page 3699](#)
- [Verifying the IGMP Version on page 3699](#)
- [Verifying the PIM Mode and Interface Configuration on page 3699](#)

**Verifying SAP and SDP Addresses and Ports**

**Purpose** Verify that SAP and SDP are configured to listen on the correct group addresses and ports.

**Action** From operational mode, enter the **show sap listen** command.

**Verifying the IGMP Version**

**Purpose** Verify that IGMP version 2 is configured on all applicable interfaces.

**Action** From operational mode, enter the **show igmp interface** command.

**Verifying the PIM Mode and Interface Configuration**

**Purpose** Verify that PIM sparse mode is configured on all applicable interfaces.

**Action** From operational mode, enter the **show pim interfaces** command.

**Configuring the Static PIM RP Address on the Non-RP Routing Device**

Consider statically defining an RP if the network does not have many different RPs defined or if the RP assignment does not change very often. The Junos IPv6 PIM implementation supports only static RP configuration. Automatic RP announcement and bootstrap routers are not available with IPv6.

You configure a static RP address on the non-RP routing device. This enables the non-RP routing device to recognize the local statically defined RP. For example, if R0 is a non-RP router and R1 is the local RP router, you configure R0 with the static RP address of R1. The static IP address is the routable address assigned to the loopback interface on R1. In the following example, the loopback address of the RP is 2001:db8:85a3::8a2e:370:7334.

You can configure a static RP address globally or for a routing instance. This example shows how to configure a static RP address in a routing instance for IPv6.

To configure the static RP address:

1. On a non-RP routing device, configure the routing instance to point to the routable address assigned to the loopback interface of the RP.

```
[routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334
```

**NOTE:** Logical systems are also supported. You can configure a static RP address in a logical system only if the logical system is not directly connected to a source.

2. (Optional) Set the PIM sparse mode version.

For each static RP address, you can optionally specify the PIM version. The default PIM version is version 1.

```
[edit routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334 version 2
```

**NOTE:** The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIM version 1 is the default for RP mode ([edit **pim rp static address address**]). PIM version 2 is the default for interface mode ([edit **pim interface interface-name**]). Explicitly configured versions override the defaults.

3. (Optional) Set the group address range.

By default, a routing device running PIM is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12). The following example limits the groups for which the 2001:db8:85a3::8a2e:370:7334 address can be the RP.

```
[edit routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334 group-ranges fec0::/10
```

The RP that you select for a particular group must be consistent across all routers in a multicast domain.

4. (Optional) Override dynamic RP for the specified group address range.

If you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for the given static RP group range, and allow dynamic RP mapping for all other groups.

If you exclude this statement from the configuration and you use both static and dynamic RP mechanisms for different group ranges within the same routing instance, the dynamic RP mapping takes precedence over the static RP mapping, even if static RP is defined for a specific group range.

```
[edit routing-instances VPN-A protocols pim rp static address
 2001:db8:85a3::8a2e:370:7334]
user@host# set override
```

5. Monitor the operation of PIM by running the **show pim** commands. Run **show pim ?** to display the supported commands.

### Configuring PIM Bootstrap Router

- [Understanding the PIM Bootstrap Router on page 3701](#)
- [Configuring PIM Bootstrap Properties for IPv4 on page 3701](#)
- [Configuring PIM Bootstrap Properties for IPv4 or IPv6 on page 3702](#)
- [Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain on page 3704](#)
- [Example: Configuring PIM BSR Filters on page 3705](#)

#### ***Understanding the PIM Bootstrap Router***

To determine which routing device is the rendezvous point (RP), all routing devices within a PIM sparse-mode domain collect bootstrap messages. A PIM sparse-mode domain is a group of routing devices that all share the same RP router. The domain bootstrap routing device initiates bootstrap messages, which are sent hop by hop within the domain. The routing devices use bootstrap messages to distribute RP information dynamically and to elect a bootstrap routing device when necessary.

#### ***Configuring PIM Bootstrap Properties for IPv4***

For correct operation, every multicast routing device within a PIM domain must be able to map a particular multicast group address to the same Rendezvous Point (RP). The bootstrap routing device mechanism is one way that a multicast routing device can learn the set of group-to-RP mappings. Bootstrap routing devices are supported in IPv4 and IPv6.

**NOTE:** For legacy configuration purposes, there are two sections that describe the configuration of bootstrap routing devices: one section for both IPv4 and IPv6, and this section, which is for IPv4 only. The method described in [“Configuring PIM Bootstrap Properties for IPv4 or IPv6” on page 3702](#) is recommended. A commit error occurs if the same IPv4 bootstrap statements are included in both the IPv4-only and the IPv4-and-IPv6 sections of the hierarchy. The error message is “duplicate IPv4 bootstrap configuration.”

To determine which routing device is the RP, all routing devices within a PIM domain collect bootstrap messages. A PIM domain is a contiguous set of routing devices that implement PIM. All are configured to operate within a common boundary. The domain's bootstrap routing device initiates bootstrap messages, which are sent hop by hop within the domain. The routing devices use bootstrap messages to distribute RP information dynamically and to elect a bootstrap routing device when necessary.

PIM bootstrap messages are sourced from the loopback address, which is always up. The loopback address must be routable; if it is not routable, then the bootstrap routing device is unable to send bootstrap messages to update the RP domain members. See [Configuring the Loopback Interface](#) for information about configuring a loopback interface.

You can configure bootstrap properties globally or for a routing instance. This example shows the global configuration.

To configure the bootstrap routing device properties:

1. Configure the bootstrap priority.

By default, each routing device has a bootstrap priority of 0, which means the routing device can never be the bootstrap routing device. A priority of 0 disables the function for IPv4 and does not cause the routing device to send bootstrap routing device packets with a 0 in the priority field. The routing device with the highest priority value is elected to be the bootstrap routing device. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap routing device. A simple bootstrap configuration assigns a bootstrap priority value to a routing device.

```
[edit protocols pim rp]
user@host# set bootstrap-priority 3
```

2. (Optional) Create import and export policies to control the flow of IPv4 bootstrap messages to and from the RP, and apply the policies to PIM. Import and export policies are useful when some of the routing devices in your PIM domain have interfaces that connect to other PIM domains. Configuring a policy prevents bootstrap messages from crossing domain boundaries. The **bootstrap-import** statement prevents messages from being imported into the RP. The **bootstrap-export** statement prevents messages from being exported from the RP.

```
[edit protocols pim rp]
user@host# set bootstrap-import pim-bootstrap-import
user@host# set bootstrap-export pim-bootstrap-export
```

3. Configure the policies.

```
[edit policy-options policy-statement pim-bootstrap-import]
user@host# set from interface se-0/0/0
user@host# set then reject
```

```
[edit policy-options policy-statement pim-bootstrap-export]
user@host# set from interface se-0/0/0
user@host# set then reject
```

4. Monitor the operation of PIM bootstrap routing devices by running the **show pim bootstrap** command.

### ***Configuring PIM Bootstrap Properties for IPv4 or IPv6***

For correct operation, every multicast routing device within a PIM domain must be able to map a particular multicast group address to the same Rendezvous Point (RP). The bootstrap routing device mechanism is one way that a multicast routing device can learn the set of group-to-RP mappings. Bootstrap routing devices are supported in IPv4 and IPv6.

**NOTE:** For legacy configuration purposes, there are two sections that describe the configuration of bootstrap routing devices: one section for IPv4 only, and this section, which is for both IPv4 and IPv6. The method described in this section is recommended. A commit error occurs if the same IPv4 bootstrap statements are included in both the IPv4-only and the IPv4-and-IPv6 sections of the hierarchy. The error message is “duplicate IPv4 bootstrap configuration.”

To determine which routing device is the RP, all routing devices within a PIM domain collect bootstrap messages. A PIM domain is a contiguous set of routing devices that implement PIM. All devices are configured to operate within a common boundary. The domain's bootstrap routing device initiates bootstrap messages, which are sent hop by hop within the domain. The routing devices use bootstrap messages to distribute RP information dynamically and to elect a bootstrap routing device when necessary.

PIM bootstrap messages are sourced from the loopback address, which is always up. The loopback address must be routable; if it is not routable, then the bootstrap routing device is unable to send bootstrap messages to update the RP domain members. See *Configuring the Loopback Interface* for information about configuring a loopback interface.

You can configure bootstrap properties globally or for a routing instance. This example shows the global configuration.

To configure the bootstrap routing device properties:

1. Configure the bootstrap priority.

By default, each routing device has a bootstrap priority of 0, which means the routing device can never be the bootstrap routing device. The routing device with the highest priority value is elected to be the bootstrap routing device. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap routing device. A simple bootstrap configuration assigns a bootstrap priority value to a routing device.

**NOTE:** In the IPv4-only configuration, specifying a bootstrap priority of 0 disables the bootstrap function and does not cause the routing device to send BSR packets with a 0 in the priority field. In the configuration shown here, specifying a bootstrap priority of 0 does not disable the function, but causes the routing device to send BSR packets with a 0 in the priority field. To disable the bootstrap function in the IPv4 and IPv6 configuration, delete the `bootstrap` statement.

```
user@host# edit protocols pim rp
user@host# set bootstrap family inet priority 3
```

2. (Optional) Create import and export policies to control the flow of bootstrap messages to and from the RP, and apply the policies to PIM. Import and export policies are useful when some of the routing devices in your PIM domain have interfaces that connect to other PIM domains. Configuring a policy prevents bootstrap messages from crossing domain boundaries. The **import** statement prevents messages from being imported

into the RP. The **export** statement prevents messages from being exported from the RP.

```
[edit protocols pim rp]
user@host# set bootstrap family inet import pim-bootstrap-import
user@host# set bootstrap family inet export pim-bootstrap-export
```

3. Configure the policies.

```
[edit policy-options policy-statement pim-bootstrap-import]
user@host# set from interface se-0/0/0
user@host# set then reject
user@host# exit
user@host# edit policy-options policy-statement pim-bootstrap-export
user@host# set from interface se-0/0/0
user@host# set then reject
```

4. Monitor the operation of PIM bootstrap routing devices by running the **show pim bootstrap** command.

#### *Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain*

In this example, the **from interface so-0-1/0 then reject** policy statement rejects bootstrap messages from the specified interface (the example is configured for both IPv4 and IPv6 operation):

```
protocols {
 pim {
 rp {
 bootstrap {
 family inet {
 priority 1;
 import pim-import;
 export pim-export;
 }
 family inet6 {
 priority 1;
 import pim-import;
 export pim-export;
 }
 }
 }
 }
}
policy-options {
 policy-statement pim-import {
 from interface so-0/1/0;
 then reject;
 }
 policy-statement pim-export {
 to interface so-0/1/0;
 then reject;
 }
}
```

**Example: Configuring PIM BSR Filters**

Configure a filter to prevent BSR messages from entering or leaving your network. Add this configuration to all routers:

```
protocols {
 pim {
 rp {
 bootstrap-import no-bsr;
 bootstrap-export no-bsr;
 }
 }
}
policy-options {
 policy-statement no-bsr {
 then reject;
 }
}
```

**Understanding PIM Auto-RP**

You can configure a more dynamic way of assigning rendezvous points (RPs) in a multicast network by means of auto-RP. When you configure auto-RP for a , the learns the address of the RP in the network automatically and has the added advantage of operating in PIM version 1 and version 2.

Although auto-RP is a nonstandard (non-RFC-based) function that typically uses dense mode PIM to advertise control traffic, it provides an important failover advantage that simple static RP assignment does not. You can configure multiple s as RP candidates. If the elected RP fails, one of the other preconfigured s takes over the RP functions. This capability is controlled by the auto-RP mapping agent.

**Configuring PIM Auto-RP**

For correct operation, every multicast within a PIM domain must be able to map a particular multicast group address to the same rendezvous point (RP). The auto-RP mechanism is one way that a multicast can learn the set of group-to-RP mappings. Auto-RP automatically distributes mapping information to routing devices. It simplifies use of multiple RPs for different multicast group ranges, thus allowing multiple RPs to act as backups for each other. Auto-RP relies on a to act as the RP mapping agent.

Potential RPs announce themselves to the mapping agent, and the mapping agent resolves any conflicts.

The mapping agent sends the multicast group-RP mapping information to the other s using PIM dense mode. The specific groups used are 224.0.1.39 and .40. The first (.39) is used to advertise, the second (.40) is used for discovery. Because PIM dense mode is necessary to enable auto-RP to work, which in turns enables PIM sparse mode to work, you must configure PIM sparse-dense mode in the PIM domains that use auto-RP.

Although auto-RP is a nonstandard (non-RFC-based) function requiring dense mode PIM to advertise control traffic, it provides an important failover advantage that static RP assignment does not. That is, you can configure multiple routing devices as RP candidates. If the elected RP fails, one of the other preconfigured routing devices takes over the RP functions. This capability is controlled by the auto-RP mapping agent.

Auto-RP operates in PIM version 1 and version 2.

In most cases, how the routing device handles auto-RP discovery, announce, or mapping messages depends on whether the routing device is an RP (configured as local RP) or not. [Table 277 on page 3706](#) shows how the routing device behaves depending on the local RP configuration.

**Table 277: Local RP and Auto-RP Message Types**

| Auto-RP Message Type | Local RP? | Routing Device Behavior                                                                                                                                             |
|----------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| discovery            | No        | Listen for auto-RP mapping messages.                                                                                                                                |
| discovery            | Yes       | Listen for auto-RP mapping messages.                                                                                                                                |
| announce             | No        | Listen for auto-RP mapping messages.                                                                                                                                |
| announce             | Yes       | Listen for auto-RP mapping messages. Send auto-RP announce messages.                                                                                                |
| mapping              | No        | Listen for auto-RP mapping messages. Listen for auto-RP announce messages. If elected mapping agent, send auto-RP mapping messages.                                 |
| mapping              | Yes       | Listen for auto-RP mapping messages. Send auto-RP announce messages. Listen for auto-RP announce messages. If elected mapping agent, send auto-RP mapping messages. |

**NOTE:** If the routing device receives auto-RP announcements split across multiple messages, the routing device loses the information in the previous part of the message as soon as the next part of the message is received.

You can configure auto-RP properties globally or for a routing instance. This example shows the global configuration.

To configure auto-RP properties:

1. Configure PIM in sparse-dense mode on all routing devices in the PIM domain.

```
[edit protocols pim]
user@host# edit
user@host# set interface all mode sparse-dense
```

This configuration allows the routing device to operate in sparse mode for most groups and dense mode for others. The default is to operate in sparse mode unless the routing device is specifically informed of a dense mode group.

2. Configure a routable loopback interface address on all routing devices in the PIM domain.

The routing device joins the auto-RP groups on the configured interfaces and on the loopback interface **lo0.0**. For auto-RP to work correctly, configure a routable IP address on the loopback interface. The router ID is used as the address for auto-RP updates. You cannot use the loopback address 127.0.0.1. Also, you must enable PIM sparse-dense mode on the **lo0.0** interface if you do not specify **interface all**.

```
[edit interfaces lo0.0 unit 0 family inet]
user@host# set address 192.168.0.3 preferred
```

3. Configure the two multicast dense groups on all the routing devices.

Auto-RP requires multicast flooding to announce potential RP candidates and to discover the elected RPs in the network. Multicast flooding occurs through a PIM dense mode model, where group 224.0.1.39 is used for **announce** messages and group 224.0.1.40 is used for **discovery** messages.

```
[edit protocols pim]
user@host# set dense-groups 224.0.1.39/32
user@host# set dense-groups 224.0.1.40/32
```

**TIP:** Step 3 is required. When auto-RP is enabled, the auto-RP announce group (224.0.1.39) and auto-RP-discovery group (224.0.1.40) must be configured explicitly as dense groups. When the auto-RP discovery group is not configured as a dense group, auto-RP is not enabled. When the auto-RP announce group is not configured as a dense group, auto-RP is enabled in the discovery mode only, and mapping and announce modes are disabled.

4. Configure the auto-RP **announce** option.

At least one routing device in the PIM domain must announce auto-RP messages and at least one must map them, or you can configure a routing device to perform both functions.

When a routing device sends announce messages in the network, it is advertising itself as a candidate RP. A routing device configured with this option must also be configured as an RP, or announce messages are not sent.

```
[edit protocols pim rp]
user@host# set local address 192.168.0.1
user@host# set auto-rp announce
```

**NOTE:** You cannot include the `auto-rp announce` option at the `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim]` hierarchy level.

#### 5. Configure the auto-RP mapping agent.

The mapping agent sends discovery messages to the network, informing all routing devices in a multicast group of which RP to use. If the mapping agent is also an RP, the **mapping** option also allows the routing device to send auto-RP announcements (mapping on an RP allows the routing device to perform both the announcement and mapping functions).

```
[edit protocols pim rp]
user@host# set auto-rp mapping
```

If the mapping agent is also an RP, configure the mapping agent as a local RP.

```
[edit protocols pim rp]
user@host# set local address 192.168.0.2
```

#### 6. Configure mapping agent election.

If you configure the **mapping** option on more than one routing device in the PIM domain, configure mapping agent election on each potential mapping agent.

Auto-RP specifications state that mapping agents do not send mapping messages if they receive messages from a mapping agent with a higher IP address. However, some vendors' mapping agents continue to announce mappings, even in the presence of higher-addressed mapping agents. In other words, some mapping agents will always send mapping messages.

The default auto-RP operation is to perform mapping agent election. To explicitly configure mapping agent election, you can include the **mapping-agent-election** statement. When this option is configured, the mapping agent will stop sending mapping messages if it receives messages from a mapping agent with a higher IP address.

```
[edit protocols pim rp]
user@host# set auto-rp mapping mapping-agent-election
```

Mapping message suppression is disabled with the **no-mapping-agent-election** statement. When this option is configured, the mapping agent will always send mapping messages even in the presence of higher-addressed mapping agents.

To disable mapping agent election for compatibility with other vendors' equipment, include the **no-mapping-agent-election** statement.

```
[edit protocols pim rp]
user@host# set auto-rp mapping no-mapping-agent-election
```

7. Configure the remaining routing devices in the PIM domain to discover the RP.

Discovery enables the routing devices to receive and process discovery messages from the mapping agent. This is the most basic auto-RP option.

```
[edit protocols pim rp]
user@host# set auto-rp discovery
```

8. Monitor the operation of PIM auto-RP routers by running the following commands:

- `show pim interfaces`
- `show pim rps`
- `show pim rps`

9. Issue the `show pim rps extensive` command to see information about how an RP is learned, what groups it handles, and the number of groups actively using the RP.

```
user@host> show pim rps extensive
RP: 192.168.5.1
Learned from 192.168.5.1 via: auto-rp
Time Active: 00:34:29
Holdtime: 150 with 108 remaining
Device Index: 6
Subunit: 32769
Interface: pd-0/0/0.32769
Group Ranges:
 224.0.0.0/4
Active groups using RP:
 224.2.2.100
 total 1 groups active
Register State for RP:
Group Source FirstHop RP Address StateRP address Type Holdtime
Timeout
```

In the example, the RP at 192.168.5.1 was learned through auto-RP. The RP is able to support all groups in the 224.0.0.0/4 range (all possible groups). The local router has sent PIM control traffic for the 224.2.2.100 group to the RP.

Additionally, the presence of a Tunnel Physical Interface Card (PIC) in an RP router creates a de-encapsulation interface, which allows the RP to receive multicast traffic from the source. This interface is indicated by `pd-0/0/0.32769`.

### Understanding Embedded RP for IPv6 Multicast

Global IPv6 multicast between routing domains has been possible only with source-specific multicast (SSM) because there is no way to convey information about IPv6 multicast RPs between PIM sparse mode RPs. In IPv4 multicast networks, this information is conveyed between PIM RPs using MSDP, but there is no IPv6 support in current MSDP standards. IPv6 uses the concept of an embedded RP to resolve this issue without requiring SSM. This feature embeds the RP address in an IPv6 multicast address.

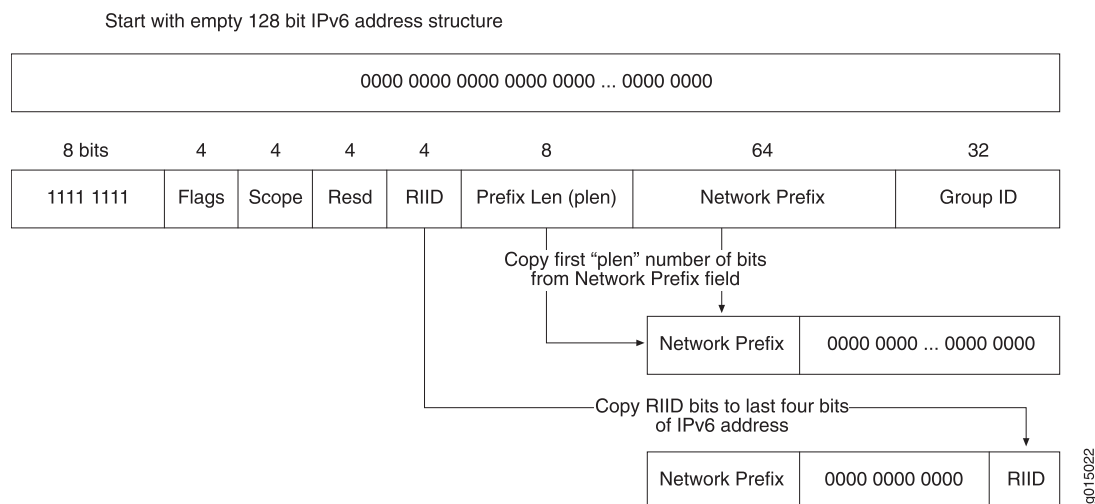

All IPv6 multicast addresses begin with 8 1-bits (1111 1111) followed by a 4-bit flag field normally set to 0011. The flag field is set to 0111 when embedded RP is used. Then the low-order bits of the normally reserved field in the IPv6 multicast address carry the 4-bit RP interface identifier (RIID).

When the IPv6 address of the RP is embedded in a unicast-prefix-based any-source multicast (ASM) address, all of the following conditions must be true:

- The address must be an IPv6 multicast address and have 0111 in the flags field (that is, the address is part of the prefix FF70::/12).
- The 8-bit prefix length (plen) field must not be all 0. An all 0 plen field implies that SSM is in use.
- The 8-bit prefix length field value must not be greater than 64, which is the length of the network prefix field in unicast-prefix-based ASM addresses.

The routing platform derives the value of the interdomain RP by copying the prefix length field number of bits from the 64-bit network prefix field in the received IPv6 multicast address to an empty 128-bit IPv6 address structure and copying the last bits from the 4-bit RIID. For example, if the prefix length field bits have the value 32, then the routing platform copies the first 32 bits of the IPv6 multicast address network prefix field to an all-0 IPv6 address and appends the last four bits determined by the RIID. See [Figure 88 on page 3710](#) for an illustration of this process.

**Figure 88: Extracting the Embedded RP IPv6 Address**

For example, the administrator of IPv6 network 2001:DB8::/32 sets up an RP for the 2001:DB8:BEEF:FEED::/96 subnet. In that case, the received embedded RP IPv6 ASM address has the form:

FF70:y40:2001:DB8:BEEF:FEED::/96

and the derived RP IPv6 address has the form:

2001:DB8:BEEF:FEED::y

where y is the RIID (y cannot be 0).

When configured, the routing platform checks for embedded RP information in every PIM join request received for IPv6. The use of embedded RP does not change the processing of IPv6 multicast and RPs in any way, except that the embedded RP address is used if available and selected for use. There is no need to specify the IPv6 address family for embedded RP configuration because the information can be used only if IPv6 multicast is properly configured on the routing platform.

The following receive events trigger extraction of an IPv6 embedded RP address on the routing platform:

- Multicast Listener Discovery (MLD) report for an embedded RP multicast group address
- PIM join message with an embedded RP multicast group address
- Static embedded RP multicast group address associated with an interface
- Packets sent to an embedded RP multicast group address received on the DR

The embedded RP node discovered through these events is added if it does not already exist on the routing platform. The routing platform chooses the embedded RP as the RP for a multicast group before choosing an RP learned through BSRs or a statically configured RP. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.

### ***Configuring PIM Embedded RP for IPv6***

You configure embedded RP to allow multidomain IPv6 multicast networks to find RPs in other routing domains. Embedded RP embeds an RP address inside PIM join messages and other types of messages sent between routing domains. Global IPv6 multicast between routing domains has been possible only with source-specific multicast (SSM) because there is no way to convey information about IPv6 multicast RPs between PIM sparse mode RPs. In IPv4 multicast networks, this information is conveyed between PIM RPs using MSDP, but there is no IPv6 support in current MSDP standards. IPv6 uses the concept of an embedded RP to resolve this issue without requiring SSM. Thus, embedded RP enables you can deploy IPv6 with any-source multicast (ASM).

Embedded RP is disabled by default.

When you configure embedded RP for IPv6, embedded RPs are preferred to RPs discovered by IPv6 any other way. You configure embedded RP independent of any other IPv6 multicast properties. This feature is applied only when IPv6 multicast is properly configured.

You can configure embedded RP globally or for a routing instance. This example shows the routing instance configuration.

To configure embedded RP for IPv6 PIM sparse mode:

1. Define which multicast addresses or prefixes can embed RP address information. If messages within a group range contain embedded RP information and the group range is not configured, the embedded RP in that group range is ignored. Any valid unicast-prefix-based ASM address can be used as a group range. The default group range is FF70::/12 to FFF0::/12. Messages with embedded RP information that do not match any configured group ranges are treated as normal multicast addresses.

```
[edit routing-instances vpn-A protocols pim rp embedded-rp]
user@host# set group-ranges fec0::/10
```

If the derived RP address is not a valid IPv6 unicast address, it is treated as any other multicast group address and is not used for RP information. Verification fails if the extracted RP address is a local interface, unless the routing device is configured as an RP and the extracted RP address matches the configured RP address. Then the local RP determines whether it is configured to act as an RP for the embedded RP multicast address.

2. Limit the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.

```
[edit routing-instances vpn-A protocols pim rp]
user@host# set maximum-rps 50
```

3. Monitor the operation by running the **show pim rps** and **show pim statistics** commands.

- [Configuring Register Message Filters on a PIM RP and DR on page 3723](#)

### ***Understanding Multicast Message Filters***

Multicast sources and routers generate a considerable number of control messages, especially when using PIM sparse mode. These messages form distribution trees, locate rendezvous points (RPs) and designated routers (DRs), and transition from one type of tree to another. In most cases, this multicast messaging system operates transparently and efficiently. However, in some configurations, more control over the sending and receiving of multicast control messages is necessary.

You can configure multicast filtering to control the sending and receiving of multicast control messages.

To prevent unauthorized groups and sources from registering with an RP router, you can define a routing policy to reject PIM register messages from specific groups and sources and configure the policy on the designated router or the RP router.

- If you configure the reject policy on an RP router, it rejects incoming PIM register messages from the specified groups and sources. The RP router also sends a register stop message by means of unicast to the designated router. On receiving the register stop message, the designated router sends periodic null register messages for the specified groups and sources to the RP router.
- If you configure the reject policy on a designated router, it stops sending PIM register messages for the specified groups and sources to the RP router.

**NOTE:** If you have configured the reject policy on an RP router, we recommend that you configure the same policy on all the RP routers in your multicast network.

**NOTE:** If you delete a group and source address from the reject policy configured on an RP router and commit the configuration, the RP router will register the group and source only when the designated router sends a null register message.

### ***Filtering MAC Addresses***

When a router is exclusively configured with multicast protocols on an interface, multicast sets the interface media access control (MAC) filter to multicast promiscuous mode, and the number of multicast groups is unlimited. However, when the router is not exclusively used for multicasting and other protocols such as OSPF, Routing Information Protocol version 2 (RIPv2), or Network Time Protocol (NTP) are configured on an interface, each of these protocols individually requests that the interface program the MAC filter to pick up its respective multicast group only. In this case, without multicast configured on the interface, the maximum number of multicast MAC filters is limited to 20. For example, the maximum number of interface MAC filters for protocols such as OSPF

(multicast group 224.0.0.5) is 20, unless a multicast protocol is also configured on the interface.

No configuration is necessary for MAC filters.

### ***Filtering RP and DR Register Messages***

You can filter Protocol Independent Multicast (PIM) register messages sent from the designated router (DR) or to the rendezvous point (RP). The PIM RP keeps track of all active sources in a single PIM sparse mode domain. In some cases, more control over which sources an RP discovers, or which sources a DR notifies other RPs about, is desired. A high degree of control over PIM register messages is provided by RP and DR register message filtering. Message filtering also prevents unauthorized groups and sources from registering with an RP router.

Register messages that are filtered at a DR are not sent to the RP, but the sources are available to local users. Register messages that are filtered at an RP arrive from source DRs, but are ignored by the router. Sources on multicast group traffic can be limited or directed by using RP or DR register message filtering alone or together.

If the action of the register filter policy is to discard the register message, the router needs to send a register-stop message to the DR. Register-stop messages are throttled to prevent malicious users from triggering them on purpose to disrupt the routing process.

Multicast group and source information is encapsulated inside unicast IP packets. This feature allows the router to inspect the multicast group and source information before sending or accepting the PIM register message.

Incoming register messages to an RP are passed through the configured register message filtering policy before any further processing. If the register message is rejected, the RP router sends a register-stop message to the DR. When the DR receives the register-stop message, the DR stops sending register messages for the filtered groups and sources to the RP. Two fields are used for register message filtering:

- Group multicast address
- Source address

The syntax of the existing policy statements is used to configure the filtering on these two fields. The **route-filter** statement is useful for multicast group address filtering, and the **source-address-filter** statement is useful for source address filtering. In most cases, the action is to **reject** the register messages, but more complex filtering policies are possible.

Filtering cannot be performed on other header fields, such as DR address, protocol, or port. In some configurations, an RP might not send register-stop messages when the policy action is to discard the register messages. This has no effect on the operation of the feature, but the router will continue to receive register messages.

When anycast RP is configured, register messages can be sent or received by the RP. All the RPs in the anycast RP set need to be configured with the same RP register message filtering policies. Otherwise, it might be possible to circumvent the filtering policy.

### Filtering MSDP SA Messages

Along with applying MSDP source active (SA) filters on all external MSDP sessions (in and out) to prevent SAs for groups and sources from leaking in and out of the network, you need to apply bootstrap router (BSR) filters. Applying a BSR filter to the boundary of a network prevents foreign BSR messages (which announce RP addresses) from leaking into your network. Since the routers in a PIM sparse-mode domain need to know the address of only one RP router, having more than one in the network can create issues.

If you did not use multicast scoping to create boundary filters for all customer-facing interfaces, you might want to use PIM join filters. Multicast scopes prevent the actual multicast data packets from flowing in or out of an interface. PIM join filters prevent PIM sparse-mode state from being created in the first place. Since PIM join filters apply only to the PIM sparse-mode state, it might be more beneficial to use multicast scoping to filter the actual data.

**NOTE:** When you apply firewall filters, firewall action modifiers, such as **log**, **sample**, and **count**, work only when you apply the filter on an inbound interface. The modifiers do not work on an outbound interface.

### Configuring Interface-Level PIM Neighbor Policies

You can configure a policy to filter unwanted PIM neighbors. In the following example, the PIM interface compares neighbor IP addresses with the IP address in the policy statement before any hello processing takes place. If any of the neighbor IP addresses (primary or secondary) match the IP address specified in the prefix list, PIM drops the hello packet and rejects the neighbor.

If you configure a PIM neighbor policy after PIM has already established a neighbor adjacency to an unwanted PIM neighbor, the adjacency remains intact until the neighbor hold time expires. When the unwanted neighbor sends another hello message to update its adjacency, the router recognizes the unwanted address and rejects the neighbor.

To configure a policy to filter unwanted PIM neighbors:

1. Configure the policy. The neighbor policy must be a properly structured policy statement that uses a prefix list (or a route filter) containing the neighbor primary address (or any secondary IP addresses) in a prefix list, and the **reject** option to reject the unwanted address.

```
[edit policy-options]
user@host# set prefix-list nbrGroup 1 20.20.20.1/32
user@host# set policy-statement nbr-policy from prefix-list nbrGroup1
user@host# set policy-statement nbr-policy then reject
```

2. Configure the interface globally or in the routing instance. This example shows the configuration for the routing instance.

```
[edit routing-instances PIM.master protocols pim]
user@host# set neighbor-policy nbr-policy
```

3. Verify the configuration by checking the **Hello dropped on neighbor policy** field in the output of the **show pim statistics** command.

### ***Filtering Outgoing PIM Join Messages***

When the core of your network is using MPLS, PIM join and prune messages stop at the customer edge (CE) routers and are not forwarded toward the core, because these routers do not have PIM neighbors on the core-facing interfaces. When the core of your network is using IP, PIM join and prune messages are forwarded to the upstream PIM neighbors in the core of the network.

When the core of your network is using a mix of IP and MPLS, you might want to filter certain PIM join and prune messages at the upstream egress interface of the CE routers.

You can filter PIM sparse mode (PIM-SM) join and prune messages at the egress interfaces for IPv4 and IPv6 in the upstream direction. The messages can be filtered based on the group address, source address, outgoing interface, PIM neighbor, or a combination of these values. If the filter is removed, the join is sent after the PIM periodic join timer expires.

To filter PIM sparse mode join and prune messages at the egress interfaces, create a policy rejecting the group address, source address, outgoing interface, or PIM neighbor, and then apply the policy.

The following example filters PIM join and prune messages for group addresses 224.0.1.2 and 225.1.1.1.

1. In configuration mode, create the policy.

```
user@host# set policy-options policy-statement block-groups term t1 from route-filter
224.0.1.2/32 exact
user@host# set policy-options policy-statement block-groups term t1 from route-filter
225.1.1.1/32 exact
user@host# set policy-options policy-statement block-groups term t1 then reject
user@host# set policy-options policy-statement block-groups term last then accept
```

2. Verify the policy configuration by running the **show policy-options** command.

```
user@host# show policy-options
policy-statement block-groups {
 term t1 {
 from {
 route-filter 224.0.1.2/32 exact;
 route-filter 225.1.1.1/32 exact;
 then reject;
 }
 term last {
 then accept;
 }
 }
}
```

3. Apply the PIM join and prune message filter.

```
user@host> set protocols pim export block-groups
```

4. After the configuration is committed, use the **show pim statistics** command to verify that outgoing PIM join and prune messages are being filtered.

```

user@host> show pim statistics | grep filtered
RP Filtered Source 0

Rx Joins/Prunes filtered 0

Tx Joins/Prunes filtered 254

```

The egress filter count is shown on the **Tx Joins/Prunes filtered** line.

### ***Example: Stopping Outgoing PIM Register Messages on a Designated Router***

This example shows how to stop outgoing PIM register messages on a designated router.

- [Requirements on page 3717](#)
- [Overview on page 3717](#)
- [Configuration on page 3718](#)
- [Verification on page 3719](#)

#### ***Requirements***

Before you begin:

1. Determine whether the router is directly attached to any multicast sources. Receivers must be able to locate these sources.
2. Determine whether the router is directly attached to any multicast group receivers. If receivers are present, IGMP is needed.
3. Determine whether to configure multicast to use sparse, dense, or sparse-dense mode. Each mode has different configuration considerations.
4. Determine the address of the RP if sparse or sparse-dense mode is used.
5. Determine whether to locate the RP with the static configuration, BSR, or auto-RP method.
6. Determine whether to configure multicast to use its own RPF routing table when configuring PIM in sparse, dense, or sparse-dense mode.
7. Configure the SAP and SDP protocols to listen for multicast session announcements.
8. Configure IGMP.
9. Configure the PIM static RP.
10. Filter PIM register messages from unauthorized groups and sources. See [“Example: Rejecting Incoming PIM Register Messages on RP Routers” on page 3721](#).

#### ***Overview***

In this example, you configure the group address as **224.2.2.2/32** and the source address in the group as **20.20.20.1/32**. You set the match action to not send PIM register messages for the group and source address. Then you configure the policy on the designated router to **stop-pim-register-msg-dr**.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement stop-pim-register-msg-dr from route-filter
 224.2.2.2/32 exact
set policy-options policy-statement stop-pim-register-msg-dr from source-address-filter
 20.20.20.1/32 exact
set policy-options policy-statement stop-pim-register-msg-dr then reject
set protocols pim rp dr-register-policy stop-pim-register-msg-dr
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To stop outgoing PIM register messages on a designated router:

1. Configure the policy options.  

```
[edit]
user@host# edit policy-options
```
2. Set the group address.  

```
[edit policy-options]
user@host# set policy statement stop-pim-register-msg-dr from route-filter
 224.2.2.2/32 exact
```
3. Set the source address.  

```
[edit policy-options]
user@host# set policy statement stop-pim-register-msg-dr from
 source-address-filter 20.20.20.1/32 exact
```
4. Set the match action.  

```
[edit policy-options]
user@host# set policy statement stop-pim-register-msg-dr then reject
```
5. Assign the policy.  

```
[edit]
user@host# set dr-register-policy stop-pim-register-msg-dr
```

**Results** From configuration mode, confirm your configuration by entering the **show policy-options** and **show protocols** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show policy-options
policy-statement stop-pim-register-msg-dr {
 from {
 route-filter 224.2.2.2/32 exact;
 source-address-filter 20.20.20.1/32 exact;
```

```

 }
 then reject;
 }
[edit]
user@host# show protocols
pim {
 rp {
 dr-register-policy stop-pim-register-msg-dr;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

To confirm that the configuration is working properly, perform these tasks:

- [Verifying SAP and SDP Addresses and Ports on page 3719](#)
- [Verifying the IGMP Version on page 3719](#)
- [Verifying the PIM Mode and Interface Configuration on page 3719](#)
- [Verifying the PIM RP Configuration on page 3719](#)

#### **Verifying SAP and SDP Addresses and Ports**

**Purpose** Verify that SAP and SDP are configured to listen on the correct group addresses and ports.

**Action** From operational mode, enter the **show sap listen** command.

#### **Verifying the IGMP Version**

**Purpose** Verify that IGMP version 2 is configured on all applicable interfaces.

**Action** From operational mode, enter the **show igmp interface** command.

#### **Verifying the PIM Mode and Interface Configuration**

**Purpose** Verify that PIM sparse mode is configured on all applicable interfaces.

**Action** From operational mode, enter the **show pim interfaces** command.

#### **Verifying the PIM RP Configuration**

**Purpose** Verify that the PIM RP is statically configured with the correct IP address.

**Action** From operational mode, enter the **show pim rps** command.

#### **Filtering Incoming PIM Join Messages**

Multicast scoping controls the propagation of multicast messages. Whereas multicast scoping prevents the actual multicast data packets from flowing in or out of an interface, PIM join filters prevent a state from being created in a router. A state—the (\*,G) or (S,G)

entries—is the information used for forwarding unicast or multicast packets. Using PIM join filters prevents the transport of multicast traffic across a network and the dropping of packets at a scope at the edge of the network. Also, PIM join filters reduce the potential for denial-of-service (DoS) attacks and PIM state explosion—large numbers of PIM join messages forwarded to each router on the rendezvous-point tree (RPT), resulting in memory consumption.

To use PIM join filters to efficiently restrict multicast traffic from certain source addresses, create and apply the routing policy across all routers in the network.

See [Table 278 on page 3720](#) for a list of match conditions.

**Table 278: PIM Join Filter Match Conditions**

| Match Condition              | Matches On                                                                           |
|------------------------------|--------------------------------------------------------------------------------------|
| <b>interface</b>             | Router interface or interfaces specified by name or IP address                       |
| <b>neighbor</b>              | Neighbor address (the source address in the IP header of the join and prune message) |
| <b>route-filter</b>          | Multicast group address embedded in the join and prune message                       |
| <b>source-address-filter</b> | Multicast source address embedded in the join and prune message                      |

The following example shows how to create a PIM join filter. The filter is composed of a route filter and a source address filter—**bad-groups** and **bad-sources**, respectively. the **bad-groups** filter prevents (\*G) or (S,G) join messages from being received for all groups listed. The **bad-sources** filter prevents (S,G) join messages from being received for all sources listed. The **bad-groups** filter and **bad-sources** filter are in two different terms. If route filters and source address filters are in the same term, they are logically ANDed.

To filter incoming PIM join messages:

1. Configure the policy.

```
[edit policy-statement pim-join-filter term bad-groups]
user@host# set from route-filter 224.0.1.2/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set then reject

[edit policy-statement pim-join-filter term bad-sources]
user@host# set from source-address-filter 10.0.0.0/8 orlonger
user@host# set from source-address-filter 127.0.0.0/8 orlonger
user@host# set then reject

[edit policy-statement pim-join-filter term last]
user@host# set then accept
```

2. Apply one or more policies to routes being imported into the routing table from PIM.

```
[edit protocols pim]
user@host# set import pim-join-filter
```

3. Verify the configuration by checking the output of the **show pim join** and **show policy** commands.

### ***Example: Rejecting Incoming PIM Register Messages on RP Routers***

This example shows how to reject incoming PIM register messages on RP routing devices.

- [Requirements on page 3721](#)
- [Overview on page 3721](#)
- [Configuration on page 3721](#)
- [Verification on page 3723](#)

### ***Requirements***

Before you begin:

1. Determine whether the routing device is directly attached to any multicast sources. Receivers must be able to locate these sources.
2. Determine whether the routing device is directly attached to any multicast group receivers. If receivers are present, IGMP is needed.
3. Determine whether to configure multicast to use sparse, dense, or sparse-dense mode. Each mode has different configuration considerations.
4. Determine the address of the RP if sparse or sparse-dense mode is used.
5. Determine whether to locate the RP with the static configuration, BSR, or auto-RP method.
6. Determine whether to configure multicast to use its own RPF routing table when configuring PIM in sparse, dense, or sparse-dense mode.
7. Configure the SAP and SDP protocols to listen for multicast session announcements. See *Configuring the Session Announcement Protocol*.
8. Configure IGMP. See [“Configuring IGMP” on page 3657](#).
9. Configure the PIM static RP. See [“Configuring Static RP” on page 3694](#).

### ***Overview***

In this example, you configure the group address as **224.1.1.1/32** and the source address in the group as **10.10.10.1/32**. You set the match action to reject PIM register messages and assign reject-pim-register-msg-rp as the policy on the RP.

### ***Configuration***

#### **CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement reject-pim-register-msg-rp from route-filter
 224.1.1.1/32 exact
```

```
set policy-options policy-statement reject-pim-register-msg-rp from source-address-filter
10.10.10.1/32 exact
set policy-options policy-statement reject-pim-register-msg-rp then reject
set protocols pim rp rp-register-policy reject-pim-register-msg-rp
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

To reject the incoming PIM register messages on an RP routing device:

1. Configure the policy options.

```
[edit]
user@host# edit policy-options
```

2. Set the group address.

```
[edit policy-options]
user@host# set policy statement reject-pim-register-msg-rp from route-filter
224.1.1.1/32 exact
```

3. Set the source address.

```
[edit policy-options]
user@host# set policy statement reject-pim-register-msg-rp from
source-address-filter 10.10.10.1/32 exact
```

4. Set the match action.

```
[edit policy-options]
user@host# set policy statement reject-pim-register-msg-rp then reject
```

5. Configure the protocol.

```
[edit]
user@host# edit protocols pim rp
```

6. Assign the policy.

```
[edit]
user@host# set rp-register-policy reject-pim-register-msg-rp
```

**Results** From configuration mode, confirm your configuration by entering the **show policy-options** and **show protocols pim** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show policy-options
policy-statement reject-pim-register-msg-rp {
 from {
 route-filter 224.1.1.1/32 exact;
 source-address-filter 10.10.10.1/32 exact;
 }
 then reject;
}
[edit]
user@host# show protocols pim
rp {
```

```
rp-register-policy reject-pim-register-msg-rp;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

To confirm that the configuration is working properly, perform these tasks:

- [Verifying SAP and SDP Addresses and Ports on page 3723](#)
- [Verifying the IGMP Version on page 3723](#)
- [Verifying the PIM Mode and Interface Configuration on page 3723](#)
- [Verifying the PIM Register Messages on page 3723](#)

### **Verifying SAP and SDP Addresses and Ports**

**Purpose** Verify that SAP and SDP are configured to listen on the correct group addresses and ports.

**Action** From operational mode, enter the **show sap listen** command.

### **Verifying the IGMP Version**

**Purpose** Verify that IGMP version 2 is configured on all applicable interfaces.

**Action** From operational mode, enter the **show igmp interface** command.

### **Verifying the PIM Mode and Interface Configuration**

**Purpose** Verify that PIM sparse mode is configured on all applicable interfaces.

**Action** From operational mode, enter the **show pim interfaces** command.

### **Verifying the PIM Register Messages**

**Purpose** Verify whether the rejected policy on the RP routing device is enabled.

**Action** From operational mode, enter the **show policy-options** and **show protocols pim** command.

### **Configuring Register Message Filters on a PIM RP and DR**

PIM register messages are sent to the rendezvous point (RP) by a designated router (DR). When a source for a group starts transmitting, the DR sends unicast PIM register packets to the RP.

Register messages have the following purposes:

- Notify the RP that a source is sending to a group.
- Deliver the initial multicast packets sent by the source to the RP for delivery down the shortest-path tree (SPT).

The PIM RP keeps track of all active sources in a single PIM sparse mode domain. In some cases, you want more control over which sources an RP discovers, or which sources a DR notifies other RPs about. A high degree of control over PIM register messages is provided by RP or DR register message filtering. Message filtering prevents unauthorized groups and sources from registering with an RP routing device.

You configure RP or DR register message filtering to control the number and location of multicast sources that an RP discovers. You can apply register message filters on a DR to control outgoing register messages, or apply them on an RP to control incoming register messages.

When anycast RP is configured, all RPs in the anycast RP set need to be configured with the same register message filtering policy.

You can configure message filtering globally or for a routing instance. These examples show the global configuration.

To configure an RP filter to drop the register packets for multicast group range 224.1.1.0/24 from source address 10.10.94.2:

1. On the RP, configure the policy.

```
[edit policy-options policy-statement incoming-policy-for-rp from]
user@host# set route-filter 224.1.1.0/24 orlonger
user@host# set source-address-filter 10.10.94.2/32 exact
user@host# set then reject
user@host# exit
```

2. Apply the policy to the RP.

```
[edit protocols pim rp]
user@host# set rp-register-policy incoming-policy-for-rp
user@host# set local address 10.10.10.5
user@host# exit
```

To configure a DR filter to prevent sending register packets for group range 224.1.1.0/24 and source address 10.10.10.1/32:

1. On the DR, configure the policy.

```
[edit policy-options policy-statement outgoing-policy-for-rp]
user@host# set from route-filter 224.1.1.0/24 orlonger
user@host# set from source-address-filter 10.10.10.1/32 exact
user@host# set then reject
user@host# exit
```

2. Apply the policy to the DR.

The static address is the address of the RP to which you do not want the DR to send the filtered register messages.

```
[edit protocols pim rp]
user@host# set dr-register-policy outgoing-policy-for-dr
user@host# set static 10.10.10.3
user@host# exit
```

To configure a policy expression to accept register messages for multicast group 224.1.1.5 but reject those for 224.1.1.1:

1. On the RP, configure the policies.

```
[edit policy-options policy-statement reject_224_1_1_1]
user@host# set from route-filter 224.1.1.0/24 orlonger
user@host# set from source-address-filter 10.10.94.2/32 exact
user@host# set then reject
user@host# exit

[edit policy-options policy-statement accept_224_1_1_5]
user@host# set term one from route-filter 224.1.1.5/32 exact
user@host# set term one from source-address-filter 10.10.94.2/32 exact
user@host# set term one then accept
user@host# set term two then reject
user@host# exit
```

2. Apply the policies to the RP.

```
[edit protocols pim rp]
user@host# set rp-register-policy [reject_224_1_1_1 | accept_224_1_1_5]
user@host# set local address 10.10.10.5
```

To monitor the operation of the filters, run the **show pim statistics** command. The command output contains the following fields related to filtering:

- RP Filtered Source
- Rx Joins/Prunes filtered
- Tx Joins/Prunes filtered
- Rx Register msgs filtering drop
- Tx Register msgs filtering drop

- [Configuring BFD for PIM on page 3727](#)

- [Configuring BFD Authentication for PIM on page 3729](#)
- [Example: Configuring BFD Liveness Detection for PIM IPv6 on page 3732](#)

### ***Understanding Bidirectional Forwarding Detection Authentication for PIM***

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels.

**NOTE:** Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over PIM. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3726](#)
- [Security Authentication Keychains on page 3727](#)
- [Strict Versus Loose Authentication on page 3727](#)

### ***BFD Authentication Algorithms***

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.

- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### **Strict Versus Loose Authentication**

By default, strict authentication is enabled, and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Configuring BFD for PIM**

The Bidirectional Forwarding Detection (BFD) Protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the Protocol Independent Multicast (PIM) hello hold time, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

You must specify the minimum transmit and minimum receive intervals to enable BFD on PIM.

To enable failure detection:

1. Configure the interface globally or in a routing instance.

This example shows the global configuration.

```
[edit protocols pim]
user@host# edit interface fe-1/0/0.0 bfd-liveness-detection
```

2. Configure the minimum transmit interval.

This is the minimum interval after which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Specifying an interval smaller than 300 ms can cause undesired BFD flapping.

```
[edit protocols pim interface fe-1/0/0.0 bfd-liveness-detection]
user@host# set transmit-interval 350
```

3. Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Specifying an interval smaller than 300 ms can cause undesired BFD flapping.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set minimum-receive-interval 350
```

4. (Optional) Configure other BFD settings.

As an alternative to setting the receive and transmit intervals separately, configure one interval for both.

```
[edit protocols pim interface fe-1/0/0.0 bfd-liveness-detection]
user@host# set minimum-interval 350
```

5. Configure the threshold for the adaptation of the BFD session detection time.

When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

```
[edit protocols pim interface fe-1/0/0.0 bfd-liveness-detection]
user@host# set detection-time threshold 800
```

6. Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

```
[edit protocols pim interface fe-1/0/0.0 bfd-liveness-detection]
user@host# set multiplier 50
```

7. Configure the BFD version.

```
[edit protocols pim interface fe-1/0/0.0 bfd-liveness-detection]
user@host# set version 1
```

8. Specify that BFD sessions should not adapt to changing network conditions.

We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

```
[edit protocols pim interface fe-1/0/0.0 bfd-liveness-detection]
user@host# set no-adaptation
```

9. Verify the configuration by checking the output of the **show bfd session** command.

### ***Configuring BFD Authentication for PIM***

Beginning with Junos OS Release 9.6, you can configure authentication for Bidirectional Forwarding Detection (BFD) sessions running over Protocol Independent Multicast (PIM). Routing instances are also supported. The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the PIM protocol.
2. Associate the authentication keychain with the PIM protocol.
3. Configure the related security authentication keychain.

The following sections provide instructions for configuring and viewing BFD authentication on PIM:

- [Configuring BFD Authentication Parameters on page 3729](#)
- [Viewing Authentication Information for BFD Sessions on page 3730](#)

### ***Configuring BFD Authentication Parameters***

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on a PIM route or routing instance.

```
[edit protocols pim]
user@host# set interface if3-pim bfd-liveness-detection authentication algorithm
keyed-sha-1
```

**NOTE:** Nonstop active routing (NSR) is not supported with the meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on the specified PIM route or routing instance with the unique security authentication keychain attributes.

The keychain you specify must match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit protocols pim]
user@host# set interface if3-pim bfd-liveness-detection authentication keychain
bfd-pim
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:
  - The matching keychain name as specified in Step 2.
  - At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
  - The secret data used to allow access to the session.
  - The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security]
user@host# set authentication-key-chains key-chain bfd-pim key 53 secret
9ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit protocols pim]
user@host# set interface if3-pim bfd-liveness-detection authentication loose-check
```

5. (Optional) View your configuration by using the **show bfd session detail** or **show bfd session extensive** command.
6. Repeat these steps to configure the other end of the BFD session.

### ***Viewing Authentication Information for BFD Sessions***

You can view the existing BFD authentication configuration by using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **if3-pim** BGP group. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-pim**.

The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9L.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols pim]
interface if3-pim {
 bfd-liveness-detection {
 authentication {
 algorithm keyed-sha-1;
 key-chain bfd-pim;
 }
 }
}
[edit security]
authentication key-chains {
 key-chain bfd-pim {
 key 1 {
 secret "9ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
 start-time "2009-6-1.09:46:02 -0700";
 }
 key 2 {
 secret "9a5jiKW9L.reP38ny.TszF2/9";
 start-time "2009-6-1.15:29:20 -0700";
 }
 }
}
```

If you commit these updates to your configuration, you see output similar to the following example. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured. For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

#### show bfd session detail

```
user@host# show bfd session detail
```

| Address  | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|
| 50.0.0.2 | Up    | ge-0/1/5.0 | 0.900       | 0.300             | 3          |

Client PIM, TX interval 0.300, RX interval 0.300, **Authenticate**  
 Session up time 3d 00:34  
 Local diagnostic None, remote diagnostic NbrSignal  
 Remote state Up, version 1  
 Replicated

#### show bfd session extensive

```
user@host# show bfd session extensive
```

| Address  | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|
| 50.0.0.2 | Up    | ge-0/1/5.0 | 0.900       | 0.300             | 3          |

Client PIM, TX interval 0.300, RX interval 0.300, **Authenticate**  
 keychain bfd-pim, algo keyed-sha-1, mode strict

```
Session up time 00:04:42
Local diagnostic None, remote diagnostic NbrSignal
Remote state Up, version 1
Replicated
Min async interval 0.300, min slow interval 1.000
Adaptive async TX interval 0.300, RX interval 0.300
Local min TX interval 0.300, minimum RX interval 0.300, multiplier 3
Remote min TX interval 0.300, min RX interval 0.300, multiplier 3
Local discriminator 2, remote discriminator 2
Echo mode disabled/inactive
Authentication enabled/active, keychain bfd-pim, algo keyed-sha-1, mode strict
```

### ***Example: Configuring BFD Liveness Detection for PIM IPv6***

This example shows how to configure Bidirectional Forwarding Detection (BFD) liveness detection for IPv6 interfaces configured for the Protocol Independent Multicast (PIM) topology. BFD is a simple hello mechanism that detects failures in a network.

The following steps are needed to configure BFD liveness detection:

1. Configure the interface.
2. Configure the related security authentication keychain.
3. Specify the BFD authentication algorithm for the PIM protocol.
4. Configure PIM, associating the authentication keychain with the desired protocol.
5. Configure BFD authentication for the routing instance.

**NOTE:** You must perform these steps on both ends of the BFD session.

---

- [Requirements on page 3732](#)
- [Overview on page 3732](#)
- [Configuration on page 3733](#)
- [Verification on page 3736](#)

### ***Requirements***

This example uses the following hardware and software components:

- Two peer routing devices.
- Junos OS 12.2 or later.

### ***Overview***

In this example, Device R1 and Device R2 are peers. Each routing device runs PIM, connected over a common medium.

[Figure 89 on page 3733](#) shows the topology used in this example.

Figure 89: BFD Liveness Detection for PIM IPv6 Topology

Assume that the routing devices initialize. No BFD session is yet established. For each routing device, PIM informs the BFD process to monitor the IPv6 address of the neighbor that is configured in the routing protocol. Addresses are not learned dynamically and must be configured.

Configure the IPv6 address and BFD liveness detection at the `[edit protocols pim]` hierarchy level for each routing device.

```
[edit protocols pim]
user@host# set interface interface-name family inet6 bfd-liveness-detection
```

Configure BFD liveness detection for the routing instance at the `[edit routing-instances instance-name protocols pim interface all family inet6]` hierarchy level (here, the *instance-name* is `instance1`):

```
[edit routing-instances instance1 protocols pim]
user@host# set bfd-liveness-detection
```

You will also configure the authentication algorithm and authentication keychain values for BFD.

In a BFD-configured network, when a client launches a BFD session with a peer, BFD begins sending slow, periodic BFD control packets that contain the interval values that you specified when you configured the BFD peers. This is known as the initialization state. BFD does not generate any up or down notifications in this state. When another BFD interface acknowledges the BFD control packets, the session moves into an up state and begins to more rapidly send periodic control packets. If a data path failure occurs and BFD does not receive a control packet within the configured amount of time, the data path is declared down and BFD notifies the BFD client. The BFD client can then perform the necessary actions to reroute traffic. This process can be different for different BFD clients.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

```
Device R1 set interfaces ge-1/1/1 unit 0 description toRouter2
 set interfaces ge-1/1/1 unit 0 family inet6
 set interfaces ge-1/1/1 unit 0 family inet6 address e80::21b:c0ff:fed5:e4dd
 set protocols pim interface ge-1/1/1 family inet6 bfd-liveness-detection authentication
 algorithm keyed-sha-1
 set protocols pim interface ge-1/1/1 family inet6 bfd-liveness-detection authentication
 key-chain bfd-pim
 set routing-instances instance1 protocols pim interface all family inet6
 bfd-liveness-detection authentication algorithm keyed-sha-1
```

```

set routing-instances instance1 protocols pim interface all family inet6
 bfd-liveness-detection authentication key-chain bfd-pim
set security authentication key-chain bfd-pim key 1 secret
 "9ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM"
set security authentication key-chain bfd-pim key 1 start-time "2012-01-01.09:46:02
 -0700"
set security authentication key-chain bfd-pim key 2 secret
 "9a5jiKW9L.reP38ny.TszF2/9"
set security authentication key-chain bfd-pim key 2 start-time "2012-01-01.15:29:20
 -0700"

```

**Device R2**

```

set interfaces ge-1/1/0 unit 0 description toRouter1
set interfaces ge-1/1/0 unit 0 family inet6 address e80::21b:c0ff:fed5:e5dd
set protocols pim interface ge-1/1/0 family inet6 bfd-liveness-detection authentication
 algorithm keyed-sha-1
set protocols pim interface ge-1/1/0 family inet6 bfd-liveness-detection authentication
 key-chain bfd-pim
set routing-instances instance1 protocols pim interface all family inet6
 bfd-liveness-detection authentication algorithm keyed-sha-1
set routing-instances instance1 protocols pim interface all family inet6
 bfd-liveness-detection authentication key-chain bfd-pim
set security authentication key-chain bfd-pim key 1 secret
 "9ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM"
set security authentication key-chain bfd-pim key 1 start-time "2012-01-01.09:46:02
 -0700"
set security authentication key-chain bfd-pim key 2 secret
 "9a5jiKW9L.reP38ny.TszF2/9"
set security authentication key-chain bfd-pim key 2 start-time "2012-01-01.15:29:20
 -0700"

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode”](#) on page 4704 in the *CLI User Guide*.

To configure BFD liveness detection for PIM IPv6 interfaces on Device R1:

**NOTE:** This procedure is for Device R1. Repeat this procedure for Device R2, after modifying the appropriate interface names, addresses, and any other parameters.

1. Configure the interface, using the **inet6** statement to specify that this is an IPv6 address.  

```

[edit interfaces]
user@R1# set ge-1/1/1 unit 0 description toRouter2
user@R1# set ge-1/1/1 unit 0 family inet6 address e80::21b:c0ff:fed5:e4dd

```
2. Specify the BFD authentication algorithm and keychain for the PIM protocol.  

The keychain is used to associate BFD sessions on the specified PIM route or routing instance with the unique security authentication keychain attributes. This keychain

name should match the keychain name configured at the **[edit security authentication]** hierarchy level.

```
[edit protocols]
user@R1# set pim interface ge-1/1/1.0 family inet6 bfd-liveness-detection
authentication algorithm keyed-sha-1
user@R1# set pim interface ge-1/1/1 family inet6 bfd-liveness-detection
authentication key-chain bfd-pim
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Configure a routing instance (here, **instance1**), specifying BFD authentication and associating the security authentication algorithm and keychain.

```
[edit routing-instances]
user@R1# set instance1 protocols pim interface all family inet6
bfd-liveness-detection authentication algorithm keyed-sha-1
user@R1# set instance1 protocols pim interface all family inet6
bfd-liveness-detection authentication key-chain bfd-pim
```

4. Specify the unique security authentication information for BFD sessions:
  - The matching keychain name as specified in Step 2.
  - At least one key, a unique integer between **0** and **63**. Creating multiple keys allows multiple clients to use the BFD session.
  - The secret data used to allow access to the session.
  - The time at which the authentication key becomes active, in the format **YYYY-MM-DD.hh:mm:ss**.

```
[edit security authentication]
user@R1# set key-chain bfd-pim key 1 secret
"9ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM"
user@R1# set key-chain bfd-pim key 1 start-time "2012-01-01.09:46:02 -0700"
user@R1# set key-chain bfd-pim key 2 secret "9a5jiKW9l.reP38ny.TszF2/9"
user@R1# set key-chain bfd-pim key 2 start-time "2012-01-01.15:29:20 -0700"
```

## Results

Confirm your configuration by issuing the **show interfaces**, **show protocols**, **show routing-instances**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
ge-1/1/1 {
 unit 0 {
 description toRouter2;
 family inet6 {
 address e80::21b:c0ff:fed5:e4dd {
 }
 }
 }
}
```

```
 }
 }
}

user@R1# show protocols
pim {
 interface ge-1/1/1.0 {
 family inet6;
 bfd-liveness-detection {
 authentication {
 algorithm keyed-sha-1;
 key-chain bfd-pim;
 }
 }
 }
}

user@R1# show routing-instances
instance1 {
 protocols {
 pim {
 interface all {
 family inet 6 {
 bfd-liveness-detection {
 authentication {
 algorithm keyed-sha-1;
 key-chain bfd-pim;
 }
 }
 }
 }
 }
 }
}

user@R1# show security
authentication {
 key-chain bfd-pim {
 key 1 {
 secret "9ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
 start-time "2012-01-01.09:46:02 -0700";
 }
 key 2 {
 secret "9a5jiKW9l.reP38ny.TszF2/9";
 start-time "2012-01-01.15:29:20 -0700";
 }
 }
}
```

### **Verification**

Confirm that the configuration is working properly.

#### **Verifying the BFD Session**

**Purpose** Verify that BFD liveness detection is enabled.

**Action** user@R1# run `show pim neighbors detail`

Instance: PIM.master

Interface: ge-1/1/1.0

Address: fe80::21b:c0ff:fed5:e4dd, IPv6, PIM v2, Mode: Sparse, sg Join Count: 0, tsf Join Count: 0

Hello Option Holdtime: 65535 seconds

Hello Option DR Priority: 1

Hello Option Generation ID: 1417610277

Hello Option LAN Prune Delay: delay 500 ms override 2000 ms  
Join Suppression supported

Address: fe80::21b:c0ff:fedc:28dd, IPv6, PIM v2, sg Join Count: 0, tsf Join Count: 0

Secondary address: beef::2

BFD: Enabled, Operational state: Up

Hello Option Holdtime: 105 seconds 80 remaining

Hello Option DR Priority: 1

Hello Option Generation ID: 1648636754

Hello Option LAN Prune Delay: delay 500 ms override 2000 ms  
Join Suppression supported

**Meaning** The display from the `show pim neighbors detail` command shows **BFD: Enabled, Operational state: Up**, indicating that BFD is operating between the two PIM neighbors. For additional information about the BFD session (including the session ID number), use the `show bfd session extensive` command.

## Configuring PIM Dense Mode

- [Understanding PIM Dense Mode on page 3737](#)
- [Configuring PIM Dense Mode Properties on page 3739](#)

### Understanding PIM Dense Mode

PIM dense mode is less sophisticated than PIM sparse mode. PIM dense mode is useful for multicast LAN applications, the main environment for all dense mode protocols.

PIM dense mode implements the same flood-and-prune mechanism that DVMRP and other dense mode routing protocols employ. The main difference between DVMRP and PIM dense mode is that PIM dense mode introduces the concept of protocol independence. PIM dense mode can use the routing table populated by any underlying unicast routing protocol to perform reverse-path-forwarding (RPF) checks.

Internet service providers (ISPs) typically appreciate the ability to use any underlying unicast routing protocol with PIM dense mode because they do not need to introduce and manage a separate routing protocol just for RPF checks. While unicast routing protocols extended as multiprotocol BGP (MBGP) and Multitopology Routing in IS-IS

(M-IS-IS) were later employed to build special tables to perform RPF checks, PIM dense mode does not require them.

PIM dense mode can use the unicast routing table populated by OSPF, IS-IS, BGP, and so on, or PIM dense mode can be configured to use a special multicast RPF table populated by MBGP or M-IS-IS when performing RPF checks.

Unlike sparse mode, in which data is forwarded only to routing devices sending an explicit request, dense mode implements a *flood-and-prune* mechanism, similar to DVMRP. In PIM dense mode, there is no RP. A routing device receives the multicast data on the interface closest to the source, then forwards the traffic to all other interfaces (see [Figure 90 on page 3738](#)).

**Figure 90: Multicast Traffic Flooded from the Source Using PIM Dense Mode**

Flooding occurs periodically. It is used to refresh state information, such as the source IP address and multicast group pair. If the routing device has no interested receivers for the data, and the OIL becomes empty, the routing device sends a prune message upstream to stop delivery of multicast traffic (see [Figure 91 on page 3739](#)).

**Figure 91: Prune Messages Sent Back to the Source to Stop Unwanted Multicast Traffic**

### Configuring PIM Dense Mode Properties

In PIM dense mode (PIM-DM), the assumption is that almost all possible subnets have at least one receiver wanting to receive the multicast traffic from a source, so the network is flooded with traffic on all possible branches, then pruned back when branches do not express an interest in receiving the packets, explicitly (by message) or implicitly (time-out silence). LANs are appropriate networks for dense-mode operation.

By default, PIM is disabled. When you enable PIM, it operates in sparse mode by default.

You can configure PIM dense mode globally or for a routing instance. This example shows how to configure the routing instance and how to specify that PIM dense mode use **inet.2** as its RPF routing table instead of **inet.0**.

To configure the routing device properties for PIM dense mode:

1. (Optional) Create an IPv4 routing table group so that interface routes are installed into two routing tables, **inet.0** and **inet.2**.

```
[edit routing-options rib-groups]
user@host# set pim-rg export-rib inet.0
user@host# set pim-rg import-rib [inet.0 inet.2]
```

2. (Optional) Associate the routing table group with a PIM routing instance.

```
[edit routing-instances PIM.dense protocols pim]
user@host# set rib-group inet pim-rg
```

3. Configure the PIM interface. If you do not specify any interfaces, PIM is enabled on all routing device interfaces. Generally, you specify interface names only if you are disabling PIM on certain interfaces.

```
[edit routing-instances PIM.dense protocols pim]
user@host# set interface fe-0/0/1.0 mode dense
```

**NOTE:** You cannot configure both PIM and Distance Vector Multicast Routing Protocol (DVMRP) in forwarding mode on the same interface. You can configure PIM on the same interface only if you configured DVMRP in unicast-routing mode.

4. Monitor the operation of PIM dense mode by running the **show pim interfaces**, **show pim join**, **show pim neighbors**, and **show pim statistics** commands.

#### Related Documentation

- [Configuring PIM Sparse-Dense Mode on page 3740](#)
- [Configuring Basic PIM Settings on page 3680](#)

### Configuring PIM Sparse-Dense Mode

- [Understanding PIM Sparse-Dense Mode on page 3740](#)
- [Mixing PIM Sparse and Dense Modes on page 3740](#)
- [Configuring PIM Sparse-Dense Mode Properties on page 3741](#)

#### Understanding PIM Sparse-Dense Mode

Sparse-dense mode, as the name implies, allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as dense is not mapped to an RP. Instead, data packets destined for that group are forwarded by means of PIM dense-mode rules. A group specified as sparse is mapped to an RP, and data packets are forwarded by means of PIM sparse-mode rules.

For information about PIM sparse-mode and PIM dense-mode rules, see *Understanding PIM Sparse Mode* and “[Understanding PIM Dense Mode](#)” on page 3737.

#### Mixing PIM Sparse and Dense Modes

It is possible to mix PIM dense mode, PIM sparse mode, and PIM source-specific multicast (SSM) on the same network, the same routing device, and even the same interface. This is because modes are effectively tied to multicast groups, an IP multicast group address must be unique for a particular group's traffic, and scoping limits enforce the division between potential or actual overlaps.

**NOTE:** PIM sparse mode was capable of forming shortest-path trees (SPTs) already. Changes to PIM sparse mode to support PIM SSM mainly involved defining behavior in the SSM address range, because shared-tree behavior is prohibited for groups in the SSM address range.

A multicast routing device employing sparse-dense mode is a good example of mixing PIM modes on the same network or routing device or interface. Dense modes are easy to support because of the flooding, but scaling issues make dense modes inappropriate for Internet use beyond very restricted uses.

### ***Configuring PIM Sparse-Dense Mode Properties***

Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as “dense” is not mapped to an RP. Instead, data packets destined for that group are forwarded by means of PIM dense mode rules. A group specified as “sparse” is mapped to an RP, and data packets are forwarded by means of PIM sparse-mode rules. Sparse-dense mode is useful in networks implementing auto-RP for PIM sparse mode.

By default, PIM is disabled. When you enable PIM, it operates in sparse mode by default.

You can configure PIM sparse-dense mode globally or for a routing instance. This example shows how to configure PIM sparse-dense mode globally on all interfaces, specifying that the groups 224.0.1.39 and 224.0.1.40 are using dense mode.

To configure the routing device properties for PIM sparse-dense mode:

1. Configure the dense-mode groups.

```
[protocols pim]
user@host# set dense-groups 224.0.1.39
user@host# set dense-groups 224.0.1.40
```

2. Configure all interfaces on the routing device to use sparse-dense mode. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```
[edit protocols pim]
user@host# set interface all mode sparse-dense
user@host# set interface fxp0.0 disable
```

3. Monitor the operation of PIM sparse-dense mode by running the **show pim interfaces**, **show pim join**, **show pim neighbors**, and **show pim statistics** commands.

### ***PIM Join Load Balancing on Multipath MVPN Routes Overview***

A multicast virtual private network (MPVN) is a technology to deploy the multicast service in an existing MPLS/BGP VPN.

The two main MVPN services are:

- Dual PIM MVPNs (also referred to as Draft-Rosen)
- Multiprotocol BGP-based MVPNs (also referred to as next-generation)

Next-generation MVPNs constitute the next evolution after the Draft-Rosen MVPN and provide a simpler solution for administrators who want to configure multicast over Layer 3 VPNs. A Draft-Rosen MVPN uses Protocol Independent Multicast (PIM) for customer multicast (C-multicast) signaling, and a next-generation MVPN uses BGP for C-multicast signaling.

Multipath routing in an MVPN is applied to make data forwarding more robust against network failures and to minimize shared backup capacities when resilience against network failures is required.

By default, PIM join messages are sent toward a source based on the reverse path forwarding (RPF) routing table check. If there is more than one equal-cost path toward the source [S, G] or rendezvous point (RP) [\*; G], then one upstream interface is used to send the join messages. The upstream path can be:

- A single active external BGP (EBGP) path when both EBGP and internal BGP (IBGP) paths are present.
- A single active IBGP path when there is no EBGP path present.

With the introduction of the multipath PIM join load-balancing feature, customer PIM (C-PIM) join messages are load-balanced in the following ways:

- In the case of a Draft-Rosen MVPN, unequal EBGP and IBGP paths are utilized.
- In the case of next-generation MVPN:
  - Available IBGP paths are utilized when no EBGP path is present.
  - Available EBGP paths are utilized when both EBGP and IBGP paths are present.

This feature is applicable to IPv4 C-PIM join messages over the Layer 3 MVPN service.

By default, a customer source (C-S) or a customer RP (C-RP) is considered remote if the active **rt\_entry** is a secondary route and the primary route is present in a different routing instance. Such determination is being done without taking into consideration the (C-\*;G) or (C-S,G) state for which the check is being performed. The multipath PIM join load-balancing feature determines if a source (or RP) is remote by taking into account the associated (C-\*;G) or (C-S,G) state.

When the provider network does not have provider edge (PE) routing devices with the multipath PIM join load-balancing feature enabled, hash-based join load balancing is used. Although the decision to configure this feature does not impact PIM or overall system performance, network performance can be affected temporarily, if the feature is not enabled.

With hash-based join load balancing, adding new PE routing devices to the candidate upstream toward the C-S or C-RP results in C-PIM join messages being redistributed to new upstream paths. If the number of join messages is large, network performance is impacted because of join messages being sent to the new RPF neighbor and prune messages being sent to the old RPF neighbor. In next-generation MVPN, this results in BGP C-multicast data messages being withdrawn from old upstream paths and advertised on new upstream paths, impacting network performance.

In [Figure 92 on page 3743](#), PE1 and PE2 are the upstream PE routing devices. Router PE1 learns route Source from EBGP and IBGP peers—the customer edge CE1 router and the PE2 router, respectively.

**Figure 92: PIM Join Load Balancing**

- If the PE routing devices run the Draft-Rosen MVPN, the PE1 router distributes C-PIM join messages between the EBGP path to the CE1 router and the IBGP path to the PE2 router. The join messages on the IBGP path are sent over a multicast tunnel interface through which the PE routing devices establish C-PIM adjacency with each other.

If a PE routing device loses one or all EBGP paths toward the source (or RP), the C-PIM join messages that were previously using the EBGP path are moved to a multicast tunnel interface, and the RPF neighbor on the multicast tunnel interface is selected based on a hash mechanism.

On discovering the first EBGP path toward the source (or RP), only new join messages get load-balanced across EBGP and IBGP paths, whereas the existing join messages on the multicast tunnel interface remain unaffected.

- If the PE routing devices run the next-generation MVPN, the PE1 router sends C-PIM join messages directly to the CE1 router over the EBGP path. There is no C-PIM adjacency between the PE1 and PE2 routers. Router PE3 distributes the C-PIM join messages between the two IBGP paths to PE1 and PE2. The Bitwise-XOR hash algorithm is used to send the C-multicast data according to Internet draft [draft-ietf-l3vpn-2547bis-mcast-bgp](#), *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*.

Because the multipath PIM join load-balancing feature in a Draft-Rosen MVPN utilizes unequal EGBP and IBGP paths to the destination, loops can be created when forwarding unicast packets to the destination. To avoid or break such loops:

- Traffic arriving from a core or master instance should not be forwarded back to the core facing interfaces.
- A single multicast tunnel interface should either be selected as the upstream interface or the downstream interface.
- An upstream or downstream multicast tunnel interface should point to a non-multicast tunnel interface.

As a result of the loop avoidance mechanism, join messages arriving from an EGBP path get load-balanced across EIBGP paths as expected, whereas join messages from an IBGP path are constrained to choose the EGBP path only.

In [Figure 92 on page 3743](#), if the CE2 host sends unicast data traffic to the CE1 host, the PE1 router could send the multicast flow to the PE2 router over the MPLS core due to traffic load balancing. A data forwarding loop is prevented by ensuring that PE2 does not forward traffic back on the MPLS core because of the load-balancing algorithm.

In the case of C-PIM join messages, assuming that both the CE2 host and the CE3 host are interested in receiving traffic from the source (S, G), and if both PE1 and PE2 choose each other as the RPF neighbor toward the source, then a multicast tree cannot be formed completely. This feature implements mechanisms to prevent such join loops in the multicast control plane in a Draft-Rosen MVPN scenario.

**NOTE:**

Disruption of multicast traffic or creation of join loops can occur, resulting in a multicast distribution tree (MDT) not being formed properly due to one of the following reasons:

- During a graceful Routing Engine switchover (GRES), the EIBGP path selection for C-PIM join messages can vary, because the upstream interface selection is performed again for the new Routing Engine based on the join messages it receives from the CE and PE neighbors. This can lead to disruption of multicast traffic depending on the number of join messages received and the load on the network at the time of the graceful restart. However, nonstop active routing (NSR) is not supported and has no impact on the multicast traffic in a Draft-Rosen MVPN scenario.
  - Any PE routing device in the provider network is running another vendor's implementation that does not apply the same hashing algorithm implemented in this feature.
  - The multipath PIM join load-balancing feature has not been configured properly.
-

## PIM Snooping for VPLS

- [Understanding PIM Snooping for VPLS on page 3745](#)
- [Example: Configuring PIM Snooping for VPLS on page 3746](#)

### Understanding PIM Snooping for VPLS

There are two ways to direct PIM control packets:

- By the use of PIM snooping
- By the use of PIM proxying

PIM snooping configures a device to examine and operate only on PIM hello and join/prune packets. A PIM snooping device snoops PIM hello and join/prune packets on each interface to find interested multicast receivers and populates the multicast forwarding tree with this information. PIM snooping differs from PIM proxying in that both PIM hello and join/prune packets are transparently flooded in the VPLS as opposed to the flooding of only hello packets in the case of PIM proxying. PIM snooping is configured on PE routers connected through pseudowires. PIM snooping ensures that no new PIM packets are generated in the VPLS, with the exception of PIM messages sent through LDP on pseudowires.

**NOTE:** In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

A device that supports PIM snooping snoops hello packets received on attachment circuits. It does not introduce latency in the VPLS core when it forwards PIM join/prune packets.

To configure PIM snooping on a PE router, use the **pim-snooping** statement at the **[edit routing-instances *instance-name* protocols]** hierarchy level:

```
routing-instances {
 customer {
 instance-type vpls;
 ...
 protocols {
 pim-snooping{
 traceoptions {
 file pim.log size 10m;
 flag all;
 flag timer disable;
 }
 }
 }
 }
}
```

```
}
```

“[Example: Configuring PIM Snooping for VPLS](#)” on [page 3746](#) explains the PIM snooping method. The use of the PIM proxying method is not discussed here and is outside the scope of this document. For more information about PIM proxying, see [PIM Snooping over VPLS](#).

### **Example: Configuring PIM Snooping for VPLS**

This example shows how to configure PIM snooping in a virtual private LAN service (VPLS) to restrict multicast traffic to interested devices.

- [Requirements on page 3746](#)
- [Overview on page 3746](#)
- [Configuration on page 3747](#)
- [Verification on page 3753](#)

### **Requirements**

This example uses the following hardware and software components:

- MX Series 3D Universal Edge Routers (except MX80)
- Junos OS Release 12.3 or later

### **Overview**

The following example shows how to configure PIM snooping to restrict multicast traffic to interested devices in a VPLS.

**NOTE:** This example demonstrates PIM snooping by the use of a PIM snooping device to restrict multicast traffic. The use of the PIM proxying method to achieve PIM snooping is out of the scope of this document and is yet to be implemented in Junos OS.

### **Topology**

In this example, two PE routing devices are connected to each other through a pseudowire connection. Router PE1 is connected to Routers CE1 and CE2. A multicast receiver is attached to Router CE2. Router PE2 is connected to Routers CE3 and CE4. A multicast source is connected to Router CE3, and a second multicast receiver is attached to Router CE4.

PIM snooping is configured on Routers PE1 and PE2. Hence, data sent from the multicast source is received only by members of the multicast group.

[Figure 93 on page 3747](#) shows the topology used in this example.

Figure 93: PIM Snooping for VPLS

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Router PE1
set multicast-snooping-options traceoptions file snoop.log size 10m
set interfaces ge-2/0/0 encapsulation ethernet-vpls
set interfaces ge-2/0/0 unit 0 description toCE1

```

**Configuring PIM Snooping for VPLS****Step-by-Step  
Procedure**

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [“Using the CLI Editor in Configuration Mode” on page 4704](#) in the *CLI User Guide*.

**NOTE:** This section includes a step-by-step configuration procedure for one or more routing devices in the topology. For comprehensive configurations for all routing devices, see [“CLI Quick Configuration” on page 3747](#).

To configure PIM snooping for VPLS:

1. Configure the router interfaces forming the links between the routing devices.

**Router PE2**

[edit interfaces]

```

user@PE2# set ge-2/0/0 encapsulation ethernet-vpls
user@PE2# set ge-2/0/0 unit 0 description toCE3
user@PE2# set ge-2/0/1 encapsulation ethernet-vpls
user@PE2# set ge-2/0/1 unit 0 description toCE4
user@PE2# set ge-2/0/2 unit 0 description toPE1
user@PE2# set ge-2/0/2 unit 0 family mpls
user@PE2# set ge-2/0/2 unit 0 family inet address 10.0.0.2/30
user@PE2# set lo0 unit 0 family inet address 10.255.7.7/32

```

**NOTE:** ge-2/0/0.0 and ge-2/0/1.0 are configured as VPLS interfaces and connect to Routers CE3 and CE4. See *Configuring VPLS Encapsulation on CE-Facing Interfaces* for more details.

**Router CE3**

```
[edit interfaces]
user@CE3# set ge-2/0/0 unit 0 description toPE2
user@CE3# set ge-2/0/0 unit 0 family inet address 10.0.0.18/30
user@CE3# set ge-2/0/1 unit 0 description toSource
user@CE3# set ge-2/0/1 unit 0 family inet address 10.0.0.29/30
user@CE3# set lo0 unit 0 family inet address 10.255.3.3/32
```

**NOTE:** The ge-2/0/1.0 interface on Router CE3 connects to the multicast source.

```
Router CE4
[edit interfaces]
user@CE4# set ge-2/0/0 unit 0 description toPE2
user@CE4# set ge-2/0/0 unit 0 family inet address 10.0.0.22/30
user@CE4# set ge-2/0/1 unit 0 description toReceiver2
user@CE4# set ge-2/0/1 unit 0 family inet address 10.0.0.25/30
user@CE4# set lo0 unit 0 family inet address 10.255.4.4/32
```

**NOTE:** The ge-2/0/1.0 interface on Router CE4 connects to a multicast receiver.

Similarly, configure Routers PE1, CE1, and CE2.

2. Configure the router IDs of all routers.

```
Router PE2
[edit routing-options]
user@PE2# set router-id 10.255.7.7
```

Similarly, configure other routers.

3. Configure an IGP on interfaces of all routers.

```
Router PE2
[edit protocols ospf area 0.0.0.0]
user@PE2# set interface ge-2/0/2.0
user@PE2# set interface lo0.0
```

Similarly, configure other routers.

4. Configure the LDP, MPLS, and BGP protocols on the PE routers.

```
Router PE2
[edit protocols]
user@PE2# set ldp interface lo0.0
user@PE2# set mpls interface ge-2/0/2.0
user@PE2# set bgp group toPE1 type internal
user@PE2# set bgp group toPE1 local-address 10.255.7.7
user@PE2# set bgp group toPE1 family l2vpn signaling
user@PE2# set bgp group toPE1 neighbor 10.255.1.1
user@PE2# set ldp interface ge-2/0/2.0
```

The BGP group is required for interfacing with the other PE router. Similarly, configure Router PE1.

5. Configure PIM on all CE routers.

Ensure that Router CE3 is configured as the rendezvous point (RP) and that the RP address is configured on other CE routers.

```
Router CE3
[edit protocols pim]
user@CE3# set rp local address 10.255.3.3
user@CE3# set interface all
```

```
Router CE4
[edit protocols pim]
user@CE4# set rp static address 10.255.3.3
user@CE4# set interface all
```

Similarly, configure Routers CE1 and CE2.

6. Configure multicast snooping options on the PE routers.

```
Router PE2
[edit multicast-snooping-options traceoptions]
user@PE2# set file snoop.log size 10m
```

Similarly, configure Router PE1.

7. Create a routing instance (**titanium**), and configure the VPLS on the PE routers.

```
Router PE2
[edit routing-instances titanium]
user@PE2# set instance-type vpls
user@PE2# set vlan-id none
user@PE2# set interface ge-2/0/0.0
user@PE2# set interface ge-2/0/1.0
user@PE2# set route-distinguisher 101:101
user@PE2# set vrf-target target:201:201
user@PE2# set protocols vpls vpls-id 15
user@PE2# set protocols vpls site pe2 site-identifier 2
```

Similarly, configure Router PE1.

8. Configure PIM snooping on the PE routers.

```
Router PE2
[edit routing-instances titanium]
user@PE2# set protocols pim-snooping
```

Similarly, configure Router PE1.

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show protocols**, **show multicast-snooping-options**, and **show routing-instances** commands.

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE2# show interfaces
ge-2/0/2 {
 unit 0 {
 description toPE1
 family inet {
 address 10.0.0.2/30;
 }
 family mpls;
 }
}
ge-2/0/0 {
 encapsulation ethernet-vpls;
 unit 0 {
 description toCE3;
 }
}
ge-2/0/1 {
 encapsulation ethernet-vpls;
 unit 0 {
 description toCE4;
 }
}
lo0 {
 unit 0 {
 family inet {
 address 10.255.7.7/32;
 }
 }
}
```

```
user@PE2# show routing-options
router-id 10.255.7.7;
```

```
user@PE2# show protocols
mpls {
 interface ge-2/0/2.0;
}
ospf {
 area 0.0.0.0 {
 interface ge-2/0/2.0;
 interface lo0.0;
 }
}
ldp {
 interface ge-2/0/2.0;
 interface lo0.0;
}
bgp {
 group toPE1 {
 type internal;
 local-address 10.255.7.7;
 family l2vpn {
 signaling;
 }
 }
}
```

```

 neighbor 10.255.1.1;
 }

user@PE2# show multicast-snooping-options
traceoptions {
 file snoop.log size 10m;
}

user@PE2# show routing-instances
titanium {
 instance-type vpls;
 vlan-id none;
 interface ge-2/0/0.0;
 interface ge-2/0/1.0;
 route-distinguisher 101:101;
 vrf-target target:201:201;
 protocols {
 vpls {
 site pe2 {
 site-identifier 2;
 }
 vpls-id 15;
 }
 pim-snooping;
 }
}

```

Similarly, confirm the configuration on all other routing devices. If you are done configuring the routing devices, enter **commit** from configuration mode.

**NOTE:** Use the **show protocols** command on the CE routers to verify the configuration for the PIM RP.

### Verification

Confirm that the configuration is working properly.

- [Verifying PIM Snooping for VPLS on page 3753](#)

### Verifying PIM Snooping for VPLS

**Purpose** Verify that PIM Snooping is operational in the network.

**Action** To verify that PIM snooping is working as desired, use the following commands:

- ***show pim snooping interfaces***
- ***show pim snooping neighbors detail***
- ***show pim snooping statistics***
- ***show pim snooping join***

- ***show pim snooping join extensive***
- ***show multicast snooping route extensive*** instance <instance-name> group <group-name>

1. From operational mode on Router PE2, run the **show pim snooping interfaces** command.

```
user@PE2> show pim snooping interfaces
Instance: titanium
```

```
Learning-Domain: default
```

| Name       | State | IP | NbrCnt |
|------------|-------|----|--------|
| ge-2/0/0.0 | Up    | 4  | 1      |
| ge-2/0/1.0 | Up    | 4  | 1      |

```
DR address: 10.0.0.22
```

```
DR flooding is ON
```

The output verifies that PIM snooping is configured on the two interfaces connecting Router PE2 to Routers CE3 and CE4.

Similarly, check the PIM snooping interfaces on Router PE1.

2. From operational mode on Router PE2, run the **show pim snooping neighbors detail** command.

```
user@PE2> show pim snooping neighbors detail
Instance: titanium
Learning-Domain: default
```

```
Interface: ge-2/0/0.0
```

```
Address: 10.0.0.18
```

```
Uptime: 00:17:06
```

```
Hello Option Holdtime: 105 seconds 99 remaining
```

```
Hello Option DR Priority: 1
```

```
Hello Option Generation ID: 552495559
```

```
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Tracking is supported
```

```
Interface: ge-2/0/1.0
```

```
Address: 10.0.0.22
```

```
Uptime: 00:15:16
```

```
Hello Option Holdtime: 105 seconds 103 remaining
```

```
Hello Option DR Priority: 1
```

```
Hello Option Generation ID: 1131703485
```

```
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Tracking is supported
```

The output verifies that Router PE2 can detect the IP addresses of its PIM snooping neighbors (10.0.0.18 on CE3 and 10.0.0.22 on CE4).

Similarly, check the PIM snooping neighbors on Router PE1.

3. From operational mode on Router PE2, run the **show pim snooping statistics** command.

```
user@PE2> show pim snooping statistics
```

Instance: titanium

Learning-Domain: default

|                              |      |
|------------------------------|------|
| Tx J/P messages              | 0    |
| Rx J/P messages              | 246  |
| Rx J/P messages -- seen      | 0    |
| Rx J/P messages -- received  | 246  |
| Rx Hello messages            | 1036 |
| Rx Version Unknown           | 0    |
| Rx Neighbor Unknown          | 0    |
| Rx Upstream Neighbor Unknown | 0    |
| Rx J/P Busy Drop             | 0    |
| Rx J/P Group Aggregate       | 0    |
| Rx Malformed Packet          | 0    |
|                              |      |
| Rx No PIM Interface          | 0    |
| Rx Bad Length                | 0    |
| Rx Unknown Hello Option      | 0    |
| Rx Unknown Packet Type       | 0    |
| Rx Bad TTL                   | 0    |
| Rx Bad Destination Address   | 0    |
| Rx Bad Checksum              | 0    |
| Rx Unknown Version           | 0    |

The output shows the number of hello and join/prune messages received by Router PE2. This verifies that PIM sparse mode is operational in the network.

4. Send multicast traffic from the source terminal attached to Router CE3, for the multicast group 224.1.1.1.
5. From operational mode on Router PE2, run the **show pim snooping join**, **show pim snooping join extensive**, and **show multicast snooping route extensive instance <instance-name> group <group-name>** commands to verify PIM snooping.

```
user@PE2> show pim snooping join
```

```
Instance: titanium
Learning-Domain: default
```

```
Group: 224.1.1.1
Source: *
Flags: sparse,rptree,wildcard
Upstream neighbor: 10.0.0.18, Port: ge-2/0/0.0
```

```
Group: 224.1.1.1
Source: 10.0.0.30
Flags: sparse
Upstream neighbor: 10.0.0.18, Port: ge-2/0/0.0
```

```
user@PE2> show pim snooping join extensive
```

```
Instance: titanium
Learning-Domain: default
```

```
Group: 224.1.1.1
Source: *
Flags: sparse,rptree,wildcard
Upstream neighbor: 10.0.0.18, Port: ge-2/0/0.0
Downstream port: ge-2/0/1.0
Downstream neighbors:
10.0.0.22 State: Join Flags: SRW Timeout: 180
```

```
Group: 224.1.1.1
Source: 10.0.0.30
Flags: sparse
Upstream neighbor: 10.0.0.18, Port: ge-2/0/0.0
Downstream port: ge-2/0/1.0
Downstream neighbors:
10.0.0.22 State: Join Flags: S Timeout: 180
```

The outputs show that multicast traffic sent for the group 224.1.1.1 is sent to Receiver 2 through Router CE4 and also display the upstream and downstream neighbor details.

```
user@PE2> show multicast snooping route extensive instance titanium group 224.1.1.1
Next-hop Bulking: OFF
```

**Meaning** PIM snooping is operational in the network.

## Configuration Statements: IGMP

## igmp

---

**Syntax**    `igmp {  
    accounting;  
    interface interface-name {  
        disable;  
        (accounting | no-accounting);  
        group-limit limit;  
        group-policy [ policy-names ];  
        group-threshold  
        immediate-leave;  
        log-interval  
        oif-map map-name;  
        passive;  
        promiscuous-mode;  
        ssm-map ssm-map-name;  
        ssm-map-policy ssm-map-policy-name;  
        static {  
            group multicast-group-address {  
                exclude;  
                group-count number;  
                group-increment increment;  
                source ip-address {  
                    source-count number;  
                    source-increment increment;  
                }  
            }  
        }  
        version version;  
    }  
    query-interval seconds;  
    query-last-member-interval seconds;  
    query-response-interval seconds;  
    robust-count number;  
    traceoptions {  
        file filename <files number> <size size> <world-readable | no-world-readable>;  
        flag flag <flag-modifier> <disable>;  
    }  
}`

**Hierarchy Level**    `[edit logical-systems logical-system-name protocols],`  
                          `[edit protocols]`

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.  
                              Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**    Enable IGMP on the router or switch. IGMP must be enabled for the router or switch to receive multicast packets.

The remaining statements are explained separately.

|                                 |                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | IGMP is disabled on the router or switch. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP). |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify the threshold at which a warning message is logged for the multicast groups received on a logical interface. The threshold is a percentage of the maximum number of multicast groups allowed on a logical interface.</p> <p>For example, if you configure a maximum number of 1,000 incoming multicast groups, and you configure a threshold value of 90 percent, warning messages are logged in the system log when the interface receives 900 groups.</p> <p>To confirm the configured group threshold on the interface, use the <a href="#">show igmp interface</a> command.</p> |
| <b>Default</b>                  | By default, there is no configured threshold value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>value</b>—Percentage of the maximum number of multicast groups allowed on the interface that starts triggering the warning. You configure a percentage of the <b>group-limit</b> value that starts triggering the warnings. You must explicitly configure the <a href="#">group-limit</a> to configure a threshold value.</p> <p><b>Range:</b> 1 through 100</p>                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>Starting in Junos OS Release 9.3, both IGMP version 2 and IGMP version 3 do host tracking when the <b>immediate-leave</b> statement is configured. This means that the multicast group leaves only when the last host leaves. The routing device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p> <div style="margin-top: 20px;">  <p><b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</p> </div> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Specify the minimum time interval (in seconds) between sending consecutive log messages to the system log for multicast groups. To configure the time interval, you must specify the maximum number of multicast groups allowed on the interface. You must configure the <b>group-limit</b> statement before you configure the <b>log-interval</b> statement.</p> <p>To confirm the configured log interval on the interface, use the <b>show igmp interface</b> command.</p> |
| <b>Default</b>                  | By default, there is no configured time interval.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>seconds</b>—Minimum time interval (in seconds) between log messages. You must explicitly configure the <b>group-limit</b> to configure a time interval to send log messages.</p> <p><b>Range:</b> 6 through 32,767 seconds</p>                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.3.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 9.2 for dynamic profiles.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                      |
| <b>Description</b>              | Specify that the interface accepts IGMP reports from hosts on any subnetwork. Note that when enabling promiscuous-mode, all routing devices on the ethernet segment must be configured with the promiscuous mode statement. Otherwise, only the interface configured with lowest IPv4 address acts as the querier for IGMP for this Ethernet segment. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                   |

## static (Protocols IGMP)

---

**Syntax**    static {  
              group *multicast-group-address* {  
                  exclude;  
                  group-count *number*;  
                  group-increment *increment*;  
                  source *ip-address* {  
                      source-count *number*;  
                      source-increment *increment*;  
                  }  
              }  
          }  
      }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols **igmp** interface *interface-name*],  
                          [edit protocols **igmp** interface *interface-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Test multicast forwarding on an interface without a receiver host.

The **static** statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

.....  
**NOTE:** To prevent joining too many groups accidentally, the **static** statement is not supported with the **interface all** statement.  
.....

The remaining statements are explained separately.

**Required Privilege Level**    routing and trace—To view this statement in the configuration.  
                                  routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure IGMP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | The default IGMP trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>igmp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>IGMP Tracing Flags</b></p> <ul style="list-style-type: none"> <li><b>leave</b>—Leave group messages (for IGMP version 2 only).</li> <li><b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li> <li><b>packets</b>—All IGMP packets.</li> </ul> |

- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## Configuration Statements: IGMP Snooping

### igmp-snooping

---

```
Syntax igmp-snooping {
 vlan vlan-id {
 immediate-leave;
 interface interface-name {
 group-limit limit;
 host-only-interface;
 immediate-leave;
 multicast-router-interface;
 static {
 group ip-address {
 source ip-address;
 }
 }
 }
 }
 proxy {
 source-address ip-address;
 }
 query-interval seconds;
 query-last-member-interval seconds;
 query-response-interval seconds;
 robust-count number;
 }
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Enable IGMP snooping on the router or switch.

**Default** IGMP snooping is disabled on the router or switch.

**Options** The statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Configure a limit for the number of multicast groups (or [S,G] channels in IGMPv3) allowed on an interface. After this limit is reached, new reports are ignored and all related flows are not flooded on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | By default, there is no limit to the number of multicast groups joining an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <i>limit</i> —a 32-bit number for the limit on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
