<td>• <strong>Connected</strong>—SIBS on an LCC are connected and trained, but are either not online or are spare, because the plane on the the TX Matrix Plus router (SFC) is still offline.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The LCC SIB transitions to the <strong>Connected</strong> state when the F13 SIB to which it connects is online but the SFC plane (to which the LCC SIB connects) is offline for some reason; for instance, when there are insufficient number of F2 SIBs in the plane.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Disconnected</strong>—If an F13 SIB on the TX Matrix Plus router (SFC) goes offline, then the SIBs on the LCCs connected to the F13 SIB get disconnected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>On the TX Matrix Plus router with 3D SIBs, the LCC SIB is also disconnected if the F13 SIB is online, but none of the cables are connected or trained.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The <strong>Disconnected</strong> state is valid only for SIBs on an LCC. An LCC SIB transitions to the <strong>Disconnected</strong> state when the F13 SIB to which it connects goes <strong>Offline</strong>, irrespective of the state of the SFC plane.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>SFC Error</strong>—If an F13 SIB on the TX Matrix Plus router (SFC) transitions to the <strong>Fault</strong> state (because of link errors, for instance), and if an LCC SIB connected to the F13 SIB comes online, the LCC SIB transitions to the <strong>SFC Error</strong> state. This state indicates that the F13 SIB to which the LCC SIB is connected has errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong>: The <strong>Connected</strong>, <strong>Disconnected</strong>, and <strong>SFC Error</strong> states are applicable only to the SIBs on an LCC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Online</strong>—SIB is operational and running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Offline</strong>—SIB is powered down.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Spare</strong>—SIB is redundant and will move to active state if one of the working SIBs fails to pass traffic.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Empty</strong>—No SIB is present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fault</strong>—SIB is in alarmed state where the SIB’s plane is not operational for the following reasons:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• On-board fabric ASIC is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fiber optic connector faults.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FPC connector faults.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• SIB midplane connector faults.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link errors have exceeded the threshold</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Check</strong>—SIB is in alarmed state where the SIB is partially operational because of link or destination errors. Only a SIB that is <strong>Online</strong> or <strong>Spare</strong> can transition to the <strong>Check</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong>: If a SIB is not inserted properly, the SIB cannot transition to the <strong>Online</strong> or <strong>Spare</strong> state, and therefore cannot transition to the <strong>Check</strong> state.</td>
<td></td>
</tr>

</table>
Table 146: show chassis fabric plane Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LCC SIB Link State</strong></td>
<td>State of the LCC SIB link:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Links ok—Link is active.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Links error—A link error has occurred, but the link remains operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Unused—SIB is not in use.</td>
<td></td>
</tr>
<tr>
<td><strong>SG number Port number</strong></td>
<td>State of the SG chip ports on the LCC:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Links ok—Link is active.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link error—Link is operational with errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link error crc saturated—CRC has exceeded the rate threshold and reached saturation without optical issues—that is, a cable has not been cut, removed, or otherwise experienced an error.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link error crc saturated with optical errors—CRC has exceeded the rate threshold and reached saturation with optical issues—that is, a cable has been cut, removed, or otherwise experienced an error.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Unused—Port is not in use.</td>
<td></td>

**show chassis fabric plane-location**

**Syntax**

```
show chassis fabric plane-location
```

**Syntax (MX Series Routers)**

```
<all-members>
<local>
<member member-id>
```

**Syntax (MX2010 3D Universal Edge Routers)**

```
show chassis fabric plane-location
```

**Syntax (MX2020 3D Universal Edge Routers)**

```
show chassis fabric plane-location
```

**Syntax (TX Matrix Plus Router)**

```
show chassis fabric plane-location
```

**Release Information**

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.4 for EX Series switches.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**Description**

(M120, MX Series routers, and EX8200 switches only) Display the Control Board (CB) location of each plane. This command can be used on the master Routing Engine or the backup Routing Engine. For information about the meaning of “CBs” and “fabric plane” on the switches, see “EX Series Switches Hardware and CLI Terminology Mapping” on page 389.

(TX Matrix Plus routers only) Display the SIB location of each fabric plane.

(PTX Series Packet Transport Routers only) Display the fabric plane location of each SIB.

(MX2010 and MX2020 Routers only) Display the fabric plane location of each Switch Fabric Board (SFB).

**Options**

- **all-members**—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in all member routers in the Virtual Chassis configuration.
- **local**—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the local Virtual Chassis member.
- **member member-id**—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the specified member in the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.
Required Privilege Level

show chassis fabric summary

Syntax

show chassis fabric summary

Release Information

Command introduced in Junos OS Release 8.4.
Command introduced in Junos OS Release 9.4 for EX Series switches.
Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

(MX Series routers and EX8200 switches only) Display the state of all fabric planes and the elapsed uptime.

Options

This command has no options.

Required Privilege Level

view

List of Sample Output

show chassis fabric summary (MX240 Router) on page 1008
show chassis fabric summary (MX480 Router) on page 1008
show chassis fabric summary (MX480 Router with MPC4E) on page 1008
show chassis fabric summary (MX960 Router) on page 1008
show chassis fabric summary (MX2010 Router) on page 1009
show chassis fabric summary (MX2020 Router) on page 1009
show chassis fabric summary (MX2020 Router with MPC4E) on page 1009
show chassis fabric summary (EX8200 Switch) on page 1009
show chassis fabric summary (PTX Series Packet Transport Router) on page 1010

Output Fields

Table 148 on page 1006 lists the output fields for the show chassis fabric summary command. Output fields are listed in the approximate order in which they appear.

Table 148: show chassis fabric summary Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plane</td>
<td>(MX Series, MX2020 and MX2010 Routers only) Plane number.</td>
</tr>
</tbody>
</table>
### Table 148: show chassis fabric summary Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>State</strong></td>
<td>(MX Series) State of the SIB or FPC:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Online</strong>—Switch Interface Board (SIB) is operational and running.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> On the Enhanced MX SCB with Trio MPC, a maximum of 4 planes are operational and running. On all the other SCBs with Trio MPC, all the planes are operational and running.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Empty</strong>—SIB is powered down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Check</strong>—SIB is in the <strong>Check</strong> state because of the following reasons:</td>
</tr>
<tr>
<td></td>
<td>• SIB is not inserted properly.</td>
</tr>
<tr>
<td></td>
<td>• Some destination errors are detected on the SIB. In this case, the Packet Forwarding Engine stops using the SIB to send traffic to the affected destination Packet Forwarding Engine.</td>
</tr>
<tr>
<td></td>
<td>• Some link errors are detected on the channel between the SIB and a Packet Forwarding Engine. Link errors can be detected at initialization time or runtime:</td>
</tr>
<tr>
<td></td>
<td>• Link errors caused by a link training failure at initialization time—The Packet Forwarding Engine does not use the SIB to send traffic. The <code>show chassis fabric fpcs</code> command shows <strong>Plane disabled</strong> as status for this link.</td>
</tr>
<tr>
<td></td>
<td>• Link errors caused by CRC errors detected at runtime—The Packet Forwarding Engine continues to use the SIB to send traffic. The <code>show chassis fabric fpcs</code> command shows <strong>Link error</strong> as the status for this link.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The <strong>Check</strong> state does not apply to PTX Series Packet Transport Routers because there are no SIBs in the Check state.</td>
</tr>
<tr>
<td></td>
<td>For information about link and destination errors, issue the <code>show chassis fabric fpcs</code> commands.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Spare</strong>—SIB is redundant and will move to active state if one of the working SIBs fails.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> <strong>Spare</strong> does not apply to PTX Series Packet Transport Routers because there are no spare SIBs in the device.</td>
</tr>
<tr>
<td></td>
<td>(MX2010 and MX2020 Routers) State of the SFB.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Online</strong>—Switch Fabric Board (SFB) is operational and running.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Offline</strong>—Switch Fabric Board (SFB) is powered down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Check</strong>—Switch Fabric Board (SFB) is in the check state.</td>
</tr>
<tr>
<td><strong>Errors</strong></td>
<td>(PTX Series only) Indicates whether there is any error on the SIB.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>—No errors</td>
</tr>
<tr>
<td></td>
<td>• <strong>Link Errors</strong>—Fabric link errors were found on the SIB RX link.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Cell drops</strong>—Fabric cell drops were found on the SIB ASIC.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Link, Cell drops</strong>—Both Link errors and cell drops were detected on at least one of the FPC’s fabric links.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The <strong>Errors</strong> column is empty only when the FPC or SIB is offline.</td>
</tr>
</tbody>
</table>

Sample Output

show chassis fabric summary (MX240 Router)

```
user@host> show chassis fabric summary
Plane  State    Uptime
 0      Online   23 hours, 26 minutes, 54 seconds
 1      Online   23 hours, 26 minutes, 54 seconds
 2      Check    18 hours, 33 minutes, 42 seconds
 3      Online   23 hours, 26 minutes, 54 seconds
 4      Spare    23 hours, 26 minutes, 54 seconds
 5      Spare    23 hours, 26 minutes, 54 seconds
 6      Spare    23 hours, 26 minutes, 54 seconds
 7      Spare    23 hours, 26 minutes, 54 seconds
```

show chassis fabric summary (MX480 Router)

```
user@host> show chassis fabric summary
Plane  State    Uptime
 0      Online   8 hours, 45 minutes, 29 seconds
 1      Online   8 hours, 45 minutes, 28 seconds
 2      Online   8 hours, 45 minutes, 28 seconds
 3      Online   8 hours, 45 minutes, 28 seconds
 4      Spare    8 hours, 45 minutes, 28 seconds
 5      Spare    8 hours, 45 minutes, 28 seconds
 6      Spare    8 hours, 45 minutes, 28 seconds
 7      Check    6 hours, 10 minutes, 12 seconds
```

show chassis fabric summary (MX480 Router with MPC4E)

```
user@host > show chassis fabric summary
Plane  State    Uptime
 0      Online   6 hours, 57 minutes, 44 seconds
 1      Online   6 hours, 57 minutes, 40 seconds
 2      Online   6 hours, 57 minutes, 39 seconds
 3      Online   6 hours, 57 minutes, 34 seconds
 4      Spare    6 hours, 57 minutes, 34 seconds
 5      Spare    6 hours, 57 minutes, 29 seconds
 6      Spare    6 hours, 57 minutes, 29 seconds
 7      Spare    6 hours, 57 minutes, 24 seconds
```

Note:
For FPC slots with MPC Type 4 or MCC:
Fabric planes 1 and 5, 3 and 7 use shared physical links.
Those slots may run in a reduced bandwidth in case both plane 1 and 5, or both 3 and 7 are active.

show chassis fabric summary (MX960 Router)

```
user@host> show chassis fabric summary
Plane  State    Uptime
 0      Online   3 hours, 7 minutes, 9 seconds
 1      Online   3 hours, 7 minutes, 4 seconds
```
show chassis fabric summary (MX2010 Router)

```
user@host> show chassis fabric summary
Plane   State       Uptime
0       Online     1 day, 13 hours, 20 minutes, 10 seconds
1       Online     1 day, 13 hours, 19 minutes, 59 seconds
2       Offline    
3       Online     1 day, 13 hours, 19 minutes, 49 seconds
4       Online     1 day, 13 hours, 19 minutes, 28 seconds
5       Check      1 day, 13 hours, 19 minutes, 17 seconds
6       Online     1 day, 13 hours, 19 minutes, 6 seconds
7       Online     1 hour, 43 minutes, 5 seconds
```

show chassis fabric summary (MX2020 Router)

```
user@host> show chassis fabric summary
Plane   State       Uptime
0       Online     8 hours, 24 minutes, 1 second
1       Online     8 hours, 47 minutes, 54 seconds
2       Online     8 hours, 47 minutes, 44 seconds
3       Online     8 hours, 47 minutes, 33 seconds
4       Online     8 hours, 47 minutes, 22 seconds
5       Online     8 hours, 47 minutes, 12 seconds
6       Online     8 hours, 47 minutes, 1 second
7       Online     8 hours, 46 minutes, 50 seconds
```

show chassis fabric summary (MX2020 Router with MPC4E)

```
user@host > show chassis fabric summary
Plane   State       Uptime
0       Online     3 days, 6 hours, 58 minutes, 29 seconds
1       Online     3 days, 6 hours, 58 minutes, 18 seconds
2       Online     3 days, 6 hours, 58 minutes, 8 seconds
3       Online     3 days, 6 hours, 57 minutes, 57 seconds

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
Description: Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

Options: none—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached routers in the routing matrix.

NOTE: In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc

Temp  CPU Utilization (%)   Memory
Slot State            (C)  Total  Interrupt      DRAM (MB) Heap Buffer
0 Empty
1 Empty
2 Empty
3 Empty
4 Empty
5 Offline         ---Hard FPC error---
6 Empty
7 Online            26      4          0       1024        0
32

The following sample output shows the alarm raised for the failed FPCs.

user@host > show chassis alarms
4 alarms currently active
Alarm time               Class  Description
2011-03-24 00:52:51 UTC  Major  FPC 5 Hard errors
2011-03-24 00:52:31 UTC  Major  Fan Tray Failure
2011-03-24 00:52:31 UTC  Major  Fan Tray Failure
2011-03-24 00:51:26 UTC  Minor  Loss of communication with Backup RE
```
NOTE: On T4000 routers, when you include the enhanced-mode statement at the [edit chassis network-services] hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The show chassis alarm command output displays FPC misconfiguration (FPC fpc-slot misconfig) as the reason for the generation the alarms.

The following sample output shows the FPC status after the enhanced-mode statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
Temp CPU Utilization (%) Memory
Slot State (C) Total Interrupt DRAM (MB) Heap Buffer
0 offline ---FPC misconfiguration---
1 offline ---FPC misconfiguration---
2 offline ---FPC misconfiguration---
3 Empty
4 Empty
5 Online 66 50 0 2816 29
27
```

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
3 alarms currently active
Alarm time            Class Description
2011-03-24 00:52:51 PST  Major  FPC 1 misconfig
2011-03-24 00:52:31 PST  Major  FPC 2 misconfig
2011-03-24 00:52:31 PST  Major  FPC 3 misconfig
```

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see fpc-slot or slot).

all-members—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

interconnect-device name—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

fpc-slot—(Optional) FPC slot number:
- (TX Matrix and TX Matrix Plus router only—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the lcc number option (the recommended method), replace fpc-slot with a value from 0 through 7. Otherwise, replace fpc-slot with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of the specified router (line-card chassis)
by using the lcc number option (the recommended method), replace fpc-slot with a value from 0 through 7. Otherwise, replace fpc-slot with a value from 0 through 31. For example, the following commands have the same result:

user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9

- M120 router—Replace fpc-slot with a value from 0 through 5.
- MX80 router—Replace fpc-slot with a value from 0 through 1.
- MX104 router—Replace fpc-slot with a value from 0 through 2.
- MX240 router—Replace fpc-slot with a value from 0 through 2.
- MX480 router—Replace fpc-slot with a value from 0 through 5.
- MX-960 router—Replace fpc-slot with a value from 0 through 11.
- MX2010 router—Replace fpc-slot-number with a value from 0 through 9.
- MX2020 router—Replace fpc-slot-number with a value from 0 through 19.
- Other routers—Replace fpc-slot with a value from 0 through 7.

- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace fpc-slot with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace fpc-slot with a value from 0 through 9.
  - EX6210 switches—Replace fpc-slot with a value from 0 through 9.
  - EX8208 switches—Replace fpc-slot with a value from 0 through 7.
  - EX8216 switches—Replace fpc-slot with a value from 0 through 15.

- QFX Series:
  - QFX3500 switches—Replace fpc-slot with 0.
  - QFabric systems—Replace fpc-slot with 0 through 31 on the Interconnect device.

- PTX Series Packet Transport Routers:
  - PTX5000 Packet Transport Router—Replace fpc-slot with a value from 0 through 7.

- ACX Series Universal Access Routers:
  - ACX1000 and ACX2000 Universal Access Routers—Replace fpc-slot with 0.

local—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

member member-id—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.
node-device name—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

pic-status—(Optional) Display status information for all PICs or for the PIC in the specified slot (see fpc-slot).

NOTE: On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the show chassis fpc command with the pic-status option, the CLI displays the string “Not Supported” for 10x10GE (LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0   Online       E2-FPC Type 1
      PIC 0  Online       1x G/E SFP, 1000 BASE
      PIC 1  Online       Adaptive Services-II
      PIC 2  Online       1x G/E IQ, 1000 BASE
      PIC 3  Online       1x G/E IQ, 1000 BASE
Slot 1   Online       FPC Type 3-ES
      PIC 0  Present      UNUSED- Not Supported
Slot 2   Online       FPC Type 4-ES
      PIC 0  Offline      4x OC-192 SONET XFP
      PIC 1  Present      10x10GE (LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4   Offline      FPC Type 1-ES
Slot 5   Offline      FPC Type 2-ES
Slot 6   Online       E2-FPC Type 3
      PIC 0  Online       1x OC-192 SONET XFP
      PIC 1  Online       4x OC-48 SONET
      PIC 2  Online       4x OC-48 SONET
      PIC 3  Online       MultiServices 500
Slot 7   Online       FPC Type 4-ES
      PIC 0  Online       4x 10GE (LAN/WAN) XFP
      PIC 1  Online       4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (/var/log/messages) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr 5 08:47:36 router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC: PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see PSN-2010-03-696.
NOTE: When there is a double-bit ECC error in a network processor’s memory, the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP or Channelized E1/T1 Circuit Emulation MIC is switched to the offline state.

```
user@host> show chassis fpc pic-status
Slot 1   Online       MPC Type 2 3D Q
PIC 0  Offline      1xCOC12/4xCOC3 CH-CE- ECC error detected
```

`lcc number`—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Output Fields

Table 149 on page 1018 lists the output fields for the `show chassis fpc` command. Output fields are listed in the approximate order in which they appear.

Table 149: show chassis fpc Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slot or Slot State</td>
<td>Slot number and state. The state can be one of the following conditions:</td>
<td>all levels</td>
</tr>
<tr>
<td></td>
<td>• Dead—Held in reset because of errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Diag—Slot is being ignored while the FPC is running diagnostics.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Dormant—Held in reset.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Empty—No FPC is present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Offline—(PTX Series Packet Transport Routers only) One of the following two states is displayed:</td>
<td>all levels</td>
</tr>
<tr>
<td></td>
<td>• FPC offline due to unreachable destinations</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FPC Offline due to degraded FPC action</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Online—FPC is online and running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Present—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either Hardware Not Supported or Hardware Not In Right Slot. The FPC is coming up but not yet online.</td>
<td>all levels</td>
</tr>
<tr>
<td></td>
<td>• Probed—Probe is complete; awaiting restart of the Packet Forwarding Engine.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Probe-wait—Waiting to be probed.</td>
<td></td>
</tr>
<tr>
<td>Logical slot</td>
<td>Slot number.</td>
<td>all levels</td>
</tr>
<tr>
<td>Temp (C) or Temperature</td>
<td>Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.</td>
<td>all levels</td>
</tr>
<tr>
<td></td>
<td></td>
<td>all levels</td>
</tr>
</tbody>
</table>
Table 149: show chassis fpc Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Temperature (PTX Series)</strong></td>
<td>On PTX Series Packet Transport Routers, temperature details are provided in degrees Celsius and Fahrenheit. Output includes:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Temperature (Intake)—Temperature of the air flowing into the chassis.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC.</td>
<td></td>
</tr>
<tr>
<td>Total CPU Utilization (%)</td>
<td>Total percentage of CPU being used by the FPC’s processor.</td>
<td>all levels</td>
</tr>
<tr>
<td>Interrupt CPU Utilization (%)</td>
<td>Of the total CPU being used by the FPC’s processor, the percentage being used for interrupts.</td>
<td>none specified</td>
</tr>
<tr>
<td>Memory DRAM (MB)</td>
<td>Total DRAM, in megabytes, available to the FPC’s processor.</td>
<td>none specified</td>
</tr>
<tr>
<td>Heap Utilization (%)</td>
<td>Percentage of heap space (dynamic memory) being used by the FPC’s processor. If this number exceeds 80 percent, there may be a software problem (memory leak).</td>
<td>none specified</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> On MX Series routers and EX Series switches in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.</td>
<td></td>
</tr>
<tr>
<td>Buffer Utilization (%)</td>
<td>Percentage of buffer space being used by the FPC’s processor for buffering internal messages.</td>
<td>none specified</td>
</tr>
<tr>
<td>Total CPU DRAM</td>
<td>Amount of DRAM available to the FPC’s CPU.</td>
<td>detail</td>
</tr>
<tr>
<td>Total RLDRAM</td>
<td>Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.</td>
<td>detail</td>
</tr>
<tr>
<td>Total DDR DRAM</td>
<td>Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.</td>
<td>detail</td>
</tr>
<tr>
<td>Total SRAM</td>
<td>Amount of static RAM (SRAM) used by the FPC's CPU.</td>
<td>detail</td>
</tr>
<tr>
<td>Total SDRAM</td>
<td>Total amount of memory used for storing packets and notifications.</td>
<td>detail</td>
</tr>
<tr>
<td>I/O Manager ASICs information</td>
<td>I/O Manager version number, manufacturer, and part number.</td>
<td>detail</td>
</tr>
<tr>
<td>Start time</td>
<td>Time when the Routing Engine detected that the FPC was running.</td>
<td>detail</td>
</tr>
</tbody>
</table>
Table 149: show chassis fpc Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uptime</td>
<td>How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.</td>
<td>detail</td>
</tr>
<tr>
<td>PIC type</td>
<td>(pic-status output only) Type of PIC.</td>
<td>none specified</td>
</tr>
</tbody>
</table>

show chassis led

| show chassis led (EX Series) | show chassis led <fpc-slot <fpc-slot-number>> |
| show chassis led (QFX Series) | show chassis led <fpc-slot <fpc-slot-number>> interconnect-device name node-device name |

Release Information
- Command introduced in Junos OS Release 10.1 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.

Options
- **none**—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).

  - **fpc-slot <fpc-slot-number>**—(Optional) (Not on EX2200 switches) Display the information as follows:
    - (EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches) Display the status of the chassis status LEDs for either an FPC slot with no fpc-slot-number value specified or for the FPC slot specified by fpc-slot 0. fpc-slot refers to the switch itself and 0 is the only valid value for fpc-slot-number. Output for these options is the same as for the none option.
    - (EX4200 switches in a Virtual Chassis with two or more members) If no fpc-slot-number value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the none option. If the fpc-slot-number value is specified (it equals the member-id value), display the status of the chassis status LEDs for the specified member.
    - (EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the fpc-slot-number value.

  - **interconnect-device name**—
    - (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.

  - **node-device name**—(QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.

Required Privilege Level
- **view**

show chassis location

Syntax  show chassis location
Syntax (TX Matrix Router)  show chassis location <fpc | interface (by-name name | by-slot fpc number lcc number) | lcc number | scc>
Syntax (TX Matrix Plus Router)  show chassis location <fpc | interface (by-name name | by-slot fpc number lcc number) | lcc number | sfc number>
Syntax (MX Series Router)  show chassis location <all-members>
Syntax (QFX Series)  show chassis location <interconnect-device name>
<node-device name>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  Display the physical location of the chassis. This command can only be used on the master Routing Engine.

Options
none—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.
all-members—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.
fpc—(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).
interconnect-device name—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.
interface by-name name—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.
interface by-slot fpc number lcc number—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a
TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: 0 through 31. On TX Matrix Plus router with 3D SIBs, the value is 0 through 63. The local FPC number is the FPC slot number on a particular T640 router.

- For `fpc`, replace `number` with a value from 0 through 7.

- For `lcc`, replace `number` with a value from 0 through 7.

`lcc number`—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

`local`—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

`member member-id`—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.

`node-device name`—(QFabric systems only) (Optional) Display the physical location of the Node device.

`scc`—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

`sfc`—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

Description

Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

Options

fpc-slot slot-number—Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the lcc number option (the recommended method), replace slot-number with a value from 0 through 7. Otherwise, replace slot-number with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the lcc number option (the recommended method), replace slot-number with a value from 0 through 7. Otherwise, replace slot-number with a value from 0 through 31. For example, the following commands have the same result:
user@host> show chassis pic fpc-slot1 lcc1 pic-slot1
user@host> show chassis pic fpc-slot9 pic-slot1

- M120 routers only—Replace `slot-number` with a value from 0 through 5.
- MX80 routers only—Replace `slot-number` with a value from 0 through 1.
- MX104 routers only—Replace `slot-number` with a value from 0 through 2.
- MX240 routers only—Replace `slot-number` with a value from 0 through 2.
- MX480 routers only—Replace `slot-number` with a value from 0 through 5.
- MX960 routers only—Replace `slot-number` with a value from 0 through 11.
- MX2010 routers only—Replace `slot-number` with a value from 0 through 9.
- MX2020 routers only—Replace `slot-number` with a value from 0 through 19.
- Other routers—Replace `slot-number` with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace `slot-number` with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace `slot-number` with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace `slot-number` with a value from 0 through 7 (line card).
  - EX8216 switches—Replace `slot-number` with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 switches—Replace `slot-number` with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace `slot-number` with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

member member-id—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.

node-device name—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot slot-number—Display information about the PIC in this particular PIC slot. For routers, replace slot-number with a value from 0 through 3. For EX3200 and EX4200 switches, replace slot-number with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace slot-number with 0. For the QFX3500 standalone switch and the QFabric system, replace slot-number with 0 or 1.

transport—Display PIC information for optical transport network.

**Output Fields** Table 152 on page 1059 lists the output fields for the `show chassis pic` command. Output fields are listed in the approximate order in which they appear.

**Table 152: show chassis pic Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>PIC type.</td>
</tr>
</tbody>
</table>

**NOTE:** On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as **MIC-3D-1STM64-XFP** and with the SONET framing mode, the type is displayed as **MIC-3D-1OC192-XFP**. By default, the 1-port OC192/STM64 MICs displays the type as **MIC-3D-1OC192-XFP**.
### Table 152: show chassis pic Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Layer2 Overhead</td>
<td>(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.</td>
</tr>
<tr>
<td>ASIC type</td>
<td>Type of ASIC on the PIC.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the PIC. State is displayed only when a PIC is in the slot.</td>
</tr>
<tr>
<td>State</td>
<td>• <strong>Online</strong>— PIC is online and running.</td>
</tr>
<tr>
<td>State</td>
<td>• <strong>Offline</strong>—PIC is powered down.</td>
</tr>
<tr>
<td>PIC version</td>
<td>PIC hardware version.</td>
</tr>
<tr>
<td>Uptime</td>
<td>How long the PIC has been online.</td>
</tr>
<tr>
<td>Package</td>
<td>(Multiservices PICs only) Services package supported: Layer-2 or Layer-3.</td>
</tr>
<tr>
<td>Port Number</td>
<td>Port number for the PIC.</td>
</tr>
<tr>
<td>Cable Type</td>
<td>Type of cable connected to the port: LH, LX, or SX.</td>

</tbody>
</table>
Options

none—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

bios—(Optional) Display the (BIOS) firmware version.

interconnect-device number—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

node-device number—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

scc—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

stc number—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace number with 0.

slot—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace slot with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

Table 153: show chassis routing-engine Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last reboot reason</td>
<td>Reason for last reboot, including:</td>
</tr>
<tr>
<td></td>
<td>• <strong>power cycle/failure</strong>—Halt of the Routing Engine using the <code>halt</code> command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the <code>request system halt</code> command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard.</td>
</tr>
<tr>
<td></td>
<td>• <strong>watchdog</strong>—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered.</td>
</tr>
<tr>
<td></td>
<td>• <strong>reset button reset</strong>—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine.</td>
</tr>
<tr>
<td></td>
<td>• <strong>power button hard power off</strong>—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the <code>request system power-off</code> command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software.</td>
</tr>
<tr>
<td></td>
<td>• <strong>misc hardware reason</strong>—Reboot due to miscellaneous hardware reasons.</td>
</tr>
<tr>
<td></td>
<td>• <strong>thermal shutdown</strong>—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>hard disk failure</strong>—Reboot due to a hard disk or solid-state drive (SSD) failure.</td>
</tr>
<tr>
<td></td>
<td>• <strong>reset from debugger</strong>—Reboot due to reset from the debugger.</td>
</tr>
<tr>
<td></td>
<td>• <strong>chassis control reset</strong>—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the <code>restart chassis-control</code> command.</td>
</tr>
<tr>
<td></td>
<td>• <strong>bios auto recovery reset</strong>—Reboot due to a BIOS auto-recovery reset.</td>
</tr>
<tr>
<td></td>
<td>• <strong>could not be determined</strong>—Reboot due to an undetermined reason.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Router rebooted after a normal shutdown</strong>—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the <code>request system reboot</code> command. You can enter this command to reboot the chassis or specific Routing Engines.</td>
</tr>
<tr>
<td>Load averages</td>
<td>Routing Engine load averages for the last 1, 5, and 15 minutes.</td>
</tr>
</tbody>
</table>

**Sample Output**

**show chassis routing-engine (M5 Router)**

```
user@host> show chassis routing-engine
Routing Engine status:
  Temperature                  25 degrees C / 77 degrees F
  DRAM                        768 MB
  Memory utilization          21 percent

**Syntax**

```
show log
<filename | user <username>>
```

**Syntax (QFabric System)**

```
show log filename
<device-type (device-id | device-alias)>
```

**Syntax (TX Matrix Routers)**

```
show log
<all-lcc | lcc number | scc>
<filename | user <username>>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- Option `device-type (device-id | device-alias)` is introduced in Junos OS Release 13.1 for the QFX Series.

**Description**

List log files, display log file contents, or display information about users who have logged in to the router or switch.

**Options**

- `none`—List all log files.

  - `<all-lcc | lcc number | scc>`—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace `number` with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

- `device-type`—(QFabric system only) (Optional) Display log messages for only one of the following device types:
  - `director-device`—Display logs for Director devices.
  - `interconnect-device`—Display logs for Interconnect devices.
  - `node-device`—Display logs for Node devices.

---

**NOTE:** If you specify the `device-type` optional parameter, you must also specify either the `device-id` or `device-alias` optional parameter.

- `(device-id | device-alias)`—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).
filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The filename parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include username, display logging information about the specified user.

show pfe next-hop

Syntax

```
show pfe next-hop
  <interface interface-name>
```  

Syntax (TX Matrix and TX Matrix Plus Routers)

```
show pfe next-hop
  <fpc slot>
  <interface interface-name>
  <lcc number>
```  

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Packet Forwarding Engine next-hop information.

Options

- **none**—Display all Packet Forwarding Engine next-hop information.

  - **fpc slot**—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.
    - On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31.
    - On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31.
    - On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 63.

  For example, the following commands have the same result:

  ```
  user@host> show pfe next-hop fpc 1 lcc 1
  user@host> show pfe next-hop fpc 9
  ```

- **interface interface-name**—(Optional) Display the Packet Forwarding Engine next-hop interface.

- **lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine next-hop interface for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine next-hop interface for the router (or line-card chassis) that is connected to a TX Matrix Plus router.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Required Privilege Level**

### show pfe route

**Syntax**

```plaintext
show pfe route <<inet6 | ip | iso> <prefix prefix> | <table <table-name> | <index index> | <prefix prefix> | <mpls> | <summary>
```

**Syntax (EX Series Switch and QFX Series)**

```plaintext
show pfe route <<inet6 | ip> <prefix prefix> | <table <table-name> | <index index> | <prefix prefix> | <mpls> | <summary>
```

**Syntax (TX Matrix and TX Matrix Plus Routers)**

```plaintext
show pfe route <<fpc slot> <<inet6 | ip | iso> <prefix prefix> | <table <table-name> | <index index> | <prefix prefix> | <lcc number> | <mpls> | <summary>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.

**Options**

- `none`—Display all Packet Forwarding Engine forwarding table information.
- `fpc slot`—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.
  - On a TX Matrix router, if you specify the number of a T640 router by using the `lcc number` option (the recommended method), replace `slot` with a value from 0 through 7. Otherwise, replace `slot` with a value from 0 through 31.
  - On a TX Matrix Plus router, if you specify the number of a T1600 router by using the `lcc number` option (the recommended method), replace `slot` with a value from 0 through 7. Otherwise, replace `slot` with a value from 0 through 31.
  - On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the `lcc number` option (the recommended method), replace `slot`
with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 63.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

**index** *(Optional)* Display table index.

**inet6** *(Optional)* Display Packet Forwarding Engine IPv6 routes.

**ip** *(Optional)* Display Packet Forwarding Engine IPv4 routes.

**iso** *(Optional)* Display ISO version routing tables.

**lcc number** *(TX Matrix and TX Matrix Plus routers only) *(Optional)* On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**mpls** *(Optional)* Display Packet Forwarding Engine MPLS information.

**prefix prefix** *(Optional)* IPv4 or IPv6 prefix for which to show table entries.

**summary** *(Optional)* Display summary of Packet Forwarding Engine information.

**table <table-name>** *(Optional)* Display table information.

**Required Privilege Level**

`admin`

**show pfe terse**

**Syntax**

```
show pfe terse
```

**Syntax (TX Matrix and TX Matrix Plus Router)**

```
show pfe terse
<lcc number | scc>
<sfc number>
```

**Syntax (MX Series Router)**

```
show pfe terse
<all-members>
<local>
<member member-id>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display Packet Forwarding Engine status information.

**Options**

- `none`—Display brief information about the Packet Forwarding Engine.

- `all-members`—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for all members in the Virtual Chassis configuration.

- `lcc number`—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine information for a T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine information for the router (or line-card chassis) that is connected to a TX Matrix Plus router.

  Replace `number` with the following values depending on the LCC configuration:

  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

- `local`—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for the local Virtual Chassis member.

- `member member-id`—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for the specified member of the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.

- `scc`—(TX Matrix routers only) (Optional) Display Packet Forwarding Engine information for the TX Matrix router (or switch-card chassis).
**sfc**—(TX Matrix Plus routers only) (Optional) Display Packet Forwarding Engine information for the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

- **admin**

**List of Sample Output**

- `show pfe terse (TX Matrix Router) on page 1106`
- `show pfe terse (TX Matrix Plus Router) on page 1106`
- `show pfe terse sfc (TX Matrix Plus Router) on page 1106`

**Sample Output**

**show pfe terse (TX Matrix Router)**

```
user@host> show pfe terse
Slot Type Slot    State   Flags Uptime
0  SFM  Present Online  0x0bf 01:25:42
2  SFM  Present Online  0x0bf 01:25:40
0  FPC  Present Online  0x102 01:25:57
1  FPC  Present Online  0x102 01:25:55
2  FPC  Present Online  0x102 01:25:53
```

**show pfe terse (TX Matrix Plus Router)**

```
user@host> show pfe terse

--------------------------------------------------------------------------
Slot Type Slot      State     Uptime
0   LCC  Present   Online    2d 05:25
```
show system alarms

Syntax

show system alarms

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display active system alarms.

Options

This command has no options.

Additional Information

System alarms are preset. They include a configuration alarm that appears when no rescue configuration alarm is set and a license alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the Junos OS Administration Library for Routing Devices.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

Starting with Junos OS Release 13.2, you can view degraded fabric alarms on a routing matrix based on TX Matrix Plus router with 3D SIBs. The alarm indicates that the source FPC is running with a degraded fabric condition. This alarm is an early warning of a possible fabric black-hole condition. When the degraded fabric alarm is raised on the source FPC, you can take remedial action to avoid a fabric black-hole condition. The degraded fabric alarm is raised on the source FPC if both the following conditions are met:

- The active Packet Forwarding Engine destinations are reachable on one or no active switching planes.
- At least one of the inactive switching planes has a fault that causes the destination Packet Forwarding Engine to become unreachable.

Required Privilege

admin

List of Sample Output

show system alarms on page 1107
show system alarms (Fan Tray) on page 1108
show system alarms (QFX Series) on page 1108
show system alarms (TX Matrix Plus router with 3D SIBs) on page 1108

Sample Output

show system alarms

user@host> show system alarms
2 alarms currently active

<table>
<thead>
<tr>

<root-only>

Syntax (TX Matrix Plus Router)

show system audit
<all-chassis | all-lcc | lcc number | sfc number>
<root-only>

Syntax (QFX Series)

show system audit
<infrastructure name | interconnect-device name | node-group name | root-only>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the state and checksum values for file systems.

Options

none—Display the state and checksum values for all file systems.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.

all-members—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**infrastructure name**—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device name**—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

**local**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

**member-member-id**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

**node-group name**—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

**root-only**—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

**scc**—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace number with 0.

**Additional Information**

To redirect the output to a file, issue the following command:

```
ssh device-name 'show system audit root-only' > output-file
```

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.
By default, when you issue the `show system audit` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Required Privilege Level**

- admin

**List of Sample Output**

- `show system audit root-only` on page 1111
- `show system audit lcc (TX Matrix Router)` on page 1111
- `show system audit lcc (TX Matrix Plus Router)` on page 1113
- `show system audit root-only (QFX3500 Switch)` on page 1115

**Sample Output**

**show system audit root-only**

```

show system buffers

Syntax  
show system buffers

Syntax (EX Series)  
show system buffers
<all-members>
<local>
<member member-id>

Syntax (TX Matrix Router)  
show system buffers
<all-chassis | all-lcc | lcc number | scc>

Syntax (TX Matrix Plus Router)  
show system buffers
<all-chassis | all-lcc | lcc number | sfc number>

Syntax (MX Series Router)  
show system buffers
<all-members>
<local>
<member member-id>

Syntax (QFX Series)  
show system buffers
<infrastructure name | interconnect-device name | node-group name | root-only (infrastructure name | interconnect-device name | node-group name)>

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).

Options  
none—Show all buffer statistics.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.

all-members—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.

infrastructure name—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.
**interconnect-device name**—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group name**—(QFabric systems only) (Optional) Show buffer statistics for the Node group

**sfc**—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information**

By default, when you issue the `show system buffers` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

Output Fields

Table 154 on page 1120 describes the output fields for the show system buffers command. Output fields are listed in the approximate order in which they appear.
Table 154: show system buffers Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mbufs in use</td>
<td>Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.</td>
</tr>
<tr>
<td>mbufs allocated to packet headers</td>
<td>Number of memory buffers currently holding packet headers</td>
</tr>
<tr>
<td>mbufs allocated to control blocks</td>
<td>Number of memory buffers currently holding the state for sockets.</td>
</tr>
<tr>
<td>mbufs allocated to send data</td>
<td>Number of memory buffers currently holding socket send data.</td>
</tr>
<tr>
<td>mbufs allocated to pfe refill data</td>
<td>Number of memory buffers currently holding Packet Forwarding Engine refill data.</td>
</tr>
<tr>
<td>mbufs allocated to fxp data</td>
<td>Number of memory buffers currently holding fxp data.</td>
</tr>
<tr>
<td>mbufs allocated to socket names and addresses</td>
<td>Number of memory buffers currently holding addresses for sockets.</td>
</tr>
<tr>
<td>mbuf clusters in use</td>
<td>Allocation statistics for memory buffer clusters.</td>
</tr>
<tr>
<td>allocated to network</td>
<td>Total amount of memory in use by the networking and interprocess communication (IPC) code.</td>
</tr>
<tr>
<td>requests for memory denied</td>
<td>Number of times a memory allocation request within the IPC and networking code failed.</td>
</tr>
<tr>
<td>requests for memory delayed</td>
<td>Number of times a memory allocation request within the IPC and networking code was postponed.</td>
</tr>
<tr>
<td>calls to protocol drain routines</td>
<td>Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.</td>
</tr>
</tbody>
</table>

Sample Output

show system buffers

user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)

**show system connections**

**Syntax**

```
show system connections
<extensive>
<all-chassis | all-lcc | lcc number | scc>
<inet | inet6>
<show-routing-instances>
```

**Syntax (EX Series)**

```
show system connections
<extensive>
<all-members>
<inet | inet6>
<local>
<member member-id>
<show-routing-instances>
```

**Syntax (TX Matrix Router)**

```
show system connections
<extensive>
<all-chassis | all-lcc | lcc number | scc>
<inet | inet6>
<show-routing-instances>
```

**Syntax (TX Matrix Plus Router)**

```
show system connections
<extensive>
<all-chassis | all-lcc | lcc number | sfc number>
<inet | inet6>
<show-routing-instances>
```

**Syntax (MX Series Router)**

```
show system connections
<extensive>
<all-members>
<inet | inet6>
<local>
<member member-id>
<show-routing-instances>
```

**Syntax (QFX Series)**

```
show system connections
<extensive>
<inet>
<infrastructure name>
<interconnect-device name>
<node-group name>
<show-routing-instances>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `sfc` option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.
Options

none—Display information about all active IP sockets on the Routing Engine.

extensive—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.

inet | inet6—(Optional) Display IPv4 connections or IPv6 connections, respectively.

infrastructure name—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device name—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

node-group name—(QFabric systems only) (Optional) Display system connection activity for the Node group.
scc—(TX Matrix routers only) (Optional) Display system connection activity for the
TX Matrix router (or switch-card chassis).

sfc—(TX Matrix routers only) (Optional) Display system connection activity for the
TX Matrix Plus router.

show-routing-instances—(Optional) Display routing instances.

Additional Information
By default, when you issue the show system connections command on the master Routing
Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all
the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise,
if you issue the same command on the backup Routing Engine of a TX Matrix or a TX
Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs
that are connected to it in the routing matrix.

Output Fields
Table 155 on page 1126 describes the output fields for the show system connections
command. Output fields are listed in the approximate order in which they appear.

Table 155: show system connections Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proto</td>
<td>Protocol of the socket: IP, TCP, or UDP for IPv4 or IPv6.</td>
</tr>
<tr>
<td>Recv-Q</td>
<td>Number of input packets received by the protocol and waiting to be processed by the application.</td>
</tr>
<tr>
<td>Send-Q</td>
<td>Number of output packets sent by the application and waiting to be processed by the protocol.</td>
</tr>
<tr>
<td>Local Address</td>
<td>Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.</td>
</tr>
<tr>
<td>Foreign Address</td>
<td>Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.</td>
</tr>
</tbody>
</table>
Table 155: show system connections Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Routing Instance</strong></td>
<td>(Displayed only when the <strong>show-routing-instance</strong> option is used.) Routing instances associated with active IP sockets on the Routing Engine.</td>
</tr>
<tr>
<td>(state)</td>
<td>For TCP, the protocol state of the socket.</td>
</tr>
</tbody>
</table>

Sample Output

show system connections

```
user@host> show system connections

show system core-dumps

Syntax

```
show system core-dumps
    <brief | detail>
    <core-filename>
    <core-file-info>
```

Syntax (EX Series Switches)

```
show system core-dumps
    <all-members>
    <brief | detail>
    <core-filename>
    <core-file-info>
    <local>
    <member member-id>
```

Syntax (TX Matrix Router)

```
show system core-dumps
    <all-chassis | all-lcc | lcc number | scc>
    <brief | detail>
    <core-filename>
    <core-file-info>
```

Syntax (TX Matrix Plus Router)

```
show system core-dumps
    <all-chassis | all-lcc | lcc number | sfc number>
    <brief | detail>
    <core-filename>
    <core-file-info>
```

Syntax (QFX Series)

```
show system core-dumps
    <brief | detail>
    <component (UUID | serial number | all)>
    <core-file-info component (UUID | serial number) core-file-name>
    <display-period (hours | minutes | seconds)>
    <display-order>
    <kernel-crashinfo component (UUID | serial number)>
    <repository (core | log)>
```

Release Information

Command introduced before Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Show core files on all routers or switches running Junos OS. You can use the `show system core-dumps` command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.

You can use the option `core-filename` and its options `core-file-info`, `brief`, and `detail` to display more information about the specified core-dump files.

Options

```
none—Display a list of all existing core-dump files.
```
**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

**<all-lcc | lcc number>**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the `lcc number` option, replace `number` with a value from 0 through 3.

**NOTE:** The all-chassis option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the all-lcc option only displays system core files for the LCCs in the routing matrix.

**all-members**—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

**brief**—(Optional) View details of a binary file.

**component (UUID | serial number | all)**—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

**core-file-info**—(Optional) Display the stack trace of a core file.

**core-filename**—(Optional) Name of a specific core file to display.

**detail**—(Optional) View stack trace with details of the binary file.

**display-order (timestamp-sort | alphanumeric-sort)**—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

**display-period (hours | minutes | seconds)**—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

**kernel-crashinfo component (UUID | serial number)**—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.
local—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

member member-id—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace member-id with a value from 0 through 9.

repository (core | log)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

scc—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

<interconnect-device name>
<node-group name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display directory usage information.

**Options**

- **none**—Display all directory usage information.
- **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.
all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

depth number—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

infrastructure name— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

interconnect-device name— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

node-group name— (QFabric systems only) (Optional) Display directory information for the Node group.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

path—(Optional) Path or root directory to traverse.

scc—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace number with 0.

Output Fields

Table 157 on page 1157 describes the output fields for the `show system directory-usage` command. Output fields are listed in the approximate order in which they appear.

**Table 157: show system directory-usage Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bytes</code></td>
<td>Number of bytes used by files in a directory.</td>
</tr>
<tr>
<td><code>directory-name</code></td>
<td>Name of the directory.</td>
</tr>
</tbody>
</table>
Sample Output

show system directory-usage scc (TX Matrix Router)

```shell
user@host> show system directory-usage /var/tmp scc
/var/tmp
1.0K /var/tmp/vi.recover
2.0K /var/tmp/instmp.tPMk8u
1.0K /var/tmp/install
/var/tmp/instmp.GUMpur
4.8M /var/tmp/instmp.GUMpur/packages
6.4M /var/tmp/troy1
297M /var/tmp/dsw
/var/tmp/pkg_tmp.2073
83K /var/tmp/pkg_tmp.2073/bin
/var/tmp/instmp.oMIDbl
89K /var/tmp/instmp.oMIDbl/bin
/var/tmp/instmp.byhMjR
4.6M /var/tmp/instmp.byhMjR/packages
1.7M /var/tmp/instmp.6fqHf3/packages
4.6M /var/tmp/instmp.mljEJe/packages
```

show system directory-usage sfc (TX Matrix Plus Router)

```shell
user@switch> show system directory-usage /var/tmp sfc 0
sfc0-re0:
/var/tmp
46K /var/tmp/gres-tp
/var/tmp/sec-download
2.0K /var/tmp/sec-download/sub-download
2.0K /var/tmp/vi.recover
2.0K /var/tmp/install
795M /var/tmp/cores
766K /var/tmp/pr440594
```

show system directory-usage (QFX3500 Switch)

```shell
user@switch> show system directory-usage
/var/tmp
30K /var/tmp/gres-tp
2.0K /var/tmp/rtadb
2.0K /var/tmp/vi.recover
2.0K /var/tmp/install
2.0K /var/tmp/pics
```
### show system processes

**Syntax**

```
show system processes
<brief | detail | extensive | summary>
<health (pid process-identifier | process-name process-name)>
<providers>
<resource-limits (brief | detail) process-name>
<wide>
```

**Syntax (EX Series Switches)**

```
show system processes
<all-members>
<brief | detail | extensive | summary>
<health (pid process-identifier | process-name process-name)>
<local>
<member member-id>
<providers>
<resource-limits (brief | detail) process-name>
<wide>
```

**Syntax (MX Series Routers)**

```
show system processes
<all-members>
<brief | detail | extensive | summary>
<health (pid process-identifier | process-name process-name)>
<local>
<member member-id>
<providers>
<resource-limits (brief | detail) process-name>
<wide>
```

**Syntax (QFX Series)**

```
show system processes
<brief | detail | extensive | summary>
<health (pid process-identifier | process-name process-name)>
<interconnect-device name>
<node-group name>
<providers>
<resource-limits>
<wide>
```

**Syntax (TX Matrix Routers)**

```
show system processes
<brief | detail | extensive | summary>
<all-chassis | all-lcc | lcc number | scc>
<wide>
```

**Syntax (TX Matrix Plus Router)**

```
show system processes
<brief | detail | extensive | summary>
<all-chassis | all-lcc | lcc number | sfc number>
<wide>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
**Description**
Display information about software processes that are running on the router or switch and that have controlling terminals.

**Options**
- **none**—Display standard information about system processes.
- **brief | detail | extensive | summary**—(Optional) Display the specified level of detail.
- **adaptive-services**—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- **alarm-control**—(Optional) Display the process to configure the system alarm.
- **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.
- **all-lcc**—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.
- **all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.
- **ancpd-service**—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- **application-identification**—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- **audit-process**—(Optional) Display the RADIUS accounting process.
- **auto-configuration**—Display the Interface Auto-Configuration process.
- **bootp**—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.
- **captive-portal-content-delivery**—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- **ce-l2tp-service**—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.
cfm—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

class-of-service—(Optional) Display the class-of-service (CoS) process, which controls the router’s or switch’s CoS configuration.

clicksyncd-service—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

craft-control—Display the process for the I/O of the craft interface.

database-replication—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

datapath-trace-service—Display the packet path tracing process.

dhcp-service—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

diameter-service—(Optional) Display the diameter process.

disk-monitoring—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

dynamic-flow-capture—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

event-processing—(Optional) Display the event process (eventd).

firewall—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Display the general authentication process.
health (pid process-identifier | process-name process-name)—(Optional) Display process health information, either by process id (PID) or by process name.

iccp-service—Display the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—Display the intrusion detection and prevention (IDP) protocol process.

ilmi—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

inet-process—Display the IP multicast family process.

init—Display the process that initializes the USB modem.

interface-control—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

kernel-replication—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Display the Layer 2 address flooding and learning process.

l2cpd-service—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

lACP—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
local—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

local-policy-decision-function—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

logical-system-mux—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

mac-validation—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

mib-process—(Optional) Display the MIB II process, which provides the router’s MIB II agent.

mobile-ip—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

mountd-service—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

mpls-traceroute—(Optional) Display the MPLS Periodic Traceroute process.

mspd—(Optional) Display the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

neighbor-liveness—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

nfsd-service—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

ntp—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

packet-triggered-subscribers—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.
**peer-selection-service**—(Optional) Display the Peer Selection Service process.

**periodic-packet-services**—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

**pfe**—Display the Packet Forwarding Engine management process.

**pgcp-service**—(Optional) Display the pgcpd service process running on the Routing Engine.

**pgm**—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

**pic-services-logging**—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**ppp**—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**process-monitor**—Display the process health monitor process (pmond).

**providers**—(Optional) Display provider processes.

**redundancy-interface-process**—(Optional) Display the ASP redundancy process.

**remote-operations**—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

**resource-cleanup**—Display the resource cleanup process.

**resource-limits (brief | detail) process-name**—(Optional) Display process resource limits.

**routing**—(Optional) Display the routing protocol process.

**sampling**—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—Display the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).
**sdk-service**—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**send**—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

**service-deployment**—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace *number* with 0.

**snmp**—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**sonet-aps**—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

**static-subscribers**—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**tunnel-oamd**—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**vrrp**—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**watchdog**—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

**wide**—(Optional) Display process information that might be wider than 80 columns.

### Additional Information

By default, when you issue the `show system processes` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields
Table 158 on page 1166 describes the output fields for the show system processes command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>last pid</td>
<td>Last process identifier assigned to the process.</td>
<td>brief extensive summary</td>
</tr>
<tr>
<td>load averages</td>
<td>Three load averages followed by the current time.</td>
<td>brief extensive summary</td>
</tr>
<tr>
<td>processes</td>
<td>Number of existing processes and the number of processes in each state (sleeping, running, starting, zombies, and stopped).</td>
<td>brief extensive summary</td>
</tr>
<tr>
<td>Mem</td>
<td>Information about physical and virtual memory allocation.</td>
<td>brief extensive summary</td>
</tr>
<tr>
<td>Swap</td>
<td>Information about physical and virtual memory allocation.</td>
<td>brief extensive summary</td>
</tr>

Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 1189
- Junos OS Processes on page 1190

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine— Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
Routing Engine—Provides three main functions:
- Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network.
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions. The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.

Table 159: Junos OS Processes

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassid</td>
<td>Detects hardware on the system that is used to configure network interfaces.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>switching</td>
<td></td>
<td>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>process</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Forwarding</td>
<td>pfern</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>process</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
</tbody>
</table>
### Table 159: Junos OS Processes (continued)

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management process</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</td>
</tr>
</tbody>
</table>

| Routing protocol process | rpd  | Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables. |

Extended DHCP Local Server Overview

You can enable the router or switch to function as an extended DHCP local server and configure the extended DHCP local server options on the router (or switch). The extended DHCP local server provides an IP address and other configuration information in response to a client request. The DHCP local server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or DHCP client authentication. You can configure dynamic profile and authentication support on a global basis or for a specific group of interfaces.

The extended DHCP local server enhances traditional DHCP server operation by utilizing centralized address-assignment pools. The address-assignment pools are managed by the authd process, independently of the DHCP local server, and can be shared by different client applications.

You can also configure the extended DHCP local server to support IPv6 clients. Both DHCP local server and DHCPv6 local server support the specific address request feature, which enables you to assign a particular address to a client. See “DHCPv6 Local Server Overview” on page 1196 for information about the DHCPv6 local server feature.

NOTE: You cannot configure the extended DHCP local server and extended DHCP relay on the same interface.

To configure the extended DHCP local server on the router (or switch), you include the dhcp-local-server statement at the [edit system services] hierarchy level. See the [edit system services dhcp-local-server] Hierarchy Level for the complete DHCP local server syntax.

This overview covers:

- Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools on page 1192
- Providing DHCP Client Configuration Information on page 1193
- Minimal Configuration for Clients on page 1194
- DHCP Local Server and Address-Assignment Pools on page 1194
- DHCP Liveness Detection on page 1195

Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools

The pattern of interaction between the DHCP local server, the DHCP client, and address-assignment pools is the same regardless of whether the software installation is on a router or a switch. Technically, the codes operates in the same manner, regardless of the hardware platform. However, there are some difference in the details of usage.

- On routers—in a typical carrier edge network configuration, the DHCP client is on the subscriber’s computer, and the DHCP local server is configured on the router.
• On switches—In a typical network configuration, the DHCP client is on an access device, such as a personal computer, and the DHCP local server is configured on the switch.

The following steps provide a high-level description of the interaction among the DHCP local server, DHCP client, and address-assignment pools:

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber (or DHCP client).

2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.

3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.

4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server also installs the host route and ARP entry, and then monitors the lease state.

Providing DHCP Client Configuration Information

When the extended DHCP application receives a response from an external authentication server, the response might include information in addition to the IP address and subnet mask. The extended DHCP application uses the information from the authentication grant for the response the DHCP application sends to the DHCP client. The DHCP application can either send the information in its original form or the application might merge the information with local configuration specifications. For example, if the authentication grant includes an address pool name and a local configuration specifies DHCP attributes for that pool, the extended DHCP application merges the authentication results and the attributes in the reply that the server sends to the client.

A local configuration is optional — a client can be fully configured by the external authentication service. However, if the external authentication service does not provide client configuration, you must configure the local address-assignment pool to provide the configuration for the client. When a local configuration specifies options, the extended DHCP application adds the local configuration options to the offer PDU the server sends to the client. If the two sets of options overlap, the options in the authentication response from the external service take precedence.

When you use RADIUS to provide the authentication, the additional information might be in the form of RADIUS attributes and Juniper Networks VSAs. Table 160 on page 1194 lists the information that RADIUS might include in the authentication grant. See RADIUS Attributes and Juniper Networks VSAs Supported by the AAA Service Framework for a complete list of RADIUS attributes and Juniper Networks VSAs that the extended DHCP applications supports for subscriber access management or DHCP management.

### Minimal Configuration for Clients

The extended DHCP local server provides a minimal configuration to the DHCP client if the client does not have DHCP option 55 configured. The server provides the subnet mask of the address-assignment pool that is selected for the client. In addition to the subnet mask, the server provides the following values to the client if the information is configured in the selected address-assignment pool:

- **router**—A router located on the client’s subnet. This statement is the equivalent of DHCP option 3.
- **domain name**—The name of the domain in which the client searches for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.
- **domain name server**—A Domain Name System (DNS) name server that is available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

### DHCP Local Server and Address-Assignment Pools

In the traditional DHCP server operation, the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in centralized address-assignment pools.
The centralized address-assignment pools are managed by the authd process, independently of the DHCP local server, and can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients.

NOTE: The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

**DHCP Liveness Detection**

Liveness detection for DHCP subscriber IP (or DHCP client IP) sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients are expected to respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented. You can configure

NOTE: DHCP liveness detection either globally or per DHCP group.

DHCPv6 Local Server Overview

The DHCPv6 local server enhances the extended DHCP local server by providing support for IPv6. When a DHCPv6 client logs in, the DHCPv6 local server can optionally use the AAA service framework to interact with the RADIUS server. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters.

You can configure DHCPv6 local server to communicate the following attributes to the AAA service framework and RADIUS at login time:

- Client username
- Client password

**NOTE:** The client username, which uniquely identifies a subscriber or a DHCP client, must be present in the configuration in order for DHCPv6 local server to use RADIUS authentication.

Based on the attributes that the DHCPv6 local server provides, RADIUS returns the information listed in Table 161 on page 1196 to configure the client:

<table>
<thead>
<tr>
<th>Attribute Number</th>
<th>Attribute Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>27</td>
<td>Session-Timeout</td>
<td>Lease time, in seconds. If not supplied, the lease does not expire</td>
</tr>
<tr>
<td>123</td>
<td>Delegated-IPv6-Prefix</td>
<td>Prefix that is delegated to the client</td>
</tr>
<tr>
<td>26-143</td>
<td>Max-Clients-Per-Interface</td>
<td>Maximum number of clients allowed per interface</td>
</tr>
</tbody>
</table>

The DHCPv6 local server is compatible with the extended DHCP local server and the extended DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.
The DHCPv6 local server provides many of the same features as the extended DHCP local server, including:

- Configuration for a specific interface or for a group of interfaces
- Site-specific usernames and passwords
- Numbered Ethernet interfaces
- Statically configured CoS and filters
- AAA directed login
- Use of the IA_NA option to assign a specific address to a client

To configure the extended DHCPv6 local server on the router (or switch), you include the `dhcpv6` statement at the `[editsystemservicesdhcp-local-server]` hierarchy level. See the `[edit system services dhcp-local-server] Hierarchy Level` for the complete DHCP local server syntax, including the DHCPv6 syntax.

You can also include the `dhcpv6` statement at the following hierarchy levels:

- `[edit logical-systems logical-system-name system services dhcp-local-server]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name system services dhcp-local-server]`
- `[edit routing-instances routing-instance-name system services dhcp-local-server]`

**DHCP Local Server Handling of Client Information Request Messages**

DHCP clients that already have externally provided addresses may solicit further configuration information from a DHCP server by sending a DHCP information request that indicates what information is desired. By default, DHCP local server and DHCPv6 local server ignore any DHCP information requests that they receive. You can override this default behavior to enable processing of these messages. Include the `process-inform`
statement at the [edit system services dhcp-local-server overrides] or [edit system services
dhcp-local-server dhcpv6 overrides] hierarchy level.

By default, DHCP relay and DHCP relay proxy automatically forward DHCP information
request messages without modification if the messages are received on an interface
configured for a DHCP server group. DHCP relay and relay proxy drop information request
messages received on any other interfaces. You cannot disable this default DHCP relay
and relay proxy behavior.

The information requested by these clients has typically been configured with the
dhcp-attributes statement for an address pool defined by the address-assignment pool
pool-name statement at the [edit access] hierarchy level.

When you enable processing of DHCP information requests, you can optionally specify
the name of the pool from which the local server retrieves the requested configuration
information for the client. If you do not do specify a local pool, then the local server
requests that AAA selects and returns only the name of the relevant pool.

DHCP local server responds to the client with a DHCP acknowledgment message that
includes the requested information—if it is available. DHCPv6 local server responds in
the same manner but uses a DHCP reply message. No subscriber management or
DHCP-management is applied as a result of the DHCP information request message.

NOTE: PPP interfaces are not supported on EX Series switches.

When DHCPv6 is configured over PPP interfaces, the PPP RADIUS authentication data
can be used to select the pool from which the response information is taken. Additionally
other RADIUS attributes can also be inserted into the DHCPv6 reply message. If an overlap
exists between RADIUS attributes and local pool attributes, the RADIUS values are used
instead of the local configuration data. If no RADIUS information is received from the
underlying PPP interface, then the behavior is the same as described previously for
non-PPP interfaces.

DHCP Duplicate Client Differentiation Using Client Subinterface Overview

In some network environments, client IDs and MAC addresses might not be unique,
resulting in duplicate clients. For example, two network adapters might be manufactured
with the same hardware address, resulting in a duplicate MAC address among the DHCP
clients attached to the router (or switch). A duplicate DHCP client occurs when a client
attempts to get a lease, and that client has the same client ID or the same MAC address
as an existing DHCP client.

When DHCP server receives a request from a new client that has a duplicate ID or MAC
address, DHCP server terminates the address lease for the existing client and returns the
address to its original address pool. DHCP server then assigns a new address and lease
to the new client.

By default, both DHCP local server and DHCP relay use the subnet information to
differentiate between duplicate clients. However, in some cases, this level of differentiation
is not adequate. For example, when multiple subinterfaces share the same underlying
loopback interface with the same preferred source address, the interfaces appear to be
on the same subnet. In this situation, the default configuration prevents duplicate clients.

You can provide greater differentiation between duplicate clients by configuring DHCP
to consider the client subinterface when duplicate clients occur. In this optional
configuration, DHCP uniquely identifies:

- The subnet on which the client resides
- The subinterface on which the client resides
- The client within the subnet

Group-Specific DHCP Local Server Options

You can include the following statements at the [edit system services dhcp-local-server
group group-name] hierarchy level to set group-specific DHCP local server configuration
options, and at the [edit system services dhcp-local-server] hierarchy level to set global
DHCP local server configuration options. Statements configured at the [edit system
services dhcp-local-server group group-name] hierarchy level apply only to the named
group of interfaces, and override any global DHCP local server settings configured with
the same statements at the [edit system services dhcp-local-server] hierarchy level.

DHCPv6 local server supports the same set of statements with the exception of the
dynamic-profile statement.

- authentication—Configure the parameters the router sends to the external AAA server.
- dynamic-profile—Specify the dynamic profile that is attached to a group of interfaces.
- interface—Specify one or more interfaces, or a range of interfaces, that are within the
  specified group.
- overrides—Override the default configuration settings for the extended DHCP local
  server. For information, see "Overriding Default DHCP Local Server Configuration
  Settings" on page 1261.

Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients

Dynamic reconfiguration of clients enables the extended DHCP local server to initiate a client update without waiting for the client to initiate a request.

Default Client/Server Interaction

Typically the DHCP client initiates all of the basic DHCP client/server interactions. The DHCP server sends information to a client only in response to a request from that client. This behavior does not enable a client to be quickly updated with its network address and configuration in the event of server changes:

NOTE: Technically, the DHCP client/server interactions are the same on routers and switches. However, the primary usage of this technology on the routers is for subscriber management. The switches are not used for subscriber management. Therefore, this topic provides two sample scenarios. The actions are the same, but the implementation details are different.

- On routers—Suppose a service provider restructures its addressing scheme or changes the server IP addresses that it provided to clients. Without dynamic reconfiguration, the service provider typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, the provider can wait for customers to make a service call about the network failures and then instruct them to power cycle their customer premises equipment to reinitiate the connection. Neither of these actions is timely or convenient for customers.

- On switches—Suppose you restructure the addressing scheme or change the server IP addresses that the DHCP server provides to clients. Without dynamic reconfiguration, the network typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, you can wait for users to notify you of the network failures and then instruct them to power cycle their equipment to reinitiate the connection. Neither of these actions is timely or convenient for users.

Dynamic Client/Server Interaction for DHCPv4

Dynamic reconfiguration for DHCPv4 is available through a partial implementation of RFC 3203, DHCP Reconfigure Extension for DHCPv4. It enables the DHCPv4 local server to send a message to the client to force reconfiguration.
The server sends a forcerenew message to a DHCPv4 client, initiating a message exchange. In response, DHCPv4 clients that support the forcerenew message then send a lease renewal message to the server. The server rejects the lease renewal request and sends a NAK to the client, causing the client to reinitiate the DHCP connection. A successful reconnection results in the reconfiguration of the DHCP client. Only the exchange of forcerenew, renew, and NAK messages is supported from RFC 3202. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to forcerenew messages other than to forward them to the client.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber services or DHCP-managed services, such as forwarding and statistics, continue to work. Client statistics are not maintained in the interval between a successful reconfiguration and the subsequent client binding. When the server responds to the client renewal request with a NAK, the client entry is removed from the binding table and final statistics are reported. New statistics are collected when the client sends a discover message to establish a new session.

**Dynamic Client/Server Interaction for DHCPv6**

Dynamic reconfiguration for DHCPv6 is available through a partial implementation of RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*. It enables the DHCPv6 local server to send a message to the client to force reconfiguration.

DHCPv6 servers send reconfigure messages to DHCPv6 clients, initiating a message exchange. In response, DHCPv6 clients that support the reconfigure message transition to the renewing state and send a renew message to the server. The server returns a reply message with a lifetime of zero (0). The client transitions to the init state and sends a solicit message. The server sends an advertise message to indicate that it is available for service. The client sends a request for configuration parameters, which the server then includes in its reply. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to reconfigure messages other than to forward them to the client.

When a DHCPv6 server is triggered to initiate reconfiguration on a bound DHCPv6 client, the client transitions to the reconfigure state. All subscriber services, such as forwarding and statistics, continue to work. The server then sends the reconfigure message to the client. If the DHCPv6 client is already in the reconfigure state, the DHCPv6 server ignores the reconfiguration trigger. For clients in any state other than bound or reconfigure, the server clears the binding state of the client, as if the `clear dhcpv6 server binding` command had been issued.

**Dynamic Configuration Options**

You can enable dynamic reconfiguration for all DHCP clients or only the DHCP clients serviced by a specified group of interfaces, and you can modify the behavior accordingly.

- To enable dynamic reconfiguration with default reconfiguration values for all DHCP clients, include the `reconfigure` statement at the `[edit system services dhcp-local-server]` hierarchy level for DHCPv4 clients, and at the `[edit system services dhcp-local-server dhcpv6]` hierarchy level for DHCPv6 clients.
Alternatively, to enable dynamic reconfiguration for only the DHCP clients serviced by a specified group of interfaces, include the `reconfigure` statement at the `[edit system services dhcp-local-server group group-name]` hierarchy level for DHCPv4 clients, and at the `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level for DHCPv6 clients.

You can optionally modify the behavior of the reconfiguration process by including the appropriate statements at the `[edit system services dhcp-local-server reconfigure]` hierarchy level for all DHCPv4 clients, and at the `[edit system services dhcp-local-server dhcpv6 reconfigure]` hierarchy level for all DHCPv6 clients. To override this global configuration for only the DHCP clients serviced by a specified group of interfaces, you can include the statements with different values at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level for DHCPv4 clients, and at the `[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]` hierarchy level for DHCPv6 clients.

Include the `attempts` statement to specify how many times the local server sends the `forcerenew` or `reconfigure` message to initiate client reconfiguration. Include the `timeout` statement to set the interval between the first and second attempts. The interval between each subsequent attempt doubles the previous value. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on.

By default, the DHCP client’s original configuration is restored if all of the reconfiguration attempts fail. Include the `clear-on-abort` statement to delete the client instead.

You can configure an authentication token by including the `token` statement. The DHCP local server then includes this token inside the authentication option when it sends `forcerenew` or `reconfigure` messages. If the service provider has previously configured the DHCP client with this token, then the client can compare that token against the newly received token, and reject the message if the tokens do not match. This functionality corresponds to RFC 3118, *Authentication for DHCP Messages*, section 4.

In the event of a RADIUS-initiated disconnect (RID), the client is deleted by default. You can configure the client to be reconfigured instead of deleted by including the `radius-disconnect` statement. The client is deleted if all attempts to reconfigure the client fail.

For the DHCPv6 server only, you can include the `strict` statement. By default, the server accepts `solicit` messages from clients that do not support server-initiated reconfiguration. Including this statement causes the server to discard `solicit` messages from nonsupporting clients; consequently the server does not bind these clients.

You can force the local server to initiate the reconfiguration process for clients by issuing the `request dhcp server reconfigure` command for DHCPv4 clients, and the `request dhcpv6 server reconfigure` command for DHCPv6 clients. Command options determine whether reconfiguration is then attempted for all clients or specified clients.
Events that take place while a reconfiguration is in process take precedence over the reconfiguration. Table 162 on page 1203 lists the actions taken in response to several different events.

### Table 162: Action Taken for Events That Occur During a Reconfiguration

<table>
<thead>
<tr>

### DHCP Snooping Support

DHCP snooping provides DHCP security on the router or switch by filtering incoming messages. When DHCP snooping is enabled, the router differentiates between trusted and untrusted interfaces, and forwards messages from trusted sources while rejecting the untrusted messages.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the `dhcp-relay` statement at the `[edit forwarding-options]` hierarchy level, or the `dhcp-local-server` statement at the `[edit system services]` hierarchy level in that routing instance. However, depending on the Junos OS release, the router processes the snooped packets differently, as described in the following list:

- In Junos OS Release 10.0 and earlier, the router processes snooped packets normally.
- In Junos OS Release 10.1 and later, the router discards snooped packets by default. To enable normal processing of snooped packets in Junos OS Release 10.1 and later, you must explicitly configure the `allow-snooped-clients` statement at the `[edit forwarding-options dhcp-relay]` hierarchy level.
You can configure DHCP snooping support for the following:

- **DHCPv4 relay agent**—Override the router’s (or switch’s) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

  In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets.

- **DHCPv6 relay agent**—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

  In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

  Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- **DHCP local server**—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.

**DHCP Auto Logout Overview**

This topic provides an introduction to the optional DHCP auto logout feature and includes the following sections:

- Auto Logout Overview on page 1204
- How DHCP Identifies and Releases Clients on page 1205
- Option 60 and Option 82 Requirements on page 1206

**Auto Logout Overview**

Auto logout is an optional configuration for DHCP local server and DHCP relay agent that improves the efficiency of DHCP IP address assignment. Auto logout enables IP addresses to be immediately released and returned to the address pool when the addresses are no
longer used by DHCP clients. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example (on the routers), you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

How DHCP Identifies and Releases Clients

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier. However, in some cases this type of identification might not be sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful—the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. The secondary identification method is based on the DHCP option 60 and option 82 information in DHCP discover messages.

Both the primary and secondary identification methods use subnet information to differentiate between clients. The primary identification method differentiates between two clients with the same MAC address (or same Client Identifier) if the clients are on different subnets. Similarly, the secondary identification method considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a DISCOVER message from an existing client, the DHCP relay forwards the DISCOVER message to the DHCP server. The DHCP relay preserves the binding if the client’s existing IP address is returned by the DHCP server. This
behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

NOTE: If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in "DHCP Relay Agent Option 82 Value for Auto Logout" on page 1292.

Address-Assignment Pools Overview

The address-assignment pool feature supports subscriber management and DHCP management functionality by enabling you to create centralized IPv4 and IPv6 address pools independently of the client applications that use the pools. The authd process manages the pools and the address allocation, whether the addresses come from local pools or from a RADIUS server. For example, multiple client applications, such as DHCP, can use the same address-assignment pool to provide addresses for their particular clients. Client applications can acquire addresses for either authenticated or unauthenticated clients.

Address-assignment pools support both dynamic and static address assignment. In dynamic address assignment, a client is automatically assigned an address from the address-assignment pool. In static address assignment, which is supported for IPv4 pools only, you reserve an address that is then always used by a particular client. Addresses that are reserved for static assignment are removed from the dynamic address pool and cannot be assigned to other clients.

You can configure named address ranges within an address-assignment pool. A named range is a subset of the overall address range. A client application can use named ranges to manage address assignment based on client-specific criteria. For example, for IPv4 address-assignment pools, you might create a named range that is based on a specific DHCP option 82 value. Then, when a DHCP client request matches the specified option 82 value, an address from the specified range is assigned to the client.
You can link address-assignment pools together to provide backup pools for address assignment. When the primary pool is fully allocated, the router or switch automatically switches to the linked, or secondary, pool and begins allocating addresses from that pool.

You can also explicitly identify that an address-assignment pool is used for ND/RA.

**Use of DHCP Option 50 and DHCPv6 IA_NA Option to Request a Specific IP Address**

Subscriber management or DHCP management enables you to specify that DHCP local server assign a particular address to a client. For example, if a client is disconnected, you might use this capability to assign the same address that the client was using prior to being disconnected. If the requested address is available, DHCP assigns it to the client. If the address is unavailable, the DHCP local server offers another address, based on the address allocation process.

Both DHCP local server and DHCPv6 local server support the specific address request feature. DHCP local server uses DHCP option 50 in DHCP DISCOVER messages to request a particular address, while DHCPv6 local server uses the IA_NA option (Identity Association for Non-Temporary Addresses) in DHCPv6 SOLICIT messages.

---

**NOTE:** Subscriber management (DHCP management) supports only one address for each of the DHCPv6 IA_NA or IA_PD address types. If the DHCPv6 client requests more than one address for a given type, the DHCPv6 local server uses only the first address and ignores the other addresses.

---

Multiple Address Assignment for DHCPv6 Clients

Subscriber management (on the routers) or DHCP management (on the switches) enables you to assign multiple addresses to a single DHCPv6 client. Multiple address support is enabled by default, and is activated when the DHCPv6 local server receives a DHCPv6 Solicit message from a subscriber (or DHCP client) that contains multiple addresses.

For example, if you are implementing this feature on the routers, you might use the multiple address assignment feature in a networking environment in which a customer premises equipment (CPE) device requires a host address and a delegated prefix. In such an environment, you can configure subscriber management to assign both a DHCPv6 IA_NA (Identity Association for Non-Temporary Addresses) and an IA_PD (Identity Association for Prefix Delegation) address to the client (the CPE device).

- Multiple Address Assignment Using Local Address Pools or RADIUS on page 1208
- Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment on page 1208

Multiple Address Assignment Using Local Address Pools or RADIUS

You can use either local address pools or RADIUS when assigning multiple addresses to a DHCP client. When at least one address is successfully allocated, the router or switch creates a subscriber (or DHCP client) entry and binds the entry to the assigned address. If both addresses are successfully allocated, the router (or switch) creates a single subscriber (or DHCP client) entry and binds both addresses to that entry.

You can also configure a delegated address pool, which explicitly specifies the address pool that subscriber management (or DHCP management) uses to assign IPv6 prefixes for subscribers (or DHCP clients).

Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment

NOTE: EX Series switches do not support demux.

(On the routers only) Subscriber management provides a predefined variable that you can use to dynamically configure DHCPv6 multiple address assignment. You apply the Junos OS predefined variable, $junos-subscriber-ipv6-multi-address, as a demux source address in a dynamic profile. When the dynamic profile is attached to a subscriber, the variable is expanded to include both the host and prefix addresses. You use this variable instead of the $junos-subscriber-ipv6-address variable, which supports a single IPv6 address.

You include the $junos-subscriber-ipv6-multi-address variable at the [edit dynamic-profile profile-name interfaces interface-name unit logical-unit-number family inet6 demux-source] hierarchy level.

Centrally Configured Opaque DHCP Options
Subscriber management (on the routers) or DHCP management (on the switches) enables you to centrally configure DHCP options on a RADIUS server and then distribute the options on a per-subscriber or per DHCP-client basis. This method results in RADIUS-sourced DHCP options—the DHCP options originate at the RADIUS server and are sent to the subscriber (or DHCP client). This differs from the traditional client-sourced method (also called DHCP-sourced) of configuring DHCP options, in which the options originate at the client and are sent to the RADIUS server. The subscriber management (DHCP management) RADIUS-sourced DHCP options are also considered to be *opaque*, because DHCP local server performs minimal processing and error checking for the DHCP options string before passing the options to the subscriber (DHCP client).

Subscriber management (or DHCP management) uses Juniper Networks VSA 26-55 (DHCP-Options) to distribute the RADIUS-sourced DHCP options. The RADIUS server includes VSA 26-55 in the Access-Accept message that the server returns during subscriber authentication or DHCP client authentication. The RADIUS server sends the Access-Accept message to the RADIUS client, and then on to DHCP local server for return to the DHCP subscriber. The RADIUS server can include multiple instances of VSA 26-55 in a single Access-Accept message. The RADIUS client concatenates the multiple instances and uses the result as a single instance.

There is no CLI configuration required to enable subscriber management (DHCP management) to use the centrally configured DHCP options—the procedure is triggered by the presence of VSA 26-55 in the RADIUS Access-Accept message.

When building the offer packet for the DHCP client, DHCP local server uses the following sequence:

1. Processes any RADIUS-configured parameters that are passed as separate RADIUS attributes; for example, RADIUS attribute 27 (Session Timeout).
2. Processes any client-sourced parameters; for example, RADIUS attributes 53 (DHCP Message Type) and 54 (Server Identifier).
3. Appends (without performing any processing) the opaque DHCP options string contained in the VSA 26-55 received from the RADIUS server.

In addition to supporting central configuration of DHCP options directly on the RADIUS server (RADIUS-sourced options), subscriber management (DHCP management) also supports the traditional client-sourced options configuration, in which the router’s (switch’s) DHCP component sends the options to the RADIUS server. The client-sourced DHCP options method is supported for both DHCP local server and DHCP relay agent; however, the RADIUS-sourced central configuration method is supported on DHCP local server only. Both the RADIUS-sourced and client-sourced methods support DHCPv4 and DHCPv6 subscribers (clients).

**NOTE:** You can use the RADIUS-sourced and client-sourced methods simultaneously on DHCP local server. However, you must ensure that the central configuration method does not include options that override client-sourced DHCP options, because this can create unpredictable results.
Data Flow for RADIUS-Sourced DHCP Options

Figure 5 on page 1211 shows the procedure subscriber management (DHCP management) uses when configuring DHCP options for subscribers (DHCP clients).

Figure 5: DHCP Options Data Flow

The following general sequence describes the data flow when subscriber management (DHCP management) uses RADIUS-sourced DHCP options and VSA 26-55 to configure a DHCP subscriber (client):

1. The subscriber (DHCP client) sends a DHCP discover message (or DHCPv6 solicit message) to the DHCP local server. The message includes client-sourced DHCP options.
2. The DHCP local server initiates authentication with the Junos OS RADIUS client.
3. The RADIUS client sends an Access-Request message on behalf of the subscriber (DHCP client) to the external RADIUS server. The message includes the subscriber’s (DHCP client’s) client-sourced DHCP options.
4. The external RADIUS server responds by sending an Access-Accept message to the RADIUS client. The Access-Accept message includes the RADIUS-sourced opaque DHCP options in VSA 26-55.
5. The RADIUS client sends the DHCP options string to DHCP local server. If there are multiple VSA 26-55 instances, the RADIUS client first assembles them into a single options string.
6. DHCP local server processes all options into the DHCP offer (or DHCPv6 reply) message, except for the RADIUS-sourced VSA 26-55 DHCP options. After processing all other options, DHCP local server then appends the unmodified VSA 26-55 DHCP options to the message and sends the message to the subscriber (DHCP client).
7. The subscriber (DHCP client) is configured with the DHCP options.

8. The following operations occur after the subscriber (DHCP client) receives the DHCP options:
   • Accounting—The RADIUS client sends Acct-Start and Interim-Accounting requests to the RADIUS server, including the RADIUS-sourced DHCP options in VSA 26-55. By default, the DHCP options are included in accounting requests.
   • Renewal—When the subscriber (DHCP client) renews, the cached DHCP options value is returned in the DHCP renew (or DHCPv6 ACK) message. The originally assigned DHCP options cannot be modified during a renew cycle.
   • Logout—When the subscriber (DHCP client) logs out, the RADIUS client sends an Acct-Stop message to the RADIUS server, including the RADIUS-sourced VSA 26-55.

### Multiple VSA 26-55 Instances Configuration

VSA 26-55 supports a maximum size of 247 bytes. If your RADIUS-sourced DHCP options field is greater than 247 bytes, you must break the field up and manually configure multiple instances of VSA 26-55 for the RADIUS server to return. When using multiple instances for an options field, you must place the instances in the packet in the order in which the fragments are to be reassembled by the RADIUS client. The fragments can be of any size of 247 bytes or less.

**BEST PRACTICE:** For ease of configuration and management of your DHCP options, you might want to have one DHCP option per VSA 26-55 instance, regardless of the size of the option field.

When the RADIUS client returns a reassembled opaque options field in an accounting request to the RADIUS server, the client uses 247-byte fragments. If you had originally created instances of fewer than 247 bytes, the returned fragments might not be the same as you originally configured on the RADIUS server.

**NOTE:** If you are configuring Steel-Belted Radius (SBR) to support multiple VSA 26-55 instances, ensure that you specify VSA 26-55 with the RO flags in the Subscriber Management RADIUS dictionary file. The R value indicates a multivalued reply attribute and the O value indicates an ordered attribute.

### DHCP Options That Cannot Be Centrally Configured

Table 163 on page 1213 shows the DHCP options that you must not centrally configure on the RADIUS server.

Port Number Requirements for DHCP Firewall Filters

When you configure a firewall filter to perform some action on DHCP packets at the Routing Engine, such as protecting the Routing Engine by allowing only proper DHCP packets, you must specify both port 67 (bootps) and port 68 (bootpc) for both the source and destination. The firewall filter acts at both the line cards and the Routing Engine.

This requirement applies to both DHCP local server and DHCP relay, but it applies only when DHCP is provided by the jdhcpd process. MX Series routers, MI20 routers, and M320 routers use jdhcpd. For DHCP relay, that means the configuration is required only at the \[edit forwarding-options dhcp-relay\] hierarchy level and not at the \[edit forwarding-options helpers bootp\] hierarchy level.

DHCP packets received on the line cards are encapsulated by jdhcpd with a new UDP header where their source and destination addresses are set to port 68 before being forwarded to the Routing Engine.

For DHCP relay and DHCP proxy, packets sent to the DHCP server from the router have both the source and destination UDP ports set to 67. The DHCP server responds using the same ports. However, when the line card receives these DHCP response packets, it changes both port numbers from 67 to 68 before passing the packets to the Routing Engine. Consequently the filter needs to accept port 67 for packets relayed from the client to the server, and port 68 for packets relayed from the server to the client.
Failure to include both port 67 and port 68 as described here results in most DHCP packets not being accepted.

For complete information about configuring firewall filters in general, see Junos OS Firewall Filters and Traffic Policers Library for Routing Devices.

Extended DHCP Relay Agent Overview

You can configure extended DHCP relay options on the router or on the switch and enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or DHCP client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

NOTE: The PTX Series Packet Transport Routers do not support authentication for DHCP relay agents.

On the routers, you can use DHCP relay in carrier edge applications such as video/IPTV to obtain configuration parameters, including an IP address, for your subscribers. For more information about how to use the DHCP relay agent in a video/IPTV application, see the Junos OS Feature Guides.

On the switches, you can use DHCP relay to obtain configuration parameters including an IP address for DHCP clients.

NOTE: The extended DHCP relay agent options configured with the dhcp-relay statement are incompatible with the DHCP/BOOTP relay agent options configured with the bootp statement. As a result, you cannot enable both the extended DHCP relay agent and the DHCP/BOOTP relay agent on the router at the same time.

For information about the DHCP/BOOTP relay agent, see the Routing Policy Feature Guide for Routing Devices.

You can also configure the extended DHCP relay agent to support IPv6 clients. See “DHCPv6 Relay Agent Overview” on page 1220 for information about the DHCPv6 relay agent feature.

To configure the extended DHCP relay agent on the router (or switch), include the dhcp-relay statement at the [edit forwarding-options] hierarchy level. See the [edit forwarding-options dhcp-relay] Hierarchy Level for the complete DHCP relay agent syntax.

You can also include the dhcp-relay statement at the following hierarchy levels:

- [edit logical-systems logical-system-name forwarding-options]
- [edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options]
- [edit routing-instances routing-instance-name forwarding-options]
This overview covers:

- Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers on page 1216
- DHCP Liveness Detection on page 1217

### Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers

The pattern of interaction among the DHCP Relay agent, DHCP client, and DHCP servers is the same regardless of whether the software installation is on a router or a switch. However, there are some differences in the details of usage.

On routers—in a typical carrier edge network configuration, the DHCP client is on the subscriber’s computer, and the DHCP relay agent is configured on the router between the DHCP client and one or more DHCP servers.

On switches—in a typical network configuration, the DHCP client is on an access device such as a personal computer and the DHCP relay agent is configured on the switch between the DHCP client and one or more DHCP servers.

The following steps describe, at a high level, how the DHCP client, DHCP relay agent, and DHCP server interact in a configuration that includes two DHCP servers.

1. The DHCP client sends a discover packet to find a DHCP server in the network from which to obtain configuration parameters for the subscriber (or DHCP client), including an IP address.
2. The DHCP relay agent receives the discover packet and forwards copies to each of the two DHCP servers. The DHCP relay agent then creates an entry in its internal client table to keep track of the client’s state.
3. In response to receiving the discover packet, each DHCP server sends an offer packet to the client. The DHCP relay agent receives the offer packets and forwards them to the DHCP client.
4. On receipt of the offer packets, the DHCP client selects the DHCP server from which to obtain configuration information. Typically, the client selects the server that offers the longest lease time on the IP address.
5. The DHCP client sends a request packet that specifies the DHCP server from which to obtain configuration information.
6. The DHCP relay agent receives the request packet and forwards copies to each of the two DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client’s configuration parameters.
8. The DHCP relay agent receives the ACK packet and forwards it to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay agent installs a host route and Address Resolution Protocol (ARP) entry for this client.
11. After establishing the initial lease on the IP address, the DHCP client and the DHCP server use unicast transmission to negotiate lease renewal or release. The DHCP relay
agent “snoops” on all of the packets unicast between the client and the server that pass through the router (or switch) to determine when the lease for this client has expired or been released. This process is referred to as lease shadowing or passive snooping.

**DHCP Liveness Detection**

Liveness detection for DHCP subscriber or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients are expected to respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

---

**NOTE:** DHCP liveness detection either globally or per DHCP group.

DHCP Relay Proxy Overview

DHCP relay proxy mode is an enhancement to extended DHCP relay. DHCP relay proxy supports all DHCP relay features while providing additional features and benefits.

Normally, extended DHCP relay operates as a helper application for DHCP operations. Except for the ability to add DHCP relay agent options and the gateway address (giaddr) to DHCP packets, DHCP relay is transparent to DHCP clients and DHCP servers, and simply forwards messages between DHCP clients and servers.

When you configure DHCP relay to operate in proxy mode, the relay is no longer transparent. In proxy mode, DHCP relay conceals DHCP server details from DHCP clients, which interact with a DHCP relay in proxy mode as though it is the DHCP server. For DHCP servers there is no change, because proxy mode has no effect on how the DHCP server interacts with the DHCP relay.

DHCP relay proxy provides the following benefits:

- **DHCP server isolation and DoS protection**—DHCP clients are unable to detect the DHCP servers, learn DHCP server addresses, or determine the number of servers that are providing DHCP support. Server isolation also provides denial-of-service (DoS) protection for the DHCP servers.

- **Multiple lease offer selection**—DHCP relay proxy receives lease offers from multiple DHCP servers and selects a single offer to send to the DHCP client, thereby reducing traffic in the network. Currently, the DHCP relay proxy selects the first offer received.

- **Support for both numbered and unnumbered Ethernet interfaces**—For DHCP clients connected through Ethernet interfaces, when the DHCP client obtains an address, the DHCP relay proxy adds an access internal host route specifying that interface as the outbound interface. The route is automatically removed when the lease time expires or when the client releases the address.

- **Logical system support**—DHCP relay proxy can be configured in a logical system, whereas a non-proxy mode DHCP relay cannot.

---

**NOTE:** Extended DHCP relay proxy is not supported for the J Series Services Routers DHCP server. Also, you cannot configure both DHCP relay proxy and extended DHCP local server on the same interface.

---

Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP Servers

The DHCP relay agent is configured on the router (or switch), which operates between the DHCP client and one or more DHCP servers.
The following steps provide a high-level description of how DHCP relay proxy interacts with DHCP clients and DHCP servers.

1. The DHCP client sends a discover packet to locate a DHCP server in the network from which to obtain configuration parameters for the subscriber.
2. The DHCP relay proxy receives the discover packet from the DHCP client and forwards copies of the packet to each supporting DHCP server. The DHCP relay proxy then creates a client table entry to keep track of the client state.
3. In response to the discover packet, each DHCP server sends an offer packet to the client, which the DHCP relay proxy receives. The DHCP relay proxy does the following:
   - a. Selects the first offer received as the offer to sent to the client
   - b. Replaces the DHCP server address with the address of the DHCP relay proxy
   - c. Forwards the offer to the DHCP client.
4. The DHCP client receives the offer from the DHCP relay proxy.
5. The DHCP client sends a request packet that indicates the DHCP server from which to obtain configuration information—the request packet specifies the address of the DHCP relay proxy.
6. The DHCP relay proxy receives the request packet and forwards copies, which include the address of selected server, to all supporting DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client configuration parameters.
8. The DHCP relay proxy receives the ACK packet, replaces the DHCP server address with its own address, and forwards the packet to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay proxy installs a host route and Address Resolution Protocol (ARP) entry for the DHCP client.
11. After the initial DHCP lease is established, the DHCP relay proxy receives all lease renewals and lease releases from the DHCP client and forwards them to the DHCP server.

Related Documentation

DHCPv6 Relay Agent Overview

The DHCPv6 relay agent enhances the extended DHCP relay agent by providing support in an IPv6 network. The DHCPv6 relay agent passes messages between the DHCPv6 client and the DHCPv6 server, similar to the way DHCP relay agent supports an IPv4 network.

When a DHCPv6 client logs in, the DHCPv6 relay agent uses the AAA service framework to interact with the RADIUS server to provide authentication and accounting. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters, such as session timeout and the maximum number of clients allowed per interface.

NOTE: The PTX Series Packet Transport Routers do not support authentication for DHCPv6 relay agents.

The DHCPv6 relay agent is compatible with the extended DHCP local server and the extended DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.

To configure the DHCPv6 relay agent on the router (or switch), you include the `dhcpv6` statement at the `[edit forwarding-options dhcp-relay]` hierarchy level.

You can also include the `dhcpv6` statement at the following hierarchy levels:

- `[edit logical-systems logical-system-name forwarding-options dhcp-relay]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay]`
- `[edit routing-instances routing-instance-name forwarding-options dhcp-relay]`

DHCP Duplicate Client Differentiation Using Client Subinterface Overview

In some network environments, client IDs and MAC addresses might not be unique, resulting in duplicate clients. For example, two network adapters might be manufactured with the same hardware address, resulting in a duplicate MAC address among the DHCP clients attached to the router (or switch). A duplicate DHCP client occurs when a client attempts to get a lease, and that client has the same client ID or the same MAC address as an existing DHCP client.

When DHCP server receives a request from a new client that has a duplicate ID or MAC address, DHCP server terminates the address lease for the existing client and returns the address to its original address pool. DHCP server then assigns a new address and lease to the new client.

By default, both DHCP local server and DHCP relay use the subnet information to differentiate between duplicate clients. However, in some cases, this level of differentiation is not adequate. For example, when multiple subinterfaces share the same underlying loopback interface with the same preferred source address, the interfaces appear to be on the same subnet. In this situation, the default configuration prevents duplicate clients.

You can provide greater differentiation between duplicate clients by configuring DHCP to consider the client subinterface when duplicate clients occur. In this optional configuration, DHCP uniquely identifies:

- The subnet on which the client resides
- The subinterface on which the client resides
- The client within the subnet

Group-Specific DHCP Relay Options

You can include the following statements at the [edit forwarding-options dhcp-relay group group-name] hierarchy level to set group-specific DHCP relay agent configuration options. Group-specific statements apply only to the named group of interfaces, and override any global DHCP relay agent settings for the same statement.

Include the statements at the [edit forwarding-options dhcp-relay dhcpv6 group group-name] hierarchy level to configure group-specific options for DHCPv6 relay agent.

- active-server-group—Configure an active server group to apply a common DHCP relay agent configuration to a named group of DHCP server addresses. For information, see “Configuring Active Server Groups” on page 1307.
- authentication—Configure the parameters the router (or switch) sends to the external AAA server.
- dynamic-profile—Specify the dynamic profile that is attached to a group of interfaces.
interface—Specify one or more interfaces, or a range of interfaces, that are within the specified group.

liveness-detection—Configure bidirectional failure detection timers and authentication criteria for static routes. For more information, see “DHCP Liveness Detection Overview” on page 1309.

overrides—Override the default configuration settings for the extended DHCP relay agent. For information, see “Overriding the Default DHCP Relay Configuration Settings” on page 1285.

relay-agent-interface-id—(DHCPv6 only) Insert the DHCPv6 Relay Agent Interface-ID option (option 18) in DHCPv6 packets destined for the DHCPv6 server.

relay-option—Configure selective processing, which uses DHCP options in client packets to identify and filter client traffic, and to specify the action DHCP relay agent takes with the traffic. For more information, see Using DHCP Option Information to Selectively Process DHCP Client Traffic.

relay-option-82—(DHCPv4 only) Enable or disable the insertion of option 82 information in packets destined for a DHCP server. For information, see “Enabling and Disabling Insertion of Option 82 Information” on page 1303.

service-profile—Specify the default subscriber service, (or default profile) which is activated when the subscriber (or DHCP client) logs in and no other service is activated by a RADIUS server or a provisioning server. For more information, see Default Subscriber Service Overview.

Grouping Interfaces with Common DHCP Configurations on page 1258

DHCP Snooping Support

DHCP snooping provides DHCP security on the router or switch by filtering incoming messages. When DHCP snooping is enabled, the router differentiates between trusted and untrusted interfaces, and forwards messages from trusted sources while rejecting the untrusted messages.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the dhcp-relay statement at the [edit forwarding-options] hierarchy level, or the dhcp-local-server statement at the [edit system services] hierarchy level in that routing instance. However, depending on the Junos OS release, the router processes the snooped packets differently, as described in the following list:

- In Junos OS Release 10.0 and earlier, the router processes snooped packets normally.
- In Junos OS Release 10.1 and later, the router discards snooped packets by default. To enable normal processing of snooped packets in Junos OS Release 10.1 and later, you must explicitly configure the allow-snooped-clients statement at the [edit forwarding-options dhcp-relay] hierarchy level.
You can configure DHCP snooping support for the following:

- **DHCPv4 relay agent**—Override the router’s (or switch’s) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

  In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets.

- **DHCPv6 relay agent**—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

  In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

  Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- **DHCP local server**—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.

### DHCP Auto Logout Overview

This topic provides an introduction to the optional DHCP auto logout feature and includes the following sections:

- Auto Logout Overview on page 1223
- How DHCP Identifies and Releases Clients on page 1224
- Option 60 and Option 82 Requirements on page 1225

### Auto Logout Overview

Auto logout is an optional configuration for DHCP local server and DHCP relay agent that improves the efficiency of DHCP IP address assignment. Auto logout enables IP addresses to be immediately released and returned to the address pool when the addresses are no
longer used by DHCP clients. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example (on the routers), you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

How DHCP Identifies and Releases Clients

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier. However, in some cases this type of identification might not be sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful—the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. The secondary identification method is based on the DHCP option 60 and option 82 information in DHCP discover messages.

Both the primary and secondary identification methods use subnet information to differentiate between clients. The primary identification method differentiates between two clients with the same MAC address (or same Client Identifier) if the clients are on different subnets. Similarly, the secondary identification method considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a DISCOVER message from an existing client, the DHCP relay forwards the DISCOVER message to the DHCP server. The DHCP relay preserves the binding if the client’s existing IP address is returned by the DHCP server. This
behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

NOTE: If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in “DHCP Relay Agent Option 82 Value for Auto Logout” on page 1292.

Public Key Cryptography Overview

- Understanding Public Key Cryptography on Switches on page 1226
Understanding Public Key Cryptography on Switches

Cryptography describes the techniques related to the following aspects of information security:

- Privacy or confidentiality
- Integrity of data
- Authentication
- Nonrepudiation or nonrepudiation of origin—Nonrepudiation of origin means that signers cannot claim that they did not sign a message while claiming that their private key remains secret. In some nonrepudiation schemes used in digital signatures, a timestamp is attached to the digital signature, so that even if the private key is exposed, the signature remains valid. Public and private keys are described in the following text.

In practice, cryptographic methods protect the data transferred from one system to another over public networks by encrypting the data using an encryption key. Public key cryptography (PKC), which is used on Juniper Networks EX Series Ethernet Switches, uses a pair of encryption keys: a public key and a private key. The public and private keys are created simultaneously using the same encryption algorithm. The private key is held by a user secretly and the public key is published. Data encrypted with a public key can be decrypted only with the corresponding private key and vice versa. When you generate a public/private key pair, the switch automatically saves the key pair in a file in the certificate store, from which it is subsequently used in certificate request commands. The generated key pair is saved as `certificate-id.priv`.

**NOTE:** The default RSA and DSA key size is 1024 bits. If you are using the Simple Certificate Enrollment Protocol (SCEP), Juniper Networks Junos operating system (Junos OS) supports RSA only.

This topic describes:

- Public Key Infrastructure (PKI) and Digital Certificates on page 1226

**Public Key Infrastructure (PKI) and Digital Certificates**

Public key infrastructure (PKI) allows the distribution and use of the public keys in public key cryptography with security and integrity. PKI manages the public keys by using digital certificates. A digital certificate provides an electronic means of verifying the identity of an individual, an organization, or a directory service that can store digital certificates.

A PKI typically consists of a Registration Authority (RA) that verifies the identities of entities, authorizes their certificate requests, and generates unique asymmetric key pairs (unless the users’ certificate requests already contain public keys); and a Certificate Authority (CA) that issues corresponding digital certificates for the requesting entities. Optionally, you can use a Certificate Repository that stores and distributes certificates and a certificate revocation list (CRL) identifying the certificates that are no longer valid.
Each entity possessing the authentic public key of a CA can verify the certificates issued by that CA.

Digital signatures exploit the public key cryptographic system as follows:

1. A sender digitally signs data by applying a cryptographic operation, involving its private key, on a digest of the data.
2. The resulting signature is attached to the data and sent to the receiver.
3. The receiver obtains the digital certificate of the sender, which provides the sender’s public key and confirmation of the link between its identity and the public key. The sender’s certificate is often attached to the signed data.
4. The receiver either trusts this certificate or attempts to verify it. The receiver verifies the signature on the data by using the public key contained in the certificate. This verification ensures the authenticity and integrity of the received data.

As an alternative to using a PKI, an entity can distribute its public key directly to all potential signature verifiers, so long as the key’s integrity is protected. The switch does it by using a self-signed certificate as a container for the public key and the corresponding entity’s identity.

**Related Documentation**
- Understanding Self-Signed Certificates on EX Series Switches on page 1227

**Self-Signed Certificates Overview**

- Understanding Self-Signed Certificates on EX Series Switches on page 1227

**Understanding Self-Signed Certificates on EX Series Switches**

When you initialize a Juniper Networks EX Series Ethernet Switch with the factory default configuration, the switch generates a self-signed certificate, allowing secure access to the switch through the Secure Sockets Layer (SSL) protocol. Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) and XML Network Management over Secure Sockets Layer (XNM-SSL) are the two services that can make use of the self-signed certificates.

**NOTE:** Self-signed certificates do not provide additional security as do those generated by Certificate Authorities (CAs). This is because a client cannot verify that the server he or she has connected to is the one advertised in the certificate.

The switches provide two methods for generating a self-signed certificate:

- **Automatic generation**

  In this case, the creator of the certificate is the switch. An automatically generated (also called “system-generated”) self-signed certificate is configured on the switch by default.
After the switch is initialized, it checks for the presence of an automatically generated self-signed certificate. If it does not find one, the switch generates one and saves it in the file system.

A self-signed certificate that is automatically generated by the switch is similar to an SSH host key. It is stored in the file system, not as part of the configuration. It persists when the switch is rebooted, and it is preserved when a request system snapshot command is issued.

The switch uses the following distinguished name for the automatically generated certificate:

“CN=<device serial number>, CN=system generated, CN=self-signed”

If you delete the system-generated self-signed certificate on the switch, the switch generates a self-signed certificate automatically.

- Manual generation

In this case, you create the self-signed certificate for the switch. At any time, you can use the CLI to generate a self-signed certificate. Manually generated self-signed certificates are stored in the file system, not as part of the configuration.

Self-signed certificates are valid for five years from the time they are generated. When the validity of an automatically generated self-signed certificate expires, you can delete it from the switch so that the switch generates a new self-signed certificate.

System-generated self-signed certificates and manually generated self-signed certificates can coexist on the switch.

DHCP Local Server Examples

- Example: Minimum Extended DHCP Local Server Configuration on page 1229
- Example: Extended DHCP Local Server Configuration with Optional Pool Matching on page 1230
- Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1231

Example: Minimum Extended DHCP Local Server Configuration

This example shows the minimum configuration you need to use for the extended DHCP local server on the router or switch:

```
[edit system services]
dhcp-local-server {
    group group_one {
        interface fe-0/0/2.0;
    }
}
```

NOTE: The interface type in this topic is just an example. The fe- interface type is not supported by EX Series switches.
This example creates the server group named `group_one`, and specifies that the DHCP local server is enabled on interface `fe-0/0/2.0` within the group. The DHCP local server uses the default pool match configuration of `ip-address-first`.

**Related Documentation**

- Extended DHCP Local Server Overview on page 1192

**Example: Extended DHCP Local Server Configuration with Optional Pool Matching**

This example shows an extended DHCP local server configuration that includes optional IPv4 address-assignment pool matching and interface groups. For pool matching, this configuration specifies that the DHCP local server first check the response from an external authentication authority (for example, RADIUS) and use the Framed-IPv6-Pool attribute to determine the address-assignment pool to use for the client address. If no external authority match is found, the DHCP local server then uses ip-address-first matching together with the option 82 information to match the named address range for client IPv4 address assignment. The option 82 matching must also be included in the address-assignment pool configuration.

```
[edit system services]
dhcp-local-server {
    group group_one {
        interface fe-0/0/2.0;
        interface fe-0/0/2.1;
    }
    group group_two {
        interface fe-0/0/3.0;
        interface fe-0/0/3.1;
    }
    pool-match-order {
        external-authority
        ip-address-first;
        option-82;
    }
}
```

**NOTE:** The interface type in this topic is just an example. The fe-interface type is not supported by EX Series switches.

Example: Configuring Group Liveness Detection for DHCP Local Server Clients

This example shows how to configure group liveness detection for DHCP local server subscribers or DHCP clients using Bidirectional Forwarding Detection (BFD) as the liveness detection method.

- Requirements on page 1231
- Overview on page 1231
- Configuration on page 1231

Requirements

- Juniper Networks MX Series routers
- Juniper Networks EX Series switches
- Junos OS Release 12.1R1 or later
- Junos OS Release 12.3R2 or later for EX Series switches
- Configure DHCP local server. See “Extended DHCP Local Server Overview” on page 1192.

Overview

In this example, you configure group liveness detection for DHCP local server subscribers (clients) by completing the following operations:

1. Enable liveness detection for DHCP local server subscriber (or DHCP client) groups.
2. Specify BFD as the liveness detection method for all dynamically created DHCP local server subscribers (clients).
3. Configure BFD-specific statements to define how the protocol behaves.
4. Configure the action the router (switch) takes when a liveness detection failure occurs.

NOTE: This example explains how to configure liveness detection for a DHCPv4 network. Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the liveness-detection statement, and any subsequent configuration statements, at the [edit system services dhcp-local-server dhcpv6] or [edit system services dhcp-local-server dhcpv6 group group-name] hierarchy level.

Configuration

Step-by-Step Procedure

To configure group liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.

```plaintext
[edit system services dhcp-local-server ]
user@host# edit liveness-detection
```
2. Specify that you want to configure liveness detection for a specific DHCP local server group.

   ```
   [edit system services dhcp-local-server liveness-detection]
   user@host# edit group local_group_1
   ```

3. Specify that you want to configure the liveness detection method.

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection]
   user@host# edit method
   ```

4. Specify BFD as the liveness detection method that you want DHCP to use.

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method]
   user@host# edit bfd
   ```

5. Configure the detection time threshold (in milliseconds) at which a trap is produced.

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set detection-time threshold 30000
   ```

6. Configure the time (in milliseconds) for which BFD holds a session up notification.

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set holddown-interval 50
   ```

7. Configure the BFD minimum transmit and receive interval (in milliseconds).

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set minimum-interval 45000
   ```

8. Configure the minimum receive interval (in milliseconds).

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set minimum-receive-interval 60000
   ```

9. Configure a multiplier value for the detection time.

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set multiplier 100
   ```

10. Disable the ability for BFD interval timers to change or adapt to network situations.

   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set enable false
   ```
11. Configure the BFD session mode.
   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set no-adaptation
   ```

12. Configure the threshold and minimum interval for the BFD transmit interval.
   ```
   [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
   user@host# set session-mode automatic
   ```
   
   **NOTE:** You do not need to configure the transmit interval values if you have already configured the minimum transmit and receive interval for BFD.

13. Configure the BFD protocol version you want to detect.
    ```
    [edit system services dhcp-local-server group local_group_1 liveness-detection method bfd]
    user@host# set version automatic
    ```

14. Configure the action the router (switch) takes when a liveness detection failure occurs. In this example, the failure action is to clear the client session only when a liveness detection failure occurs and the local interface is detected as being up.
    ```
    [edit system services dhcp-local-server group local_group_1 liveness-detection]
    user@host# edit failure-action action
    ```

**Results**

From configuration mode, confirm your configuration by entering the `show system` command. If the output does not display the intended configuration, repeat the instructions in this example to correct it.

```
[edit]
regress@montag# show system
services {
    dhcp-local-server {
        group local_group_1 {
            liveness-detection {
                failure-action clear-binding-if-interface-up;
                method {
                    bfd {
                        version automatic;
                        minimum-interval 45000;
                        minimum-receive-interval 60000;
                        multiplier 100;
                        no-adaptation;
                        transmit-interval {
                            minimum-interval 45000;
                            threshold 60000;
                        }
                    }
                }
            }
        }
    }
}
```
If you are done configuring the device, enter `commit` from configuration mode.

**DHCP Relay Agent Examples**

- Example: Minimum DHCP Relay Agent Configuration on page 1234
- Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings on page 1235
- Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 1239

**Example: Minimum DHCP Relay Agent Configuration**

This example shows the minimum configuration you need to use the extended DHCP relay agent on the router or switch:

```plaintext
[edit forwarding-options]
dhcp-relay {
  server-group {
    test 10.0.2.1;
  }
  active-server-group test;
  group all {
    interface fe-0/0/2.0;
  }
}
```

**NOTE:** The interface type in this topic is just an example. The fe- interface type is not supported by EX Series switches.

This example creates a server group and an active server group named `test` with IP address 10.0.2.1. The DHCP relay agent configuration is applied to a group named `all`. Within this group, the DHCP relay agent is enabled on interface fe-0/0/2.0.
Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings

This example shows how to configure DHCP relay agent to use DHCP option strings to selectively identify, filter, and process client traffic.

- Requirements on page 1235
- Overview on page 1235
- Configuration on page 1236
- Verification on page 1237

Requirements

This example uses the following hardware and software components:

- MX Series 3D Universal Edge Routers or EX Series Switches
- Junos OS Release 12.3 or later or Junos OS Release 12.3R2 for EX Series switches

Before you configure DHCP relay agent selective processing support, be sure you:

- Configure DHCP relay agent.
  See “Extended DHCP Relay Agent Overview” on page 1215.
- (Optional) Configure a named DHCP local server group if you want to forward client traffic to a server group.
  See “Grouping Interfaces with Common DHCP Configurations” on page 1258.

Overview

In this example, you configure DHCP relay agent to use DHCP option strings in client packets to selectively identify, filter, and process client traffic. To configure selective processing, you perform the following procedures:

1. Identify the client traffic—Specify the DHCP option that DHCP relay agent uses to identify the client traffic you want to process. The option you specify matches the option in the client traffic.
2. Configure a default action—Specify the default processing action, which DHCP relay uses for identified client traffic that does not satisfy any configured match criteria.
3. Create match filters and associate an action with each filter—Specify match criteria that filter the client traffic. The criteria can be an exact match or a partial match with the option string in the client traffic. Associate a processing action with each match criterion.
Configuration

To configure DHCP relay agent selective processing based on DHCP option information, perform these tasks:

- Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings on page 1236
- Results on page 1237

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the [edit] hierarchy level.

```
set forwarding-options dhcp-relay relay-option option-number 60
set forwarding-options dhcp-relay relay-option equals ascii video-gold forward-only
set forwarding-options dhcp-relay relay-option equals ascii video-bronze local-server-group servergroup-15
set forwarding-options dhcp-relay relay-option starts-with-hexadecimal ffffff
local-server-group servergroup-east
set forwarding-options dhcp-relay relay-option default-action drop
```

Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings

Step-by-Step Procedure

To configure DHCP relay selective processing:

1. Specify that you want to configure DHCP relay agent support.

   ```
   [edit forwarding-options]
   user@host# edit dhcp-relay
   ```

2. Specify the DHCP option that DHCP relay agent uses to identify incoming client traffic.

   ```
   [edit forwarding-options dhcp-relay]
   user@host# set relay-option option-number 60
   ```

3. Configure a default action, which DHCP relay agent uses when the incoming client traffic does not satisfy any configured match criteria.

   ```
   [edit forwarding-options dhcp-relay]
   user@host# set relay-option default-action drop
   ```

4. Configure an exact match condition and associated action that DHCP relay uses to process the identified client traffic.

   ```
   [edit forwarding-options dhcp-relay]
   user@host# set relay-option equals ascii video-gold forward-only
   ```

5. Configure a second exact match condition and associated action that DHCP relay uses to process client traffic.

   ```
   [edit forwarding-options dhcp-relay]
   user@host# set relay-option equals ascii video-bronze local-server-group servergroup-15
   ```
6. Configure a partial match criteria and associated action that DHCP relay uses to process client traffic.

   [edit forwarding-options dhcp-relay]
   user@host# set relay-option starts-with hexadecimal ffffff local-server-group servergroup-east

**Results**

From configuration mode, confirm the results of your configuration by issuing the `show` statement at the `[edit forwarding-options]` hierarchy level. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

   [edit forwarding-options]
   user@host# show
   dhcp-relay {
     relay-option {
       option-number 60;
       equals {
         asciivideo-gold {
           forward-only;
         }
       }
       equals {
         asciivideo-bronze {
           local-server-group servergroup-15;
         }
       }
       default-action {
         drop;
       }
       starts-with {
         hexadecimal ffffff {
           local-server-group servergroup-east;
         }
       }
     }
   }

If you are done configuring the device, enter `commit` from configuration mode.

**Verification**

To verify the status of DHCP relay agent selective traffic processing, perform this task:

- Verifying the Status of DHCP Relay Agent Selective Traffic Processing on page 1237

**Verifying the Status of DHCP Relay Agent Selective Traffic Processing**

**Purpose** Verify the DHCP relay agent selective traffic processing status.
**Action**  Display statistics for DHCP relay agent.

```bash
user@host> show dhcp relay statistics
Packets dropped:
  Total                      30

  BOOTREQUEST                2
  BOOTREPLY                  2
```

**Meaning**  The `Packets forwarded` field in the `show dhcp relay statistics` command output displays the number of client packets that have been forwarded as a result of the selective traffic processing configuration. In this example, the output indicates the total number of packets that DHCP relay agent has forwarded, as well as a breakdown for the number of `BOOTREQUEST` and `BOOTREPLY` packets forwarded.

Example: Configuring DHCP Snooping Support for DHCP Relay Agent

This example shows how to configure DHCP snooping support for DHCP relay agent.

• Requirements on page 1239
• Overview on page 1239
• Configuration on page 1239

Requirements

• Configure DHCP relay agent. See “Extended DHCP Relay Agent Overview” on page 1215.

Overview

In this example, you configure DHCP snooping support for DHCP relay agent by completing the following operations:

• Override the default DHCP snooping configuration and enable DHCP snooping support for the interfaces in group frankfurt.
• Configure DHCP relay agent to forward snooped packets to only configured interfaces.

NOTE: By default, DHCP snooping is enabled globally in Junos OS Release 10.0 and earlier and disabled globally in Junos OS Release 10.1 and later.

Configuration

Step-by-Step Procedure

To configure DHCP relay support for DHCP snooping:

1. Specify that you want to configure DHCP relay agent.
   
   [edit]
   user@host# edit forwarding-options dhcp-relay

2. Specify the named group of interfaces on which DHCP snooping is supported.
   
   [edit forwarding-options dhcp-relay]
   user@host# edit group frankfurt

3. Specify the interfaces that you want to include in the group. DHCP relay agent considers these as the configured interfaces when determining whether to forward or drop traffic.
   
   [edit forwarding-options dhcp-relay group frankfurt]
   user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9

4. Specify that you want to override the default configuration for the group.
   
   [edit forwarding-options dhcp-relay group frankfurt]
   user@host# edit overrides

5. Enable DHCP snooping support for the group.
   
   [edit forwarding-options dhcp-relay group frankfurt overrides]
   user@host# set allow-snooped-clients
6. Return to the [edit forwarding-options dhcp-relay] hierarchy level to configure the forwarding action and specify that DHCP relay agent forward snooped packets on only configured interfaces:

   [edit forwarding-options dhcp-relay group frankfurt overrides]
   user@host# up 2

7. Enable DHCP snooped packet forwarding for DHCP relay agent.

   [edit forwarding-options dhcp-relay]
   user@host# edit forward-snooped-clients

8. Specify that snooped packets are forwarded on only configured interfaces (the interfaces in group frankfurt).

   [edit forwarding-options dhcp-relay forward-snooped-clients]
   user@host# set configured-interfaces

Results

From configuration mode, confirm your configuration by entering the show forwarding-options command. If the output does not display the intended configuration, repeat the instructions in this example to correct it. The following output also shows a range of configured interfaces in group frankfurt.

   [edit]
   regress@montag# show forwarding-options
dhcp-relay {
   forward-snooped-clients configured-interfaces;
group frankfurt {
   overrides {
   allow-snooped-clients;
   }
   interface fe-1/0/1.3 {
   upto fe-1/0/1.9;
   }
   }
}

If you are done configuring the device, enter commit from configuration mode.

Configuring DHCP Services (J-Web Procedure)

Use the J-Web DHCP Configuration pages to configure DHCP pools for subnets and static bindings for DHCP clients on an ACX Series Universal Access Gateway router or an EX Series Ethernet Switch. If DHCP pools or static bindings are already configured, use the Configure Global DHCP Parameters Configuration page to add settings for these pools and static bindings. Settings that have been previously configured for DHCP pools or static bindings are not overridden when you use the Configure Global DHCP Parameters Configuration page.

To configure the DHCP server:

1. Select Configure > Services > DHCP
2. Access a DHCP Configuration page:
   - To configure a DHCP pool for a subnet, click Add in the DHCP Pools box.
   - To configure a static binding for a DHCP client, click Add in the DHCP Static Binding box.
   - To globally configure settings for existing DHCP pools and static bindings, click Configure Global DHCP Parameters.
3. Enter information into the DHCP Service Configuration pages as described in Table 164 on page 1241
4. To apply the configuration, click Apply.

NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

| Boot File                           | Specifies the path and filename of the initial boot file to be used by the client. | Type a path and filename.                                                                                                                    |
| Boot Server                         | Specifies the Trivial File Transfer Protocol (TFTP) server that the client uses to obtain the client configuration file. | Type the IP address or hostname of the TFTP server.                                                                                          |
| DHCP Static Binding Information     |                                                                          | |
| DHCP MAC Address (required)         | Specifies the MAC address of the client to be permanently assigned a static IP address. | Type the hexadecimal MAC address of the client.                                                                                               |
| Fixed IP Addresses (required)       | Defines a list of IP addresses permanently assigned to the client. A static binding must have at least one fixed address assigned to it, but multiple addresses are also allowed. | • To add an IP address, type it next to the **Add** button, and click **Add**.  
  • To remove an IP address, select it in the Fixed IP Addresses box, and click **Delete**. |
| Host Name                           | Specifies the name of the client used in DHCP messages exchanged between the server and the client. The name must be unique to the client within the subnet on which the client resides. | Type a client hostname.                                                                                                                      |
| Client Identifier                   | Specifies the name of the client used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides. | Type a client identifier in string form.                                                                                                      |
| Hexadecimal Client Identifier       | Specifies the name of the client, in hexadecimal form, used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides. | Type a client identifier in hexadecimal form.                                                                                               |

**Configuring DHCP Services on EX4300 Switches (J-Web Procedure)**

On EX4300 switches, use the DHCP Configuration page to create DHCP pools and set the DHCP parameters for them and to configure DHCP settings for existing DHCP pools and static bindings.
To configure the DHCP services on EX4300 switches:

1. Select **Configure > Services > DHCP**

2. Access a DHCP Configuration page:
   - To configure a DHCP pool for a subnet, click **Add** in the DHCP Pools box.
   - To configure DHCP groups, click **Add** in the DHCP Groups box.
   - To globally configure settings for existing DHCP pools and static bindings, click **Configure Global DHCP Parameters**.

3. Enter information into the DHCP Service Configuration pages as described in **Table 165 on page 1244**

4. To apply the configuration, click **OK**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

Configuring a DHCP SIP Server (CLI Procedure)

You can use the `sip-server` statement on the EX Series switch to configure option 120 on a DHCP server. The DHCP server sends configured option values—Session Initiation Protocol (SIP) server addresses or names—to DHCP clients when they request them. Previously, you were only allowed to specify a SIP server by address using `[edit system services dhcp option 120]`. You specify either an IPv4 address or a fully qualified domain name to be used by SIP clients to locate a SIP server. You cannot specify both an address and name in the same statement.

To configure a SIP server using the `address` option:

```
[edit system services dhcp]
user@switch# set sip-server address
```

For example, to configure one address:

```
[edit system services dhcp]
user@switch set sip-server 172.168.0.11
```

To configure a SIP server using the `name` option:

```
[edit system services dhcp]
user@switch# set sip-server name
```

For example, to configure a name:

```
[edit system services dhcp]
user@switch set sip-server abc.example.com
```
Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see “Configuring a DHCP Server on Switches (CLI Procedure)” on page 1250.

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp configuration-statement
```

The options that you can configure are listed in Table 166 on page 1249. Replace the variable `configuration-statement` with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

<table>
<thead>
<tr>
<th>Configuration Statement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identifier</td>
<td>Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.</td>
</tr>
<tr>
<td>lease-time</td>
<td>Time in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.</td>
</tr>
<tr>
<td>retransmission-attempt</td>
<td>Number of times the client attempts to retransmit a DHCP packet.</td>
</tr>
<tr>
<td>retransmission-interval</td>
<td>Time between transmission attempts.</td>
</tr>
<tr>
<td>server-address</td>
<td>IP address of the server that the client queries for an IP address.</td>
</tr>
<tr>
<td>update-server</td>
<td>TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.</td>
</tr>
<tr>
<td>vendor-option</td>
<td>Vendor class ID (CPU’s manufacturer ID string) for the DHCP client.</td>
</tr>
</tbody>
</table>
Configuring a DHCP Server on Switches (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, optional reconfiguration of default settings on DHCP clients and configuration of a DHCP server. This topic covers configuration of the DHCP server. For directions for reconfiguring a DHCP client, see “Configuring a DHCP Client (CLI Procedure)” on page 1249.

You can configure either of two versions of a DHCP server on a switch—either the extended server version or the legacy server version. We recommend that you use the extended server configuration unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. Configuring an Extended DHCP Server on a Switch on page 1250
2. Configuring a Legacy DHCP Server on a Switch (CLI Procedure) on page 1251

Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before assigning them to clients.

1. Create an address pool for DHCP IP addresses:
   
   [edit]
   user@switch# set access address-pool address-pool

2. Configure addresses for DHCP dynamic assignment:
   
   [edit access address-assignment]
   user@switch# set pool address-pool-name

3. Create a server group on the switch, providing a group name and an interface for DHCP:
   
   [edit system services dhcp-local-server]
   user@switch# set group group-name interface interface-name

4. Optionally, process the information protocol data units (PDUs):
   
   [edit system services dhcp-local-server]
   user@switch# set overrides process-inform

5. Optionally, redefine the order of attribute matching for pool selection:
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first

6. Optionally, enable dynamic reconfiguration triggered by the DHCP extended server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces:

[edit system services dhcp-local-server]
user@switch# set reconfigure

[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure

Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

[edit system services dhcp]
user@switch# set pool (Legacy DHCP) network-range

NOTE: Step 2 through step 15 assign global values at the [edit system services dhcp] hierarchy level. You can also assign the same values to a specific pool using those same commands at the [edit system services dhcp pool network-range] hierarchy level.

2. Optionally, change the domain search list used to resolve hostnames:

[edit system services dhcp]
user@switch# set domain-search [domain-list]

3. Optionally, change the domain name server (DNS) name that the DHCP server advertises to clients:

[edit system services dhcp]
user@switch# set name-server address

4. Optionally, change the DHCP options:

[edit system services dhcp]
user@switch# set option id-number

5. Optionally, change the devices advertised to clients:

[edit system services dhcp]
user@switch# set router address

6. Optionally, change the SIP server:

[edit system services dhcp]
user@switch# set sip-server addresses-or-names

For more information, see "Configuring a DHCP SIP Server (CLI Procedure)" on page 1248.

7. Optionally, change the DHCP client’s hardware address:
You can configure an EX Series switch to act as an extended DHCP relay agent. This means that a locally attached host can issue a DHCP request as a broadcast message and the switch configured for DHCP relay relays the message to a specified DHCP server. Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server.

Before you begin:

- Ensure that the switch can connect to the DHCP server.

To configure a switch to act as an extended DHCP relay agent server:

1. Create at least one DHCP server group, which is a group of 1 through 5 DHCP server IP addresses:

   ```
   [edit forwarding-options dhcp-relay]
   user@switch# set server-group server-group-name ip-address
   ```

2. Set the global active DHCP server group. The DHCP relay server relays DHCP client requests to the DHCP servers defined in the active server group:

   ```
   [edit forwarding-options dhcp-relay]
   user@switch# set active-server-group server-group-name
   ```

3. Create a DHCP relay group that includes at least one interface. DHCP relay runs on the interfaces defined in DHCP groups:

   ```
   [edit forwarding-options dhcp-relay]
   user@switch# set group group-name interface interface-name
   ```

4. (Optional) Configure overrides of default DHCP relay behaviors, at the global level. See the override options in the `overrides` statement.

   ```
   [edit forwarding-options dhcp-relay]
   user@switch# set overrides
   ```

5. (Optional) Configure DHCP relay to use the DHCP vendor class identifier option (option 60) in DHCP client packets, at the global level:

   ```
   [edit forwarding-options dhcp-relay]
   user@switch# set relay-option option-number 60
   ```

Related Documentation

- Configuring a DHCP Client (CLI Procedure) on page 1249
- Configuring a DHCP SIP Server (CLI Procedure) on page 1248
- Understanding DHCP Services for Switches
6. (Optional) Configure settings for a DHCP relay group that override the settings at the global level, using these statements:

   [edit forwarding-options dhcp-relaygroup group-name]
   user@switch# set active-server-group server-group-name
   user@switch# set overrides
   user@switch# set relay-option option-number 60

7. (Optional) Configure settings for a DHCP relay group interface that override the settings at the global and group levels, using these statements:

   [edit forwarding-options dhcp-relaygroup group-name interface interface-name]
   user@switch# exclude
   user@switch# set overrides
   user@switch# set trace
   user@switch# set upto upto-interface-name

Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates (CLI Procedure)

You can use the system-generated self-signed certificate or a manually generated self-signed certificate to enable Web management HTTPS and XNM-SSL services.

- To enable HTTPS services using the automatically generated self-signed certificate:
  
  [edit]
  user@switch# set system services web-management https system-generated-certificate

- To enable HTTPS services using a manually generated self-signed certificate:
  
  [edit]
  user@switch# set system services web-management https pki-local-certificate certificate-id-name

  **NOTE:** The value of the `certificate-id-name` must match the name you specified when you generated the self-signed certificate manually.

- To enable XNM-SSL services using a manually generated self-signed certificate:
  
  [edit]
  user@switch# set system services xnm-ssl local-certificate certificate-id-name

  **NOTE:** The value of the `certificate-id-name` must match the name you specified when you generated the self-signed certificate manually.

Related Documentation
- Manually Generating Self-Signed Certificates on Switches (CLI Procedure) on page 1254
- Understanding Self-Signed Certificates on EX Series Switches on page 1227
Manually Generating Self-Signed Certificates on Switches (CLI Procedure)

EX Series switches allow you to generate custom self-signed certificates and store them in the file system. The certificate you generate manually can coexist with the automatically generated self-signed certificate on the switch. To enable secure access to the switch over SSL, you can use either the system-generated self-signed certificate or a certificate you have generated manually.

To generate self-signed certificates manually, you must complete the following tasks:

- Generating a Public-Private Key Pair on Switches on page 1254
- Generating Self-Signed Certificates on Switches on page 1254

Generating a Public-Private Key Pair on Switches

A digital certificate has an associated cryptographic key pair that is used to sign the certificate digitally. The cryptographic key pair comprises a public key and a private key. When you generate a self-signed certificate, you must provide a public-private key pair that can be used to sign the self-signed certificate. Therefore, you must generate a public-private key pair before you can generate a self-signed certificate.

To generate a public-private key pair:

```
user@switch> request security pki generate-key-pair certificate-id certificate-id-name
```

**NOTE:** Optionally, you can specify the encryption algorithm and the size of the encryption key. If you do not specify the encryption algorithm and encryption key size, default values are used. The default encryption algorithm is RSA, and the default encryption key size is 1024 bits.

After the public-private key pair is generated, the switch displays the following:

```
generated key pair certificate-id-name, key size 1024 bits
```

Generating Self-Signed Certificates on Switches

To generate the self-signed certificate manually, include the certificate ID name, the subject of the distinguished name (DN), the domain name, the IP address of the switch, and the e-mail address of the certificate holder:

```
user@switch> request security pki local-certificate generate-self-signed certificate-id certificate-id-name domain-name domain-name email email-address ip-address switch-ip-address subject subject-of-distinguished-name
```

The certificate you have generated is stored in the switch’s file system. The certificate ID you have specified while generating the certificate is a unique identifier that you can use to enable the HTTPS or XNM-SSL services.

To verify that the certificate was generated and loaded properly, enter the `show security pki local-certificate` operational command.

Related Documentation

- Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates (CLI Procedure) on page 1253
Deleting Self-Signed Certificates (CLI Procedure)

You can delete a self-signed certificate that is automatically or manually generated from the EX Series switch. When you delete the automatically generated self-signed certificate, the switch generates a new self-signed certificate and stores it in the file system.

- To delete the automatically generated certificate and its associated key pair from the switch:
  
  ```
  user@switch> clear security pki local-certificate system-generated
  ```

- To delete a manually generated certificate and its associated key pair from the switch:
  
  ```
  user@switch> clear security pki local-certificate certificate-id certificate-id-name
  ```

- To delete all manually generated certificates and their associated key pairs from the switch:
  
  ```
  user@switch> clear security pki local-certificate all
  ```

Using External AAA Authentication Services with DHCP

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

NOTE: This section uses the term extended DHCP application to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the authentication-server statement at the [edit access profile profile-name] hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the username-include statement to enable the use of authentication. The password statement is not required and does not cause DHCP to use authentication if the username-include statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.
   
   • For DHCP local server:
     
     [edit system services dhcp-local-server]
     user@host# edit authentication

   • For DHCP relay agent:
     
     [edit forwarding-options dhcp-relay]
     user@host# edit authentication
2. (Optional) Configure a password that authenticates the username to the external authentication service.
   See “Configuring Passwords for Usernames” on page 1276.

3. (Optional) Configure optional features to create a unique username.
   See “Creating Unique Usernames for DHCP Clients” on page 1276.

### Guidelines for Configuring Support for DHCP Duplicate Clients

This topic describes the guidelines for configuring DHCP to include the client subinterface in order to distinguish between duplicate clients (clients with the same MAC address or client ID) in a subscriber access or in a DHCP-managed environment.

When configuring DHCP duplicate client support, consider the following guidelines:

- The optional DHCP duplicate client support feature is used for DHCPv4 clients. For DHCPv6, client identification is independent of MAC address.
- For DHCP relay agent configuration:
  - DHCP relay must be configured to insert option 82, regardless of whether or not the incoming packet has option 82.
  - Option 82 must include the Agent Circuit ID suboption (suboption 1).
  - Option 82 must be the interface name, not the interface description.
  - DHCP server must echo option 82 in the server’s reply. This is required because of the following:
    - The giaddr inserted by DHCP relay is the same for duplicate clients on different subinterfaces. The DHCP local server uses option 82 when allocating the IP address.
    - DHCP relay uses the echoed option 82 to learn the client subinterface and to construct the client key.
For the Layer 3 wholesale model:

- The wholesaler and retailer logical system/routing instances must have the same `duplicate-clients-on-interface` statement configuration.
- For DHCP relay, the wholesaler and the retailer routing contexts must both be configured with the Agent Circuit ID suboption (suboption 1) in option 82.

**Related Documentation**
- DHCP Duplicate Client Differentiation Using Client Subinterface Overview on page 1198
- Configuring DHCP Duplicate Client Support on page 1258

### Configuring DHCP Duplicate Client Support

You can optionally configure DHCP local server and DHCP relay to include a client subinterface when distinguishing between two clients that have the same MAC address or client ID. The configuration is a global setting for each logical system/routing instance.

To configure DHCP local server to include the client subinterface:

1. Specify that you want to configure DHCP local server.
   
   ```
   [edit system services]
   user@host# edit dhcp-local-server
   ```

2. Configure the optional duplicate client support.
   
   ```
   [edit system services dhcp-local-server]
   user@host# set duplicate-clients-on-interface
   ```

To configure DHCP relay agent to include the client subinterface:

1. Specify that you want to configure DHCP relay agent.
   
   ```
   [edit forwarding-options]
   user@host# edit dhcp-relay
   ```

2. Configure the optional duplicate client support.
   
   ```
   [edit system services dhcp-relay]
   user@host# set duplicate-clients-on-interface
   ```

### Grouping Interfaces with Common DHCP Configurations

You use the group feature to group together a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.
To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

   [edit system services]
   user@host# edit dhcp-local-server

2. Create the group and assign a name.

   [edit system services dhcp-local-server]
   user@host# edit group boston

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the `interface interface-name` statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

   [edit system services dhcp-local-server group boston]
   user@host# set interface fe-1/0/1.1
   user@host# set interface fe-1/0/1.2

4. (Optional) You can use the `upto` option to specify a range of interfaces for a group.

   [edit system services dhcp-local-server group boston]
   user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9

5. (Optional) You can use the `exclude` option to exclude a specific interface or a specified range of interfaces from the group. For example:

   [edit system services dhcp-local-server group boston]
   user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
   user@host# set interface fe-1/0/1.6 exclude
   user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude

- Group-Specific DHCP Relay Options on page 1221
- Guidelines for Configuring Interface Ranges on page 1259

### Guidelines for Configuring Interface Ranges

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

   user@host# set interface interface-name upto upto-interface-name
• The start subunit, interface interface-name, serves as the key for the stanza. The remaining configuration settings are considered attributes.

• If the subunit is not included, an implicit .0 subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, interface ge-2/2/2 is treated as interface ge-2/2/2.0.

• Ranged entries contain the upto option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a 0 (zero) subunit acts as a wildcard.

• Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.

• Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because ge-1/0/0.10 is the start subunit for both.

  interface ge-1/0/0.10 upto ge-1/0/0.30
  interface ge-1/0/0.10

• Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—interface ge-1/0/0.26 is common to all three.

  dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.26
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35

• Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

  interface ge-1/0/0.10 upto ge-1/0/0.30
  interface ge-1/0/0.20 upto ge-1/0/0.40

• A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

  In the following example, the three ranges nest properly:

  interface ge-1/0/0.10 upto ge-1/0/0.30
  interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
  interface ge-1/0/0.25 upto ge-1/0/0.29 exclude

• Discrete interfaces take precedence over ranges. In the following example, interface ge-1/0/0.20 takes precedence and enforces an interface client limit of 5.

  interface ge-1/0/0.10 upto ge-1/0/0.30
  interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
  interface ge-1/0/0.20 overrides interface-client-limit 5

Overridding Default DHCP Local Server Configuration Settings

Subscriber management enables you to override certain default DHCP and DHCPv6 local server configuration settings. You can override settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP local server configuration options, include the `overrides` statement and its subordinate statements at the `[edit system services dhcp-local-server]` or `[edit system services dhcp-local-server dhcpv6]` hierarchy level.

- To override DHCP local server configuration options for a named group of interfaces, include the statements at the `[edit system services dhcp-local-server group group-name]` or `[edit system services dhcp-local-server dhcpv6 group]` hierarchy level.

- To override DHCP local server configuration options for a specific interface within a named group of interfaces, include the statements at the `[edit system services dhcp-local-server group group-name interface]` or `[edit system services dhcp-local-server dhcpv6 group group-name interface]` hierarchy level.

To override default DHCP local server configuration settings:

1. Specify that you want to configure override options.
   - Global override:
     ```
     [edit system services dhcp-local-server]
     user@host# edit overrides
     ```
     - Group level override:
       ```
       [edit system services dhcp-local-server]
       user@host# edit group boston overrides
       ```
     - Per-interface override:
       ```
       [edit system services dhcp-local-server]
       user@host# edit group boston overrides interface fe-1/0/1.1
       ```

2. (Optional) Override the maximum number of DHCP clients allowed per interface.
   - See “Specifying the Maximum Number of DHCP Clients Per Interface” on page 1262.

3. (Optional) Configure DHCP client auto logout.
   - See “Automatically Logging Out DHCP Clients” on page 1264.

4. (Optional) Enable processing of information requests from clients.
   - See “Enabling Processing of Client Information Requests” on page 1265.

5. (Optional, DHCPv6 only) Specify a delegated pool name to use for DHCPv6 multiple address assignment.
   - See “Specifying the Delegated Address Pool for IPv6 Prefix Assignment” on page 1266.

6. (Optional, DHCPv6 only) Enable DHCPv6 rapid commit support.
See “Enabling DHCPv6 Rapid Commit Support” on page 1267.

7. (Optional) Delete DHCP override settings.

See “Deleting DHCP Local Server and DHCP Relay Override Settings” on page 1267.

**Specifying the Maximum Number of DHCP Clients Per Interface**

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

NOTE: The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the interface-client-limit statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.

To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.

   - For DHCP local server:
     ```
     [edit system services dhcp-local-server]
     user@host# edit overrides
     ```

   - For DHCPv6 local server:
     ```
     [edit system services dhcp-local-server dhcpv6]
     user@host# edit overrides
     ```

   - For DHCP relay agent:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit overrides
     ```

   - For DHCPv6 relay agent:
     ```
     [edit forwarding-options dhcp-relay dhcpv6]
     user@host# edit overrides
     ```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the interface-client-limit statement.)
Disabling ARP Table Population

By default, DHCP populates the ARP table with the MAC address of a client when the client binding is established. However, you may choose to use the DHCP `no-arp` statement to hide the subscriber MAC address or the DHCP client MAC address, as it appears in ARP table entries.

When running in a trusted environment (that is, when not using the `no-arp` statement), DHCP populates the ARP table with unique MAC addresses contained within the DHCP PDU for each DHCP client:

**Table 167: ARP Table in Trusted Environment**

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client 1 IP Address</td>
<td>MAC A</td>
</tr>
<tr>
<td>Client 2 IP Address</td>
<td>MAC B</td>
</tr>
<tr>
<td>Client 3 IP Address</td>
<td>MAC C</td>
</tr>
</tbody>
</table>

In distrusted environments, you can specify the `no-arp` statement to hide the MAC addresses of clients. When you specify the `no-arp` statement, DHCP does not automatically populate the ARP table with MAC address information from the DHCP PDU for each client. Instead, the system performs an ARP to obtain the MAC address of each client and obtains the MAC address of the immediately attached device (for example, a DSLAM). DHCP populates the ARP table with the same interface MAC address (for example, MAC X from a DSLAM interface) for each client:

**Table 168: ARP Table in Distrusted Environment**

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client 1 IP Address</td>
<td>MAC X</td>
</tr>
<tr>
<td>Client 2 IP Address</td>
<td>MAC X</td>
</tr>
<tr>
<td>Client 3 IP Address</td>
<td>MAC X</td>
</tr>
</tbody>
</table>
To disable ARP table population:

1. Configure route suppression and specify that you want to suppress destination routes.
   
   • For DHCP local server:
     
     ```
     [edit system services dhcp-local-server]
     user@host# set route-suppression destination
     ```
   
   • For DHCP relay:
     
     ```
     [edit forwarding-options dhcp-relay]
     user@host# set route-suppression destination
     ```

Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet that has the same DHCP option 60 and DHCP option 82 information as the existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

![i]

**NOTE:** When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.
   
   • For DHCP local server:
     
     ```
     [edit system services dhcp-local-server]
     user@host# edit overrides
     ```
   
   • For DHCP relay agent:
     
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit overrides
     ```

2. Enable auto logout. (DHCP local server and DHCP relay agent both support the `client-discover-match` statement.)
   
   • For DHCP local server:
     
     ```
     [edit system services dhcp-local-server overrides]
     user@host# set client-discover-match
     ```
For DHCP relay:

[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match

NOTE: If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

- Extended DHCP Relay Agent Overview on page 1215

Enabling Processing of Client Information Requests

By default, DHCP local server and DHCPv6 local server do not respond to information request messages from the client. You can enable DHCP local server and DHCPv6 local server to process these messages and respond to them with an acknowledgment (ack or reply message, respectively) and the requested information.

DHCP relay agent automatically forwards the information request messages without modification to the configured server group by means of the interfaces configured for the respective server group. The messages are dropped if they are received on an unconfigured interface. DHCP relay proxy also supports forwarding these messages. You cannot disable forwarding of the information request messages.

Configure one or more local address pools if you want to use a local pool rather than one provided by AAA. See Configuring an Address-Assignment Pool Name and Addresses. For processing information request messages, the address configuration is not necessary. For DHCP local server, you must specify the IPv4 family; for DHCPv6 local server, you must specify the IPv6 family.

See Configuring DHCP Client-Specific Attributes for details about how to configure the information sought by clients that send information request messages.

To enable processing of DHCP client information request messages:

1. Specify that you want to configure override options.
   - For DHCP local server:
     [edit system services dhcp-local-server overrides]
     user@host# set process-inform
   - For DHCPv6 local server:
     [edit system services dhcp-local-server dhcpv6 overrides]
     user@host# set process-inform
2. (Optional) Specify a pool name from which DHCP information is returned to the client.

   • For DHCP local server:
     ```
     [edit system services dhcp-local-server overrides process-inform]
     user@host# set pool pool-name
     ```

   • For DHCPv6 local server:
     ```
     [edit system services dhcp-local-server dhcpv6 overrides process-inform]
     user@host# set pool pool-name
     ```

**Related Documentation**

### Specifying the Delegated Address Pool for IPv6 Prefix Assignment

You can explicitly specify a delegated address pool:

- On routers—Subscriber management uses the pool to assign IPv6 prefixes for subscribers. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.

- On switches—DHCP management uses the pool to assign IPv6 prefixes for DHCP clients. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.

**NOTE:** You can also use by Juniper Networks VSA 26-161 to specify the delegated address pool. The VSA-specified value always takes precedence over the delegated-address statement.

To configure the delegated address pool for DHCPv6 local server:

1. Specify that you want to configure override options.
   ```
   [edit system services dhcp-local-server dhcpv6]
   user@host# edit overrides
   ```

2. Configure the delegated address pool.
   ```
   [edit system services dhcp-local-server dhcpv6 overrides]
   user@host# set delegated-pool paris-cable-12
   ```

**Related Documentation**

Enabling DHCPv6 Rapid Commit Support

You can configure the extended DHCPv6 local server to support the DHCPv6 Rapid Commit option (DHCPv6 option 14). When rapid commit is enabled on the extended DHCPv6 local server, the server recognizes the Rapid Commit option in Solicit messages sent from the DHCPv6 client. (DHCPv6 clients are configured separately to include the DHCPv6 Rapid Commit option in the Solicit messages.) The server and client then use a two-message exchange (Solicit and Reply) to configure clients, rather than the default four-method exchange (Solicit, Advertise, Request, and Reply). The two-message exchange provides faster client configuration, and is beneficial in environments in which networks are under a heavy load.

You can configure the DHCPv6 local server to support the Rapid Commit option globally, for a specific group, or for a specific interface. By default, Rapid Commit support is disabled on the DHCPv6 local server.

To configure the DHCPv6 local server to support the DHCPv6 Rapid Commit option:

1. Specify that you want to configure override options.
   
   ```
   [edit system services dhcp-local-server dhcpv6]
   user@host# edit overrides
   ```

2. Enable rapid commit support.
   
   ```
   [edit system services dhcp-local-server dhcpv6 overrides]
   user@host# set rapid-commit
   ```

- Extended DHCP Local Server Overview on page 1192

Deleting DHCP Local Server and DHCP Relay Override Settings

You can delete override settings for DHCP local server and DHCP relay globally, for a named group, or for a specific interface within a named group. You can delete a specific override setting or all overrides.

- To delete a specific DHCP override setting at a particular hierarchy level, include the `overrides` statement with the appropriate subordinate statements. For example, to delete the DHCP local server override `interface-client-limit` setting for a group named `marin20`:

   ```
   [edit system services dhcp-local-server]
   user@host# delete group marin20 overrides interface-client-limit
   ```

- To delete all DHCP override settings at a hierarchy level, include the `overrides` statement without any subordinate statements. For example, to delete all DHCP relay overrides for interface `fxp0.0`, which is in group `marin20`:

   ```
   [edit forwarding-options dhcp-relay]
   user@host# delete group marin20 interface fkp0.0 overrides
   ```
Configuring Extended DHCP Local Server Dynamic Client Reconfiguration

The DHCP local server can initiate reconfiguration of its clients to avoid extended outages because of server configuration changes. In addition to requesting that the DHCP local server initiate reconfiguration, you can specify the reconfiguration behavior.

To configure dynamic reconfiguration of DHCP clients:

1. Enable dynamic reconfiguration with default values for all clients.
   For DHCPv4:
   ```
   [edit system services dhcp-local-server]
   user@host# set reconfigure
   ```
   For DHCPv6:
   ```
   [edit system services dhcp-local-server dhcpv6]
   user@host# set reconfigure
   ```

2. (Optional) Override the global configuration for a particular group of clients.
   For DHCPv4:
   ```
   [edit system services dhcp-local-server group-name]
   user@host# set reconfigure
   ```
   For DHCPv6:
   ```
   [edit system services dhcp-local-server dhcpv6 group group-name]
   user@host# set reconfigure
   ```

3. (Optional) Configure how the server attempts reconfiguration.
   See "Configuring Dynamic Reconfiguration Attempts for DHCP Clients" on page 1269.

4. (Optional) Configure the response to a failed reconfiguration.
   See "Configuring Deletion of the Client When Dynamic Reconfiguration Fails" on page 1270.

5. (Optional) Configure the behavior in response to a RADIUS-initiated disconnect.
   See "Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect" on page 1270.

6. (Optional) Configure a token for rudimentary server authentication.
   See "Configuring a Token for DHCP Local Server Authentication" on page 1271.

7. (Optional) Initiate reconfiguration of some or all client bindings.
See “Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings” on page 1272.

8. (Optional) Prevent DHCPv6 clients from binding if they do not support reconfigure messages.

See “Preventing Binding of Clients That Do Not Support Reconfigure Messages” on page 1271.

Configuring Dynamic Reconfiguration Attempts for DHCP Clients

You can configure how many attempts the local server makes to initiate reconfiguration of the DHCP client by sending forcerenew messages. You can also specify how long the server waits between attempts. By default, eight attempts are made and the initial interval is two seconds.

Each successive attempt doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.

(Optional) To configure DHCP local server reconfiguration behavior for all DHCP clients:

1. Specify the number of reconfiguration attempts.
   
   For DHCPv4:
   ```
   [edit system services dhcp-local-server reconfigure]
   user@host# set attempts 5
   ```
   
   For DHCPv6:
   ```
   [edit system services dhcp-local-server dhcpv6 reconfigure]
   user@host# set attempts 5
   ```

2. Specify the interval between reconfiguration attempts.
   
   For DHCPv4:
   ```
   [edit system services dhcp-local-server reconfigure]
   user@host# set timeout 8
   ```
   
   For DHCPv6:
   ```
   [edit system services dhcp-local-server dhcpv6 reconfigure]
   user@host# set timeout 8
   ```

To override the global configuration for a particular group of clients, include the statements at the [edit system services dhcp-local-server group group-name reconfigure] hierarchy level or the [edit system services dhcpv6 dhcp-local-server group group-name reconfigure] hierarchy level.

Related Documentation

• attempts on page 1314
Configuring Deletion of the Client When Dynamic Reconfiguration Fails

You can configure the local server to delete the client when the maximum number of reconfiguration attempts has been made without success. By default, the client’s original configuration is restored.

(Optional) To configure the DHCP local server to delete the client when reconfiguration is not successful, for all clients:

• Specify the client deletion.
  
  For DHCPv4:
  
  [edit system services dhcp-local-server reconfigure]
  user@host# set clear-on-abort
  
  For DHCPv6:
  
  [edit system services dhcp-local-server dhcpv6 reconfigure]
  user@host# set clear-on-abort

To override the global configuration for a particular group of clients, include the statement at the [edit system services dhcp-local-server group group-name reconfigure] hierarchy level or the [edit system services dhcpv6 dhcp-local-server group group-name reconfigure] hierarchy level.

Related Documentation

• Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 1268
• clear-on-abort on page 1318

Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect

You can configure the local server to reconfigure the client when the client receives a RADIUS-initiated disconnect. By default, the client is deleted when a RADIUS-initiated disconnect is received.

(Optional) To configure the DHCP local server to reconfigure the client instead of deleting the client when a RADIUS-initiated disconnect is received, for all clients:

• Specify the RADIUS-initiated disconnect trigger.
  
  For DHCPv4:
  
  [edit system services dhcp-local-server reconfigure trigger]
  user@host# set radius-disconnect
  
  For DHCPv6:
  
  [edit system services dhcp-local-server dhcpv6 reconfigure trigger]
  user@host# set radius-disconnect

To override the global configuration for a particular group of clients, include the statement at the [edit system services dhcp-local-server group group-name reconfigure trigger]
hierarchy level or the `edit system services dhcpv6 dhcp-local-server group group-name reconfigure trigger` hierarchy level.

**Related Documentation**
- Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 1268
- radius-disconnect on page 1365
- trigger on page 1382

**Configuring a Token for DHCP Local Server Authentication**

You can configure the local server to include a constant, unencoded token in the DHCP forcerenew message as part of the authentication option it sends to clients. The client compares the received token with a token already configured on the client. If the tokens do not match, the DHCP client discards the forcerenew message. Use of the token provides rudimentary protection against inadvertently instantiated DHCP servers.

(Optional) To configure the DHCP local server to include a token in the forcerenew message sent to the client, for all clients:

- Specify the token.
  - For DHCPv4:
    ```
    [edit system services dhcp-local-server reconfigure]
    user@host# set token 8ysIU9E32k8r
    ```
  - For DHCPv6:
    ```
    [edit system services dhcp-local-server dhcpv6 reconfigure]
    user@host# set token 8ysIU9E32k8r
    ```

To override the global configuration for a particular group of clients, include the statement at the `edit system services dhcp-local-server group group-name reconfigure` hierarchy level or the `edit system services dhcpv6 dhcp-local-server group group-name reconfigure` hierarchy level.

**Related Documentation**
- Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 1268
- token on page 1377

**Preventing Binding of Clients That Do Not Support Reconfigure Messages**

The DHCPv6 client and server negotiate the use of reconfigure messages. When the client can accept reconfigure messages from the server, then the client includes the Reconfigure Accept option in both solicit and request messages sent to the server.

By default, the DHCPv6 server accepts solicit messages from clients regardless of whether they support reconfiguration. You can specify that the server require clients to accept reconfigure messages. In this case, the DHCPv6 server includes the Reconfigure Accept option in both advertise and reply messages when reconfiguration is configured for the client interface. Solicit messages from nonsupporting clients are discarded and the clients are not allowed to bind.
(Optional) To configure the DHCPv6 local server to require that all clients accept reconfiguration:

- Specify strict reconfiguration.

  ```
  [edit system services dhcp-local-server dhcpv6 reconfigure]
  user@host# set strict
  ```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]` hierarchy level.

The `show dhcpv6 server statistics` command displays a count of solicit messages that the server has discarded.

### Related Documentation
- Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 1268
- strict on page 1373

### Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings

You can request that the DHCP local server initiate reconfiguration of all of clients or only specified clients.

To request reconfiguration of all clients:

- Specify the `all` option.
  
  For DHCPv4:

  ```
  user@host> request dhcp server reconfigure all
  ```

  For DHCPv6:

  ```
  user@host> request dhcpv6 server reconfigure all
  ```

You can use any of the following methods to request reconfiguration of specific clients:

- Specify the IP address of the DHCP client.
  
  For DHCPv4:

  ```
  user@host> request dhcp server reconfigure 192.168.27.3
  ```

  For DHCPv6:

  ```
  user@host> request dhcpv6 server reconfigure 2001:bd8:1111:2222::
  ```

- Specify the client ID of a DHCPv6 client.

  ```
  user@host> request dhcpv6 server reconfigure LL_TIME0x1-0x2e159c0-00:10:94:00:00:02
  ```

- Specify the session ID of a DHCPv6 client.

  ```
  user@host> request dhcpv6 server reconfigure 5
  ```

- Specify the MAC address of a DHCPv4 client.

  ```
  user@host> request dhcp server reconfigure 12:23:34:45:56:67
  ```
Specify an interface; reconfiguration is attempted for all clients on this interface.

user@host> request dhcp server reconfigure interface fe-0/0/0.100

Specify a logical system; reconfiguration is attempted for all clients or the specified clients in this logical system.

user@host> request dhcp server reconfigure all logical-system ls-bldg5

Specify a routing instance; reconfiguration is attempted for all clients or the specified clients in this routing instance.

user@host> request dhcp server reconfigure all routing-instance ri-boston

Configuring Detection of DHCP Local Server Client Connectivity

Liveness detection for DHCP subscriber IP sessions or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

NOTE: You can also configure DHCP liveness detection for DHCP relay.

To configure liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.
   - For DHCP global configuration:
     [edit system services dhcp-local-server]
     user@host# edit liveness-detection
   - For DHCP group configuration:
     [edit system services dhcp-local-server group group-name]
     user@host# edit liveness-detection

   NOTE: Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the liveness-detection statement, and any subsequent configuration statements, at the [edit system services dhcp-local-server dhcpv6] or [edit system services dhcp-local-server dhcpv6 group group-name] hierarchy level.

2. Specify that you want to configure the liveness detection method.
   - For DHCP global configuration:
For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit method
```

3. Specify the liveness detection method that you want DHCP to use.

**NOTE:** In this release, the only method supported for liveness detection is Bidirectional Forwarding Detection (BFD).

For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection method]
user@host# edit bfd
```

For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection method]
user@host# edit bfd
```

4. Configure the liveness detection method as desired.

See “Example: Configuring Group Liveness Detection for DHCP Local Server Clients” on page 1231 for an example of how to configure DHCPv4 groups for DHCP local server liveness detection.

5. Configure the action the router takes when a liveness detection failure occurs.

For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit failure-action action
```

For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit failure-action action
```

### Configuring DHCP Snooped Packets Forwarding Support for DHCP Local Server

You can configure how DHCP local server handles DHCP snooped packets. Depending on the configuration, DHCP local server either forwards or drops the snooped packets it receives.
Table 169 on page 1275 indicates the action the router takes for DHCP local server snooped packets.

NOTE: Configured interfaces are those interfaces that have been configured with the group statement in the [edit system services dhcp-local-server] hierarchy. Non-configured interfaces are those that are in the logical system-routing instance but have not been configured by the group statement.

<table>
<thead>
<tr>
<th>forward-snooped-clients Configuration</th>
<th>Action on Configured Interfaces</th>
<th>Action on Non-Configured Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward-snooped-clients not configured</td>
<td>dropped</td>
<td>dropped</td>
</tr>
<tr>
<td>all-interfaces</td>
<td>forwarded</td>
<td>forwarded</td>
</tr>
<tr>
<td>configured-interfaces</td>
<td>forwarded</td>
<td>dropped</td>
</tr>
<tr>
<td>non-configured-interfaces</td>
<td>dropped</td>
<td>forwarded</td>
</tr>
</tbody>
</table>

To configure DHCP snooped packet forwarding for DHCP local server:

1. Specify that you want to configure DHCP local server.
   ```
   [edit]
   user@host# edit system services dhcp-local-server
   ```
2. Enable DHCP snooped packet forwarding for DHCP local server.
   ```
   [edit system services dhcp-local-server]
   user@host# edit forward-snooped-clients
   ```
3. Specify the interfaces that are supported for snooped packet forwarding.
   ```
   [edit system services dhcp-local-server forward-snooped-clients]
   user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
   ```

For example, to configure DHCP local server to forward DHCP snooped packets on only configured interfaces:

```
[edit]
system {
  services {
    dhcp-local-server {
      forward-snooped-clients configured-interfaces;
    }
  }
}
```

Related Documentation • DHCP Snooping Support on page 1203
Configuring Passwords for Usernames

You can configure an optional password that the extended DHCP application presents to the external AAA authentication service to authenticate the specified username.

To configure a password that authenticates the username:

1. Specify that you want to configure authentication options.
   - For DHCP local server:
     ```
     [edit system services dhcp-local-server]
     user@host# edit authentication
     ```
   - For DHCPv6 local server:
     ```
     [edit system services dhcp-local-server dhcpv6]
     user@host# edit authentication
     ```
   - For DHCP relay agent:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit authentication
     ```

2. Configure the password. (DHCP local server, DHCPv6 local server, and DHCP relay agent all support the `password` statement.)
   ```
   [edit system services dhcp-local-server authentication]
   user@host# set password myPassword1234
   ```

Creating Unique Usernames for DHCP Clients

You can configure the extended DHCP application to include additional information in the username that is passed to the external AAA authentication service when the DHCP client logs in. This additional information enables you to construct usernames that uniquely identify subscribers (DHCP clients).

NOTE: If you do not include a username in the authentication configuration, the router (or switch) does not perform authentication; however, the IP address is provided by the local pool if it is configured.

When you use the DHCPv6 local server, you must configure authentication and the client username; otherwise client login fails.
The following list describes the optional information that you can include as part of the username:

- **circuit-type**—The circuit type used by the DHCP client, for example `enet`.
- **client-id**—The client identifier option (option 1). (DHCPv6 local server DHCPv6 relay agent only)
- **delimiter**—The delimiter character that separates components that make up the concatenated username. The default delimiter is a period (.). The semicolon (;) is not supported as a delimiter character.
- **domain-name**—The client domain name as a string. The router adds the `@` delimiter to the username.
- **interface-name**—The interface name, including the interface device and associated VLAN IDs.
- **logical-system-name**—The name of the logical system, if the receiving interface is in a logical system.
- **mac-address**—The client MAC address, in a string of the format `xxxx.xxxx.xxxx`. (Not supported for DHCPv6 local server)
- **option-60**—The portion of the option 60 payload that follows the length field. (Not supported for DHCPv6 local server)
- **option-82 <circuit-id> <remote-id>**—The specified contents of the option 82 payload. (Not supported for DHCPv6 local server)
  - **circuit-id**—The payload of the Agent Circuit ID suboption.
  - **remote-id**—The payload of the Agent Remote ID suboption.
  - Both **circuit-id** and **remote-id**—The payloads of both suboptions, in the format: `circuit-id[delimiter]remote-id`.
  - Neither **circuit-id** or **remote-id**—The raw payload of the option 82 from the PDU is concatenated to the username.

**NOTE:** For DHCP relay agent, the option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.

- **relay-agent-interface-id**—The Interface-ID option (option 18). (DHCPv6 local server only)
- **relay-agent-remote-id**—The DHCPv6 Relay Agent Remote-ID option (option 37). (DHCPv6 local server only)
- **relay-agent-subscriber-id**—(On routers only) The DHCPv6 Relay Agent Subscriber-ID option (option 38). (DHCPv6 local server only)
• **routing-instance-name**—The name of the routing instance, if the receiving interface is in a routing instance.

• **user-prefix**—A string indicating the user prefix.

The router (switch) creates the unique username by including the specified additional information in the following order, with the fields separated by a delimiter.

For DHCP local server and DHCP relay agent:

```
```

For DHCPv6 local server:

```
```

To configure a unique username:

1. Specify that you want to configure authentication.

   • For DHCP local server:
     
     ```
     [edit system services dhcp-local-server]
     user@host# edit authentication
     ```

   • For DHCPv6 local server:
     
     ```
     [edit system services dhcp-local-server dhcpv6]
     user@host# edit authentication
     ```

   • For DHCP relay agent:
     
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit authentication
     ```

2. Specify that you want to include optional information in the username. (DHCP local server, DHCPv6 local server, and DHCP relay agent all support the `username-include` statement.)

   ```
   [edit system services dhcp-local-server authentication]
   user@host# set username-include
   ```

3. (Optional) Specify the optional information you want to include in the username.

   ```
   [edit system services dhcp-local-server authentication username-include]
   user@host# set username-include circuit-type
   user@host# set username-include domain-name isp55.com
   user@host# set username-include mac-address
   user@host# set username-include user-prefix wallybrown
   ```

The previous `username-include` configuration produces this unique username:

```
wallybrown.0090.1a01.1234.enet@isp55.com
```

Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use

You can specify the match order in which the extended DHCP local server uses the client data to determine the address-assignment pool that provides the IP address and configuration for a DHCP client. You use the `pool-match-order` statement to specify the match order. If you do not specify the `pool-match-order`, the router (or switch) uses the default `ip-address-first` matching to select the address pool. After DHCP local server determines the address assignment pool to use, the server performs the matching based on the criteria you specified in the pool configuration.

In the default `ip-address-first` matching, the server selects the address-assignment pool to use by matching the IP address in the client DHCP request with the network address of the address-assignment pool. If the client request contains the gateway IP address (giaddr), the local server matches the giaddr to the address-assignment pool’s address. If there is no giaddr in the request, then the DHCP local server matches the IP address of the receiving interface to the address of the address-assignment pool.

In `external-authority` matching, the DHCP local server receives the address assignment from an external authority, such as RADIUS or Diameter. If RADIUS is the external authority, the DHCP local server uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. If Diameter is the external authority, the server uses the Diameter counterpart of the Framed-IPv6-Pool attribute to determine the pool.

For IPv4 address-assignment pools, you can optionally configure the extended DHCP local server to match the DHCP relay agent information option (option 82) in the client DHCP packets to a named range in the address-assignment pool used for the client. Named ranges are subsets within the overall address-assignment pool address range, which you can configure when you create the address-assignment pool.

**NOTE:** To use the DHCP local server option 82 matching feature with an IPv4 address-assignment pool, you must ensure that the `option-82` statement is included in the `dhcp-attributes` statement for the address-assignment pool.

To configure the matching order the extended DHCP local server uses to determine the address-assignment pool used for a client:

1. Access the `pool-match-order` configuration.

   ```
   [edit system services dhcp-local-server] 
   user@host# edit pool-match-order 
   ```
2. Specify the pool matching methods in the order in which the router (switch) performs the methods. You can specify the methods in any order. All methods are optional—the router (switch) uses the ip-address-first method by default.

- Configure the router (switch) to use an external addressing authority.
  
  ```
  [edit system services dhcp-local-server pool-match-order]
  user@host# set external-authority
  ```

- Configure the router (switch) to use the ip-address-first method.
  
  ```
  [edit system services dhcp-local-server pool-match-order]
  user@host# set ip-address-first
  ```

- (IPv4 address-assignment pools only) Specify the option 82 matching method.
  
  ```
  [edit system services dhcp-local-server pool-match-order]
  user@host# set option-82
  ```

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

**NOTE:** This section uses the term extended DHCP application to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors thelogout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the authentication-server statement at the [edit access profile profile-name] hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the username-include statement to enable the use of authentication. The password statement is not required and does not cause DHCP to use authentication if the username-include statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.
   - For DHCP local server:
[edit system services dhcp-local-server]
user@host# edit authentication

- For DHCP relay agent:
  [edit forwarding-options dhcp-relay]
  user@host# edit authentication

- For DHCPv6 local server:
  [edit system services dhcp-local-server dhcpv6]
  user@host# edit authentication

- For DHCPv6 relay agent:
  [edit forwarding-options dhcp-relay dhcpv6]
  user@host# edit authentication

2. (Optional) Configure a password that authenticates the username to the external authentication service.
   See “Configuring Passwords for Usernames” on page 1276.

3. (Optional) Configure optional features to create a unique username.
   See “Creating Unique Usernames for DHCP Clients” on page 1276.

Configuring DHCP Duplicate Client Support

You can optionally configure DHCP local server and DHCP relay to include a client subinterface when distinguishing between two clients that have the same MAC address or client ID. The configuration is a global setting for each logical system/routing instance.

To configure DHCP local server to include the client subinterface:

1. Specify that you want to configure DHCP local server.
   [edit system services]
   user@host# edit dhcp-local-server

2. Configure the optional duplicate client support.
   [edit system services dhcp-local-server]
   user@host# set duplicate-clients-on-interface

To configure DHCP relay agent to include the client subinterface:

1. Specify that you want to configure DHCP relay agent.
   [edit forwarding-options]
   user@host# edit dhcp-relay
2. Configure the optional duplicate client support.

[edit system services dhcp-relay]
user@host# set duplicate-clients-on-interface

Related Documentation

Grouping Interfaces with Common DHCP Configurations

You use the group feature to group together a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.

To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

   [edit system services]
   user@host# edit dhcp-local-server

2. Create the group and assign a name.

   [edit system services dhcp-local-server]
   user@host# edit group boston

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the interface interface-name statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

   [edit system services dhcp-local-server group boston]
   user@host# set interface fe-1/0/1.1
   user@host# set interface fe-1/0/1.2

4. (Optional) You can use the upto option to specify a range of interfaces for a group.

   [edit system services dhcp-local-server group boston]
   user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9

5. (Optional) You can use the exclude option to exclude a specific interface or a specified range of interfaces from the group. For example:

   [edit system services dhcp-local-server group boston]
   user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
   user@host# set interface fe-1/0/1.6 exclude
   user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude

Guidelines for Configuring Interface Ranges

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

```plaintext
user@host# set interface interface-name upto interface-name
```

- The start subunit, `interface interface-name`, serves as the key for the stanza. The remaining configuration settings are considered attributes.

- If the subunit is not included, an implicit `.0` subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, `interface ge-2/2/2` is treated as `interface ge-2/2/2.0`.

- Ranged entries contain the `upto` option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a `0` (zero) subunit acts as a wildcard.

- Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.

- Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because `ge-1/0/0.10` is the start subunit for both.

  ```plaintext
  interface ge-1/0/0.10 upto ge-1/0/0.30
  interface ge-1/0/0.10
  ```

- Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—`interface ge-1/0/0.26` is common to all three.

  ```plaintext
  dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.26
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35
  ```

- Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

  ```plaintext
  interface ge-1/0/0.10 upto ge-1/0/0.30
  interface ge-1/0/0.20 upto ge-1/0/0.40
  ```
• A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

In the following example, the three ranges nest properly:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
interface ge-1/0/0.25 upto ge-1/0/0.29 exclude
```

• Discrete interfaces take precedence over ranges. In the following example, interface `ge-1/0/0.20` takes precedence and enforces an interface client limit of 5.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
interface ge-1/0/0.20 overrides interface-client-limit 5
```

### Overriding the Default DHCP Relay Configuration Settings

You can override the default DHCP and DHCPv6 relay agent configuration settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

• To override global default DHCP relay agent configuration options, include the `overrides` statement and its subordinate statements at the `[edit forwarding-options dhcp-relay]` hierarchy level.

• To override DHCP relay configuration options for a named group of interfaces, include the statements at the `[edit forwarding-options dhcp-relay group group-name]` hierarchy level.

• To override DHCP relay configuration options for a specific interface within a named group of interfaces, include the statements at the `[edit forwarding-options dhcp-relay group group-name interface]` hierarchy level.

• To configure overrides for DHCPv6 relay, use the supported statements at the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level.

To override default DHCP relay agent configuration settings:

1. Specify that you want to configure override options.

   Global override:

   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit overrides
   ```

   Group-level override:

   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit group boston overrides
   ```

   Per-interface override:

   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit group boston interface fe-1/0/1.2 overrides
   ```
2. (DHCPv4 only) Enable DHCP relay proxy mode.
   See “Enabling DHCP Relay Proxy Mode” on page 1307.

3. (DHCPv4 only) Overwrite the giaddr in DHCP packets that the DHCP relay agent forwards.
   See “Overwriting giaddr Information” on page 1287.

4. (DHCPv4 only) Replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).
   See “Replacing the DHCP Relay Request and Release Packet Source Address” on page 1287.

5. (DHCPv4 only) Override the DHCP relay agent information option (option 82) in DHCP packets.
   See “Overriding Option 82 Information” on page 1287.

6. (DHCPv4 only) Override the setting of the broadcast bit in DHCP request packets and use the Layer 2 unicast transmission method.
   See “Using Layer 2 Unicast Transmission for DHCP Packets” on page 1288.

7. (DHCPv4 only) Trust DHCP client packets that have a giaddr of 0 and that contain option 82 information.
   See “Trusting Option 82 Information” on page 1288.

8. (DHCPv4 and DHCPv6) Override the maximum number of DHCP clients allowed per interface.
   See “Specifying the Maximum Number of DHCP Clients Per Interface” on page 1262.

9. (DHCPv4 only) Configure client auto logout.
   See “DHCP Auto Logout Overview” on page 1204.

10. (DHCPv4 and DHCPv6) Enable or disable support for DHCP snooped clients on interfaces.
    See “Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 1294.

11. (DHCPv4 and DHCPv6) Send release messages to the DHCP server when clients are deleted.
    See “Sending Release Messages When Clients Are Deleted” on page 1301.

12. (DHCPv4 only) Disable the DHCP relay agent on specific interfaces.
    See “Disabling DHCP Relay” on page 1312.

13. (DHCPv4 and DHCPv6) Disable automatic binding of stray DHCP requests.
    See “Disabling Automatic Binding of Stray DHCP Requests” on page 1302.

Related Documentation

Overwriting giaddr Information

You can configure the DHCP relay agent to change the gateway IP address (giaddr) field in packets that it forwards between a DHCP client and a DHCP server.

To overwrite the giaddr of every DHCP packet with the giaddr of the DHCP relay agent before forwarding the packet to the DHCP server:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the giaddr of DHCP packets is overwritten.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-giaddr
```

Related Documentation

- Extended DHCP Relay Agent Overview on page 1215
- Overriding the Default DHCP Relay Configuration Settings on page 1285

Replacing the DHCP Relay Request and Release Packet Source Address

You can configure the DHCP relay agent to replace request and release packets with the gateway IP address (giaddr) before forwarding the packet to the DHCP server.

To replace the source address with giaddr:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that you want to replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).

```
[edit forwarding-options dhcp-relay overrides]
user@host# set replace-ip-source-with giaddr
```

Related Documentation

- Extended DHCP Relay Agent Overview on page 1215
- Overriding the Default DHCP Relay Configuration Settings on page 1285

Overriding Option 82 Information

You can configure the DHCP relay agent to add or remove the DHCP relay agent information option (option 82) in DHCP packets.
This feature causes the DHCP relay agent to perform one of the following actions, depending on the configuration:

- If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.
- If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.

To override the default option 82 information in DHCP packets destined for a DHCP server:

1. Specify that you want to configure override options.
   
   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit overrides
   ```

2. Specify that the option 82 information in DHCP packets is overwritten.
   
   ```
   [edit forwarding-options dhcp-relay overrides]
   user@host# set always-write-option-82
   ```

**Related Documentation**

- Extended DHCP Relay Agent Overview on page 1215
- Overriding the Default DHCP Relay Configuration Settings on page 1285

**Using Layer 2 Unicast Transmission for DHCP Packets**

You can configure the DHCP relay agent to override the setting of the broadcast bit in DHCP request packets. DHCP relay agent then instead uses the Layer 2 unicast transmission method to send DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.

To override the default setting of the broadcast bit in DHCP request packets:

1. Specify that you want to configure override options.
   
   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit overrides
   ```

2. Specify that the DHCP relay agent uses the Layer 2 unicast transmission method.
   
   ```
   [edit forwarding-options dhcp-relay overrides]
   user@host# set layer2-unicast-replies
   ```

**Related Documentation**

- Extended DHCP Relay Agent Overview on page 1215
- Overriding the Default DHCP Relay Configuration Settings on page 1285

**Trusting Option 82 Information**

By default, the DHCP relay agent treats client packets with a giaddr of 0 (zero) and option 82 information as if the packets originated at an untrusted source, and drops them...
without further processing. You can override this behavior and specify that the DHCP relay agent process DHCP client packets that have a giaddr of 0 (zero) and contain option 82 information.

To configure DHCP relay agent to trust option 82 information:

1. Specify that you want to configure override options.
   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit overrides
   ```

2. Specify that the DHCP relay agent process DHCP client packets with a giaddr of 0 and that contain option 82 information.
   ```
   [edit forwarding-options dhcp-relay overrides]
   user@host# set trust-option-82
   ```

Related Documentation
- Extended DHCP Relay Agent Overview on page 1215
- Overriding the Default DHCP Relay Configuration Settings on page 1285

Disabling ARP Table Population

By default, DHCP populates the ARP table with the MAC address of a client when the client binding is established. However, you may choose to use the DHCP `no-arp` statement to hide the subscriber MAC address or the DHCP client MAC address, as it appears in ARP table entries.

When running in a trusted environment (that is, when not using the `no-arp` statement), DHCP populates the ARP table with unique MAC addresses contained within the DHCP PDU for each DHCP client:

Table 170: ARP Table in Trusted Environment

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client 1 IP Address</td>
<td>MAC A</td>
</tr>
<tr>
<td>Client 2 IP Address</td>
<td>MAC B</td>
</tr>
<tr>
<td>Client 3 IP Address</td>
<td>MAC C</td>
</tr>
</tbody>
</table>

In distrusted environments, you can specify the `no-arp` statement to hide the MAC addresses of clients. When you specify the `no-arp` statement, DHCP does not automatically populate the ARP table with MAC address information from the DHCP PDU for each client. Instead, the system performs an ARP to obtain the MAC address of each client and obtains the MAC address of the immediately attached device (for example, a DSLAM). DHCP populates the ARP table with the same interface MAC address (for example, MAC X from a DSLAM interface) for each client:
Table 171: ARP Table in Distrusted Environment

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client 1 IP Address</td>
<td>MAC X</td>
</tr>
<tr>
<td>Client 2 IP Address</td>
<td>MAC X</td>
</tr>
<tr>
<td>Client 3 IP Address</td>
<td>MAC X</td>
</tr>
</tbody>
</table>

To disable ARP table population:

1. Configure route suppression and specify that you want to suppress destination routes.
   - For DHCP local server:
     ```
     [edit system services dhcp-local-server]
     user@host# set route-suppression destination
     ```
   - For DHCP relay:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# set route-suppression destination
     ```

Related Documentation

- Overriding Default DHCP Local Server Configuration Settings on page 1261

- DHCPv6 Local Server Overview on page 1196
- Extended DHCP Relay Agent Overview on page 1215
- Deleting DHCP Local Server and DHCP Relay Override Settings on page 1267

Specifying the Maximum Number of DHCP Clients Per Interface

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

**NOTE:** The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the interface-client-limit statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.
To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.
   - For DHCP local server:
     ```
     [edit system services dhcp-local-server]
     user@host# edit overrides
     ```
   - For DHCPv6 local server:
     ```
     [edit system services dhcp-local-server dhcpv6]
     user@host# edit overrides
     ```
   - For DHCP relay agent:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit overrides
     ```
   - For DHCPv6 relay agent:
     ```
     [edit forwarding-options dhcp-relay dhcpv6]
     user@host# edit overrides
     ```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the `interface-client-limit` statement.)
   ```
   [edit system services dhcp-local-server overrides]
   user@host# set interface-client-limit number
   ```

- Extended DHCP Relay Agent Overview on page 1215

Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet that has the same DHCP option 60 and DHCP option 82 information as the existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

**NOTE:** When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.
   - For DHCP local server:
For DHCP relay agent:

[edit forwarding-options dhcp-relay]
user@host# edit overrides

2. Enable auto logout. (DHCP local server and DHCP relay agent both support the client-discover-match statement.)

• For DHCP local server:

[edit system services dhcp-local-server overrides]
user@host# set client-discover-match

• For DHCP relay:

[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match

---

**NOTE:** If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

---

Configuring DHCP Snooping for DHCP Relay Agent

DHCP relay agent uses a two-part configuration to determine how to handle DHCP snooped packets. First, you enable or disable snooping support for DHCP relay agent and, optionally, override the default snooping configuration. Then you configure the forwarding action for snooped clients, which specifies whether DHCP relay agent forwards or drops snooped traffic.

To configure DHCP snooping for DHCP relay agent:

1. (DHCPv4 and DHCPv6) Enable or disable DHCP snooping. You can configure DHCP snooping globally, for a named group of interfaces, or for a specific interface.
See “Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 1294.

2. (DHCPv4 only) Configure snooped packets forwarding support.

See “Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent” on page 1299.

- Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 1239

Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent

DHCP relay agent uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes the first procedure, in which you configure DHCP relay to either enable or disable support for snooped packets.

The second procedure, which applies only to DHCPv4 relay agent, is described in “Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent” on page 1299, and configures the forward-snooped-clients statement, which determines whether the snooped packets are forwarded or dropped, depending on the type of interface.

NOTE: The router has a default global setting that specifies whether DHCP snooping support is enabled or disabled for DHCP relay. In Junos OS Release 10.0 and earlier, DHCP snooping is enabled by default. In Junos OS Release 10.1 and later, DHCP snooping is disabled by default.

You can override the default global DHCP snooping configuration and explicitly enable or disable DHCP snooping support. You can configure the explicit snooping support globally, for a group of interfaces, or for a specific interface in a group.

- To enable DHCP relay or DHCPv6 relay snooping support, include the allow-snooped-clients option in the overrides statement.
- To disable DHCP relay or DHCPv6 relay snooping support, include the no-allow-snooped-clients option in the overrides statement.

To enable or disable DHCP snooping support globally:

1. Specify that you want to configure DHCP relay agent.

   - For DHCP relay agent:

   [edit]
user@host# edit forwarding-options dhcp-relay

• For DHCPv6 relay agent:

  [edit]
  user@host# edit forwarding-options dhcp-relay dhcpv6

2. Specify that you want to override the default configuration.

• For DHCP relay agent:

  [edit forwarding-options dhcp-relay
  user@host# edit overrides

• For DHCPv6 relay agent:

  [edit forwarding-options dhcp-relay dhcpv6
  user@host# edit overrides

3. Enable or disable DHCP snooping support.

• To enable DHCP snooping:

  • For DHCP relay agent:

    [edit forwarding-options dhcp-relay overrides
    user@host# set allow-snooped-clients

  • For DHCPv6 relay agent:

    [edit forwarding-options dhcp-relay dhcpv6 overrides
    user@host# set allow-snooped-clients

• To disable DHCP snooping:

  • For DHCP relay agent:

    [edit forwarding-options dhcp-relay overrides
    user@host# set no-allow-snooped-clients

  • For DHCPv6 relay agent:

    [edit forwarding-options dhcp-relay dhcpv6 overrides
    user@host# set no-allow-snooped-clients

For example, to enable global DHCP snooping support:

forwarding-options {
  dhcp-relay {
    overrides {
      allow-snooped-clients;
    }
  }
}
}
To enable or disable DHCP snooping support for a group of interfaces:

1. Specify that you want to configure DHCP relay agent.
   - For DHCP relay agent:
     ```
     [edit]
     user@host# edit forwarding-options dhcp-relay
     ```
   - For DHCPv6 relay agent:
     ```
     [edit]
     user@host# edit forwarding-options dhcp-relay dhcpv6
     ```

2. Specify the named group.
   - For DHCP relay agent:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit group group-name
     ```
   - For DHCPv6 relay agent:
     ```
     [edit forwarding-options dhcp-relay dhcpv6]
     user@host# edit group group-name
     ```

3. Specify that you want to override the default configuration.
   - For DHCP relay agent:
     ```
     [edit forwarding-options dhcp-relay group group-name]
     user@host# edit overrides
     ```
   - For DHCPv6 relay agent:
     ```
     [edit forwarding-options dhcp-relay dhcpv6 group group-name]
     user@host# edit overrides
     ```

4. Enable or disable DHCP snooping support.
   - To enable DHCP snooping:
     ```
     - For DHCP relay agent:
       ```
       [edit forwarding-options dhcp-relay group group-name overrides]
       user@host# set allow-snooped-clients
       ```
     - For DHCPv6 relay agent:
       ```
       [edit forwarding-options dhcp-relay dhcpv6 group group-name overrides]
       user@host# set allow-snooped-clients
       ```
   - To disable DHCP snooping:
     ```
     - For DHCP relay agent:
       ```
       [edit forwarding-options dhcp-relay group group-name overrides]
       user@host# set no-allow-snooped-clients
       ```
     - For DHCPv6 relay agent:
       ```
       [edit forwarding-options dhcp-relay dhcpv6 group group-name overrides]
       user@host# set no-allow-snooped-clients
       ```
For example, to enable DHCP snooping support on all interfaces in group **boston**:

```conf
forwarding-options {
    dhcp-relay {
        group boston {
            overrides {
                allow-snooped-clients;
            }
        }
    }
}
```

To enable or disable DHCP snooping support on a specific interface:

1. Specify that you want to configure DHCP relay agent.
   - For DHCP relay agent:
     ```bash
     [edit]
     user@host# edit forwarding-options dhcp-relay
     ```
     - For DHCPv6 relay agent:
       ```bash
       [edit]
       user@host# edit forwarding-options dhcp-relay dhcpv6
       ```

2. Specify the named group containing the interface.
   - For DHCP relay agent:
     ```bash
     [edit forwarding-options dhcp-relay]
     user@host# edit group group-name
     ```
   - For DHCPv6 relay agent:
     ```bash
     [edit forwarding-options dhcp-relay dhcpv6]
     user@host# edit group group-name
     ```

3. Specify the interface for which you want to configure DHCP snooping.
   - For DHCP relay agent:
     ```bash
     [edit forwarding-options dhcp-relay group group-name]
     user@host# edit interface interface-name
     ```
   - For DHCPv6 relay agent:
     ```bash
     [edit forwarding-options dhcp-relay dhcpv6 group group-name]
     user@host# edit interface interface-name
     ```

4. Specify that you want to override the default configuration on the interface.
   - For DHCP relay agent:
     ```bash
     [edit forwarding-options dhcp-relay group group-name interface interface-name]
     user@host# edit overrides
     ```
   - For DHCPv6 relay agent:
     ```bash
     [edit forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name]
     user@host# edit overrides
     ```

5. Enable or disable DHCP snooping support.
• To enable DHCP snooping:
  • For DHCP relay agent:
    [edit forwarding-options dhcp-relay group group-name interface interface-name overrides]
    user@host# set allow-snooped-clients
  • For DHCPv6 relay agent:
    [edit forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name overrides]
    user@host# set allow-snooped-clients
• To disable DHCP snooping:
  • For DHCP relay agent:
    [edit forwarding-options dhcp-relay group group-name interface interface-name overrides]
    user@host# set no-allow-snooped-clients
  • For DHCPv6 relay agent:
    [edit forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name overrides]
    user@host# set no-allow-snooped-clients

For example, to disable DHCP snooping support on interface ge-2/1/8.0 in group boston:

forwarding-options {
  dhcp-relay {
    group boston {
      interface ge-2/1/8.0 {
        overrides {
          no-allow-snooped-clients;
        }
      }
    }
  }
}

To enable DHCPv6 snooping support on interface ge-3/2/1.1 in group sunnyvale:

forwarding-options {
  dhcp-relay {
    dhcpv6 {
      group sunnyvale {
        interface ge-3/2/1.1 {
          overrides {
            allow-snooped-clients;
          }
        }
      }
    }
  }
}

You can configure how DHCP relay agent handles DHCP snooped packets. Depending on the configuration, DHCP relay agent either forwards or drops the snooped packets it receives.

DHCP relay uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes how you use the `forward-snooped-clients` statement to manage whether DHCP relay agent forwards or drops snooped packets, depending on the type of interface on which the packets are snooped. In the other part of the DHCP relay agent snooping configuration, which is described in “Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 1294, you enable or disable the DHCP relay snooping feature.

Table 173 on page 1299 shows the action the router or switch takes on snooped packets when DHCP snooping is enabled by the `allow-snooped-clients` statement. Table 174 on page 1300 shows the action the router (or switch) takes on snooped packets when DHCP snooping is disabled by the `no-allow-snooped-clients` statement.

The router or switch also uses the configuration of the DHCP relay agent forwarding support to determine how to handle snooped BOOTREPLY packets. Table 175 on page 1300 shows the action the router (or switch) takes for the snooped BOOTREPLY packets.

### Note

**Configured interfaces** have been configured with the group statement in the `[edit forwarding-options dhcp-relay]` hierarchy. Non-configured interfaces are in the logical system/routing instance but have not been configured by the group statement.

### Table 173: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled

<table>
<thead>
<tr>
<th>forward-snooped-clients Configuration</th>
<th>Action on Configured Interfaces</th>
<th>Action on Non-Configured Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward-snooped-clients not configured</td>
<td>snooped packets result in subscriber (DHCP client) creation</td>
<td>dropped</td>
</tr>
<tr>
<td>all-interfaces</td>
<td>forwarded</td>
<td>forwarded</td>
</tr>
<tr>
<td>configured-interfaces</td>
<td>forwarded</td>
<td>dropped</td>
</tr>
</tbody>
</table>
Table 173: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled (continued)

<table>
<thead>
<tr>
<th>forward-snooped-clients Configuration</th>
<th>Action on Configured Interfaces</th>
<th>Action on Non-Configured Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>non-configured-interfaces</td>
<td>snooped packets result in subscriber (DHCP client) creation</td>
<td>forwarded</td>
</tr>
</tbody>
</table>

Table 174: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Disabled

<table>
<thead>
<tr>
<th>forward-snooped-clients Configuration</th>
<th>Action on Configured Interfaces</th>
<th>Action on Non-Configured Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward-snooped-clients not configured</td>
<td>dropped</td>
<td>dropped</td>
</tr>
<tr>
<td>all-interfaces</td>
<td>dropped</td>
<td>forwarded</td>
</tr>
<tr>
<td>configured-interfaces</td>
<td>dropped</td>
<td>dropped</td>
</tr>
<tr>
<td>non-configured-interfaces</td>
<td>dropped</td>
<td>forwarded</td>
</tr>
</tbody>
</table>

Table 175: Actions for Snooped BOOTREPLY Packets

<table>
<thead>
<tr>
<th>forward-snooped-clients Configuration</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward-snooped-clients not configured</td>
<td>snooped BOOTREPLY packets dropped if client is not found</td>
</tr>
<tr>
<td>forward-snooped-clients all configurations</td>
<td>snooped BOOTREPLY packets forwarded if client is not found</td>
</tr>
</tbody>
</table>

To configure DHCP snooped packet forwarding and BOOTREPLY snooped packet forwarding for DHCP relay agent:

1. Specify that you want to configure DHCP relay agent.
   
   [edit]
   user@host# edit forwarding-options dhcp-relay

2. Enable DHCP snooped packet forwarding.
   
   [edit forwarding-options dhcp-relay]
   user@host# edit forward-snooped-clients

3. Specify the interfaces that are supported for snooped packet forwarding.
   
   [edit forwarding-options dhcp-relay forward-snooped-clients]
   user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
For example, to configure DHCP relay agent to forward DHCP snooped packets on only configured interfaces:

```
[edit]
forwarding-options {
  dhcp-relay {
    forward-snooped-clients configured-interfaces;
  }
}
```

- Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent on page 1294

Sending Release Messages When Clients Are Deleted

By default, when DHCP relay and relay proxy delete a client, they do not send a release message to the DHCP server. You can override the default behavior and configure DHCP relay and relay proxy to send a release message whenever they delete a client. The release message sent by DHCP relay and relay proxy includes option 82 information.

**NOTE:** In Junos OS Release 10.1 and earlier, DHCP relay sends a release message to the DHCP server when the client-discover-match statement is included as a DHCP relay override. In Junos OS Release 10.2 and later, you must include the send-release-on-delete statement to configure DHCP relay and relay proxy to send the release message when the client-discover-match statement is included.

You can use the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level to override the default behavior for DHCPv6 relay agent.

To send a release message:

1. Specify that you want to configure override options.
   
   - For DHCP relay agent:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit overrides
     ```
   
   - For DHCPv6 relay agent:
     ```
     [edit forwarding-options dhcp-relay dhcpv6]
     user@host# edit overrides
     ```

2. Specify that you want DHCP relay and relay proxy (or DHCPv6 relay agent) to send a release message when clients are deleted.
   ```
   [edit forwarding-options dhcp-relay overrides]
   user@host# set send-release-on-delete
   ```
Disabling Automatic Binding of Stray DHCP Requests

DHCP requests that are received but have no entry in the database are known as stray requests. By default, DHCP relay, DHCP relay proxy, and DHCPv6 relay agent attempt to bind the requesting client by creating a database entry and forwarding the request to the DHCP server. If the server responds with an ACK, the client is bound and the ACK is forwarded to the client. If the server responds with a NAK, the database entry is deleted and the NAK is forwarded to the client. This behavior occurs regardless of whether authentication is configured.

You can override the default configuration at the global level, for a named group of interfaces, or for a specific interface within a named group. Overriding the default causes DHCP relay, DHCP relay proxy, and DHCPv6 relay agent to drop all stray requests instead of attempting to bind the clients.

NOTE: In Junos OS Release 10.4 and later, automatic binding of stray requests is enabled by default.

In Junos OS Release 10.3 and earlier releases, automatic binding of stray requests is disabled by default. In those releases, DHCP relay drops stray requests and forwards a NAK to the client when authentication is configured. Otherwise, DHCP relay attempts to bind the requesting client. In those releases, DHCP relay proxy always drops stray requests and forwards a NAK to the client, regardless of the authentication configuration.

To disable automatic binding behavior, include the no-bind-on-request statement when you configure DHCP overrides at the global, group, or interface level.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-bind-on-request
```

To override the default behavior for DHCPv6 relay agent, configure the override at the

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# set no-bind-on-request
```

The following two examples show a configuration that disables automatic binding of stray requests for a group of interfaces and a configuration that disables automatic binding on a specific interface.

To disable automatic binding of stray requests on a group of interfaces:

1. Specify the named group.

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston
```
2. Specify that you want to configure overrides.

   [edit forwarding-options dhcp-relay group boston]
   user@host# edit overrides

3. Disable automatic binding for the group.

   [edit forwarding-options dhcp-relay group boston overrides]
   user@host# set no-bind-on-request

To disable automatic binding of stray requests on a specific interface:

1. Specify the named group of which the interface is a member.

   [edit forwarding-options dhcp-relay]
   user@host# edit group boston

2. Specify the interface on which you want to disable automatic binding.

   [edit forwarding-options dhcp-relay group boston]
   user@host# edit interface fe-1/0/1.2

3. Specify that you want to configure overrides.

   [edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2 overrides]
   user@host# edit overrides

4. Disable automatic binding on the interface.

   [edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2 overrides]
   user@host# set no-bind-on-request

- Overriding the Default DHCP Relay Configuration Settings on page 1285

Enabling and Disabling Insertion of Option 82 Information

You can enable or disable support for the DHCP relay agent information option (option 82) in packets destined for a DHCP server. You can configure option 82 support globally or for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), you use the `delete relay-option-82` statement.

To configure support for the DHCP relay agent information option 82, you use the `relay-option-82` statement.

The following sections describe the option 82 operations you can configure:

- Configuring Agent Circuit ID Information on page 1304
- Configuring an Option 82 Prefix on page 1304
- Using a Textual Description in Option 82 on page 1306
Configuring Agent Circuit ID Information

You use the `relay-option-82` statement to enable insertion of option 82 information in DHCP packets. You must also specify at least the `circuit-id` statement to include the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option.

If you specify the `circuit-id` statement, the format of the Agent Circuit ID information for Fast Ethernet (fe) or Gigabit Ethernet (ge) interfaces is one of the following, depending on your network configuration:

- For Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual local area networks (VLANs) or stacked VLANs (S-VLANs):
  
  `(fe | ge)-fpc/pic/port`

- For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs:
  
  `(fe | ge)-fpc/pic/port:vlan-id`

- For Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs:
  
  `(fe | ge)-fpc/pic/port:svlan-id-vlan-id`

To enable insertion of option 82 information:

1. Specify that you want to configure option 82 support.
   
   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit relay-option-82
   ```

2. Specify insertion of the Agent Circuit ID suboption.
   
   ```
   [edit forwarding-options dhcp-relay relay-option-82]
   user@host# set circuit-id
   ```

Configuring an Option 82 Prefix

You can include an optional prefix to the base option 82 information in DHCP packets destined for a DHCP server.

The prefix is separated from the option 82 Agent Circuit ID information by a colon (:), and can include any combination of the `host-name`, `logical-system-name`, and `routing-instance-name` options. The DHCP relay agent obtains the values for the `host-name`, `logical-system-name`, and `routing-instance-name` as follows:

- If you include the `host-name` option, the DHCP relay agent uses the hostname of the router configured with the `host-name` statement at the [edit system] hierarchy level.

- If you include the `logical-system-name` option, the DHCP relay agent uses the logical system name configured with the `logical-system` statement at the [edit logical-system] hierarchy level.

- If you include the `routing-instance-name` option, the DHCP relay agent uses the routing instance name configured with the `routing-instance` statement at the [edit routing-instances] hierarchy level or at the [edit logical-system logical-system-name routing-instances] hierarchy level.
If you include the hostname and either or both of the logical system name and the routing instance name in the prefix, the hostname is followed by a forward slash (/). If you include both the logical system name and the routing instance name in the prefix, these values are separated by a semicolon (;).

The following examples show several possible formats for the Agent Circuit ID information when you specify the prefix statement for Fast Ethernet (fe) or Gigabit Ethernet (ge) interfaces with S-VLANs.

- If you include only the hostname in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:
  
  **hostname:**(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include only the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:
  
  **logical-system-name:**(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include only the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:
  
  **routing-instance-name:**(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include both the hostname and the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:
  
  **host-name/logical-system-name:**(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include both the logical system name and the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:
  
  **logical-system-name:/routing-instance-name:**(fe | ge)-fpc/pic/port:svlan-id-vlan-id

- If you include the hostname, logical system name, and routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:
  
  **host-name/logical-system-name:/routing-instance-name:**(fe | ge)-fpc/pic/port:svlan-id-vlan-id

For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs but not S-VLANs, only the vlan-id value appears in the Agent Circuit ID format. For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs or S-VLANs, neither the vlan-id value nor the svlan-id value appears.

To configure an optional prefix with the option 82 information:

1. Specify that you want to configure option 82 support.

   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit relay-option-82
   ```

2. Specify insertion of the Agent Circuit ID information.

   ```
   [edit forwarding-options dhcp-relay relay-option-82]
   user@host# edit circuit-id
   ```

3. Specify that the prefix is included in the option 82 information. In this example, the prefix includes the hostname and logical system name.
Using a Textual Description in Option 82

By default, when DHCP option 82 is inserted into client packets, the Agent Circuit ID suboption includes the interface identifier. You can optionally configure that the Agent Circuit ID suboption include the textual description that is configured for the interface instead of the interface identifier. You can use the textual description for either the logical interface or the device interface.

You can include the textual interface description in the Agent Circuit ID suboption for static interfaces. The textual description is configured using the `description` statement at the `[edit interfaces interface-name]` hierarchy level. If you specify that the textual description is used and no description is configured for the interface, DHCP relay defaults to using the interface identifier.

To configure the DHCP relay option 82 suboption to include the textual interface description:

1. Specify that you want to configure option 82 support.
   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit relay-option-82
   ```

2. Specify insertion of the Agent Circuit ID information.
   ```
   [edit forwarding-options dhcp-relay relay-option-82]
   user@host# edit circuit-id
   ```

3. Specify that the textual description is included in the option 82 information. In this example, the option 82 information includes the description used for the device interface.
   ```
   [edit forwarding-options dhcp-relay relay-option-82 circuit-id]
   user@host# set use-interface-description device
   ```

Configuring Server Groups

You can configure a named group of DHCP servers for use by the extended DHCP relay agent on the router or switch.

You specify the name of the DHCP server group and the IP addresses of one or more DHCP servers that belong to this group. You can configure a maximum of five IP addresses per named server group.

To configure a named server group:

1. Specify the name of the server group.
   ```
   [edit forwarding-options dhcp-relay]
   user@host# set server-group myServerGroup
   ```

2. Add the IP addresses of the DHCP servers belonging to the group.
   ```
   [edit forwarding-options dhcp-relay server-group myServerGroup]
   ```
Configuring Active Server Groups

You can configure an active server group. Using an active server group enables you to apply a common DHCP relay agent configuration to a named group of DHCP server addresses.

Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

To configure an active server group:

- Specify the name of the active server group.

```
[edit forwarding-options dhcp-relay]
user@host# set active-server-group myServerGroup
```

To create an active server group as a global DHCP relay agent configuration option, include the `active-server-group` statement at the `[edit forwarding-options dhcp-relay]` hierarchy level. To have the group apply only to a named group of interfaces, include the `active-server-group` statement at the `[edit forwarding-options dhcp-relay group group-name]` hierarchy level.

Including the `active-server-group` statement at the `[edit forwarding-options dhcp-relay group group-name]` hierarchy level (as a group-specific option) overrides the effect of including the `active-server-group` statement at the `[edit forwarding-options dhcp-relay]` hierarchy level as a global option.

Related Documentation

- Grouping Interfaces with Common DHCP Configurations on page 1258

Enabling DHCP Relay Proxy Mode

You can enable DHCP relay proxy mode on all interfaces or a group of interfaces.

To enable DHCP relay proxy mode:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set proxy-mode
```

Related Documentation
- DHCP Relay Proxy Overview on page 1218
- Overriding the Default DHCP Relay Configuration Settings on page 1285
Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets

You can configure DHCPv6 relay agent to insert the DHCPv6 Interface-ID (option 18) in the packets that the relay sends to a DHCPv6 server. You can configure the option 18 support at either the DHCPv6 global or group level.

- Prefix—Specify the prefix option to add a prefix to the interface identifier. The prefix can be any combination of hostname, logical system name, and routing instance name.
- Interface description—Specify the use-interface-description option to include the textual interface description instead of the interface identifier. You can include either the device interface description or the logical interface description.
- Option 82 Agent Circuit ID suboption (suboption 1)—Specify the use-option-82 option to use the DHCPv4 Option 82 Agent Circuit ID suboption (suboption 1). This configuration is useful in a dual-stack environment, which has both DHCPv4 and DHCPv6 subscribers that reside over the same underlying logical interface. The router checks for the option 82 suboption 1 value and inserts it into the outgoing packets. If no DHCPv4 binding exists or if the binding does not have an option 82 suboption 1 value, the router sends the packets without adding an option 18.

**NOTE:** If you specify one of the optional configurations, and the specified information does not exist (for example, there is no interface description), DHCPv6 relay ignores the optional configuration and inserts the default interface identifier in the packets.

To insert the DHCPv6 Interface-ID option (option 18) in DHCPv6 packets:

1. Configure the DHCPv6 relay to include option 18.
   ```
   [edit forwarding-options dhcp-relay dhcpv6]
   user@host# edit relay-agent-interface-id
   ```

2. (Optional) Specify the prefix to include in option 18.
   ```
   [edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
   user@host# set prefix prefix
   ```

3. (Optional) Specify that option 18 include the textual description of the interface. You can specify either the logical interface description or the device interface description.
   ```
   [edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
   user@host# set use-interface-description (logical | device)
   ```

4. (Optional) Specify that option 18 use the DHCPv4 Option 82 Agent Circuit ID suboption (suboption 1) value.
   ```
   [edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
   user@host# set use-option-82
   ```

DHCP Liveness Detection Overview

Unlike PPP, DHCP does not define a native keepalive mechanism as part of either the DHCPv4 or DHCPv6 protocols. Without a keepalive mechanism, DHCP local server, DHCP relay, or DHCP relay proxy is unable to quickly detect if it has lost connectivity with a subscriber or a DHCP client; and it must rely on standard DHCP subscriber session or DHCP client session termination messages.

DHCP clients often do not send DHCP release messages prior to exiting the network. The discovery of their absence is dependent on existing DHCP lease time and release request mechanisms. These mechanisms are often considered insufficient when serving as session health checks for clients in a DHCP subscriber access or a DHCP-managed network. Because DHCP lease times are typically too long to provide an adequate response time for a session health failure, and configuring short DHCP lease times can pose an undue burden on control plane processing, implementing a DHCP liveness detection mechanism enables better monitoring of bound DHCP clients. When configured with a liveness detection protocol, if a given subscriber (or client) fails to respond to a configured number of consecutive liveness detection requests, the subscriber (or client) binding is deleted and its resources released.

DHCP liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

Using DHCP liveness detection, IP sessions are acted upon as soon as liveness detection checks fail. This faster response time serves to:

- Provide more accurate time-based accounting of subscriber (or DHCP client) sessions.
- Better preserve router (switch) resources.
- Help to reduce the window of vulnerability to some security attacks.

Examples of liveness detection protocols include Bidirectional Forwarding Detection (BFD) for both DHCPv4 and DHCPv6 subscribers, IPv4 Address Resolution Protocol (ARP) for DHCPv4 subscribers, and IPv6 Neighbor Unreachability Detection for DHCPv6 subscribers.

NOTE: This release supports only BFD for DHCPv4 and DHCPv6 liveness detection.
When configuring BFD liveness detection, keep the following in mind:

- You can configure DHCPv4 and DHCPv6 liveness detection either globally or per DHCPv4 or DHCPv6 group.
- DHCPv4 or DHCPv6 subscriber access clients that do not support BFD are not affected by the liveness detection configuration. These clients can continue to access the network (once validated) even if BFD liveness detection is enabled on the router (or switch).
- When configured, DHCPv4 or DHCPv6 initiates liveness detection checks for relevant clients (that is, clients that support BFD) when those clients enter a bound state.
- After protocol-specific messages are initiated for a BFD client, they are periodically sent to the subscriber (or client) IP address of the client and responses to those liveness detection requests are expected within a configured amount of time.
- If liveness detection responses are not received from clients that support BFD within the configured amount of time for a configured number of consecutive attempts, the liveness detection check is deemed to have failed and a configured failure action is implemented.

**Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity**

Liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

**NOTE:** You can also configure DHCP liveness detection for DHCP local server.
To configure liveness detection for DHCP relay:

1. Specify that you want to configure liveness detection.
   - For DHCP global configuration:
     ```
     [edit forwarding-options dhcp-relay]
     user@host# edit liveness-detection
     ```
   - For DHCP group configuration:
     ```
     [edit forwarding-options dhcp-relay group group-name]
     user@host# edit liveness-detection
     ```

   **NOTE:** Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the `liveness-detection` statement, and any subsequent configuration statements, at the `[edit forwarding-options dhcp-relay dhcpv6]` or `[edit forwarding-options dhcp-relay dhcpv6 group group-name]` hierarchy level.

2. (Optional) Specify that you want to use DHCP relay proxy mode.
   ```
   [edit forwarding-options dhcp-relay group group-name]
   user@host# set overrides proxy-mode
   ```

3. Specify that you want to configure the liveness detection method.
   - For DHCP global configuration:
     ```
     [edit forwarding-options dhcp-relay liveness-detection]
     user@host# edit method
     ```
   - For DHCP group configuration:
     ```
     [edit forwarding-options dhcp-relay group group-name liveness-detection]
     user@host# edit method
     ```

4. Specify the liveness detection method that you want DHCP to use.
   **NOTE:** In this release, the only method supported for liveness detection is Bidirectional Forwarding Detection (BFD).

   - For DHCP global configuration:
     ```
     [edit forwarding-options dhcp-relay liveness-detection method]
     user@host# edit bfd
     ```
   - For DHCP group configuration:
     ```
     [edit forwarding-options dhcp-relay group group-name liveness-detection method]
     user@host# edit bfd
     ```

5. Configure the liveness detection method as desired.
See Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients for an example of how to globally configure DHCP relay liveness detection.

6. Configure the action the router takes when a liveness detection failure occurs.

   • For DHCP global configuration:
     ```
     [edit forwarding-options dhcp-relay liveness-detection]
     user@host# edit failure-action action
     ```

   • For DHCP group configuration:
     ```
     [edit forwarding-options dhcp-relay group group-name liveness-detection]
     user@host# edit failure-action action
     ```

### Disabling DHCP Relay

You can disable DHCP relay on all interfaces or a group of interfaces.

To disable DHCP relay agent:

1. Specify that you want to configure override options.
   ```
   [edit forwarding-options dhcp-relay]
   user@host# edit overrides
   ```

2. Disable the DHCP relay agent.
   ```
   [edit forwarding-options dhcp-relay overrides]
   user@host# set disable-relay
   ```

Release Information

Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at the [edit...dhcpv6...] hierarchy levels introduced in Junos OS Release 10.4.

Description

Configure how many attempts are made to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.

Options

attempt-count—Maximum number of attempts.
Range: 1 through 10
Default: 8

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

**Release Information**
- Statement introduced in Junos OS Release 9.1.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**
Specify the character used as the delimiter between the concatenated components of the username.

**Options**
- `delimiter-character`—Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.

**Required Privilege Level**
- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.
**detection-time**

**Syntax**

detection-time {
    threshold milliseconds;
}

**Hierarchy Level**

- [edit system services dhcp-local-server liveness-detection method bfd],
- [edit system services dhcp-local-server dhcpv6 liveness-detection method bfd],
- [edit forwarding-options dhcp-relay liveness-detection method bfd], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd],
- [edit system services dhcp-local-server group group-name liveness-detection method bfd],
- [edit system services dhcp-local-server dhcpv6 group group-name liveness-detection method bfd],
- [edit forwarding-options dhcp-relay group group-name liveness-detection method bfd],
- [edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd]

**Release Information**

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Enable failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.

The remaining statement is explained separately.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

Release Information
Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description
Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch and enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The extended DHCP local server is incompatible with the DHCP server on J Series routers and so is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the [edit forwarding-options helpers] hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The dhcpv6 stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

NOTE: When you configure the dhcp-local-server statement at the routing instance hierarchy level, you must use a routing instance type of virtual-router.

The remaining statements are explained separately.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

[edit system services dhcp-local-server]

Release Information
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description
Configure DHCPv6 local server options on the router or switch and enable the router or switch to function as a server for the DHCP protocol for IP version 6 (IPv6). The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.

The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.

The remaining statements are explained separately.

Required Privilege
Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

**Release Information**

- Statement introduced in Junos OS Release 9.1.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Specify the domain name that is concatenated with the username during the subscriber authentication or DHCP client authentication process.

**Options**

- `domain-name-string`—Domain name formatted string.

**Required Privilege Level**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.
duplicate-clients-on-interface (DHCP Local Server)

**Syntax**

duplicate-clients-on-interface;

**Hierarchy Level**

[edit logical-systems logical-system-name routing-instances routing-instance-name system services dhcp-local-server],
[edit logical-systems logical-system-name system services dhcp-local-server],
[edit routing-instances routing-instance-name system services dhcp-local-server],
[edit system services dhcp-local-server]

**Release Information**

Statement introduced in Junos OS Release 10.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Configure DHCP local server to include the client subinterface when distinguishing between duplicate DHCP clients (clients with the same MAC address or client ID) in the same subnet. By default, DHCP distinguishes clients by subnet. This feature is supported on DHCPv4 only.

**Required Privilege Level**

system—To view this statement in the configuration.

[edit system services dhcp-local-server pool-match-order]

**Release Information**  
Statement introduced in Junos OS Release 10.0.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**  
Specify that an external authority (for example, RADIUS or Diameter) provides the address assignment.

When RADIUS is the external authority, the router uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. When Diameter is the external authority, the router uses the Diameter counterpart of RADIUS Framed-IPv6-Pool attribute.

**Required Privilege**  
Level  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Release Information  
Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  
Configure the action the router (or switch) takes when a liveness detection failure occurs.

Options  
clear-binding—The client session is cleared when a liveness detection failure occurs.

clear-binding-if-interface-up—The client session is cleared only when a liveness detection failure occurs and the local interface is detected as being up.

log-only—A message is logged to indicate the event; no action is taken and DHCP is left to manage the failure.

Required Privilege Level  
routing—To view this statement in the configuration.
            routing-control—To add this statement to the configuration.

[edit system services dhcp-local-server]
```

**Release Information**

Statement introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Configure how the DHCP local server handles DHCP snooped packets on specific interfaces.

**Options**

- **all-interfaces**—Perform the action on all interfaces.
- **configured-interfaces**—Perform the action only on configured interfaces.
- **non-configured-interfaces**—Perform the action only on nonconfigured interfaces.

**Required Privilege Level**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

**Related Documentation**

Release Information
Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description
Configure a group of interfaces that have a common configuration, such as authentication parameters. A group must contain at least one interface.

Options

  group-name—Name of the group.

The remaining statements are explained separately.

Required Privilege Level
  system—To view this statement in the configuration.
  system-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name system services dhcp-local-server ...]

Release Information

Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Options upto and exclude introduced in Junos OS Release 9.1.

Description

Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the interface interface-name statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP relay agent.

NOTE: DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see the Ethernet Networking Feature Guide for MX Series Routers.

Options

exclude—Exclude an interface or a range of interfaces from the group. This option and the overrides option are mutually exclusive.

interface-name—Name of the interface. You can repeat this option multiple times.

upto-interface-name—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the upto-interface-name must be the same as the device name of the interface-name.
The remaining statements are explained separately.

**Required Privilege**

- system — To view this statement in the configuration.
- system-control — To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Set the maximum number of DHCP subscribers or DHCP clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.

Default

No limit

Options

number—Maximum number of clients allowed.
Range: 1 through 500,000

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

interface-delete (Subscriber Management or DHCP Client Management)

Syntax  interface-delete;

Hierarchy Level  [edit system services subscriber-management maintain-subscriber]

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  On router—Configure the router to maintain, rather than log out, subscribers when the subscriber interface is deleted. By default, the router logs out subscribers when the subscriber interface is deleted.

On switch—Configure the switch to maintain rather than log out DHCP clients when the client interface is deleted. By default, the switch logs out DHCP clients when the client interface is deleted.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

[edit system services dhcp-local-server pool-match-order]
```

**Release Information**

Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.

**Required Privilege**

```

**Release Information**

Statement introduced in Junos OS Release 12.1.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the `transmit-interval minimal-interval` and `minimum-receive-interval` statements.

**Options**

- `milliseconds` — Specify the minimum interval value for BFD liveliness detection.  
  **Range:** 1 through 255,000

**Required Privilege Level**

- routing — To view this statement in the configuration.  
- routing-control — To add this statement to the configuration.

**Related Documentation**

- Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1231

**Description**
Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication or DHCP client authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.

**Options**
- `circuit-id`—(Optional) Agent Circuit ID suboption (suboption 1).
- `remote-id`—(Optional) Agent Remote ID suboption (suboption 2).

**Required Privilege Level**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

option-82 (DHCP Local Server Pool Matching)

Syntax

```
option-82;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name system services dhcp-local-server pool-match-order],
[edit logical-systems logical-system-name system services dhcp-local-server pool-match-order],
[edit routing-instances routing-instance-name system services dhcp-local-server pool-match-order],
[edit system services dhcp-local-server pool-match-order]
```

Release Information

Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the `ip-address-first` statement before configuring the `option-82` statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

overrides (DHCP Local Server)

Syntax
overrides {
  client-discover-match;
  delegated-pool;
  interface-client-limit number;
  process-inform {
    pool pool-name;
  }
  rapid-commit;
}

Hierarchy Level
[edit system services dhcp-local-server],
[edit system services dhcp-local-server dhcv6],
[edit system services dhcp-local-server dhcv6 group group-name],
[edit system services dhcp-local-server dhcv6 group group-name interface interface-name],
[edit system services dhcp-local-server group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name system services dhcp-local-server ...],
[edit logical-systems logical-system-name system services dhcp-local-server ...],
[edit routing-instances routing-instance-name system services dhcp-local-server ...]

Release Information
Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description
Override the default configuration settings for the extended DHCP local server. Specifying the overrides statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.

- To override global DHCP local server configuration options, include the overrides statement and its subordinate statements at the [edit system services dhcp-local-server] hierarchy level.

- To override configuration options for a named group of interfaces, include the statements at the [edit system services dhcp-local-server group group-name] hierarchy level.

- To override configuration options for a specific interface within a named group of interfaces, include the statements at the [edit system services dhcp-local-server group group-name interface interface-name] hierarchy level.

- Use the [edit system services dhcp-local-server dhcv6] hierarchy level to override DHCPv6 configuration options.

The remaining statements are explained separately.

The interface-client-limit statement is not supported in the [edit system services dhcp-local-server dhcv6] hierarchy level.

The delegated-pool and the rapid-commit statements are supported in the [edit system services dhcp-local-server dhcv6 ...] hierarchy level only.
Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Release Information
Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at the [edit...] hierarchy levels introduced in Junos OS Release 10.4.

Description
Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.

Default
The client is deleted when a RADIUS-initiated disconnect is received.

Required Privilege Level
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Release Information**
Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**
Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.

**Default**
Rapid commit support is not enabled.

**Required Privilege**
- **Level**
  - system—To view this statement in the configuration.
  - system-control—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Specify the default subscriber service or DHCP client management service, which is activated when the subscriber or client logs in and no other service is activated by a RADIUS server or a provisioning server.

- To specify the default service for all DHCP local server clients, include the `service-profile` statement at the `[edit system services dhcp-local-server]` hierarchy level.
- To specify the default service for a named group of interfaces, include the `service-profile` statement at the `[edit system services dhcp-local-server group group-name]` hierarchy level.
- To specify the default service for a particular interface within a named group of interfaces, include the `service-profile` statement at the `[edit system services dhcp-local-server group group-name interface interface-name]` hierarchy level.
- For DHCPv6 clients, use the `service-profile` statement at the `[edit system services dhcp-local-server dhcpv6]` hierarchy level.

**Options**

- `dynamic-profile-name`—Name of the dynamic profile that defines the service.

**Required Privilege Level**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

- [edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd]

Release Information

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Configure the session mode.

Options

- **automatic**—Configure single-hop BFD sessions if the peer is directly connected to the router interface and multihop BFD sessions if the peer is not directly connected to the router interface.
- **multihop**—Configure multihop BFD sessions.
- **single-hop**—Configure single hop BFD sessions.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Release Information**
Statement introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**
Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.

**Default**
Accept solicit messages from clients that do not support reconfiguration and permit them to bind.

**Required Privilege Level**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Extended DHCP Local Server Dynamic Client Reconfiguration on page 1268

[edit forwarding-options dhcp-relay group group-name liveness-detection method bfd
detection-time],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd
detection-time]

Release Information

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Specify the threshold for the adaptation of the detection time. When the BFD session
detection time adapts to a value equal to or greater than the threshold, a single trap and
and a single system log message are sent.

NOTE: The threshold time must be greater than or equal to the
minimum-interval or the minimum-receive-interval.

Options

milliseconds—Value for the detection time adaptation threshold.

Range: 1 through 255,000

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Related Documentation

threshold (transmit-interval)

Syntax

threshold milliseconds;

Hierarchy Level

[edit system services dhcp-local-server liveness-detection method bfd transmit-interval], [edit system services dhcp-local-server dhcpv6 liveness-detection method bfd transmit-interval], [edit forwarding-options dhcp-relay liveness-detection method bfd transmit-interval], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd transmit-interval], [edit system services dhcp-local-server group group-name liveness-detection method bfd transmit-interval], [edit system services dhcp-local-server dhcpv6 group group-name liveness-detection method bfd transmit-interval], [edit forwarding-options dhcp-relay group group-name liveness-detection method bfd transmit-interval], [edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd transmit-interval]

Release Information

Statement introduced in Junos OS Release 12.1.

Description

Specify the threshold for detecting the adaptation of the transmit interval. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.

Options

milliseconds — Threshold value.

Range: 0 through 4,294,967,295 (2^{32} – 1)

NOTE: The threshold value specified in the threshold statement must be greater than the value specified in the minimum-interval statement for the transmit-interval statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**Release Information**

- Statement introduced in Junos OS Release 10.0.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
- Support at the `[edit...dhcpv6...]` hierarchy levels introduced in Junos OS Release 10.4.

**Description**

Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, *Authentication for DHCP Messages*, section 4.

**Options**

- `token-value`—Plain-text alphanumeric string.

**Default**: null (empty string)

**Required Privilege Level**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

traceoptions (DHCP Server)

Syntax

traceoptions {
  file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
  flag flag;
}

Hierarchy Level

[edit system services dhcp]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Define tracing operations for DHCP processes for J Series Services Routers and EX Series switches.

Options

file filename—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory /var/log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

Range: 2 through 1000
Default: 3 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- all—All tracing operations
- binding—Trace binding operations
- config—Log reading of configuration
- conflict—Trace user-detected conflicts for IP addresses
- event—Trace important events
- ifdb—Trace interface database operations
- io—Trace I/O operations
- lease—Trace lease operations
- main—Trace main loop operations
- misc—Trace miscellaneous operations
- packet—Trace DHCP packets
• **options**—Trace DHCP options
• **pool**—Trace address pool operations
• **protocol**—Trace protocol operations
• **rtsock**—Trace routing socket operations
• **scope**—Trace scope operations
• **signal**—Trace DHCP signal operations
• **trace**—All tracing operations
• **ui**—Trace user interface operations

**match regex**—(Optional) Refine the output to include lines that contain the regular expression.

• **all**—All tracing operations
• **binding**—Trace binding operations
• **config**—Log reading of configuration
• **conflict**—Trace user-detected conflicts for IP addresses
• **event**—Trace important events
• **ifdb**—Trace interface database operations
• **io**—Trace I/O operations
• **lease**—Trace lease operations
• **main**—Trace main loop operations
• **match regex**—Refine the output to include lines that contain the regular expression.
• **misc**—Trace miscellaneous operations
• **packet**—Trace DHCP packets
• **options**—Trace DHCP options
• **pool**—Trace address pool operations
• **protocol**—Trace protocol operations
• **rtsock**—Trace routing socket operations
• **scope**—Trace scope operations
• **signal**—Trace DHCP signal operations
• **trace**—All tracing operations
• **ui**—Trace user interface operations

**no-world-readable**—(Optional) Disable unrestricted file access.
size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and filename.

Syntax: `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

[edit system services dhcp-local-server dynamic-profile profile-name],
[edit system services dhcp-local-server group group-name dynamic-profile profile-name]

Release Information

Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber or DHCP client logs in. Subsequent subscribers (or clients) are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber (or client) logs out, the next subscriber (or client) that logs in is assigned the primary dynamic profile.

Options

primary-profile-name—Name of the dynamic profile to configure as the primary dynamic profile

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

- [edit logical-systems logical-system-name routing-instances routing-instance-name system services dhcp-local-server ...],
- [edit logical-systems logical-system-name system services dhcp-local-server ...],
- [edit routing-instances routing-instance-name system services dhcp-local-server ...]

**Release Information**
- Statement introduced in Junos OS Release 9.1.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**
Configure the username that the router or switch passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS.

The statements are explained separately. The `option-60` and `option-82` statements are not supported in the DHCPv6 hierarchy levels. The `client-id`, `relay-agent-interface-id`, `relay-agent-remote-id` and `relay-agent-subscriber-id` statements are supported in the DHCPv6 hierarchy levels only.

**Required Privilege Level**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

DHCP Relay Agent Configuration Statements

• [edit forwarding-options dhcp-relay] Hierarchy Level on page 1386

[edit forwarding-options dhcp-relay] Hierarchy Level

This topic lists supported and unsupported configuration statements in the [edit forwarding-options dhcp-relay] hierarchy level on EX Series switches.

• Supported statements are those that you can use to configure some aspect of a software feature on the switch.
• Unsupported statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
• Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see "EX Series Switch Software Features Overview" on page 27.

This topic lists:

• Supported Statements in the [edit forwarding-options dhcp-relay] Hierarchy Level on page 1387
• Unsupported Statements in the [edit forwarding-options dhcp-relay] Hierarchy Level on page 1391

Supported Statements in the [edit forwarding-options dhcp-relay] Hierarchy Level

The following hierarchy shows the [edit forwarding-options dhcp-relay] configuration statements supported on EX Series switches:

```plaintext
forwarding-options {
    dhcp-relay {
        active-server-group server-group-name;
        arp-inspection;
        authentication {
            ...;
        }
    }
    authentication {
        password password-string;
    }
    username-include {
        circuit-type;
        client-id;
        delimiter delimiter-character;
        domain-name domain-name-string;
        interface-name;
        mac-address;
        option-60;
        option-82 <circuit-id> <remote-id>;
        relay-agent-interface-id;
        relay-agent-remote-id;
        relay-agent-subscriber-id;
        routing-instance-name;
        user-prefix user-prefix-string;
    }
    dhcpv6 {
        active-server-group server-group-name;
        authentication {
            ...

access (Dynamic Access Routes)

Syntax

```
access {
  route prefix {
    next-hop next-hop;
    metric route-cost;
    preference route-distance;
    tag route-tag;
  }
}
```

Hierarchy Level

- [edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options],
- [edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name],
- [edit dynamic-profiles profile-name routing-options]

Release Information

Description

Dynamically configure access routes.

BEST PRACTICE: We recommend that you always include the access-internal stanza in the dynamic-profile when the access stanza is present for framed-route support.

Options

The remaining statements are explained separately.

Required Privilege Level

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

Related Documentation

- Configuring Dynamic Access Routes for Subscriber Management
access-internal (Dynamic Access-Internal Routes)

**Syntax**

```
access-internal {
    route subscriber-ip-address {
        qualified-next-hop underlying-interface {
            mac-address address;
        }
    }
}
```

**Hierarchy Level**

- `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options]`
- `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name]`
- `[edit dynamic-profiles routing-options]`

**Release Information**

**Description**

Dynamically configure access-internal routes. Access-internal routes are optional, but are used instead of access routes if the next-hop address is not specified in the Framed-Route Attribute [22] for IPv4 or the Framed-IPv6-Route attribute [99] for IPv6.

---

**BEST PRACTICE:** We recommend that you always include the access-internal stanza in the dynamic-profile when the access stanza is present for framed-route support.

The remaining statements are explained separately.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 8.3.
Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Apply a DHCP relay agent configuration to the named group of DHCP server addresses.
Use the statement at the `[edit ... dhcpv6]` hierarchy levels to configure DHCPv6 support.
A group-specific configuration overrides a global option.

**Options**

- `server-group-name`—Name of the group of DHCP or DHCPv6 server addresses to which the DHCP or DHCPv6 relay agent configuration applies.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]

Release Information  
Statement introduced in Junos OS Release 10.2.  
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 12.1.

Description  
Explicitly enable DHCP snooping support on the router.

Use the statement at the [edit ... dhcpv6] hierarchy levels to explicitly enable snooping support on the router for DHCPv6 relay agent.

NOTE: In Junos OS Release 10.0 and earlier, DHCP snooping is enabled by default. In Release 10.1 and later, DHCP snooping is disabled by default.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

  [edit routing-instances routing-instance-name forwarding-options dhcp-relay overrides],
  [edit routing-instances routing-instance-name forwarding-options dhcp-relay group-group-name overrides],
  [edit routing-instances routing-instance-name forwarding-options dhcp-relay group-group-name interface interface-name overrides]

Release Information  Statement introduced in Junos OS Release 8.3.
  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  Override the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server. The use of this option causes the DHCP relay agent to perform one of the following actions, depending on how it is configured:

  • If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.

  • If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.

Required Privilege Level  interface—To view this statement in the configuration.
  interface-control—To add this statement to the configuration.

Related Documentation  • Extended DHCP Relay Agent Overview on page 1215
authentication (DHCP Relay Agent)

Syntax  

authentication {  
  password password-string;  
  username-include {  
    circuit-type;  
    client-id;  
    delimiter delimiter-character;  
    domain-name domain-name-string;

**Release Information**

- Statement introduced in Junos OS Release 8.3.
- Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description**

Specify the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix or textual description, or both, instead of `circuit-id`.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs) or stacked VLANs (S-VLANs) is as follows:

```plaintext
(fe | ge)-fpc/pic/port
```

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

```plaintext
(fe | ge)-fpc/pic/port:vlan-id
```

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

```plaintext
(fe | ge)-fpc/pic/port:svlan-id:vlan-id
```

The remaining statements are explained separately.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Enable failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.

The remaining statement is explained separately.

**Required Privilege**

- **Level**
  - routing—to view this statement in the configuration.
  - routing-control—to add this statement to the configuration.

Release Information
Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the router or switch and enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

The extended DHCP and DHCPv6 relay agent options configured with the `dhcp-relay` and `dhcpv6` statements are incompatible with the DHCP/BOOTP relay agent options configured with the `bootp` statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router (or switch) at the same time.

The remaining statements are explained separately.

**Required Privilege**

Release Information
Statement introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description
Configure DHCPv6 relay options on the router or switch and enable the router or switch
to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request
and reply packets between a DHCPv6 client and a DHCPv6 server.

The DHCPv6 relay agent server is fully compatible with the extended DHCP local server
and DHCP relay agent. However, the options configured with the dhcpv6 statement are
incompatible with the DHCP/BOOTP relay agent options configured with the bootp
statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot
be enabled on the router or switch at the same time.

The remaining statements are explained separately.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Configure DHCP relay agent to include the client subinterface when distinguishing between duplicate DHCP clients (clients with the same MAC address or client ID) in the same subnet. By default, DHCP relay distinguishes clients by subnet. This feature is supported on DHCPv4 only.

Required Privilege

Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit forwarding-options dhcp-relay group group-name liveness-detection],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection]

**Release Information**

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Configure the action the router (or switch) takes when a liveness detection failure occurs.

**Options**

- **clear-binding**—The client session is cleared when a liveness detection failure occurs.

- **clear-binding-if-interface-up**—The client session is cleared only when a liveness detection failure occurs and the local interface is detected as being up.

- **log-only**—A message is logged to indicate the event; no action is taken and DHCP is left to manage the failure.

**Required Privilege**

- **routin**g—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

forward-snooped-clients (DHCP Relay Agent)

**Syntax**
```
forward-snooped-clients (all-interfaces | configured-interfaces | non-configured-interfaces);
```

**Hierarchy Level**
- `[edit forwarding-options dhcp-relay]`
- `[edit logical-systems logical-system-name forwarding-options dhcp-relay]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay]`
- `[edit routing-instances routing-instance-name forwarding-options dhcp-relay]`

**Release Information**
- Statement introduced in Junos OS Release 10.4.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**
Configure how DHCP relay agent handles DHCP snooped packets on specific interfaces. The router or switch determines the DHCP snooping action to perform based on a combination of the `forward-snooped-clients` configuration and the configuration of either the `allow-snooped-clients` statement or the `no-allow-snooped-clients` statement.

The router (or switch) also uses this statement to determine how to handle snooped BOOTREPLY packets received on nonconfigured interfaces.

**Options**
- `all-interfaces`—Perform the action on all interfaces.
- `configured-interfaces`—Perform the action only on configured interfaces.
- `non-configured-interfaces`—Perform the action only on nonconfigured interfaces.

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

Release Information

Statement introduced in Junos OS Release 8.3.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Specify the name of a group of interfaces that have a common DHCP or DHCPv6 relay agent configuration. A group must contain at least one interface. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

Options

group-name—Name of a group of interfaces that have a common DHCP or DHCPv6 relay agent configuration.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

```

Release Information

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Configure the time (in milliseconds) for which Bidirectional Forwarding Detection (BFD) holds a session up notification.

Options

```
milliseconds — Interval specifying how long a BFD session must remain up before a state change notification is sent.
```

Range: 0 through 255,000
Default: 0

Required Privilege Level

```
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
```

Release Information

Statement introduced in Junos OS Release 8.3.
Options upto and exclude introduced in Junos OS Release 9.1.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the `interface` statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

NOTE: DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see the Ethernet Networking Feature Guide for MX Series Routers.
Options  

- **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

- **interface-name**—Name of the interface. You can repeat this option multiple times.

- **overrides**—Override the specified default configuration settings for the interface. The **overrides** statement is described separately.

- **upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately.

**Required Privilege**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Set the maximum number of DHCP (or DHCPv6) subscribers or clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

M120 and M320 routers do not support DHCPv6.

Default

No limit

Options

- `number`—Maximum number of clients allowed.
  - Range: 1 through 500,000

Required Privilege Level

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.
interface-delete (Subscriber Management or DHCP Client Management)

Syntax

interface-delete;

Hierarchy Level

[edit system services subscriber-management maintain-subscriber]

Release Information

Statement introduced in Junos OS Release 11.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

On router—Configure the router to maintain, rather than log out, subscribers when the subscriber interface is deleted. By default, the router logs out subscribers when the subscriber interface is deleted.

On switch—Configure the switch to maintain rather than log out DHCP clients when the client interface is deleted. By default, the switch logs out DHCP clients when the client interface is deleted.

Required Privilege Level

system—to view this statement in the configuration.
system-control—to add this statement to the configuration.

[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd transmit-interval]

**Release Information**

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the transmit-interval minimal-interval and minimum-receive-interval statements.

**Options**

milliseconds — Specify the minimum interval value for BFD liveliness detection.

**Range:** 1 through 255,000

**Required Privilege Level**

routing—To view this statement in the configuration.
routeing-control—To add this statement to the configuration.

**Related Documentation**

# next-hop (Dynamic Access-Internal Routes)

**Syntax**
```
next-hop next-hop;
```

**Hierarchy Level**
- `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options access route prefix]`
- `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name access route prefix]`
- `[edit dynamic-profiles profile-name routing-options access route prefix]`

**Release Information**

**Description**
Dynamically configure the next-hop address for an access route. Access routes are typically unnumbered interfaces.

**Options**
- **next-hop**—Either the specific next-hop address you want to assign to the access route or one of the following next-hop address predefined variables.
  - For IPv4 access routes, use the variable, `$junos-framed-route-nexthop`. The route prefix variable is dynamically replaced with the value in Framed-Route RADIUS attribute [22].
  - For IPv6 access routes, use the variable, `$junos-framed-route-ipv6-nexthop`. The variable is dynamically replaced with the value in Framed-IPv6-Route RADIUS attribute [99].

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

Release Information  
Statement introduced in Junos OS Release 10.2.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description  
Explicitly disable DHCP snooping support on the router or switch.
Use the statement at the [edit ... dhcpv6] hierarchy levels to explicitly disable snooping support on the router or switch for DHCPv6 relay agent.

NOTE: In Junos OS Release 10.0 and earlier, DHCP snooping is enabled by default. In Release 10.1 and later, DHCP snooping is disabled by default.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 10.4.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description**

Explicitly disable automatic binding of received DHCP request messages that have no entry in the database (stray requests). Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

M120 and M320 routers do not support DHCPv6.

**NOTE:** Beginning with Junos OS Release 10.4, automatic binding of stray requests is enabled by default. In Junos OS Release 10.3 and earlier releases, automatic binding of stray requests is disabled by default.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.
option-60 (DHCP Relay Agent)

[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay authentication username-include],
[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay group group-name authentication username-include],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay authentication username-include],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name authentication username-include]

Release Information

Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Specify the option 82 that is concatenated with the username during the subscriber authentication or client authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.

NOTE: The option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.

Options

circuit-id—(Optional) The string for the Agent Circuit ID suboption (suboption 1).

remote-id—(Optional) The string for the Agent Remote ID suboption (suboption 2).

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit logical-systems logical-system-name forwarding-options dhcp-relay ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

Release Information

Statement introduced in Junos OS Release 12.3.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description

Specify the DHCP option DHCP relay agent uses for selective processing of client traffic. You can configure support globally or for a named group of interfaces. You can also configure support for the extended DHCP relay agent on a per logical system and per routing instance basis.

Use the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level to configure the DHCPv6 relay agent support.

Options

```
option-number—The DHCP or DHCPv6 option in the incoming traffic.
```

**NOTE:** EX Series switches do not support the User Class Options.

- 15 (DHCPv6 only)—Use DHCPv6 option 15 (User Class Option) in packets
- 16 (DHCPv6 only)—(MX Series routers and EX Series switches only) Use DHCPv6 option 16 (Vendor Class Option) in packets
- 60 (DHCPv4 only)—(MX Series routers and EX Series switches only) Use DHCP option 60 (Vendor Class Identifier) in DHCP packets
- 77 (DHCPv4 only)—Use DHCP option 77 (User Class Identifier) in packets

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]

Release Information

Statement introduced in Junos OS Release 8.3.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Override the default configuration settings for the extended DHCP relay agent. Specifying the overrides statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

M120 and M320 routers do not support DHCPv6.

The following statements are supported at both the [edit ... dhcp-relay] and [edit ... dhcpv6] hierarchy levels. All other statements are supported at the dhcp-relay hierarchy levels only.

- allow-snooped-clients
- interface-client-limit
- no-allow-snooped-clients
- no-bind-on-request
- send-release-on-delete
The remaining statements are explained separately.

### preference (Subscriber Management)

**Syntax**

```plaintext
preference route-distance
```

**Hierarchy Level**

```plaintext
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options access route prefix],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name access route prefix],
[edit dynamic-profiles profile-name routing-options access route prefix]
```

**Release Information**

Statement introduced in Junos OS Release 9.5.

**Description**

Dynamically configure the distance for an access route.

**Options**

- **route-distance**—Either the specific distance you want to assign to the access route or either of the following distance variables:
  - ```$junos-framed-route-distance```—Distance of an IPv4 access route; the variable is dynamically replaced with the preference value (Subattribute 5) from the RADIUS Framed-Route attribute [22].
  - ```$junos-framed-route-ipv6-distance```—Distance of an IPv6 access route; the variable is dynamically replaced with the preference value (Subattribute 5) from the RADIUS Framed-IPv6-Route attribute [99].

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

- `[edit routing-instances routing-instance-name forwarding-options dhcp-relay group-name relay-option-82 circuit-id]`

Release Information

Statement introduced in Junos OS Release 8.3.
Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description

Add a prefix to the base option 82 Agent Circuit ID information in DHCP packets destined for a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name. Use the statement at the `[edit ... dhcpv6]` hierarchy levels to configure DHCPv6 support.

If you include only the hostname, only the logical system name, or only the routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with stacked virtual LANs (S-VLANs) is one of the following:

```markdown
host-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

If you include both the logical system name and the routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs is as follows:

```markdown
logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```
**logical-system-name:** routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id

If you include the hostname, logical system name, and routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs is as follows:

```
host-name/logical-system-name:routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

For Fast Ethernet or Gigabit Ethernet interfaces that use virtual LANs (VLANs) but not S-VLANs, only the **vlan-id** value appears in the Agent Circuit ID format. For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs or S-VLANs, neither the **vlan-id** value nor the **svlan-id** value appears.

**Options**  
**prefix**—Any of the following:

- **host-name**—Prepend the hostname of the router configured with the `host-name` statement at the [edit system] hierarchy level to the Agent Circuit ID information.
- **logical-system-name**—Prepend the name of the logical system to the Agent Circuit ID information.
- **routing-instance-name**—Prepend the name of the routing instance to the Agent Circuit ID information.

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Enable DHCP relay proxy mode on the extended DHCP relay. Proxy mode supports all extended DHCP relay functionality.

The extended DHCP relay proxy is not supported for the J Series routers DHCP server. Also, you cannot configure both the DHCP relay proxy and the extended DHCP local server on the same interface.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### relay-option-82

#### Syntax
```
relay-option-82 {
  circuit-id {
    prefix prefix;
    use-interface-description (logical | device);
  }
}
```

#### Hierarchy Level
- `[edit forwarding-options dhcp-relay]`
- `[edit forwarding-options dhcp-relay group group-name]`
- `[edit logical-systems logical-system-name forwarding-options dhcp-relay group group-name]`
- `[edit logical-systems logical-system-name forwarding-options routing-instance-name forwarding-options dhcp-relay group group-name]`
- `[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name]`
- `[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name]`

#### Release Information
Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

#### Description
Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.

If you enable insertion of option 82 information in DHCP packets, you must specify at least the `circuit-id` statement to include the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option.

You can use the `relay-option-82` statement and its subordinate statements at the `[edit forwarding-options dhcp-relay]` hierarchy level to control insertion of option 82 information globally, or at the `[edit forwarding-options dhcp-relay group group-name]` hierarchy level to control insertion of option 82 information for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), use the `delete relay-option-82` statement.

The remaining statements are explained separately.

#### Required Privilege Level
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

 [edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay ...],
 [edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

Release Information
Statement introduced in Junos OS Release 12.3.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description
Relay DHCP client packets to the specified group of DHCP servers when you use the DHCP relay selective processing feature. You can configure the relay operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.

Options
```
relay-server-group—Name of DHCP server group.
```

Required Privilege Level
```
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.
```

Release Information

Statement introduced in Junos OS Release 8.3.
Support at the [edit... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Specify the name of a group of DHCP server addresses for use by the extended DHCP relay agent. Use the statement at the [edit... dhcpv6] hierarchy levels to configure DHCPv6 support.

Options

- **server-group-name**—Name of the group of DHCP or DHCPv6 server addresses.
- **server-ip-address**—IP address of the DHCP server belonging to this named server group. Use IPv6 addresses when configuring DHCPv6 support. You can configure a maximum of five IP addresses in each named server group.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at the [edit forwarding-options dhcp-relay...] hierarchy levels introduced in Junos OS Release 11.4.

Description

Specify the default subscriber service (or the default DHCP client management service), which is activated when the subscriber (or client) logs in and no other service is activated by a RADIUS server or a provisioning server.

- To specify the default service for all DHCP relay agent clients, include the `service-profile` statement at the [edit forwarding-options dhcp-relay] hierarchy level.
- To specify the default service for a named group of interfaces, include the `service-profile` statement at the [edit forwarding-options dhcp-relay group group-name] hierarchy level.
- To specify the default service for a particular interface within a named group of interfaces, include the `service-profile` statement at the [edit forwarding-options dhcp-relay group group-name interface interface-name] hierarchy level.

Options

- `dynamic-profile-name`—Name of the dynamic profile.

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

[edit forwarding-options dhcp-relay group group-name liveness-detection method bfd],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd]

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  Configure the session mode.

Options  automatic—Configure single-hop BFD sessions if the peer is directly connected to the router interface and multihop BFD sessions if the peer is not directly connected to the router interface.

multihop—Configure multihop BFD sessions.

single-hop—Configure single hop BFD sessions.

Required Privilege  Level  routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit forwarding-options dhcp-relay group group-name liveness-detection method bfd
detection-time],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd
detection-time]

Release Information
Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description
Specify the threshold for the adaptation of the detection time. When the BFD session
detection time adapts to a value equal to or greater than the threshold, a single trap and
and a single system log message are sent.

NOTE: The threshold time must be greater than or equal to the
minimum-interval or the minimum-receive-interval.

Options
milliseconds—Value for the detection time adaptation threshold.
Range: 1 through 255,000

Required Privilege
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit forwarding-options dhcp-relay group group-name liveness-detection method bfd transmit-interval],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd transmit-interval]
```

Release Information

Statement introduced in Junos OS Release 12.1.

Description

Specify the threshold for detecting the adaptation of the transmit interval. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.

Options

- `milliseconds` — Threshold value.
- `Range`: 0 through 4,294,967,295 ($2^{32} - 1$)

NOTE: The threshold value specified in the threshold statement must be greater than the value specified in the minimum-interval statement for the transmit-interval statement.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Release Information

Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description

Use the textual interface description instead of the interface identifier when creating the agent-circuit-id suboption of the DHCP relay agent option 82. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

If you specify that the textual description is used and no description is configured for the interface, DHCP relay defaults to using the interface identifier. The textual description is configured using the description statement at the [edit interfaces interface-name] hierarchy level.

NOTE: By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description is longer than 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.
**Options**

- **logical**—Use the textual description that is configured for the logical interface.
- **device**—Use the textual description that is configured for the device interface.

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 9.3.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.

Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

EX Series switches do not support DHCPv6.

**Options**

- **primary-profile-name**—Name of the dynamic profile to configure as the primary dynamic profile

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name authentication username-include],

Release Information

Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.

Description

Specify the user prefix that is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.

Options

user-prefix-string—User prefix string.

Required Privilege Level

interface—To view this statement in the configuration.
ininterface-control—To add this statement to the configuration.

Related Documentation

• Using External AAA Authentication Services with DHCP on page 1256
username-include (DHCP Relay Agent)

Syntax
username-include {
    circuit-type;
    client-id;
    delimiter delimiter-character;
    domain-name domain-name-string;
    interface-name;
    logical-system-name;
    mac-address;
    option-60;
    option-82 <circuit-id> <remote-id>;
    relay-agent-interface-id;
    relay-agent-remote-id;
    relay-agent-subscriber-id;

[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]

Release Information
Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at the [edit ... dhcpv6] hierarchy levels introduced in Junos OS Release 11.4.

Description
Configure the username that the router (or switch) passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS. Use the statement at the [edit...dhcppv6] hierarchy levels to configure DHCPv6 support.

The following statements are not supported in the DHCPv6 hierarchy levels:

- mac-address
- option-60
- option-82

The following statements are supported in the DHCPv6 hierarchy levels only:

- relay-agent-interface-id
- relay-agent-remote-id
- relay-agent-subscriber-id
The remaining statements are explained separately.

**Required Privilege**

- **Level**
  - interface—to view this statement in the configuration.
  - interface-control—to add this statement to the configuration.

**Related Documentation**

[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd],
[edit forwarding-options dhcp-relay liveness-detection method bfd],
[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd],
[edit system services dhcp-local-server group group-name liveness-detection method bfd],
[edit system services dhcp-local-server dhcpv6 group group-name liveness-detection method bfd],
[edit forwarding-options dhcp-relay group group-name liveness-detection method bfd],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection method bfd]
```

**Release Information**

- Statement introduced in Junos OS Release 12.1.
- Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Configure the BFD protocol version to detect.

**Options**

- **0**—Use BFD protocol version 0.
- **1**—Use BFD protocol version 1.
- **automatic**—Autodetect the BFD protocol version.

**Default:** automatic

**Required Privilege**

- **Level**
  - routing—to view this statement in the configuration.
  - routing-control—to add this statement to the configuration.

**Related Documentation**

Other Configuration Statements

cache-size

Syntax  cache-size bytes;

Hierarchy Level  [edit security certificates]

Release Information  Statement introduced before Junos OS Release 7.4.
  Statement introduced in Junos OS Release 9.0 for EX Series switches.
  Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  (Encryption interface on M Series and T Series routers and EX Series switches only)
  Configure the cache size for digital certificates.

Options  bytes—Cache size for digital certificates.
  Range:  64 through 4,294,967,295
  Default:  2 megabytes (MB)

NOTE:  We recommend that you limit your cache size to 4 MB.

Required Privilege Level
  admin—To view this statement in the configuration.
  admin-control—To add this statement to the configuration

Related Documentation

**cache-timeout-negative**

**Syntax**
cache-timeout-negative seconds;

**Hierarchy Level**
[edit security certificates]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
(Encryption interface on M Series and T Series routers and EX Series switches only)
Configure a negative cache for digital certificates.

**Options**
seconds—Negative time to cache digital certificates, in seconds.
Range: 10 through 4,294,967,295
Default: 20

---

**CAUTION:** Configuring a large negative cache value can lead to a denial-of-service attack.

**Required Privilege Level**
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration

**Related Documentation**
• Configuring Digital Certificates for an ES PIC
certificates

**Syntax**

```
certificates {
  cache-size bytes;

    crl file-name;
    encoding (binary | pem);
    enrollment-url url-name;
    file certificate-filename;
    ldap-url url-name;
  }
  enrollment-retry attempts;
  local certificate-name {
    certificate-key-string;
    load-key-file URL filename;
  }
  maximum-certificates number;
  path-length certificate-path-length;
}
```

**Hierarchy Level**

[edit security]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

(Encryption interface on M Series and T Series routers and EX Series switches only)

Configure the digital certificates for IPsec.

The remaining statements are explained separately.

**Required Privilege Level**

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Digital Certificates for an ESPIC
certification-authority

Syntax  
certification-authority ca-profile-name {  
  ca-name ca-identity;  
  crl file-name;  
  encoding (binary | pem);  
  enrollment-url url-name;  
  file certificate-filename;  
  ldap-url url-name;  
}

Hierarchy Level  [edit security certificates]

Release Information  Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  (Encryption interface on M Series and T Series routers and EX Series switches only)  
Configure a certificate authority profile name.

  The remaining statements are explained separately.

Required Privilege Level  
admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration

## connection-limit

### Syntax

```
connection-limit limit;
```

### Hierarchy Level

- [edit system services finger]
- [edit system services ftp]
- [edit system services netconf ssh]
- [edit system services ssh]
- [edit system services telnet]
- [edit system services xnm-clear-text]
- [edit system services xnm-ssl]

### Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

### Description

Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).

### Options

- **limit**—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).
  - **Range**: 1 through 250
  - **Default**: 75

### Required Privilege

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

### Related Documentation

- Configuring clear-text or SSL Service for Junos XML Protocol Client Applications
- Configuring DTCP-over-SSH Service for the Flow-Tap Application
- Configuring Finger Service for Remote Access to the Router
- Configuring FTP Service for Remote Access to the Router or Switch
- Configuring SSH Service for Remote Access to the Router or Switch
- Configuring Telnet Service for Remote Access to a Router or Switch

---

**NOTE:** The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured connection-limit value if the system resources are limited.
crl (Encryption Interface)

Syntax  
crl file-name;

Hierarchy Level  
[edit security certificates]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
(Encryption interface on M Series and T Series routers and EX Series switches only)  
Configure the certificate revocation list (CRL). A CRL is a time-stamped list identifying  
revoked certificates, which is signed by a CA and made available to the participating  
IPsec peers on a regular periodic basis.

Options  
file-name—Specify the file from which to read the CRL.

Required Privilege  
Level  
admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration

Related Documentation  
• Configuring Digital Certificates for an ESPIC

domain-search

Syntax  
domain-search [ domain-list ];

Hierarchy Level  
[edit system],  
[edit system services dhcp],  
[edit system services dhcp],  
[edit system services dhcp pool],  
[edit system services dhcp static-binding]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Configure a list of domains to be searched.

Options  
domain-list—A list of domain names to search. The list can contain up to six domain  
names, with a total of up to 256 characters.

Required Privilege  
Level  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Related Documentation

encoding

Syntax  encoding (binary | pem);

Hierarchy Level  [edit security ike policy ike-peer-address],
                 [edit security certificates certification-authority ca-profile-name]

Release Information  Statement introduced before Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 9.0 for EX Series switches.
                      Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  (Encryption interface on M Series and T Series routers and EX Series switches only)
             Specify the file format used for the local-certificate and local-key-pair
             statements.

Options  binary—Binary file format.
         pem—Privacy-enhanced mail (PEM), an ASCII base 64 encoded format.
         Default: binary

Required Privilege
Level  admin—To view this statement in the configuration.
       admin-control—To add this statement to the configuration.

Related Documentation  • Configuring Digital Certificates for an ES PIC
                       • Configuring an IKE Policy for Digital Certificates for an ES PIC

enrollment-retry

Syntax  enrollment-retry attempts;

Hierarchy Level  [edit security certificates]

Release Information  Statement introduced before Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  (Encryption interface on M Series and T Series routers and EX Series switches only)
             Specify how many times a router or switch can resend a digital certificate request.

Options  attempts—Number of enrollment retries.
         Range: 0 through 100
         Default: 0

Required Privilege
Level  admin—To view this statement in the configuration.
       admin-control—To add this statement to the configuration.

Related Documentation  • Configuring Digital Certificates for an ES PIC
enrollment-url

Syntax enrollment-url url-name;

Hierarchy Level [edit security certificates certification-authority ca-profile-name]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description (Encryption interface on M Series and T Series routers and EX Series switches only)
Specify where your router or switch sends Simple Certificate Enrollment Protocol-based
(SCEP-based) certificate enrollment requests (certificate authority URL).

Options url-name—Certificate authority URL.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

  mtu bytes;
}

family mpls family mpls {
  mtu bytes;
}

Hierarchy Level [edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range name unit logical-unit-number]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches, including options ethernet-switching, inet, and iso.
Option inet6 introduced in Junos OS Release 9.3 for EX Series switches.
Options ccc and mpls introduced in Junos OS Release 9.5 for EX Series switches.

Description Configure protocol family information for the logical interface on the switch.
You must configure a logical interface to be able to use the physical device.
**Default**  Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to family ethernet-switching by the default factory configuration. Before you can change the family setting for an interface to another family type, you must delete this default setting or any user-configured family setting. EX6200 and EX8200 switch interfaces do not have a default family setting.

**Options**  See Table 177 on page 1484 for protocol families available on the switch interfaces. Different protocol families support different subsets of the interface types on the switch. Interface types on the switch are:

- Aggregated Ethernet (ae)
- Gigabit Ethernet (ge)
- Interface-range configuration (interface-range)
- Loopback (lo0)
- Management Ethernet (me0)
- Routed VLAN interface (RVI) (vlan)
- Virtual management Ethernet (vme)
- 10-Gigabit Ethernet (xe)

If you are using an interface range, the supported protocol families are the ones supported by the interface types that compose the range.

Not all interface types support all family substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

*Supported on EX8200 switches only

The remaining statements are explained separately.
file

Syntax file certificate-filename;

Hierarchy Level [edit security certificates certification-authority ca-profile-name]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description (Encryption interface on M Series and T Series routers and EX Series switches only)
Specify the file from which to read the digital certificate.

Options certificate-filename—File from which to read the digital certificate.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation • Configuring Digital Certificates for an ES PIC
ftp

Syntax  ftp {
connection-limit limit;
rate-limit limit;
}

Hierarchy Level  [edit system services]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Allow FTP requests from remote systems to the local router or switch.

Options  The remaining statements are explained separately.

Required Privilege Level  system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation  • Configuring FTP Service for Remote Access to the Router or Switch
http

Syntax:

```
http {
  interfaces [ interface-names ];
  port port;
}
```

Hierarchy Level: [edit system services web-management]

Description: Configure the port and interfaces for HTTP service, which is unencrypted.

Options:

```
interfaces [ interface-names ]—Name of one or more interfaces on which to allow the HTTP service. By default, HTTP access is allowed through built-in Fast Ethernet or Gigabit Ethernet interfaces only.
```

The remaining statement is explained separately.

Required Privilege Level:

**lease-time**

**Syntax**  
`lease-time (seconds | infinite);`

**Hierarchy Level**  
`[edit interfaces interface-name unit logical-unit-number family inet dhcp]`

**Release Information**  
Statement introduced in Junos OS Release 8.5 for J Series devices.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 9.2 for SRX Series devices.

**Description**  
Request a specific lease time for the IP address. The lease time is the length of time in seconds that a client holds the lease for an IP address assigned by a DHCP server.

**Default**  
If no lease time is requested by client, then the server sends the lease time. The default lease time on a JUNOS OS DHCP server is one day.

**Options**  
- `seconds` — Request a lease time of a specific duration.  
  - **Range:** 60 through 2147483647 seconds
- `infinite` — Request that the lease never expire.

**Required Privilege Level**  
- `interface` — To view this statement in the configuration.  
- `interface-control` — To add this statement to the configuration.

local

Syntax

local certificate-name {
    certificate-key-string;
    load-key-file URL filename;
}

Hierarchy Level
[edit security certificates]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Import a paired X.509 private key and authentication certificate, to enable Junos XML protocol client applications to establish Secure Sockets Layer (SSL) connections to the router or switch.

Options
certificate-name certificate-key-string—String of alphanumeric characters that constitute the private key and certificate.

certificate-name—Name that uniquely identifies the certificate.

load-key-file URL filename—File that contains the private key and certificate. It can be one of two types of values:

- Pathname of a file on the local disk (assuming you have already used another method to copy the certificate file to the router’s or switch’s local disk)

- URL to the certificate file location (for instance, on the computer where the Junos XML protocol client application runs)

Required Privilege Level
system—to view this statement in the configuration.
system-control—to add this statement to the configuration.

**maximum-hop-count**

Syntax  
maximum-hop-count *number*;

Hierarchy Level  
[edit forwarding-options helpers bootp],
[edit forwarding-options helpers bootpinterface (interface-name | interface-group)]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for QFX Series switches.

Description  
Specify the maximum number of hops allowed.

Options  
*number*—Maximum number of hops.
Default: 4 hops

Required Privilege Level  
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  
- Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents

**maximum-lease-time (DHCP)**

Syntax  
maximum-lease-time *seconds*;

Hierarchy Level  
[edit system services dhcp],

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
For J Series Services Routers and EX Series switches only. Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.
An exception is that the dynamic BOOTP lease length can exceed the maximum lease length specified.

Options  
*seconds*—The maximum number of seconds the lease can be held.

Required Privilege Level  
system—To view this statement in the configuration.
system-control—To add this statement to the configuration

Related Documentation  
- Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers
- default-lease-time
**minimum-wait-time**

**Syntax**  
minimum-wait-time seconds;

**Hierarchy Level**  
[edit forwarding-options helpers bootp],  
[edit forwarding-options helpers bootpinterface (interface-name | interface-group)]

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for QFX Series switches.

**Description**  
Specify the minimum time allowed.

**Options**  
seconds—Minimum time.  
Default: 0 seconds

**Required Privilege Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**  
• Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents

**name-server**

**Syntax**  
name-server {  
  address;  
}

**Hierarchy Level**  
[edit system],  
[edit system services dhcp],  
[edit system services dhcp],  
[edit system services dhcp pool],  
[edit system services dhcp static-binding]

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Configure one or more Domain Name System (DNS) name servers.

**Options**  
address—Address of the name server. To configure multiple name servers, include a maximum of three address options.

**Required Privilege Level**  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

    file filename <files number> <match regex> <size size> <world-readable |
    no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

**Hierarchy Level**

[edit system services]

**Release Information**

Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure a router or switch running the Junos OS behind a firewall to communicate with client management applications on the other side of the firewall.

**Default**

To configure transmission of the router’s or switch’s device ID to the application, include the `device-id` statement at the `[edit system services]` hierarchy level.

**Options**

- **client-id**—Identifies the `outbound-ssh` configuration stanza on the router or switch. Each `outbound-ssh` stanza represents a single outbound SSH connection. This attribute is not sent to the client.

- **device-id**—Identifies the router or switch to the client during the initiation sequence.

- **keep-alive**—(Optional) When configured, specifies that the router or switch send keepalive messages to the management server. To configure the keepalive message, you must set both the `timeout` and `retry` attributes.

- **reconnect-strategy**—(Optional) Specify the method the router or switch uses to reestablish a disconnected outbound SSH connection. Two methods are available:
• **in-order**—Specify that the router or switch first attempt to establish an outbound SSH session based on the management server address list. The router or switch attempts to establish a session with the first server on the list. If this connection is not available, the router or switch attempts to establish a session with the next server, and so on down the list until a connection is established.

• **sticky**—Specify that the router or switch first attempt to reconnect to the management server that it was last connected to. If the connection is unavailable, it attempts to establish a connection with the next client on the list and so forth until a connection is made.

**retry**—Number of keepalive messages the router or switch sends without receiving a response from the client before the current SSH connection is disconnected. The default is three messages.

**secret**—(Optional) Router's or switch's public SSH host key. If added to the `outbound-ssh` statement, during the initialization of the outbound SSH service, the router or switch passes its public key to the management server. This is the recommended method of maintaining a current copy of the router's or switch's public key.

**timeout**—Length of time that the Junos server waits for data before sending a keep alive signal. The default is 15 seconds.

When reconnecting to a client, the router or switch attempts to reconnect to the client based on the **retry** and **timeout** values for each client listed.

**address**—Hostname or the IPv4 address of the NSM application server. You can list multiple clients by adding each client's IP address or hostname along with the following connection parameters:

• **port**—Outbound SSH port for the client. The default is port 22.

• **retry**—Number of times the router or switch attempts to establish an outbound SSH connection before giving up. The default is three tries.

• **timeout**—Length of time that the router or switch attempts to establish an outbound SSH connection before giving up. The default is fifteen seconds.

**filename**—(Optional) By default, the filename of the log file used to record the trace options is the name of the traced process (for example, `mib2d` or `snmpd`). Use this option to override the default value.

**files**—(Optional) Maximum number of trace files generated. By default, the maximum number of trace files is 10. Use this option to override the default value.

When a trace file reaches its maximum size, the system archives the file and starts a new file. The system archives trace files by appending a number to the filename in sequential order from 1 to the maximum value (specified by the default value or the options value set here). Once the maximum value is reached, the numbering sequence is restarted at 1, overwriting the older file.
size—(Optional) Maximum size of the trace file in kilobytes (KB). Once the maximum file size is reached, the system archives the file. The default value is 1000 KB. Use this option to override the default value.

match—(Optional) When used, the system only adds lines to the trace file that match the regular expression specified. For example, if the match value is set to =error, the system only records lines to the trace file that include the string error.

services—Services available for the session. Currently, NETCONF is the only service available.

world-readable | no-world-readable—(Optional) Whether the files are accessible by the originator of the trace operation only or by any user. By default, log files are only accessible by the user that started the trace operation (no-world-readable).

all | configuration | connectivity—(Optional) Type of tracing operation to perform.

all—Log all events.

configuration—Log all events pertaining to the configuration of the router or switch.

connectivity—Log all events pertaining to the establishment of a connection between the client server and the router or switch.

no-remote-trace—(Optional) Disable remote tracing.

**Required Privilege**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

port (SRC Server)

**Syntax**
```
port port-number;
```

**Hierarchy Level**
```
[edit system services service-deployment servers server-address]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the port number on which to contact the SRC server.

**Options**
- `port-number`—(Optional) The TCP port number for the SRC server.
  - Default: 3333

**Required Privilege**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

process-inform

**Syntax**
```
process-inform {
  pool pool-name network address-range
}
```

**Hierarchy Level**
```
[edit system services dhcp-local-server overrides]
```

**Release Information**
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**
For extended Dynamic Host Configuration Protocol (DHCP) servers, enable the processing of DHCP information request messages sent from the client to the server to request DHCP options. The messages are also passed to the configured server list.

**Default**
Information request messages are not processed.

**Required Privilege**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**
- Configuring a DHCP Server on Switches (CLI Procedure) on page 1250
**protocol-version**

**Syntax**  
protocol-version version;

**Hierarchy Level**  
[edit system services ssh]

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**  
Specify the secure shell (SSH) protocol version.

**Default**  
v2—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.

**Options**  
version—SSH protocol version: v1, v2, or both.

**Required Privilege Level**  
admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring SSH Service for Remote Access to the Router or Switch
rate-limit

Syntax
rate-limit limit;

Hierarchy Level
[edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.

Default
150 connections

Options
rate-limit limit—(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6).
Range: 1 through 250
Default: 150

Required Privilege
system—To view this statement in the configuration.

Level
system-control—To add this statement to the configuration.

Related Documentation
• Configuring clear-text or SSL Service for Junos XML Protocol Client Applications
reconfigure

Syntax reconfigure {
  attempts attempts;
  clear-on-abort;
  timeout interval;
  token token;
}

Hierarchy Level [edit system services dhcp-local-server ]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description For extended Dynamic Host Configuration Protocol (DHCP) servers, enable dynamic reconfiguration triggered by the server of all DHCP clients.

Options attempts—Number of attempts made to reconfigure all DHCP clients.

  clear-on-abort—Delete all DHCP clients when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success.

  timeout interval—Initial value (in seconds) between attempts to reconfigure all DHCP clients. Each successive attempt doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.

  token—Configure a plain-text token for all DHCP clients. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled.

Required Privilege Level system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation • Configuring a DHCP Server on Switches (CLI Procedure) on page 1250
retransmission-attempt

Syntax retransmission-attempt number;

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family inet dhcp]

Description Specify the number of times the device retransmits a Dynamic Host Control Protocol (DHCP) packet if a DHCP server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.

Options number—Number of retransmit attempts.
  Range: 0 through 6
  Default: 4

Required Privilege Level interface—To view this statement in the configuration.
  interface-control—To add this statement to the configuration.

Related Documentation • Configuring a DHCP Client (CLI Procedure) on page 1249
  • Example: Configuring the Device as a DHCP Client

  • unit on page 2458
  • family on page 1482
retransmission-interval

Syntax   retransmission-interval seconds;

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number family inet dhcp]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the time between successive retransmissions of the client DHCP request if a DHCP server fails to respond.

Options  seconds—Number of seconds between successive retransmissions.
           Range: 4 through 64 seconds
           Default: 4 seconds

Required Privilege Level  interface—To view this statement in the configuration.
                         interface-control—To add this statement to the configuration.

Related Documentation  • Configuring a DHCP Client (CLI Procedure) on page 1249

server (DNS and TFTP Service)

Syntax   server address <logical-system logical-system-name> <routing-instance routing-instance-name>;

Hierarchy Level  [edit forwarding-options helpers domain],
                 [edit forwarding-options helpers domain interface interface-name],
                 [edit forwarding-options helpers tftp],
                 [edit forwarding-options helpers tftp interface interface-name]

Release Information  Statement introduced before Junos OS Release 7.4.
                     Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the DNS or TFTP server for forwarding DNS or TFTP requests. Only one server can be specified for each interface.

Options  address—Address of the server.
          logical-system logical-system-name—(Optional) Logical system of the server.
          routing-instance [ routing-instance-names ]—(Optional) Set the routing instance name or names that belong to the DNS server or TFTP server.

Required Privilege Level  interface—To view this statement in the configuration.
                         interface-control—To add this statement to the configuration.

Related Documentation  • Configuring DNS and TFTP Packet Forwarding
server-address

Syntax server-address ip-address;

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family inet dhcp]

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.2 for SRX Series devices.

Description Specify the address of the DHCP server that the client should accept DHCP offers from.
If this option is included in the DHCP configuration, the client accepts offers only from
this server and ignores all other offers.

Default The client accepts the first offer it receives from any DHCP server.

Options ip-address—DHCP server address.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

server-identifier

Syntax  
server-identifier address;

Hierarchy Level  
[edit system services dhcp],  
[edit system services dhcp pool],  
[edit system services dhcp static-binding]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
For J Series Services Routers and EX Series switches only. Configure a server identifier.  
The identifier can be used to identify a DHCP server in a DHCP message. It can also be used as a destination address from clients to servers (for example, when the boot file is set, but not the boot server).

Servers include the server identifier in DHCP OFFER messages so that clients can distinguish between multiple lease offers. Clients include the server identifier in DHCP REQUEST messages to select a lease and indicate which offer is accepted from multiple lease offers. Also, clients can use the server identifier to send unicast request messages to specific DHCP servers to renew a current lease.

This address must be a manually assigned, static IP address. The server cannot send a request and receive an IP address from itself or another DHCP server.

Default  
If no server identifier is set, the DHCP server sets the server identifier based on the primary interface address used by the server to receive a client request. For example, if the client sends a DHCP request and the server receives it on fe-0/0/0 and the primary interface address is 1.1.1.1, then the server identifier is set to 1.1.1.1.

Options  
address—IPv4 address of the server. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).

Required Privilege Level  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Related Documentation

session (Time-out)

Syntax

```
session {
    idle-timeout minutes;
    session-limit session-limit;
}
```

Hierarchy Level [edit system services web-management]

Release Information Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure limits for the number of minutes a session can be idle before it times out, and configure the number of simultaneous J-Web user login sessions.

Options

- **idle-timeout minutes**—Configure the number of minutes a session can be idle before it times out.
  - Range: 1 through 1440
  - Default: 1440

- **session-limit session-limit**—Configure the maximum number of simultaneous J-Web user login sessions.
  - Range: 1 through 1024
  - Default: Unlimited

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

### sip-server

**Syntax**

```
sip-server [address | name];
```

**Hierarchy Level**

```
[edit system services dhcp],
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]
```

**Release Information**

Statement introduced in Junos OS Release 10.1 for EX Series switches.

**Description**

Configure Session Initiation Protocol (SIP) server addresses or names for DHCP servers.

**Options**

- **address**—IPv4 address of the SIP server. To configure multiple SIP servers, include multiple `address` options. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).

- **name**—Fully qualified domain name of the SIP server. To configure multiple SIP servers, include multiple `name` options. This domain name must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).

**Required Privilege**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring a DHCP SIP Server (CLI Procedure) on page 1248

### source-address (SRC Software)

**Syntax**

```
source-address source-address;
```

**Hierarchy Level**

```
[edit system services service-deployment]
```

**Release Information**

**Description**

Enable Junos OS to work with the Session and Resource Control (SRC) software.

**Options**

- **source-address**—Local IPv4 address to be used as source address for traffic to the SRC server. The source address restricts traffic within the out-of-band network.

**Required Privilege**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring the Junos OS to Work with SRC Software
source-address-giaddr

**Syntax**

source-address-giaddr;

**Hierarchy Level**

[edit forwarding-options helpers bootp],
[edit forwarding-options helpers bootp interface interface-name]

**Release Information**

Statement introduced in Junos OS Release 10.1 for EX Series switches.

**Description**

Configure the gateway IP address (giaddr) as the source IP address of the switch for relayed DHCP packets when the switch is used as the DHCP relay agent.

When this statement is entered in the [edit forwarding-options helpers bootp] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting all interfaces on the switch.

When this statement is entered in the [edit forwarding-options helpers bootp interface interface-name] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting the specified interface of the switch.

In Junos OS Release 10.1 for EX Series switches and later releases, the IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is used as the source IP address for relayed DHCP packets by default.

In Junos OS Releases 9.6 and 10.0 for EX Series switches, the gateway IP address of the switch is always used as the source IP address for relayed DHCP packets when the switch is used as the DHCP relay agent.

In Junos OS Releases 9.3 through 9.5 for EX Series switches, the IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is always used as the source IP address for relayed DHCP packets.

**Required Privilege Level**

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

ssh

Syntax

```plaintext
ssh {
    ciphers [ cipher-1 cipher-2 cipher-3 ...];
    client-alive-count-max seconds;
    client-alive-interval seconds;
    connection-limit limit;
    hostkey-algorithm <algorithm|no-algorithm>;
    key-exchange <algorithm>;
    macs <algorithm>;
    max-sessions-per-connection <number>;
    no-tcp-forwarding;
    protocol-version [v1 v2];
    rate-limit limit;
    root-login (allow | deny | deny-password);
}
```

Hierarchy Level  [edit system services]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
`client-alive-interval` and `client-alive-max-count` statements introduced in Junos OS Release 12.2.

Description

Allow SSH requests from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

static-binding

**Syntax**

    static-binding mac-address {
        client-identifier (ascii client-id | hexadecimal client-id);
        fixed-address {
            address;
        }
        host-name client-hostname;
    }

**Hierarchy Level**

[edit system services dhcp],
[edit system services dhcp]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

For J Series Services routers and EX Series switches only. Set static bindings for DHCP clients. A static binding is a mapping between a fixed IP address and the client's MAC address or client identifier.

**Options**

- **mac-address**—The MAC address of the client. This is a hardware address that uniquely identifies a client on the network.
- **fixed-address address**—Fixed IP address assigned to the client. Typically a client has one address assigned, but you can assign more.
- **host-name client-hostname**—Hostname of the client requesting the DHCP server. The name can include the local domain name. Otherwise, the name is resolved based on the `domain-name` statement.
- **client-identifier (ascii client-id | hexadecimal client-id)**—Used by the DHCP server to index the database of address bindings. The client identifier is an ASCII string or hexadecimal number and can include a type-value pair as specified in RFC 1700, Assigned Numbers. Either a client identifier or the client's MAC address must be configured to uniquely identify the client on the network.

**Required Privilege Level**

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

traceoptions (DNS and TFTP Packet Forwarding)

**Syntax**

traceoptions {
    file filename <files number> <match regular-expression> <size bytes> <world-readable | no-world-readable>;
    flag flag;
    level level;
    <no-remote-trace>;
}

**Hierarchy Level**

[edit forwarding-options helpers]

**Release Information**

**Description**

Configure tracing operations for BOOTP, DNS and TFTP packet forwarding.

**Default**

If you do not include this statement, no tracing operations are performed.

**Options**

- **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named `fud` in the directory `/var/log`. If you include the file statement, you must specify a filename.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

  **Range**: 2 through 1000

  **Default**: 3 files

- **flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

  - **address**—Trace address management events
  - **all**—Trace all events
  - **bootp**—Trace BOOTP or DHCP services events
  - **config**—Trace configuration events
  - **domain**—Trace DNS service events
  - **ifdb**—Trace interface database operations
  - **io**—Trace I/O operations
  - **main**—Trace main loop events
  - **port**—Trace arbitrary protocol events
- rtsock—Trace routing socket operations
- tftp—Trace TFTP service events
- trace—Trace tracing operations
- ui—Trace user interface operations
- util—Trace miscellaneous utility operations

match regular-expression—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—(Optional) Disable remote tracing globally or for a specific tracing operation.

no-world-readable—(Optional) Restrict file access to the owner.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.

Syntax: \x k to specify KB, \x m to specify MB, or \x g to specify GB
Range: 0 bytes through 4,294,967,295 KB
Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation
- Tracing BOOTP, DNS, and TFTP Forwarding Operations
traceoptions

Syntax

traceoptions {
  file filename <files number> <size size>
  flag all;
  flag certificates;
  flag database;
  flag general;
  flag like;
  flag parse;
  flag policy-manager;
  flag routing-socket;
  flag timer;
  level
  no-remote-trace
}

Hierarchy Level

[edit security],
[edit services ipsec-vpn]

Trace options can be configured at either the [edit security] or the [edit services ipsec-vpn] hierarchy level, but not at both levels.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure security trace options.

To specify more than one trace option, include multiple flag statements. Trace option output is recorded in the /var/log/kmd file.

NOTE: The traceoptions statement is not supported on QFabric systems.

Options

files number—(Optional) Maximum number of trace files. When a trace file (for example, kmd) reaches its maximum size, it is renamed kmd.0, then kmd.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 0 files

size size—(Optional) Maximum size of each trace file, in kilobytes (KB). When a trace file (for example, kmd) reaches this size, it is renamed, kmd.0, then kmd.1 and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Default: 1024 KB
flag flag—Trace operation to perform. To specify more than one trace operation, include multiple flag statements.

- all—Trace all security events.
- certificates—Trace certificate events.
- database—Trace database events.
- general—Trace general events.
- ike—Trace IKE module processing.
- parse—Trace configuration processing.
- policy-manager—Trace policy manager processing.
- routing-socket—Trace routing socket messages.
- timer—Trace internal timer events.

level level—(Optional) Set traceoptions level.

- all—match all levels.
- error—Match error conditions.
- info—Match informational messages.
- notice—Match conditions that should be handled specially.
- verbose—Match verbose messages.
- warning—Match warning messages.

no-remote-trace—(Optional) Disable remote tracing

**Required Privilege**
- **Level**
  - admin—To view the configuration.
  - admin-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Tracing Operations for Security Services
**update-server**

**Syntax**
update-server;

**Hierarchy Level**
[edit interfaces interface-name unit logical-unit-number inet dhcp]

**Release Information**
- Statement introduced in Junos OS Release 8.5 for J Series devices.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 9.2 for SRX Series devices.

**Description**
Propagate TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch, router, or device.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring a DHCP Client (CLI Procedure) on page 1249
- Example: Configuring the Device as a DHCP Client

  - unit on page 2458
  - family on page 1482
web-management

Syntax
web-management {
  http {
    interfaces [ interface-names ];
    port port;
  }
  https {
    interfaces [ interface-names ];
    local-certificate name;
    port port;
  }
}

Hierarchy Level [edit system services]

Description Configure settings for HTTP or HTTPS access. HTTP access allows management of the router or switch using the browser-based J-Web graphical user interface. HTTPS access allows secure management of the router or switch using the J-Web interface. With HTTPS access, communication between the router or switch Web server and your browser is encrypted.

The remaining statements are explained separately.

Required Privilege Level
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

wins-server (System)

Syntax
wins-server {
    address;
}

Hierarchy Level
[edit system services dhcp],
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
For J Series Services Routers and EX Series switches only. Specify one or more NetBIOS Name Servers. When a DHCP client is added to the network and assigned an IP address, the NetBIOS Name Server manages the Windows Internet Name Service (WINS) database that matches IP addresses (such as 192.168.1.3) to Windows NetBIOS names (such as \Marketing). List servers in order of preference.

Options
address—IPv4 address of the NetBIOS Name Server running WINS. To configure multiple servers, include multiple address options.

Required Privilege
Level
system—to view this statement in the configuration.
system-control—to add this statement to the configuration.

Routine Monitoring

- Monitoring DHCP Services on page 1527

Monitoring DHCP Services

**Purpose** A switch or router can operate as a DHCP server. Use the monitoring functionality to view information about dynamic and static DHCP leases, conflicts, pools, and statistics.

**Action** To monitor the DHCP server in the J-Web interface, select *Monitor > Services > DHCP.*

To monitor the DHCP server in the CLI, enter the following CLI commands:

- `show system services dhcp binding`
- `show system services dhcp conflict`
- `show system services dhcp pool`
- `show system services dhcp statistics`
- `show system services dhcp relay-statistics`
- `show system services dhcp global`
- `show system services dhcp client`
- `clear system services dhcp binding`
- `clear system services dhcp conflict`
- `clear system services dhcp statistics`
- `clear dhcp relay-statistics`
On EX4300 switches, to monitor the DHCP server in the CLI, enter the following CLI commands:

- show dhcp server binding
- show dhcp server statistics
- show dhcp relay binding
- show dhcp relay statistics
- clear dhcp server binding
- clear dhcp server statistics
- clear dhcp relay binding
- clear dhcp relay statistics

**Meaning**

Table 178 on page 1528 summarizes the output fields in DHCP displays in the J-Web interface.

### DHCP Local Server Monitoring Commands
clear dhcp server binding

Syntax  
```
<address>
<all>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

Release Information  

Description  
Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.

Options  
- **address**—(Optional) Clear the binding state for the DHCP client, using one of the following entries:
  - `ip-address`—The specified IP address.
  - `mac-address`—The specified MAC address.
  - `session-id`—The specified session ID.

- **all**—(Optional) Clear the binding state for all DHCP clients.

- **interface interface-name**—(Optional) Clear the binding state for DHCP clients on the specified interface.

  **NOTE:** This option clears all bindings whose initial login requests were received over the specified interface. Dynamic demux login requests are not received over the dynamic demux interface, but rather the underlying interface of the dynamic demux interface. To clear a specific dynamic demux interface, use the `ip-address` or `mac-address` options.

- **interfaces-vlan**—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

- **interfaces-wildcard**—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (*).

- **logical-system logical-system-name**—(Optional) Clear the binding state for DHCP clients on the specified logical system.

- **routing-instance routing-instance-name**—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

Sample Output

clear dhcp server binding <ip-address>

The following sample output displays the address bindings in the DHCP client table on the extended DHCP local server before and after the `clear dhcp server binding` command is issued.

```
user@host> show dhcp server binding
2 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)

IP address       Hardware address   Type     Lease expires at
100.20.32.1      90:00:00:01:00:01  active   2007-01-17 11:38:47 PST
100.20.32.3      90:00:00:02:00:01  active   2007-01-17 11:38:41 PST

user@host> clear dhcp server binding 10.20.32.1
user@host> show dhcp server binding
1 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)

IP address       Hardware address   Type     Lease expires at
100.20.32.3      90:00:00:02:00:01  active   2007-01-17 11:38:41 PST
```

clear dhcp server binding all

The following command clears all DHCP local server bindings:

```
user@host> clear dhcp server binding all
```

clear dhcp server binding interface

The following command clears DHCP local server bindings on a specific interface:

```
user@host> clear dhcp server binding interface fe-0/0/2
```
clear dhcp server binding <interfaces-vlan>
The following command uses the interfaces-vlan option to clear all DHCP local server bindings on top of the underlying interface ae0, which clears DHCP bindings on all demux VLANs on top of ae0:

    user@host> clear dhcp server binding ae0

clear dhcp server binding <interfaces-wildcard>
The following command uses the interfaces-wildcard option to clear all DHCP local server bindings over a specific interface:

    user@host> clear dhcp server binding ge-1/0/0.*
clear dhcp server statistics

**Syntax**
```
clear dhcp server statistics
<interface interface-name>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

**Release Information**
Command introduced in Junos OS Release 9.0.

**Description**
Clear all extended Dynamic Host Configuration Protocol (DHCP) local server statistics.

**Options**
- `logical-system logical-system-name`—(Optional) Clear the statistics for DHCP clients on the specified logical system. If you do not specify a logical system, statistics are cleared for the default logical system.

- `routing-instance routing-instance-name`—(Optional) Clear the statistics for DHCP clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.

clear dhcpv6 server binding

Syntax

```
clear dhcpv6 server binding
  <address>
  <all>
  <interface interface-name>
  <interfaces-vlan>
  <interfaces-wildcard>
  <logical-system logical-system-name>
  <routing-instance routing-instance-name>
```

Release Information

Options `interfaces-vlan` and `interfaces-wildcard` added in Junos OS Release 12.1.

Description

Clear the binding state of a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client from the client table on the extended DHCPv6 local server.

Options

- **address**—(Optional) Clear the binding state for the DHCPv6 client, using one of the following entries:
  - `CID`—The specified Client ID (CID).
  - `ipv6-prefix`—The specified IPv6 prefix.
  - `session-id`—The specified session ID.
- **all**—(Optional) Clear the binding state for all DHCPv6 clients.
- **interface interface-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified interface.
- **interfaces-vlan**—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.
- **interfaces-wildcard**—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (*).
- **logical-system logical-system-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified logical system.
- **routing-instance routing-instance-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified routing instance.

Required Privilege Level

`clear`

- clear dhcpv6 server binding <ipv6-prefix> on page 1540
**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

clear dhcpv6 server binding all

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

clear dhcpv6 server binding <ipv6-prefix>

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

clear dhcpv6 server binding interface

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

clear dhcpv6 server binding <interfaces-vlan>

The following command uses the `interfaces-vlan` option to clear all DHCPv6 local server bindings on top of the underlying interface `ae0`, which clears DHCPv6 bindings on all demux VLANs on top of `ae0`:

```
user@host> clear dhcpv6 server binding interface ae0
```

clear dhcpv6 server binding <interfaces-wildcard>

The following command uses the `interfaces-wildcard` option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```
clear dhcpv6 server statistics

Syntax

```
clear dhcpv6 server statistics
  <interface interface-name>
  <logical-system logical-system-name>
  <routing-instance routing-instance-name>
```

Release Information

Description

Clear all extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.

Options

- `logical-system logical-system-name`—(Optional) Clear the statistics for DHCPv6 clients on the specified logical system. If you do not specify a logical system, statistics are cleared for the default logical system.
- `routing-instance routing-instance-name`—(Optional) Clear the statistics for DHCPv6 clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.

clear dhcpv6 server statistics

```
user@host> clear dhcpv6 server statistics
```
request dhcp server reconfigure

Syntax

request dhcp server reconfigure (all | address | interface interface–name | logical-system logical-system–name | routing-instance routing-instance-name)

Release Information

Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the clear dhcp server binding command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the forcerenew message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the clear-on-abort statement to configure the client to be cleared when reconfiguration fails.

Options

all—Initiate reconfiguration for all DHCP clients.

address—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.

interface interface–name—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).

NOTE: You cannot use the interface interface–name option with the request dhcp server reconfigure command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.

logical-system logical-system–name—Initiate reconfiguration for all DHCP clients on the specified logical system.

routing-instance routing-instance-name—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request dhcp server reconfigure

user@host> request dhcp server reconfigure interface fe-0/0/0.100
request dhcpv6 server reconfigure

**Syntax**

```
request dhcpv6 server reconfigure (all | address address | client-id client-id | interface interface-name interface-name |
logical-system logical-system-name logical-system-name | routing-instance routing-instance-name routing-instance-name | session-id session-id)
```

**Release Information**

Command introduced in Junos OS Release 10.4.
Command introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Initiate reconfiguration processing for the specified DHCPv6 clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the `clear dhcpv6 server binding` command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfigure state and the local server sends a reconfigure message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the reconfigure message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the `clear-on-abort` statement to configure the client to be cleared when reconfiguration fails.

**Options**

- **all**—Initiate reconfiguration for all DHCPv6 clients.
- **address**—Initiate reconfiguration for DHCPv6 client with the specified IPv6 address.
- **client-id**—Initiate reconfiguration for DHCPv6 client with the specified client ID.
- **interface interface-name**—Initiate reconfiguration for all DHCPv6 clients on this logical interface (clients whose initial login requests were received over the specified interface).
- **logical-system logical-system-name**—Initiate reconfiguration for all DHCPv6 clients on the specified logical system.
- **routing-instance routing-instance-name**—Initiate reconfiguration reconfigured for all DHCPv6 clients in the specified routing instance.
- **session-id**—Initiate reconfiguration for DHCPv6 client with the specified session ID.

- <both-routing-engines>
- <in minutes>
- <local>
- <media (external | internal)>
- <member member-id>
- <message "text">
- <other-routing-engine>

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
Reboot the software.

**Options**
- **none**—Reboot the software immediately.
- **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.
- **all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.
- **all-members**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.
- **at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:
  - **now**—Stop or reboot the software immediately. This is the default.
  - **+minutes**—Number of minutes from now to reboot the software.
  - **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
  - **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.
- **both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.
- **in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.
- **lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.
  Replace **number** with the following values depending on the LCC configuration:
  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
local—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options removable-compact-flash and usb pertain to the J Series routers only.)

media (external | internal)—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:
  • external—Reboot the external mass storage device.
  • internal—Reboot the internal flash device.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

message "text"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

partition—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:
  • 1—Reboot from partition 1.
  • 2—Reboot from partition 2.
  • alternate—Reboot from the alternate partition.

scc—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from the re1, re1 is rebooted.

sfc number—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace number with 0.

slice slice—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:
  • 1—Power off partition 1.
  • 2—Power off partition 2.
  • alternate—Reboot from the alternate partition.
Reboot requests are recorded in the system log files, which you can view with the `show log` command (see `show log`). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the `show system processes` command (see `show system processes`).

On a TX Matrix or TX Matrix Plus router, if you issue the `request system reboot` command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the `request system reboot` command on a TX Matrix Plus router with no options or the all-chassis, all-lcc, lcc `number`, or `sfc` options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the `request system reboot` command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**Related Documentation**
- clear system reboot on page 163
- request system halt on page 180

**List of Sample Output**
- request system reboot on page 1550
- request system reboot (at 2300) on page 1550
- request system reboot (in 2 Hours) on page 1550
- request system reboot (Immediately) on page 1550
- request system reboot (at 1:20 AM) on page 1550

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.
Sample Output

request system reboot

user@host> request system reboot
Reboot the system? [yes,no] (no)

request system reboot (at 2300)

user@host> request system reboot at 2300 message ?Maintenance time? yes
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

user@host> request system reboot +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00

request system reboot (Immediately)

user@host> request system reboot at now

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
show dhcp server binding

Syntax
show dhcp server binding
<address>
<brie | detail | summary>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<logical-system logical-system-name>
<routing-instance routing-instance-name>

Release Information
Command introduced in Junos OS Release 9.0.
Options interfaces-vlan and interfaces-wildcard added in Junos OS Release 12.1.

Description
Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol (DHCP) local server.

Options
address—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:
  • ip-address—The specified IP address.
  • mac-address—The specified MAC address.
  • session-id—The specified session ID.

brie | detail | summary—(Optional) Display the specified level of output about active client bindings. The default is brief, which produces the same output as show dhcp server binding.

interface interface-name—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

interfaces-vlan—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

interfaces-wildcard—(Optional) The set of interfaces on which to show the binding state information. This option supports the use of the wildcard character (*).

logical-system logical-system-name—(Optional) Display information about active client bindings for DHCP clients on the specified logical system.

routing-instance routing-instance-name—(Optional) Display information about active client bindings for DHCP clients on the specified routing instance.

show dhcp server statistics

Syntax

```
show dhcp server statistics
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

Release Information

Command introduced in Junos OS Release 9.0.

Description

Display extended Dynamic Host Configuration Protocol (DHCP) local server statistics.

Options

- **logical-system logical-system-name**—(Optional) Display information about extended DHCP local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.

- **routing-instance routing-instance-name**—(Optional) Display information about extended DHCP local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.

Required Privilege

- **view**

Output Fields

Table 182 on page 1557 lists the output fields for the show dhcp server statistics command. Output fields are listed in the approximate order in which they appear.
Table 182: show dhcp server statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Packets dropped</strong></td>
<td>Number of packets discarded by the extended DHCP local server because of errors. Only nonzero statistics appear in the Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.</td>
</tr>
<tr>
<td>• Total</td>
<td>Total number of packets discarded by the extended DHCP local server</td>
</tr>
<tr>
<td>• Authentication</td>
<td>Number of packets discarded because they could not be authenticated</td>
</tr>
<tr>
<td>• Bad hardware address</td>
<td>Number of packets discarded because an invalid hardware address was specified</td>
</tr>
<tr>
<td>• Bad opcode</td>
<td>Number of packets discarded because an invalid operation code was specified</td>
</tr>
<tr>
<td>• Bad options</td>
<td>Number of packets discarded because invalid options were specified</td>
</tr>
<tr>
<td>• Dynamic profile</td>
<td>Number of packets discarded due to dynamic profile information</td>
</tr>
<tr>
<td>• Invalid server address</td>
<td>Number of packets discarded because an invalid server address was specified</td>
</tr>
<tr>
<td>• No available addresses</td>
<td>Number of packets discarded because there were no addresses available for assignment</td>
</tr>
<tr>
<td>• No interface match</td>
<td>Number of packets discarded because they did not belong to a configured interface</td>
</tr>
<tr>
<td>• Norouting instance match</td>
<td>Number of packets discarded because they did not belong to a configured routing instance</td>
</tr>
<tr>
<td>• No valid local address</td>
<td>Number of packets discarded because there was no valid local address</td>
</tr>
<tr>
<td>• Packet too short</td>
<td>Number of packets discarded because they were too short</td>
</tr>
<tr>
<td>• Read error</td>
<td>Number of packets discarded because of a system read error</td>
</tr>
<tr>
<td>• Send error</td>
<td>Number of packets that the extended DHCP local server could not send</td>
</tr>
<tr>
<td><strong>Messages received</strong></td>

show dhcpv6 server binding

Syntax

show dhcpv6 server binding
<address>
<brief | detail | summary>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<logical-system logical-system-name>
<routing-instance routing-instance-name>

Release Information

Options interfaces-vlan and interfaces-wildcard added in Junos OS Release 12.1.

Description

Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.

Options

address—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:
- CID—The specified Client ID (CID).
- ipv6-prefix—The specified IPv6 prefix.
- session-id—The specified session ID.

brief | detail | summary—(Optional) Display the specified level of output about active client bindings. The default is brief, which produces the same output as show dhcpv6 server binding.

interface interface-name—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

interfaces-vlan—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.

interfaces-wildcard—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).

logical-system logical-system-name—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.

routing-instance routing-instance-name—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.

Required Privilege

Output Fields  Table 183 on page 1560 lists the output fields for the `show dhcpv6 server binding` command. Output fields are listed in the approximate order in which they appear.

### Table 183: show dhcpv6 server binding Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>number clients, (number init, number bound, number selecting, number requesting, number renewing)</td>
<td>Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.</td>
<td>summary</td>
</tr>
<tr>
<td>Prefix</td>
<td>Client’s DHCPv6 prefix, or prefix used to support multiple address assignment.</td>
<td>brief detail</td>
</tr>
<tr>
<td>Session Id</td>
<td>Session ID of the subscriber session.</td>
<td>brief detail</td>
</tr>
<tr>
<td>Expires</td>
<td>Number of seconds in which lease expires.</td>
<td>brief detail</td>
</tr>
</tbody>
</table>
| State | State of the address binding table on the extended DHCPv6 local server:  
- **BOUND**—Client has active IP address lease.  
- **INIT**—Initial state.  
- **RECONFIGURE**—Server has sent reconfigure message to client.  
- **RELEASE**—Client is releasing IP address lease.  
- **RENEWING**—Client sending request to renew IP address lease.  
- **REQUESTING**—Client requesting a DHCPv6 server.  
- **SELECTING**—Client receiving offers from DHCPv6 servers. | brief detail |
| Interface | Interface on which the DHCPv6 request was received. | brief |
| Client IPv6 Address | Client’s IPv6 address. | detail |
| Client IPv6 Prefix | Client’s IPv6 prefix. | detail |
| Client DUID | Client’s DHCP Unique Identifier (DUID). | brief detail |
| Lease expires | Date and time at which the client’s IP address lease expires. | detail |

show dhcpv6 server binding summary

user@host> show dhcpv6 server binding summary
5 clients, (0 init, 5 bound, 0 selecting, 0 requesting, 0 renewing, 0 releasing)
show dhcpv6 server statistics

Syntax

show dhcpv6 server statistics
<logical-system logical-system-name>
<routing-instance routing-instance-name>

Release Information

Description
Display extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.

Options
- logical-system logical-system-name—(Optional) Display information about extended DHCPv6 local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.
- routing-instance routing-instance-name—(Optional) Display information about extended DHCPv6 local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.

DHCP Relay Agent Monitoring Commands
clear dhcp relay binding

Syntax

```plaintext
clear dhcp relay binding
  <address>
  <all>
  <interface interface-name>
  <interfaces-vlan>
  <interfaces-wildcard>
  <logical-system logical-system-name>
  <routing-instance routing-instance-name>
```

Release Information

Command introduced in Junos OS Release 8.3.
Options `all` and `interface` added in Junos OS Release 8.4.
Options `interfaces-vlan` and `interfaces-wildcard` added in Junos OS Release 12.1.
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

Description

Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table.

Options

- `address`—(Optional) Clear the binding state for the DHCP client, using one of the following entries:
  - `ip-address`—The specified IP address.
  - `mac-address`—The specified MAC address.
  - `session-id`—The specified session ID.
- `all`—(Optional) Clear the binding state for all DHCP clients.
- `interface interface-name`—(Optional) Clear the binding state for DHCP clients on the specified interface.
- `interfaces-vlan`—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.
- `interfaces-wildcard`—(Optional) The set of interfaces on which to clear bindings. This option supports the use of the wildcard character (*).
- `logical-system logical-system-name`—(Optional) Clear the binding state for DHCP clients on the specified logical system.
- `routing-instance routing-instance-name`—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

Required Privilege Level

- `view`

- `clear dhcp relay binding all on page 1569`
- `clear dhcp relay binding interface on page 1569`
- `clear dhcp relay binding <interfaces-vlan> on page 1569`
- `clear dhcp relay binding <interfaces-wildcard> on page 1569`

Output Fields

See `show dhcp relay binding` for an explanation of output fields.

Sample Output

`clear dhcp relay binding`

The following sample output displays the address bindings in the DHCP client table before and after the `clear dhcp relay binding` command is issued.

```
user@host> show dhcp relay binding
IP address       Hardware address   Type     Lease expires at
100.20.32.1      90:00:00:01:00:01  active   2007-02-08 16:41:17 EST
192.168.14.8      90:00:01:01:02:01  active   2007-02-10 10:01:06 EST

user@host> clear dhcp relay binding 100.20.32.1

user@host> show dhcp relay binding
IP address       Hardware address   Type     Lease expires at
192.168.14.8      90:00:01:01:02:01  active   2007-02-10 10:01:06 EST
```

clear dhcp relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcp relay binding all
```

clear dhcp relay binding interface

The following command clears DHCP relay agent bindings on a specific interface:

```
user@host> clear dhcp relay binding interface fe-0/0/3
```

clear dhcp relay binding <interfaces-vlan>

The following command uses the `interfaces-vlan` option to clear all DHCP relay agent bindings on top of the underlying interface `ae0`, which clears DHCP bindings on all demux VLANs on top of `ae0`:

```
user@host> clear dhcp relay binding interface ae0
```

clear dhcp relay binding <interfaces-wildcard>

The following command uses the `interfaces-wildcard` option to clear all DHCP relay agent bindings over a specific interface:

```
user@host> clear dhcp relay binding ge-1/0/0.*
```
clear dhcp relay statistics

Syntax

```
clear dhcp relay statistics
  <logical-system logical-system-name>  
  <routing-instance routing-instance-name>
```

Syntax for EX Series switches:

```
show dhcp relay statistics
  <routing-instance routing-instance-name>
```

Release Information

Command introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

Description

Clear all Dynamic Host Configuration Protocol (DHCP) relay statistics.

Options

- `logical-system logical-system-name`—(On routers only) (Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are cleared for the default logical system.

- `routing-instance routing-instance-name`—(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are cleared for the default routing instance.

clear dhcpv6 relay binding

Syntax

```
clear dhcpv6 relay binding
  <address>
  <all>
  <interface interface-name>
  <interfaces-vlan>
  <interfaces-wildcard>
  <logical-system logical-system-name>
  <routing-instance routing-instance-name>
```

Release Information

Command introduced in Junos OS Release 11.4.
Command introduced in Junos OS Release 12.3R2 for EX Series switches.
Options `interfaces-vlan` and `interfaces-wildcard` added in Junos OS Release 12.1.
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

Description

Clear the binding state of Dynamic Host Configuration Protocol for IPv6 (DHCPv6) clients from the client table.

Options

- **address**—(Optional) Clear the binding state for the DHCPv6 client, using one of the following entries:
  - `CID`—The specified Client ID (CID).
  - `ipv6-prefix`—The specified IPv6 prefix.
  - `session-id`—The specified session ID.

- **all**—(Optional) Clear the binding state for all DHCPv6 clients.

- **interfaces-vlan**—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

- **interfaces-wildcard**—(Optional) The set of interfaces on which to clear bindings. This option supports the use of the wildcard character (*).

- **interface interface-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified interface.

- **logical-system logical-system-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified logical system.

- **routing-instance routing-instance-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified routing instance.

show dhcp relay binding

Syntax

```
show dhcp relay binding
<address>
<brief>
<detail>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<ip-address | mac-address>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
<summary>
```

Release Information

Command introduced in Junos OS Release 8.3.
Options `interface` and `mac-address` added in Junos OS Release 8.4.
Options `interfaces-vlan` and `interfaces-wildcard` added in Junos OS Release 12.1.
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

Description

Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

Options

- `address`—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:
  - `ip-address`—The specified IP address.
  - `mac-address`—The specified MAC address.
  - `session-id`—The specified session ID.

- `brief`—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as `show dhcp relay binding`.

- `detail`—(Optional) Display detailed client binding information.

- `interface interface-name`—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

- `interfaces-vlan`—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

- `interfaces-wildcard`—(Optional) The set of interfaces on which to show binding state information. This option supports the use of the wildcard character (`*`).

- `logical-system logical-system-name`—(Optional) Perform this operation on the specified logical system.

- `routinig-instance routing-instance-name`—(Optional) Perform this operation on the specified routing instance.

- `summary`—(Optional) Display a summary of DHCP client information.

show dhcp relay binding summary

user@host> show dhcp relay binding summary

3 clients, (2 init, 1 bound, 0 selecting, 0 requesting, 0 renewing, 0 rebinding, 0 releasing)
**show dhcp relay statistics**

**Syntax**
```
show dhcp relay statistics
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

**Syntax for EX Series switches:**
```
show dhcp relay statistics
<routing-instance routing-instance-name>
```

**Release Information**
Command introduced in Junos OS Release 8.3.
Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

**Description**
Display Dynamic Host Configuration Protocol (DHCP) relay statistics.

**Options**
`logical-system logical-system-name`—(On routers only) (Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.

`routing-instance routing-instance-name`—(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.

show dhcpv6 relay binding

**Syntax**

```
show dhcpv6 relay binding
<address>
<brief>
<detail>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
<summary>
```

**Release Information**

Command introduced in Junos OS Release 11.4.

*interfaces-vlan* and *interfaces-wildcard* options introduced in Junos OS Release 12.1.

**Description**

Display the DHCPv6 address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

**Options**

- **address**—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:
  - `CID`—The specified Client ID (CID).
  - `ipv6-prefix`—The specified IPv6 prefix.
  - `session-id`—The specified session ID.
- **brief**—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as `show dhcpv6 relay binding`.
- **detail**—(Optional) Display detailed client binding information.
- **interface interface-name**—(Optional) Perform this operation on the specified interface.
  You can optionally filter on VLAN ID and S-VLAN ID.
- **interfaces-vlan**—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.
- **interfaces-wildcard**—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).
- **logical-system logical-system-name**—(Optional) Perform this operation on the specified logical system.
- **routing-instance routing-instance-name**—(Optional) Perform this operation on the specified routing instance.
- **summary**—(Optional) Display a summary of DHCPv6 client information.

**Required Privilege**

**show dhcpv6 relay statistics**

**Syntax**
```
show dhcpv6 relay statistics
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

**Release Information**
- Command introduced in Junos OS Release 11.4.
- Command introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

**Options**
- `logical-system logical-system-name`—(Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.
- `routing-instance routing-instance-name`—(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.

**Required Privilege Level**
view

**Related Documentation**
- `clear dhcpv6 relay statistics` on page 1576
- `List of Sample Output` on page 1592

**Output Fields**
Table 189 on page 1591 lists the output fields for the `show dhcpv6 relay statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 189: show dhcpv6 relay statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPv6 Packets dropped</td>
<td>Number of packets discarded by the extended DHCPv6 relay agent application due to errors. Only nonzero statistics appear in the Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.</td>
</tr>
<tr>
<td></td>
<td>- Total—Total number of packets discarded by the DHCPv6 relay agent application.</td>
</tr>
<tr>
<td></td>
<td>- Bad options—Number of packets discarded because invalid options were specified.</td>
</tr>
<tr>
<td></td>
<td>- Bad send—Number of packets that the extended DHCP relay application could not send.</td>
</tr>
<tr>
<td></td>
<td>- Bad src address—Number of packets discarded because the family type was not AF_INET6.</td>
</tr>
<tr>
<td></td>
<td>- No client id—Number of packets discarded because they could not be matched to a client.</td>
</tr>
<tr>
<td></td>
<td>- No safd—Number of packets discarded because they arrived on an unconfigured interface.</td>
</tr>
<tr>
<td></td>
<td>- Short packet—Number of packets discarded because they were too short.</td>
</tr>
<tr>
<td></td>
<td>- Relay hop count—Number of packets discarded because the hop count in the packet exceeded 32.</td>
</tr>
</tbody>
</table>

</table>
show route extensive

Syntax

```
show route extensive
<destination-prefix>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches)

```
show route extensive
<destination-prefix>
```

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display extensive information about the active entries in the routing tables.

Options

- `none`—Display all active entries in the routing table.
- `destination-prefix`—(Optional) Display active entries for the specified address or range of addresses.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

- view

List of Sample Output

- show route extensive on page 1600
- show route extensive (Access Route) on page 1606
- show route extensive (BGP PIC Edge) on page 1607
- show route extensive (FRR and LFA) on page 1607
- show route extensive (Route Reflector) on page 1608
- show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1608

Output Fields

Table 190 on page 1594 describes the output fields for the `show route extensive` command. Output fields are listed in the approximate order in which they appear.

Table 190: show route extensive Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>routing-table-name</code></td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td><code>number destinations</code></td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
<tr>
<td><code>number routes</code></td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• active (routes that are active).</td>
</tr>
<tr>
<td></td>
<td>• holdown (routes that are in the pending state before being declared inactive).</td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy).</td>
</tr>
</tbody>
</table>
Table 190: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>route-destination</strong> (entry, announced)</td>
<td>Route destination (for example: 10.0.0.1/24). The entry value is the number of route for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</td>
</tr>
<tr>
<td></td>
<td>• <strong>MPLS-label</strong> (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface-name</strong> (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address; control-word-status: encapsulation type; vc-id; source</strong> (Layer 2 circuit only; for example, 10.1.1.10:NoCtrlWord:1:1;Local/96).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong>—Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>control-word-status</strong>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</td>
</tr>
<tr>
<td></td>
<td>• <strong>encapsulation type</strong>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>• <strong>vc-id</strong>—Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>• <strong>source</strong>—Source of the advertisement: Local or Remote.</td>
</tr>
<tr>
<td></td>
<td>Protocol header information.</td>
</tr>
<tr>
<td><strong>TSI</strong></td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>• <strong>[protocol, preference]</strong></td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• -—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• * —An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
<tr>
<td></td>
<td>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</td>
</tr>
<tr>
<td><strong>Level</strong></td>
<td>(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td><strong>Route Distinguisher</strong></td>
<td>IP subnet augmented with a 64-bit prefix.</td>
</tr>
</tbody>
</table>
## Table 190: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Next-hop type</strong></td>
<td>Type of next hop. For a description of possible values for this field, see the Output Field table in the show route detail command.</td>
</tr>
<tr>
<td><strong>Next-hop reference count</strong></td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td><strong>Flood next-hop branches exceed maximum message</strong></td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td><strong>Next hop</strong></td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
<tr>
<td><strong>via</strong></td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <strong>Selected</strong>. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td><strong>Label-switched-path</strong></td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td><strong>lsp-path-name</strong></td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td><strong>Label operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
<tr>
<td><strong>Offset</strong></td>
<td>Whether the metric has been increased or decreased by an offset value.</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td><strong>Protocol next hop</strong></td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.</td>
</tr>
<tr>
<td><strong>label-operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
</tbody>
</table>
Table 190: show route extensive Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| **Indirect next hops** | When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.  
When BGP PIC Edge is enabled, the output lines that contain *indirect next hop: weight* follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:  
• 0x1 indicates active next hops.  
• 0x4000 indicates passive next hops. |
| **State**           | State of the route (a route can be in more than one state). See the Output Field table in the `show routedetail` command. |
| **Session ID**      | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA). |
| **Weight**          | Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.  
For sample output, see `show route table`. |
Table 190: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inactive reason</td>
<td>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</td>
</tr>
<tr>
<td></td>
<td>• Active preferred—Currently active route was selected over this route.</td>
</tr>
<tr>
<td></td>
<td>• Always compare MED—Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td></td>
<td>• AS path—Shorter AS path is available.</td>
</tr>
<tr>
<td></td>
<td>• Cisco Non-deterministic MED selection—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</td>
</tr>
<tr>
<td></td>
<td>• Cluster list length—Path with a shorter cluster list length is available.</td>
</tr>
<tr>
<td></td>
<td>• Forwarding use only—Path is only available for forwarding purposes.</td>
</tr>
<tr>
<td></td>
<td>• IGP metric—Path through the next hop with a lower IGP metric is available.</td>
</tr>
<tr>
<td></td>
<td>• IGP metric type—Path with a lower OSPF link-state advertisement type is available.</td>
</tr>
<tr>
<td></td>
<td>• Interior &gt; Exterior &gt; Exterior via Interior—Direct, static, IGP, or EBGP path is available.</td>
</tr>
<tr>
<td></td>
<td>• Local preference—Path with a higher local preference value is available.</td>
</tr>
<tr>
<td></td>
<td>• Next hop address—Path with a lower metric next hop is available.</td>
</tr>
<tr>
<td></td>
<td>• No difference—Path from a neighbor with a lower IP address is available.</td>
</tr>
<tr>
<td></td>
<td>• Not Best in its group—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process.</td>
</tr>
<tr>
<td></td>
<td>• Number of gateways—Path with a higher number of next hops is available.</td>
</tr>
<tr>
<td></td>
<td>• Origin—Path with a lower origin code is available.</td>
</tr>
<tr>
<td></td>
<td>• OSPF version—Path does not support the indicated OSPF version.</td>
</tr>
<tr>
<td></td>
<td>• RIIB preference—Route from a higher-numbered routing table is available.</td>
</tr>
<tr>
<td></td>
<td>• Route destinguisher—64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td></td>
<td>• Route metric or MED comparison—Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td></td>
<td>• Route preference—Route with a lower preference value is available.</td>
</tr>
<tr>
<td></td>
<td>• Router ID—Path through a neighbor with a lower ID is available.</td>
</tr>
<tr>
<td></td>
<td>• Unusable path—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</td>
</tr>
<tr>
<td></td>
<td>• Update source—Last tiebreaker is the lowest IP address value.</td>
</tr>
<tr>
<td>Local AS</td>
<td>Autonomous system (AS) number of the local routing device.</td>
</tr>
<tr>
<td>Age</td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td>AIGP</td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
<tr>
<td>Metric</td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td>MED-plus-IGP</td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td>TTL-Action</td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</td>
</tr>
<tr>
<td></td>
<td>For sample output, see show route table.</td>
</tr>
</tbody>
</table>
### Table 190: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
</tr>
<tr>
<td>Announcement bits</td>
<td>List of protocols that announce this route. <em>n-Resolve inet</em> indicates that the route is used for route resolution for next hops found in the routing table. <em>n</em> is an index used by Juniper Networks customer support only.</td>
</tr>
<tr>
<td>AS path</td>
<td>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</td>
</tr>
<tr>
<td></td>
<td>• I—IGP.</td>
</tr>
<tr>
<td></td>
<td>• E—EGP.</td>
</tr>
<tr>
<td></td>
<td>• Recorded—The AS path is recorded by the sample process (sampled).</td>
</tr>
<tr>
<td></td>
<td>• ?—Incomplete; typically, the AS path was aggregated.</td>
</tr>
<tr>
<td></td>
<td>When AS path numbers are included in the route, the format is as follows:</td>
</tr>
<tr>
<td></td>
<td>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</td>
</tr>
<tr>
<td></td>
<td>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</td>
</tr>
<tr>
<td></td>
<td>• ()—Parentheses enclose a confederation.</td>
</tr>
<tr>
<td></td>
<td>• ( [ ] )—Parentheses and brackets enclose a confederation set.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</td>
</tr>
<tr>
<td>FECs bound to route</td>
<td>Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</td>
</tr>
<tr>
<td>AS path: I &lt;Originator&gt;</td>
<td>(For route reflected output only) Originator ID attribute set by the route reflector.</td>
</tr>
<tr>
<td>VC Label</td>
<td>MPLS label assigned to the Layer 2 circuit virtual connection.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) of the Layer 2 circuit.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier of the Layer 2 circuit.</td>
</tr>
<tr>
<td>Cluster list</td>
<td>(For route reflected output only) Cluster ID sent by the route reflector.</td>
</tr>
<tr>
<td>Originator ID</td>
<td>(For route reflected output only) Address of router that originally sent the route to the route reflector.</td>
</tr>
<tr>
<td>Prefixes bound to route</td>
<td>Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.</td>
</tr>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See the Output Field table in the <code>show route detail</code> command for all possible values for this field.</td>
</tr>
<tr>
<td>Layer2-info: encaps</td>
<td>Layer 2 encapsulation (for example, VPLS).</td>
</tr>
</tbody>
</table>
Table 190: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>control flags</td>
<td>Control flags: none or Site Down.</td>
</tr>
<tr>
<td>mtu</td>
<td>Maximum transmission unit (MTU) information.</td>
</tr>
<tr>
<td>Label-Base, range</td>
<td>First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.</td>
</tr>
<tr>
<td>status vector</td>
<td>Layer 2 VPN and VPLS network layer reachability information (NLRI).</td>
</tr>
<tr>
<td>Localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>Router ID</td>
<td>BGP router ID as advertised by the neighbor in the open message.</td>
</tr>
<tr>
<td>Primary Routing Table</td>
<td>In a routing table group, the name of the primary routing table in which the route resides.</td>
</tr>
<tr>
<td>Secondary Tables</td>
<td>In a routing table group, the name of one or more secondary tables in which the route resides.</td>
</tr>
<tr>
<td>Originating RIB</td>
<td>Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.</td>
</tr>
<tr>
<td>Node path count</td>
<td>Number of nodes in the path.</td>
</tr>
<tr>
<td>Forwarding nexthops</td>
<td>Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.</td>
</tr>
</tbody>
</table>

show route protocol

Syntax

```
show route protocol protocol
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches)

```
show route protocol protocol
  <brief | detail | extensive | terse>
```

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `opsf2` and `ospf3` options introduced in Junos OS Release 9.2.
- `opsf2` and `ospf3` options introduced in Junos OS Release 9.2 for EX Series switches.
- `flow` option introduced in Junos OS Release 10.0.
- `flow` option introduced in Junos OS Release 10.0 for EX Series switches.

Description

Display the route entries in the routing table that were learned from a particular protocol.

Options

- `brief | detail | extensive | terse`—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to `brief`.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`protocol`—Protocol from which the route was learned:

- `access`—Access route for use by DHCP application
- `access-internal`—Access-internal route for use by DHCP application
- `aggregate`—Locally generated aggregate route
- `arp`—Route learned through the Address Resolution Protocol
- `atmvpn`—Asynchronous Transfer Mode virtual private network
- `bgp`—Border Gateway Protocol
- `ccc`—Circuit cross-connect
- `direct`—Directly connected route
- `dvmrp`—Distance Vector Multicast Routing Protocol
- `esis`—End System-to-Intermediate System
- `flow`—Locally defined flow-specification route
- `frr`—Precomputed protection route or backup route used when a link goes down
- `isis`—Intermediate System-to-Intermediate System
- `ldp`—Label Distribution Protocol
- `l2circuit`—Layer 2 circuit
- `l2vpn`—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

**NOTE:** EX Series switches run a subset of these protocols. See the switch CLI for details.

Other Operational Commands
clear security pki local-certificate

Syntax

```
clear security pki local-certificate
<all | certificate-id certificate-id-name | system-generated>
```

Release Information

Command introduced in Junos OS Release 11.1 for EX Series switches.

Description

Delete local digital certificates, certificate requests, and the corresponding public/private key pairs from the switch.

Options

```
all—(Optional) Delete all local digital certificates, certificate requests, and the corresponding public and private key pairs from the router.
```

```
NOTE: This option does not delete the automatically generated self-signed certificate or its public/private key pair.
```

```
certificate-id certificate-id-name—(Optional) Delete the specified local digital certificate and corresponding public and private key pair.
```

```
system-generated—(Optional) Delete the automatically generated self-signed certificate.
```

Required Privilege Level

Clear

clear system services dhcp binding

Syntax

```
clear system services dhcp binding
<address>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

(J Series routers and EX Series switches only) Remove obsolete IP address bindings on a Dynamic Host Configuration Protocol (DHCP) server and return them to the IP address pool.

Options

```
address—(Optional) Remove a specific IP address binding and return it to the address pool.
```

Required Privilege Level

view and system

clear system services dhcp statistics

```bash
user@host> clear system services dhcp statistics
```
request ipsec switch

Syntax  request ipsec switch (interface <es-fpc/pic/port> | security-associations <sa-name> )

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  (Encryption interface on M Series, PTX Series, and T Series routers and EX Series switches only) Manually switch from the primary to the backup encryption services interface, or switch from the primary to the backup IP Security (IPsec) tunnel.

Options  interface <es-fpc/pic/port>—Switch to the backup encryption interface.
security-associations <sa-name>—Switch to the backup tunnel.

Required Privilege  view

Related Documentation  • show ipsec redundancy

List of Sample Output  request ipsec switch on page 1626

Output Fields  When you enter this command, you are provided feedback on the status of your request.

Sample Output  request ipsec switch

user@host> request ipsec switch security-associations sa-private
**request security certificate (signed)**

**Syntax**
```
request security certificate enroll filename filename subject subject alternative-subject alternative-subject certification-authority certification-authority encoding (binary | pem) key-file key-file domain-name domain-name
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
(Encryption interface on M Series and T Series routers and EX Series switches only)
Obtain a signed certificate from a certificate authority (CA). The signed certificate validates the CA and the owner of the certificate. The results are saved in a specified file to the /var/etc/ikecert directory.

**Options**
- `filename` *filename*—File that stores the certificate.
- `subject` *subject*—Distinguished name (dn), which consists of a set of components—for example, an organization (o), an organization unit (ou), a country (c), and a locality (l).
- `alternative-subject` *alternative-subject*—Tunnel source address.
- `certification-authority` *certification-authority*—Name of the certificate authority profile in the configuration.
- `encoding` *(binary | pem)*—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default format is binary.
- `key-file` *key-file*—File containing a local private key.
- `domain-name` *domain-name*—Fully qualified domain name.

**Required Privilege Level**
maintenance

**List of Sample Output**
`request security certificate (signed)` on page 1627

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
```
user@host> request security certificate enroll filename host.crt subject c=uk,o=London alternative-subject 10.50.1.4 certification-authority verisign key-file host-1.prv domain-name host.juniper.net
CA name: juniper.net CA file: ca_verisign local pub/private key pair: host.prv subject: c=uk,o=London domain name: host.juniper.net alternative subject: 10.50.1.4 Encoding: binary
```
Certificate enrollment has started. To view the status of your enrollment, check the key management process (kmd) log file at /var/log/kmd.
request security certificate (unsigned)

Syntax
request security certificate enroll filename filename ca-file ca-file ca-name ca-name encoding (binary | perm) url url

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
(Encryption interface on M Series and T Series routers and EX Series switches only)
Obtain a certificate from a certificate authority (CA). The results are saved in a specified file to the /var/etc/ikecert directory.

Options
filename — File that stores the public key certificate.
ca-file — Name of the certificate authority profile in the configuration.
ca-name — Name of the certificate authority.
encoding (binary | pem) — File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default value is binary.
url — Certificate authority URL.

Required Privilege
Level maintenance

List of Sample Output
request security certificate (unsigned) on page 1629

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output
request security certificate (unsigned)

user@host> request security certificate enroll filename ca_verisign ca-file verisign ca-name juniper.net url xyzcompany URL
http://<verisign ca-name xyzcompany url>/cgi-bin/pkcclient.exe CA name: juniper.net
CA file: verisign Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check the key management process (kmd) log file at /var/log/kmd. <--------------
request security key-pair

Syntax  
request security key-pair filename
<size key-size>
<type (rsa | dsa)>

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  
(Encryption interface on M Series and T Series routers and EX Series switches only)
Generate a public and private key pair for a digital certificate.

Options  
filename—Name of a file in which to store the key pair.

size key-size—(Optional) Key size, in bits. The key size can be 512, 1024, or 2048. The default value is 1024.

type—(Optional) Algorithm used to encrypt the key:
  • rsa—RSA algorithm. This is the default.
  • dsa—Digital signature algorithm with Secure Hash Algorithm (SHA).

Required Privilege  
Level maintenance

List of Sample Output  
request security key-pair on page 1630

Output Fields  
When you enter this command, you are provided feedback on the status of your request.

Sample Output  
request security key-pair

user@host> request security key-pair security-key-file
**request security pki generate-key-pair**

**Syntax**
request security pki generate-key-pair certificate-id certificate-id-name
<size (512 | 1024 | 2048)><type (dsa | rsa)>

**Release Information**
Command introduced in Junos OS Release 11.1 for EX Series switches.

**Description**
Generate a public key infrastructure (PKI) public/private key pair for a local digital certificate.

**Options**
certificate-id certificate-id-name—Name of the local digital certificate and the public/private key pair.

size—(Optional) Key pair size. The key pair size can be 512, 1024, or 2048 bits. If a key pair size is not specified, the default value, 1024 bits, is applied.

type—(Optional) The algorithm to be used for encrypting the public/private key pair. The encryption algorithm can be dsa or rsa. If an encryption algorithm is not specified, the default value, rsa, is applied.

**Required Privilege Level**
maintenance

**Related Documentation**
- Manually Generating Self-Signed Certificates on Switches (CLI Procedure) on page 1254

**List of Sample Output**
request security pki generate-key-pair on page 1631

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
request security pki generate-key-pair

user@switch> request security pki generate-key-pair certificate-id billy size 2048
Generated key pair billy, key size 2048 bits
request security pki local-certificate generate-self-signed

Syntax
request security pki local-certificate generate-self-signed certificate-id certificate-id-name
domain-name domain-name ip-address ip-address email email-address
subject subject-distinguished-name

Release Information
Command introduced in Junos OS Release 11.1 for EX Series switches.

Description
Manually generate a self-signed certificate for the given distinguished name.

Options
- **certificate-id certificate-id-name**—Name of the local digital certificate and the public/private key pair.
- **domain-name domain-name**—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.
- **email email-address**—E-mail address of the certificate holder.
- **ip-address ip-address**—IP address of the switch.
- **subject subject-distinguished-name**—Distinguished name format that contains the common name, department, company name, state, and country:
  - **CN**—Common name
  - **OU**—Organizational unit name
  - **O**—Organization name
  - **ST**—State
  - **C**—Country

Required Privilege
- **Level**
  - maintenance
  - security

Code: 32, Type: ip-address, Value: 3.3.3.33
show system services dhcp conflict

Syntax

show system services dhcp conflict

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

(J Series routers only and EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) client-detected conflicts for IP addresses. When a conflict is detected, the DHCP server removes the address from the address pool.

Options

This command has no options.

Required Privilege Level

view and system

show system services dhcp global

**Syntax**

```
show system services dhcp global
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) global configuration options. Global options apply to all scopes and clients served by the DHCP server. Global options are overridden if specified otherwise in scope or client options. Scope options apply to specific subnets or ranges of addresses. Client options apply to specific clients.

**Options**
This command has no options.

**Required Privilege**
view and system

**List of Sample Output**

ssh

Syntax

ssh host
  <bypass-routing>
  <inet | inet6>
  <interface interface-name>
  <logical-system logical-system-name>
  <routing-instance routing-instance-name>
  <source address>
  <v1 | v2>

Syntax (EX Series Switch and the QFX Series)

ssh host
  <bypass-routing>
  <inet | inet6>
  <interface interface-name>
  <routing-instance routing-instance-name>
  <source address>
  <v1 | v2>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the ssh command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

ssh address 'cli-command1 ; cli-command2'

Options

host—Name or address of the remote system.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

inet | inet6—(Optional) Create an IPv4 or IPv6 connection, respectively.

interface interface-name—(Optional) Interface name for the SSH session. (This option does not work when default-address-selection is configured at the [edit system] hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

logical-system logical-system-name—(Optional) Name of a particular logical system for the SSH attempt.

routing-instance routing-instance-name—(Optional) Name of the routing instance for the SSH attempt.
source address—(Optional) Source address of the SSH connection.

v1 | v2—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

Additional Information
To configure an SSH (version 1) key for your user account, include the authentication ssh-rsa statement at the [edit system login user user-name] hierarchy level. To configure an SSH (version 2) key for your user account, include the authentication dsa-rsa statement at the [edit system login user user-name] hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the retry-options statement at the [edit system login] hierarchy level. For details, see the .

Last login: Sun Jun 21 10:43:42 1998 from junos-router
% ...
```
telnet

Syntax

telnet host
<8bit>
<bypass-routing>
<inet | inet6>
<interface interface-name>
<logical-system logical-system-name>
<no-resolve>
<port port-number>
<routing-instance routing-instance-name>
<source source-address>

Syntax (EX Series Switches)
telnet host
<8bit>
<bypass-routing>
<inet | inet6>
<interface interface-name>
<no-resolve>
<port port-number>
<routing-instance routing-instance-name>
<source source-address>

Release Information

Description

Open a telnet session to a remote system. Type Ctrl+] to escape from the telnet session to the telnet command level, and then type quit to exit from telnet.

Options

host—Name or address of the remote system.

8bit—(Optional) Use an 8-bit data path.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

inet | inet6—(Optional) Open an IPv4 or IPv6 session, respectively.

interface interface-name—(Optional) Interface name for the telnet session. (This option does not work when default-address-selection is configured at the [edit system] hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

logical-system logical-system-name—(Optional) Name of a particular logical system for the telnet attempt.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

port port-number—(Optional) Port number or service name on the remote system.
**Routing-Instance** *(Optional)* Name of the routing instance for the telnet attempt.

**Source** *(Optional)* Source address of the telnet connection.

**Additional Information**
You can limit the number of times a user can attempt to enter a password while logging in through telnet. To specify the number of times a user can attempt to enter a password to log in through telnet, include the `retry-options` statement at the `[edit system login]` hierarchy level. For details, see the *Junos OS Administration Library for Routing Devices*.

802.1X for EX Series Switches Overview

IEEE 802.1X provides network edge security, protecting Ethernet LANs from unauthorized user access.

How 802.1X Authentication Works

802.1X authentication works by using an Authenticator Port Access Entity (the switch) to block all traffic to and from a supplicant (end device) at the port until the supplicant's credentials are presented and matched on the Authentication server (a RADIUS server). When authenticated, the switch stops blocking traffic and opens the port to the supplicant.

The end device is authenticated in either single mode, single-secure mode, or multiple mode:

- single—Authenticates only the first end device. All other end devices that connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the end devices' authentication.
• **single-secure**—Allows only one end device to connect to the port. No other end device is allowed to connect until the first logs out.

• **multiple**—Allows multiple end devices to connect to the port. Each end device will be authenticated individually.

Network access can be further defined using VLANs and firewall filters, which both act as filters to separate and match groups of end devices to the areas of the LAN they require. For example, you can configure VLANs to handle different categories of authentication failures depending upon:

• Whether or not the end device is 802.1X-enabled.

• Whether or not MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected.

• Whether the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message. See “Configuring Server Fail Fallback (CLI Procedure)” on page 1752.

**802.1X Features Overview**

**NOTE:** The 802.1X features available on the switches depend upon which switch you are using. See “EX Series Switch Software Features Overview” on page 27 for a complete list of the Junos OS 802.1X features that are supported on specific switches.

802.1X features on Juniper Networks EX Series Ethernet Switches are:

• Guest VLAN—Provides limited access to a LAN, typically just to the Internet, for nonresponsive end devices that are not 802.1X-enabled when MAC RADIUS authentication has not been configured on the switch interfaces to which the hosts are connected. Also, a guest VLAN can be used to provide limited access to a LAN for guest users. Typically, the guest VLAN provides access just to the Internet and to other guests’ end devices.

• Server-reject VLAN—Provides limited access to a LAN, typically just to the Internet, for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials.

• Server-fail VLAN—Provides limited access to a LAN, typically just to the Internet, for 802.1X end devices during a RADIUS server timeout.

• Dynamic VLAN—Enables an end device, after authentication, to be a member of a VLAN dynamically.

• Private VLAN—Enables configuration of 802.1X authentication on interfaces that are members of private VLANs (PVLANs).

• Dynamic changes to a user session—Allows the switch administrator to terminate an already authenticated session. This feature is based on support of the RADIUS Disconnect Message defined in RFC 3576.
• Support for VoIP—Supports IP telephones. If the phone is 802.1X-enabled, it is authenticated like any other supplicant. If the phone is not 802.1X-enabled, but has another 802.1X-compatible device connected to its data port, that device is authenticated, and then VoIP traffic can flow to and from the phone (providing that the interface is configured in single mode and not in single-secure mode).

NOTE: Configuring a VoIP VLAN on private VLAN (PVLAN) interfaces is not supported.

• RADIUS accounting—Sends accounting information to the RADIUS accounting server. Accounting information is sent to the server whenever a subscriber logs in or logs out and whenever a subscriber activates or deactivates a subscription.

• Vendor Specific Attributes (VSAs)—Supports the Juniper-Switching-Filter attribute on the RADIUS authentication server that can be used further define a supplicant's access during the 802.1X authentication process. Centrally configuring VSAs on the authentication server does away with the need to configure these same attributes in the form of firewall filters on every switch in the LAN to which the supplicant may connect to the LAN. This feature is based on RLI 4583, AAA RADIUS BRAS VSA Support.

Supported Features Related to 802.1X Authentication

802.1X does not replace other security technologies. 802.1X works together with port security features, such as DHCP snooping, dynamic ARP inspection (DAI), and MAC limiting, to guard against spoofing.

Supported features related to authentication include:

• Static MAC bypass—Provides a bypass mechanism to authenticate devices that are not 802.1X-enabled (such as printers). Static MAC bypass connects these devices to 802.1X-enabled ports, bypassing 802.1X authentication.

• MAC RADIUS authentication—Provides a means to enable or disable MAC authentication independently of whether 802.1X authentication is enabled.

NOTE: You cannot configure 802.1X authentication on redundant trunk groups (RTGs).

Understanding Authentication on EX Series Switches

You can control access to your network through a Juniper Networks EX Series Ethernet Switch using several different authentication methods—802.1X, MAC RADIUS, or captive portal. Authentication prevents unauthorized devices and users from gaining access to your LAN. For 802.1X and MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server. For captive portal authentication, the switch allows the end devices to get an IP address and allows forwarding of DHCP, DNS, and ARP packets.

You can allow end devices to access the network without authentication by including the MAC address of the end device in the static MAC bypass list or, for captive portal, by including the MAC address of the end device in the authentication whitelist.

You can configure 802.1X, MAC RADIUS, and captive portal on the same interface and in any combination, except that you cannot configure MAC RADIUS and captive portal on an interface without also configuring 802.1X. If you configure multiple authentication methods on a single interface, the switch falls back to another method if the first method is unsuccessful. For a description of the process flow when multiple authentication methods are configured on an interface, see “Authentication Process Flow for EX Series Switches” on page 1672.

This topic covers:

- Sample Basic Authentication Topology on page 1658
- 802.1X Authentication on page 1659
- MAC RADIUS Authentication on page 1661
- Captive Portal Authentication on page 1661
- Static MAC Bypass of Authentication on page 1662
- Fallback of Authentication Methods on page 1662

Sample Basic Authentication Topology

Figure 6 on page 1659 illustrates a basic deployment topology for authentication on an EX Series switch:
802.1X Authentication

802.1X is an IEEE standard for port-based network access control (PNAC). It provides an authentication mechanism to allow devices to access a LAN. The 802.1X authentication feature on an EX Series switch is based upon the IEEE 802.1D standard Port-Based Network Access Control.

The communication protocol between the end device and the switch is Extensible Authentication Protocol Over LAN (EAPoL). EAPoL is a version of EAP designed to work with Ethernet networks. The communication protocol between the authentication server and the switch is RADIUS.
During the authentication process, the switch completes multiple message exchanges between the end device and the authentication server. While 802.1X authentication is in process, only 802.1X traffic is allowed. Other traffic, such as DHCP and HTTP, is blocked at the data link layer.

**NOTE:** You can configure both the maximum number of times an EAPoL request packet is retransmitted and the timeout period between attempts. For information, see “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740.

An 802.1X authentication configuration for a LAN contains three basic components:

- **Supplicant** (also called end device)—Supplicant is the IEEE term for an end device that requests to join the network. The end device can be responsive or nonresponsive. A responsive end device is 802.1X-enabled and provides authentication credentials—specifically, a username and password for EAP MD5 or a username and client certificates for EAP-TLS, EAP-TTLS, and EAP-PEAP.

You can configure a server-reject VLAN to provide limited LAN access for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials. A server-reject VLAN can provide a remedial connection, typically just to the Internet, for these devices. See “Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients” on page 1735 for additional information.

**NOTE:** If the end device that is authenticated using the server-reject VLAN is an IP phone, voice traffic is not allowed.

A nonresponsive end device is not 802.1X-enabled, but it can be authenticated through MAC RADIUS authentication.

- **Authenticator port access entity**—The IEEE term for the authenticator. The EX Series switch is the authenticator, and it controls access by blocking all traffic to and from end devices until they are authenticated.

- **Authentication server**—The authentication server contains the backend database that makes authentication decisions. It contains credential information for each end device that is allowed to connect to the network. The authenticator forwards credentials supplied by the end device to the authentication server. If the credentials forwarded by the authenticator match the credentials in the authentication server database, access is granted. If the credentials forwarded do not match, access is denied. The EX Series switches support RADIUS authentication servers.

**NOTE:** You cannot configure 802.1X authentication on redundant trunk groups (RTGs). For more information on RTGs, see “Understanding Redundant Trunk Links on EX Series Switches” on page 2068.
MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices that are not 802.1X-enabled but that you want to allow to access the LAN.

The EAP method supported for MAC RADIUS authentication on EX Series switches is EAP-MD5.

If both 802.1X-enabled end devices and end devices that are not 802.1X-enabled connect to an interface, you can configure both 802.1X and MAC RADIUS authentication methods on the interface. In this case, the switch first attempts to authenticate using 802.1X, and if that method fails, it attempts to authenticate the end device using MAC RADIUS authentication.

If you know that only non-802.1X-enabled end devices connect on that interface, you can eliminate the delay that occurs while the switch determines that the end device is non-802.1X-enabled by configuring the `mac-radius restrict` option. When this option is configured, the switch does not attempt to authenticate the end device through 802.1X but instead immediately sends a request to the RADIUS server for authentication of the MAC address of the end device. If the MAC address of an end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device on the interface to which it is connected.

This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface. When you configure `mac-radius restrict` on an interface to eliminate this delay, the switch drops all 802.1X packets.

Captive Portal Authentication

Captive portal authentication (hereafter referred to as captive portal) allows you to authenticate users on EX Series switches by redirecting Web browser requests to a login page that requires users to input a username and password before they are allowed access to the network. Captive portal controls network access by requiring users to provide information that is authenticated against a RADIUS server database using EAP-MD5. You can also use captive portal to display an acceptable-use policy to users before they access your network.

Juniper Networks Junos operating system (Junos OS) for EX Series switches provides a template that allows you to easily design and modify the look of the captive portal login page. You enable specific interfaces for captive portal. The first time an end device connected to a captive portal interface attempts to access a web page, the switch presents the captive portal login page. Upon successful authentication, the user is allowed access to the network and to continue to the original page requested.

**NOTE:** If Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) is enabled, Hypertext Transfer Protocol (HTTP) requests are redirected to an HTTPS connection for the captive portal authentication process. After authentication, the end device is returned to the HTTP connection.
If there are end devices that are not HTTP-enabled connected to the captive portal interface, you can allow them to bypass captive portal authentication by adding their MAC addresses to an authentication whitelist.

When the user is authenticated by the RADIUS server, any per-user policies (attributes) associated with that user are also sent to the switch.

Captive portal on EX Series switches has the following limitations:

- The captive portal interface must be configured for `family ethernet-switching` and set to port mode `access`.

- Captive portal does not support dynamic assignment of VLANs downloaded from the RADIUS server.

- If the user is idle for more than about 5 minutes and there is no traffic passed, the user must log back in to the captive portal.

**Static MAC Bypass of Authentication**

You can allow end devices to access the LAN without authentication on a RADIUS server by including their MAC addresses in the static MAC bypass list (also known as the exclusion list).

You might choose to include a device in the bypass list to:

- Allow non-802.1X-enabled devices access to the LAN.

- Eliminate the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

When you configure static MAC on the switch, the MAC address of the end device is first checked in a local database (a user-configured list of MAC addresses). If a match is found, the end device is successfully authenticated and the interface is opened up for it. No further authentication is done for that end device. If a match is not found and 802.1X authentication is enabled on the switch, the switch attempts to authenticate the end device through the RADIUS server.

For each MAC address, you can also configure the VLAN to which the end device is moved or the interfaces on which the host connects.

---

**CAUTION:** When you clear the learned MAC addresses from an interface using the `clear dot1x interface` command, all MAC addresses are cleared, including those in the static MAC bypass list.

---

**Fallback of Authentication Methods**

You can configure multiple authentication methods on a single interface to enable fallback to another method if one method fails.

If an interface is configured in multiple supplicant mode, all end devices connecting through the interface must use either captive portal or a combination of 802.1X and MAC...
RADIUS, captive portal cannot be mixed with 802.1X or MAC RADIUS. Therefore, if there is already an end device on the interface that was authenticated through 802.1X or MAC RADIUS authentication, then additional end devices authenticating do not fall back to captive portal. If only 802.1X authentication or MAC RADIUS authentication is configured, some end devices can be authenticated using 802.1X and others can still be authenticated using MAC RADIUS.

Fallback of authentication methods occurs in the following order:

1. **802.1X authentication**—If 802.1X is configured on the interface, the switch sends EAPoL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the switch checks whether MAC RADIUS authentication is configured on the interface.

2. **MAC RADIUS authentication**—If MAC RADIUS authentication is configured on the interface, the switch sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the switch checks whether captive portal is configured on the interface.

3. **Captive portal authentication**—If captive portal is configured on the interface, the switch attempts to authenticate using this method after attempting any other configured authentication methods. If an end device is authenticated on the interface using captive portal, this becomes the active authentication method on the interface. When captive portal is the active authentication method, the switch falls back to 802.1X authentication if there are no sessions in the authenticated state and if the interface receives an EAP packet.

Understanding Guest VLANs for 802.1X on EX Series Switches

Guest VLANs can be configured on switches that are using 802.1X authentication to provide limited access—typically only to the Internet—for:

- Corporate guests
- End devices that are not 802.1X-enabled
- Nonresponsive end devices when MAC RADIUS authentication has not been configured on the switch interfaces to which the hosts are connected

A guest VLAN is not used for supplicants sending incorrect credentials. Those supplicants are directed to the server-reject VLAN instead.

For end devices that are not 802.1X-enabled, a guest VLAN can allow limited access to a server from which the non-802.1X-enabled end device can download the supplicant software and attempt authentication again.

A guest VLAN is not used when MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected. Some end devices, such as a printer, cannot be enabled for 802.1X. The hosts for such devices should be connected to switch interfaces that are configured for MAC RADIUS authentication. See "Configuring MAC RADIUS Authentication (CLI Procedure)" on page 1754.

Understanding 802.1X and RADIUS Accounting on EX Series Switches

Juniper Networks EX Series Ethernet Switches support IETF RFC 2866, RADIUS Accounting. Configuring RADIUS accounting on an EX Series switch permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. In the event that the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Juniper Networks Junos operating system (Junos OS).

The RADIUS accounting process between a switch and a RADIUS server works like this:
1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.

2. The switch forwards an accounting-request packet containing an event record to the accounting server. For example, a supplicant is authenticated through 802.1X authentication and connected to the LAN. The event record associated with this supplicant contains an Acct-Status-Type attribute whose value indicates the beginning of user service for this supplicant. When the supplicant’s session ends, the accounting request will contain an Acct-Status-Type attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.

3. The RADIUS accounting server logs these events as start-accounting or stop-accounting records. The records are in a file. On FreeRADIUS, the file name is the server's address; for example, 122.69.1.250.

4. The accounting server sends an accounting-response packet back to the switch confirming it has received the accounting request.

5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

**Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches**

Juniper Networks EX Series Ethernet Switches use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to quickly identify a variety of devices, resulting in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include information such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in the Juniper Networks Junos operating system (Junos OS).

LLDP-MED goes one step further than LLDP, exchanging IP-telephony messages between the switch and the IP telephone.
**NOTE:** If your IP telephone is configured for voice over IP (VoIP), the switch automatically detects the configuration and assigns the telephone to the voice VLAN. The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

LLDP and LLDP-MED also provide PoE power management capabilities. LLDP power negotiation allows the switch to manage PoE power by negotiating with LLDP-enabled powered devices to dynamically allocate PoE power as needed. LLDP power priority allows an LLDP-enabled powered device to set the PoE power priority on the switch interface to which it connects.

The switch also uses these protocols to ensure that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p CoS and 802.1Q tag information can be sent to the IP telephone.

EX Series switches support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—Interface name for the port.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information is not configurable, but taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports; for example, bridge or router. This information is not configurable, but based on the model of the product.
- **Management Address**—The IPv4 or IPv6 management address of the local system.

**NOTE:** The Chassis ID TLV has a subtype for Network Address Family. LLDP frames are validated only if this subtype has a value of 1 (IPv4) or 2 (IPv6). For any other value, the transmitting device is detected by LLDP as a neighbor and displayed in the output of the "show lldp neighbors" command, but is not assigned to the VLAN.

EX Series switches support the following 802.3 TLVs:
• **Power via MDI**—A TLV that advertises MDI power support, PSE power pair, and power class information.

• **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is not configurable, but based on the physical interface structure.

• **Link Aggregation**—A TLV that advertises if the port is aggregated and its aggregated port ID.

• **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.

• **Port VLAN**—A TLV that advertises the VLAN name configured on the interface.

EX Series switches support the following LLDP-MED TLVs:

• **LLDP MED Capabilities**—A TLV that advertises the primary function of the port. The capabilities values range 0 through 15:
  - 0—Capabilities
  - 1—Network Policy
  - 2—Location Identification
  - 3—Extended Power via MDI-PSE
  - 4—Inventory
  - 5–15—Reserved

• **LLDP-MED Device Class Values**:
  - 0—Class not defined.
  - 1—Class 1 Device.
  - 2—Class 2 Device.
  - 3—Class 3 Device.
  - 4—Network Connectivity Device
  - 5–255—Reserved.

• **Network Policy**—A TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.

• **Endpoint Location**—A TLV that advertises the physical location of the endpoint.

• **Extended Power via MDI**—A TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

**Related Documentation**

- [Understanding Layer 2 Protocol Tunneling on EX Series Switches](#)
When you use Voice over IP (VoIP), you can connect IP telephones to the switch and configure IEEE 802.1X authentication for 802.1X-compatible IP telephones. The 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access.

VoIP is a protocol used for the transmission of voice through packet-switched networks. VoIP transmits voice calls using a network connection instead of an analog phone line.

When VoIP is used with 802.1X, the RADIUS server authenticates the phone, and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) provides the class-of-service (CoS) parameters to the phone.

You can configure 802.1X authentication to work with VoIP in multiple supplicant or single supplicant mode. In *multiple-suppliant* mode, the 802.1X process allows multiple supplicants to connect to the interface. Each supplicant will be authenticated individually. For an example of a VoIP multiple supplicant topology, see Figure 7 on page 1668.
If an 802.1X-compatible IP telephone does not have an 802.1X host but has another 802.1X-compatible device connected to its data port, you can connect the phone to an interface in single-supplicant mode. In single-supplicant mode, the 802.1X process authenticates only the first supplicant. All other supplicants who connect later to the interface are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication. For an example of a VoIP single supplicant topology, see Figure 8 on page 1669.

**Figure 8: VoIP Single Supplicant Topology**

![Figure 8: VoIP Single Supplicant Topology](image)

If an IP telephone does not support 802.1X, you can configure VoIP to bypass 802.1X and LLDP-MED and have the packets forwarded to a VoIP VLAN.

Understanding 802.1X and VSAs on EX Series Switches

Juniper Networks EX Series Ethernet Switches support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, Remote Authentication Dial In User Service (RADIUS). Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are clear text fields sent from the RADIUS server to the switch as a result of the 802.1X authentication success or failure. The 802.1X authentication prevents unauthorized user access by blocking a supplicant at the port until the supplicant is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with 802.1X authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the 802.1X authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches. For more information, see “Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch” on page 1719.

VSAs are only supported for 802.1X single-suppliant configurations and multiple-suppliant configurations.

Understanding Dynamic VLANs for 802.1X on EX Series Switches

Dynamic VLANs, in conjunction with the 802.1X authentication process, provide secure access to the LAN for end devices belonging to different VLANs on a single port.

When this feature is configured on the RADIUS server, an end device or user authenticating on the RADIUS server is assigned to the VLAN configured for it. The end device or user becomes a member of a VLAN dynamically after successful 802.1X authentication. For information on configuring dynamic VLANs on your RADIUS server, see the documentation for your RADIUS server.

Successful authentication requires that the VLAN ID or VLAN name exist on the switch and match the VLAN ID or VLAN name sent by the RADIUS server during authentication.
If neither exists, the end device is unauthenticated. If a guest VLAN is established, the unauthenticated end device is automatically moved to the guest VLAN.

Understanding Server Fail Fallback and Authentication on EX Series Switches

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

Juniper Networks EX Series Ethernet Switches use authentication to implement access control in an enterprise network. If 802.1X, MAC RADIUS, or captive portal authentication are configured on the interface, end devices are evaluated at the initial connection by an authentication (RADIUS) server. If the end device is configured on the authentication server, the device is granted access to the LAN and the EX Series switch opens the interface to permit access.

A RADIUS server timeout occurs if no RADIUS authentication servers are reachable when an end device logs in and attempts to access the LAN. Server fail fallback allows you to specify one of four actions to be taken toward end devices awaiting authentication when the server is timed out:

- **Permit** authentication, allowing traffic to flow from the end device through the interface as if the end device were successfully authenticated by the RADIUS server.
- **Deny** authentication, preventing traffic from flowing from the end device through the interface. This is the default.
- **Move** the end device to a specified VLAN. (The VLAN must already exist on the switch.)
- **Sustain** authenticated end devices that already have LAN access and **deny** unauthenticated end devices. If the RADIUS servers time out during reauthentication, previously authenticated end devices are reauthenticated and new users are denied LAN access.

Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by an end device’s first attempt at authentication through the RADIUS server.

Server fail fallback allows you to specify that an end device be moved to a specified VLAN if the switch receives a RADIUS access-reject message. The configured VLAN name overrides any attributes sent by the server.

Related Documentation
- 802.1X for EX Series Switches Overview on page 1655
- Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch on page 1707
You can control access to your network through an EX Series switch by using several different authentication methods—including 802.1X, MAC RADIUS, or captive portal.

Figure 9 on page 1672 illustrates the authentication process:

Figure 9: Authentication Process Flow for an EX Series Switch
Understanding Authentication Session Timeout

You can specify authentication session timeout values for captive portal authentication sessions and 802.1X and MAC RADIUS authentication sessions.

For captive portal authentication, the length of the session depends on the value configured for the `session-expiry` statement. The remainder of this topic pertains only to 802.1X and MAC RADIUS authentication sessions.

For 802.1X and MAC RADIUS authentication sessions, the timeout of the session depends on the value of `reauthentication-interval` for `dot1x authentication`. The authentication session might also end when the MAC table aging time expires because, unless you configure it not to, the session is removed from the authentication session table when the MAC address is removed from the Ethernet switching table.

Information about each 802.1X and MAC RADIUS authentication session—including the associated interfaces and VLANs for each MAC address that is authenticated by 802.1X authentication or MAC RADIUS authentication—is stored in the authentication session table. The authentication session table is tied to the Ethernet switching table (also called the MAC table). Each time the switch detects traffic from a MAC address, it updates the timestamp for that network node in the Ethernet switching table. A timer on the switch periodically checks the timestamp and if its value exceeds the user-configured `mac-table-aging-time` value, the switch removes the MAC address from the Ethernet switching table. When a MAC address ages out of the Ethernet switching table, the entry for that MAC address is also removed from the authentication database, with the result that the session ends.

You can control variables affecting timeout of authentication sessions in the following ways:

- Set the authentication session timeout on all interfaces or on selected interfaces using the `reauthentication` statement.

- Disassociate the authentication session table from the Ethernet switching table using the `no-mac-table-binding` statement. This setting prevents the termination of the authentication session when the associated MAC address ages out of the Ethernet switching table.
- Controlling Authentication Session Timeouts (CLI Procedure) on page 1761
- Configuring MAC Table Aging (CLI Procedure)
CHAPTER 29

Configuration

- Configuration Examples on page 1675
- Configuration Tasks on page 1739
- Configuration Statements on page 1762

**Configuration Examples**

- **Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch** on page 1675
- **Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch** on page 1679
- **Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch** on page 1684
- **Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch** on page 1690
- **Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication** on page 1698
- **Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch** on page 1704
- **Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch** on page 1707
- **Example: Configuring MAC RADIUS Authentication on an EX Series Switch** on page 1713
- **Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch** on page 1719
- **Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication** on page 1725
- **Example: Setting Up Captive Portal Authentication on an EX Series Switch** on page 1730
- **Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients** on page 1735

**Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch**

802.1X is the IEEE standard for Port-Based Network Access Control (PNAC). You use 802.1X to control network access. Only users and devices providing credentials that have been verified against a user database are allowed access to the network. You can use a
RADIUS server as the user database for 802.1X authentication, as well as for MAC RADIUS authentication.

This example describes how to connect a RADIUS server to an EX Series switch, and configure it for 802.1X:

- Requirements on page 1676
- Overview and Topology on page 1676
- Configuration on page 1678
- Verification on page 1679

**Requirements**

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073. For all other switches, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch.

  **NOTE:** For more about ELS, see: “Getting Started with Enhanced Layer 2 Software” on page 3

- Configured users on the RADIUS authentication server.

**Overview and Topology**

The EX Series switch acts as an authenticator Port Access Entity (PAE). It blocks all traffic and acts as a control gate until the supplicant (client) is authenticated by the server. All other users and devices are denied access.

Figure 10 on page 1677 shows one EX4200 switch that is connected to the devices listed in Table 198 on page 1677.
## Table 198: Components of the Topology

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports (ge-0/0/0 through ge-0/0/7) and 16 non-PoE ports (ge-0/0/8 through ge-0/0/23)</td>
</tr>
<tr>
<td>VLAN name</td>
<td>default</td>
</tr>
<tr>
<td>One RADIUS server</td>
<td>Backend database with an address of 10.0.0.100 connected to the switch at port ge-0/0/10</td>
</tr>
</tbody>
</table>
In this example, connect the RADIUS server to access port ge-0/0/10 on the EX4200 switch. The switch acts as the authenticator and forwards credentials from the supplicant to the user database on the RADIUS server. You must configure connectivity between the EX4200 and the RADIUS server by specifying the address of the server and configuring the secret password. This information is configured in an access profile on the switch.

**NOTE:** For more information about authentication, authorization, and accounting (AAA) services, see the *Junos OS System Basics Configuration Guide*.

### Configuration

**CLI Quick Configuration**

To quickly connect the RADIUS server to the switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set access radius-server 10.0.0.100 secret juniper
set access radius-server 10.0.0.200 secret juniper
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server [10.0.0.100 10.2.14.200]
```

**Step-by-Step Procedure**

To connect the RADIUS server to the switch:

1. Define the address of the servers, and configure the secret password. The secret password on the switch must match the secret password on the server:
   ```
   [edit]
   user@switch# set access radius-server 10.0.0.100 secret juniper
   user@switch# set access radius-server 10.0.0.200 secret juniper
   ```

2. Configure the authentication order, making radius the first method of authentication:
   ```
   [edit]
   user@switch# set access profile profile1 authentication-order radius
   ```

3. Configure a list of server IP addresses to be tried in order to authenticate the supplicant:
   ```
   [edit]
   user@switch# set access profile profile1 radius authentication-server [10.0.0.100 10.2.14.200]
   ```

**Results**

Display the results of the configuration:

```
user@switch> show configuration access
radius-server {  
  10.0.0.100  
  port 1812;  
  secret "$9$qPT3ApBsv69rvWLVb.P5"; ## SECRET-DATA
  }
}
profile profile1{
  authentication-order radius;
  radius {
    authentication-server 10.0.0.100 10.2.14.200;
  }
}
```
Verification

To confirm that the configuration is working properly, perform these tasks:

- Verify That the Switch and RADIUS Server are Properly Connected on page 1679

**Verify That the Switch and RADIUS Server are Properly Connected**

**Purpose**
Verify that the RADIUS server is connected to the switch on the specified port.

**Action**
Ping the RADIUS server to verify the connection between the switch and the server:

```
user@switch> ping 10.0.0.100
PING 10.0.0.100 (10.0.0.100): 56 data bytes
64 bytes from 10.93.15.218: icmp_seq=0 ttl=64 time=9.734 ms
64 bytes from 10.93.15.218: icmp_seq=1 ttl=64 time=0.228 ms
```

**Meaning**
ICMP echo request packets are sent from the switch to the target server at 10.0.0.100 to test whether it is reachable across the IP network. ICMP echo responses are being returned from the server, verifying that the switch and the server are connected.

**Related Documentation**
- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch on page 1684
- Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch on page 1679
- Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch

- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1742

**Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch**

802.1X on EX Series switches provides LAN access to users who do not have credentials in the RADIUS database. These users, referred to as guests, are authenticated and typically provided with access to the Internet.

This example describes how to create a guest VLAN and configure 802.1X authentication for it.

- Requirements on page 1680
- Overview and Topology on page 1680
- Configuration of a Guest VLAN That Includes 802.1X Authentication on page 1682
- Verification on page 1682
Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator interface access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure guest VLAN authentication, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See Connecting and Configuring an EX Series Switch (CLI Procedure).
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073. For all other switches, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch.

NOTE: For more about ELS, see: “Getting Started with Enhanced Layer 2 Software” on page 3

Overview and Topology

As part of IEEE 802.1X Port-Based Network Access Control (PNAC), you can provide limited network access to supplicants who do not belong to a VLAN authentication group by configuring authentication to a guest VLAN. Typically, guest VLAN access is used to provide Internet access to visitors to a corporate site. However, you can also use the guest VLAN feature to provide supplicants that fail 802.1X authentication to a corporate LAN with access to a VLAN with limited resources.

Figure 11 on page 1681 shows the conference room connected to the switch at interface ge-0/0/1.
Table 199: Components of the Guest VLAN Topology

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>EX4200 switch, 24 Gigabit Ethernet interfaces: 8 PoE interfaces (ge-0/0/0 through ge-0/0/7) and 16 non-PoE interfaces (ge-0/0/8 through ge-0/0/23)</td>
</tr>
<tr>
<td>VLAN names and tag IDs</td>
<td>sales, tag 100&lt;br&gt;support, tag 200&lt;br&gt;guest-vlan, tag 300</td>
</tr>
<tr>
<td>One RADIUS server</td>
<td>Backend database connected to the switch through interface ge-0/0/10</td>
</tr>
</tbody>
</table>
In this example, access interface ge-0/0/1 provides LAN connectivity in the conference room. Configure this access interface to provide LAN connectivity to visitors in the conference room who are not authenticated by the corporate VLAN.

### Configuration of a Guest VLAN That Includes 802.1X Authentication

#### CLI Quick Configuration

To quickly configure a guest VLAN, with 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans guest-vlan vlan-id 300
set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

#### Step-by-Step Procedure

To configure a guest VLAN that includes 802.1X authentication on an EX Series switch:

1. Configure the VLAN ID for the guest VLAN:
   ```
   [edit]
   user@switch# set vlans guest-vlan vlan-id 300
   ```

2. Configure the guest VLAN under dot1x protocols:
   ```
   [edit]
   user@switch# set protocols dot1x authenticator interface all guest-vlan guest-vlan
   ```

#### Results

Check the results of the configuration:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        all {
          guest-vlan {
            guest-vlan;
          }
        }
      }
    }
  }
}
vlans {
  guest-vlan {
    vlan-id 300;
  }
}
```

#### Verification

To confirm that the configuration is working properly, perform these tasks:

- **Verifying That the Guest VLAN is Configured on page 1682**

**Verifying That the Guest VLAN is Configured**

Verify that the guest VLAN is created and that an interface has failed authentication and been moved to the guest VLAN.
NOTE: On switches running Junos OS for EX Series with support for the Enhanced Layer 2 Software (ELS), the output for the `show vlans` command will contain additional information. If your switch runs software that supports ELS, see `show vlans`. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

### Action
Use the operational mode commands:

```bash
user@switch> show vlans
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Tag</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td></td>
<td>ge-0/0/3.0*</td>
</tr>
<tr>
<td>dynamic</td>
<td>40</td>
<td>None</td>
</tr>
<tr>
<td>guest</td>
<td>30</td>
<td>None</td>
</tr>
<tr>
<td>guest-vlan</td>
<td>300</td>
<td>ge-0/0/1.0*</td>
</tr>
<tr>
<td>vlan_dyn</td>
<td></td>
<td>None</td>
</tr>
</tbody>
</table>

```bash
user@switch> show dot1x interface ge-0/0/1.0 detail
```

- Role: Authenticator
- Administrative state: Auto
- Supplicant mode: Single
- Number of retries: 3
- Quiet period: 60 seconds
- Transmit period: 30 seconds
- Mac Radius: Enabled
- Mac Radius Restrict: Disabled
- Reauthentication: Enabled
- Configured Reauthentication interval: 3600 seconds
- Supplicant timeout: 30 seconds
- Server timeout: 30 seconds
- Maximum EAPOL requests: 2
- Guest VLAN member: guest-vlan
- Number of connected supplicants: 1
  - Supplicant: user1, 00:00:00:00:13:23
  - Operational state: Authenticated
  - Authentication method: Radius
  - Authenticated VLAN: vol1
  - Dynamic Filter: match source-dot1q-tag 10 action deny
  - Session Reauth interval: 60 seconds
  - Reauthentication due in 50 seconds

### Meaning
The output from the `show vlans` command shows `guest-vlan` as the the name of the VLAN and the VLAN ID as 300.

The output from the `show dot1x interface ge-0/0/1.0 detail` command displays the **Guest VLAN membership** field, indicating that a supplicant at this interface failed 802.1X authentication and was passed through to the `guest-vlan`. 
802.1x Port-Based Network Access Control (PNAC) authentication on EX Series switches provides three types of authentication to meet the access needs of your enterprise LAN:

- Authenticate the first end device (supplicant) on an authenticator port, and allow all others also connecting to have access.
- Authenticate only one end device on an authenticator port at one time.
- Authenticate multiple end devices on an authenticator port. Multiple supplicant mode is used in VoIP configurations.

This example configures an EX4200 switch to use IEEE 802.1X to authenticate end devices that use three different administrative modes:

- Requirements on page 1684
- Overview and Topology on page 1685
- Configuration of 802.1X to Support Multiple Supplicant Modes on page 1687
- Verification on page 1688

Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from end devices until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for end devices (supplicants) that have permission to connect to the network.

Before you configure the ports for 802.1X authentication, be sure you have:

- Installed your EX Series switch.
- Performed the initial switch configuration. See Connecting and Configuring an EX Series Switch (CLI Procedure).
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a
switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see "Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch" on page 2073. For all other switches, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch.

**NOTE:** For more about ELS, see: "Getting Started with Enhanced Layer 2 Software" on page 3

- Configured users on the authentication server.

**Overview and Topology**

As shown in Figure 12 on page 1686, the topology contains an EX4200 access switch connected to the authentication server on port ge-0/0/10. Interfaces ge-0/0/8, ge-0/0/9, and ge-0/0/11 will be configured for three different administrative modes.
To configure the administrative modes to support supplicants in different areas of the Enterprise network:
- Configure access port `ge-0/0/8` for single supplicant mode authentication.
- Configure access port `ge-0/0/9` for single secure supplicant mode authentication.
- Configure access port `ge-0/0/11` for multiple supplicant mode authentication.

Single supplicant mode authenticates only the first end device that connects to an authenticator port. All other end devices connecting to the authenticator port after the first has connected successfully, whether they are 802.1X-enabled or not, are permitted free access to the port without further authentication. If the first authenticated end device logs out, all other end devices are locked out until an end device authenticates.

Single-secure supplicant mode authenticates only one end device to connect to an authenticator port. No other end device can connect to the authenticator port until the first logs out.

Multiple supplicant mode authenticates multiple end devices individually on one authenticator port. If you configure a maximum number of devices that can be connected to a port through port security, the lesser of the configured values is used to determine the maximum number of end devices allowed per port.

**Configuration of 802.1X to Support Multiple Supplicant Modes**

**CLI Quick Configuration**

To quickly configure the ports with different 802.1X authentication modes, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/8 supplicant single
set protocols dot1x authenticator interface ge-0/0/9 supplicant single-secure
set protocols dot1x authenticator interface ge-0/0/11 supplicant multiple
```

**Step-by-Step Procedure**

Configure the administrative mode on the interfaces:

1. Configure the supplicant mode as single on interface `ge-0/0/8`:
   ```
   [edit protocols]
   user@switch# set dot1x authenticator interface ge-0/0/8 supplicant single
   ```
2. Configure the supplicant mode as single secure on interface `ge-0/0/9`:
   ```
   [edit protocols]
   user@switch# set dot1x authenticator interface ge-0/0/9 supplicant single-secure
   ```
3. Configure multiple supplicant mode on interface `ge-0/0/11`:
   ```
   [edit protocols]
   user@switch# set dot1x authenticator interface ge-0/0/11 supplicant multiple
   ```

**Results**

Check the results of the configuration:

```
[edit]
user@access-switch> show configuration protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
```
ge-0/0/9.0 {
    supplicant single-secure;
}
ge-0/0/11.0 {
    supplicant multiple;
}

Verification
To confirm that the configuration is working properly, perform these tasks:

- Verifying the 802.1X Configuration on page 1688

Verifying the 802.1X Configuration

Purpose Verify the 802.1X configuration on interfaces ge-0/0/8, ge-0/0/9, and ge-0/0/5.
**Action** Verify the 802.1X configuration with the operational mode command `show dot1x interface`:

```plaintext
user@switch> show dot1x interface ge-0/0/8.0 detail
ge-0/0/8.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>

user@switch> show dot1x interface ge-0/0/9.0 detail
ge-0/0/9.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single-Secure
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0

user@switch> show dot1x interface ge-0/0/11.0 detail
ge-0/0/11.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

**Meaning** The **Supplicant mode** output field displays the configured administrative mode for each interface. Interface `ge-0/0/8.0` displays **Single** supplicant mode. Interface `ge-0/0/9.0` displays **Single Secure** supplicant mode. Interface `ge-0/0/11.0` displays **Multiple** supplicant mode.
Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol forwards VoIP parameters from the switch to the phone. You also configure 802.1X authentication to allow the telephone access to the LAN. Authentication is done through a backend RADIUS server.

This example describes how to configure VoIP on an EX Series switch to support an Avaya IP phone, as well as the LLDP-MED protocol and 802.1X authentication:

- Requirements on page 1690
- Overview and Topology on page 1691
- Configuration on page 1693
- Verification on page 1695

Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2X50 or later for EX Series switches
- One EX4300 switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An Avaya IP telephone that supports LLDP-MED and 802.1X

Before you configure VoIP, be sure you have:
• Installed your EX Series switch. See the installation information for your switch.

• Performed the initial switch configuration. See Connecting and Configuring an EX Series Switch (CLI Procedure).

• Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073.

• Configured the RADIUS server for 802.1X authentication and set up the access profile. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.

• (Optional) Configured the interface ge-0/0/2 for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see “Configuring PoE (CLI Procedure)” on page 3942.

NOTE: If the IP address is not configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the voip statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN’s ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

Overview and Topology

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface ge-0/0/2 on the EX4300 switch is connected to an Avaya IP telephone. Avaya phones have a built-in bridge that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one interface on the switch. The EX Series switch is connected to a RADIUS server on the ge-0/0/10 interface (see Figure 13 on page 1692).
In this example, you configure VoIP parameters and specify the forwarding class **assured-forward** for voice traffic to provide the highest quality of service.

Table 201 on page 1692 describes the components used in this VoIP configuration example.

**Table 201: Components of the VoIP Configuration Topology**

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>EX4300 switch</td>
</tr>
</tbody>
</table>
Table 201: Components of the VoIP Configuration Topology (continued)

<table>

<td></td>
</tr>
<tr>
<td>One RADIUS server</td>
<td>Provides backend database connected to the</td>
</tr>
<tr>
<td></td>
<td>switch through interface ge-0/0/10.</td>
</tr>
</tbody>
</table>

As well as configuring a VoIP for interface ge-0/0/2, you configure:

- 802.1X authentication. Authentication is set to multiple supplicant mode to support more than one supplicant's access to the LAN through interface ge-0/0/2.
- LLDP-MED protocol information. The switch uses LLDP-MED to forward VoIP parameters to the phone. Using LLDP-MED ensures that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p class of service and 802.1Q tag information can be sent to the IP telephone.

NOTE: A PoE configuration is not necessary if an IP telephone is using a power adapter.

### Configuration

**CLI Quick Configuration**

To quickly configure VoIP, LLDP-MED, and 802.1X, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan switch-options interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set switch-options voip interface ge-0/0/2.0 vlan voice-vlan
set switch-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Step-by-Step Procedure**

To configure VoIP with LLDP-MED and 802.1X:

1. Configure the VLANs for voice and data:

   ```
   [edit vlans]
   user@switch# set data-vlan vlan-id 77
   user@switch# set voice-vlan vlan-id 99
   ```

2. Associate the VLAN data-vlan with the interface:

   ```
   [edit vlans]
   user@switch# set data-vlan switch-options interface ge-0/0/2.0
   ```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the data-vlan VLAN:
4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit switch-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

5. Configure LLDP-MED protocol support:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2
```

6. To authenticate an IP phone and a PC connected to the IP phone on the interface, configure 802.1X authentication support and specify *multiple* supplicant mode:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Results**

Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces { 
  ge-0/0/2 { 
    unit 0 { 
      family ethernet-switching { 
        interface-mode access; 
        vlan { 
          members data-vlan; 
        } 
      } 
    } 
  } 
}

protocols { 
  lldp-med { 
    interface ge-0/0/2; 
  } 
  dot1x { 
    authenticator { 
      interface { 
        ge-0/0/2.0 { 
          supplicant multiple; 
        } 
      } 
    } 
  } 
}

vlans { 
  data-vlan { 

VLAN Configuration

```
  vlan-id 77;
  switch-options {
    interface ge-0/0/2.0;
  }
  voice-vlan {
    vlan-id 99;
  }
  switch-options {
    voip {
      interface ge-0/0/2.0 {
        vlan voice-vlan;
        forwarding-class assured-forwarding;
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying LLDP-MED Configuration on page 1695
- Verifying 802.1X Authentication for IP Phone and Desktop PC on page 1696
- Verifying the VLAN Association with the Interface on page 1697

**Verifying LLDP-MED Configuration**

**Purpose**
Verify that LLDP-MED is enabled on the interface.
**Action**

```
user@switch> show lldp detail
```

Basic Management TLVs supported:
End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name,
System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:
MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum Frame Size,
Port VLAN tag, Port VLAN name.

**Meaning**

The `show lldp detail` output shows that both LLDP and LLDP-MED are configured on the ge-0/0/2 interface. The end of the output shows the list of supported LLDP basic management TLVs and organizationally specific TLVs that are supported.

**Verifying 802.1X Authentication for IP Phone and Desktop PC**

**Purpose**

Display the 802.1X configuration to confirm that the VoIP interface has access to the LAN.
**Action**

```
user@switch> show dot1x interface ge/0/0/2.0 detail
ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
  Supplicant: user101, 00:04:0f:fd:ac:fe
    Operational state: Authenticated
    Authentication method: Radius
    Authenticated VLAN: vo11
    Dynamic Filter: match source-dot1q-tag 10 action deny
    Session Reauth interval: 60 seconds
    Reauthentication due in 50 seconds
```

**Meaning**
The field **Role** shows that the ge-0/0/2.0 interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

**Verifying the VLAN Association with the Interface**

**Purpose**
Display the interface's VLAN membership.

**Action**

```
user@switch> show ethernet-switching interface ge-0/0/2.0
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,  
  LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
gre-0/0/2.0                    65535                                 untagged
  voice-vlan 99
      65535    Discarding
  data-vlan  77
      65535    Discarding
```

**Meaning**
The field **VLAN members** shows that the ge-0/0/2.0 interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN.

**Related Documentation**
- Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 1675
- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch on page 1684
- Defining CoS Forwarding Classes (CLI Procedure) on page 1927
You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones.

To configure VoIP on an EX Series switch to support an IP phone that does not support 802.1X authentication, you must either add the MAC address of the phone to the static MAC bypass list or enable MAC RADIUS authentication on the switch.

This example describes how to configure VoIP on an EX Series switch without 802.1X authentication by using static MAC bypass of authentication:

**Requirements**

This example uses the following hardware and software components:

- One EX4300 switch.
- Junos OS Release 13.2 or later for EX Series switches
- An Avaya IP telephone

Before you configure VoIP, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073.
• Configured the RADIUS server for 802.1X authentication and set up the access profile. See "Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch" on page 1675.

• (Optional) Configured the interface ge-0/0/2 for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see "Configuring PoE (CLI Procedure)" on page 3942.

NOTE: If the IP address is not configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the voip statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface ge-0/0/2 on the EX4300 switch is connected to a non-802.1X IP phone.

To configure VoIP on an EX Series switch to support an IP phone that does not support 802.1X authentication, add the MAC address of the phone as a static entry in the authenticator database and set the supplicant mode to multiple.

Configuration

To quickly configure VoIP without using 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```plaintext
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan switch-options interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set switch-options voip interface ge-0/0/2.0 vlan voice-vlan
set switch-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-medi interface ge-0/0/2
set protocols dot1x authenticator authentication-profile-name auth-profile
set protocols dot1x authenticator static 00:04:f2:11:aa:a7
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```
Step-by-Step Procedure

To configure VoIP without 802.1X authentication:

1. Configure the VLANs for voice and data:

   [edit vlans]
   user@switch# set data-vlan vlan-id 77
   user@switch# set voice-vlan vlan-id 99

2. Associate the VLAN data-vlan with the interface:

   [edit vlans]
   user@switch# set data-vlan switch-options interface ge-0/0/2.0

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the data-vlan VLAN:

   [edit interfaces]
   user@switch# set ge-0/0/2 unit 0 family ethernet-switching interface-mode access
   user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan

4. Configure VoIP on the interface and specify the assured-forwarding forwarding class to provide the most dependable class of service:

   [edit switch-options]
   user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
   user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding

5. Configure LLDP-MED protocol support:

   [edit protocols]
   user@switch# set lldp-med interface ge-0/0/2

6. Set the authentication profile (see “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740 and “Configuring 802.1X RADIUS Accounting (CLI Procedure)” on page 1741):

   [edit protocols]
   set dot1x authenticator authentication-profile-name auth-profile

7. Add the MAC address of the phone to the static MAC bypass list:

   [edit protocols]
   set dot1x authenticator static 00:04:f2:11:aa:a7

8. Set the supplicant mode to multiple:

   [edit protocols]
   set dot1x authenticator interface ge-0/0/2.0 supplicant multiple

Results

Display the results of the configuration:

   [edit]
   user@switch# show configuration interfaces { 
   ge-0/0/2 { 
   unit 0 [ 
   family ethernet-switching [ 
   interface-mode access;

        }
    }
    interface {
        ge-0/0/2.0 {
            supplicant multiple;
        }
    }
}
vlans {
    data-vlan {
        vlan-id 77;
        switch-options {
            interface ge-0/0/2.0;
        }
    }
    voice-vlan {
        vlan-id 99;
    }
}
switch-options {
    voip {
        interface ge-0/0/2.0 {
            vlan voice-vlan;
            forwarding-class assured-forwarding;
        }
    }
}

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying LLDP-MED Configuration on page 1701
- Verifying Authentication for the Desktop PC on page 1702
- Verifying the VLAN Association with the Interface on page 1703

Verifying LLDP-MED Configuration

Purpose  Verify that LLDP-MED is enabled on the interface.
**Action**

```
user@switch>  show lldp detail
```

**ge-0/0/4** | -                   | 1          | vlan-1     |
**ge-0/0/5** | -                   | 1          | vlan-1     |
**ge-0/0/6** | -                   | 1          | vlan-1     |
**ge-0/0/7** | -                   | 1          | vlan-1     |
**ge-0/0/8** | -                   | 1          | vlan-1     |
**ge-0/0/9** | -                   | 1          | vlan-1     |
**ge-0/0/10**| -                   | 1          | vlan-1     |

**Meaning**

The `show lldp detail` output shows that both LLDP and LLDP-MED are configured on the `ge-0/0/2` interface. The end of the output shows the list of supported LLDP basic management TLVs and organizationally specific TLVs that are supported.

**Verifying Authentication for the Desktop PC**

**Purpose**

Display the 802.1X configuration for the desktop PC connected to the VoIP interface through the IP phone.
**Action**

```
user@switch> show dot1x interface ge/0/0/2.0 detail
```

- **Role:** Authenticator
- **Administrative state:** Auto
- **Supplicant mode:** Multiple
- **Number of retries:** 3
- **Quiet period:** 60 seconds
- **Transmit period:** 30 seconds
- **Mac Radius:** Disabled
- **Mac Radius Restrict:** Disabled
- **Reauthentication:** Enabled
- **Configured Reauthentication interval:** 3600 seconds
- **Supplicant timeout:** 30 seconds
- **Server timeout:** 30 seconds
- **Maximum EAPOL requests:** 2
- **Guest VLAN member:** <not configured>
- **Number of connected supplicants:** 1
  - **Supplicant:** user101, 00:04:0f:fd:ac:fe
  - **Operational state:** Authenticated
  - **Authentication method:** Radius
  - **Authenticated VLAN:** vo11
  - **Dynamic Filter:** match source-dot1q-tag 10 action deny
  - **Session Reauth interval:** 60 seconds
  - **Reauthentication due in 50 seconds**

**Meaning**
The field **Role** shows that the ge-0/0/2.0 interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

**Verifying the VLAN Association with the Interface**

**Purpose**
Display the interface's VLAN membership.

**Action**

```
user@switch> show ethernet-switching interface ge-0/0/2.0
```

```
Routing Instance Name : default-switch

```

**Meaning**
The field **VLAN members** shows that the ge-0/0/2.0 interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN.

**Related Documentation**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch on page 1690
- Understanding 802.1X and VoIP on EX Series Switches on page 1668
- Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches on page 1665
**Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch**

To allow devices to access your LAN through 802.1X-configured interfaces without authentication, you can configure a static MAC bypass list on the EX Series switch. The static MAC bypass list, also known as the *exclusion list*, specifies MAC addresses that are allowed on the switch without a request to an authentication server.

You can use static MAC bypass of authentication to allow connection for devices that are not 802.1X-enabled, such as printers. If a host's MAC address is compared and matched against the static MAC address list, the nonresponsive host is authenticated and an interface opened for it.

This example describes how to configure static MAC bypass of authentication for two printers:

- **Requirements on page 1704**
- **Overview and Topology on page 1704**
- **Configuration on page 1706**
- **Verification on page 1707**

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

Before you configure static MAC authentication, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see "Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch" on page 2073. For all other switches, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch.

  For more about ELS, see: "Getting Started with Enhanced Layer 2 Software" on page 3

- Specified the RADIUS server connections and configured an access profile on the switch. See "Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch" on page 1675.

### Overview and Topology

To permit printers access to the LAN, add them to the static MAC bypass list. The MAC addresses on this list are permitted access without authentication from the RADIUS server.

*Figure 14 on page 1705* shows the two printers connected to the EX4200.
The interfaces shown in Table 202 on page 1705 will be configured for static MAC authentication.

Table 202: Components of the Static MAC Authentication Configuration Topology

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>EX4200, 24 Gigabit Ethernet ports: 8 PoE ports (ge-0/0/0 through ge-0/0/23)</td>
</tr>
<tr>
<td>VLAN name</td>
<td>default</td>
</tr>
</tbody>
</table>
| Connections to integrated printer/fax/copier machines (no PoE required) | ge-0/0/19, MAC address 00:04:0f:fd:ac:fe  
  ge-0/0/20, MAC address 00:04:ae:cd:23:5f |
The printer with the MAC address 00:04:0f:fd:ac:fe is connected to access interface ge-0/0/19. A second printer with the MAC address 00:04:ae:cd:23:5f is connected to access interface ge-0/0/20. Both printers will be added to the static list and bypass 802.1X authentication.

### Configuration

#### CLI Quick Configuration

To quickly configure static MAC authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator authentication-profile-name profile1
set protocols dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
set protocols dot1x authenticator interface all supplicant multiple
```

#### Step-by-Step Procedure

Configure static MAC authentication:

1. Configure the authentication profile name (access profile name) to use for authentication:
   
   ```
   [edit protocols]
   user@switch# set dot1x authenticator authentication-profile-name profile1
   ```

2. Configure MAC addresses 00:04:0f:fd:ac:fe and 00:04:ae:cd:23:5f as static MAC addresses:
   
   ```
   [edit protocols]
   user@switch# set dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
   ```

3. Configure the 802.1X authentication method:
   
   ```
   [edit protocols]
   user@switch# set dot1x authenticator interface all supplicant multiple
   ```

#### Results

Display the results of the configuration:

```
user@switch> show
interfaces {
  ge-0/0/19 {

      family ethernet-switching {
        vlan members default;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      family ethernet-switching {
        vlan members default;
      }
    }
  }
}
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile1
    static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f];
    interface {
      all {
      ```
To confirm that the configuration is working properly, perform these tasks:

- Verifying Static MAC Bypass of Authentication on page 1707

**Verifying Static MAC Bypass of Authentication**

**Purpose**
Verify that the MAC address for both printers is configured and associated with the correct interfaces.

**Action**
Use the operational mode command:

```
user@switch> show dot1x static-mac-address
```

<table>
<thead>
<tr>
<th>MAC address</th>
<th>VLAN-Assignment</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:04:0f:fd:ac:fe</td>
<td>default</td>
<td>ge-0/0/19.0</td>
</tr>
<tr>
<td>00:04:ae:cd:23:5f</td>
<td>default</td>
<td>ge-0/0/20.0</td>
</tr>
</tbody>
</table>

**Meaning**
The output field *MAC address* shows the MAC addresses of the two printers.

The output field *Interface* shows that the MAC address 00:04:0f:fd:ac:fe can connect to the LAN through interface ge-0/0/19.0 and that the MAC address 00:04:ae:cd:23:5f can connect to the LAN through interface ge-0/0/20.0.

**Related Documentation**
- Configuring 802.1X Authentication (*J-Web Procedure*)
- Configuring Static MAC Bypass of Authentication (CLI Procedure) on page 1755
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1740
- Understanding Authentication on EX Series Switches on page 1658

**Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch**

Server failback allows you to specify how 802.1X supplicants connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

You use 802.1X to control network access. Only users and devices (supplicants) providing credentials that have been verified against a user database are allowed access to the network. You use a RADIUS server as the user database.
This example describes how to configure an interface to move a supplicant to a VLAN in the event of a RADIUS server timeout:

- Requirements on page 1708
- Overview and Topology on page 1708
- Configuration on page 1710
- Verification on page 1711

Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073. For all other switches, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch.

  NOTE: For more about ELS, see: “Getting Started with Enhanced Layer 2 Software” on page 3

- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.

- Disable firewall filters on the interface. Firewall filters interfere with server fail fallback operation.

- Configured users on the authentication server.

Overview and Topology

A RADIUS server timeout occurs if no authentication RADIUS servers are reachable when a supplicant logs in and attempts to access the LAN. Using server fail fallback, configure alternative options for supplicants attempting LAN access. You can configure the switch to accept or deny access to supplicants or to maintain the access already granted towards supplicants before the RADIUS server timeout. Additionally, you can configure the switch to move supplicants to a specific VLAN if a RADIUS timeout occurs or if the RADIUS server sends an EAP Access-Reject message. Figure 15 on page 1709 shows the topology...
used for this example. The RADIUS server is connected to the EX4200 switch on access port ge-0/0/10. The switch acts as the authenticator Port Access Entity (PAE) and forwards credentials from the supplicant to the user database on the RADIUS server. The switch blocks all traffic and acts as a control gate until the supplicant is authenticated by the authentication server. A supplicant is connected to the switch through interface ge-0/0/1.

Figure 15: Topology for Configuration

Table 203 on page 1709 describes the components in this topology.

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports.</td>
</tr>
<tr>
<td>VLAN names</td>
<td>default VLAN</td>
</tr>
<tr>
<td></td>
<td>vlan-sf VLAN</td>
</tr>
<tr>
<td>Supplicant</td>
<td>Suppliant attempting access on interface ge-0/0/1</td>
</tr>
</tbody>
</table>
Table 203: Components of the Topology (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>One RADIUS server</td>
<td>Backend database with an address of 10.0.0.100 connected to the switch at port ge-0/0/10</td>
</tr>
</tbody>
</table>

In this example, configure interface ge-0/0/1 to move a supplicant attempting access to the LAN during a RADIUS timeout to another VLAN. A RADIUS timeout prevents the normal exchange of EAP messages that carry information from the RADIUS server to the switch and permit the authentication of a supplicant. The default VLAN is configured on interface ge-0/0/1. When a RADIUS timeout occurs, supplicants on the interface will be moved from the default VLAN to the VLAN named vlan-sf.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see Junos OS System Basics Configuration Guide.

Configuration

### CLI Quick Configuration

To quickly configure server fail fallback on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit protocols dot1x authenticator]
set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

### Step-by-Step Procedure

To configure an interface to divert supplicants to a specific VLAN when a RADIUS timeout occurs (here, the VLAN is vlan-sf):

1. Define the VLAN to which supplicants are diverted:

   ```
   [edit protocols dot1x authenticator]
   user@switch# set interface ge-0/0/1 server-fail vlan-name vlan-sf
   ```

### Results

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members default;
        }
      }
    }
  }
}
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile52;
      interface {
        ge-0/0/1.0 {
          server-fail vlan-name vlan-sf;
        }
      }
    }
  }
```
Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout on page 1711

Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout

Purpose

Verify that the interface moves supplicants to an alternative VLAN during a RADIUS timeout.

NOTE: On switches running Junos OS for EX Series with support for the Enhanced Layer 2 Software (ELS), the output for the show vlans command will contain additional information. If your switch runs software that supports ELS, see show vlans. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.
**Action**  
Display the VLANs configured on the switch; the interface ge-0/0/1.0 is a member of the default VLAN:

```
user@switch> show vlans
Name      Tag     Interfaces
default   -       ge-0/0/0.0, ge-0/0/1.0*, ge-0/0/5.0*, ge-0/0/10.0,
           -       ge-0/0/12.0*, ge-0/0/14.0*, ge-0/0/15.0, ge-0/0/20.0
v2        77      None
vlansf    50      None
mgmt      -       me0.0*
```

Display 802.1X protocol information on the switch to view supplicants that are authenticated on interface ge-0/0/1.0:

```
user@switch> show dot1x interface brief
802.1X Information:
Interface     Role           State           MAC address          User
ge-0/0/1.0    Authenticator  Authenticated   00:00:00:00:00:01    abc
ge-0/0/10.0   Authenticator  Initialize     -                   
ge-0/0/14.0   Authenticator  Connecting     -                   
ge-0/0/15.0   Authenticator  Initialize     -                   
ge-0/0/20.0   Authenticator  Initialize     -                   
```

A RADIUS server timeout occurs. Display the Ethernet switching table to show that the supplicant with the MAC address 00:00:00:00:00:01 previously accessing the LAN through the default VLAN is now being learned on the VLAN named vlan-sf:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 1 learned
VLAN      MAC address       Type         Age Interfaces
v1        *                 Flood          - All-members
vlansf    00:00:00:00:00:01 Learn       1:07 ge-0/0/1.0
default   *                 Flood          - All-members
```

Display 802.1X protocol information to show that interface ge-0/0/1.0 is connecting and will open LAN access to supplicants:

```
user@switch> show dot1x interface brief
802.1X Information:
Interface     Role           State           MAC address          User
ge-0/0/1.0    Authenticator  Connecting     -                   
ge-0/0/10.0   Authenticator  Initialize     -                   
ge-0/0/14.0   Authenticator  Connecting     -                   
ge-0/0/15.0   Authenticator  Initialize     -                   
ge-0/0/20.0   Authenticator  Initialize     -                   
```

**Meaning**  
The command `show vlans` displays interface ge-0/0/1.0 as a member of the default VLAN. The command `show dot1x interface brief` shows that a supplicant (abc) is authenticated on interface ge-0/0/1.0 and has the MAC address 00:00:00:00:00:01. A RADIUS server timeout occurs, and the authentication server cannot be reached by the
switch. The command **show-ethernet-switching table** shows that MAC address 00:00:00:00:00:01 is learned on VLAN vlan-sf. The supplicant has been moved from the default VLAN to the vlan-sf VLAN. The supplicant is then connected to the LAN through the VLAN named vlan-sf.

### Related Documentation

- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1742
- Understanding Server Fail Fallback and Authentication on EX Series Switches on page 1671

### Example: Configuring MAC RADIUS Authentication on an EX Series Switch

To permit hosts that are not 802.1X-enabled to access the LAN, you can configure MAC RADIUS authentication on the switch interfaces to which the non-802.1X-enabled hosts are connected. When MAC RADIUS authentication is configured, the switch will attempt to authenticate the host with the RADIUS server using the host’s MAC address.

This example describes how to configure MAC RADIUS authentication for two non-802.1X-enabled hosts:

- Requirements on page 1713
- Overview and Topology on page 1714
- Configuration on page 1716
- Verification on page 1717

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later for EX Series switches.
- An EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- A RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a
switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073. For all other switches, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch.

NOTE: For more about ELS, see: “Getting Started with Enhanced Layer 2 Software” on page 3

• Performed basic 802.1X configuration. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740.

Overview and Topology

IEEE 802.1X Port-Based Network Access Control (PNAC) authenticates and permits devices access to a LAN if the devices can communicate with the switch using the 802.1X protocol (are 802.1X-enabled). To permit non-802.1X-enabled end devices to access the LAN, you can configure MAC RADIUS authentication on the interfaces to which the end devices are connected. When the MAC address of the end device appears on the interface, the switch consults the RADIUS server to check whether it is a permitted MAC address. If the MAC address of the end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device.

You can configure both MAC RADIUS authentication and 802.1X authentication methods on an interface configured for multiple supplicants. Additionally, if an interface is only connected to a non-802.1X-enabled host, you can enable MAC RADIUS and not enable 802.1X authentication using the mac-radius restrict option, and thus avoid the delay that occurs while the switch determines that the device is does not respond to EAP messages.

Figure 16 on page 1715 shows the two printers connected to the switch.
The diagram illustrates the topology for MAC RADIUS Authentication Configuration.

Table 204 on page 1715 shows the components in the example for MAC RADIUS authentication.

### Table 204: Components of the MAC RADIUS Authentication Configuration Topology

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>EX4200 ports (ge-0/0/0 through ge-0/0/23)</td>
</tr>
<tr>
<td>VLAN name</td>
<td>sales</td>
</tr>
<tr>
<td>Connections to printers</td>
<td>ge-0/0/19, MAC address 00040ffdacfe</td>
</tr>
<tr>
<td>(no PoE required)</td>
<td>ge-0/0/20, MAC address 0004aecd235f</td>
</tr>
<tr>
<td>RADIUS server</td>
<td>Connected to the switch on interface ge-0/0/10</td>
</tr>
</tbody>
</table>
The printer with the MAC address 00040ffdacfe is connected to access interface ge-0/0/19. A second printer with the MAC address 0004aecd235f is connected to access interface ge-0/0/20. In this example, both interfaces are configured for MAC RADIUS authentication on the switch, and the MAC addresses (without colons) of both printers are configured on the RADIUS server. Interface ge-0/0/20 is configured to eliminate the normal delay while the switch attempts 802.1X authentication; MAC RADIUS authentication is enabled and 802.1X authentication is disabled using the `mac radius restrict` option.

### Configuration

**CLI Quick Configuration**

To quickly configure MAC RADIUS authentication, copy the following commands and paste them into the switch terminal window:

```conf
[edit]
set protocols dot1x authenticator interface ge-0/0/19 mac-radius
set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

**NOTE:** You must also configure the two MAC addresses as usernames and passwords on the RADIUS server, as is done in step 2 of the Step-by-Step Procedure.

### Step-by-Step Procedure

Configure MAC RADIUS authentication on the switch and on the RADIUS server:

1. On the switch, configure the interfaces to which the printers are attached for MAC RADIUS authentication, and configure the `restrict` option on interface `ge-0/0/20`, so that only MAC RADIUS authentication is used:

   ```conf
   [edit]
   user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
   user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
   ```

2. On the RADIUS server, configure the MAC addresses 00040ffdacfe and 0004aecd235f as usernames and passwords:

   ```sh
   [root@freeradius#]
   edit /etc/raddb
   vi users
   00040ffdacfe Auth-type:=EAP,User-Password = "00040ffdacfe"
   0004aecd235f Auth-type:=EAP,User-Password = "0004aecd235f"
   ```

### Results

Display the results of the configuration on the switch:

```text
user@switch> show configuration
protocols {  
dot1x {  
authenticator {  
authentication-profile-name profile52;  
interface {  
ge-0/0/19.0 {  
   mac-radius;
  }
ge-0/0/20.0 {
   mac-radius
  }
  
```
Verification

Verify that the supplicants are authenticated:

- Verifying That the Supplicants Are Authenticated on page 1717

Verifying That the Supplicants Are Authenticated

Purpose

After supplicants are configured for MAC RADIUS authentication on the switch and on the RADIUS server, verify that they are authenticated and display the method of authentication:
Action

Display information about 802.1X-configured interfaces ge-0/0/19 and ge-0/0/20:

user@switch> show dot1x interface ge-0/0/19.0 detail
ge-0/0/19.0
Role: Authenticator
Administrative state: Auto
Supplicant mode: Single
Number of retries: 3
Quiet period: 60 seconds
Transmit period: 30 seconds
Mac Radius: Enabled
Mac Radius Restrict: Disabled
Reauthentication: Enabled
Configured Reauthentication interval: 3600 seconds
Supplicant timeout: 30 seconds
Server timeout: 30 seconds
Maximum EAPOL requests: 2
Guest VLAN member: <not configured>
Number of connected supplicants: 1
Supplicant: user101, 00:04:0f:fd:ac:fe
   Operational state: Authenticated
   Authentication method: Radius
   Authenticated VLAN: vo11
   Dynamic Filter: match source-dot1q-tag 10 action deny
   Session Reauth interval: 60 seconds
   Reauthentication due in 50 seconds

user@switch> show dot1x interface ge-0/0/20.0 detail
ge-0/0/20.0
Role: Authenticator
Administrative state: Auto
Supplicant mode: Single
Number of retries: 3
Quiet period: 60 seconds
Transmit period: 30 seconds
Mac Radius: Enabled
Mac Radius Restrict: Enabled
Reauthentication: Enabled
Configured Reauthentication interval: 3600 seconds
Supplicant timeout: 30 seconds
Server timeout: 30 seconds
Maximum EAPOL requests: 2
Guest VLAN member: <not configured>
Number of connected supplicants: 1
Supplicant: user102, 00:04:ae:cd:23:5f
   Operational state: Authenticated
   Authentication method: Radius
   Authenticated VLAN: vo11
   Dynamic Filter: match source-dot1q-tag 10 action deny
   Session Reauth interval: 60 seconds
   Reauthentication due in 50 seconds

Meaning

The sample output from the `show dot1x interface detail` command displays the MAC address of the connected end device in the Supplicant field. On interface ge-0/0/19, the MAC address is 00:04:0f:fd:ac:fe, which is the MAC address of the first printer configured for MAC RADIUS authentication. The Authentication method field displays the authentication method as MAC Radius. On interface ge-0/0/20, the MAC address is 00:04:ae:cd:23:5f, which is the MAC address of the second printer configured for MAC Radius.
RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**.

- Understanding Authentication on EX Series Switches on page 1658

**Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch**

You can use RADIUS server attributes and a port firewall filter to centrally apply terms to multiple supplicants (end devices) connected to an EX Series switch in your enterprise. Terms are applied after a device is successfully authenticated through 802.1X. If the firewall filter configuration is modified after end devices are authenticated using the 802.1X authentication, then the established 802.1X authentication session must be terminated and re-established for the firewall filter changes to take effect.

EX Series switches support port firewall filters. Port firewall filters are configured on a single EX Series switch, but in order for them to operate throughout an enterprise, they have to be configured on multiple switches. To reduce the need to configure the same port firewall filter on multiple switches, you can instead apply the filter centrally on the RADIUS server using RADIUS server attributes.

The following example uses FreeRADIUS to apply a port firewall filter on a RADIUS server. For specifics on configuring your server, consult the documentation that was included with your RADIUS server.

This example describes how to configure a port firewall filter with terms, create counters to count packets for the supplicants, apply the filter to user profiles on the RADIUS server, and display the counters to verify the configuration:

- **Requirements** on page 1719
- **Overview and Topology** on page 1720
- **Configuring the Port Firewall Filter and Counters** on page 1722
- **Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server** on page 1724
- **Verification** on page 1724

**Requirements**

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.
- Configured 802.1X authentication on the switch, with the authentication mode for interface ge-0/0/2 set to multiple. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740 and “Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch” on page 1684.
- Configured users on the RADIUS authentication server (in this example, the user profiles for Supplicant 1 and Supplicant 2 in the topology are modified on the RADIUS server).

**Overview and Topology**

When the 802.1X configuration on an interface is set to multiple supplicant mode, you can apply a single port firewall filter configured through the Junos OS CLI on the EX Series switch to any number of end devices (supplicants) on one interface by adding the filter centrally to the RADIUS server. Only a single filter can be applied to an interface; however, the filter can contain multiple terms for separate end devices.

For more information about firewall filters, see “Firewall Filters for EX Series Switches Overview” on page 4088.

RADIUS server attributes are applied to end devices after the devices are successfully authenticated using 802.1X. To authenticate an end device, the switch forwards the end device's credentials to the RADIUS server. The RADIUS server matches the credentials against preconfigured information about the supplicant located in the supplicant’s user profile on the RADIUS server. If a match is found, the RADIUS server instructs the switch to open an interface to the end device. Traffic then flows from and to the end device on the LAN. Further instructions configured in the port firewall filter and added to the end device’s user profile using a RADIUS server attribute further define the access that the end device is granted. Filtering terms configured in the port firewall filter are applied to the end device after 802.1X authentication is complete.

**NOTE:** If you modify the port firewall filter after an end device is successfully authenticated using 802.1X, you must terminate and re-establish the 802.1X authentication session for the firewall filter configuration changes to be effective.

Figure 17 on page 1721 shows the topology used for this example. The RADIUS server is connected to an EX4200 switch on access port ge-0/0/10. Two end devices (supplicants) are accessing the LAN on interface ge-0/0/2. Supplicant 1 has the MAC address 00:50:8b:6f:60:3a. Supplicant 2 has the MAC address 00:50:8b:6f:60:3b.
Table 205 on page 1721 describes the components in this topology.

Table 205: Components of the Firewall Filter and RADIUS Server Attributes Topology

</tr>
</tbody>
</table>
| User profiles on the RADIUS server | • Supplicant 1 has the user profile supplicant1.  
• Supplicant 2 has the user profile supplicant2. |

In this example, you configure a port firewall filter named filter1. The filter contains terms that will be applied to the end devices based on the MAC addresses of the end devices. When you configure the filter, you also configure the counters counter1 and counter2. Packets from each end device are counted, which helps you verify that the configuration is working. Policer policer p1 limits the traffic rate based on the values for exceeding and discard parameters. Then, you check to see that the RADIUS server attribute is available on the RADIUS server and apply the filter to the user profiles of each end device on the RADIUS server. Finally, you verify the configuration by displaying output for the two counters.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see the Junos OS System Basics Configuration Guide.

Configuring the Port Firewall Filter and Counters

**CLI Quick Configuration**

To quickly configure a port firewall filter with terms for Supplicant 1 and Supplicant 2 and create parallel counters for each supplicant, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term supplicant1 from source-mac-address 00:50:8b:6f:60:3a
set firewall family ethernet-switching filter filter1 term supplicant2 from source-mac-address 00:50:8b:6f:60:3b
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
set firewall family ethernet-switching-filter filter filter1 term supplicant1 then count counter1
set firewall family ethernet-switching-filter filter filter1 term supplicant2 then count counter2
```

**Step-by-Step Procedure**

1. Configure a port firewall filter (here, filter1) with terms for each end device based upon the MAC address of each end device:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term supplicant1 from source-mac-address 00:50:8b:6f:60:3a
user@switch# set filter filter1 term supplicant2 from source-mac-address 00:50:8b:6f:60:3b
```
2. Set policer definition:

user@switch# show policer p1 | display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard

3. Create two counters that will count packets for each end device and a policer which limits the traffic rate:

   [edit firewall family ethernet-switching]
   user@switch# set filter filter1 term supplicant1 then count counter1
   user@switch# set filter filter1 term supplicant1 then policer p1
   user@switch# set filter filter1 term supplicant2 then count counter2

Results

Display the results of the configuration:

user@switch> show configuration
firewall {
    family ethernet-switching {
        filter filter1 {
            term supplicant1 {
                from {
                    source-mac-address {
                        00:50:8b:6f:60:3a;
                    }
                }
                then count counter1;
                then policer p1;
            }
            term supplicant2 {
                from {
                    source-mac-address {
                        00:50:8b:6f:60:3b;
                    }
                }
                then count counter2;
            }
        }
    }
    policer p1 {
        if-exceeding {
            bandwidth-limit 1m;
            burst-size-limit 1k;
        }
        then discard;
    }
}
Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server

Step-by-Step Procedure

To verify that the RADIUS server attribute Filter-ID is on the RADIUS server and to apply the filter to the user profiles:

1. Display the dictionary dictionary.rfc2865 on the RADIUS server, and verify that the attribute Filter-ID is in the dictionary:

   [root@freeradius]# cd/usr/share/freeradius/dictionary.rfc2865

2. Close the dictionary file.

3. Display the local user profiles of the end devices to which you want to apply the filter (here, the user profiles are called supplicant1 and supplicant2):

   [root@freeradius]# cat /usr/local/etc/raddb/users

   The output shows:

   supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
   Tunnel-Type = VLAN,
   Tunnel-Medium-Type = IEEE-802,
   Tunnel-Private-Group-Id = "1005"

   supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
   Tunnel-Type = VLAN,
   Tunnel-Medium-Type = IEEE-802,
   Tunnel-Private-Group-Id = "1005"

4. Apply the filter to both user profiles by adding the line Filter-Id = "filter1" to each profile, and then close the file:

   [root@freeradius]# cat /usr/local/etc/raddb/users

   After you paste the line into the files, the files look like this:

   supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
   Tunnel-Type = VLAN,
   Tunnel-Medium-Type = IEEE-802,
   Tunnel-Private-Group-Id = "1005",
   Filter-Id = "filter1"

   supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
   Tunnel-Type = VLAN,
   Tunnel-Medium-Type = IEEE-802,
   Tunnel-Private-Group-Id = "1005",
   Filter-Id = "filter1"

Verification

Verifying That the Filter Has Been Applied to the Supplicants

Purpose

After the end devices are authenticated, verify that the filter has been configured on the switch and added to each end device’s user profile on the RADIUS server:
**Action**

Display information about firewall filter `filter1`:

```plaintext
user@switch> show firewall filter filter1
Filter: filter1
Counters:
Name       Bytes  Packets
counter1   128     2
counter2   64      1
```

**Meaning**

The output of the command `show firewall filter filter1` displays `counter1` and `counter2`. Packets from Supplicant 1 are counted using `counter1`, and packets from Supplicant 2 are counted using `counter2`. The output displays packets incrementing for both counters. The filter has been applied to both end devices.

- Understanding Authentication on EX Series Switches on page 1658
- Understanding 802.1X and VSAs on EX Series Switches on page 1670

**Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication**

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see “Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication” on page 4186. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.
This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- **Requirements** on page 1726
- **Overview and Topology** on page 1726
- **Configuration** on page 1728
- **Verification** on page 1730

**Requirements**

This example uses the following hardware and software components:

- Junos OS Release 13.2 or later for EX Series switches
- One EX4300 switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.
- Configured 802.1X authentication on the switch, with the authentication mode for the interface ge-0/0/2 set to **multiple**. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740 and “Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch” on page 1684.
- Configured users on the RADIUS authentication server.

**Overview and Topology**

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines the interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in Figure 18 on page 1727, when User 1 is authenticated by the EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User 2 is authenticated, another term is added to the firewall filter, and so on.
This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface ge-0/0/2 to the file server, which is located on subnet 192.0.2.16/28, and set policer definitions to rate-limit the traffic. Figure 19 on page 1728 shows the network topology for this example.
Figure 19: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server

**Configuration**

**Configuring Firewall Filters on Interfaces with Multiple Supplicants**

**CLI Quick Configuration**
To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term term1 from ip-destination-address 192.0.2.16/28
set firewall family ethernet-switching filter filter1 term term2 from ip-destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1500
set firewall policer p1 then discard
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

**Step-by-Step Procedure**
To configure firewall filters on an interface enabled for multiple supplicants:

1. Set the policer definition:

```
user@switch# show policer p1 | display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1500
set firewall policer p1 then discard
```
2. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from ip-destination-address 192.0.2.16/28
user@switch# set filter filter1 term term2 from ip-destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

### Results

Check the results of the configuration:

```
user@switch> show configuration

firewall {
    family ethernet-switching {
        filter filter1 {
            term term1 {
                from {
                    ip-destination-address {
                        192.0.2.16/28;
                    }
                }
                then count counter1;
            }
            term term2 {
                from {
                    ip-destination-address {
                        192.0.2.16/28;
                    }
                }
                then policer p1;
            }
        }
        policer p1 {
            if-exceeding {
                bandwidth-limit 1m;
                burst-size-limit 1500;
            }
            then discard;
        }
    }
    protocols {
        dot1x {
            authenticator
            interface ge-0/0/2 {
                supplicant multiple;
            }
        }
    }
}
```
Verification

**Verifying Firewall Filters on Interfaces with Multiple Supplicants**

**Purpose**
Verify that firewall filters are functioning on the interface with multiple supplicants.

**Action**
1. Check the results with one user authenticated on the interface. In this case, User 1 is authenticated on ge-0/0/2:

   ```
   user@switch> show dot1x firewall
   Filter: dot1x_ge-0/0/2
   Counters
   counter1_dot1x_ge-0/0/2_user1 100
   ```

2. When a second user, User 2, is authenticated on the same interface, ge-0/0/2, you can verify that the filter includes the results for both of the users authenticated on the interface:

   ```
   user@switch> show dot1x firewall
   Filter: dot1x-filter-ge-0/0/0
   Counters
   counter1_dot1x_ge-0/0/2_user1 100
   counter1_dot1x_ge-0/0/2_user2 400
   ```

**Meaning**
The results displayed by the `show dot1x firewall` command output reflect the dynamic filter created with the authentication of each new user. User 1 accessed the file server located at the specified destination address 100 times, while User 2 accessed the same file server 400 times.

- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1742

**Example: Setting Up Captive Portal Authentication on an EX Series Switch**

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Setting Up Captive Portal Authentication on an EX Series Switch. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.
This example describes how to set up captive portal on an EX4300 switch:

- Requirements on page 1731
- Overview and Topology on page 1731
- Configuration on page 1731
- Verification on page 1733
- Troubleshooting on page 1734

**Requirements**

This example uses the following hardware and software components:

- Junos OS Release 13.2X50 or later for EX Series switches
- An EX4300 Series switch

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073.
- Generated an SSL certificate and installed it on the switch. See “Generating SSL Certificates to Be Used for Secure Web Access” on page 418.
- Configured basic access between the EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.
- Designed your captive portal login page. See “Designing a Captive Portal Authentication Login Page on an EX Series Switch” on page 1759.

**Overview and Topology**

This example shows the configuration required on the switch to enable captive portal on an interface. To permit a printer connected to the captive portal interface to access the LAN, add its MAC address to the authentication whitelist and assign to a VLAN, vlan1. The MAC addresses on this list are permitted access on the interface without captive portal authentication.

The topology for this example consists of one EX4300 switch connected to a RADIUS authentication server. One interface on the switch is configured for captive portal. In this example, the interface is configured in multiple supplicant mode.

**Configuration**

To configure captive portal on your switch:

To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window:

```
[edit]
set system services web-management https local-certificate my-signed-cert
set services captive-portal secure-authentication https
set services captive-portal interface ge-0/0/10.0 supplicant multiple
set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1
```
To configure captive portal on the switch:

1. To create a secure channel for Web access to the switch, configure captive portal for HTTPS:
   a. Associate the security certificate with the Web server and enable HTTPS on the switch:

   ```
   [edit]
   user@switch# set system services web-management https local-certificate my-signed-cert
   ```

   **NOTE:** You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

   b. Configure captive portal to use HTTPS:

   ```
   [edit]
   user@switch# set services captive-portal secure-authentication https
   ```

2. Enable an interface for captive portal:

   ```
   [edit]
   user@switch# set services captive-portal interface ge-0/0/10 supplicant multiple
   ```

3. (Optional) Allow specific clients to bypass captive portal authentication:

   ```
   [edit]
   user@switch# set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1
   ```

   **NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the clear captive-portal mac-address mac-address command after adding its MAC address to the whitelist. Otherwise, the new entry for the MAC address will not be added to the Ethernet switching table and the authentication bypass will not be allowed.

   ```
   [edit]
   user@switch# set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1
   ```

   **NOTE:** Optionally, you can use set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1 interface ge-0/0/10.0 to limit the scope to the interface.

4. (Optional) To redirect clients to a specified page rather than the page they originally requested, configure the post-authentication URL:

   ```
   [edit services captive-portal]
   user@switch# set custom-options post-authentication-url http://www.my-home-page.com
   ```

**Results** Display the results of the configuration:
[edit]
user@switch# show
system {
    services {
        web-management {
            https {
                local-certificate my-signed-cert;
            }
        }
    }
}
security {
    certificates {
        local {
            my-signed-cert {
                "-----BEGIN RSA PRIVATE KEY-----
                MIIICXwIBAAKBgQDk8sUggnXdDUmr7TvL63yJq/\nRfDASfDZI3z9ZDe1Kfk5C9\n
Pt5YmvWDoGo0mSjoE/iH0BqYdh9YGqV3T2IEUflSTQQHEOShS0ogWDHF\nonyOb1Q/vQtjK2X9NVQgJHBwidssY9eRp\n
-----END CERTIFICATE-----
";
            ##SECRET-DATA
        }
    }
}
services {
    captive-portal {
        interface {
            ge-0/0/10.0 {
                supplicant multiple;
            }
        }
        secure-authentication https;
        custom-options {
            post-authentication-url http://www.my-home-page.com;
        }
    }
}
switch-options {
    authentication-whitelist {
        00:10:12:e0:28:22/48 {
            vlan-assignment vlan1;
        }
    }
}

**Verification**

To confirm that captive portal authentication is configured and working properly, perform these tasks:

- [Verifying That Captive Portal Is Enabled on the Interface on page 1734](#)
- [Verify That Captive Portal Is Working Correctly on page 1734](#)
Verifying That Captive Portal Is Enabled on the Interface

Purpose
Verify that captive portal is configured on the interface ge-0/0/10.

Action
Use the operational mode command show captive-portal interface interface-name detail:

```
user@switch> show captive-portal interface ge-0/0/10.0 detail
ge-0/0/10.0
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Configured CP session timeout: 3600 seconds
  Server timeout: 15 seconds
```

Meaning
The output confirms that captive portal is configured on the interface ge-0/0/10, with the default settings for number of retries, quiet period, CP session timeout, and server timeout.

Verify That Captive Portal Is Working Correctly

Purpose
Verify that captive portal is working on the switch.

Action
Connect a client to the interface ge-0/0/10. From the client, open a Web browser and request a webpage. The captive portal login page that you designed should be displayed. After you enter your login information and are authenticated against the RADIUS server, the Web browser should display either the page you requested or the post-authentication URL that you configured.

Troubleshooting
To troubleshoot captive portal, perform these tasks:

- Troubleshooting Captive Portal on page 1734

Troubleshooting Captive Portal

Problem
The switch does not return the captive portal login page when a user connected to a captive portal interface on the switch requests a webpage.

Solution
You can examine the ARP, DHCP, HTTPS, and DNS counters—if one or more of these counters are not incrementing, this provides an indication of where the problem lies. For example, if the client cannot get an IP address, you might check the switch interface to determine whether the DHCP counter is incrementing—if the counter increments, the DHCP packet was received by the switch.

```
user@switch> show captive-portal firewall ge-0/0/10.0
ge-0/0/10.0
  Filter name: dot1x_ge-0/0/10
Counters:
Name                  Bytes  Packets
  dot1x_ge-0/0/10_CP_arp        7616     119
  dot1x_ge-0/0/10_CP_dhcp        0       0
  dot1x_ge-0/0/10_CP_http        0       0
```
Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients

For 802.1X user authentication, EX Series switches support RADIUS authentication servers that are using Extensible Authentication Protocol–Tunneled TLS (EAP-TTLS) to authenticate Odyssey Access Client (OAC) supplicants. OAC networking software runs on endpoint computers (desktop, laptop, or notepad computers and supported wireless devices) and provides secure access to both wired and wireless networks.

This example describes how to configure an 802.1X-enabled interface on the switch to provide fallback support for OAC users who have entered incorrect login credentials:

- Requirements on page 1735
- Overview and Topology on page 1736
- Configuration on page 1737
- Verification on page 1738

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.2 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.
- One OAC end device acting as a supplicant.

Before you begin configuring the fallback option, ensure that you have:

- Set up a connection between the switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch" on page 1675.
- Configured EAP-TTLS on the server. See your RADIUS server documentation.
- Configured users on the RADIUS server. See your RADIUS server documentation.
Overview and Topology

OAC is networking software that runs on endpoint computers (desktop, laptop, or notepad) and supported wireless devices. OAC provides full support for EAP, which is required for secure wireless LAN access.

In this topology, OAC is deployed with an 802.1X-enabled switch and a RADIUS server. The switch functions as an enforcement point in the network security architecture. This topology:

- Ensures that only authorized users can connect.
- Maintains privacy of login credentials.
- Maintains data privacy over the wireless link.

This example includes the configuration of a server-reject VLAN on the switch, which can be used to prevent accidental lockout for users who have entered incorrect login credentials. These users can be given limited LAN access.

However, this fallback configuration is complicated by the fact that the OAC supplicant and RADIUS server are using EAP-TTLS. EAP-TTLS creates a secure encrypted tunnel between the server and the end device to complete the authentication process. When the user enters an incorrect login, the RADIUS server sends EAP failure messages directly to the client through this tunnel. The EAP failure message causes the client to restart the authentication procedure, so that the switch’s 802.1X authentication process tears down the session that was established with the switch using the server-reject VLAN. You can enable the remedial connection to continue by configuring:

- **eapol-block**—Enable the EAPoL block timer on the 802.1X interface that is configured to belong to the server-reject VLAN. The block timer causes the authentication port access entity to ignore EAP start messages from the client, attempting to restart the authentication procedure.

  **NOTE:** The EAPoL block timer is triggered only after the retries on the 802.1X interface have been exhausted. You can configure retries to specify the number of times the switch attempts to authenticate the port after an initial failure. The default is three retries.

- **block-interval**—Configure the amount of time that you want the EAPoL block timer to continue to ignore EAP start messages. If you do not configure the block interval, the EAPoL block timer defaults to 120 seconds.

When the 802.1X interface ignores the EAP start messages from the client, the switch allows the existing remedial session that was established through the server-reject VLAN to remain open.

These configuration options apply to **single**, **single-secure**, and **multiple** supplicant authentication modes. In this example, the 802.1X interface is configured in single-suppliant mode.
Figure 20 on page 1737 shows an EX Series switch connecting an OAC end device to a RADIUS server, and indicates the protocols being used to connect the network entities.

Figure 20: EX Series Switch Connecting OAC to RADIUS Server Using EAP-TTLS Authentication

Table 206 on page 1737 describes the components in this OAC deployment:

<table>

**Table 206: Components of the OAC Deployment**

**Configuration**

To configure fallback options for EAP-TTLS and OAC supplicants, perform this task:

To quickly configure the fallback options for EAP-TTLS and OAC supplicants, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans remedial vlan-id 700
set protocols dot1x authenticator interface ge-0/0/8 retries 4
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan remedial
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan eapol-block
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan block-interval 130
```
To configure the fallback options for EAP-TTLS and OAC supplicants:

**Step-by-Step Procedure**

1. **TIP:** In this example, the switch has only one server-reject VLAN. Therefore, the configuration specifies `eapol-block` and `block-interval` directly after `server-reject-vlan`. However, if you have configured multiple VLANs on the switch, you should include the VLAN name or VLAN ID directly after `server-reject-vlan` to indicate which VLAN is being modified.

1. Configure a VLAN that will function as the server-reject VLAN to provide limited LAN access for users who have entered incorrect login credentials:

   ```
   [edit]
   user@switch# set vlans remedial vlan-id 700
   ```

2. Configure the number of times for the client to be prompted for username and password before an incorrect login is directed to the server-reject VLAN:

   ```
   [edit protocols dot1x authenticator interface ge-0/0/8]
   user@switch# set retries 4
   ```

3. Configure the 802.1X authenticator interface to use the server-reject VLAN as a fallback for incorrect logins:

   ```
   [edit protocols dot1x authenticator interface ge-0/0/8]
   user@switch# set server-reject-vlan remedial
   ```

4. Enable the EAPoL block timer on the 802.1X interface that is configured to belong to the server-reject VLAN:

   ```
   [edit protocols dot1x authenticator interface ge-0/0/8]
   user@switch# set server-reject-vlan eapol-block
   ```

5. Configure the amount of time for the EAPoL block to remain in effect:

   ```
   [edit protocols dot1x authenticator interface ge-0/0/8]
   user@switch# set server-reject-vlan block-interval 130
   ```

**Results**

Check the results of the configuration:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
          retries 4;
          server-reject-vlan remedial block-interval 130 eapol-block;
        }
      }
    }
  }
}
```

**Verification**

To confirm that the configuration and the fallback options are working correctly, perform this task:

- **Verifying the Configuration of the 802.1X Interface on page 1739**
Verifying the Configuration of the 802.1X Interface

Purpose
Verify that the 802.1X interface is configured with the desired options:

Action
```
user@switch> show dot1x interface ge-0/0/8.0 detail
```

```
ge-0/0/8.0
Role: Authenticator
Administrative state: Auto
Supplicant mode: Single
Number of retries: 4
Quiet period: 60 seconds
Transmit period: 30 seconds
Mac Radius: Disabled
Mac Radius Restrict: Disabled
Reauthentication: Enabled
Configured Reauthentication interval: 120 seconds
Supplicant timeout: 30 seconds
Server timeout: 30 seconds
Maximum EAPoL requests: 2
Guest VLAN member: guest
Number of connected supplicants: 1
Supplicant: tem, 2A:92:E6:F2:00:00
  Operational state: Authenticated
  Backend Authentication state: Idle
  Authentication method: Radius
  Authenticated VLAN: remedial
  Session Reauth interval: 120 seconds
  Reauthentication due in 68 seconds
```

Meaning
The `show dot1x ge-0/0/8 detail` output shows that the `ge-0/0/8` interface is in the **Authenticated** state and that it is using the **remedial** VLAN.

- Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure) on page 1756
- Configuring Captive Portal Authentication (CLI Procedure) on page 1757
IEEE 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from a supplicant (client) at the interface until the supplicant's credentials are presented and matched on the authentication server (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

NOTE:
- You can also specify an 802.1X exclusion list to specify supplicants that can bypass authentication and be automatically connected to the LAN. See “Configuring Static MAC Bypass of Authentication (CLI Procedure)” on page 1755.
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.
- You cannot configure 802.1X user authentication on redundant trunk groups (RTGs). For more information on RTGs, see “Understanding Redundant Trunk Links on EX Series Switches” on page 2068.

Before you begin, specify the RADIUS server or servers to be used as the authentication server. See “Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure)” on page 1756.

To configure 802.1X on an interface:

1. Configure the supplicant mode as single (authenticates the first supplicant), single-secure (authenticates only one supplicant), or multiple (authenticates multiple supplicants):

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/5 supplicant multiple
   ```

2. Enable reauthentication and specify the reauthentication interval:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/5/0 reauthentication interval 5
   ```

3. Configure the interface timeout value for the response from the supplicant:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/5 supplicant-timeout 5
   ```

4. Configure the timeout for the interface before it resends an authentication request to the RADIUS server:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/5 server-timeout 5
   ```

5. Configure how long, in seconds, the interface waits before retransmitting the initial EAPOL PDUs to the supplicant:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/5 transmit-period 60
   ```
6. Configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 maximum-requests 5
```

7. Configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 retries 1
```

**NOTE:** This setting specifies the number of tries before the switch puts the interface in a “HELD” state.

**Configuring 802.1X RADIUS Accounting (CLI Procedure)**

RADIUS accounting permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure basic RADIUS accounting using the CLI:

1. Specify the accounting servers to which the switch will forward accounting statistics:

   ```
   [edit access]
   user@switch# set profile profile1 radius accounting-server [122.69.1.250 122.69.1.252]
   ```

2. Define the RADIUS accounting servers:

   ```
   [edit access]
   user@switch# set radius-server 122.69.1.250 secret juniper
   user@switch# set radius-server 122.69.1.252 secret juniper1
   ```

3. Enable accounting for an access profile:

   ```
   [edit access]
   user@switch# set profile profile1 accounting
   ```

4. Configure the RADIUS servers to use while sending accounting messages and updates:

   ```
   [edit access]
   user@switch# set profile profile1 accounting order radius
   ```

5. Configure the statistics to be collected on the switch and forwarded to the accounting server:

   ```
   [edit access]
   ```
6. Display accounting statistics collected on the switch:

   user@switch> show network-access aaa statistics accounting
   Accounting module statistics
   Requests received: 1
   Accounting Response failures: 0
   Accounting Response Success: 1
   Requests timeout: 0

7. Open an accounting log on the RADIUS accounting server using the server’s address, and view accounting statistics:

   [root@freeradius]# cd /usr/local/var/log/radius/radacct/122.69.1.250
   [root@freeradius 122.69.1.250]# ls
   detail-20071214

   [root@freeradius 122.69.1.250]# vi details-20071214

   User-Name = "000347e1bab9"
   NAS-Port = 67
   Acct-Status-Type = Stop

Filtering 802.1X Supplicants Using RADIUS Server Attributes

There are two ways to configure the RADIUS server with port firewall filters:

- Include a match statement and corresponding action in the Juniper-Firewall-Filter attribute. The Juniper-Firewall-Filter attribute is a vendor-specific attribute (VSA) in
the Juniper dictionary on the RADIUS server. Use this attribute to configure simple filter
conditions for authenticated users. Nothing needs to be configured on the switch; all
of the configuration is on the RADIUS server.

- Apply a local firewall filter to users authenticated through the RADIUS server. Use this
  method for more complex filters. The firewall filter must be configured on each switch.

  **NOTE:** If the firewall filter configuration is modified after users are
  authenticated using the 802.1X authentication, then the established 802.1X
  authentication session must be terminated and re-established for the
  firewall filter configuration changes to take effect.

This example describes using FreeRADIUS software to configure VSAs. For specifics on
configuring your server, consult the AAA documentation that was included with your
server.

This topic includes the following tasks:

1. Configuring Match Statements on the RADIUS Server on page 1743
2. Applying a Port Firewall Filter from the RADIUS Server on page 1745

**Configuring Match Statements on the RADIUS Server**

You can configure simple filter conditions using the `Juniper-Switching-Filter` attribute in
the Juniper dictionary on the RADIUS server. These filters are then sent to a switch
whenever a new user is authenticated successfully. The filters are created and applied
on all EX Series switches that authenticate users through that RADIUS server without
the need to configure anything on each individual switch.

To configure the `Juniper-Switching-Filter` attribute, enter one or more match conditions
and a resulting action using the CLI for the RADIUS server. Enter the match statement
plus an action statement enclosed within quotes (" ") using the following syntax:

```plaintext
match <destination-mac mac-address> <source-vlan vlan-name> <source-dot1q-tag tag> <destination-ip ip-address> <ip-protocol protocol-id> <source-port port> <destination-port port>
}
action [allow | deny] <forwarding-class class-of-service> <loss-priority (low | medium | high)>}
```

See “VSA Match Conditions and Actions” on page 1749 for definitions of match statement
options.

To configure match conditions on the RADIUS server:

1. Verify that the Juniper dictionary is loaded on your RADIUS server and includes the
   filtering attribute `Juniper-Switching-Filter`, attribute ID 48:

   ```bash
   [root@freeradius]# cat /usr/local/share/freeradius/dictionary.juniper
   # dictionary.juniper
   ```
2. Enter the match conditions and actions. For example:

   - To deny authentication based on the 802.1Q tag (here, the 802.1Q tag is 10):
     
     ```
     [root@freeradius]# cd /usr/local/etc/raddb
     vi users
     ```
     
     For each relevant user, add the `Juniper-Switching-Filter` attribute:
     
     ```
     Juniper-Switching-Filter = "match source-dot1q-tag 10 action deny"
     ```

   - To deny access based on a destination IP address:
     
     ```
     [root@freeradius]# cd /usr/local/etc/raddb
     vi users
     ```
     
     For each relevant user, add the `Juniper-Switching-Filter` attribute:
     
     ```
     Juniper-Switching-Filter = "match destination-ip 192.168.1.0/31 action deny"
     ```

   - To set the packet loss priority (PLP) to high based on a destination MAC address and the IP protocol:
     
     ```
     [root@freeradius]# cd /usr/local/etc/raddb
     vi users
     ```
     
     For each relevant user, add the `Juniper-Switching-Filter` attribute:
     
     ```
     Juniper-Switching-Filter = "match destination-mac 00:04:0f:fd:ac:fe, ip-protocol 2, forwarding-class high, action loss-priority high"
     ```

     
     **NOTE:** For the forwarding-class option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored. You must specify both the forwarding class and the packet loss priority.

3. Stop and restart the RADIUS process to activate the configuration.
Applying a Port Firewall Filter from the RADIUS Server

You can apply a firewall filter to user policies on the RADIUS server. The RADIUS server can then specify the firewall filters that are to be applied to each user that requests to authenticate. Use this method when the firewall filter has more extensive conditions or you want to use different conditions for the same filter on different switches. The firewall filters must be configured on each switch.

For more information about firewall filters, see “Firewall Filters for EX Series Switches Overview” on page 4088.

To apply a port firewall filter centrally from the RADIUS server:

1. Create the firewall filter on the local switch. In this example, the filter is called `filter1`.

2. Open the users file on the RADIUS server:

   ```
   [root@freeradius#] cd /usr/local/pool/raddb
   [root@freeradius#] vi users
   ```

3. For each relevant user, add the filter (here, the filter ID is `filter1`):

   ```
   Filter-Id = "filter1"
   ```

```

**NOTE:** Multiple filters are not supported on a single interface. However, you can support multiple filters for multiple users that are connected to the switch on the same interface by configuring a single filter with policies for each of those users.

4. Stop and restart the RADIUS process to activate the configuration.

Related Documentation

- Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch on page 1719
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4161

- Understanding 802.1X and VSAs on EX Series Switches on page 1670

Configuring LLDP (CLI Procedure)

Devices use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device
information on network links. The information allows the device to quickly identify a variety of other devices, resulting in a LAN that interoperates smoothly and efficiently.

This topic describes:

- Enabling LLDP on Interfaces on page 1746
- Adjusting LLDP Advertisement Settings on page 1746
- Adjusting SNMP Notification Settings of LLDP Changes on page 1747
- Specifying a Management Address for the LLDP Management TLV on page 1747
- Configuring LLDP Power Negotiation on page 1747

**Enabling LLDP on Interfaces**

LLDP is enabled on all interfaces by default. If it is disabled, you can enable LLDP by configuring it on all interfaces or on specific interfaces.

- To configure LLDP on all interfaces:
  
  ```
  [edit protocols lldp]
  user@switch# set interface all
  ```

- To configure LLDP on a specific interface:
  
  ```
  [edit protocols lldp]
  user@switch# set interface ge-0/0/3
  ```

**Adjusting LLDP Advertisement Settings**

You can adjust the following settings for LLDP advertisements for troubleshooting or verification purposes. The default values are applied when LLDP is enabled. For normal operations, we recommend that you do not adjust these settings from the default values.

- To specify the frequency at which LLDP advertisements are sent (in seconds):
  
  ```
  [edit protocols lldp]
  user@switch# set advertisement-interval 45
  ```

- To specify the number of seconds that LLDP information is held before it is discarded (the multiplier value is used in combination with the `advertisement-interval` value):
  
  ```
  [edit protocols lldp]
  user@switch# set hold-multiplier 5
  ```

- To specify the number of seconds the device delays before sending advertisements to neighbors after a change is made in a TLV (type, length, or value) element in LLDP or in the state of the local system, such as a change in hostname or management address, set the transmit delay. The transmit delay is enabled by default on switches to reduce the delay in notifying neighbors of a change in the local system. The default value is 2 seconds if the `advertisement-interval` value is set to 8 seconds or more or 1 second if the `advertisement-interval` value is set to less than 8 seconds.

  ```
  [edit protocols lldp]
  user@switch# set transmit-delay 2
  ```
NOTE: The advertisement-interval value must be greater than or equal to four times the transmit-delay value, or an error will be returned when you attempt to commit the configuration.

Adjusting SNMP Notification Settings of LLDP Changes

You can adjust the following settings for SNMP notifications of LLDP changes. If the values are not specified or if the interval values are set to 0, the notifications are disabled.

- To specify the frequency at which LLDP database changes are sent (in seconds):
  ```
  [edit protocols lldp]
  user@switch# set lldp-configuration-notification-interval 600
  ```

- To specify the frequency at which changes in topology global statistics are sent (in seconds):
  ```
  [edit protocols lldp]
  user@switch# set ptopo-configuration-trap-interval 600
  ```

- To specify the holding time (used in combination with the `ptopo-configuration-trap-interval` value) to determine the length of time that topology global statistics are held before they are discarded (in seconds):
  ```
  [edit protocols lldp]
  user@switch# set ptopo-configuration-maximum-hold-time 2147483647
  ```

Specifying a Management Address for the LLDP Management TLV

You can configure an IP management address to be used in the LLDP Management type, length, and value (TLV).

To configure the management address:

```
[edit protocols lldp]
user@switch# set management-address 192.168.0.1
```

Configuring LLDP Power Negotiation

LLDP power negotiation allows the switch’s Power over Ethernet (PoE) controller to dynamically allocate PoE power to PoE interfaces, based on the needs of the powered device, by negotiating with LLDP-enabled powered devices.

NOTE: LLDP power negotiation is not supported on EX3200 and EX4200 (except EX4200 PX models) switches.

LLDP power negotiation is supported on switches running PoE controller software version 4.04 or higher. For information about the PoE controller software, see “Upgrading the PoE Controller Software” on page 3967.

LLDP power negotiation is automatically enabled when the PoE management mode is set to `class`. 
• To disable LLDP power negotiation on switch interfaces:

```
[edit protocols lldp interface all power-negotiation]
user@switch# disable
```

• To disable LLDP power negotiation on a specific switch interface:

```
[edit protocols lldp interface ge-0/0/10 power-negotiation]
user@switch# disable
```

**Related Documentation**

- Configuring LLDP (J-Web Procedure)
- Configuring LLDP-MED (CLI Procedure) on page 1748
- Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches on page 1665

## Configuring LLDP-MED (CLI Procedure)

Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) is an extension of LLDP. The EX Series switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations.

LLDP-MED is turned on by default on EX Series switches.

This topic describes:

- Enabling LLDP-MED on Interfaces on page 1748
- Configuring Location Information Advertised by the Switch on page 1748
- Configuring for Fast Start on page 1749

### Enabling LLDP-MED on Interfaces

LLDP-MED is enabled on all interfaces by default. If it is disabled, you can enable LLDP-MED by configuring it on all interfaces or on specific interfaces.

**NOTE:** On switches running Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, configure LLDP-MED on the physical interface—for example, on ge-0/0/2. For more about ELS, see “Getting Started with Enhanced Layer 2 Software” on page 3.

To configure LLDP-MED on all interfaces or on a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface (LLDP-MED) ge-0/0/2.0
```

### Configuring Location Information Advertised by the Switch

You can configure the location information that is advertised from the switch to the LLDP-MED device. You can specify a civic-based location (geographic location) or a location based on an ELIN (Emergency Location Identification Number):

- To specify a location by geography:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0 location civic-based country-code US
```
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 1 ca-value “El Dorado County”
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 2 ca-value CA
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 3 ca-value Somerset
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 6 ca-value “Mount Aukum Road”
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 19 ca-value 6450
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 21 ca-value “Holiday Market”

To specify a location using an elin string:

[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0 location elin 4085551212

Configuring for Fast Start

You can specify the number of LLDP-MED advertisements sent from the switch in the first second after it has detected an LLDP-MED device. The default is 3; to set it to another value:

[edit protocols lldp-med]
user@switch# set fast-start 6

NOTE: If an interface is configured as a VoIP interface, then the switch does not wait for an attached phone to identify itself as an LLDP-MED device before it performs an LLDP-MED fast start after a graceful Routing Engine switchover (GRES) or a reboot. Instead, it immediately performs an LLDP-MED fast start after a GRES or reboot. This behavior prevents certain models of IP phones from resetting after a GRES.

VSA Match Conditions and Actions

EX Series switches and the QFX Series support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of match conditions and an action. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are
specified for the term, the packet is accepted by default. The action is the action that
the switch takes if a packet matches the match conditions for the specific term. Allowed
actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action**
  statement.
- Fields separated by commas will be ANDed if they are of a different type. The same
types cannot be repeated.
- For OR cases (for example, match `10.1.1.0/24 OR 11.1.1.0/24`), apply multiple VSAs to
  the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be
  configured on the switch. If it is not configured on the switch, this option is ignored.

Table 207 on page 1750 describes the match conditions you can specify when configuring
a VSA using the **match** command on the RADIUS server. The string that defines a match
condition is called a **match statement**.

### Table 207: Match Conditions

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination-mac mac-address</td>
<td>Destination media access control (MAC) address of the packet.</td>
</tr>
<tr>
<td>source-vlan source-vlan</td>
<td>Name of the source VLAN.</td>
</tr>
<tr>
<td>source-dot1q-tag tag</td>
<td>Tag value in the 802.1Q header, in the range 0 through 4095.</td>
</tr>
<tr>
<td>destination-ip ip-address</td>
<td>Address of the final destination node.</td>
</tr>
<tr>
<td>ip-protocol protocol-id</td>
<td>IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms: ah, egp (8), esp (50), gre (47), icmp (1), igmp (2), ipv6 (41), ospf (89), pim (103), rsvp (46), tcp (6), or udp (17)</td>
</tr>
<tr>
<td>source-port port</td>
<td>TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <strong>ip-protocol</strong> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <strong>destination-port</strong>.</td>
</tr>
</tbody>
</table>
TCP or UDP destination port field. Normally, you specify this match in conjunction with the `ip-protocol` match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):

- afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cvspserv (2401), cmd (514), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobile-ip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfld (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkin (2108), smtp (25), snmp (161), snmp-trap (162), sntp (444), socks (1080), ssh (22), snoop (111), syslog (514), telnet (23), tacacs+ (6), talk (517), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. Table 208 on page 1751 shows the actions that you can specify in a term.

### Table 208: Actions for VSAs

Configuring Server Fail Fallback (CLI Procedure)

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

802.1X and MAC RADIUS authentication work by using an authenticator port access entity (the EX Series switch) to block all traffic to and from an end device at the interface until the end device’s credentials are presented and matched on the authentication server (a RADIUS server). When the end device has been authenticated, the switch stops blocking and opens the interface to the end device.

When you set up 802.1X or MAC RADIUS authentication on the switch, you specify a primary authentication server and one or more backup authentication servers. If the primary authentication server cannot be reached by the switch and the secondary authentication servers are also unreachable, a RADIUS server timeout occurs. Because the authentication server grants or denies access to the end devices awaiting authentication, the switch does not receive access instructions for end devices attempting access to the LAN and normal authentication cannot be completed. Server fail fallback allows you to configure authentication alternatives that permit the switch to take appropriate actions toward end devices awaiting authentication or reauthentication.

NOTE: The authentication fallback method called server-reject VLAN provides limited access to a LAN, typically just to the Internet, for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials. If the end device that is authenticated using the server-reject VLAN is an IP phone, voice traffic is not allowed.
To configure basic server fail fallback options using the CLI:

- Configure an interface to allow traffic to flow from a supplicant to the LAN if a RADIUS server timeout occurs (as if the end device had been successfully authenticated by a RADIUS server):

  ```
  [edit protocols dot1x authenticator]
  user@switch# set interface ge-0/0/1 server-fail permit
  ```

- Configure an interface to prevent traffic flow from an end device to the LAN (as if the end device had failed authentication and had been rejected by the RADIUS server):

  ```
  [edit protocols dot1x authenticator]
  user@switch# set interface ge-0/0/1 server-fail deny
  ```

- Configure an interface to move an end device to a specified VLAN if a RADIUS server timeout occurs (in this case, the VLAN name is `vlan1`):

  ```
  [edit protocols dot1x authenticator]
  user@switch# set interface ge-0/0/1 server-fail vlan-name vlan1
  ```

- Configure an interface to recognize already connected end devices as reauthenticated if there is a RADIUS timeout during reauthentication (new users will be denied access):

  ```
  [edit protocols dot1x authenticator]
  user@switch# set interface ge-0/0/1 server-fail use-cache
  ```

- Configure an interface that receives a RADIUS access-reject message from the authentication server to move end devices attempting LAN access on the interface to a specified VLAN already configured on the switch (in this case, the VLAN name is `vlan-sf`):

  ```
  [edit protocols dot1x authenticator]
  user@switch# set interface ge-0/0/1 server-reject-vlan vlan-sf
  ```

NOTE: If an IP phone is authenticated in the server-reject VLAN, voice traffic is not allowed.

Configuring MAC RADIUS Authentication (CLI Procedure)

You can permit devices that are not 802.1X-enabled LAN access by configuring MAC RADIUS authentication on the EX Series switch interfaces to which the hosts are connected.

**NOTE:** You can also allow non-802.1X-enabled devices to access the LAN by configuring their MAC address for static MAC bypass of authentication.

You can configure MAC RADIUS authentication on an interface that also allows 802.1X authentication, or you can configure either authentication method alone.

If both MAC RADIUS and 802.1X authentication are enabled on the interface, the switch first sends the host three EAPOL requests to the host. If there is no response from the host, the switch sends the host's MAC address to the RADIUS server to check whether it is a permitted MAC address. If the MAC address is configured as permitted on the RADIUS server, the RADIUS server sends a message to the switch that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.

If MAC RADIUS authentication is configured on the interface but 802.1X authentication is not (by using the *mac-radius restrict* option), the switch attempts to authenticate the MAC address with the RADIUS server without delaying by attempting 802.1X authentication first.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.

To configure MAC RADIUS authentication using the CLI:

- On the switch, configure the interfaces to which the nonresponsive hosts are attached for MAC RADIUS authentication, and add the *restrict* qualifier for interface ge-0/0/20 to have it use only MAC RADIUS authentication:

  ```
  [edit]
  user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
  user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
  ```

- On a RADIUS authentication server, create user profiles for each nonresponsive host using the MAC address (without colons) of the nonresponsive host as the username and password (here, the MAC addresses are 00:04:0f:fd:ac:fe and 00:04:ae:cd:23:5f):

  ```
  [root@freeradius]#
  edit /etc/raddb
  vi users
  00040ff dacfe Auth-type:=Local, User-Password = "00040ff dacfe"
  0004ae cd23 5f Auth-type:=Local, User-Password = "0004ae cd23 5f"
  ```

**Related Documentation**

- Example: Configuring MAC RADIUS Authentication on an EX Series Switch on page 1713
Configuring Static MAC Bypass of Authentication (CLI Procedure)

You can configure a static MAC bypass list (sometimes called the exclusion list) on the switch to specify MAC addresses of devices allowed access to the LAN without 802.1X or MAC RADIUS authentication requests to the RADIUS server.

To configure the static MAC bypass list:

- Specify a MAC address to bypass authentication:

  [edit protocols dot1x]
  user@switch#  set authenticator static 00:04:0f:fd:ac:fe

- Configure a supplicant to bypass authentication if connected through a particular interface:

  [edit protocols dot1x]
  user@switch#  set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5

- You can configure a supplicant to be moved to a specific VLAN after it is authenticated:

  [edit protocols dot1x]
  user@switch#  set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5 vlan-assignment default-vlan

Related Documentation

- Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch on page 1704
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1740
- Configuring 802.1X Authentication (J-Web Procedure)
Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure)

IEEE 802.1X and MAC RADIUS authentication both provide network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from devices at the interface until the supplicant’s credentials or MAC address are presented and matched on the authentication server (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

To use 802.1X or MAC RADIUS authentication, you must specify the connections on the switch for each RADIUS server to which you will connect.

To configure a RADIUS server on the switch:

1. Define the IP address of the RADIUS server, the RADIUS server authentication port number, and the secret password. You can define more than one RADIUS server. The secret password on the switch must match the secret password on the server:

   [edit access]
   user@switch# set radius-server 10.0.0.100 port 1812 secret abc

   **NOTE:** Specifying the authentication port is optional, and port 1812 is the default. However, we recommend that you configure it in order to avoid confusion as some RADIUS servers might refer to an older default.

2. (Optional) Specify the IP address by which the switch is identified by the RADIUS server. If you do not specify this, the RADIUS server uses the address of the interface sending the RADIUS request. We recommend that you specify this IP address because if the request gets diverted on an alternate route to the RADIUS server, the interface relaying the request might not be an interface on the switch:

   [edit access]
   user@switch# set access radius-erversource-address 10.93.14.100

3. Configure the authentication order, making radius the first method of authentication:

   [edit access]
   user@switch# set profile profile1 authentication-order radius

4. Create a profile and specify the list of RADIUS servers to be associated with the profile. For example, you might choose to group your RADIUS servers geographically by city. This feature enables easy modification whenever you want to change to a different set of authentication servers:

   [edit access profile]
   user@switch# set atlanta radius authentication-server 10.0.0.100 10.2.14.200

5. Specify the group of servers to be used for 802.1X or MAC RADIUS authentication by identifying the profile name:

   [edit access profile]
   user@switch# set protocols dot1x authenticator authentication-profile-name denver

6. Configure the IP address of the EX Series switch in the list of clients on the RADIUS server. For specifics on configuring the RADIUS server, consult the documentation for your server.

Configuring Captive Portal Authentication (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Captive Portal Authentication (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Configure captive portal authentication (hereafter referred to as captive portal) on an EX Series switch so that users connected to the switch are authenticated before being allowed to access the network. When the user requests a webpage, a login page is displayed that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2073.
- Generated an SSL certificate and installed it on the switch. See “Generating SSL Certificates to Be Used for Secure Web Access” on page 418.
- Configured basic access between the EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.
- Designed your captive portal login page. See “Designing a Captive Portal Authentication Login Page on an EX Series Switch” on page 1759.

This topic includes the following tasks:

- Configuring Secure Access for Captive Portal on page 1757
- Enabling an Interface for Captive Portal on page 1758
- Configuring Bypass of Captive Portal Authentication on page 1758

Configuring Secure Access for Captive Portal

To configure secure access for captive portal:

1. Associate the security certificate with the Web server and enable HTTPS on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate my-signed-cert
```
NOTE: You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

2. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

Enabling an Interface for Captive Portal

To enable an interface for use with captive portal authentication:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10
```

Configuring Bypass of Captive Portal Authentication

You can allow specific clients to bypass captive portal authentication:

```
[edit]
user@switch# set switch-options authentication-whitelist 00:10:12:e0:28:22
```

NOTE: Optionally, you can use `set switch-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0` to limit the scope to the interface.

NOTE: If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address session-mac-addr` command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the Ethernet switching table and the authentication bypass will not be allowed.

Related Documentation

- Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 1730

Designing a Captive Portal Authentication Login Page on an EX Series Switch

You can set up captive portal authentication on your switch to redirect all Web browser requests to a login page that requires the user to input a username and password before they are allowed access. Upon successful authentication, the user is allowed access to the network and redirected to the original page requested.

Junos OS provides a customizable template for the captive portal window that allows you to easily design and modify the look of the captive portal login page. You can modify the design elements of the template to change the look of your captive portal login page and to add instructions or information to the page. You can also modify any of the design elements of a captive portal login page.

The first screen displayed before the captive login page requires the user to read the “Terms and Conditions of Use”. By clicking the Agree button, the user can access the captive portal login page.

Figure 21 on page 1759 shows an example of a captive portal login page:

Figure 21: Example of a Captive Portal Login Page

Table 209 on page 1759 summarizes the configurable elements of a captive portal login page.

Table 209: Configurable Elements of a Captive Portal Login Page

<table>
<thead>
<tr>

<td>footerbgcolor hex-color</td>
<td>The HTML hexadecimal code for the background color of the captive portal login page footer.</td>
</tr>
</tbody>
</table>
Table 209: Configurable Elements of a Captive Portal Login Page (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>CLI Statement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Footer message</td>
<td>footer-message text-string</td>
<td>Text displayed in the footer of the captive portal login page. You can include copyright information, links, and additional information such as help instructions, legal notices, or a privacy policy. The default text shown in the footer is Copyright © 2010, Juniper Networks Inc.</td>
</tr>
<tr>
<td>Footer text color</td>
<td>footer-text-color color</td>
<td>Color of the text in the footer. The default color is white.</td>
</tr>
<tr>
<td>Form header background color</td>
<td>form-header-bgc hex-color</td>
<td>The HTML hexadecimal code for the background color of the header bar across the top of the form area of the captive portal login page.</td>
</tr>
<tr>
<td>Form header message</td>
<td>form-header-message text-string</td>
<td>Text displayed in the header of the captive portal login page. The default text is Captive Portal User Authentication.</td>
</tr>
<tr>
<td>Form header text color</td>
<td>form-header-text-color color</td>
<td>Color of the text in the form header. The default color is black.</td>
</tr>
<tr>
<td>Form reset button label</td>
<td>form-reset-label label-name</td>
<td>Using the Reset button, the user can clear the username and password fields on the form.</td>
</tr>
<tr>
<td>Form submit button label</td>
<td>form-submit-label label-name</td>
<td>Using the Login button, the user can submit the login information.</td>
</tr>
<tr>
<td>Header background color</td>
<td>header-bgc hex-color</td>
<td>The HTML hexadecimal code for the background color of the captive portal login page header.</td>
</tr>
<tr>
<td>Header logo</td>
<td>header-logo filename</td>
<td>Filenname of the file containing the image of the logo that you want to appear in the header of the captive portal login page. The image file can be in GIF, JPEG, or PNG format. You can upload a logo image file to the switch. Copy the logo to the /var/tmp directory on the switch (during commit, the files are saved to persistent locations). If you do not specify a logo image, the Juniper Networks logo is displayed.</td>
</tr>
<tr>
<td>Header message</td>
<td>header-message text-string</td>
<td>Text displayed in the page header. The default text is User Authentication.</td>
</tr>
<tr>
<td>Header text color</td>
<td>header-text-color color</td>
<td>Color of the text in the header. The default color is white.</td>
</tr>
<tr>
<td>Post-authentication URL</td>
<td>post-authentication-url url</td>
<td>URL to which the users are directed on successful authentication. By default, users are directed to the page they had originally requested.</td>
</tr>
</tbody>
</table>

To design the captive portal login page:

1. (Optional) Upload your logo image file to the switch:
   ```
   user@switch> file copy ftp://username:prompt@ftp.hostname.net/var/tmp/my-logo.jpeg
   ```
2. Configure the custom options to specify the background colors and text displayed in the captive portal page:
[edit system services captive-portal]
user@switch# set custom-options header-bgcolor #006600
set custom-options header-message "Welcome to Our Network"
set custom-options banner-message "Please enter your username and password". The banner
displays the message "XXXXXXX" by default. The user can modify this message.
set custom-options footer-message "Copyright ©2010, Our Network"

Now you can commit the configuration.

---

**NOTE:** For the custom options that you do not specify, the default value is used.

---

Controlling Authentication Session Timeouts (CLI Procedure)

For 802.1X and MAC RADIUS authentication sessions, the timeout of the session depends on the reauthentication value that you configure. Additionally, unless you configure it not to, the session is removed from the authentication session table when the MAC address ages out of the Ethernet switching table (when the value specified for the mac-table-aging-time is exceeded).

Before you begin:

- Specify the RADIUS server or servers to be used as the authentication server. See “Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure)” on page 1756.
- Configure 802.1X authentication on the switch. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740.
To configure the authentication session time on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator interface all seconds;
```

To configure the authentication session time on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name seconds;
```

To disable removal of authentication sessions from the authentication session table when a MAC address ages out of the Ethernet switching table, remove the binding of the authentication table to the Ethernet switching table.

To remove the binding on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator interface all no-mac-table-binding;
```

To remove the binding on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name no-mac-table-binding;
```

### Configuration Statements

- [edit access] Configuration Statement Hierarchy on EX Series Switches on page 1762
- [edit protocols dot1x] Configuration Statement Hierarchy on EX Series Switches on page 1769

#### [edit access] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit access] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.
- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit access] Hierarchy Level on page 1763
- Unsupported Statements in the [edit access] Hierarchy Level on page 1767
Supported Statements in the [edit access] Hierarchy Level

The following hierarchy shows the [edit access] configuration statements supported on EX Series switches:

access {
    address-assignment {
        abated-utilization;
        abated-utilization-v6;
        high-utilization;

This topic lists supported and unsupported configuration statements in the [edit protocols dot1x] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.
- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit protocols dot1x] Hierarchy Level on page 1769
- Unsupported Statements in the [edit protocols dot1x] Hierarchy Level on page 1770

**Supported Statements in the [edit protocols dot1x] Hierarchy Level**

The following hierarchy shows the [edit protocols dot1x] configuration statements supported on EX Series switches:

```
protocols {
    dot1x {
        authenticator {
            authentication-profile-name access-profile-name;
            interface (all | [ interface-names ] ) {
                disable;
                guest-vlan (vlan-id | vlan-name);
                mac-radius {
                    flap-on-disconnect;
                    restrict;
                }
                maximum-requests number;
                no-reauthentication;
                quiet-period seconds;
                reauthentication {
                    interval seconds;
                }
                retries number;
                server-fail (deny | permit | use-cache | vlan-id | vlan-name);
                server-reject-vlan (vlan-id | vlan-name) {
                    eapol-block;
                    block-interval block-interval;
                }
                server-timeout seconds;
                supplicant (single | single-secure | multiple);
                supplicant-timeout seconds;
                transmit-period seconds;
            }
            no-mac-table-binding {
                interface interface-names
            }
        }
    }
}
```
static mac-address
}  
static mac-address {
  interface interface-names;
  vlan-assignment (vlan-id |vlan-name);
}
}
}
}
}

traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match regex>;
  flag flag ;
}

Unsupported Statements in the [edit protocols dot1x] Hierarchy Level

All statements in the [edit protocols dot1x] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

    vrf-name vrf-name;
  }
  immediate-update;
  order [ accounting-method ];
  send-acct-status-on-config-change
  statistics (time | volume-time);
  update-interval minutes;
  wait-for-acct-on-ack;
}
```

Hierarchy Level

[edit access profile profile-name]

Release Information

Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description

Configure RADIUS accounting parameters and enable RADIUS accounting for an access profile.

The remaining statements are explained separately.

Required Privilege

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

accounting-order

Syntax
accounting-order (radius | [accounting-order-data-list]);

Hierarchy Level
[edit access profile profile-name]

Release Information
Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description
Enable RADIUS accounting for an L2TP profile.

Options
radius—Use the RADIUS accounting method.

[accounting-order-data-list]—Set of data listing the accounting order to be used, enclosed by brackets. This can be any combination of accounting methods, up to and including and entire list of the entire accounting order.

Required Privilege
Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
• Configuring Access Profiles for L2TP or PPP Parameters

accounting-port

Syntax
accounting-port port-number;

Hierarchy Level
[edit access radius-server server-address],
[edit access profile profile-name radius-server server-address]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description
Configure the port number on which to contact the accounting server.

Options
port-number—Port number on which to contact the accounting server. Most RADIUS servers use port number 1813 (as specified in RFC 2866).

Required Privilege
Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

address-assignment (Address-Assignment Pools)

Syntax

address-assignment {
  abated-utilization percentage;
  abated-utilization-v6 percentage;
  high-utilization percentage;
  high-utilization-v6 percentage;
  neighbor-discovery-router-advertisement ndra-pool-name;
  pool pool-name {
    family family {
      dhcp-attributes {
        protocol-specific attributes;
      }
      host hostname {
        hardware-address mac-address;
        ip-address ip-address;
      }
      network ip-prefix/<prefix-length>;
      prefix ipv6-prefix;
      range range-name {
        high upper-limit;
        low lower-limit;
        prefix-length prefix-length;
      }
      range pool-name;
    }
  }
}

Hierarchy Level [edit access]

Release Information Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description Configure address-assignment pools that can be used by different client applications.

NOTE: Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

Options pool-name—Name assigned to an address-assignment pool.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation • Address-Assignment Pools Overview on page 1206
• Configuring Address-Assignment Pools
address-protection

Syntax

```plaintext
address-protection;
```

Hierarchy Level

- [edit access],
- [edit logical-systems logical-system-name routing-instances routing-instance-name access]

Release Information

- Statement introduced in Junos OS Release 11.2.
- Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Prevents IPv6 prefixes from being used more than once when AAA is used to supply IPv6 prefixes for router advertisement.

If enabled, the router checks the following attributes received from external servers:

- Framed-IPv6-Prefix
- Framed-IPv6-Pool

The router then takes one of the following actions:

- If a prefix overlaps with a prefix in an address pool, the prefix is taken from the pool if it is available.
- If the prefix is already in use, it is rejected as unavailable.
- If the prefix length requested from the external server does not match the pool's prefix length exactly, the authentication request is denied. If configured, the Acct-Stop message includes a termination cause.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Duplicate Prefix Protection for Router Advertisement
- Duplicate Prefix Protection for NDRA
Authorization Order

Syntax
authorization-order (jsrc | [authorization-order-data-list]);

Hierarchy Level
[edit access profile profile-name]

Release Information
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description
Configure AAA to use JSRC in an SRC environment to request authorization from the SAE when verifying that a DHCP subscriber can access the router. When you include this statement, AAA ignores any configured authentication order settings. This statement is ignored for non-DHCP subscribers.

Options
- jsrc—Use JSRC application to communicate with the SAE for subscriber authorization. JSRC is the only application that is currently available.
- [authorization-order-data-list]—Set of data listing the authorization order to be used, enclosed by brackets. This can be any combination of authorization methods, up to and including the entire list of the entire authorization order.

Required Privilege
- admin—to view this statement in the configuration.
- admin-control—to add this statement to the configuration.

Related Documentation
- Configuring JSRC
- Authorizing Subscribers with JSRC
**authentication-order**

Syntax  
authentication-order [(none | ldap | password | radius | secureid)];

Hierarchy Level  
[edit access profile profile-name]

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
(EX and QFX Series only) Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

Default  
Not enabled

Options  
none—No authentication for specified subscribers.

password—Locally configured password in access profile.

radius—RADIUS authentication.

securid—RSA SecurID authentication.

Required Privilege  
Level  
admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Related Documentation  
•  Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 1675

•  Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1741
**authentication-whitelist**

Syntax  
authentication-whitelist {  
  mac-address {  
    interface interface-name;  
    vlan-assignment {  
      vlan-id | vlan-name;  
    }  
  }  
}

Hierarchy Level  
[edit ethernet-switching-options].  
[edit switch-options]

Release Information  
Statement introduced in Junos OS Release 10.1 for EX Series switches.  

Description  
Configure MAC addresses for which RADIUS authentication is to be bypassed.

Required Privilege Level  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Related Documentation  
• Example: Setting Up Captive Portal Authentication on an EX Series Switch  
• Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 1730

**client-accounting-algorithm**

Syntax  
client-accounting-algorithm (direct | round-robin);

Hierarchy Level  
[edit access profile profile-name radius options]

Release Information  
Statement introduced in Junos OS Release 10.0.  
Statement introduced in Junos OS for EX Series switches Release 13.2X50-D10.

Description  
Configure the access method the router uses to access RADIUS accounting servers.

Default  
direct

Options  
direct—Use the direct method.  
round-robin—Use the round-robin method.

Required Privilege Level  
admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

Related Documentation  
• Configuring RADIUS Server Parameters for Subscriber Access  
• Configuring RADIUS Server Options for Subscriber Access
**client-authentication-algorithm**

**Syntax**

client-authentication-algorithm (direct | round-robin);

**Hierarchy Level**

[edit access profile profile-name radius options]

**Release Information**

Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Configure the access method the router uses to access RADIUS authentication servers.

**Default**

direct

**Options**

direct—Use the direct method.

round-robin—Use the round-robin method.

**Required Privilege Level**

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

**Related Documentation**

• Configuring RADIUS Server Options for Subscriber Access

**coa-dynamic-variable-validation**

**Syntax**

coa-dynamic-variable-validation;

**Hierarchy Level**

[edit access profile profile-name radius options]

**Release Information**

Statement introduced in Junos OS Release 12.1.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Specify that when a CoA operation includes a change to a client profile dynamic variable that cannot be applied (such as an update to a non-existent filter), the router does not apply any changes to client profile dynamic variables in the request, and responds with a NACK message.

**Default**

If you do not configure this statement, the router does not apply any incorrect variable updates but does make any other changes to the client profile dynamic variables, and then responds with an ACK message.

**Required Privilege Level**

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

**Related Documentation**

• Configuring RADIUS Server Options for Subscriber Access
• Configuring RADIUS Server Parameters for Subscriber Access
**destination-host (Gx-Plus)**

Syntax  
destination-host hostname;

Hierarchy Level  
[edit access gx-plus partition partition-name]

Release Information  
Statement introduced in Junos OS Release 11.2.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  
Configure the host on which the PCRF application resides.

Options  
* hostname—Host on which the PCRF is installed.

Required Privilege Level  
* admin—To view this statement in the configuration.  
* admin-control—To add this statement to the configuration.

Related Documentation  
* Configuring Gx-Plus  
* Configuring the Gx-Plus Partition

**destination-realm (Gx-Plus)**

Syntax  
destination-realm realm;

Hierarchy Level  
[edit access gx-plus partition partition-name]

Release Information  
Statement introduced in Junos OS Release 11.2.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  
Configure the realm in which the PCRF host resides.

Options  
* realm—Realm in which the PCRF host resides.

Required Privilege Level  
* admin—To view this statement in the configuration.  
* admin-control—To add this statement to the configuration.

Related Documentation  
* Configuring Gx-Plus  
* Configuring the Gx-Plus Partition
diameter-instance (Gx-Plus)

**Syntax**
diameter-instance instance-name;

**Hierarchy Level**
[edit access gx-plus partition partition-name]

**Release Information**
Statement introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**
Specify the Diameter instance associated with the Gx-Plus partition.

**Options**
instance-name—Name of the Diameter instance. Currently, only master is supported.

**Required Privilege**
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Gx-Plus
- Configuring the Gx-Plus Partition
domain (Domain Map)

Syntax

```plaintext
domain {
    delimiter [delimiter-character];
    map domain-map-name {
        aaa-logical-system logical-system-name {
            aaa-routing-instance routing-instance-name;
        }
        aaa-routing-instance routing-instance-name;
        access-profile profile-name;
        address-pool pool-name;
        dynamic-profile profile-name;
        padn destination-address {
            mask destination-mask;
            metric route-metric;
        }
        strip-domain;
        target-logical-system logical-system-name {
            target-routing-instance routing-instance-name;
        }
        target-routing-instance routing-instance-name;
        tunnel-profile profile-name;
        tunnel-switch-profile profile-name;
    }
    parse-direction (left-to-right | right-to-left);
}
```

Hierarchy Level

[edit access]

Release Information

Statement introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Configure a domain map, which is used to map access options and session parameters for subscriber sessions.

The remaining statements are explained separately.

Required Privilege Level

admin—to view this statement in the configuration.
admin-control—to add this statement to the configuration.

Related Documentation

- Configuring a Domain Map
**domain-name-server (Routing Instances and Access Profiles)**

**Syntax**
```
domain-name-server dns-address;
```

**Hierarchy Level**
- [edit access],
- [edit access profile]

**Release Information**
Statement introduced in Junos OS Release 12.3.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**
Configure an IPv4 address for a DNS name server. You can configure an address globally for a routing instance at the [edit access] hierarchy level or for an access profile at the [edit access profile profile-name] hierarchy level. You can configure more than one address by including the statement multiple times.

**NOTE:** A DNS name server address configured with this statement is lower in preference than one configured with the domain-name-server-inet statement.

**Options**
- `dns-address`—IPv4 address of the DNS name server.

**Required Privilege Level**
- admin—To view this statement in the configuration
- admin-control—To add this statement to the configuration.

**Related Documentation**
- Configuring DNS Name Server Addresses for Subscriber Management
- DNS Name Server Address Overview
domain-name-server-inet (Routing Instances and Access Profiles)

Syntax  
domain-name-server-inet dns-address;

Hierarchy Level  
[edit access],  
[edit access profile]

Release Information  
Statement introduced in Junos OS Release 12.3.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  
Configure an IPv4 address for a DNS name server. You can configure an address globally for a routing instance at the [edit access] hierarchy level or for an access profile at the [edit access profile profile-name] hierarchy level. You can configure more than one address by including the statement multiple times.

NOTE: A DNS name server address configured with this statement is higher in preference than one configured with the domain-name-server statement.

Options  
dns-address—IPv4 address of the DNS name server.

Required Privilege  
admin—To view this statement in the configuration  
admin-control—To add this statement to the configuration.

Related Documentation  
• Configuring DNS Name Server Addresses for Subscriber Management  
• DNS Name Server Address Overview
domain-name-server-inet6 (Routing Instances and Access Profiles)

Syntax  
domain-name-server-inet6 dns-address;

Hierarchy Level  
[edit access],  
[edit access profile]

Release Information  
Statement introduced in Junos OS Release 12.3.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  
Configure an IPv6 address for a DNS name server. You can configure an address globally for a routing instance at the [edit access] hierarchy level or for an access profile at the [edit access profile profile-name] hierarchy level. You can configure more than one address by including the statement multiple times.

Options  
dns-address—IPv6 address of the DNS name server.

Required Privilege  
Level  
admin—To view this statement in the configuration  
admin-control—To add this statement to the configuration.

Related Documentation

ethernet-port-type-virtual

Syntax  
ethernet-port-type-virtual;

Hierarchy Level  
[edit access profile profile-name radius options]

Release Information  
Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description  
Specify the physical port type the router or switch uses to authenticate clients. The router or switch passes a port type of ethernet in RADIUS attribute 61 (NAS-Port-Type) by default. This statement specifies a port type of virtual.

NOTE: This statement takes precedence over the nas-port-type statement if you include both statements in the same access profile.

Required Privilege  
Level  
admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**global (Gx-Plus)**

Syntax

```
global {
  include-ipv6;
  max-outstanding-requests number;
}
```

Hierarchy Level [edit access gx-plus]

Description Configure global attributes for the Gx-Plus application. The remaining statements are explained separately.

Required Privilege Level

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

Related Documentation
- *Configuring Gx-Plus*

**gx-plus (Gx-Plus)**

Syntax

```
gx-plus {
  global {
    include-ipv6;
    max-outstanding-requests number;
  }
  partition partition-name {
    diameter-instance instance-name;
    destination-host hostname;
    destination-realm realm;
  }
}
```

Hierarchy Level [edit access]

Description Configure the Gx-Plus application to interact with a PCRF to authorize and provision subscribers. The remaining statements are explained separately.

Required Privilege Level

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

Related Documentation

ignore

**Syntax**

```
ignore {
  dynamic-iflset-name;
  framed-ip-netmask;
  input-filter;
  logical-system-routing-instance;
  output-filter;
}
```

**Hierarchy Level**

[edit access profile profile-name radius attributes]

**Release Information**

Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description**

Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. By default, the router or switch processes the attributes it receives from the external server.

**Options**

- `dynamic-iflset-name`—Ignore Interface-Set/Dynamic-Ifiset-Name (VSA 26-130).
- `framed-ip-netmask`—Ignore Framed-IP-Netmask (RADIUS attribute 9).
- `input-filter`—Ignore Ingress-Policy-Name (VSA 26-10).
- `logical-system-routing-instance`—Ignore Virtual-Router (VSA 26-1).
- `output-filter`—Ignore Egress-Policy-Name (VSA 26-11).

**Required Privilege Level**

- `admin`—To view this statement in the configuration.
- `admin-control`—To add this statement to the configuration.

**Related Documentation**

## interface (Static MAC Bypass)

**Syntax**  
interface [interface-names];

**Hierarchy Level**  
[edit protocols dot1x authenticator authentication-profile-name static mac-address],  
[edit ethernet-switching-options authentication-whitelist mac-address],  
[edit switch-options on page 2027 authentication-whitelist mac-address]

**Release Information**  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  

**Description**  
Configure interfaces on which the specified MAC addresses are allowed to bypass RADIUS authentication and allowed to connect to the LAN without authentication.

**Options**  
* interface-names—List of interfaces.

**Required Privilege Level**  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

interface (VoIP)

Syntax

interface (all|interface-name|access-ports)
  vlan vlan-name;
  forwarding-class <assured-forwarding|best-effort|expedited-forwarding|
  network-control>;
}

Hierarchy Level

- For platforms with ELS:
  [edit switch-options on page 2027 voip]
- For platforms without ELS:
  [edit ethernet-switching-options voip],

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Hierarchy level [edit switch-options] introduced in Junos OS Release 13.2X50-D10. (See
“Getting Started with Enhanced Layer 2 Software” on page 3 for information about
ELS.)

Description

Enable voice over IP (VoIP) for all interfaces or specific interfaces.

Options

all | interface-name | access-ports—Enable VoIP on all interfaces, on a specific interface,
  or on all access ports.

Required Privilege

Level

system—To view this statement in the configuration.
  system-control—To add this statement to the configuration.

**interface-description-format**

**Syntax**

```plaintext
interface-description-format {
    exclude-adapter;
    exclude-sub-interface;
}
```

**Hierarchy Level**

[edit access profile profile-name radius options]

**Release Information**

Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Options `exclude-adapter` and `exclude-sub-interface` introduced in Junos OS Release 10.4.

**Description**

Specify the information that is excluded from the interface description that the device passes to RADIUS for inclusion in the RADIUS attribute 87 (NAS-Port-Id). By default, the device includes both the subinterface and the adapter in the interface description.

**Options**

- `exclude-adapter`—Exclude the adapter from the interface description.
- `exclude-sub-interface`—Exclude the subinterface from the interface description.

**Required Privilege**

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

**Related Documentation**

- Configuring RADIUS Server Options for Subscriber Access
- RADIUS Server Options for Subscriber Access
juniper-dsl-attributes

Syntax  
juniper-dsl-attributes;

Hierarchy Level  
[edit access profile profile-name radius options]

Release Information  
Statement introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  
Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:

- Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.
- Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.

Default  
The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.

Required Privilege
Level  
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring AAA to Include Juniper Networks DSL VSAs in RADIUS Messages
- Configuring ANCP
max-outstanding-requests (Gx-Plus)

Syntax
max-outstanding-requests number;

Hierarchy Level
[edit accessgx-plus global]

Release Information
Statement introduced in Junos OS Release 11.2.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description
Limit the number of outstanding requests to the PCRF that Gx-Plus can retry when the requests are improperly answered. Too many requests risks overloading the PCRF and increases the chance of losing messages.

Options
number—Number of outstanding requests from Gx-Plus to the PCRF that can exist at any time.
Default: 40
Range: 2 through 40

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
• Configuring Gx-Plus Global Attributes
• Configuring Gx-Plus

nas-identifier

Syntax
nas-identifier identifier-value;

Hierarchy Level
[edit accessprofile profile-name radius options]

Release Information
Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description
Configure the value for the client RADIUS attribute 32 (NAS-Identifier). This attribute is used for authentication and accounting requests.

Options
identifier-value—String to use for authentication and accounting requests.
Range: 1 through 64 characters

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

• Configuring RADIUS Server Parameters for Subscriber Access
**nas-port-extended-format (Access Profile)**

**Syntax**

```plaintext
nas-port-extended-format {
  adapter-width width;
  ae-width width;
  port-width width;
  slot-width width;
  stacked;
  stacked-vlan-width width;
  vlan-width width;
  atm {
    adapter-width width;
    port-width width:
    slot-width width;
    vci-width width:
    vpi-width width;
  }
}
```

**Hierarchy Level**

```
[edit access profile profile-name radius options]
```

**Release Information**

Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Option `ae-width` introduced in Junos OS Release 12.1.
Option `stacked` introduced in Junos OS Release 12.3.
Option `atm` introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.
Option `atm` supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description**

In an access profile, configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute. You can use the same access profile to configure the NAS-Port extended format for Ethernet subscribers and ATM subscribers.

**Options**

- `adapter-width width`—Number of bits in the adapter field.
- `ae-width width`—Number of bits in the aggregated Ethernet identifier field.
- `port-width width`—Number of bits in the port field.
- `slot-width width`—Number of bits in the slot field.
- `stacked`—Include stacked VLAN IDs, in addition to VLAN IDs, in the NAS-Port extended format.
- `stacked-vlan-width width`—Number of bits in the SVLAN ID field.
- `vlan-width width`—Number of bits in the VLAN ID field.
- `atm`—Configure the NAS-Port extended format for ATM subscribers; options include:
  - `adapter-width width`—Number of bits in the adapter field.
• **port-width width**—Number of bits in the port field.
• **slot-width width**—Number of bits in the slot field.
• **vci-width width**—Number of bits in the ATM virtual circuit identifier (VCI) field.
• **vpi-width width**—Number of bits in the ATM virtual path identifier (VPI) field.

**NOTE:** Each field can be 0 through 32 bits wide; however, the total of the widths of all fields must not exceed 32 bits, or the configuration fails. The router may truncate the values of individual fields depending on the bit width you specify.

### Required Privilege
- **Level**
  - admin—To view this statement in the configuration.
  - admin-control—To add this statement to the configuration.

### Related Documentation

### nas-port-id-delimiter (Subscriber Management)

**Syntax**

```
ns-port-id-delimiter delimiter-character;
```

**Hierarchy Level**

```
[edit access profile profile-name radius options]
```

**Release Information**

Statement introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Specify the character that the router uses as a separator between the concatenated values in the NAS-Port-ID string. The router uses the delimiter when you configure more than one value in the `nas-port-id-format` statement.

**Default**

The hash (#) character.

**Options**

- `delimiter-character`—Character used for the delimiter.

**Required Privilege**

- **Level**
  - admin—To view this statement in the configuration.
  - admin-control—To add this statement to the configuration.

**Related Documentation**

- Configuring RADIUS Server Options for Subscriber Access

nas-port-id-format (Subscriber Management)

Syntax

```
nas-port-id-format { 
  agent-circuit-id; 
  agent-remote-id; 
  interface-description; 
  nas-identifier; 
} 
```

Hierarchy Level

```
[edit access profile profile-name radius options]
```

Release Information

Statement introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Specify the information that the router includes in the NAS-Port-ID (RADIUS attribute 87) that it is passed to the RADIUS server during authentication and accounting. You can include any combination of the optional values.

Default

The router includes the interface description.

Options

- `agent-circuit-id`—Include the agent circuit ID from either DHCP option 82 or the DSL forum VSAs.
- `agent-remote-id`—Include the agent remote ID from either DHCP option 82 or the DSL forum VSAs.
- `interface-description`—Include the interface description.
- `nas-identifier`—Include the NAS identifier value (RADIUS attribute 32).

Required Privilege

- `admin`—To view this statement in the configuration.
- `admin-control`—To add this statement to the configuration.

Related Documentation

**nas-port-type (Subscriber Management)**

**Syntax**

```
    nas-port-type {
        ethernet {
            port-type;
        }
    }
```

**Hierarchy Level**

```
[edit access profile profile-name radius options]
```

**Release Information**

Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Specify the port type used to authenticate subscribers. The router includes the port type in RADIUS attribute 61 (NAS-Port-Type attribute).

---

**NOTE:** This statement is ignored if the ethernet-port-type-virtual statement is included in the same access profile.

---

**Default**

The router uses a port type of `ethernet`.

**Options**

*port-type*—One of the following port types:

- `value`—A value from 0-65535
- `adsl-cap`—Asymmetric DSL, carrierless amplitude phase (CAP) modulation
- `adsl-dmt`—Asymmetric DSL, discrete multitone (DMT)
- `async`—Asynchronous
- `cable`—Cable
- `ethernet`—Ethernet
- `fddi`—Fiber Distributed Data Interface
- `g3-fax`—G.3 Fax
- `hdlc-clear-channel`—HDLC Clear Channel
- `iapp`—Inter-Access Point Protocol (IAPP)
- `idsl`—ISDN DSL
- `isdn-sync`—ISDN Synchronous
- `isdn-v110`—ISDN Async V.110
- `isdn-v120`—ISDN Async V.120
- `piafs`—Personal Handyphone System (PHS) Internet Access Forum Standard
- `sdsl`—Symmetric DSL
• sync—Synchronous

```
[edit access radius-server server-address],
[edit access profile profile-name radius-server server-address]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the routing instance used to send RADIUS packets to the RADIUS server.

**Options**
- `routing-instance-name`—Routing instance name.

**Required Privilege Level**
- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring the PPP Authentication Protocol
- Configuring Authentication and Accounting Parameters for Subscriber Access
secret

**Syntax**
```
secret password;
```

**Hierarchy Level**
- [edit access profile profile-name radius-server server-address]
- [edit access radius-disconnect client-address]
- [edit access radius-server server-address]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the password to use with the RADIUS server. The secret password used by the local router or switch must match that used by the server.

**Options**
- **password**—Password to use; it can include spaces if the character string is enclosed in quotation marks.

**Required Privilege**
- **Level**
  - system—To view this statement in the configuration.
  - system-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Authentication and Accounting Parameters for Subscriber Access
- Configuring Router or Switch Interaction with RADIUS Servers
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP
- Configuring the RADIUS Disconnect Server for L2TP
- Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure)

send-acct-status-on-config-change (Access Profile)

**Syntax**
```
send-acct-status-on-config-change;
```

**Hierarchy Level**
```
[edit access profile profile-name accounting]
```

**Release Information**
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**
Configure the router's authd process to send an Acct-On message when the first RADIUS server is added to an access profile, and to send an Acct-Off message when the last RADIUS server is removed from an access profile.

**Required Privilege**
- **Level**
  - admin—To view this statement in the configuration.
  - admin-control—To add this statement to the configuration.

**Related Documentation**
- Configuring RADIUS Server Parameters for Subscriber Access
- Configuring Per-Subscriber Session Accounting
service (Service Accounting)

Syntax

```
service {
    accounting-order (activation-protocol | radius);
}
```

Hierarchy Level

```
[edit access profile profile-name]
```

Release Information

Statement introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Define the subscriber service accounting configuration.

The remaining statement is explained separately.

Required Privilege

Level

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Service Accounting with JSRC
- Service Accounting with JSRC

source-address

Syntax

```
source-address source-address;
```

Hierarchy Level

```
[edit access radius-server server-address],
[edit access profile profile-name radius-server server-address]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure a source address for each configured RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address.

Options

```
source-address—Valid IPv4 address configured on one of the router or switch interfaces.
```

On M Series routers only, the source address can be an IPv6 address and the UDP source port is 514.

Required Privilege

Level

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Router or Switch Interaction with RADIUS Servers
- Configuring Authentication and Accounting Parameters for Subscriber Access
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP
timeout (RADIUS)

Syntax

timeout seconds;

Hierarchy Level

[edit access radius-server server-address],
[edit access profile profile-name radius-server server-address]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure the amount of time that the local router or switch waits to receive a response from a RADIUS server.

Options

seconds—Amount of time to wait.
Range: 1 through 90 seconds
Default: 3 seconds

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

• Configuring Router or Switch Interaction with RADIUS Servers
• Configuring Authentication and Accounting Parameters for Subscriber Access
• Example: Configuring CHAP Authentication with RADIUS
• Configuring RADIUS Authentication for L2TP
vlan-assignment

Syntax
vlan-assignment (vlan-id | vlan-name);

Hierarchy Level
[edit protocols dot1x authenticator authentication-profile-name static (Protocols 802.1X) mac-address],
[edit ethernet-switching-options authentication-whitelist],
[edit switch-options on page 2027 authentication-whitelist]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.

Options
vlan-id | vlan-name—The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

vlan-nas-port-stacked-format

Syntax
vlan-nas-port-stacked-format;

Hierarchy Level
[edit access profile profile-name radius options]

Release Information
Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description
Configure RADIUS attribute 5 (NAS-Port) to include the S-VLAN ID, in addition to the VLAN ID, for subscribers on Ethernet interfaces.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

CHAPTER 30

Administration

- Routine Monitoring on page 1813
- Operational Commands on page 1815

Routine Monitoring

- Monitoring 802.1X Authentication on page 1813
- Verifying 802.1X Authentication on page 1814

Monitoring 802.1X Authentication

**Purpose**

Use the monitoring feature to display details of authenticated users and users who have failed authentication.

**Action**

To display authentication details in the J-Web interface, select Monitoring > Security > 802.1X.

To display authentication details in the CLI, enter the following commands:

- `show dot1x interface detail | display xml`
- `show dot1x interface detail <interface> | display xml`
- `show dot1x auth-failed-users`

**Meaning**

The details displayed include:

- A list of authenticated users.
- The total number of users connected.
- A list of users who have failed authentication

You can also specify an interface for which the details must be displayed.

**Related Documentation**

- *Configuring 802.1X Authentication (J-Web Procedure)*
- *Configuring 802.1X Interface Settings (CLI Procedure)* on page 1740
- *Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch* on page 1684
Verifying 802.1X Authentication

**Purpose** Verify that supplicants are being authenticated on an interface on an EX Series switch with the interface configured for 802.1X authentication, and display the method of authentication being used.

**Action** Display detailed information about an interface configured for 802.1X (here, the interface is `ge-0/0/16`):

```bash
user@switch> show dot1x interface ge-0/0/16.detail
ge-0/0/16.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Strict: Disabled
  Reauthentication: Enabled Reauthentication interval: 40 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 1
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user5, 00:30:48:8C:66:BD
    Operational state: Authenticated
    Authentication method: Radius
    Authenticated VLAN: v200
    Reauthentication due in 17 seconds
```

**Meaning** The sample output from the `show dot1x interface detail` command shows that the **Number of connected supplicants** is 1. The supplicant that was authenticated and is now connected to the LAN is known as **user5** on the RADIUS server and has the MAC address **00:30:48:8C:66:BD**. The supplicant was authenticated by means of the 802.1X authentication method called **Radius** authentication. When the **Radius** authentication method is used, the supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. The sample output also shows that the supplicant is connected to VLAN v200.

Other 802.1X authentication methods supported on EX Series switches in addition to the RADIUS method are:

- **Guest VLAN**—A nonresponsive host is granted Guest-VLAN access.
- **MAC Radius**—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.
- **Server-fail deny**—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default.
• **Server-fail permit**—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server.

• **Server-fail use-cache**—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are granted access, but new supplicants are denied LAN access.

• **Server-fail VLAN**—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)

**Operational Commands**
clear captive-portal

Syntax: clear captive-portal (firewall [interface-names] | interface (802.1X) (all | [interface-names]) | mac-address [mac-addresses])

Release Information: Command introduced in Junos OS Release 10.1 for EX Series switches.

Description: Reset the authentication state of a captive portal interface or captive-portal firewall statistics on one or more interfaces.

Options:
- **firewall [interface-names]** — Resets captive portal statistics on all interfaces or on the specified interface.
- **interface (all | interface-names)** — Resets the authentication state of users connected to all interfaces or the specified interfaces.
- **mac-address mac-addresses** — Resets the authentication state for the specified MAC addresses.

Required Privilege: view

Related Documentation:

</table>
clear dot1x

Syntax

```
clear dot1x (firewall <counter-name> | interface <[interface-name]> | mac-address [mac-addresses] | statistics <interface interface-name>)
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches. firewall option added in Junos OS Release 9.5 for EX Series switches.

Description

Reset the authentication state of an interface or delete 802.1X statistics from the switch. When you reset an interface using the interface or mac-address options, reauthentication on the interface is also triggered. The switch sends out a multicast message on the interface to restart the authentication of all connected supplicants. If a MAC address is reset, then the switch sends out a unicast message to that specific MAC address to restart authentication.

If a supplicant is sending traffic when the clear dot1x interface command is issued, the authenticator immediately initiates reauthentication. This process happens quickly, and it might seem that reauthentication did not occur. To verify that reauthentication has happened, issue the show dot1x interface detail command. The values for Reauthentication due and Reauthentication interval will be about the same.

**CAUTION:** When you clear the learned MAC addresses from an interface using the clear dot1x interface command, all MAC addresses are cleared, including those in static MAC bypass list.

Options

```
firewall <counter-name>—Clear 802.1X firewall counter statistics. If the counter-name option is specified, clear 802.1X firewall statistics for that counter.

interface <[interface-name]>—Reset the authentication state of all the supplicants (also, clears all the authentication bypassed clients) connected to the specified interface (when the interface is an authenticator) or reset the authentication state for the interface itself (when the interface is a supplicant).

mac-address [mac-addresses]—Reset the authentication state of the specified MAC addresses.

statistics <interface interface-name>—Clear 802.1X statistics on all 802.1X-enabled interfaces. If the interface option is specified, clear 802.1X firewall statistics for that interface or interfaces.
```

**show captive-portal interface**

**Syntax**

```
show captive-portal interface
  <interface-name>
detail
```

**Release Information**
Command introduced in Junos OS Release 10.1 for EX Series switches.

**Description**
Display the current operational state of all captive portal interfaces with the list of connected users and the configured values of captive portal attributes on the interfaces.

**Options**
- `none`—Display all captive portal interfaces.
- `interface-name`—(Optional) Display the state for the specified captive portal interface and lists the MAC address and user names of any clients authenticated on the interface.
- `interface-name detail`—(Optional) Displays the configured values of captive portal attributes on the specified captive portal interface.

**Required Privilege Level**
view

**Related Documentation**
- `show captive-portal authentication-failed-users on page 1822`
- `show captive-portal firewall on page 1823`
- `captive-portal`
- `clear captive-portal on page 1816`
- *Example: Setting Up Captive Portal Authentication on an EX Series Switch*
- *Configuring Captive Portal Authentication (CLI Procedure)*

**List of Sample Output**
- `show captive-portal interface (Only captive portal is enabled) on page 1827`
- `show captive-portal interface (Both 802.1X authentication and captive portal are enabled) on page 1827`
- `show captive-portal interface detail (Only captive portal is enabled) on page 1827`
- `show captive-portal interface detail (Both 802.1X authentication and captive portal are enabled) on page 1827`

**Output Fields**
Table 213 on page 1825 lists the output fields for the `show captive-portal interface` command. Output fields are listed in the approximate order in which they appear.

**Table 213: show captive-portal interface Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>

<tr>
<td></td>
<td>• <strong>CP Session expiration due in</strong>—Time remaining in session.</td>
<td></td>
</tr>
</tbody>
</table>
Sample Output

show captive-portal interface (Only captive portal is enabled)

```
show captive-portal interface
Captive Portal Information:
Interface      State           MAC address          User          Fallen back
ge-0/0/1.0     Connecting      00:30:48:8c:66:bd    No User
ge-0/0/10.0    Connecting      00:30:48:8c:66:bd    No User
ge-0/0/5.0     Authenticated   00:30:48:8d:7a:9b    abcdeX      No
```

show captive-portal interface (Both 802.1X authentication and captive portal are enabled)

```
show captive-portal interface
Captive Portal Information:
Interface      State           MAC address          User          Fallen back
ge-0/0/1.0     Connecting      00:30:48:8c:66:bd    No User
ge-0/0/10.0    Connecting      00:30:48:8c:66:bd    No User
ge-0/0/5.0     Authenticated   00:30:48:8d:7a:9b    abcdeX      Yes
```

show captive-portal interface detail (Only captive portal is enabled)

```
show captive-portal interface detail ge-6/0/5.0
Supplicant mode: Multiple
Number of retries: 3
Quiet period: 60 seconds
Configured CP session timeout: 3600 seconds
Server timeout: 15 seconds
CP fallen back: No
Number of connected supplicants: 1
  Supplicant: abcdeX, 00:30:48:8d:7a:9b
    Operational state: Authenticated
    Dynamic CP Session Timeout: 3600 seconds
    CP Session Expiration due in: 3583 seconds
```

show captive-portal interface detail (Both 802.1X authentication and captive portal are enabled)

```
show captive-portal interface detail ge-6/0/5.0
Supplicant mode: Multiple
Number of retries: 3
Quiet period: 60 seconds
Configured CP session timeout: 3600 seconds
Server timeout: 15 seconds
CP fallen back: Yes
Number of connected supplicants: 1
  Supplicant: abcdeX, 00:30:48:8d:7a:9b
    Operational state: Authenticated
    Dynamic CP Session Timeout: 3600 seconds
    CP Session Expiration due in: 3583 seconds
```
show dot1x

Syntax

```
show dot1x
  <brief | detail>
  <interface interface-name>
```

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display the current operational state of all ports with the list of connected users. This command displays the list of connected supplicants received from the RADIUS authentication server regardless of the session state—that is, for both authenticated supplicants and for supplicants that attempted authentication.

Options

```
none—Display information for all authenticator ports.
brief | detail—(Optional) Display the specified level of output.
interface interface-name—Display information for the specified port with a list of connected supplicants.
```

Output Fields
Table 214 on page 1828 lists the output fields for the `show dot1x` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of a port.</td>
<td>All levels</td>
</tr>
<tr>
<td>MAC address</td>
<td>The MAC address of the connected supplicant on the port.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 214: show dot1x Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Role</strong></td>
<td>The 802.1X authentication role of the interface. When 802.1X is enabled on an interface, the role is <strong>Authenticator</strong>. As <strong>Authenticator</strong>, the interface blocks LAN access until a supplicant is authenticated through 802.1X or MAC RADIUS authentication.</td>
<td>brief, detail</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>The state of the port:</td>
<td>brief</td>
</tr>
<tr>
<td></td>
<td>• <strong>Authenticated</strong>—The supplicant has been authenticated through the RADIUS server or has been permitted access through server fail fallback.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Authenticating</strong>—The supplicant is authenticating through the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Held</strong>—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.</td>
<td></td>
</tr>
<tr>
<td><strong>User</strong></td>
<td>The user name of the connected supplicant</td>
<td>brief</td>
</tr>
<tr>
<td><strong>Administrative state</strong></td>
<td>The administrative state of the port:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• <strong>auto</strong>—Traffic is allowed through the port based on the authentication result. (Default)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>force-authorize</strong>—All traffic flows through the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to <strong>dynamic</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>force-unauthorize</strong>—All traffic drops on the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to <strong>dynamic</strong>.</td>
<td></td>
</tr>
<tr>
<td><strong>Supplicant</strong></td>
<td>The mode for the supplicant:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• <strong>single</strong>—Authenticates only the first supplicant. All other supplicants who connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>single-secure</strong>—Allows only one supplicant to connect to the port. No other supplicant is allowed to connect until the first supplicant logs out.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>multiple</strong>—Allows multiple supplicants to connect to the port. Each supplicant is authenticated individually.</td>
<td></td>
</tr>
<tr>
<td><strong>Quiet period</strong></td>
<td>The number of seconds the port remains in the wait state following a failed authentication exchange with the supplicant before reattempting the authentication. The default value is 60 seconds. The range is 0 through 65,535 seconds.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Transmit period</strong></td>
<td>The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant. The default value is 30 seconds. The range is 1 through 65,535 seconds.</td>
<td>detail</td>
</tr>
</tbody>
</table>
Table 214: show dot1x Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MAC radius</strong></td>
<td>MAC RADIUS authentication:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• enabled—The switch sends an EAPOL request to the connecting host to attempt 802.1X authentication and if the connecting host is unresponsive, the switch tries to authenticate using the MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• disabled—The default. The switch will not attempt to authenticate the MAC address of the connecting host.</td>
<td></td>
</tr>
<tr>
<td><strong>MAC radius restrict</strong></td>
<td>The authentication method is restricted to MAC RADIUS only. 802.1X authentication is not enabled.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Reauthentication</strong></td>
<td>The reauthentication state:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• disable—Periodic reauthentication of the client is disabled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• interval—Sets the periodic reauthentication time interval. The default value is 3600 seconds. The range is 1 through 65,535 seconds.</td>
<td></td>
</tr>
<tr>
<td><strong>Supplicant timeout</strong></td>
<td>The number of seconds the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request. The default value is 30 seconds. The range is 1 through 60 seconds.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Server timeout</strong></td>
<td>The number of seconds the port waits for a reply when relaying a response from the supplicant to the authentication server before timing out. The default value is 30 seconds. The range is 1 through 60 seconds.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Maximum EAPOL requests</strong></td>
<td>The maximum number of retransmission times of an EAPOL request packet to the supplicant before the authentication session times out. The default value is 2. The range is 1 through 10.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Number of clients bypassed because of authentication</strong></td>
<td>The number of non-802.1X clients granted access to the LAN by means of static MAC bypass. The following fields are displayed:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• Client—MAC address of the client.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• vlan—The name of the VLAN to which the client is connected.</td>
<td></td>
</tr>
<tr>
<td><strong>Guest VLAN member</strong></td>
<td>The VLAN to which a supplicant is connected when the supplicant is authenticated using a guest VLAN. If a guest VLAN is not configured on the interface, this field displays &lt;not configured&gt;.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Number of connected supplicants</strong></td>
<td>The number of supplicants connected to a port.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Supplicant</strong></td>
<td>The user name and MAC address of the connected supplicant.</td>
<td>detail</td>
</tr>
</tbody>
</table>

<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication method</td>
<td>The 802.1X authentication method used for a supplicant:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• <strong>Guest VLAN</strong>—A supplicant is connected to the LAN through the guest VLAN.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC Radius</strong>—A nonresponsive host is authenticated based on its MAC address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Radius</strong>—A supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Server-fail deny</strong>—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Server-fail permit</strong>—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Server-fail use-cache</strong>—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are reauthenticated, but new supplicants are denied LAN access.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Server-fail VLAN</strong>—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)</td>
<td></td>

show dot1x firewall

Syntax
show dot1x firewall <interface interface-name>

Release Information
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description
Displays information about the firewall filters for each user or nonresponsive host that is authenticated on each 802.1X-enabled interface that is configured for multiple supplicants. For example, if the firewall filter is configured with a term for counters, the command shows the count for each user.

Options
interface interface-names—(Optional) Display information for the specified interface.

# show lldp

**Syntax**

```plaintext
show lldp <detail>
```

**Release Information**

**Description**

Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol–Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

**NOTE:** LLDP-MED is not available on the QFX Series.

**Options**

- `none`—Display LLDP information for all interfaces.
- `detail`—(Optional) Display detailed LLDP information for all interfaces.

**NOTE:** fast-start is not available on the QFX Series.

**Required Privilege Level**

<td>Frequency, in seconds, at which LLDP advertisements are sent.</td>
<td>All levels</td>
</tr>
<tr>
<td>This value is set by the advertisement-interval configuration statement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Transmit delay</td>
<td>Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.</td>
<td></td>
</tr>
<tr>
<td>This value is set by the transmit-delay configuration statement.</td>
<td>All levels</td>
<td></td>
</tr>
<tr>
<td>Hold timer</td>
<td>Multiplier used in combination with the advertisement-interval value to determine the length of time LLDP information is held before it is discarded.</td>
<td></td>
</tr>
<tr>
<td>This value is set by the hold-multiplier configuration statement.</td>
<td>All levels</td>
<td></td>
</tr>
<tr>
<td>Notification interval</td>
<td>How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications of database changes are disabled.</td>
<td></td>
</tr>
<tr>
<td>This value is set by the lldp-configuration-notification-interval configuration statement.</td>
<td>All levels</td>
<td></td>
</tr>
<tr>
<td>Config Trap Interval</td>
<td>How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications of topology changes are disabled.</td>
<td></td>
</tr>
<tr>
<td>This value is set by the topo-configuration-trap-interval configuration statement.</td>
<td>All levels</td>

</table>
show lldp neighbors

Syntax

show lldp neighbors
<interface interface>

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the information about neighboring devices learned by the switch by using the Link Layer Discovery Protocol (LLDP).

NOTE: The Chassis ID TLV has a subtype for Network Address Family. The supported network address families are IPv4 and IPv6. LLDP frames are validated only if the Network Address subtype of the Chassis ID TLV has a value of 1 (IPv4) or 2 (IPv6). For any other value, the transmitting device is detected by LLDP as a neighbor and displayed in the output of the "show lldp neighbors" command, but is not assigned to the VLAN.

Options

none—Display LLDP neighbor information for all interfaces.

interface interface—(Optional) Display LLDP neighbor information for a selected interface.

Required Privilege Level

view

Junos OS CoS for EX Series Switches Overview

When a network experiences congestion and delay, some packets must be dropped. Junos operating system (Junos OS) class of service (CoS) divides traffic into classes to which you can apply different levels of throughput and packet loss when congestion occurs. This allows packet loss to happen according to rules that you configure.

For interfaces that carry IPv4, IPv6, and MPLS traffic, you can configure Junos OS CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP), IP precedence, 802.1p, or EXP CoS bits of packets egressing out of an interface, thus allowing you to tailor packets for the remote peers’ network requirements. See Understanding Using CoS with MPLS Networks on EX Series Switches for more information about CoS for MPLS networks.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue.

In designing CoS applications, you must give careful consideration to your service needs and thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because Juniper Networks EX Series Ethernet Switches implement CoS in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet-forwarding and switching performance.

NOTE: CoS policies can be enabled or disabled on each interface of an EX Series switch. Also, each physical and logical interface on the switch can have custom CoS rules associated with it. When CoS is used in an MPLS network, there are some additional restrictions. See Understanding Using CoS with MPLS Networks on EX Series Switches.

- How Junos OS CoS Works on page 1862
- Default CoS Behavior on EX Series Switches on page 1863

How Junos OS CoS Works

Junos OS CoS works by examining traffic entering at the edge of your network. The switches classify traffic into defined service groups to provide the special treatment of traffic across the network. For example, voice traffic can be sent across certain links, and data traffic can use other links. In addition, the data traffic streams can be serviced differently along the network path. As the traffic leaves the network at the far edge, you can rewrite the traffic to meet the policies of the targeted peer.

To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings then dictate which packets are transmitted first to the next downstream switch. Switches at the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.
Figure 22 on page 1863 represents the network scenario of an enterprise. Switch A is receiving traffic from various network nodes such as desktop computers, servers, surveillance cameras, and VoIP telephones. As each packet enters, Switch A examines the packet’s CoS settings and classifies the traffic into one of the groupings defined by the enterprise. This definition allows Switch A to prioritize resources for servicing the traffic streams it receives. Switch A might alter the CoS settings of the packets to better match the enterprise’s traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packets according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can rewrite the CoS bits of the packets before transmitting them.

Figure 22: Packet Flow Across the Network

Default CoS Behavior on EX Series Switches

If you do not configure any CoS settings on the switch, the software performs some CoS functions to ensure that user traffic and protocol packets are forwarded with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

Understanding Junos OS CoS Components for EX Series Switches

This topic describes the Juniper Networks Junos operating system (Junos OS) class-of-service (CoS) components for Juniper Networks EX Series Ethernet Switches:

- Code-Point Aliases on page 1864
- Policers on page 1864
• Classifiers on page 1864
• Forwarding Classes on page 1864
• Tail Drop Profiles on page 1865
• Schedulers on page 1865
• Rewrite Rules on page 1865

**Code-Point Aliases**

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

**Policers**

Policers limit traffic of a certain class to a specified bandwidth and *burst size*. Packets exceeding the policer limits can be discarded. You define policers with filters that can be associated with input interfaces.

For more information about policers, see “Understanding the Use of Policers in Firewall Filters” on page 4155.

**NOTE:** You can configure policers to discard packets that exceed the rate limits. If you want to configure CoS parameters such as loss-priority and forwarding-class, you must use firewall filters.

**Classifiers**

Packet classification associates incoming packets with a particular CoS servicing level. In Juniper Networks Junos operating system (Junos OS), *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examines the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, and IEEE 802.1p value.

- Multifield traffic classifiers—Examines multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

**Forwarding Classes**

Forwarding classes group the packets for transmission. Based on forwarding classes, you assign packets to output queues. Forwarding classes affect the forwarding, scheduling, and marking policies applied to packets as they transit a switch. By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and...
and network control. For EX Series switches, 16 forwarding classes are supported, providing
granular classification capability.

**Tail Drop Profiles**

Drop profile is a mechanism that defines parameters that allow packets to be dropped
from the network. Drop profiles define the meanings of the loss priorities. When you
configure drop profiles you are essentially setting the value for queue fullness. The queue
fullness represents a percentage of the queue used to store packets in relation to the
total amount that has been allocated for that specific queue.

Loss priorities set the priority of dropping a packet. Loss priority affects the scheduling
of a packet without affecting the packet’s relative ordering. You can use the loss priority
setting to identify packets that have experienced congestion. Typically you mark packets
exceeding some service level with a high loss priority.

**Schedulers**

Each switch interface has multiple queues assigned to store packets. The switch
determines which queue to service based on a particular method of scheduling. This
process often involves determining which type of packet should be transmitted before
another. You can define the priority, bandwidth, delay buffer size, and tail drop profiles
to be applied to a particular queue for packet transmission.

A scheduler map associates a specified forwarding class with a scheduler configuration.
You can associate up to four user-defined scheduler maps with the interfaces.

**Rewrite Rules**

A rewrite rule sets the appropriate CoS bits in the outgoing packet, thus allowing the next
downstream device to classify the packet into the appropriate service group. Rewriting,
or marking, outbound packets is useful when the switch is at the border of a network and
must alter the CoS values to meet the policies of the targeted peer.

---

**NOTE:** Egress firewall filters can also assign forwarding class and loss priority
so that the packets are rewritten based on forwarding class and loss priority.

---

Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs), IP precedence, and IEEE 802.1p bits to associate incoming packets with a particular CoS servicing level. On a switch, you can assign a meaningful name or alias to the CoS values and use this alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure user-defined classifiers in terms of alias names. If the value of an alias changes, it alters the behavior of any classifier that references it.

This topic covers:

Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and loss priority, and packets are associated to an output queue based on the forwarding class. You can define classifiers for IPv4 and IPv6 traffic to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), integrated routing and bridging (IRB) interfaces (also known as routed VLAN interfaces (RVIs)), Layer 3 interfaces, and Layer 3 VLAN-tagged logical interfaces.

There are two general types of classifiers:

- Behavior aggregate (BA) classifiers
- Multifield (MF) classifiers

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification. If the two classification results conflict, the MF classification result overrides the BA classification result.

On Juniper Networks EX8200 Ethernet Switches, you can specify BA classifiers for bridged multidestination traffic and for IP multidestination traffic. A BA classifier for multicast packets is applied to all interfaces on the EX8200 switch.

**NOTE:** EX8200 switches implement the on-demand allocation of memory space for ternary content addressable memory (TCAM) so that when additional TCAM space is required for CoS classifiers, it is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers to use memory space that exceeds the available TCAM space that includes both the free and unused space.

This topic describes:

- Behavior Aggregate Classifiers on page 1869
- Multifield Classifiers on page 1871

**Behavior Aggregate Classifiers**

The behavior aggregate classifier maps packets to a forwarding class and a loss priority. The forwarding class determines the output queue for a packet. The loss priority is used by a scheduler to control packet discard during periods of congestion.

There are three types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ
- IP precedence bits
- IEEE 802.1p CoS bits
BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore core devices, which handle high traffic volumes, are normally configured to perform BA classification.

**Default Behavior Aggregate Classification**

Juniper Networks Junos operating system (Junos OS) automatically assigns implicit default BA classifiers to logical interfaces based on the type of interface. Table 226 on page 1870 lists different types of interfaces and the corresponding implicit default BA classification.

### Table 226: Default BA Classification

<table>
<thead>
<tr>
<th>Type of Interface</th>
<th>Default BA Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trunk and Circuit Cross-Connect (CCC) interfaces</td>
<td>ieee8021p-default</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> This BA classification for a CCC interface is applicable only for EX8200 switches.</td>
</tr>
<tr>
<td>Layer 3 interface (IPv4)</td>
<td>dscp-default</td>

<td>No default classification</td>
</tr>
<tr>
<td>MPLS</td>
<td>EXP</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> This BA classification is applicable only for EX8200 switches.</td>
</tr>
</tbody>
</table>

When you explicitly associate a BA classifier with a logical interface, you are overriding the implicit (default) BA classifier with an explicit BA classifier.

Table 227 on page 1870 describes the BA classifier types you can configure on Layer 2 and Layer 3 interfaces.

### Table 227: Allowed BA Classification

<table>
<thead>
<tr>
<th>Type of Interface</th>
<th>Allowed BA Classification</th>

<td>IEEE 802.1p, IP precedence, DSCP</td>
</tr>
<tr>
<td>Layer 3 interface (IPv6)</td>
<td>IEEE 802.1p, IP precedence, DSCP IPv6</td>
</tr>
</tbody>
</table>

You can configure all the allowed classifier types on the same logical interface or on different logical interfaces. If you need to apply all classifier rules on the same logical interface, configure the classifier rules allowed for both IPv4 and IPv6 on the logical interface.
If you have not explicitly configured a classifier on a logical interface, the default classifiers are assigned and classification works as follows:

- To a logical interface configured with an IPv4 address, a DSCP classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP classifier.
- To logical interface configured with an IPv6 address, a DSCP IPv6 classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP IPv6 classifier.

**NOTE:** On EX8200 switches, you can configure either one classifier of type DSCP or IEEE802.1p, or you can configure one classifier each of type DSCP and IEEE802.1p.

You can configure integrated routing and bridging (IRB) interfaces (also known as routed VLAN interfaces (RVIs)) to classify packets. After you do this, the User Priority (UP) bits in the incoming packets are rewritten according to the default IEEE 802.1p rewrite rule, except on EX8200 switches. On EX8200 switches, you must explicitly assign the default IEEE 802.1p rewrite rule to RVIs.

**NOTE:** By default, all BA classifiers classify traffic into either the best-effort forwarding class or the network-control forwarding class.

**Multifield Classifiers**

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of support for DSCP or IP precedence classifiers in end-user applications. On an edge switch, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, any classifier performs matching operations on the selected fields against a configured value.

Understanding CoS Forwarding Classes

Class-of-Service (CoS) forwarding classes can be thought of as output queues. In effect, the result of classifying packets is the identification of an output queue for a particular packet. For a classifier to assign an output queue to a packet, it must associate the packet with one of the following forwarding classes:

- best-effort (be)—Provides no service profile. Loss priority is typically not carried in a CoS value.
- expedited-forwarding (ef)—Provides a low loss, low latency, low jitter, assured bandwidth, end-to-end service.
- assured-forwarding (af)—Provides a group of values you can define and includes four subclasses: AF1, AF2, AF3, and AF4, each with two drop probabilities: low and high.
- network-control (nc)—Supports protocol control and thus is typically high priority.
- multicast best-effort (mcast-be)—Provides no service profile for multicast packets.
- multicast expedited forwarding (mcast-ef)—Supports high-priority multicast packets.
- multicast assured-forwarding (mcast-af)—Provides two drop profiles; high, and low, for multicast packets.

NOTE: The forwarding classes multicast expedited-forwarding, multicast assured-forwarding, and multicast best-effort are applicable only to Juniper Networks EX8200 and Juniper Networks EX4300 Ethernet Switches.

Juniper Networks EX Series Ethernet Switches support up to 16 forwarding classes, thus allowing granular packet classification. For example, you can configure multiple classes of expedited forwarding (EF) traffic such as EF, EF1, and EF2.

EX Series switches except EX4300 switches support up to eight output queues. Therefore, if you configure more than eight forwarding classes, you must map multiple forwarding classes to single output queues. EX4300 switches support up to 12 output queues. On EX8200 Virtual Chassis, you can configure only eight forwarding classes and you can assign only one forwarding class to each output queue.

NOTE: On EX8200 Virtual Chassis, the queue number seven carries Virtual Chassis port (VCP) traffic and can also carry high-priority user traffic.

This topic describes:

- Default Forwarding Classes on page 1873
Default Forwarding Classes

Table 228 on page 1873 shows the four default forwarding classes defined for unicast traffic, and Table 229 on page 1873 shows the three default forwarding classes defined for multicast traffic.

NOTE: The default forwarding classes for multicast traffic are applicable only to EX8200 switches.

You can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. However, because CoS configurations can be quite complicated, we recommend that you avoid altering the default class names or queue number associations.

</tbody>
</table>

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. If you commit such a configuration, the commit fails and a message displays that states the number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that is displayed in the default configuration for a queue number is that of the forwarding class currently associated with that queue.

Understanding CoS Congestion Management

A congestion in a network occurs because of various parameters and some packets must be dropped to avoid congestion and to facilitate easy flow of traffic in the network. On Juniper Networks EX Series Ethernet Switches, class of service (CoS) provides congestion management mechanisms for a switch to drop arriving packets based on certain parameters when a queue is full. Based on the EX Series switch that you are using, packets are dropped depending on the priority of a packet or on both priority and drop probability of a packet.

You can specify parameters at the [edit class-of-service drop-profiles] hierarchy level for dropping packets and reference the parameters in a scheduler configuration.

This topic describes:

- Weighted Tail Drop Congestion Management on page 1875
- Weighted Random Early Detection Congestion Management on page 1876

Weighted Tail Drop Congestion Management

A weighted tail drop (WTD) is a congestion management mechanism for packets to be dropped from the tail of the queue when the queue reaches a certain buffer capacity (that is, the fill level), and hence the name weighted tail drop. The packets that are dropped are based on priority and are those marked with a packet loss priority (PLP) of high. You can configure a WTD profile (a WTD mechanism) usually on edge devices in a network.

**NOTE:** A WTD profile is supported only on the Juniper Networks EX2200, EX3200, EX3300, EX4200, EX4500, EX4550, and EX6200 Ethernet Switches.

When you configure a WTD profile, you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the memory, known as delay-buffer bandwidth, that is used to store packets in relation to the total amount of memory that has been allocated for that specific queue. The delay-buffer bandwidth provides packet buffer space to absorb burst traffic up to the specified duration of delay. When the specified delay buffer becomes full, packets are dropped from the tail of the buffer.

By default, if you do not configure any drop profile, WTD profile is in effect and functions as the primary mechanism for managing congestion.

**NOTE:** The default WTD profile associated with the packets whose PLP is low cannot be modified. You can configure custom drop profile only for those packets whose PLP is high.
Weighted Random Early Detection Congestion Management

In a weighted random early detection (WRED) congestion management mechanism, random packets with a PLP of low or high are gradually dropped (based on drop probability) when the queue reaches a certain buffer capacity (that is, fill level).

NOTE: The WRED mechanism is supported only on Juniper Networks EX4300 standalone switches, EX4300 Virtual Chassis, Juniper Networks EX8200 standalone switches, and EX8200 Virtual Chassis.

Following are the different implementations of WRED:

- Segmented Drop Profile
- Interpolated Drop Profile

From a high level, segmented drop profile is a stair-step-like drop profile, whereas interpolated drop profile is a smoother (curve) drop profile. Figure 23 on page 1877 and Figure 24 on page 1878 show a graphical representation of segmented and interpolated drop profiles. Regardless of the implementation, a drop profile represents a graph where the x-axis represents the percentage of fill level (l) and the y-axis represents the percentage of drop probability (p). The origin (0,0) represents the drop profile in which the drop probability is 0 percent when the queue fullness is 0 percent, and the point (100,100) represents that the drop probability is 100 percent when the queue fullness is 100 percent. Although the formation of graph lines in Figure 23 on page 1877 and Figure 24 on page 1878 is different, the application of the profile is the same. When a packet reaches the head of the queue, a random number between 0 and 100 is calculated. This random number is plotted against the drop profile graph using the current queue fullness of that particular queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped from the network.

The following sections discuss the WRED drop profile implementations and parameters:

- Segmented Drop Profile on page 1876
- Interpolated Drop Profile on page 1877
- Drop Profile Parameters on page 1879

Segmented Drop Profile

In a segmented drop profile configuration, you can define multiple data points for fill level and drop probability. Figure 23 on page 1877 shows a graphical representation of a segmented drop profile.
To create the profile’s graph line, the software begins at the bottom-left corner of the graph, representing a 0 percent fill level and a 0 percent drop probability (that is the point (0,0)). The configuration draws a line directly to the right until it reaches the first defined fill level (that is, 25 percent represented in the graph on the x-axis). The software then continues the line vertically until the first drop probability is reached (that is, 25 percent represented in the graph in the y-axis). This process is repeated for all of the defined fill levels and drop probabilities until the top-right corner of the graph is reached (that is point (100,100) in the graph).

Interpolated Drop Profile

An interpolated drop profile configuration forms a smoother graph line compared to the graph in a segmented drop profile configuration. In this method of congestion management also, a switch uses multiple drop profile values to drop incoming packets to reduce congestion in the output queue.

Following are interpolated drop profile configurations on EX Series switches:

- Interpolated Drop Profile Configuration on EX Series Switches Except EX4300 Switches on page 1877
- Interpolated Drop Profile Configuration on EX4300 Switches on page 1878

Interpolated Drop Profile Configuration on EX Series Switches Except EX4300 Switches

An interpolated drop profile on all EX Series switches except EX4300 switches automatically generates 64 pairs of data points on the graph beginning at (0, 0) and
Figure 24 on page 1878 shows a graphical representation of an interpolated drop profile.

**Figure 24: Graphical Representation of an Interpolated Drop Profile on EX Series Switches Except EX4300 Switches**

**Interpolated Drop Profile Configuration on EX4300 Switches**

On EX4300 switches, you can set two queue fill levels and two drop probabilities in each drop profile. The two fill levels and the two drop probabilities create two pairs of values. The first fill level and the first drop probability create one value pair and the second fill level and the second drop probability create the second value pair.

**NOTE:** You can configure a maximum of 64 drop profiles on EX4300 switches.

The first fill level value specifies the percentage of queue fullness at which packets begin to drop, known as the drop start point. Until the queue reaches this level of fullness, no packets are dropped. The second fill level value specifies the percentage of queue fullness at which all packets are dropped, known as the drop end point.

The first drop probability value is always 0 (zero). This pairs with the drop start point and specifies that until the queue fullness level reaches the first fill level, no packets drop. When the queue fullness exceeds the drop start point, packets begin to drop until the queue exceeds the second fill level, when all packets drop. The second drop probability value, known as the maximum drop rate, specifies the likelihood of dropping packets.
when the queue fullness reaches the drop end point. As the queue fills from the drop start point to the drop end point, packets drop in a smooth, linear pattern (called an interpolated graph) as shown in Figure 25 on page 1879. After the drop end point, all packets drop.

**Figure 25: Tail-Drop Profile Packet Drop on EX4300 Switches**

The thick line in Figure 25 on page 1879 shows the packet drop characteristics for a sample tail drop profile. At the drop start point, the queue reaches a fill level of 30 percent. At the drop end point, the queue fill level reaches 50 percent, and the maximum drop rate is 80 percent.

No packets drop until the queue fill level reaches the drop start point of 30 percent. When the queue reaches the 30 percent fill level, packets begin to drop. As the queue fills, the percentage of packets dropped increases in a linear fashion. When the queue fills to the drop end point of 50 percent, the rate of packet drop has increased to the maximum drop rate of 80 percent. When the queue fill level exceeds the drop end point of 50 percent, all of the packets drop until the queue fill level drops below 50 percent.

**Drop Profile Parameters**

You can specify the following two values in drop profile configuration:

- **Fill level**—The queue fullness value, which represents a percentage of the memory used to store packets in relation to the total amount of memory allocated to the queue.
- **Drop probability**—The percentage value that corresponds to the likelihood that an individual packet is dropped.

**Related Documentation**

Understanding CoS Schedulers

You use class-of-service (CoS) schedulers to define the properties of output queues on Juniper Networks EX Series Ethernet Switches. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues, packet schedulers, and tail drop processes that operate according to this mapping.

This topic describes:

- Default Schedulers on page 1880
- Excess Rate on page 1881
- Transmission Rate on page 1881
- Scheduler Buffer Size on page 1881
- Priority Scheduling on page 1882
- Scheduler Drop-Profile Maps on page 1883
- Scheduler Maps on page 1883

Default Schedulers

Each forwarding class has an associated scheduler priority. On EX Series switches other than Juniper Networks EX8200 and Juniper Networks EX4300 Ethernet Switches, only two forwarding classes—best-effort (queue 0) and network-control (queue 7)—are used in the default configuration. On EX8200 switches three forwarding classes—best-effort (queue 0), multicast best-effort (queue 2), and network-control (queue 7)—are used in the default configuration.

On EX Series switches other than EX8200 and EX4300 switches, by default, the best-effort forwarding class (queue 0) receives 95 percent of the bandwidth and the buffer space for the output link, and the network-control forwarding class (queue 7) receives 5 percent. The default drop profile causes the buffer to fill completely and then to discard all incoming packets until it has free space. On EX8200 switches, by default, the best-effort forwarding class (queue 0) receives 75 percent of the bandwidth, the multicast best-effort forwarding class (queue 2) receives 20 percent, and the network-control forwarding class (queue 7) receives 5 percent of the bandwidth and buffer space for the output link.

On EX4300 switches, four forwarding classes—best-effort (queue 0), multicast best-effort (queue 8), network-control (queue 3), and multicast network-control (queue 11)—are used in the default configuration. By default, all the multicast traffic flows through the multicast best-effort queue. EX4300 switches support 12 queues (0–11), and the default scheduler transmission rates for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively, of the total available bandwidth.

On EX Series switches other than EX4300 switches, the expedited-forwarding (queue 5) and assured-forwarding (queue 1) classes have no scheduler because no resources are
assigned to queue 5 or queue 1, by default. However, you can manually configure resources
to be assigned to the expedited-forwarding and assured-forwarding classes. On EX4300
switches, the expedited-forwarding (queue 1) and assured-forwarding (queue 2) classes
have no scheduler because no resources are assigned to queue 1 or queue 2, by default.
However, you can manually configure resources to be assigned to the
expedited-forwarding and assured-forwarding classes.

Also by default, any queue can exceed the assigned bandwidth if additional bandwidth
is available from other queues. When a forwarding class does not fully use the allocated
transmission bandwidth, the remaining bandwidth can be used by other forwarding
classes if they have a traffic load that exceeds their allocated bandwidth.

**Excess Rate**

Excess rate traffic determines the percentage of the excess bandwidth to share when a
queue receives traffic in excess of its bandwidth allocation. By default, the excess
bandwidth is shared in the ratio of the transmit rates. You can control this distribution
by configuring the `excess-rate` statement at the [edit class-of-service schedulers
scheduler-name] hierarchy. You can specify the excess rate sharing in percentage.

**Transmission Rate**

Transmission-rate control determines the actual traffic bandwidth for each forwarding
class you configure. The transmission rate is specified in bits per second. Each queue is
allocated some portion of the bandwidth of the interface. This bandwidth can be a fixed
value, such as 1 megabit per second (Mbps), a percentage of the total available bandwidth,
or the rest of the available bandwidth. In case of congestion, the configured transmission
rate is guaranteed for the queue. Transmission-rate control allows you to ensure that
each queue receives the bandwidth appropriate for its level of service.

**Scheduler Buffer Size**

To control congestion at the output stage, you can configure the delay-buffer bandwidth
by using the `buffer-size` configuration statement. The delay-buffer bandwidth provides
packet buffer space to absorb burst traffic up to the specified duration of delay. When
the specified delay buffer becomes full, packets with 100 percent drop probability are
dropped from the tail of the buffer.

On EX Series switches other than EX8200 and EX4300 switches, the default scheduler
transmission rates for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent,
respectively, of the total available bandwidth. The default buffer-size percentages for
queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent, respectively, of the total available
buffer. On EX8200 switches, the default scheduler transmission rates for queues 0
through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent, respectively, of the total available
bandwidth, and the default buffer-size percentages for queues 0 through 7 are 75, 0, 20,
0, 0, 0, 0, and 5 percent, respectively, of the total available buffer. On EX4300 switches,
the default scheduler transmission rates for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0,
0, 15, 0, 0 and 5 percent, respectively, of the total available buffer. On EX4300 switches,
the default buffer-size percentages for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15,
0, 0 and 5 percent, respectively, of the total available buffer.
For each scheduler on EX Series switches other than EX8200 switches, you can configure the buffer size as one of the following:

- The exact buffer size.
- A percentage of the total buffer.
- The remaining buffer available. The remainder is the buffer percentage that is not assigned to other queues. For example, if you assign 40 percent of the delay buffer to queue 0, allow queue 2 to keep the default allotment of 20 percent, allow queue 7 to keep the default allotment of 5 percent, and assign the remainder to queue 3, then queue 3 uses 35 percent of the delay buffer.

On EX8200 switches, you can configure the buffer size as a temporal value (in microseconds), percentage of the total buffer, or the remaining buffer available. You can configure the buffer size as a temporal value on Juniper Networks EX4200 and EX4300 Ethernet Switches also.

When you configure buffer size as a temporal value on EX4200 switches, if sufficient buffer size is not available in the shared pool, an error message is logged in the system log (syslog) file and the default profile is applied to the interface. After the temporal buffer space is allocated successfully, if the shared buffer size is less than the current value (which was set using the `set class-of-service shared-buffer percent value` command), the new reduced value must be greater than a sum of the existing reserved temporal buffer size and the required minimum buffer size. Otherwise, the modification to the shared-buffer configuration fails and an error message is logged in the system log.

**Priority Scheduling**

Priority scheduling determines the order in which an interface transmits traffic from queues, thus ensuring that queues containing important traffic are provided faster access.

Priority scheduling is accomplished through a procedure in which the scheduler examines the priority of the queue. Juniper Networks Junos operating system (Junos OS) supports two levels of transmission priority:

- **Low**—The scheduler determines whether the individual queue is within its defined bandwidth profile or not. This binary decision, which is re-evaluated on a regular time cycle, involves comparing the amount of data transmitted by the queue against the bandwidth allocated to it by the scheduler. If the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out of profile when the amount of traffic that it transmits is larger than the queue’s allocated limit. An out-of-profile queue is transmitted only if bandwidth is available. Otherwise, it is buffered.

- **Strict-high**—A strict-high priority queue receives preferential treatment over a low-priority queue. Unlimited bandwidth is assigned to a strict-high priority queue. On EX Series switches other than EX4300 switches, a queue from a set of queues is selected based on the shaped deficit weighted round robin (SDWRR) algorithm, which operates within the set. On EX4300 switches, the weighted deficit round-robin (WDRR) algorithm is used to select a queue from a set of queues.
the queue number, starting with the highest queue, 7, with decreasing priority down through queue 0. Traffic in higher-numbered queues is always scheduled prior to traffic in lower-numbered queues. In other words, if there are two high-priority queues, the queue with the higher queue number is processed first. On EX4300 switches, you can configure multiple strict-high priority queues on an interface and an EX4300 switch processes these queues in a round-robin method.

Packets in low-priority queues are transmitted only when strict-high priority queues are empty.

**Scheduler Drop-Profile Maps**

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type. The inputs for a drop-profile map are the PLP and the protocol type. The output is the drop profile.

**Scheduler Maps**

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map and then associate the scheduler map with an output interface.

On EX Series switches, if you configure more than the supported number of scheduler maps on a switch or for a port group in a line card, an error is logged in the system log. On any interface in a port group on a line card or on a switch, if you configure a scheduler map that causes the number of scheduler maps for that port group to exceed the maximum number supported, the default scheduler map is bound to that interface. We recommend that you check the system log for errors after the commit operation to verify that you have not configured more than the maximum permitted number of scheduler maps.

**NOTE:** On EX Series switches, you cannot configure a scheduler map on an individual interface that is a member of a link aggregation group (LAG). Instead, you must configure the scheduler map on the LAG itself (that is, on the aggregated Ethernet (ae) interface).

Table 230 on page 1883 shows the number of scheduler maps supported for each port group in a switch or line card.

Understanding CoS Two-Color Marking

Networks police traffic by limiting the input or output transmission rate of a class of traffic on the basis of user-defined criteria. Policing traffic allows you to control the maximum rate of traffic sent or received on an interface and to partition a network into multiple priority levels or classes of service.

Policers require you to apply limits to the traffic flow and set a consequence for packets that exceed these limits—usually a higher loss priority, so that packets exceeding the policer limits are discarded first.

Juniper Networks EX Series Ethernet Switches support a single-rate two-color marking type of policer, which is a simplified version of Single-Rate-Three-Color marking, defined in RFC 2697, A Single Rate Three Color Marker. This type of policer meters traffic based on the configured committed information rate (CIR) and committed burst size (CBS).

The single-rate two-color marker meters traffic and marks incoming packets depending on whether they are smaller than the committed burst size (CBS)—marked green—or exceed it—marked red.

The single-rate two-color marking policer operates in color-blind mode. In this mode, the policer's actions are not affected by any previous marking or metering of the examined packets. In other words, the policer is “blind” to any previous coloring a packet might have had.

Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. This topic describes how to use rewrite rules to alter the CoS settings. It covers:

This topic covers:

- How Rewrite Rules Work on page 1887
- Default Rewrite Rule on page 1888

How Rewrite Rules Work

Rewrite rules set the value of the CoS bits within a packet's header. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header. For rewrites to occur, rewrite rules must be explicitly assigned to an interface.
NOTE: On EX4300 switches, you cannot configure a rewrite rule for logical interfaces. Each physical interface in a switch can be logically divided into multiple logical interfaces for moving traffic between those logical interfaces.

On EX Series switches except EX4300 switches, you can define rewrite rules for IPv4 and IPv6 traffic to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), routed VLAN interfaces (RVIs), Layer 3 interfaces, and Layer 3 VLAN-tagged sub-interfaces. Multiple rewrite rules of different types can be assigned to a single interface.

On EX4300 switches, you can define rewrite rules for IPv4 and IPv6 traffic only to network interfaces, aggregated Ethernet interfaces, and Layer 3 interfaces. You cannot define rewrite rules for IPv4 and IPv6 traffic on integrated routing and bridging (IRB) interfaces, Layer 3 logical interfaces, and Layer 3 VLAN-tagged logical interfaces. Multiple rewrite rules of different types cannot be assigned to a single interface. Therefore, you cannot configure DSCP IPv4 and DSCP IPv6 rewrite rules on the same interface. If you configure a DSCP IPv4 rewrite rule on an interface to rewrite IPv4 traffic, then the same rewrite rule is applied to IPv6 traffic also on that interface, and vice versa.

In effect, the rewrite rule performs the reverse function of the behavior aggregate (BA) classifier, which is used when the packet enters the switch. As the packet leaves the switch, the final CoS action is generally the application of a rewrite rule.

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an edge switch to meet the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

NOTE: When an IP precedence rewrite rule is active, bits 3, 4, and 5 of the type-of-service (ToS) byte are always reset to zero when code points are rewritten.

Default Rewrite Rule

To define a rewrite rule on an interface, you can either create your own rewrite rule and enable it on the interface or enable a default rewrite rule. See “Defining CoS Rewrite Rules (CLI Procedure)” on page 1939.

Table 231 on page 1889 shows the default rewrite-rule mappings. These are based on the default bit definitions of Differentiated Services code point (DSCP), IEEE 802.1p, and IP precedence values and the default forwarding classes. You can configure multiple CoS rewrite rules for DSCP, IP precedence and IEEE 802.1p.

NOTE: By default, rewrite rules are not assigned to an interface. You must explicitly assign a user-defined or system-defined rewrite rule to an interface for the rewrites to occur.
When the CoS values of a packet match the forwarding class and packet-loss-priority (PLP) values, the switch rewrites markings on the packet based on the rewrite table.

### Understanding Port Shaping and Queue Shaping for CoS on EX Series Switches

When the amount of traffic on a switch's network exceeds the maximum bandwidth, packets are lost because of congestion in the network. The excess traffic in the network must be handled carefully to ensure minimum or no data loss in the network. A class-of-service (CoS) configuration includes several parameters that classify traffic into different queues and also define packet loss priorities (PLPs) to ensure smooth transmission of data in the network. You can use these configuration parameters to control or shape traffic for a specific port on a switch or for a specific CoS queue. While port shaping defines the maximum bandwidth allocated to an interface, queue shaping defines a limit on excess-bandwidth usage for each queue.

This topic covers:
- Port Shaping on page 1890
- Queue Shaping on page 1890
Port Shaping

Port shaping enables you to shape the aggregate traffic through a port or channel to a rate that is less than the line rate. You can configure interfaces to shape traffic based on the rate-limited bandwidth of the total interface bandwidth. This allows you to shape the output of the interface so that the interface transmits less traffic than it is capable of transmitting. For port shaping, you can specify shaping rate as the peak rate at which traffic can pass through the interface. You can specify rate as a value in bits per second (bps) either as a decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000) and the value can range from 1000 through 160,000,000,000 bps.

By default, shaping is not configured on an interface. If you do not configure a shaping rate on an interface, the default shaping rate is 100 percent, which is the equivalent to no shaping configured for that interface.

On EX Series switches except EX4300 switches, when you configure a shaping rate on an aggregated Ethernet (ae) interface, all members of the ae interface are shaped at the configured shaping rate. For example, consider an interface ae0 that consists of three interfaces: ge-0/0/0, ge-0/0/1, and ge-0/0/2. If a shaping rate of X Mpbs is configured on ae0, traffic at the rate of X Mpbs flows through each of the three interfaces. Therefore, the total traffic flowing through ae0 would be at the rate of 3X Mbps. On EX4300 switches, when you configure a shaping rate on an ae interface, the traffic is equally divided among the members of the ae interface.

Queue Shaping

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-priority queue so that the strict-priority queue does not lock out (or starve) low-priority queues. Similarly, for any queue, you can configure queue shaping.

You can specify queue shaping as the maximum rate at which traffic can pass through the queue or as a percentage of the available bandwidth. On EX Series switches except EX4300 switches, you can specify the rate as a value between 3200 and 160,000,000,000 bps and the percentage as a value from 0 to 100 percent. On EX4300 switches, you can specify the rate as a value between 8000 and 160,000,000,000 bps and the percentage as a value from 0 to 100 percent.

Understanding Junos OS EZQoS for CoS Configurations on EX Series Switches

Junos operating system (Junos OS) EZQoS on Juniper Networks EX Series Ethernet Switches eliminates the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

Junos OS CoS allows you to divide traffic into classes and offer various levels of throughput and packet loss when congestion occurs. You can use CoS to ensure that different types
of traffic (voice, video, and data) get the bandwidth and consideration they need to meet user expectations and business objectives.

Configuring CoS requires careful consideration of your service needs and thorough planning and design to ensure consistency across all switches in a CoS domain. To configure CoS manually, you must define and fine-tune all CoS components such as classifiers, rewrite rules, forwarding classes, schedulers, and scheduler-maps and then apply these components to the interfaces. Therefore, configuring CoS can be a fairly complex and time-consuming task.

EZQoS works by automatically assigning preconfigured values to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name. You can change the preconfigured values of these parameters to suit your particular application needs.

For using EZQoS, you must identify which switch ports are being used for a specific application (such as VoIP, video, and data) and manually apply the corresponding application-specific EZQoS template to these switch ports.

**NOTE:** Currently, we provide an EZQoS template for configuring CoS for VoIP.

**NOTE:** We recommend that you do not use the term EZQoS for defining a classifier.

**Understanding CoS Queues on EX8200 Line Cards That Include Oversubscribed Ports**

Some line cards available for Juniper Networks EX8200 Ethernet Switches include oversubscribed ports that are combined in logical port groups that share bandwidth. These oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth. You might need to configure CoS queues differently for oversubscribed ports than for line-rate ports.

This topic describes:

- Oversubscribed Ports on Line Cards on page 1891
- EX8200 Line Cards That Include Oversubscribed Ports on page 1892
- Ingress Queueing on page 1892
- Egress Queues on page 1894

**Oversubscribed Ports on Line Cards**

Oversubscribed ports on a line card are grouped into logical port groups. A port group collectively supports a certain bandwidth.
An EX8200 switch supports different line cards that provide line-rate and oversubscribed ports. Based on your requirement, you can choose the appropriate line card for an EX8200 switch. Line cards are field-replaceable units (FRUs) that can be installed in the line card slots in an EX8200 switch. In a line-rate EX8200 line card, each port in the line card supports the same amount of bandwidth and a single port can utilize that complete bandwidth. In an oversubscribed line card, a group of ports collectively support a certain total bandwidth and each port in that group can use either a portion or all of the available bandwidth. However, the total utilization of bandwidth by the ports in the group cannot exceed the bandwidth available for that group.

Because the port groups share bandwidth, class-of-service (CoS) ingress and egress queues are handled differently for these shared-bandwidth ports in logical port groups than they are for ports that individually support line-rate bandwidth. Some EX8200 line cards combine both port types, those that share bandwidth across port groups and those that individually support line-rate bandwidth.

**EX8200 Line Cards That Include Oversubscribed Ports**

Table 232 on page 1892 lists EX8200 line cards that include oversubscribed ports in logical port groups.

</tbody>
</table>

**Ingress Queueing**

Classification of packets occurs in two phases for the oversubscribed ports in the port groups.

- Preclassification of Packets and Port Ingress Queueing on page 1893
- Full Classification of Packets and Fabric Ingress Queueing on page 1893
**Preclassification of Packets and Port Ingress Queuing**

Packets entering ports are forwarded to one of the ingress queues. The ingress queues schedule traffic from ports into the Packet Forwarding Engine.

The ingress queues are:

- **Low-priority queue**—Each interface in the line card has one low-priority queue. Traffic on these queues is scheduled using the shaped deficit weighted round-robin (SDWRR) algorithm, with each interface's queue having equal weight. On EX4300 switches, traffic is queued using the weighted deficit round-robin (WDRR) algorithm.

- **High-priority queue**—A set of interfaces in the line card shares a single high-priority queue. Traffic on this queue is scheduled by strict-high priority. The switch always sends critical network control packets on the high-priority queue.

- **Line-rate priority queue**—The packets entering line-rate ports are forwarded to this queue. Traffic on this queue is scheduled by strict priority and is always given higher priority than the traffic on the high-priority queue. This queue is used only in the following oversubscribed lines cards for an EX8200 switch:
  - EX8200-2XS-40P
  - EX8200-2XS-40T

For the purpose of port ingress queuing on oversubscribed ports, packets are classified only by behavior aggregate (BA) classification. To control the ingress queue (high priority or low priority) to which packets are sent, configure a BA classifier on the physical port and specify switch fabric priorities for the forwarding classes. On EX8200 switches, fabric priority determines the priority of packets ingressing the switch fabric. For the EX8200-40XS line card, fabric priority also determines the priority of packets ingressing the port group.

By default, the fabric priority for all forwarding classes is low. To direct packets belonging to a forwarding class to the high-priority ingress queue, set the fabric priority to high for that class.

Critical network-control packets and line-rate packets are handled differently from other packets. Instead of using the BA classifier to classify critical network-control packets, the switch always sends critical network packets to the high-priority queue. The line-rate packets are always sent to the line-rate priority queue. This difference in handling of network-control packets and line-rate packets ensures that these packets are not dropped because of congestion on the shared-bandwidth ports.

**Full Classification of Packets and Fabric Ingress Queuing**

When packets (apart from line-rate and critical network-control packets) from an oversubscribed port reach the Packet Forwarding Engine, it performs full packet classification, along with other actions, such as multifield (MF) classification, traffic policing, and storm control. It then schedules and queues the packets for ingressing the fabric. The fabric priority associated with the forwarding class determines whether packets are sent to the low priority or high-priority ingress queues.
Egress Queues

On EX Series switches except EX4300 switches, each interface supports eight egress CoS queues. You can map up to 16 forwarding classes to these queues. An EX4300 switch interface supports 12 egress CoS queues.

In the EX8200–40XS line card, all interfaces in a port group share a single set of eight egress queues at the Packet Forwarding Engine. Egress traffic is fanned out from the Packet Forwarding Engine queues to the corresponding queues for the individual ports. For this reason, the interfaces in a port group must share the same scheduler map configuration. If you configure different scheduler map configurations for the different interfaces in a port group, an error is logged in the system log and the default scheduler map is used for all ports in the port group.

- Configuration Statements on page 1946

Configuration Examples

- Example: Configuring CoS on EX Series Switches on page 1895

Example: Configuring CoS on EX Series Switches

Configure class of service (CoS) on your switch to manage traffic so that when the network experiences congestion and delay, critical applications are protected. Using CoS, you can divide traffic on your switch into classes and provide various levels of throughput and packet loss. This is especially important for traffic that is sensitive to jitter and delay, such as voice traffic.

This example shows how to configure CoS on a single EX Series switch in the network.

- Requirements on page 1895

- Configuration on page 1898
- Verification on page 1908

Requirements

This example uses the following hardware and software components:

- EX3200, EX4200, or EX4300 switches
- Junos OS Release 9.0 or later for EX Series switches

Overview and Topology

This example uses the topology shown in Figure 26 on page 1896.
The topology for this configuration example consists of EX3200 and EX4200 switches at the access layer.

The EX Series access switch is configured to support VLAN membership. Interfaces ge-0/0/0 and ge-0/0/1 are assigned to the voice VLAN (voice-vlan) for two VoIP phones. Switch port ge-0/0/2 is assigned to the camera VLAN (camera-vlan) for the surveillance camera. Switch ports ge-0/0/3, ge-0/0/4, ge-0/0/5, and ge-0/0/6 are assigned to the server VLAN (server-vlan) for the servers hosting various applications such as those provided by Citrix, Microsoft, Oracle, and SAP.

Table 233 on page 1897 shows the VLAN configuration components.
Table 233: Configuration Components: VLANs

<table>
<thead>
<tr>
<th>VLAN Name</th>
<th>VLAN ID</th>
<th>VLAN Subnet and Available IP Addresses</th>
<th>VLAN Description</th>
</tr>
</thead>
</table>
| voice-vlan | 10      | 192.168.1.0/32
192.168.1.1 through 192.168.1.11
192.168.1.12 is the subnet’s broadcast address. | Voice VLAN used for employee VoIP communication. |
| camera-vlan| 20      | 192.168.1.13/32
192.168.1.14 through 192.168.1.20
192.168.1.21 is the subnet’s broadcast address. | VLAN for the surveillance cameras. |
| server-vlan| 30      | 192.168.1.22/32
192.168.1.23 through 192.168.1.35
192.168.1.36 is the subnet’s broadcast address. | VLAN for the servers hosting enterprise applications. |

PoE-capable ports on EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. Table 234 on page 1897 shows the switch interfaces that are assigned to the VLANs and the IP addresses for devices connected to the switch ports on a 48-port switch, all ports of which are PoE-capable.

Table 234: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

<table>
<thead>
<tr>
<th>Interfaces</th>
<th>VLAN Membership</th>
<th>IP Addresses</th>
<th>Port Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/0, ge-0/0/1</td>
<td>voice-vlan</td>
<td>192.168.1.1 through 192.168.1.2</td>
<td>Two VoIP telephones.</td>
</tr>
<tr>
<td>ge-0/0/2</td>
<td>camera-vlan</td>
<td>192.168.1.14</td>
<td>Surveillance camera.</td>
</tr>
<tr>
<td>ge-0/0/3, ge-0/0/4, ge-0/0/5, ge-0/0/6</td>
<td>server-vlan</td>
<td>192.168.1.23 through 192.168.1.26</td>
<td>Four servers hosting applications such as those provided by Citrix, Microsoft, Oracle, and SAP.</td>
</tr>
</tbody>
</table>

**NOTE:** This example shows how to configure CoS on a standalone EX Series switch. This example does not consider across-the-network applications of CoS in which you might implement different configurations on ingress and egress switches to provide differentiated treatment to different classes across a set of nodes in a network.
To quickly configure CoS, copy the following commands and paste them into the switch terminal window:

```
[edit]
set class-of-service forwarding-classes class app queue-num 5
set class-of-service forwarding-classes class mail queue-num 1
set class-of-service forwarding-classes class db queue-num 2
set class-of-service forwarding-classes class erp queue-num 3
set class-of-service forwarding-classes class video queue-num 4

set class-of-service schedulers voice-sched-queue-shap shaping-rate 30m
Step-by-Step Procedure

To configure and apply CoS:

1. Configure one-to-one mappings between eight forwarding classes and eight queues:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class app queue-num 5
   user@switch# set forwarding-classes class mail queue-num 1
   user@switch# set forwarding-classes class db queue-num 2
   user@switch# set forwarding-classes class erp queue-num 3
   user@switch# set forwarding-classes class video queue-num 4
   user@switch# set forwarding-classes class best-effort queue-num 0
   user@switch# set forwarding-classes class voice queue-num 6
   user@switch# set forwarding-classes class network-control queue-num 7
   ```

2. Define the firewall filter `voip_class` to classify the VoIP traffic:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter voip_class
   ```

3. Define the term `voip`:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter voip_class term voip from source-address 192.168.1.1/32
   user@switch# set family ethernet-switching filter voip_class term voip from source-address 192.168.1.2/32
   ```

4. Define the term `network_control` (for the `voip_class` filter):

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter voip_class term network_control from precedence [net-control internet-control]
   user@switch# set family ethernet-switching filter voip_class term network_control then forwarding-class network-control loss-priority low
   ```

5. Define the term `best_effort_traffic` with no match conditions (for the `voip_class` filter):

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter voip_class term best_effort_traffic then forwarding-class best-effort loss-priority low
   ```

6. Apply the firewall filter `voip_class` as an input filter to the interfaces for the VoIP phones:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0 description phone1-voip-ingress-port
   user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input voip_class
   user@switch# set ge-0/0/1 description phone2-voip-ingress-port
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input voip_class
   ```

7. Apply port shaping on the interface ge-0/0/0:

   ```
   [edit]
   user@switch# set class-of-service interfaces ge-0/0/0 shaping-rate 100m
   ```

8. Define the firewall filter `video_class` to classify the video traffic:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter video_class
   ```
9. Define the term video:

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term video from source-address 192.168.1.14/32
user@switch# set family ethernet-switching filter video_class term video protocol udp
user@switch# set family ethernet-switching filter video_class term video source-port 2979
user@switch# set family ethernet-switching filter video_class term video then forwarding-class video loss-priority low
```

10. Define the term network_control (for the video_class filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term network_control from precedence [net-control internet-control]
user@switch# set family ethernet-switching filter video_class term network_control then forwarding-class network-control loss-priority low
```

11. Define the term best_effort_traffic with no match conditions (for the video_class filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term best_effort_traffic then forwarding-class best-effort loss-priority low
```

12. Apply the firewall filter video_class as an input filter to the interface for the surveillance camera:

```
[edit interfaces]
user@switch# set ge-0/0/2 description video-ingress-port
user@switch# set ge-0/0/2 unit 0 family ethernet-switching filter input video_class
```

13. Define the firewall filter app_class to classify the application server traffic:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class
```

14. Define the term app (for the app_class filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term app from source-address 192.168.1.23/32
user@switch# set family ethernet-switching filter app_class term app protocol tcp
user@switch# set family ethernet-switching filter app_class term app source-port [1494 2512 2513 2598 2897]
user@switch# set family ethernet-switching filter app_class term app then forwarding-class app loss-priority low
```

15. Define the term mail (for the app_class filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term mail from source-address 192.168.1.24/32
user@switch# set family ethernet-switching filter app_class term mail protocol tcp
user@switch# set family ethernet-switching filter app_class term mail source-port [25 143 389 691 993 3268 3269]
user@switch# set family ethernet-switching filter app_class term mail then forwarding-class mail loss-priority low
```

16. Define the term db (for the app_class filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term db from source-address 192.168.1.25/32
user@switch# set family ethernet-switching filter app_class term db protocol tcp
user@switch# set family ethernet-switching filter app_class term db source-port [1521 1525 1527 1571 1810 2481]
```
17. Define the term **erp** (for the **app_class** filter):

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter app_class term erp from source-address 192.168.1.26/32
   user@switch# set family ethernet-switching filter app_class term erp protocol tcp
   user@switch# set family ethernet-switching filter app_class term erp source-port [3200 3300 3301 3600]
   user@switch# set family ethernet-switching filter app_class term erp then forwarding-class erp loss-priority low
   ```

18. Define the term **network_control** (for the **app_class** filter):

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter app_class term network_control from precedence [net-control internet-control]
   user@switch# set family ethernet-switching filter app_class term network_control then forwarding-class network-control loss-priority low
   ```

19. Define the term **best_effort_traffic** (for the **app_class** filter):

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter app_class term best_effort_traffic then forwarding-class best-effort loss-priority low
   ```

20. Apply the firewall filter **app_class** as an input filter to the interfaces for the servers hosting applications:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/3 unit 0 family ethernet-switching filter input app_class
   user@switch# set ge-0/0/4 unit 0 family ethernet-switching filter input app_class
   user@switch# set ge-0/0/5 unit 0 family ethernet-switching filter input app_class
   user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input app_class
   ```

21. Configure schedulers:

   ```
   [edit class-of-service]
   user@switch# set schedulers voice-sched buffer-size percent 10
   user@switch# set schedulers voice-sched priority strict-high
   user@switch# set schedulers voice-sched transmit-rate percent 10
   user@switch# set schedulers video-sched buffer-size percent 15
   user@switch# set schedulers video-sched priority low
   user@switch# set schedulers video-sched transmit-rate percent 15
   user@switch# set schedulers app-sched buffer-size percent 10
   user@switch# set schedulers app-sched priority low
   user@switch# set schedulers app-sched transmit-rate percent 10
   user@switch# set schedulers mail-sched buffer-size percent 5
   user@switch# set schedulers mail-sched priority low
   user@switch# set schedulers mail-sched transmit-rate percent 5
   user@switch# set schedulers db-sched buffer-size percent 10
   user@switch# set schedulers db-sched priority low
   user@switch# set schedulers db-sched transmit-rate percent 10
   user@switch# set schedulers erp-sched buffer-size percent 10
   user@switch# set schedulers erp-sched priority low
   user@switch# set schedulers erp-sched transmit-rate percent 10
   user@switch# set schedulers nc-sched buffer-size percent 5
   user@switch# set schedulers nc-sched priority strict-high
   user@switch# set schedulers nc-sched transmit-rate percent 5
   user@switch# set schedulers be-sched buffer-size percent 35
   user@switch# set schedulers be-sched priority low
   user@switch# set schedulers be-sched transmit-rate percent 35
   ```
22. Assign the forwarding classes to schedulers with the scheduler map ethernet-cos-map:

```
[edit class-of-service]
user@switch# set scheduler-map ethernet-cos-map forwarding-class voice scheduler voice-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class video scheduler video-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class app scheduler app-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class mail scheduler mail-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class db scheduler db-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class erp scheduler erp-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class network-control scheduler nc-sched
user@switch# set scheduler-map ethernet-cos-map forwarding-class best-effort scheduler be-sched
```

23. Associate the scheduler map with the outgoing interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
```

24. Apply queue shaping for the best-effort queue:

```
[edit]
user@switch# set class-of-service schedulers voice-sched queue-shap shap shaping-rate 30m
user@switch# set class-of-service scheduler-maps sched-map be forwarding-class
user@switch# set class-of-service interfaces ge-0/0/2 scheduler-map sched-map be
```

**Results**

Display the results of the configuration:

```

Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues

Purpose

Verify that the forwarding classes **app**, **best-effort**, **db**, **erp**, **mail**, **network-control**, **video**, and **voice** have been defined and mapped to queues.
### Action

<table>
<thead>
<tr>
<th>Forwarding class</th>
<th>ID</th>
<th>Queue</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>db</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>erp</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>best-effort</td>
<td>3</td>
<td>0</td>
</tr>
<tr>
<td>mail</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>voice</td>

<td>4</td>
</tr>
<tr>
<td>network-control</td>
<td>7</td>
<td>7</td>
</tr>
</tbody>
</table>

### Meaning

This output shows that the forwarding classes have been defined and mapped to appropriate queues.

### Verifying That the Forwarding Classes Have Been Assigned to Schedulers

### Purpose

Verify that the forwarding classes have been assigned to schedulers.
Action 

user@switch> show class-of-service scheduler-map
Scheduler map: ethernet-cos-map, Index: 2
Scheduler: voice-sched, Forwarding class: voice, Index: 22
  Transmit rate: 5 percent, Rate Limit: none, Buffer size: 15 percent,
  Priority: Strict-high
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: video-sched, Forwarding class: video, Index: 22
  Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
  Priority: low
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: app-sched, Forwarding class: app, Index: 22
  Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
  Priority: low
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: mail-sched, Forwarding class: mail, Index: 22
  Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
  Priority: low
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: db-sched, Forwarding class: db, Index: 22
  Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
  Priority: low
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: erp-sched, Forwarding class: erp, Index: 22
  Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
  Priority: low
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: be-sched, Forwarding class: best-effort, Index: 20
  Transmit rate: 35 percent, Rate Limit: none, Buffer size: 35 percent,
  Priority: low
  Drop profiles:
    Loss priority Protocol  Index    Name
    High          non-TCP      1    <default-drop-profile>
    High          TCP          1    <default-drop-profile>
Scheduler: nc-sched, Forwarding class: network-control, Index: 22
  Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
Meaning  This output shows that the forwarding classes have been assigned to schedulers.

Verifying That the Scheduler Map Has Been Applied to the Interface

Purpose  Verify that the scheduler map has been applied to the interface.

Action  
user@switch> show class-of-service interface
...  
Physical interface: ge-0/0/20, Index: 149
Queues supported: 8, Queues in use: 8
  Scheduler map: ethernet-cos-map, Index: 43366
  Input scheduler map: <default>, Index: 3
...

Meaning  This output shows that the scheduler map (ethernet-cos-map) has been applied to the interface (ge-0/0/20).

Verifying That Port Shaping Has Been Applied

Purpose  Verify that the port shaping has been applied to an interface.

Action  Following is the output before port shaping is applied to the interface ge-0/0/0, when there is egress traffic of 400 Mpbps exiting on that interface:

user@switch> show interfaces ge-0/0/0 extensive
Physical interface: ge-0/0/0, Enabled, Physical link is Up
  Interface index: 239, SNMP ifIndex: 548, Generation: 242
  Device flags  : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags    : None
  CoS queues    : 8 supported, 8 maximum usable queues
  Hold-times    : Up 0 ms, Down 0 ms
  Current address: 00:23:9c:0b:ae:8d, Hardware address: 00:23:9c:0b:ae:8d
  Last flapped  : 2012-07-07 03:21:52 UTC (1d 18:02 ago)

Interface transmit statistics: Disabled

Logical interface ge-1/0/10.0 (Index 69) (SNMP ifIndex 638) (Generation 138)
Flags: SNMP-Traps 0x0 Encapsulation: ENET2
Traffic statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Transit statistics:
Input bytes : 0
Output bytes : 0
          0 bps
Meaning

In the output for the `show interfaces ge-0/0/0 statistics` command, the Traffic statistics: field shows that egress traffic is ~100 Mbps (100,223,104 bps). The output for the `show class-of-service interface ge-0/0/0` command shows that the shaping rate is 100,000,000 bps, which indicates that a port shaping of 100 Mbps is applied to the ge-0/0/0 interface.

**Verifying That Queue Shaping Has Been Applied**

**Purpose**

Verify that the queue shaping has been applied to the best-effort queue.

**Action**

Following is the output before queue shaping is applied to the best-effort queue when there is egress traffic of 400 Mbps exiting on that interface:

```bash
user@switch> show interfaces ge-0/0/2 extensive
Physical interface: ge-0/0/2, Enabled, Physical link is Up
   Interface index: 239, SNMP ifIndex: 548, Generation: 242
   Media type: Copper
   Device flags   : Present Running
   Interface flags: SNMP-Traps Internal: 0x0
   Link flags     : None
   CoS queues     : 8 supported, 8 maximum usable queues
   Hold-times     : Up 0 ms, Down 0 ms

</tbody>
</table>

**Meaning**

In the output for the `show interfaces ge-0/0/2 statistics` command, the Traffic statistics: field shows that the egress traffic is ~30 Mbps (30,097,712 bps). The output for the `show class-of-service scheduler-map sched-map-be` command, shows that a shaping rate of 30,000,000 bps (that is 30 Mbps) is applied to the best-effort queue.

Configuring CoS (J-Web Procedure)

The Class of Service Configuration pages allow you to configure the Junos CoS components. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue. After defining the CoS components you must assign classifiers to the required physical and logical interfaces.

Using the Class of Service Configuration pages, you can configure various CoS components individually or in combination to define particular CoS services.

To configure CoS components:

1. In the J-Web interface, select **Configure>Class of Service**.
2. On the Class of Service Configuration page, select one of the following options depending on the CoS component that you want to define. Enter information into the pages as described in the respective table:
   - To define or edit CoS value aliases, select **CoS Value Aliases**.
   - To define or edit forwarding classes and assign queues, select **Forwarding Classes**.
   - To define or edit classifiers, select **Classifiers**.
   - To define or edit rewrite rules, select **Rewrite Rules**.
   - To define or edit schedulers, select **Schedulers**.
   - To define or edit virtual channel groups, select **Interface Associations**.
3. Click **Apply** after completing configuration on any Configuration page.

- Assigning CoS Components to Interfaces (J-Web Procedure) on page 1942
You can use code-point aliases to streamline the process of configuring CoS features on your EX Series switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- **dscp** and **dscp-ipv6**—Handles incoming IPv4 and IPv6 packets, respectively.
- **ieee-802.1**—Handles Layer 2 CoS.
- **inet-precedence**—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

To configure a code-point alias for a specified CoS marker type (**dscp**), assign an alias (**my1**) to the code-point (**110001**):

```
[edit class-of-service code-point-aliases]
user@switch# set dscp my1 110001
```

The **my1** alias will be applicable for incoming IPv4 packets.

### Defining CoS Code-Point Aliases (J-Web Procedure)

You can use the J-Web interface to define CoS code-point aliases on an EX Series switch. By defining aliases you can assign meaningful names to a particular set of bit values and refer to them when configuring CoS components.

To define CoS code-point aliases:

1. Select **Configure > Class of Service > CoS Value Aliases**.

```
NOTE: After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.
```

2. Click one of the following options:

   - **Add**—Adds a code-point alias. Enter information into the code point alias page as described in Table 235 on page 1922.
- **Edit**—Modifies an existing code-point alias. Enter information into the code point alias page as described in Table 235 on page 1922.
- **Delete**—Deletes an existing code-point alias.

Table 235 on page 1922 describes the related fields.

### Table 235: CoS Value Aliases Configuration Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code point name</td>
<td>Specifies the name for a code-point—for example, af11 or be.</td>
<td>Enter a name.</td>
</tr>
<tr>
<td>Code point type</td>
<td>Specifies a code-point type. The code-point type can be DSCP or IP precedence.</td>
<td>Select a value.</td>
</tr>
</tbody>
</table>
| Code point value bits | Specifies the CoS value for which an alias is defined. Changing this value alters the behavior of all classifiers that refer to this alias. | To specify a CoS value, type it in the appropriate format:

- For DSCP CoS values, use the format xxxxxx, where x is 1 or 0—for example, 101110.
- For IP precedence CoS values, use the format xxx, where x is 1 or 0—for example, 111.

### Related Documentation

- Example: Configuring CoS on EX Series Switches on page 1895
Defining CoS Classifiers (CLI Procedure)

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- **Behavior aggregate (BA) classifier**—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, or IEEE 802.1p value. EX Series switches except EX4300 switches support two types of loss priorities: high and low. EX4300 switches support four types of loss priorities: high, medium-high, low, and medium-low.

You can configure BA classifiers for the following CoS marker types:

- **dscp** and **dscp-ipv6**—Handles incoming IPv4 and IPv6 packets, respectively.
- **ieee-802.1**—Handles Layer 2 CoS.
- **inet-precedence**—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

- **Multifield (MF) classifier**—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

**NOTE:** Juniper Networks EX8200 Ethernet Switches implement the on-demand ternary content addressable memory (TCAM) allocation of memory so that when additional TCAM space is required for CoS, the space is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers beyond the available TCAM space that includes both the free and unused space.

The following example describes how to configure a BA classifier (**ba-classifier**) as the default DSCP map for handling IPv4 traffic and to apply the BA classifier to either a specific Gigabit Ethernet interface or to all the Gigabit Ethernet interfaces on the switch. The BA classifier assigns loss priorities, as shown in Table 236 on page 1923, to incoming packets in the four forwarding classes.

You can use the same procedure to set MF classifiers (except that you would use firewall filter rules).

**Table 236: BA-classifier Loss Priority Assignments**

<table>
<thead>
<tr>
<th>Forwarding Class</th>
<th>For CoS Traffic Type</th>
<th>ba-classifier Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>be</td>
<td>Best-effort traffic</td>
<td>High-priority code point: 000001</td>
</tr>
</tbody>
</table>
### Table 236: BA-classifier Loss Priority Assignments (continued)

<table>
<thead>
<tr>
<th>Code Point</th>
<th>Traffic Type</th>
<th>High-priority Code Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>ef</td>
<td>Expedited-forwarding traffic</td>
<td>101110</td>
</tr>
<tr>
<td>af</td>
<td>Assured-forwarding traffic</td>
<td>001100</td>
</tr>
<tr>
<td>nc</td>
<td>Network-control traffic</td>
<td>110001</td>
</tr>
</tbody>
</table>

To configure a DSCP BA classifier named `ba-classifier` as the default DSCP map:

- Associate code point `000001` with forwarding class `be` and loss priority `high`:

  ```
  [edit class-of-service classifiers]
  user@switch# set dscp ba-classifier import default forwarding-class be loss-priority high code-points 000001
  ```

- Associate code point `101110` with forwarding class `ef` and loss priority `high`:

  ```
  [edit class-of-service classifiers]
  user@switch# set dscp ba-classifier forwarding-class ef loss-priority high code-points 101110
  ```

- Associate code point `001100` with forwarding class `af` and loss priority `high`:

  ```
  [edit class-of-service classifiers]
  user@switch# set dscp ba-classifier forwarding-class af loss-priority high code-points 001100
  ```

- Associate code point `110001` with forwarding class `nc` and loss priority `high`:

  ```
  [edit class-of-service classifiers]
  user@switch# set dscp ba-classifier forwarding-class nc loss-priority high code-points 110001
  ```

- Apply the classifier to a specific interface or to all Gigabit Ethernet interfaces on the switch.

  ```
  To apply the classifier to a specific interface:
  ```

  ```
  [edit class-of-service interfaces]
  user@switch# set ge-0/0/0 unit 0 classifiers dscp ba-classifier
  ```

  ```
  To apply the classifier to all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:
  ```

  ```
  [edit class-of-service interfaces]
  user@switch# set ge-* unit * classifiers dscp ba-classifier
  ```

---

**NOTE:** On EX8200 switches, it can take a long time to install code-point classifiers on multiple interfaces (for example, approximately 25 minutes to install 64 code-point classifiers on multiple interfaces in the order of 280 or more).
Defining CoS Classifiers (J-Web Procedure)

You can use the J-Web interface to define CoS classifiers on an EX Series switch. Classifiers examine the CoS value or alias of an incoming packet and assign the packet a level of service by setting its forwarding class and loss priority.

To define CoS classifiers:

1. Select **Configure > Class of Service > Classifiers**.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Adds a classifier. Enter information into the classifier page as described in Table 237 on page 1925.
   - **Edit**—Modifies an existing classifier. Enter information into the classifier page as described in Table 237 on page 1925.
   - **Delete**—Deletes an existing classifier.

### Table 237: Classifiers Configuration Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classifier Name</td>
<td>Specifies the name for a classifier.</td>
<td>To name a classifier, type the name—for example, <em>ba-classifier</em>.</td>

</table>
| Code Point Mapping     | Sets the forwarding classes and the packet loss priorities (PLPs) for specific CoS values and aliases. | To add a code point mapping:  
1. Click **Add**.  
2. Select the code point.  
3. Select a forwarding class from the following list:  
   - **expedited-forwarding**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped.  
   - **best-effort**—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined.  
   - **assured-forwarding**—Provides high assurance for packets within the specified service profile. Excess packets are dropped.  
   - **network-control**—Packets can be delayed but not dropped.  
4. Select the loss priority.  
   To assign a loss priority, select one:  
   - **high**—Packet has a high loss priority.  
   - **low**—Packet has a low loss priority. |

### Related Documentation

- Example: Configuring CoS on EX Series Switches on page 1895  
- Monitoring CoS Classifiers on page 1975  
- Understanding CoS Classifiers
Defining CoS Forwarding Classes (CLI Procedure)

Forwarding classes allow you to group packets for transmission. Based on forwarding classes, you assign packets to output queues.

By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and network control. EX Series switches support up to 16 forwarding classes.

You can configure forwarding classes in one of the following ways:

- Using `class` statement—You can configure up to 16 forwarding classes and you can map multiple forwarding classes to single queue.
- Using `queue` statement—You can configure up to 8 forwarding classes and you can map one forwarding class to one queue.

This example uses the `class` statement to configure forwarding classes.

To configure CoS forwarding classes, map the forwarding classes to queues:

```
[edit class-of-service forwarding-classes]
user@switch# set class be queue=num 0
user@switch# set class ef queue=num 1
user@switch# set class af queue=num 2
user@switch# set class nc queue=num 3
user@switch# set class efi queue=num 4
user@switch# set class ef2 queue=num 5
user@switch# set class af1 queue=num 6
user@switch# set class nc1 queue=num 7
```

Defining CoS Forwarding Classes (J-Web Procedure)

You can define CoS forwarding classes on an EX Series switch using the J-Web interface. Assigning a forwarding class to a queue number affects the scheduling and marking of a packet as it transits a switch.

To define forwarding classes:

1. Select **Configure > Class of Service > Forwarding Classes.**
NOTE: After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Adds a forwarding class. Enter information into the forwarding class page as described in Table 238 on page 1928.
   - **Edit**—Modifies an existing forwarding class. Enter information into the forwarding class page as described in Table 238 on page 1928.
   - **Delete**—Deletes an existing forwarding class.

Table 238: Forwarding Classes Configuration Fields

Understanding CoS Forwarding Classes

Defining CoS Schedulers and Scheduler Maps (CLI Procedure)

You use schedulers to define the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues and packet schedulers that operate according to this mapping.

NOTE: On EX Series switches, you cannot configure a scheduler map on an individual interface that is a member of a link aggregation group (LAG). Instead, you must configure the scheduler map on the LAG itself (that is, on the aggregated Ethernet (ae) interface).

You can associate up to four user-defined scheduler maps with an interface.

This topic describes:

- Configuring a Scheduler and a Scheduler Map on page 1929
- Assigning a Scheduler Map to Interfaces on page 1930
- Assigning Scheduler Maps to Interfaces on EX8200 Line Cards That Include Oversubscribed Ports on page 1930

Configuring a Scheduler and a Scheduler Map

You can define the properties for an output queue by configuring a scheduler. You can then define a scheduler map to associate a forwarding class with a scheduler.

To configure a scheduler and a scheduler map:

1. Create a scheduler, and assign one or more output queue properties to it:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name output-queue-properties
```

For various properties that you can define for an output queue, see the schedulers hierarchy.

2. Configure a scheduler map that associates the scheduler with the forwarding class:

```
[edit class-of-service]
user@switch# set scheduler-maps map-name forwarding-class class-name scheduler scheduler-name
```
Assigning a Scheduler Map to Interfaces

After defining a scheduler map, you can assign the scheduler map to one or more interfaces. You can also assign the scheduler map to multiple interfaces by using a wildcard representation of the interface or Virtual Chassis Ports (VCPs).

Following are sample syntaxes and examples for assigning a scheduler map to a single or to multiple interfaces:

- To assign the scheduler map to one interface:

  ```
  [edit class-of-service interfaces]
  user@switch# set interface-name scheduler-map map-name
  ```

- To assign the scheduler map to more than one interface, you can use a wildcard representation of the interface:

  ```
  [edit class-of-service interfaces]
  user@switch# set wild-card-representation-of-interface-name scheduler-map map-name
  ```

  For example, following is the configuration to assign the be-map scheduler map to all Gigabit Ethernet interfaces (ge-*):

  ```
  [edit class-of-service interfaces]
  user@switch# set ge-* scheduler-map be-map
  ```

- To assign the scheduler map to all VCPs:

  ```
  [edit class-of-service interfaces]
  user@switch# set wild-card-representation-of-vcp scheduler-map map-name
  ```

  **NOTE:** You can assign a scheduler map to a VCP only on EX4200, EX4300 or EX4500 switches that are members of Virtual Chassis composed exclusively either of EX4200 switches, EX4300 switches or of EX4500 switches, or that are members of a mixed Virtual Chassis composed of EX4200, EX4300, and EX4500 switches.

  For example, following is the configuration to assign the be-map scheduler map to all VCPs:

  ```
  [edit class-of-service interfaces]
  user@switch# set vcp-* scheduler-map be-map
  ```

Assigning Scheduler Maps to Interfaces on EX8200 Line Cards That Include Oversubscribed Ports

Some line cards available for Juniper Networks EX8200 Ethernet Switches include oversubscribed ports that are combined in logical port groups that share bandwidth. These oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth. You might need to configure CoS queues differently for oversubscribed ports than for line-rate ports. For more information about EX8200 line cards that include oversubscribed ports, see “Understanding CoS Queues on EX8200 Line Cards That Include Oversubscribed Ports” on page 1891.

For interfaces on oversubscribed EX8200 line cards, you use the same procedure to configure CoS schedulers as you do for other interfaces. However, you must assign the
same scheduler map to all the interfaces in a port group. When you assign a scheduler map to one interface in a port group, you do not need to assign the scheduler map to the remaining interfaces in the port group. The switch automatically uses that scheduler map for all the interfaces in the port group when you bring the interfaces up. Therefore, you do not need to assign the scheduler map to the remaining interfaces in that port group.

If you assign different scheduler maps to different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, an error is logged in the system log. When you bring an interface in the port group up, the default scheduler map is assigned to all interfaces in the port group. If you assign a scheduler map to an interface that is down and if that scheduler map is different from the scheduler map being used by the currently operating interfaces in the port group, then the default scheduler map is used by all interfaces in the port group, even the currently operating ones, when you bring the interface up.

To assign a scheduler map to a port group, assign a scheduler map to at least one interface in the port group:

```
[edit class-of-service interfaces]
user@switch# set interface-name scheduler-map map-name
```

Considering that the xe-0/0/2 interface is part of a port group, following is the configuration to assign a scheduler map named `ef-map` to a port group that contains xe-0/0/2:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/2 scheduler-map ef-map
```

### Related Documentation

- Defining CoS Schedulers (J-Web Procedure) on page 1931
- Example: Configuring CoS on EX Series Switches on page 1895
- Assigning CoS Components to Interfaces (CLI Procedure) on page 1942
- Monitoring CoS Scheduler Maps on page 1980
- Understanding CoS Schedulers on page 1880

### Defining CoS Schedulers (J-Web Procedure)

You can use the J-Web interface to define CoS schedulers on an EX Series switch. Using schedulers, you can assign attributes to queues and thereby provide congestion control for a particular class of traffic. These attributes include the amount of interface bandwidth, memory buffer size, transmit rate, and schedule priority.

To configure schedulers:

1. Select `Configure > Class of Service > Schedulers`. 
NOTE: After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Adds a scheduler. Enter information into the Schedulers page as described in Table 239 on page 1932.
   - **Edit**—Modifies an existing scheduler. Enter information into the Schedulers page as described in Table 239 on page 1932.
   - **Delete**—Deletes an existing scheduler.

### Table 239: Schedulers Configuration Page

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduler name</td>
<td>Specifies the name for a scheduler.</td>
<td>To name a scheduler, type the name—for example, <code>be-scheduler</code>.</td>
</tr>
</tbody>
</table>
| Scheduling priority | Sets the transmission priority of the scheduler, which determines the order in which an output interface transmits traffic from the queues. | You can set the scheduling priority at different levels in the order of increasing priority from low to high. A high-priority queue with a high transmission rate might lock out lower-priority traffic. To set a priority, select one:  
  - **low**—Packets in this queue are transmitted last.  
  - **strict-high**—Packets in this queue are transmitted first.  
  - To specify no scheduling priority, select the blank check box. |

**Defining CoS Scheduler Maps (J-Web Procedure)**

You can use the J-Web interface to configure CoS scheduler maps on an EX Series switch.

**Note:** On EX Series switches, you cannot configure a scheduler map on an individual interface that is a member of a link aggregation group (LAG). Instead, you must configure the scheduler map on the LAG itself (that is, on the aggregated Ethernet (ae) interface).

To configure scheduler maps:
1. Select Configure > Class of Service > Scheduler Maps.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Adds a scheduler map. Enter information into the scheduler map page as described in Table 240 on page 1935.
   - **Edit**—Modifies an existing scheduler map. Enter information into the scheduler map page as described in Table 240 on page 1935.
   - **Delete**—Deletes an existing scheduler map.

### Configuring CoS Congestion Management (CLI Procedure)

An effective congestion management mechanism is imperative to ensure smooth flow of traffic in a network and also to ensure minimum packet drops in the network. Class of service (CoS) provides congestion management methods that allow you to define parameters based on which packets can be dropped when the output queue is full. These parameters vary depending on the EX Series switch that you are using in a network.

You can specify parameters for dropping packets at the [edit class-of-service drop-profiles] hierarchy level and reference them in a scheduler configuration. The parameters that you can specify are `fill-level` and `drop-probability`. The first parameter defines the delay-buffer bandwidth, which provides packet buffer space to absorb burst traffic up
to the specified duration of delay. When the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the head of the buffer. The second parameter represents a percentage value that correlates to the likelihood that an individual packet is dropped from the network.

Depending on the switch on which you are configuring a drop profile, you can configure either a weighted tail drop (WTD) profile or a weighted random early detection (WRED) profile.

This topic describes:

- Configuring a Weighted Tail Drop Profile on page 1936
- Configuring a Weighted Random Early Detection Drop Profile on page 1936

### Configuring a Weighted Tail Drop Profile

A weighted tail drop (WTD) is a congestion management mechanism in which packets are dropped from the tail of the queue when the queue reaches a certain buffer capacity (that is, the fill level), and hence the name weighted tail drop. When that level is reached on EX2200, EX3200, or EX4200 Switches, packets marked with a packet loss priority (PLP) of high are prevented from entering the queue (that is, they are discarded).

To configure a WTD profile, create a drop profile name and assign a fill level:

```
[edit class-of-service drop-profiles]
user@switch# set profile-name fill-level percentage
```

Following is a sample WTD profile in which the fill level is set to 80 percent:

```
[edit class-of-service drop-profiles]
user@switch# set wtd-profile fill-level 80
```

### Configuring a Weighted Random Early Detection Drop Profile

A WRED drop profile enables you to define multiple data points for fill level and drop probability so that packets are dropped at various levels of queue fullness, and for various drop probabilities. Unlike the WTD drop profile that can be defined only for packets with a PLP of high, WRED can be defined for packets with a PLP of high and also for packets with a PLP of low.

**NOTE:** The WRED drop profile is supported only on EX4300 standalone switches, EX4300 Virtual Chassis, EX8200 standalone switches and EX8200 Virtual Chassis.

WRED has two implementations: segmented and interpolated. From a high level, segmented is a stair-step-like drop profile, whereas interpolated is a smother (curve) drop profile. For a graphical representation of both these implementations, see “Understanding CoS Congestion Management” on page 1875. Although the formation of graph lines is different for both these implementations, the application of the profile is the same. On EX Series switches except EX4300 switches, when a packet reaches the head of the queue, a random number between 0 and 100 is calculated. This random number is plotted against the drop profile using the current queue fullness of that
particular queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped from the network.

For information about congestion management on EX4300 switches, see “Understanding CoS Congestion Management” on page 1875.

NOTE: On EX4300 switches, you cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Following is the procedure to define a segmented and an interpolated drop profiles:

- To configure a segmented drop profile, specify multiple data points for fill level (l) and drop probability (p) as follows:

  ```
  [edit class-of-service drop-profiles]
  user@switch# set profile-name fill-level percentage-l1 drop-probability percentage-p1
  user@switch# set profile-name fill-level percentage-l2 drop-probability percentage-p2
  user@switch# set profile-name fill-level percentage-l3 drop-probability percentage-p3
  user@switch# set profile-name fill-level percentage-l4 drop-probability percentage-p4
  ```

  Following is a sample segmented drop profile:

  ```
  [edit class-of-service drop-profiles]
  user@switch# set seg-prof fill-level 20 drop-probability 25
  user@switch# set seg-prof fill-level 40 drop-probability 50
  user@switch# set seg-prof fill-level 60 drop-probability 75
  user@switch# set seg-prof fill-level 80 drop-probability 100
  ```

- To configure an interpolated drop profile on EX Series switches except EX4300 switches, specify multiple data points for fill level (l) and drop probability (p) using the `interpolate` statement as follows:

  ```
  [edit class-of-service drop-profiles]
  user@switch# set profile-name interpolate fill-level percentage-l1 drop-probability percentage-p1
  user@switch# set profile-name interpolate fill-level percentage-l2 drop-probability percentage-p2
  user@switch# set profile-name interpolate fill-level percentage-l3 drop-probability percentage-p3
  user@switch# set profile-name interpolate fill-level percentage-l4 drop-probability percentage-p4
  ```

  Following is a sample interpolated drop profile:

  ```
  [edit class-of-service drop-profiles]
  user@switch# set inter-prof interpolate fill-level 20 drop-probability 25
  user@switch# set inter-prof interpolate fill-level 40 drop-probability 50
  user@switch# set inter-prof interpolate fill-level 60 drop-probability 75
  user@switch# set inter-prof interpolate fill-level 80 drop-probability 100
  ```

- To configure an interpolated drop profile EX4300 switches, specify two data points for fill level (l) and drop probability (p) by using the `interpolate` statement as follows:

  ```
  [edit class-of-service drop-profiles]
  user@switch# set profile-name interpolate fill-level percentage-l1 fill-level percentage-l2 drop-probability percentage-l1 percentage-l2
  ```

  Following is a sample interpolated drop profile:
[edit class-of-service drop-profiles]
user@switch#  set inter-prof interpolate fill-level 20 fill-level 80 drop-probability 25
       drop-probability 100

Defining CoS Rewrite Rules (CLI Procedure)

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an EX Series switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and a code point, thus creating a rewrite table, and you can enable the rewrite rule on an interface. On EX Series switches except EX4300 switches, you can also enable a rewrite rule on routed VLAN interfaces (RVIs). On EX4300 switches, you can also enable rewrite rules on integrated routing and bridging (IRB) interfaces. If you need to customize a rewrite rule, you can create a customized rewrite rule using a firewall filter configuration. You can configure CoS rewrite rules for DSCP, IP precedence and IEEE 802.1p.

You can configure rewrite rules for the following CoS marker types:

- **dscp** and **dscp-ipv6**—Handles incoming IPv4 and IPv6 packets, respectively. On EX4300 switches, you cannot configure DSCP IPv4 and DSCP IPv6 rewrite rules on the same interface. If you configure a DSCP IPv4 rewrite rule on an interface to rewrite IPv4 traffic, then the same rewrite rule is applied to IPv6 traffic also on that interface, and vice versa.

- **ieee-802.1**—Handles Layer 2 CoS.

- **inet-precedence**—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the rewrite rule and then apply the new rule.

To create IEEE 802.1p rewrite rules and enable them on Layer 2 interfaces:

To create an IEEE 802.1p rewrite rule named customup-rw in the rewrite table for all Layer 2 interfaces:

```plaintext
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority low code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority high code-point 011
```
user@switch# set ieee-802.1 custom-up-rw forwarding-class ef loss-priority low code-point 100
user@switch# set ieee-802.1 custom-up-rw forwarding-class ef loss-priority high code-point 101
user@switch# set ieee-802.1 custom-up-rw forwarding-class nc loss-priority low code-point 110
user@switch# set ieee-802.1 custom-up-rw forwarding-class nc loss-priority high code-point 111

- To enable an IEEE 802.1p rewrite rule named custom-up-rw on a Layer 2 interface:

  [edit]
  user@switch# set class-of-service interfaces ge-0/0/0 unit 0 rewrite-rules ieee-802.1 custom-up-rw

  (On EX4300 switches) To enable an IEEE 802.1p rewrite rule named custom-up-rw on a Layer 2 interface:

  [edit]
  user@switch# set class-of-service interfaces ge-0/0/0 rewrite-rules ieee-802.1 custom-up-rw

- To enable an IEEE 802.1p rewrite rule named custom-up-rw on all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical-interface (unit) number:

  [edit]
  user@switch# set class-of-service interfaces ge-* unit * rewrite-rules custom-up-rw

  (On EX4300 switches) To enable an IEEE 802.1p rewrite rule named custom-up-rw on all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name:

  [edit]
  user@switch# set class-of-service interfaces ge-* rewrite-rules custom-up-rw

Defining CoS Rewrite Rules (J-Web Procedure)

You can use the J-Web interface to define CoS rewrite rules. Use the rewrite rules to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule.

To define rewrite rules:

1. Select Configure > Class of Service > Rewrite Rules.

   NOTE: After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.
2. Click one of the following options:

- **Add**—Adds a rewrite rule. Enter information into the rewrite rule page as described in Table 242 on page 1941.

- **Edit**—Modifies an existing rewrite rule. Enter information into the rewrite rule page as described in Table 242 on page 1941.

- **Delete**—Deletes an existing rewrite rule.

Table 242: Rewrite Rules Configuration Page Summary

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>

| Code Point Mapping  | Rewrites outgoing CoS values of a packet based on the forwarding class and loss priority. Allows you to remove a code point mapping entry. | To configure a CoS value assignment, follow these steps: 

1. Click **Add**.

2. Select the code point.

3. Select a forwarding class from the following list:

   - **expedited-forwarding**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped.
   - **best-effort**—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined.
   - **assured-forwarding**—Provides high assurance for packets within the specified service profile. Excess packets are dropped.
   - **network-control**—Packets can be delayed but not dropped.

4. Select the loss priority.

   To assign a loss priority, select one:

   - **high**—Packet has a high loss priority.
   - **low**—Packet has a low loss priority.

To edit an existing code point mapping, select it and click **Edit**.

To remove a code point mapping entry, select it and click **Remove**.
Assigning CoS Components to Interfaces (CLI Procedure)

After you have defined the following CoS components, you must assign them to logical or physical interfaces.

- Forwarding classes—Assign only to logical interfaces.
- Classifiers—Assign only to logical interfaces.
- Scheduler maps—Assign to either physical or logical interfaces.
- Rewrite rules—Assign to either physical or logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wild cards.

To assign CoS components to interfaces:

- To assign CoS components to a single interface, associate a CoS component (for example a scheduler map named `ethernet-cos-map`) with an interface:

  ```
  [edit class-of-service interfaces]
  user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
  ```

- To assign a CoS component to multiple interfaces, associate a CoS component (for example, a rewrite rule named `customup-rw`) to all Gigabit Ethernet interfaces on the switch, use wild characters for the interface name and logical-interface (unit) number:

  ```
  [edit class-of-service interfaces]
  user@switch# set ge-* unit* rewrite-rules ieee-802.1 customup-rw
  ```

Related Documentation

Assigning CoS Components to Interfaces (J-Web Procedure)

After you have defined CoS components on an EX Series switch, you must assign them to logical or physical interfaces. You can use the J-Web interface to assign scheduler maps to physical or logical interfaces and to assign forwarding classes or classifiers to logical interfaces.

To assign CoS components to interfaces:
1. Select Configure > Class of Service > Assign to Interface.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. To configure interface association, select an interface from the list and click Edit. For an EX8200 Virtual Chassis configuration, select the member, the FPC, and the interface from the list, and click Edit.

3. Select one of the following:
   - Associate system default scheduler map—Associates the interface with the default scheduler map.
   - Select the scheduler map—Associates the interface with a configured scheduler map. Select the scheduler map from the list.

**NOTE:** On the 40-port SFP+ line card for EX8200 switches, the J-Web interface does not allow you to commit your changes unless you assign the same scheduler map or the default scheduler map to all interfaces in a port group.

4. Click OK.

5. To manage a CoS service assignment on a logical interface, Click one of the following options:
   - Add—Adds a CoS service to a logical interface on a specified physical interface. Enter information as described in Table 243 on page 1943.
   - Edit—Modifies a CoS service assignment to a logical interface. Enter information as described in Table 243 on page 1943.
   - Delete—Deletes the CoS service assignment to a logical interface.

**Configuring Junos OS EZQoS for CoS (CLI Procedure)**

You use Junos OS EZQoS on EX Series switches to eliminate the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

When you configure EZQoS on EX Series switches, preconfigured values are assigned to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name.

**NOTE:** Currently, we provide an EZQoS template for configuring CoS for VoIP applications. The EZQoS VoIP template is stored in /etc/config/ezqos-voip.conf.

To configure EZQoS using the CLI:

1. Load the EZQoS configuration file (/etc/config/ezqos-voip.conf):

   ```
   [edit]
   user@switch# load merge /etc/config/ezqos-voip.conf
   ```

2. Apply the EZQoS group (ezqos-voip):

   ```
   [edit]
   user@switch# set apply-groups ezqos-voip
   ```

3. Apply the DSCP classifier (ezqos-dscp-classifier) to a Gigabit Ethernet interface (ge-0/0/0):

   ```
   [edit class-of-service interfaces]
   ```
user@switch# set ge-0/0/0 unit 0 classifiers dscp ezqos-dscp-classifier

4. Apply the scheduler map (ezqos-voip-sched-maps) to a Gigabit Ethernet interface (ge-0/0/1):

[edit class-of-service interfaces]
user@switch# set ge-0/0/1 scheduler-map ezqos-voip-sched-maps

Configuring CoS Traffic Classification for Ingress Queuing on Oversubscribed Ports on EX8200 Line Cards (CLI Procedure)

EX8200 switches provide certain line cards that include oversubscribed ports. These ports are logically grouped into a port group and each port group share a certain fixed bandwidth. Because oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth, configuring CoS queues is different for oversubscribed ports than for line-rate ports.

Packets arriving on an oversubscribed port in a line card are directed to a high-priority, low priority, or line-rate queue. These queues are used for scheduling traffic from the port into the Packet Forwarding Engine. The fabric priority associated with the packet’s forwarding class determines which queue the packet is sent to. The forwarding class of the packet in turn is determined by the behavior aggregate (BA) classifier assigned to the port. By default, the fabric priority of all forwarding classes is low. Thus all packets, with the exception of critical network packets and line-rate packets, are sent to the low-priority ingress queue by default. The critical network packets and line-rate packets do not need a BA classifier as they are always sent on the high-priority and line-rate queues, respectively.

This procedure describes how you can direct traffic into the high-priority ingress queue and thus avoid congestion at the port group.

To direct traffic to the high-priority ingress queue for a port group:

1. Create the BA classifier for the forwarding class:

   [edit class-of-service]
   user@switch# set classifiers classifier-type classifier-name
   forwarding-class class-name loss-priority level code-points code-point

2. Assign a queue number and fabric priority to the forwarding class:

   [edit class-of-service]
   user@switch# set forwarding-classes class class-name queue-num number
   priority level

3. Assign the BA classifier to the physical interface:

   [edit class-of-service]
   user@switch# set interfaces interface-name unit 0
   classifiers classifier-type classifier-name
For example, to direct voice traffic to the high-priority ingress queue for interface xe-1/0/2:

```
[edit class-of-service]
user@switch# set classifiers dscp dscp1 forwarding-class cos-voice
  loss-priority low code-points ef

[edit class-of-service]
user@switch# set forwarding-classes class cos-voice queue-num 5 priority high

[edit class-of-service]
user@switch# set interfaces xe-1/0/2 unit 0 classifiers dscp dscp1
```

**NOTE:** You must use a BA classifier to classify traffic for ingress queuing. Multifield (MF) classification and port classification (that is, assigning a forwarding class to the interface) are not supported for classifying traffic for ingress queuing. The BA classifier must be assigned to a physical interface, not a Layer 3 tagged interface or a routed VLAN interface (RVI).

**Configuration Statements**

- [edit class-of-service] Configuration Statement Hierarchy on EX Series Switches on page 1946

---

**[edit class-of-service] Configuration Statement Hierarchy on EX Series Switches**

This topic lists supported and unsupported configuration statements in the [edit class-of-service] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.

- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27

This topic lists:

- Supported Statements in the [edit class-of-service] Hierarchy Level on page 1946
- Unsupported Statements in the [edit class-of-service] Hierarchy Level on page 1948

---

**Supported Statements in the [edit class-of-service] Hierarchy Level**

The following hierarchy shows the [edit class-of-service] configuration statements supported on EX Series switches:

```
class-of-service {
```
classifiers {
    (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) classifier-name {
        forwarding-class class-name {
            loss-priority (high | low | medium-high | medium-low) {
                code-points [ aliases ] [ 6 bit-patterns ];
            }
        }
        import (classifier-name | default);
    }
}
code-point-aliases {
    (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) {
        alias-name bits;
    }
}
drop-profiles {
    profile-name {
        interpolate {
            drop-probability [values];
            fill-level [values]
        }
    }
}
forwarding-classes {
    class class-name
    queue queue-number;
}
interfaces interface-name {
    scheduler-map map-name;
    shaping-rate rate;
    unit (logical-unit-number | *) {
        classifiers {
            (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) (classifier-name | default);
        }
        forwarding-class class-name;
    }
}
rewrite-rules {
    (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) (rewrite-rule-name | default);
}
}
rewrite-rules {
    (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) rewrite-name {
        import (default | rewrite-name);
        forwarding-class class-name {
            loss-priority (high | low | medium-high | medium-low) code-point (alias | bits);
        }
    }
}
scheduler-maps {
    map-name {
        forwarding-class class-name {
            scheduler scheduler-name;
        }
    }
}
schedulers {
    scheduler-name {
        buffer-size (exact | percent percentage | remainder);
        drop-profile-map {
            loss-priority (any | high | medium-high | medium-low);
            protocol any;
            {
                drop-profile profile-name
            }
        }
        excess-rate {
            percent percentage;
        }
        priority (low | strict-high);
        shaping-rate (rate | percent percentage);
        transmit-rate (EX Series Switches) (rate | percent percentage | remainder);
    }
} shared-buffer {
    percent;
} traceoptions {
    file (file-name | files files | match match | no-world-readable | size size | world-readable);
    flag (all | asynch | chassis-scheduler | cos-adjustment | dynamic | hardware-database | init | parse | performance-monitor | process | restart | route-socket | show | snmp | util);
    no-remote-trace;
    tri-color;
}

Unsupported Statements in the [edit class-of-service] Hierarchy Level
All statements in the [edit class-of-service] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

### broadcast

**Syntax**  
`broadcast forwarding-class-name;`

**Hierarchy Level**  
`[edit class-of-service multi-destination family ethernet]`

**Release Information**  
Statement introduced in Junos OS Release 9.5 for EX Series switches.

**Description**  
Specify the forwarding class for the broadcast traffic belonging to the Ethernet family.

**Options**  
`forwarding-class-name` — Name of the forwarding class:
- `mcast-af` — Default forwarding class for assured forwarding of multicast traffic.
- `mcast-be` — Default best-effort forwarding class for multicast traffic.
- `mcast-ef` — Default forwarding class for expedited forwarding of multicast traffic.

**Required Privilege**  
`interface`—To view this statement in the configuration.
`interface-control`—To add this statement to the configuration.

**Related Documentation**

buffer-size

Syntax  buffer-size (exact | percent percentage | remainder | temporal);

Hierarchy Level  [edit class-of-service schedulers scheduler-name]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify buffer size in a scheduler configuration.

Default  On EX Series switches except EX4300 switches, the default scheduler transmission rate
and buffer size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent,
respectively. On EX4300 switches, the default scheduler transmission rate and buffer
size for queues 0 through 11 are 75, 0, 5, 0, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively,
of the total available buffer.

Options  exact—(Except on EX8200 standalone switches and EX8200 Virtual Chassis) Enforce
the exact buffer size. When this option is configured, sharing is disabled on the queue,
restricting the usage to guaranteed buffers only.

percent percentage—Buffer size as a percentage of the total buffer.

remainder—Remaining buffer available.

temporal—(EX4200 standalone switches, EX4200 Virtual Chassis, EX4300 standalone
switches, EX4300 Virtual Chassis, EX8200 standalone switches, and EX8200 Virtual
Chassis only) Buffer size as a temporal value.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

classifiers

Syntax  classifiers {
  (dscp | dscp-ipv6 | leee-802.1 | inet-precedence) classifier-name {
    import (classifier-name | default);
    forwarding-class class-name {
      loss-priority level {
        code-points [aliases] [6–bit-patterns];
      }
    }
  }
}

Hierarchy Level [edit class-of-service],
[edit class-of-service interfaces interface-name unit logical-unit-number]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Expanded to include EXP classifiers in Junos OS Release 10.1 for EX Series switches.

Description Apply a CoS aggregate behavior classifier to a logical interface. You can apply a default classifier or a custom classifier.

The remaining statements are explained separately.

Required Privilege level

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**code-point-aliases**

**Syntax**

```
code-point-aliases {
  (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) {{
    alias-name bits;
  }
}
```

**Hierarchy Level**

[edit class-of-service]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Define an alias for a CoS marker.

The remaining statement is explained separately.

**Required Privilege**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

---

**code-points**

**Syntax**

```
code-points [ aliases ] [ 6 bit-patterns ];
```

**Hierarchy Level**

[edit class-of-service classifiers (dscp | ieee-802.1 | inet-precedence) forwarding-class class-name loss-priority level]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Specify one or more DSCP code-point aliases or bit sets for association with a forwarding class.

**Options**

- **aliases** —Name of the DSCP alias.
- **6 bit-patterns** —Value of the code-point bits, in decimal form.

**Required Privilege**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

drop-profile-map

Syntax:  
drop-profile-map loss-priority loss-priority protocol protocol drop-profile profile-name;

Hierarchy Level:  
[edit class-of-service schedulers scheduler-name]

Release Information:  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description:  
Define the loss priority value for the specified drop profile.

Options:  
drop-profile profile-name —Name of the drop profile.

The remaining statements are explained separately.

Required Privilege Level:  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### dscp

**Syntax**

```
dscp classifier-name {
  import (classifier-name | default);
  forwarding-class class-name {
    loss-priority level {
      code-points [ aliases ] [ 6-bit-patterns ];
    }
  }
}
```

**Hierarchy Level**

- [edit class-of-service classifiers],
- [edit class-of-service code-point-aliases],
- [edit class-of-service interfaces interface-name unit logical-unit-number classifiers],
- [edit class-of-service rewrite-rules]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Define the Differentiated Services code point (DSCP) mapping that is applied to the packets.

**Options**

- `classifier-name`—Name of the classifier.

The remaining statements are explained separately.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**dscp-ipv6**

**Syntax**
```
dscp-ipv6 classifier-name {
    import (classifier-name | default);
    forwarding-class class-name {
        loss-priority level {
            code-points [aliases] [6–bit-patterns];
        }
    }
}
```

**Hierarchy Level**
```
[edit class-of-service classifiers],
[edit class-of-service code-point-aliases],
[edit class-of-service interfaces interface-name unit logical-unit-number classifiers]
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules]
```

**Release Information**
Statement introduced in Junos OS Release 10.2 for EX Series switches.

**Description**
Define the Differentiated Services code point (DSCP) mapping that is applied to the IPv6 packets.

**Options**
- `classifier-name`—Name of the classifier.

The remaining statements are explained separately.

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

ethernet (CoS for Multidestination Traffic)

Syntax

```
ethernet {
  broadcast forwarding-class-name;
}
```

Hierarchy Level

[edit class-of-service multi-destination family]

Release Information

Statement introduced in Junos OS Release 9.5 for EX Series switches.

Description

Specify the Ethernet broadcast traffic family.

The remaining statement is explained separately.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

excess-rate (Schedulers)

Syntax

```
excess-rate {
  percent percentage;
}
```

Hierarchy Level

[edit class-of-service on page 1946 schedulers scheduler-name]

Release Information

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

(EX4300 switches only) Specify the percentage of excess bandwidth traffic to share.

Default

Excess bandwidth is shared in proportion to the configured transmit rate of each queue.

Options

- percent—Percentage of the excess bandwidth to share.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

interfaces

Syntax

```
interfaces {
  interface-name {
    congestion-notification-profile profile-name {
      input {
        ieee-802.1 {
          code-point up-bits pfc;
        }
      }
    }
  }
  scheduler-map map-name;
  unit logical-unit-number {
    forwarding-class class-name;
    classifiers {
      (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
    }
  }
}
```

Hierarchy Level
[edit class-of-service]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Configure interface-specific class-of-service (CoS) properties for incoming packets.

Options
- `interface-name`—Name of the interface.
  The remaining statements are explained separately.

Required Privilege Level
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**loss-priority (Classifiers and Rewrite Rules)**

**Syntax**

```
loss-priority level {
    code-points [aliases] [6-bit-patterns | 3-bit-patterns];
}
```

**Hierarchy Level**

```
[edit class-of-service classifiers (dscp | ieee-802.1 | inet-precedence | exp) classifier-name
    forwarding-class class-name],
[edit class-of-service rewrite-rules (dscp | ieee-802.1 | inet-precedence | exp)
    rewrite-rule-name forwarding-class class-name]
```

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement expanded to apply to EXP classifiers in Junos OS Release 10.1 for EX Series switches.

**Description**

Specify packet loss priority value for a specific set of code-point aliases and bit patterns.

**Options**

`level` — Can be one of the following:

- **high** — Packet has high loss priority.
- **medium-high** — (On EX3200, EX4200, EX4300, and EX4500 switches only) Code points to classify to loss priority medium-high.
- **low** — Packet has low loss priority.
- **medium-low** — (On EX3200, EX4200, EX4300, and EX4500 switches only) Code points to classify to loss priority medium-low.

The remaining statement is explained separately.

**Required Privilege**

- **interface** — To view this statement in the configuration.
- **interface-control** — To add this statement to the configuration.

**Related Documentation**

## policing

**Syntax**  
```plaintext```
policing (filter filter-name | no-automatic-policing);
```

**Hierarchy Level**  
- [edit protocols mpls label-switched-path lsp-name]
- [edit interfaces interface-id unit number-of-logical-unit family inet address ip-address]

**Release Information**  
Statement introduced in Junos OS Release 10.1 for EX Series switches.

**Description**  
Apply a rate-limiting policer as the specified policing filter:
- To the LSP for MPLS over CCC.
- To the customer-edge interface for IP over MPLS.

**Options**  
- `filter filter-name`—Specify the name of the policing filter.
- `no-automatic-policing`—Disable automatic policing on this LSP.

**Required Privilege Level**  
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

priority (Schedulers)

Syntax

priority priority;

Hierarchy Level

[edit class-of-service schedulers scheduler-name]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Specify packet-scheduling priority value.

Options

priority — It can be one of the following:

- low—Scheduler has low priority.
- strict-high—Scheduler has strictly high priority.

Required Privilege

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on EX Series Switches on page 1895
- Defining CoS Schedulers and Scheduler Maps (CLI Procedure) on page 1929 or Defining CoS Schedulers (J-Web Procedure) on page 1931

protocol (Drop Profiles)

Syntax

protocol protocol drop-profile profile-name;

Hierarchy Level

[edit class-of-service schedulers scheduler-name]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Specify the protocol type for the specified drop profile.

Options

drop-profile profile-name — Name of the drop profile.

protocol — Type of protocol. It can be:

- any—Accept any protocol type.

Required Privilege

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on EX Series Switches on page 1895

**rewrite-rules**

**Syntax**

```
rewrite-rules {
  (dscp | dscp-ipv6 | exp | ieee-802.1 | inet-precedence) rewrite-name {
    import (default | rewrite-name);
    forwarding-class class-name {
      loss-priority level code-point (alias | bits);
    }
  }
}
```

**Hierarchy Level**

[edit class-of-service]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement expanded for use with global EXP classifiers in Junos OS Release 10.1 for EX Series switches.

**Description**

Specify a rewrite-rules mapping for the traffic that passes through all queues on the interface.

The remaining statements are explained separately.

**Required Privilege**

- **Level**
  - interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

scheduler-maps

Syntax

scheduler-maps {
  map-name {
    forwarding-class class-name scheduler scheduler-name;
  }
}

Hierarchy Level  [edit class-of-service]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify a scheduler map name and associate it with the scheduler configuration and forwarding class.

Options  map-name —Name of the scheduler map.

The remaining statement is explained separately.

Required Privilege

Level  interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

shaping-rate

Syntax:  
```
shaping-rate (percent percentage | rate);
```

Hierarchy Level:  
```
[edit class-of-service schedulers (CoS) scheduler-name]
```

Release Information:  
Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description:  
Configure shaping rate to throttle the rate at which queues transmit packets.
We recommend that you configure the shaping rate as an absolute maximum usage and not as additional usage beyond the configured transmit rate.

Default:  
If you do not include this statement, the default shaping rate is 100 percent, which is the same as no shaping at all.

Options:  
- `percentpercentage` — Shaping rate as a percentage of the available interface bandwidth.  
  Range: 0 through 100 percent
- `rate` — Peak rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).  
  Range: 3200 through 32,000,000,000 bps  
  (EX4300 switches only) 8000 through 160,000,000,000 bps

Required Privilege:  
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

Related Documentation:  
- Example: Configuring CoS on EX Series Switches on page 1895
- Understanding Junos OS CoS Components for EX Series Switches on page 1863
transmit-rate (EX Series Switches)

Syntax: transmit-rate (rate | percent percentage | remainder);

Hierarchy Level: [edit class-of-service schedulers scheduler-name]

Release Information: Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description: Specify the transmit rate or percentage for a scheduler.

Default: If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent.

Options:
- **rate** —Transmission rate, in bps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).
  - Range: 3200 through 160,000,000,000 bps
    - (EX4300 switches only) 8000 through 160,000,000,000 bps
- **percent percentage** —Percentage of transmission capacity. A percentage of zero drops all packets in the queue.
  - Range: 0 through 100 percent
- **remainder** —Remaining rate available

Required Privilege Level:
- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

Related Documentation:
- Example: Configuring CoS on EX Series Switches on page 1895

unit

Syntax  
unit *logical-unit-number* {  
  forwarding-class *class-name*;  
  classifiers {  
    (dscp | ieee-802.1 | inet-precedence) (*classifier-name* | default);  
  }  
}

Hierarchy Level  
[edit class-of-service interfaces *interface-name*]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options  
*logical-unit-number*—Number of the logical unit.  
**Range:** 0 through 16,385

The remaining statements are explained separately.

Required Privilege
**Level**  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Monitoring CoS Classifiers

**Purpose**
Use the monitoring functionality to display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

**Action**
To monitor CoS classifiers in the J-Web interface, select Monitor > Class of Service > Classifiers.

To monitor CoS classifiers in the CLI, enter the following CLI command:

```
show class-of-service classifier
```

**Meaning**
Table 244 on page 1975 summarizes key output fields for CoS classifiers.

### Table 244: Summary of Key CoS Classifier Output Fields

<table>

**Monitoring CoS Forwarding Classes**

**Purpose**
View the current assignment of class-of-service (CoS) forwarding classes to queues on the switch.

**Action**
To monitor CoS forwarding classes in the J-Web interface, select Monitor > Class of Service > Forwarding Classes.

To monitor CoS forwarding classes in the CLI, enter the following CLI command:

```
show class-of-service forwarding-class
```

**Meaning**
Table 245 on page 1977 summarizes key output fields for CoS forwarding classes.
Names of forwarding classes assigned to queue numbers. The following are the default forwarding classes:

- **best-effort**—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value.
- **expedited-forwarding**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.
- **assured-forwarding**—Provides high assurance for packets within the specified service profile. Excess packets are dropped.
- **network-control**—Packets can be delayed but not dropped.

EX8200 switches have the following additional default forwarding classes:

- **mcast-be**—Provides no special CoS handling of packets.
- **mcast-ef**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.
- **mcast-af**—Provides high assurance for packets within the specified service profile. Excess packets are dropped.

EX4300 switches supports all the forwarding classes mentioned above and the one mentioned in this section:

- **mcast-nc**—Provides multicast network-control traffic.

Queue number corresponding to the forwarding class name. The default forwarding classes are assigned as follows:

- **best-effort**—0
- **expedited-forwarding**—5
- **assured-forwarding**—1
- **network-control**—7
- **mcast-be**—2
- **mcast-ef**—4
- **mcast-af**—6

EX4300 switches have the following queue numbers for the forwarding classes:

- **best-effort**—0
- **expedited-forwarding**—1
- **assured-forwarding**—2
- **network-control**—3
- **mcast-be**—8
- **mcast-ef**—9
- **mcast-af**—10
- **mcast-nc**—11

(EX8200 switches only) Fabric priority for the forwarding class, either high or low. The fabric priority determines the priority of packets entering the switch fabric.
Monitoring Interfaces That Have CoS Components

**Purpose**  Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

**Action**  To monitor interfaces that have CoS components in the J-Web interface, select Monitor > Class of Service > Interface Association.

To monitor interfaces that have CoS components in the CLI, enter the following command:

```
show class-of-service interface
```

**Meaning**  Table 246 on page 1978 summarizes key output fields for CoS interfaces.

### Table 246: Summary of Key CoS Interfaces Output Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Values</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Name of a physical interface to which CoS components are assigned.</td>
<td>To display names of logical interfaces configured on this physical interface, click the plus sign (+).</td>
</tr>
<tr>

<td>Index of this interface or the internal index of a specific object.</td>
<td></td>
</tr>
</tbody>
</table>
Monitoring CoS Rewrite Rules

**Purpose**
Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action**
To monitor CoS rewrite rules in the J-Web interface, select **Monitor > Class of Service > Rewrite Rules**.

To monitor CoS rewrite rules in the CLI, enter the following command:

```
show class-of-service rewrite-rules
```

**Meaning**
Table 247 on page 1979 summarizes key output fields for CoS rewrite rules.

### Table 247: Summary of Key CoS Rewrite Rules Output Fields

Monitoring CoS Scheduler Maps

**Purpose**
Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

**Action**
To monitor CoS scheduler maps in the J-Web interface, select **Monitor > Class of Service > Scheduler Maps**.

To monitor CoS scheduler maps in the CLI, enter the following CLI command:

`show class-of-service scheduler-map`

**Meaning**
Table 248 on page 1980 summarizes key output fields for CoS scheduler maps.

### Table 248: Summary of Key CoS Scheduler Maps Output Fields

<table>

### Monitoring CoS Value Aliases

**Purpose**
Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP, IEEE 802.1p, and IPv4 precedence bits.

**Action**
To monitor CoS value aliases in the J-Web interface, select Monitor > Class of Service > CoS Value Aliases.

To monitor CoS value aliases in the CLI, enter the following command:

```
show class-of-service code-point-aliases
```

**Meaning**
Table 249 on page 1982 summarizes key output fields for CoS value aliases.

### Monitoring CoS Drop Profiles

#### Purpose
Use the monitoring functionality to view data point information for each CoS random early detection (RED) drop profile on the EX8200 switch.

#### Action
- To monitor CoS RED drop profiles in the J-Web interface, select Monitor > Class of Service > RED Drop Profiles.
- To monitor CoS RED drop profiles in the CLI, enter the following CLI command: `show class-of-service drop-profile`

#### Meaning
Table 250 on page 1982 summarizes the key output fields for CoS RED drop profiles.

### Table 250: Summary of the Key Output Fields for CoS Red Drop Profiles

<table>
<thead>

**Operational Commands**
show class-of-service

Syntax
show class-of-service

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.
EXP classifiers added in Junos OS Release 10.1 for EX Series switches.

Description
Display the class-of-service (CoS) information.

Required Privilege
view

Required Privilege Level
view

**show class-of-service classifier**

**Syntax**
```
show class-of-service classifier
<name name>
<type dscp | type dscp-ipv6 | type exp | type ieee-802.1 | type inet-precedence>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
For each class-of-service (CoS) classifier, display the mapping of code point value to forwarding class and loss priority.

**Options**
- `none`—Display all classifiers.
- `name name`—(Optional) Display named classifier.
- `type dscp`—(Optional) Display all classifiers of the Differentiated Services code point (DSCP) type.
- `type dscp-ipv6`—(Optional) Display all classifiers of the DSCP for IPv6 type.
- `type exp`—(Optional) Display all classifiers of the MPLS experimental (EXP) type.
- `type ieee-802.1`—(Optional) Display all classifiers of the ieee-802.1 type.
- `type inet-precedence`—(Optional) Display all classifiers of the inet-precedence type.

**Required Privilege**
- View

**List of Sample Output**
- `show class-of-service classifier type ieee-802.1` on page 1990
- `show class-of-service classifier type ieee-802.1 (QFX Series)` on page 1990

**Output Fields**
Table 252 on page 1989 describes the output fields for the `show class-of-service classifier` command. Output fields are listed in the approximate order in which they appear.

**Table 252: show class-of-service classifier Output Fields**

  111        mcast            low
```
show class-of-service code-point-aliases

**Syntax**

```
show class-of-service code-point-aliases
<dscp | dscp-ipv6 | exp | ieee-802.1 | inet-precedence>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns.

**Options**

- `none`—Display code point aliases of all code point types.
- `dscp`—(Optional) Display Differentiated Services code point (DSCP) aliases.
- `dscp-ipv6`—(Optional) Display IPv6 DSCP aliases.
- `exp`—(Optional) Display MPLS EXP code point aliases.
- `ieee-802.1`—(Optional) Display IEEE-802.1 code point aliases.
- `inet-precedence`—(Optional) Display IPv4 precedence code point aliases.

**Required Privilege**

- `view`

**List of Sample Output**

`show class-of-service code-point-aliases exp on page 1992`

**Output Fields**

Table 253 on page 1991 describes the output fields for the `show class-of-service code-point-aliases` command. Output fields are listed in the approximate order in which they appear.

**Table 253: show class-of-service code-point-aliases Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code point type</td>
<td>Type of the code points displayed: <code>dscp</code>, <code>dscp-ipv6</code> (not on EX Series switch), <code>exp</code> (not on EX Series switch or the QFX Series), <code>ieee-802.1</code>, or <code>inet-precedence</code> (not on the QFX Series).</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias for a bit pattern.</td>
</tr>
<tr>
<td>Bit pattern</td>
<td>Bit pattern for which the alias is displayed.</td>
</tr>
</tbody>
</table>
Sample Output

show class-of-service code-point-aliases exp

```
user@host> show class-of-service code-point-aliases exp
Code point type: exp
       Alias  Bit pattern
       af11    100
       af12    101
        be     000
        be1    001
        cs6    110
        cs7    111
         ef    010
         ef1   011
        nc1    110
        nc2    111
```
show class-of-service drop-profile

**Syntax**
```
show class-of-service drop-profile
<profile-name profile-name>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Display data points for each class-of-service (CoS) random early detection (RED) drop profile.

**Options**
- `none`—Display all drop profiles.
- `profile-name profile-name`—(Optional) Display the specified profile only.

**Required Privilege Level**
`view`

**List of Sample Output**

**List of Sample Output**
- show class-of-service forwarding-class on page 1997
- show class-of-service forwarding-class (EX8200 Switch) on page 1997
- show class-of-service forwarding-class (QFX Series) on page 1997

**Output Fields**
Table 255 on page 1996 describes the output fields for the `show class-of-service forwarding-class` command. Output fields are listed in the approximate order in which they appear.

**Table 255: show class-of-service forwarding-class Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forwarding class</td>
<td>Name of the forwarding class.</td>
</tr>
<tr>
<td>ID</td>
<td>Forwarding class identifier.</td>
</tr>
<tr>
<td>Queue</td>
<td>CoS queue mapped to the forwarding class.</td>
</tr>
<tr>
<td>Policing priority</td>
<td>Not supported on EX Series switches or the QFX Series and can be ignored.</td>
</tr>
<tr>
<td>Fabric priority</td>
<td>(EX8200 switches only) Fabric priority for the forwarding class, either high or low. Determines the priority of packets entering the switch fabric.</td>
</tr>
</tbody>
</table>
Table 255: show class-of-service forwarding-class Output
Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>No-Loss</strong></td>
<td>(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes:</td>
</tr>
<tr>
<td></td>
<td>• Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is drop).</td>
</tr>
<tr>
<td></td>
<td>• Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is no-loss).</td>
</tr>
</tbody>
</table>

---

**Sample Output**

*show class-of-service forwarding-class*

```
user@switch> show class-of-service forwarding-class
Forwarding class               ID                      Queue  Policing priority
best-effort                        0                       0           normal

```
show pfe statistics traffic cpu

Syntax

show pfe statistics traffic cpu <fpc  fpc-slot>

Release Information

Command introduced in Junos OS Release 9.5 for EX Series switches.

Description

(On EX8200 switches only) Display count of multidestination packets ingressing from the physical interface to the CPU.

NOTE: Multidestination packets include unknown unicast, broadcast, and multicast packets.

Options

none—Displays the count of packets ingressing from all the physical interfaces (line cards) to the CPU.

fpc  fpc-slot—(Optional) Displays the count of packets ingressing from the physical interface, referred to by the slot number, to the CPU.

On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are 0 through 7 on the EX8208 switch and 0 through 15 on the EX8216 switch.

show pfe statistics traffic egress-queues

**Syntax**
```
show pfe statistics traffic egress-queues <fpc fpc-slot>
```

**Release Information**
Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**
(On EX8200 switches only) Display count of multidestination packets dropped on egress ports when the egress queues are oversubscribed due to multidestination traffic.

**Options**
- **none**—Displays count of packets dropped on egress ports of all physical interfaces (line cards) when egress queues are oversubscribed due to multidestination traffic.
- **fpc fpc-slot**—(Optional) Displays count of packets dropped on egress ports of the physical interface (line card) referred to by the slot number.

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**Required Privilege Level**
view

Sample Output

show pfe statistics traffic egress-queues fpc 4 (EX8208 Switch)

    user@switch> show pfe statistics traffic egress-queues fpc 4
    Tail-dropped packets : 0
**show pfe statistics traffic multicast**

**Syntax**

```
show pfe statistics traffic multicast <fpc fpc-slot dev-number>
```

**Release Information**

Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**

(On EX8200 switches only) Display class-of-service (CoS) queue information for multidestination traffic on a physical interface (line card).

**Options**

- `fpc fpc-slot dev-number` — (Optional) Displays class-of-service (CoS) queue information for multidestination traffic on the physical interface (line card) referred to by the slot number and device number.

**Required Privilege Level**

view

**Related Documentation**

- show interfaces queue on page 2518
- Monitoring Interface Status and Traffic on page 2463
- Understanding Junos OS CoS Components for EX Series Switches on page 1863

**List of Sample Output**

show pfe statistics traffic multicast fpc 0 2 (EX8208 Switch) on page 2005

**Output Fields**

Table 258 on page 2005 lists the output fields for the `show pfe statistics traffic multicast` command. Output fields are listed in the approximate order in which they appear.

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**NOTE:** To view statistical information for unicast traffic, use the `show interfaces queue` command.

**NOTE:** On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values for the FPC slot number are 0 through 7 on the EX8208 switch and 0 through 15 on the EX8216 switch. The value for the device number ranges from 0–5, where 0–4 values correspond to the statistics only from that specific device and the value 5 corresponds to the combined statistics from all the devices in the FPC.

Troubleshooting Procedures

• Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in an EX8200 Switch on page 2009
• Troubleshooting a CoS Classifier Configuration for a TCAM Space Error on page 2010

Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in an EX8200 Switch

Problem
After you configure a scheduler map on an interface on the 40-port SFP+ line card, you notice one or both of the following:

• All packets are being dropped on a class-of-service queue configured on the interface.

• A message in the system log states that the interface is using the default scheduler map, not the scheduler map you configured. For example:

  Sep 19 21:26:50  hostname cosd[907]: COSD_SCHED_MAP_GROUP_CONFLICT: Interface xe-5/0/15 cannot be bound to scheduler-map m1. It will be bound to default scheduler-map

Cause
The ports in a 40-port SFP+ line card are divided into eight groups, each group comprising five ports. The ports in a port group share 10 gigabits of bandwidth. Because the port groups share bandwidth, only one scheduler map can be active at a time in a port group. If you configure different scheduler maps for different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, default scheduler map becomes the active scheduler map for all interfaces in the port group, and messages in the system log report that the default scheduler map is in use for the affected interfaces. If the default scheduler map does not define a queue, all traffic is dropped on that queue.

Solution
Check your CoS configuration for the interfaces in the port group. If you have different scheduler maps assigned to different interfaces in the port group:

1. Delete the scheduler map configuration for all interfaces in the port group.
2. Determine the scheduler map that you want all interfaces in the port group to use.
3. Assign that scheduler map to at least one interface in the port group. The remaining interfaces in the port group will adopt this scheduler map.
BEST PRACTICE: To prevent confusion and future configuration conflicts, explicitly assign the scheduler map to each interface in the port group.

4. After you commit the configuration, verify that the scheduler map is the active scheduler map for the interfaces in the port group by using the `show class-of-service forwarding-table scheduler-map` command.

**Troubleshooting a CoS Classifier Configuration for a TCAM Space Error**

**Problem**
When a CoS classifier configuration exceeds the amount of available ternary content addressable memory (TCAM) space, the switch returns the following system log message:

```
<number_of_rules_being_added> rules for <filter_name> class <filter_class> will not be installed, key: <bind_point>. no space in tcam db(<shared_pool_information>)
```

The switch returns this message during the commit operation if the number of classifiers defined in the CoS configuration or the number of bind points (interfaces) to which classifiers are bound causes the CoS configuration to exceed the amount of available TCAM space. However, the commit operation for the CoS configuration is completed in the CLI module.

**Solution**
When a CoS configuration exceeds the amount of available TCAM table space, you must either define fewer classifiers or bind them to fewer interfaces, or both, so that the space requirements for the CoS configuration do not exceed the available space in TCAM.
To delete classifier definitions and bind points in a CoS configuration, and to apply a new CoS classifier definition to fewer bind points:

1. Delete either the CoS classifier definition or the bind points:
   - To delete the CoS classifier definition:
     - For behavioral classifiers:
       ```
       [edit class-of-service]
       user@switch# delete classifier dscp dl
       ```
     - For multifield classifiers:
       ```
       [edit]
       user@switch# delete interfaces ge-3/0/2 unit 0 family ethernet-switching filter input ipacl
       ```
     This command deletes a multifield classifier defined for a port. Similarly, you can delete a multifield classifier defined for a VLAN or router.
     You can also delete terms defined in a single multifield classifier:
     ```
     [edit]
     user@switch# delete firewall family inet filter f1 term t1
     ```
     In both these examples (for behavioral and multifield classifiers), the assumption is that too many classifier definitions resulted in the error message.
   - To delete the bind points:
     ```
     [edit class-of-service]
     user@switch# delete class-of-service interfaces ge-0/0/0
     user@switch# delete class-of-service interfaces ge-0/0/1
     user@switch# delete class-of-service interfaces ge-0/0/2
     user@switch# delete class-of-service interfaces ge-0/0/3
     user@switch# delete class-of-service interfaces ge-0/0/4
     user@switch# delete class-of-service interfaces ge-0/0/5
     user@switch# delete class-of-service interfaces ge-0/0/6
     user@switch# delete class-of-service interfaces ge-0/0/7
     user@switch# delete class-of-service interfaces ge-0/0/8
     ```
     Here the assumption is that too many bind points (nine) in the configuration resulted in the error message.

2. Commit the operation:
   ```
   [edit]
   user@switch# commit
   ```

3. Define fewer classifiers in the CoS configuration or bind classifiers to fewer interfaces, or both, so that the CoS classifier configuration does not exceed the amount of available TCAM space on the switch:
   - To define CoS classifiers:
     - For behavioral classifiers:
       ```
       [edit]
       user@switch# set class-of-service classifiers dscp d2 forwarding-class fc1 loss-priority low code-points 000001
       user@switch# set class-of-service classifiers dscp d2 forwarding-class fc2 loss-priority low code-points 000010
       user@switch# set class-of-service classifiers dscp d2 forwarding-class fc3 loss-priority low code-points 000011
       ```
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc4 loss-priority low code-points 000100
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc5 loss-priority low code-points 000101
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc6 loss-priority low code-points 000110
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc7 loss-priority low code-points 000111

- For multifield Classifiers:

  [edit]
  user@switch# set firewall family inet filter f1 term t1 from protocol tcp
  user@switch# set firewall family inet filter f1 term t1 then loss-priority high
  user@switch# set firewall family inet filter f1 term t1 then forwarding-class best-effort
  user@switch# set firewall family inet filter f1 term t2 from protocol udp
  user@switch# set firewall family inet filter f1 term t2 then loss-priority high
  user@switch# set firewall family inet filter f1 term t2 then forwarding-class assured-forwarding
  user@switch# set firewall family inet filter f1 term t3 from source-port ssh
  user@switch# set firewall family inet filter f1 term t3 then loss-priority low
  user@switch# set firewall family inet filter f1 term t3 then forwarding-class fc8
  user@switch# set class-of-service forwarding-classes best-effort, assured-forwarding, fc8

- To bind classifiers to fewer interfaces:

  [edit]
  user@switch# set class-of-service interfaces ge-0/0/0 unit 0 classifers dscp d2
  user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifers dscp d2
  user@switch# set class-of-service interfaces ge-0/0/2 unit 0 forwarding-class best-effort
  user@switch# set class-of-service interfaces ge-0/0/3 unit 0 forwarding-class assured-forwarding
  user@switch# set class-of-service interfaces ge-0/0/4 unit 0 forwarding-class fc8

4. Commit the operation:

  [edit]
  user@switch# commit

5. Check system log for an error message. If an error message is not logged, then your classifier configuration has not exceeded the TCAM space limit.

   If an error message is logged, then repeat this procedure by defining fewer classifiers or binding classifiers to fewer bind points.

Understanding Storm Control on EX Series Switches

NOTE: This topic uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Understanding Storm Control on EX Series Switches. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

A traffic storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. Storm control enables the switch to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the storm control level or storm control bandwidth—is exceeded, thus preventing packets from proliferating and degrading the LAN. As an alternative to having the switch drop packets, you can configure storm control to shut down interfaces or temporarily disable interfaces (see the action-shutdown statement and the recovery-timeout statement) when the storm control level is exceeded.

NOTE: On Juniper Networks EX4300 Ethernet Switches, the factory default configuration enables storm control on all Layer 2 interfaces, with the storm control level set to 80 percent of the combined broadcast, multicast, and unknown unicast traffic streams.

Storm control is not enabled by default on Juniper Networks EX9200 Ethernet Switches.
You can customize the storm control level for a specific interface by explicitly configuring either bandwidth level or bandwidth percentage.

- **Bandwidth level**—Configures the storm control level as the bandwidth in kilobits per second of the applicable traffic streams on that interface.

- **Bandwidth percentage**—Configures the storm control level as a percentage of the available bandwidth used by the combined applicable traffic streams that are subject to storm control on that interface.

**NOTE:** You cannot configure both bandwidth level and bandwidth percentage for the same interface.

You can disable storm control selectively for broadcast, multicast, or unknown unicast traffic, or any combination of traffic types. When disabling storm control for multicast traffic, you can specify the traffic to be either registered multicast or unregistered multicast.

The sending and receiving of broadcast, multicast, and unicast packets are part of normal LAN operation. Therefore, to recognize a storm, you must be able to identify when traffic has reached a level that is abnormal for your LAN. Suspect a storm when operations begin timing out and network response times slow down. As more packets flood the LAN, network users might be unable to access servers or e-mail.

Monitor the level of broadcast, multicast, and unknown unicast traffic in the LAN when it is operating normally. Use this data as a benchmark to determine when traffic levels are too high. Then configure storm control to set the level at which you want the switch to drop broadcast traffic, multicast traffic, unknown unicast traffic, or two or all three of those traffic types.

**NOTE:** When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth or level. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined traffic streams. Traffic might include broadcast, multicast, and unknown unicast traffic, depending upon the configuration.

Unknown Unicast Forwarding Overview

- Understanding Unknown Unicast Forwarding on EX Series Switches on page 2017

Understanding Unknown Unicast Forwarding on EX Series Switches

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward all unknown unicast traffic to a specific Layer 2 interface. This channels the unknown unicast traffic to a single interface.

Configuration Examples

- Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches on page 2019

Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on an EX Series switch to rate-limit broadcast traffic, multicast traffic, and unknown unicast traffic at a specified level and to have packets dropped when the specified traffic level is exceeded, thereby preventing packets from proliferating and degrading the LAN.

**NOTE:** On EX4300 switches, the factory default configuration enables storm control on all Layer 2 interfaces, with the storm control level set to 80 percent of the available bandwidth used by the applicable traffic streams on that interface.
This example shows how to configure storm control on an EX Series switch running Junos OS with ELS.

- Requirements on page 2020
- Overview and Topology on page 2020
- Configuration on page 2020

Requirements

This example uses the following hardware and software components:

- One EX Series switch running Junos OS with ELS
- Junos OS Release 13.2 or later for EX Series switches

Overview and Topology

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the storm control level, of broadcast traffic, multicast traffic, and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined applicable traffic streams or as the percentage of available bandwidth used by the combined applicable traffic streams.

Storm control monitors the level of applicable incoming traffic and compares it with the level that you specify. If the combined level of the applicable traffic exceeds the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure storm control to shut down interfaces or temporarily disable interfaces (see the action-shutdown statement or the recovery-timeout statement) when the storm control level is exceeded.

The topology used in this example consists of one switch connected to various network devices. This example shows how to configure the storm control level on interface ge-0/0/0 by setting the level to a traffic rate of 15,000 Kbps, based on the traffic rate of the combined applicable traffic streams. If the combined traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

Configuration

To quickly configure storm control based on the traffic rate in kilobits per second of the combined traffic streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set forwarding-options storm-control-profiles sc all bandwidth-level 15000
set interfaces ge-0/0/0 unit 0 family ethernet-switching storm-control sc
```
Step-by-Step Procedure

To configure storm control:

1. Configure a storm control profile, sc, and specify the traffic rate in kilobits per second of the combined traffic streams:

   [edit]
   user@switch> set forwarding-options storm-control-profiles sc all bandwidth-level 15000

2. Bind the storm control profile, sc, to a logical interface:

   [edit]
   user@switch> set interfaces ge-0/0/0 unit 0 family ethernet-switching storm-control sc

Results

Display the results of the configuration:

[edit forwarding-options]
user@switch> show storm-control-profiles sc
all {
   bandwidth 15000;
}

[edit]
user@switch> show interfaces ge-0/0/0
unit 0 {
   family ethernet-switching {
      vlan {
         members default;
      }
      storm-control sc;
   }
}

- Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure) on page 2023
- Configuring or Disabling Storm Control (CLI Procedure) on page 2023
NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Unknown Unicast Forwarding (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific Layer 2 interface. You can configure each VLAN to divert unknown unicast traffic to different interfaces or use one interface for multiple VLANs.

To configure unknown unicast forwarding options:

NOTE: Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

- Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is employee), and specify the Layer 2 interface to which all unknown unicast traffic will be forwarded:

  [edit switch-options]
  user@switch# set unknown-unicast-forwarding vlan vlan-name interface ge-x/y/z.0

Related Documentation

Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

An Ethernet switching access interface on an EX Series switch might shut down or be disabled as a result of one of the following port-security or storm control configurations:

- MAC limiting—`mac-limit` statement is configured with the action `shutdown`.
- MAC move limiting—(Not supported on EX9200) `mac-move-limit` statement is configured with the action `shutdown`.
- Storm control—`storm-control` statement is configured with the action `shutdown`.

You can configure the switch to automatically restore the disabled interfaces to service after a specified period of time. The specified `recovery-timeout` applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: To enable autorecovery, specify the timeout value for the interfaces to recover automatically. There is no default recovery timeout. If you do not specify a timeout value, you need to use the `clear ethernet-switching recovery-timeout` command to clear the errors and restore the interfaces to service.

Specify the recovery timeout period for the interface:

```
[edit interfaces interface-name family ethernet-switching]
user@switch# set recovery-timeout seconds
```

Configuring or Disabling Storm Control (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Disabling or Enabling Storm Control (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.
On EX4300 switches, the factory default configuration enables storm control on all Layer 2 switch interfaces. The default storm control level is set to 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.

Storm control is not enabled by default on EX9200 switches.

You can customize the storm control level for a specific interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined traffic streams or as the percentage of available bandwidth used by the combined traffic streams.

You can selectively disable storm control for broadcast, multicast, or unknown unicast traffic on all interfaces or on a specified interface. You can additionally disable storm control on registered or unregistered multicast traffic.

This topic describes:

- Configuring Storm Control on page 2025
- Disabling Storm Control on Broadcast Traffic on page 2025
- Disabling Storm Control on All Multicast Traffic on page 2025
- Disabling Storm Control on Registered Multicast Traffic on page 2026
- Disabling Storm Control on Unregistered Multicast Traffic on page 2026
- Disabling Storm Control on Unknown Unicast Traffic on page 2026
- Disabling Storm Control on Multiple Types of Traffic on page 2026
Configuring Storm Control

You can configure storm control for a specific interface. The storm control level can be customized by explicitly configuring either the bandwidth level or the bandwidth percentage.

- **bandwidth-level**—Configures the storm control level as the bandwidth in kilobits per second of the combined traffic streams.
- **bandwidth-percentage**—Configures the storm control level as a percentage of the available bandwidth used by the combined traffic streams.

To configure storm control:

1. Create a storm control profile and set the storm control level as the traffic rate in kilobits per second of the combined traffic streams:

   ```
   [edit forwarding-options]
   user@switch# set storm-control-profiles profile-name all bandwidth-level kbps
   ```

2. Bind the storm control profile to a logical interface:

   ```
   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name
   ```

Disabling Storm Control on Broadcast Traffic

To disable storm control on broadcast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams and exclude broadcast traffic:

   ```
   [edit forwarding-options]
   user@switch# set storm-control-profiles profile-name all bandwidth-level kbps no-broadcast
   ```

2. Bind the storm control profile to a logical interface:

   ```
   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name
   ```

Disabling Storm Control on All Multicast Traffic

To disable storm control on all multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude multicast traffic:

   ```
   [edit forwarding-options]
   user@switch# set storm-control-profiles profile-name all bandwidth-level kbps no-multicast
   ```

2. Bind the storm control profile to a logical interface:

   ```
   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name
   ```
Disabling Storm Control on Registered Multicast Traffic

To disable storm control on only registered multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude registered multicast traffic:

   [edit forwarding-options]
   user@switch# set storm-control-profiles profile-name all bandwidth-level kbps no-registered-multicast

2. Bind the storm control profile to a logical interface:

   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name

Disabling Storm Control on Unregistered Multicast Traffic

To disable storm control on only unregistered multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude unregistered multicast traffic:

   [edit forwarding-options]
   user@switch# set storm-control-profiles profile-name all bandwidth-level kbps no-unregistered-multicast

2. Bind the storm control profile to a logical interface:

   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name

Disabling Storm Control on Unknown Unicast Traffic

To disable storm control on only unknown unicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude unregistered multicast traffic:

   [edit forwarding-options]
   user@switch# set storm-control-profiles profile-name all bandwidth-level kbps no-unknown-unicast

2. Bind the storm control profile to a logical interface:

   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name

Disabling Storm Control on Multiple Types of Traffic

To disable storm control on broadcast and multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude broadcast and multicast traffic:
[edit forwarding-options]
user@switch# set storm-control-profiles profile-name all bandwidth-level kbps no-broadcast no-multicast

2. Bind the storm control profile to a logical interface:

[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching storm-control profile-name

Configuration Statements

- [edit switch-options] Configuration Statement Hierarchy on EX Series Switches on page 2027

[edit switch-options] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit switch-options] hierarchy level on EX Series switches.

- Supported statements are those that you can use to configure some aspect of a software feature on the switch.
- Unsupported statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit switch-options] Hierarchy Level on page 2027
- Unsupported Statements in the [edit switch-options] Hierarchy Level on page 2028

Supported Statements in the [edit switch-options] Hierarchy Level

The following hierarchy shows the [edit switch-options] configuration statements supported on EX Series switches:

switch-options {
  authentication-whitelist mac-address {
    interface interface-name;
    vlan-assignment (vlan-id | vlan-name);
  }
  interface interface-name {
    interface-mac-limit number {
      packet-action action;
    }
    no-mac-learning;
    persistent-learning
Unsupported Statements in the [edit switch-options] Hierarchy Level

All statements in the [edit switch-options] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

Table 259: Unsupported [edit switch-options] Configuration Statements on EX Series Switches

**action-shutdown**

**Syntax**

```
action-shutdown;
```

**Hierarchy Level**

- For platforms with ELS:
  ```
  [edit forwarding-options storm-control-profiles profile-name]
  ```
- For platforms without ELS:
  ```
  [edit ethernet-switching-options storm-control]
  ```

**Release Information**

Statement introduced in Junos OS Release 9.6 for EX Series switches.

(See “Getting Started with Enhanced Layer 2 Software” on page 3 for information about ELS.)

**Description**

Shut down or disable interfaces when the storm control level is exceeded, as follows:

- If you set both the action-shutdown and the port-error-disable statements, the interfaces are disabled temporarily and recover automatically when the disable timeout expires.

- If you set both the action-shutdown and the recovery-timeout statements, the interfaces are disabled temporarily and recover automatically when the recovery timeout expires.

- If you set the action-shutdown statement and do not specify the port-error-disable statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. You must issue the clear ethernet-switching port-error command to clear the port error and restore the interfaces to service.

- If you set the action-shutdown statement and do not specify the recovery-timeout statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. You must issue the clear ethernet-switching recovery-timeout command to clear the port error and restore the interfaces to service.

**Default**

The action-shutdown option is not enabled. When the storm control level is exceeded, the switch drops applicable types of traffic on the specified interfaces. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

</tr>
<tr>
<td>Release Information</td>
<td>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</td>
</tr>
<tr>
<td>Description</td>
<td>Configure the storm control level as the bandwidth in kilobits per second of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.</td>
</tr>
</tbody>
</table>

**NOTE:** When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

**Default**

On EX4300 switches—If you do not specify the storm control level using either the bandwidth-level or the bandwidth-percentage statements, the storm control level defaults to 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.

On EX9200 switches—Storm control is not enabled by default.

**Options**

- **bandwidth-level kbps**—Traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast traffic streams.
  - **Range:** 100 through 10,000,000
  - **Default:** None

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

bandwidth-percentage

Syntax      bandwidth-percentage percentage;

Hierarchy Level [edit forwarding-options storm-control-profiles profile-name all]

Release Information Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description Configure the storm control level as the percentage of available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams on an interface. The storm control level is configured as part of the storm control profile.

NOTE: When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

Default On EX4300 switches—The storm control level is 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.

On EX9200 switches—Storm control is not enabled by default.

Required Privilege Level system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

  ```

**Release Information**

Statement introduced in Junos OS Release 9.1 for EX Series switches.  
(See “Getting Started with Enhanced Layer 2 Software” on page 3 for information about ELS.)

**Description**

Disable storm control for broadcast traffic for the specified interface or for all interfaces.

**Default**

- On EX2200, EX3200, EX3300, and EX4200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control on broadcast, multicast, or unknown-unicast traffic.

- On EX4300 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. You can selectively disable storm control on any type of traffic.

- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams. On EX8200 switches, you can selectively disable storm control on registered multicast traffic, on unregistered multicast traffic, or on both types of multicast traffic.

- On EX6200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. You can selectively disable storm control for each type of traffic individually.

- On EX9200 switches—Storm control is not enabled by default.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**recovery-timeout**

**Syntax**
```
recovery-timeout seconds;
```

**Hierarchy Level**
```
[edit interfaces interface-name family ethernet-switching]
```

**Release Information**

**Description**
Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, or rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after the specified period of time:

- If you have enabled MAC limiting with the `shutdown` option and you enable `recovery-timeout`, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.

- If you have enabled MAC move limiting (Not supported on EX9200) with the `shutdown` option and you enable `recovery-timeout`, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.

- If you have enabled storm control with the `action-shutdown` option and you enable `recovery-timeout` the switch disables (rather than shuts down) the interface when applicable traffic exceeds the specified levels. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.

**NOTE:** The recovery-timeout configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after recovery-timeout has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the operational mode command `clear ethernet-switching recovery-timeout`.

**Default**
Not enabled.

**Options**
- `seconds`— Number of seconds that the interface remains in a disabled state due to a port error prior to automatic recovery.

  **Range:** 10 through 3600

- Operational Commands on page 2044

Routine Monitoring

- Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface on page 2043

Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface

Purpose  Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single trunk interface instead of flooding unknown unicast packets across all interfaces that are members of the same VLAN.

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, See: Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface. For ELS details see: "Getting Started with Enhanced Layer 2 Software" on page 3.
Action  Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is v1):

```
user@switch> show configuration switch-options

unknown-unicast-forwarding {
  vlan v1 {
    interface ge-0/0/7.0;
  }
}
```

Display the Ethernet switching table:

```
user@switch> show ethernet-switching table vlan-name v1
Ethernet-switching table: 3 unicast entries
  VLAN  MAC address  Type     Age Interfaces
    v1     *          Flood    -   All-members
    v1  00:01:09:00:00:00 Learn    24   ge-0/0/7.0
    v1  00:11:09:00:01:00 Learn    37   ge-0/0/3.0
```

Meaning  The sample output from the `show configuration switch-options` command shows that the unknown unicast forwarding interface for VLAN v1 is interface ge-0/0/7. The `show ethernet-switching table` command shows that an unknown unicast packet is received on interface ge-0/0/3 with the destination MAC address (DMAC) 00:01:09:00:00:00 and the source MAC address (SMAC) of 00:11:09:00:01:00. This shows that the SMAC of the packet is learned in the normal way (through the interface ge-0/0/3.0), while the DMAC is learned on interface ge-0/0/7.

Understanding Bridging and VLANs on EX Series Switches

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN. This topic explains the following concepts regarding bridging and VLANs on Juniper Networks EX Series Ethernet Switches:

- History of VLANs on page 2050
- How Bridging of VLAN Traffic Works on page 2050
- Packets Are Either Tagged or Untagged on page 2051
- Switch Interface Modes—Access, Trunk, or Tagged Access on page 2052

- Assigning Traffic to VLANs on page 2055
- Forwarding VLAN Traffic on page 2056
- VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces on page 2056
History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of transparent bridging (generally called simply bridging). Bridging divides a single physical LAN (now called a single broadcast domain) into two or more virtual LANs, or VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

How Bridging of VLAN Traffic Works

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is learning. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the
sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do forwarding. By consulting the Ethernet switching table to see whether the table already contains the frame’s destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

Flooding finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

Filtering, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, aging. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node’s MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

Packets Are Either Tagged or Untagged

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The VLAN IDs 1 through 4094 can be assigned to VLANs, while VLAN IDs 0 and 4095 are reserved by Junos OS and cannot be assigned.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet. The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

In addition to the TPID EtherType value of 0x8100, EX Series switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also support values of 0x88a8 (Provider Bridging and Shortest Path Bridging) and 0x9100 (Q-inQ).
For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

**Switch Interface Modes—Access, Trunk, or Tagged Access**

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

**Access Mode**

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot an EX Series switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named `default`. You can optionally configure another VLAN and use that VLAN instead of `default`.

On an EX Series switch that runs Junos OS that supports ELS, the VLAN named `default` is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For EX Series switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see “Trunk Mode and Native VLAN” on page 2053.

**Trunk Mode**

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets’ VLAN origin and VLAN destination.

On an EX Series switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On an EX Series switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on EX Series switches that run either type of software, you must configure the single VLAN
on a trunk port as a native VLAN. For more information about native VLANs, see "Trunk Mode and Native VLAN" on page 2053.

**Trunk Mode and Native VLAN**

On an EX Series switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On an EX Series switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch’s trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for EX Series switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

**Tagged-Access Mode**

Only EX Series switches that run Junos OS that does not use the ELS configuration style support tagged-access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.

- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.
NOTE: Control packets are never reflected back on the downstream port.

**Additional Advantages of Using VLANs**

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.

- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.

- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For an EX Series switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)

- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.

- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

**Maximum VLANs and VLAN Members Per Switch**

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command `set vlans <vlan-name> vlan-id ?` to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On an EX Series switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports (vmember limit = vlan max * 8). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.
On an EX Series switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports (vmember limit = vlan max * 24). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

**A Default VLAN Is Configured on Most Switches**

*NOTE:* EX Series switches that run Junos OS with the ELS configuration style do not support a default VLAN.

Some EX Series switches that run Junos OS that does not support the ELS configuration style are preconfigured with a VLAN named default that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named default and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

The following EX Series switches that run Junos OS that does not support the ELS are not preconfigured to belong to default or any other VLAN:

- Modular switches, such as the EX8200 switches and EX6200 switches
- Switches that are part of a Virtual Chassis

The reason that these switches are not preconfigured is that the physical configuration in both situations is flexible. There is no way of knowing which line cards have been inserted in either the EX8200 switch or EX6200 switch. There is also no way of knowing which switches are included in the Virtual Chassis. Switch interfaces in these two cases must first be defined as Ethernet switching interfaces. After an interface is defined as an Ethernet switching interface, the default VLAN appears in the output from the ? help and other commands.

*NOTE:* When a Juniper Networks EX4500 Ethernet Switch, EX4200 Ethernet Switch, or EX3300 Ethernet Switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

**Assigning Traffic to VLANs**

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.
Assign VLAN Traffic According to the Interface Port Source

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

Assign VLAN Traffic According to the Source MAC Address
