# Part 3 System Setup

## Chapter 3 Overview

- Software Overview ......................................................... 111
  - Understanding Software Infrastructure and Processes ........ 111
  - Routing Engine and Packet Forwarding Engine ................. 111
  - Junos OS Processes .................................................... 112

## Chapter 4 Configuration

- Initial Configuration .................................................... 115
  - Configuring the LCD Panel on EX Series Switches (CLI Procedure) 115
  - Disabling or Enabling Menus and Menu Options on the LCD Panel 115
  - Configuring a Custom Display Message ................................. 116
  - Configuring Date and Time for the EX Series Switch (J-Web Procedure) 117
  - Configuring System Identity for an EX Series Switch (J-Web Procedure) 118
- Configuration Statements ............................................... 119
  - `arp (System)` ............................................................ 120
  - `authentication-key` .................................................. 121
  - `auxiliary` .............................................................. 122
  - `boot-server (NTP)` .................................................... 123
  - `broadcast` ................................................................ 124
  - `broadcast-client` ........................................................ 125
  - `console (System Ports)` ................................................. 126
  - `default-address-selection` ............................................. 127
  - `domain-name` ............................................................ 128
  - `gre-path-mtu-discovery` .............................................. 128
  - `host-name` ............................................................... 129
  - `icmpv4-rate-limit` ....................................................... 129
  - `icmpv6-rate-limit` ....................................................... 130
  - `inet6-backup-router` .................................................... 131
  - `internet-options` ......................................................... 132
  - `ipip-path-mtu-discovery` ............................................. 133
  - `ipv6-duplicate-addr-detection-transmits` ......................... 133
  - `ipv6-path-mtu-discovery` ............................................. 134
  - `ipv6-path-mtu-discovery-timeout` .................................. 134
  - `ipv6-reject-zero-hop-limit` ......................................... 135
  - `lcd-menu` ................................................................ 136
  - `location (System)` ........................................................ 138
  - `menu-item` ............................................................... 140
  - `multicast-client` ......................................................... 143
  - `no-multicast-echo` .................................................... 144
  - `no-ping-record-route` .................................................. 145
  - `no-ping-time-stamp` .................................................... 145
  - `no-redirects (IPv4 Traffic)` .......................................... 146
  - `no-tcp-rfc1323-paws` ................................................ 147
  - `no-tcp-rfc1323` ......................................................... 147
  - `ntp` ..................................................................... 148
  - `path-mtu-discovery` .................................................... 148
  - `peer (NTP)` .............................................................. 149
  - `port-type` ............................................................... 150

## Chapter 5  Administration ................................................... 159

**Operational Commands** .................................................. 159
- clear chassis display message ........................................ 160
- clear system reboot .................................................. 163
- configure .......................................................... 167
- op .............................................................. 169
- request chassis pic ................................................... 171
- request chassis routing-engine master .................................. 175
- request system halt .................................................. 180
- request system logout .............................................. 186
- request system power-off ........................................... 187
- request system reboot ............................................... 191
- request system scripts convert ..................................... 198
- request system scripts refresh-from commit ....................... 200
- request system scripts refresh-from event ....................... 201
- request system scripts refresh-from op .......................... 202
- request system storage cleanup ................................... 203
- restart .......................................................... 213
- set chassis display message ....................................... 223
- set date ......................................................... 226
- show chassis fan ................................................... 227
- show chassis firmware .............................................. 240
- show chassis lcd ................................................... 251
- show configuration ................................................ 264
- show host ......................................................... 267
- show ntp associations .............................................. 268
- show ntp status .................................................. 270
- show system firmware ............................................. 273
- show system reboot ................................................. 275
- show system software ............................................. 278
- show system storage .............................................. 286
- show system switchover ........................................... 292
- show system uptime ................................................ 296
- show system users ................................................ 301
- show system virtual-memory ...................................... 305
- show task replication ............................................... 363
- show version ...................................................... 365
- show version fpc ................................................. 378

## Chapter 6  Troubleshooting Procedures ............................... 379

- Troubleshooting Loss of the Root Password .......................... 379
Table of Contents

Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure) ........................................... 419

  mib-profile ............................................................ 444
  minimum-changes .................................................... 445
  minimum-length ..................................................... 446
  object-names .......................................................... 447
  operation ............................................................... 447
  password (Login) ..................................................... 448
  permissions ............................................................ 449
  radius-options (edit system) ...................................... 450
  retry-options .......................................................... 451
  root-authentication ................................................. 452
  root-login .............................................................. 453
  routing-engine-profile ............................................. 454
  size ...................................................................... 455
  source-classes ........................................................ 455
  start-time (Log File Transfer) ..................................... 456
  tacplus-options ....................................................... 457
  tacplus-server ....................................................... 458
traceoptions (Address-Assignment Pool) ......................... 459
transfer-interval .................................................. 460
uid ................................................................. 461
user (Access) .................................................... 462

Chapter 12 Administration ............................................. 463
Routine Monitoring .................................................. 463
Managing Users (J-Web Procedure) .............................. 463
Operational Commands ............................................. 465
request message ................................................... 466
show subscribers ................................................... 467

Chapter 13 Troubleshooting Procedures ............................ 485
Troubleshooting Loss of the Root Password ...................... 485

Part 6 Configuration and File Management

Chapter 14 Overview .................................................. 491
Software Overview .................................................. 491
Understanding Software Infrastructure and Processes ....... 491
Routing Engine and Packet Forwarding Engine ............... 491
Junos OS Processes ............................................... 492
Configuration Files Overview ...................................... 493
Understanding Configuration Files for EX Series Switches .. 493
Using the CLI Viewer in the J-Web Interface to View Configuration Text ... 494
Using the CLI Editor in the J-Web Interface to Edit Configuration Text ... 494
Using the Point and Click CLI Tool in the J-Web Interface to Edit Configuration Text .................. 494
Understanding Automatic Refreshing of Scripts on EX Series Switches ... 496
Understanding Autoinstallation of Configuration Files ........ 497
Typical Uses for Autoinstallation ................................ 497
Autoinstallation Configuration Files and IP Addresses ....... 497
Typical Autoinstallation Process on a New Switch .......... 498
Configuration Files Terms ........................................ 499

Chapter 15 Configuration ............................................ 501
Configuration Tasks ................................................ 501
Uploading a Configuration File (CLI Procedure) ............... 501
Uploading a Configuration File (J-Web Procedure) .......... 503
Loading a Previous Configuration File (CLI Procedure) .... 503
Reverting to the Default Factory Configuration for the EX Series Switch ... 504
Reverting to the Factory-Default Configuration by Using the LCD Panel ............................................. 505
Reverting to the Factory-Default Configuration by Using the request system zeroize Command ................. 506
Reverting to the Factory-Default Configuration by Using the load factory-default Command .................. 506
Reverting to the Rescue Configuration for the EX Series Switch .......... 507
Setting or Deleting the Rescue Configuration (CLI Procedure) ........ 508
Setting or Deleting the Rescue Configuration (J-Web Procedure) .... 509
Table of Contents

Chapter 16 Administration ................................................... 523

Routine Monitoring .............................................................. 523

Managing Configuration Files Through the Configuration History (J-Web Procedure) .................................................. 523
Displaying Configuration History ............................................. 523
Displaying Users Editing the Configuration ................................ 524
Comparing Configuration Files with the J-Web Interface ................. 525
Downloading a Configuration File with the J-Web Interface ............. 525
Loading a Previous Configuration File with the J-Web Interface ........ 525
Verifying Autoinstallation Status ............................................. 526

Operational Commands ........................................................... 527

clear log .............................................................................. 528
clear system commit ............................................................. 529
file archive ......................................................................... 530
file checksum md5 ............................................................... 532
file checksum sha1 ............................................................... 533
file checksum sha-256 .......................................................... 534
file compare ................................................................. 535
file copy ........................................................................... 538
file delete ........................................................................... 540
file list .............................................................................. 541
file rename ......................................................................... 543
file show ............................................................................ 545
request system configuration rescue delete ......................... 547
request system configuration rescue save ............................ 548
request system scripts refresh-from commit ...................... 549
request system scripts refresh-from event ......................... 550
request system scripts refresh-from op ............................... 551
request system zeroize ......................................................... 552
show system commit ............................................................ 557
show system configuration archival .................................... 559
show system configuration rescue ....................................... 560
show system rollback .......................................................... 562
test configuration ............................................................... 564

Configuration Statements ......................................................... 513

archival ................................................................................. 513
archive-sites (Configuration File) ............................................. 514
autoinstallation ..................................................................... 516
synchronize (Commit configuration) ......................................... 517
configuration ..................................................................... 518
configuration-servers .......................................................... 519
interfaces ............................................................................ 520
transfer-interval (Configuration) ............................................. 521
transfer-on-commit ............................................................... 522

Configuring Autoinstallation of Configuration Files (CLI Procedure) ...... 509
Using the Commit Options to Commit Configuration Changes (J-Web Procedure) .................................................. 511

## Chapter 17 Troubleshooting Procedures

- Troubleshooting Loss of the Root Password

## Part 7 Software Installation

### Chapter 18 Overview

- Installation Overview
- Understanding Software Installation on EX Series Switches
- Overview of the Software Installation Process
- Software Package Security
- Installing Software on a Virtual Chassis
- Installing Software on Switches with Redundant Routing Engines
- Installing Software Using Automatic Software Download
- Troubleshooting Software Installation
- Understanding System Snapshot on EX Series Switches
- Understanding Resilient Dual-Root Partitions on Switches
- Resilient Dual-Root Partition Scheme (Junos OS Release 10.4R3 and Later)
- Automatic Fixing of Corrupted Primary Root Partition with the Automatic Snapshot Feature
- Earlier Partition Scheme (Junos OS Release 10.4R2 and Earlier)
- Understanding Upgrading or Downgrading Between Resilient Dual-Root Partition Releases and Earlier Releases
- Junos OS Package Names

### Software Overview

- Understanding Software Infrastructure and Processes
- Routing Engine and Packet Forwarding Engine
- Junos OS Processes

### Licenses Overview

- Understanding Software Licenses for EX Series Switches
- Purchasing a Software Feature License
- Features Requiring a License on EX2200 Switches
- Features Requiring a License on EX3300 Switches
- Features Requiring a License on EX4300 Switches
- Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches
- License Warning Messages

## Chapter 19 Configuration

- Registering the Switch
- Registering the EX Series Switch with the J-Web Interface
- Booting the Switch
- Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive
- Creating a Snapshot and Using It to Boot an EX Series Switch
- Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch
- Creating a Snapshot on an Internal Flash Drive and Using It to Boot the Switch
Installation from the Boot Loader Generates ‘cannot open package’ Error ........................................ 659
Troubleshooting a Switch That Has Booted from the Backup Junos OS Image ........................................ 660
Resilient Dual-Root Partitions Frequently Asked Questions ........................................ 661
What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Enabled? ........................................ 661
What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Not Enabled? ........................................ 662
How Will I Be Informed If My Switch Boots from the Alternate Slice Because of Corruption in the Root File System? ........................................ 663

Part 8 System Monitoring
Chapter 22 Overview ........................................ 667
Software Overview ........................................ 667
Understanding Software Infrastructure and Processes ........................................ 667
Routing Engine and Packet Forwarding Engine ........................................ 667
Junos OS Processes ........................................ 668
Alarms Overview ........................................ 669
Understanding Alarm Types and Severity Levels on EX Series Switches ........................................ 669
Dashboard Overview ........................................ 670
Dashboard for EX Series Switches ........................................ 670
System Information Panel ........................................ 671
Health Status Panel ........................................ 673
Capacity Utilization Panel ........................................ 675
Alarms Panel ........................................ 675
File System Usage ........................................ 675
Chassis Viewer ........................................ 675
Hardware/CLI Terminology Mapping Overview ........................................ 686
EX4300 Switch Hardware and CLI Terminology Mapping ........................................ 686

Chapter 23 Configuration ........................................ 689
Configuration Statements ........................................ 689
facility-override ........................................ 689
file (System Logging) ........................................ 690
files ........................................ 691
host (System) ........................................ 692
interface (Accounting or Sampling) ........................................ 694
log-prefix (System) ........................................ 694
match ........................................ 695
size (System) ........................................ 696
structured-data ........................................ 697
syslog (System) ........................................ 698
time-format ........................................ 700
time-zone ........................................ 701
user (System Logging) ........................................ 703
world-readable (System) ........................................ 704
Part 9  System Services

Chapter 25  Overview .......................................................1189

Software Overview ......................................................1189
  Understanding Software Infrastructure and Processes .................1189
    Routing Engine and Packet Forwarding Engine .......................1189
    Junos OS Processes .................................................1190

DHCP Local Server .....................................................1191
  Extended DHCP Local Server Overview ................................1192
    Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools ...1192
    Providing DHCP Client Configuration Information .................1193
    Minimal Configuration for Clients ................................1194
    DHCP Local Server and Address-Assignment Pools ..................1194
    DHCP Liveness Detection ...........................................1195

DHCPv6 Local Server Overview .......................................1196

DHCP Local Server Handling of Client Information Request Messages ...........................................1197

DHCP Duplicate Client Differentiation Using Client Subinterface

  Overview ..............................................................1198

Group-Specific DHCP Local Server Options ................................1199

Understanding Dynamic Reconfiguration of Extended DHCP Local Server

  Clients ...............................................................1200
  Default Client/Server Interaction ..................................1200
  Dynamic Client/Server Interaction for DHCPv4 .......................1200
  Dynamic Client/Server Interaction for DHCPv6 ......................1201
  Dynamic Configuration Options ....................................1201

DHCP Snooping Support ................................................1203

DHCP Auto Logout Overview ...........................................1204
  Auto Logout Overview ................................................1204
  How DHCP Identifies and Releases Clients .........................1205
  Option 60 and Option 82 Requirements ................................1206

Address-Assignment Pools Overview ................................1206

show chassis led ......................................................1042
show chassis location .................................................1052
show chassis pic .......................................................1056
show chassis routing-engine ........................................1070
show log ...............................................................1091
show pfe next-hop ....................................................1094
show pfe route .........................................................1099
show pfe terse .........................................................1105
show system alarms ..................................................1107
show system audit .....................................................1109
show system buffers ..................................................1117
show system connections .............................................1124
show system core-dumps ..............................................1143
show system directory-usage .........................................1155
show system processes ..............................................1159
Use of DHCP Option 50 and DHCPv6 IA_NA Option to Request a Specific IP Address ......................................................... 1207
Multiple Address Assignment for DHCPv6 Clients .................. 1208
Multiple Address Assignment Using Local Address Pools or RADIUS .... 1208
Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment ......................................................... 1208
Centrally Configured Opaque DHCP Options .......................... 1209
Data Flow for RADIUS-Sourced DHCP Options ...................... 1211
Multiple VSA 26-55 Instances Configuration .......................... 1212
DHCP Options That Cannot Be Centrally Configured .................. 1212
Port Number Requirements for DHCP Firewall Filters ............... 1213
DHCP Relay Agent .......................................................... 1214
Extended DHCP Relay Agent Overview ............................... 1215
Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers .......................................................... 1216
DHCP Liveness Detection ................................................... 1217
DHCP Relay Proxy Overview .............................................. 1218
Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP Servers .......................................................... 1218
DHCPv6 Relay Agent Overview .......................................... 1220
DHCP Duplicate Client Differentiation Using Client Subinterface Overview .......................................................... 1221
Group-Specific DHCP Relay Options .................................... 1221
DHCP Snooping Support ..................................................... 1222
DHCP Auto Logout Overview .............................................. 1223
Auto Logout Overview ....................................................... 1223
How DHCP Identifies and Releases Clients ............................ 1224
Option 60 and Option 82 Requirements ................................ 1225
Public Key Cryptography Overview ...................................... 1225
Understanding Public Key Cryptography on Switches ................ 1226
Public Key Infrastructure (PKI) and Digital Certificates .............. 1226
Self-Signed Certificates Overview ....................................... 1227
Understanding Self-Signed Certificates on EX Series Switches .... 1227

Chapter 26 Configuration .................................................. 1229
DHCP Local Server Examples ............................................. 1229
Example: Minimum Extended DHCP Local Server Configuration .... 1229
Example: Extended DHCP Local Server Configuration with Optional Pool Matching .................................................. 1230
Example: Configuring Group Liveness Detection for DHCP Local Server Clients .................................................. 1231
DHCP Relay Agent Examples ............................................. 1234
Example: Minimum DHCP Relay Agent Configuration .............. 1234
Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings ....................... 1235
Example: Configuring DHCP Snooping Support for DHCP Relay Agent .... 1239

xv
Configuration Tasks ................................................................. 1240
Configuring DHCP Services (J-Web Procedure) ......................... 1241
  Configuring DHCP Services (J-Web Procedure) on EX Series
  Switches ........................................................................... 1241
  Configuring DHCP Services on EX4300 Switches (J-Web
  Procedure) ................................................................. 1243
  Configuring a DHCP SIP Server (CLI Procedure) ..................... 1248
  Configuring a DHCP Client (CLI Procedure) ......................... 1249
  Configuring a DHCP Server on Switches (CLI Procedure) ........ 1250
  Configuring an Extended DHCP Server on a Switch ................. 1250
  Configuring a Legacy DHCP Server on a Switch (CLI Procedure) .. 1251
  Configuring an Extended DHCP Relay Server on EX Series Switches (CLI
  Procedure) ................................................................ 1252
Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed
  Certificates (CLI Procedure) ................................................. 1253
Manually Generating Self-Signed Certificates on Switches (CLI
  Procedure) .................................................................. 1254
Generating a Public-Private Key Pair on Switches ....................... 1254
Generating Self-Signed Certificates on Switches ....................... 1254
Deleting Self-Signed Certificates (CLI Procedure) ...................... 1255
Configuration Tasks for DHCP Local Server ................................. 1255
  Using External AAA Authentication Services with DHCP ............ 1256
  Guidelines for Configuring Support for DHCP Duplicate Clients ... 1257
  Configuring DHCP Duplicate Client Support .......................... 1258
  Grouping Interfaces with Common DHCP Configurations .......... 1258
  Guidelines for Configuring Interface Ranges ........................... 1259
  Overriding Default DHCP Local Server Configuration Settings .... 1261
  Specifying the Maximum Number of DHCP Clients Per Interface 1262
  Disabling ARP Table Population ........................................... 1263
  Automatically Logging Out DHCP Clients ............................... 1264
  Enabling Processing of Client Information Requests ................ 1265
  Specifying the Delegated Address Pool for IPv6 Prefix Assignment . 1266
  Enabling DHCPv6 Rapid Commit Support ............................ 1267
  Deleting DHCP Local Server and DHCP Relay Override Settings .... 1267
  Configuring Extended DHCP Local Server Dynamic Client
      Reconfiguration ............................................................. 1268
  Configuring Dynamic Reconfiguration Attempts for DHCP Clients .... 1269
  Configuring Deletion of the Client When Dynamic Reconfiguration Fails .... 1270
  Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated
      Disconnect .................................................................. 1270
  Configuring a Token for DHCP Local Server Authentication .......... 1271
  Preventing Binding of Clients That Do Not Support Reconfigure
      Messages .................................................................... 1271
  Requesting DHCP Local Server to Initiate Reconfiguration of Client
      Bindings .................................................................... 1272
  Configuring Detection of DHCP Local Server Client Connectivity .... 1273
  Configuring DHCP Snooped Packets Forwarding Support for DHCP Local
      Server ....................................................................... 1274
  Configuring Passwords for Usernames .................................... 1276
username-include (DHCP Local Server) ................................. 1385
version (BFD) ............................................................. 1386
DHCP Relay Agent Configuration Statements ............................. 1386
[edit forwarding-options dhcp-relay] Hierarchy Level ................. 1386
  Supported Statements in the [edit forwarding-options dhcp-relay]
    Hierarchy Level .................................................. 1387
  Unsupported Statements in the [edit forwarding-options dhcp-relay]
    Hierarchy Level .................................................. 1387
access (Dynamic Access Routes) ........................................ 1392
access-internal (Dynamic Access-Internal Routes) ..................... 1393

Part 10  Access Control

Chapter 28  Overview

Access Control Overview ....................................................... 1655
802.1X for EX Series Switches Overview ................................. 1655
How 802.1X Authentication Works ......................................... 1655
802.1X Features Overview .................................................... 1656
Supported Features Related to 802.1X Authentication ............... 1657
Understanding Authentication on EX Series Switches .......... 1658
Sample Basic Authentication Topology .................................... 1658
802.1X Authentication .......................................................... 1659
MAC RADIUS Authentication .................................................. 1661
Captive Portal Authentication .................................................. 1661
Static MAC Bypass of Authentication ....................................... 1662
Fallback of Authentication Methods ................................中央........... 1662
Understanding Guest VLANs for 802.1X on EX Series Switches . 1664
Understanding 802.1X and RADIUS Accounting on EX Series Switches . 1664
Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches . 1665
Understanding 802.1X and VoIP on EX Series Switches ................. 1668
Understanding 802.1X and VSAs on EX Series Switches .......... 1670
Understanding Dynamic VLANs for 802.1X on EX Series Switches ...... 1670
Understanding Server Fail Fallback and Authentication on EX Series Switches .................................................. 1671
Authentication Process Flow for EX Series Switches .................. 1672
Understanding Authentication Session Timeout ....................... 1673

Chapter 29  Configuration .................................................... 1675

Configuration Examples .......................................................... 1675
Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch .................................................. 1675
Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch .................................................. 1679
Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch .................................................. 1684
Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch .................................................. 1690
Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication .................................................. 1698
Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch .................................................. 1704
Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch .................................................. 1707
Example: Configuring MAC RADIUS Authentication on an EX Series Switch .................................................. 1713
Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch .................................................. 1719
Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication .................................................. 1725
Example: Setting Up Captive Portal Authentication on an EX Series Switch .................................................. 1730
Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS
Authentication and Odyssey Access Clients ........................................... 1735
Configuration Tasks ................................................................. 1739
Configuring 802.1X Interface Settings (CLI Procedure) ...................... 1740
Configuring 802.1X RADIUS Accounting (CLI Procedure) .................. 1741
Filtering 802.1X Supplicants Using RADIUS Server Attributes .......... 1742
  Configuring Match Statements on the RADIUS Server ................. 1743
  Applying a Port Firewall Filter from the RADIUS Server ........... 1745
Configuring LLDP (CLI Procedure) ............................................. 1745
  Enabling LLDP on Interfaces .............................................. 1746
  Adjusting LLDP Advertisement Settings ................................ 1746
  Adjusting SNMP Notification Settings of LLDP Changes ............ 1747
  Specifying a Management Address for the LLDP Management TLV . 1747
Configuring LLDP Power Negotiation .......................................... 1747
Configuring LLDP-MED (CLI Procedure) ..................................... 1748
  Enabling LLDP-MED on Interfaces ..................................... 1748
  Configuring Location Information Advertised by the Switch ........ 1748
  Configuring for Fast Start .............................................. 1749
VSA Match Conditions and Actions ............................................. 1749
Configuring Server Fail Fallback (CLI Procedure) ......................... 1752
Configuring MAC RADIUS Authentication (CLI Procedure) ............. 1754
Configuring Static MAC Bypass of Authentication (CLI Procedure) .... 1755
Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure) ................................................................. 1756
Configure Captive Portal Authentication (CLI Procedure) ................ 1757
  Configuring Secure Access for Captive Portal ....................... 1757
  Enabling an Interface for Captive Portal ............................. 1758
  Configuring Bypass of Captive Portal Authentication ............ 1758
Designing a Captive Portal Authentication Login Page on an EX Series Switch ............................................................... 1759
Controlling Authentication Session Timeouts (CLI Procedure) ........... 1761
Configuration Statements ......................................................... 1762
[edit access] Configuration Statement Hierarchy on EX Series Switches ................................................................. 1762
  Supported Statements in the [edit access] Hierarchy Level ........ 1763
  Unsupported Statements in the [edit access] Hierarchy Level ...... 1767

Chapter 32 Configuration

Configuration Examples .............................................. 1895
Example: Configuring CoS on EX Series Switches ................. 1895
Configuration Tasks ................................................. 1919
Configuring CoS (J-Web Procedure) ................................ 1920
Defining CoS Code-Point Aliases (CLI Procedure) ................ 1921
Defining CoS Code-Point Aliases (J-Web Procedure) .............. 1921
Defining CoS Classifiers (CLI Procedure) .......................... 1923
Defining CoS Classifiers (J-Web Procedure) ....................... 1925
Defining CoS Forwarding Classes (CLI Procedure) ................. 1927
Defining CoS Forwarding Classes (J-Web Procedure) .......... 1927
Defining CoS Schedulers and Scheduler Maps (CLI Procedure) . 1929
Configuring a Scheduler and a Scheduler Map ..................... 1929
Assigning a Scheduler Map to Interfaces .......................... 1930
Assigning Scheduler Maps to Interfaces on EX8200 Line Cards That Include Oversubscribed Ports ................. 1930
Defining CoS Schedulers (J-Web Procedure) ....................... 1931
Defining CoS Scheduler Maps (J-Web Procedure) ................. 1934
Configuring CoS Congestion Management (CLI Procedure) ....... 1935
Configuring a Weighted Tail Drop Profile ........ ................ 1936
Configuring a Weighted Random Early Detection Drop Profile .... 1936
Defining CoS Drop Profiles (J-Web Procedure) .................... 1938
Defining CoS Rewrite Rules (CLI Procedure) ...................... 1939
Defining CoS Rewrite Rules (J-Web Procedure) .................. 1940
Assigning CoS Components to Interfaces (CLI Procedure) ....... 1942
Assigning CoS Components to Interfaces (J-Web Procedure) .... 1942
Configuring Junos OS EZQoS for CoS (CLI Procedure) ........... 1944
Configuring CoS Traffic Classification for Ingress Queueing on Oversubscribed Ports on EX8200 Line Cards (CLI Procedure) ........ 1945
Configuration Statements ............................. 1946
[edit class-of-service] Configuration Statement Hierarchy on EX Series Switches ............................. 1946
Supported Statements in the [edit class-of-service] Hierarchy Level ........................................ 1946
Unsupported Statements in the [edit class-of-service] Hierarchy Level ........................................ 1948

transmit-rate (EX Series Switches) ......................... 1972
unit ..................................................... 1973

Chapter 33 Administrative Commands .......................... 1975
Routine Monitoring .................................... 1975
Monitoring CoS Classifiers ................................ 1975
Monitoring CoS Forwarding Classes ......................... 1976
Monitoring Interfaces That Have CoS Components ........... 1978
Monitoring CoS Rewrite Rules ............................ 1979
Monitoring CoS Scheduler Maps ............................ 1980
Monitoring CoS Value Aliases ............................. 1981
Monitoring CoS Drop Profiles ............................. 1982
Operational Commands .................................. 1983
show class-of-service .................................. 1984
show class-of-service classifier ............................ 1989
show class-of-service code-point-aliases .................... 1991
Chapter 37 Administration .................................................2043
Routine Monitoring .....................................................2043
Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface ..................................................2043
Operational Commands ..................................................2044
clear ethernet-switching recovery-timeout ..........................2045

Part 13 Ethernet Switching ..................................................2049
Overview .............................................................................2049
Bridging and VLANs ..........................................................2049
Understanding Bridging and VLANs on EX Series Switches ...................................................................................2049
  History of VLANs ................................................................2050
  How Bridging of VLAN Traffic Works ................................2050
  Packets Are Either Tagged or Untagged ..............................2051
  Switch Interface Modes—Access, Trunk, or Tagged Access ...................................................................................2052
  Additional Advantages of Using VLANs ..............................2054
  Maximum VLANs and VLAN Members Per Switch ..............2054
  A Default VLAN Is Configured on Most Switches ..............2055
  Assigning Traffic to VLANs ..............................................2055
  Forwarding VLAN Traffic ................................................2056
  VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces ......................2056
Understanding Integrated Routing and Bridging Interfaces and Routed VLAN Interfaces on EX Series Switches ...................................................................................2058
  When Should I Use an IRB Interface or RVI? ......................2059
  How Does an IRB Interface or RVI Work? ............................2059
  Creating an IRB Interface or RVI .......................................2060
  Viewing IRB Interface and RVI Statistics ............................2061
  IRB Interfaces and RVI Functions and Other Technologies ...................................................................................2061
Understanding Virtual Routing Instances on EX Series Switches ...................................................................................2062
Understanding Multiple VLAN Registration Protocol (MVRP) on EX Series Switches ..................................................2063
  How MVRP Updates, Creates, and Deletes VLANs on the Switches .................................................................2063
  MVRP Is Disabled by Default on the Switches ....................2063
  MRP Timers Control MVRP Updates ..................................2064
  MVRP Uses MRP Messages to Transmit Switch and VLAN States .................................................................2064
  Compatibility Issues with Junos OS Releases of MVRP ........2065
Understanding MAC Address Aging .......................................2066
Redundant Trunk Groups .....................................................2068
Understanding Redundant Trunk Links on EX Series Switches ...................................................................................2068
Proxy ARP .............................................................................2070
Understanding Proxy ARP on EX Series Switches .................2070
  What Is ARP? ....................................................................2070
  Proxy ARP Overview .......................................................2070

Part 25 Routing Policy and Packet Filtering

Chapter 77 Overview ...................................................... 4085

Security Features Overview ........................................... 4085
Security Features for EX Series Switches Overview .......... 4085
Firewall Filters Overview .............................................. 4087
Firewall Filters for EX Series Switches Overview .......... 4088
Firewall Filter Types .................................................. 4088
Firewall Filter Components .......................................... 4089
Firewall Filter Processing ............................................ 4090
Understanding Planning of Firewall Filters ..................... 4091
Understanding Firewall Filter Processing Points for Bridged and Routed
Packets on EX Series Switches ..................................... 4094
Understanding How Firewall Filters Control Packet Flows .... 4095
Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series
Switches .................................................................. 4096
Firewall Filter Elements .............................................. 4097
Match Conditions Supported on Switches ....................... 4097
Actions for Firewall Filters ........................................... 4104
Action Modifiers for Firewall Filters .............................. 4105
Support for Match Conditions and Actions for Loopback Firewall Filters on
Switches .................................................................. 4107
Platform Support for Firewall Filter Match Conditions, Actions, and Action
Modifiers on EX Series Switches ................................. 4111
Firewall Filter Types and Their Bind Points ..................... 4111
Support for IPv4 and IPv6 Firewall Filters on Switches ...... 4112
Platform Support for Match Conditions for IPv4 Traffic .... 4112
Platform Support for Match Conditions for IPv6 Traffic .... 4125
Platform Support for Match Conditions for Non-IP Traffic .. 4133
Platform Support for Actions for IPv4 Traffic ................. 4133
Platform Support for Actions for IPv6 Traffic ................. 4136
Platform Support for Action Modifiers for IPv4 Traffic ..... 4138
Platform Support for Action Modifiers for IPv6 Traffic ..... 4144
Understanding How Firewall Filters Are Evaluated .......... 4149
Understanding Firewall Filter Match Conditions .............. 4151
Filter Match Conditions .............................................. 4151
Numeric Filter Match Conditions ................................. 4151
Interface Filter Match Conditions .................................. 4152
IP Address Filter Match Conditions .............................. 4152
MAC Address Filter Match Conditions ......................... 4153
Bit-Field Filter Match Conditions ................................. 4153
Understanding How Firewall Filters Test a Packet's Protocol .. 4155
Understanding the Use of Policers in Firewall Filters ........ 4155
Policers Overview ...................................................... 4155
Policer Types .......................................................... 4156
Policer Actions ........................................................ 4157
Policer Levels .......................................................... 4157
Color Modes ............................................................. 4158
Naming Conventions for Policers ................................. 4158
Chapter 78 Configuration ................................................... 4161

Configuration Examples ................................................. 4161
Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches .............. 4161
Example: Configuring a Firewall Filter on a Management Interface on an EX Series Switch .................. 4179
Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on EX Series Switches .................. 4183
Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication .................. 4186

Configuration Tasks ...................................................... 4191
Configuring Firewall Filters (CLI Procedure) ...................... 4192
Configuring a Firewall Filter ........................................ 4192
Configuring a Term Specifically for IPv4 or IPv6 Traffic ........ 4196
Applying a Firewall Filter to a Port on a Switch ................ 4197
Applying a Firewall Filter to a Management Interface on a Switch ................ 4198
Applying a Firewall Filter to a VLAN on a Network .......... 4199
Applying a Firewall Filter to a Layer 3 (Routed) Interface .... 4200
Configuring Firewall Filters (J-Web Procedure) .................. 4201
Configuring Policers to Control Traffic Rates (CLI Procedure) .... 4206
Configuring Policers ................................................. 4207
Specifying Policers in a Firewall Filter Configuration ........... 4208
Applying a Firewall Filter That Is Configured with a Policier .... 4208
Assigning Multifield Classifiers in Firewall Filters to Specify
Packet-Forwarding Behavior (CLI Procedure) .................... 4209
Configuring Routing Policies (J-Web Procedure) .................. 4210
Configuring Tricolor Marking Policers ......................... 4215
Configuring a Tricolor Marking Policier ..................... 4216
Applying Tricolor Marking Policers to Firewall Filters ......... 4216

Configuration Statements ............................................ 4217
[edit firewall] Configuration Statement Hierarchy on EX Series Switches ........................................ 4217
Supported Statements in the [edit firewall] Hierarchy Level .... 4218
Unsupported Statements in the [edit firewall] Hierarchy Level .... 4219
Firewall Filter Configuration Statements Supported by Junos OS for EX Series Switches .......... 4219
action (TCM Policers) .................................................. 4222

Spanning-Tree Protocols

Overview ...................................................... 4297

Spanning Trees Overview ................................ 4297
Understanding MSTP for EX Series Switches .......... 4298
MSTP Maps Multiple VLANs ................................ 4298
Configuring MSTP Regions ................................. 4299
Selecting a Spanning-Tree Protocol ..................... 4299
Understanding RSTP for EX Series Switches .......... 4300
Spanning-Tree Protocols Help Prevent Broadcast Storms 4300
RSTP is an Enhancement of the Original STP .......... 4301
Port Roles Determine Participation in The Spanning-Tree 4301
Port States Determine How a Port Processes a Frame 4301
Edge Ports Connect to Devices That Cannot Be Part of a Spanning-Tree 4302
BPDUs Maintain the Spanning-Tree ....................... 4302
When an RSTP Root Bridge Fails ......................... 4303
Switches Must Relearn MAC Addresses After a Link Failure 4303
Selecting a Spanning-Tree Protocol ..................... 4303
Understanding STP for EX Series Switches ............ 4304
Selecting a Spanning-Tree Protocol ..................... 4305
RSTP or VSTP Forced to Run as IEEE 802.1D STP ....... 4306
Understanding VSTP for EX Series Switches .......... 4306
Selecting a Spanning-Tree Protocol ..................... 4307
Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches ............................. 4308
Different Kinds of BPDUs ................................ 4308
Protecting Switches From Incompatible BPDUs ....... 4308
Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches ......................... 4310
Understanding Root Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches ......................... 4311

Configuration .................................................. 4313

Configuration Examples .................................. 4313
Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches ............. 4313
Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches ......................... 4330
Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches ................................. 4352
Example: Configuring BPDU Protection on Interfaces to Prevent STP Miscalculations on EX Series Switches ................................. 4357
Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on EX Series Switches ................................. 4363
Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on EX Series Switches .......................... 4367
Configuration Tasks ....................................................... 4372
Forcing RSTP or VSTP to Run as IEEE 802.1D STP (CLI Procedure) ... 4372
Configuring Spanning-Tree Protocols (J-Web Procedure) ................. 4373
Configuring VSTP (CLI Procedure) ..................................... 4378
Unblocking an Interface That Receives BPDUs in Error (CLI Procedure) 4380
Operational Tasks ......................................................... 4380
Reverting to RSTP or VSTP from Forced IEEE 802.1D STP ............... 4381
Configuration Statements .................................................. 4381

- Documentation Conventions on page xcvii
- Documentation Feedback on page xcviii
- Requesting Technical Support on page xcix

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at http://www.juniper.net/techpubs/.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at http://www.juniper.net/books.

Supported Platforms

For the features described in this document, the following platforms are supported:

- EX Series

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the `load merge` or the `load merge relative` command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a full example. In this case, use the `load merge` command.
If the example configuration does not start at the top level of the hierarchy, the example is a snippet. In this case, use the load merge relative command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

   For example, copy the following configuration to a file and name the file ex-script.conf. Copy the ex-script.conf file to the /var/tmp directory on your routing platform.

   ```
   system {
     scripts {
       commit {
         file ex-script.xsl;
       }
     }
   }
   interfaces {
     fxp0 {
       disable;
       unit 0 {
         family inet {
           address 10.0.0.1/24;
         }
       }
     }
   }
   ```

2. Merge the contents of the file into your routing platform configuration by issuing the load merge configuration mode command:

   ```
   [edit]
   user@host# load merge /var/tmp/ex-script.conf
   load complete
   ```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

   For example, copy the following snippet to a file and name the file ex-script-snippet.conf. Copy the ex-script-snippet.conf file to the /var/tmp directory on your routing platform.

   ```
   commit {
     file ex-script-snippet.xsl; }
   ```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:
3. Merge the contents of the file into your routing platform configuration by issuing the `load merge relative` configuration mode command:

   ```
   [edit system scripts]
   user@host# load merge relative /var/tmp/ex-script-snippet.conf
   load complete
   ```

For more information about the `load` command, see the *CLI User Guide*.

**Documentation Conventions**

### Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at
https://www.juniper.net/cgi-bin/docbugreport/. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

### Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- Product warranties—For product warranty information, visit http://www.juniper.net/support/warranty/.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

### Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: http://www.juniper.net/customers/support/
- Search for known bugs: http://www2.juniper.net/kb/
- Find product documentation: http://www.juniper.net/techpubs/
- Find solutions and answer questions using our Knowledge Base: http://kb.juniper.net/
- Download the latest versions of software and review release notes: http://www.juniper.net/customers/csc/software/
- Search technical bulletins for relevant hardware and software notifications: https://www.juniper.net/alerts/
- Join and participate in the Juniper Networks Community Forum: http://www.juniper.net/company/communities/
- Open a case online in the CSC Case Management tool: http://www.juniper.net/cm/

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: https://tools.juniper.net/SerialNumberEntitlementSearch/
Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at http://www.juniper.net/cm/.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see http://www.juniper.net/support/requesting-support.html.
PART 1

Getting Started with ELS

CHAPTER 1

Getting Started with ELS

- Getting Started on page 3

Getting Started

- Getting Started with Enhanced Layer 2 Software on page 3
- Enhanced Layer 2 CLI Configuration Statement and Command Changes on page 15

Getting Started with Enhanced Layer 2 Software

- Using the ELS Translator Tool on page 3
- Configuring a VLAN on page 4
- Configuring the Native VLAN Identifier on page 4
- Configuring Layer 2 Interfaces on page 4
- Configuring Layer 3 Interfaces on page 5
- Configuring an IRB Interface on page 5
- Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface on page 6
- Enhanced Layer 2 CLI Configuration Statement and Command Changes on page 7

Using the ELS Translator Tool

The ELS Translator is a web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations used in Junos OS Release 12.3R2 and later. This conversion tool supports all Juniper Networks EX Series and MX Series platforms with ELS installed. The ELS Translator is hosted on Juniper’s Customer Support website for EX Series switches and MX Series Universal Edge routers, and is available to registered users, internal users, partners, and premium service contract customers. You need to login using your Juniper Networks user name and password to access the ELS Translator tool.

NOTE: It is possible a script might not translate correctly, so review translated scripts carefully before loading the converted configuration on your switch or other device.

Copyright © 2013, Juniper Networks, Inc.
Click to access the ELS translator tool.

**Configuring a VLAN**

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series switches can function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting the unique VLAN name and configuring the VLAN ID:
   ```
   [edit]
   user@host# set vlans vlan-name vlan-id vlan-id-number
   ```
2. Assign at least one interface to the VLAN:
   ```
   [edit]
   user@host# set interface interface-name family ethernet-switching vlan members vlan-name
   ```

**Configuring the Native VLAN Identifier**

EX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to trunk, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.
   ```
   [edit interfaces]
   user@host# set interface-name unit logical-unit-number family ethernet-switching interface-mode trunk
   ```
2. Configure the native VLAN ID:
   ```
   [edit interfaces]
   user@host# set interface-name native-vlan-id number
   ```
3. Assign the interface to the native VLAN ID:
   ```
   [edit interfaces]
   user@host# set interface-name unit logical-unit-number family ethernet-switching vlan members native-vlan-id-number
   ```

**Configuring Layer 2 Interfaces**

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch’s network interfaces.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk interface mode:

```
To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for access interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching interface-mode trunk
```

Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when configuring the protocol family. For the inet or inet6 family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.168.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.168.1.1/30).

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRBs allow the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named irb functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```
3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

### Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces ae
```

3. Specify the minimum number of links for the aggregated Ethernet interface (aex), that is, the defined bundle, to be labeled “up”:

```
[edit interfaces]
user@host# set ae x aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set ae x aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set ae x unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set ae x aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:
Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

Software Features Overview

• Software Features Overview on page 27
Software Features Overview

This topic lists the Juniper Networks EX Series Ethernet Switches software features, the Juniper Networks Junos operating system (Junos OS) release in which they were introduced, and the first Junos OS release for each switch.

NOTE: For Virtual Chassis features, see "EX Series Virtual Chassis Software Features Overview" on page 75.

NOTE: In all tables in this topic, "N.S." = "Not supported", and "–" = "Not applicable".

- Table 5 on page 28—First Junos OS Release for Each EX Series Switch
- Table 6 on page 29—Access Control Features
- Table 7 on page 30—Administration Features
- Table 8 on page 31—Class-of-Service (CoS) Features
- Table 9 on page 32—Class-of-Service (CoS) Features for EX9200 Switches
- Table 10 on page 34—Converged Networks (LAN and SAN) Features

NOTE: Compliance with RFC 4291

EX Series switches drop the following types of illegal IPv6 packets:

- Packets that have a link-local source or destination address. Because link-local addresses are intended to be used for addressing only on a single link, EX Series switches do not forward any packets with such addresses to other links.
- Packets with the IPv6 unspecified source address 0:0:0:0:0:0:0:0.
- Packets that are to be sent outside a node but have the IPv6 loopback address 0:0:0:0:0:0:0:1 as the source address. When IPv6 packets are received on an interface, EX Series switches drop packets that have the loopback address as the destination address.

EX Series switches do not support Subnet-Router Anycast address.

NOTE: Layer 3 subinterfaces as MPLS core interfaces—For EX4500 and EX4550 switches to support Layer 3 subinterfaces as MPLS core interfaces, the peer switch that the Layer 3 subinterfaces connect to, must be an EX8200 switch.

IP over MPLS—The EX4500 and EX4550 switches do not support IP over MPLS (single MPLS label in the packet) when the switch is positioned as a non-penultimate-hop popping (non-PHP) switch.

EX Series Virtual Chassis Software Features Overview

This topic lists the Juniper Networks EX Series Virtual Chassis software features, the Juniper Networks Junos operating system (Junos OS) release in which they were introduced, and the first Junos OS release for each Virtual Chassis.

NOTE: For information on software features for standalone Juniper Networks EX Series Ethernet Switches, see “EX Series Switch Software Features Overview” on page 27.

NOTE: In all tables in this topic, “N.S.” = “Not supported”, and “–” = “Not applicable”.

<td>Junos OS Release 12.2R1</td>
</tr>
<tr>
<td>EX8200 Virtual Chassis</td>
<td>Junos OS Release 10.4R1</td>
</tr>
</tbody>
</table>

**NOTE:** A mixed Virtual Chassis generally supports the same feature set regardless of the different combinations of EX4200, EX4500, and EX4550 member switches in the Virtual Chassis and regardless of which member switches are configured in which roles. The supported features for a mixed Virtual Chassis are indicated in the “Mixed EX4200, EX4500, and EX4550” column.

If a software feature only runs on a specific mixed Virtual Chassis, the “Mixed EX4200, EX4500, and EX4550” column entry for that software feature includes a note clarifying the supported mixed Virtual Chassis for that feature.

</table>
NOTE: Compliance with RFC 4291

EX Series switches drop the following types of illegal IPv6 packets:

- Packets that have a link-local source or destination address. Because link-local addresses are intended to be used for addressing only on a single link, EX Series switches do not forward any packets with such addresses to other links.
- Packets with the IPv6 unspecified source address 0:0:0:0:0:0:0:0.
- Packets that are to be sent outside a node but have the IPv6 loopback address 0:0:0:0:0:0:0:1 as the source address. When IPv6 packets are received on an interface, EX Series switches drop packets that have the loopback address as the destination address.

EX Series switches do not support Subnet-Router Anycast address.

</tbody>
</table>

**NOTE:** Layer 3 subinterfaces as MPLS core interfaces—For EX4500 and EX4550 switches to support Layer 3 subinterfaces as MPLS core interfaces, the peer switch that the Layer 3 subinterfaces connect to, must be an EX8200 switch.

IP over MPLS—The EX4500 and EX4550 switches do not support IP over MPLS (single MPLS label in the packet) when the switch is positioned as a non-penultimate-hop popping (non-PHP) switch.

**NOTE:** The member switches in an EX4200 Virtual Chassis must be running PoE controller software firmware version 4.04 or later. See show chassis firmware detail and request system firmware upgrade poe to check or upgrade this firmware.

This feature is supported for EX4200-24PX and EX4200-48PX member switch interfaces in any EX4200 Virtual Chassis.

Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 111
- Junos OS Processes on page 112

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.

- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

**Junos OS Processes**

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassisd</td>
<td>Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet switching process</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>Forwarding process</td>
<td>pfem</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
<tr>
<td>Management process</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</td>
</tr>
<tr>
<td>Routing protocol process</td>
<td>rpd</td>
<td>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</td>
</tr>
</tbody>
</table>

Configuration

- Initial Configuration on page 115
- Configuration Statements on page 119

Initial Configuration

- Configuring the LCD Panel on EX Series Switches (CLI Procedure) on page 115
- Configuring Date and Time for the EX Series Switch (J-Web Procedure) on page 117
- Configuring System Identity for an EX Series Switch (J-Web Procedure) on page 118

Configuring the LCD Panel on EX Series Switches (CLI Procedure)

This topic applies to hardware devices in the EX Series product family, which includes switches and the XRE200 External Routing Engine, that support the LCD panel interface.

The LCD panel on the front panel of EX Series switches displays a variety of information about the switch in the Status menu and provides the Maintenance menu to allow you to perform basic operations such as initial setup and reboot. You can disable these menus or individual menu options if you do not want switch users to use them. You can also set a custom message that will be displayed on the panel.

This topic describes:

- Disabling or Enabling Menus and Menu Options on the LCD Panel on page 115
- Configuring a Custom Display Message on page 116

Disabling or Enabling Menus and Menu Options on the LCD Panel

By default, the Maintenance menu, the Status menu, and the options in those menus in the LCD panel are enabled. Users can configure and troubleshoot the switch using the Maintenance menu and view certain details about the switch using the Status menu.

If you do not want users to be able to use those menus or use some of the menu options, you can disable the menus or individual menu options. You can re-enable the menus or menu options.

Issue the `show chassis lcd` operational mode command to see which menus and menu options are currently enabled.
NOTE: On some platforms you must specify an FPC slot number in these commands. See the `lcd-menu` statement for details.

To disable a menu:

```
[edit]
user@switch# set chassis lcd-menu menu-item menu-name disable
```

To enable a menu:

```
[edit]
user@switch# delete chassis lcd-menu menu-item menu-name disable
```

To disable a menu option:

```
[edit]
user@switch# set chassis lcd-menu menu-item menu-option disable
```

To enable a menu option:

```
[edit]
user@switch# delete chassis lcd-menu menu-item menu-option disable
```

**Configuring a Custom Display Message**

You can configure the second line of the LCD to display a custom message temporarily for 5 minutes or permanently.

To display a custom message temporarily:

- On an EX3200 switch, a standalone EX3300 switch, a standalone EX4200 switch, a standalone EX4500 switch, an EX8200 switch, or an XRE200 External Routing Engine:
  
  ```
  user@switch> set chassis display message message
  ```

- On an EX3300, EX4200, or EX4500 switch in a Virtual Chassis configuration:
  
  ```
  user@switch> set chassis display message message fpc-slot slot-number
  ```

To display a custom message permanently:

- On an EX3200 switch, a standalone EX3300 switch, a standalone EX4200 switch, a standalone EX4500 switch, an EX8200 switch, or an XRE200 External Routing Engine:
  
  ```
  user@switch> set chassis display message message permanent
  ```

- On an EX3300, EX4200, or EX4500 switch in a Virtual Chassis configuration:
  
  ```
  user@switch> set chassis display message message fpc-slot slot-number permanent
  ```

**NOTE:** The buttons on the LCD panel are disabled when the LCD is configured to display a custom message.

To disable the display of the custom message:

```
user@switch> clear chassis display message
```

You can view the custom message by issuing the command `show chassis lcd`.
Configuring Date and Time for the EX Series Switch (J-Web Procedure)

To configure date and time on an EX Series switch:

1. Select Configure > System Properties > Date & Time.
2. To modify the information, click Edit. Enter information into the Edit Date & Time page as described in Table 62 on page 117.
3. Click one of the following options:
   - To apply the configuration, click OK.
   - To cancel your entries and return to the System Properties page, click Cancel.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

### Table 62: Date and Time Settings

<table>
<thead>
<tr>
<th>Time</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Zone</td>
<td>Identifies the timezone that the switching platform is located in.</td>
<td>Select the appropriate time zone from the list.</td>
</tr>
</tbody>
</table>
| Set Time | Synchronizes the system time with that of the NTP server. You can also manually set the system time and date. | To immediately set the time, Click one of the following options:  
  - **Synchronize with PC time**—The switch synchronizes the time with that of the PC.  
  - **NTP Servers**—The switch sends a request to the NTP server and synchronizes the system time.  
  - **Manual**—A pop-up window allows you to select the current date and time from a list. |
To configure identification details for an EX Series switch:

1. Select **Configure > System Properties > System Identity**. The System Identity page displays configuration details.

2. To modify the configuration, click **Edit**. Enter information into the System Identity page as described in Table 63 on page 118.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

Configuration Statements
arp (System)

Syntax

```
arp {
    aging-timer minutes;
    gratuitous-arp-delay seconds;
    gratuitous-arp-on-ifup;
    interfaces {
        interface-name {
            aging-timer minutes;
        }
    }
    passive-learning;
    purging;
}
```

For EX-Series switches:

```
arp {
    aging-timer minutes;
}
```

Hierarchy Level

[edit system]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

For EX-Series switches, set only the time interval between ARP updates.

Options

- **aging-timer**—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.
- **passive-learning** (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.

Default: 20 minutes

Range: 1 to 240 minutes

The remaining statements are explained separately.

Required Privilege

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses
- Junos OS Network Interfaces Library for Routing Devices
• For more information about ARP updates, see the Junos OS System Basics Configuration Guide.

authentication-key

Syntax  
authentication-key key-number type type value password;

Hierarchy Level  
[edit system ntp]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Configure Network Time Protocol (NTP) authentication keys so that the router or switch can send authenticated packets. If you configure the router or switch to operate in authenticated mode, you must configure a key.

Both the keys and the authentication scheme (MD5) must be identical between a set of peers sharing the same key number.

Options  
key-number—Positive integer that identifies the key.

type type—Authentication type. It can only be md5.

value password—The key itself, which can be from 1 through 8 ASCII characters. If the key contains spaces, enclose it in quotation marks.

Required Privilege Level  
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

  • trusted-key on page 158
auxiliary

Syntax auxiliary {
  disable;
  insecure;
  type terminal-type:
  port-type (mini-usb | rj45);
}

Hierarchy Level [edit system ports]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure the characteristics of the auxiliary port.
Remaining statement is explained separately.

Default disable is the default option.

Options disable—Disable the port.
insecure—Disable super user access or root logins to establish terminal connection.
type terminal-type—Type of terminal that is connected to the port.
Range: ansi, vt100, small-xterm, xterm
Default: The terminal type is unknown, and the user is prompted for the terminal type. The
remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation • Configuring the Junos OS to Set Console and Auxiliary Port Properties
boot-server (NTP)

Syntax  boot-server (address | hostname);

Hierarchy Level  [edit system ntp]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure the server that NTP queries when the router or switch boots to determine the local date and time.

When you boot the router or switch, it issues an ntpdate request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP will not be able to synchronize to a time server if the server’s time appears to be very far off of the local router’s or switch’s time. You can either configure an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the ntpdate request resolves the hostname to an IP address when the router or switch boots up.

Options

• address—The IP address of an NTP boot server.
• hostname—The hostname of an NTP boot server.

Required Privilege Level  system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

• Synchronizing and Coordinating Time Distribution Using NTP
**broadcast**

**Syntax**

```
broadcast address <key key-number> <version value> <ttl value>;
```

**Hierarchy Level**

```
[edit system ntp]
```

**Release Information**

**Description**

Configure the local router or switch to operate in broadcast mode with the remote system at the specified `address`. In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast `address`. Normally, you include this statement only when the local router or switch is operating as a transmitter.

**Options**

- **address**—The broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be `224.0.1.1`.

- **key key-number**—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.

  **Range:** Any unsigned 32-bit integer

- **ttl value**—(Optional) Time-to-live (TTL) value to use.

  **Range:** 1 through 255

  **Default:** 1

- **version value**—(Optional) Specify the version number to be used in outgoing NTP packets.

  **Range:** 1 through 4

  **Default:** 4

**Required Privilege**

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

**Related Documentation**

- *Configuring the NTP Time Server and Time Services*
**broadcast-client**

**Syntax**

broadcast-client;

**Hierarchy Level**

[edit system ntp]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Router or Switch to Listen for Broadcast Messages Using NTP
**console (System Ports)**

**Syntax**

```console
console {
  disable;
  insecure;
  log-out-on-disconnect;
  type terminal-type;
}
```

**Hierarchy Level**

[edit system ports]

**Release Information**

Statement introduced before Junos OS Release 7.4.

*disable* option added in Junos OS Release 7.6.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure the characteristics of the console port.

**Default**

The console port is enabled and its speed is 9600 baud.

**Options**

- **disable**—Disable console login connections.
- **insecure**—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.

  **log-out-on-disconnect**—Log out the session when the data carrier on the console port is lost.

  **NOTE:** The *log-out-on-disconnect* option is not operational on MX80 routers. On MX80 routers you must manually log out from the console with the request system logout u0 command.

- **type terminal-type**—Type of terminal that is connected to the port.

  **Range:** ansi, vt100, small-xterm, xterm

  **Default:** The terminal type is unknown, and the user is prompted for the terminal type.

**Required Privilege**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

- Configuration the Junos OS to Set Console and Auxiliary Port Properties
default-address-selection

Syntax  default-address-selection;

Hierarchy Level  [edit system]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Use the loopback interface, lo0, as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as fxp0. The lo0 interface is the interface to the router’s or switch’s Routing Engine.

Default  The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:

- The primary address on the loopback interface lo0 that is not 127.0.0.1 is used.
- The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.

By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.

An interface’s primary address is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface’s preferred address is the default local address used for packets sourced by the local router or switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.

To configure a different primary address or preferred address, include the primary or preferred statement at the [edit interfaces interface-name unit logical-unit-number family family address address] or [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address] hierarchy levels.

For more information about default, primary, and preferred addresses for an interface, see “Configuring Default, Primary, and Preferred Addresses and Interfaces” in the Junos OS Network Interfaces Library for Routing Devices.

Required Privilege Level  system—To view this statement in the configuration.
  system-control—To add this statement to the configuration.

**inet6-backup-router**

**Syntax**

```plaintext
inet6-backup-router address <destination destination-address>;
```

**Hierarchy Level**

```plaintext
[edit system]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Set a default router (running IP version 6 [IPv6]) to use while the local router or switch (running IPv6) is booting and if the routing protocol processes fail to start. The Junos OS removes the route to this router or switch as soon as the software starts.

**Options**

- **address**—Address of the default router.
- **destination destination-address**—(Optional) Destination address that is reachable through the backup router. You can include this option to achieve network reachability while loading, configuring, and recovering the router or switch, but without the risk of installing a default route in the forwarding table.

**Default:** All hosts (default route) are reachable through the backup router.

**Required Privilege Level**

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

**Related Documentation**

Hierarchy Level
[edit chassis]

Release Information
Statement introduced in Junos OS Release 10.2 for EX Series switches.

Description
Disable or enable the Maintenance menu or the Status menu in the LCD panel.

Options

- none—(EX6200 and EX8200 switches and XRE200 External Routing Engines only) Disable or enable the specified menu or menu options.
- `fpc slot-number`—(EX3200, EX3300, EX4200, and EX4500 switches only) Disable or enable the specified menu or menu options, where `slot-number` is:
  - 0—On standalone switches.
  - 0–9—On a device in a Virtual Chassis. The value is the member ID of the device.

**NOTE:** This option is not available on an EX8200 Virtual Chassis. The LCD panel on an XRE200 External Routing Engine provides information for the XRE200 External Routing Engine only.

- `disable`—(Optional) Disable the specified menu.

The remaining statement is explained separately.

Required Privilege Level
- interface—To view this statement in the configuration.
- interface-level—To add this statement to the configuration.

**location (System)**

**Syntax**

```plaintext
location {
    altitude feet;
    building name;
    country-code code;
    floor number;
    hcoord horizontal-coordinate;
    lata service-area;
    latitude degrees;
    longitude degrees;
    npa-nxx number;
    postal-code postal-code;
    rack number;
    vcoord vertical-coordinate;
}
```

**Hierarchy Level**

[edit system]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure the system location in various formats.

**Options**

- **altitude feet**—Number of feet above sea level.
- **building name**—Name of building. The name of the building can be 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code code**—Two-letter country code.
- **floor number**—Floor in the building.
- **hcoord horizontal-coordinate**—Bellcore Horizontal Coordinate.
- **lata service-area**—Long-distance service area.
- **latitude degrees**—Latitude in degree format.
- **longitude degrees**—Longitude in degree format.
- **npa-nxx number**—First six digits of the phone number (area code and exchange).
- **postal-code postal-code**—Postal code.
- **rack number**—Rack number.
- **vcoord vertical-coordinate**—Bellcore Vertical Coordinate.

**Required Privilege Level**

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

**menu-item**

**Syntax**
```
menu-item (menu-name | menu-option) <disable>
```

**Hierarchy Level**
- [edit chassis lcd-menu],
- [edit chassis lcd-menu fpc slot-number]

**Release Information**
Statement introduced in Junos OS Release 10.2 for EX Series switches.

**Description**
Disable or enable the Maintenance menu, the Status menu, or an individual option in one of those menus in the LCD panel.

On EX3200, EX3300, EX4200, and EX4500 switches, you use `menu-item` at the `[edit chassis lcd-menu fpc slot-number]` hierarchy level.

On EX6200 and EX8200 switches, and on XRE200 External Routing Engines, you use `menu-item` at the `[edit chassis lcd-menu]` hierarchy level.

**Options**
- `menu-name`—Name of the LCD menu:
  - maintenance-menu
  - status-menu

- `menu-option`—Specific option on one of the LCD menus. You must include the quotation marks when you type the option. Table 64 on page 141 describes the different menu options of the LCD menus supported on the switches.

**disable**—(Optional) Disable the specified menu.
multicast-client

Syntax  multicast-client <address>;

Hierarchy Level  [edit system ntp]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  For NTP, configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet.

Options  address—(Optional) One or more IP addresses. If you specify addresses, the router or switch joins those multicast groups.

Default:  224.0.1.1.

Required Privilege Level  system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation  • Configuring the Router or Switch to Listen for Multicast Messages Using NTP
no-multicast-echo

Syntax  
no-multicast-echo {  
  arp {  
    aging-timer minutes;  
    gratuitous-arp-delay seconds;  
    gratuitous-arp-on-ifup;  
    interfaces {  
      interface-name {  
        aging-timer minutes;  
      }  
    }  
    passive-learning;  
    purging;  
  }  
  host-name hostname;  
  location {  
    altitude feet;  
    building name;  
    country-code code;  
    floor number;  
    hcoord horizontal-coordinate;  
    lata service-area;  
    latitude degrees;  
    longitude degrees;  
    npa-nx number;  
    postal-code postal-code;  
    rack number;  
    vcoord vertical-coordinate;  
  }  
  license {  
    autoupdate URL;  
    renew before-expiration (number | interval number)  
  }  
}

Hierarchy Level  [edit system]

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  Disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses.

Default  The Routing Engine responds to ICMP echo requests sent to multicast group addresses.

Required Privilege Level  system—To view this statement in the configuration.
system-control—To add this statement to the configuration.
Related Documentation

- Configuring the Junos OS to Disable the Routing Engine Response to Multicast Ping Packets

no-ping-record-route

Syntax

no-ping-record-route;

Hierarchy Level

[edit system]

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 9.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the Junos OS to disable the reporting of the IP address in ping responses.

Required Privilege

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

no-ping-time-stamp

Syntax

no-ping-time-stamp;

Hierarchy Level

[edit system]

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 9.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the Junos OS to disable the recording of timestamps in ping responses.

Required Privilege

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses
no-redirects (IPv4 Traffic)

Syntax  
no-redirects;

Hierarchy Level  
[edit system],  
[edit interfaces interface-name unit logical-unit-number family family]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description  
Stop protocol redirect messages for IPv4 traffic from being sent on the entire switch or on an interface on the router or switch.

To disable the sending of protocol redirect messages for the entire router or switch, include the no-redirects statement at the [edit system] hierarchy level.

To disable the sending of protocol redirect messages on a specific interface, include the no-redirects statement at the [edit interfaces interface-name unit logical-unit-number family family] hierarchy level.

Default  
The router or switch sends redirect messages.

Required Privilege Level  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Related Documentation

no-tcp-rfc1323

Syntax       no-tcp-rfc1323;
Hierarchy Level       [edit system internet-options]
Release Information       Statement introduced before Junos OS Release 7.4.
                            Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description       Configure the Junos OS to disable RFC 1323 TCP extensions.
Required Privilege Level       system—To view this statement in the configuration.
                                  system-control—To add this statement to the configuration.
Related Documentation       • Configuring the Junos OS to Disable TCP RFC 1323 Extensions
ntp

Syntax  
ntp [ 
    authentication-key number type value password; 
    boot-server address; 
    broadcast <address> <key key-number> <version value> <ttl value>; 
    broadcast-client; 
    multicast-client <address>; 
    peer address <key key-number> <version value> <prefer>; 
    server address <key key-number> <version value> <prefer>; 
    source-address source-address; 
    trusted-key [ key-numbers ]; 
  ]

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 7.4. 
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure NTP on the router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration. 
system-control—To add this statement to the configuration.

Related Documentation • Synchronizing and Coordinating Time Distribution Using NTP

path-mtu-discovery

Syntax (path-mtu-discovery | no-path-mtu-discovery);

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 7.4. 
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure path MTU discovery for outgoing Transmission Control Protocol (TCP) connections:

• path-mtu-discovery—Path MTU discovery is enabled.
• no-path-mtu-discovery—Path MTU discovery is disabled.

Default Path MTU discovery is enabled.

Required Privilege Level system—To view this statement in the configuration. 
system-control—To add this statement to the configuration.

Related Documentation • Configuring the Junos OS for Path MTU Discovery on Outgoing TCP Connections
peer (NTP)

Syntax peer address <key key-number> <version value> <prefer>;

Hierarchy Level [edit system ntp]

Description For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.

Options address—Address of the remote system. You must specify an address, not a hostname.

key key-number—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.

Range: Any unsigned 32-bit integer

prefer—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version value—(Optional) Specify the NTP version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation • Configuring the NTP Time Server and Time Services
**port-type**

**Syntax**  
port-type (mini-usb | rj45);

**Hierarchy Level**  
[edit system ports auxiliary]

**Release Information**  
Statement introduced in Junos OS Release 11.3 for EX Series switches.

**Description**  
(EX2200-C and EX4550 switch only) Set the RJ-45 console port or the Mini-USB console port as the active console port.

**Default**  
The RJ-45 console port is the active port.

**Options**  
mini-usb—Set the Mini USB type-B console port as the active console port.

rj45—Set the RJ-45 console port as the active console port.

**Required Privilege**

**Level**

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Console Port Type (CLI Procedure)
ports

Syntax

```
ports {
  auxiliary {
    disable;
    insecure;
    type terminal-type;
    port-type (mini-usb | rj45);
  }
  console {
    disable;
    insecure;
    log-out-on-disconnect;
    type terminal-type;
  }
}
```

Hierarchy Level
[
editsystem\]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Configure the properties of the console and auxiliary ports. The ports are located on the router's craft interface.

See the switch's hardware documentation for port locations.

The remaining statements are explained separately.

Required Privilege
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Related Documentation

### power

**Syntax**

```plaintext
power (off | on);
```

**Hierarchy Level**

```
[edit chassis fpc slot]
```

**Release Information**

Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**

On an EX6200 or EX8200 switch, turn a specified Flexible PIC Concentrator (FPC) on or off. See “EX Series Switches Hardware and CLI Terminology Mapping” on page 389.

**NOTE:** On an EX6200 switch, the power statement has no effect when you configure it for an uplink port FPC on the Switch Fabric and Routing Engine (SRE) module. If you configure the statement for those FPCs, the configuration will be committed, but a message that informs you that the configuration has no effect is logged in the system log. You cannot turn the power on and off for these FPCs.

**Options**

- **on**—Turn on the specified FPC.
- **off**—Turn off the specified FPC.

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

- Removing a Line Card from an EX6200 Switch
processes

Syntax

processes {
  process-name (enable | disable) failover (alternate-media | other-routing-engine);
  timeout seconds;
}

Hierarchy Level  [edit system]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure which Junos OS processes are running on the router or switch.

CAUTION: Never disable any of the software processes unless instructed to do so by a customer support engineer.

Default  All processes are enabled by default.

Options

(enable | disable)—(Optional) Enable or disable a specified process.

failover (alternate-media | other-routing-engine)—(Optional) For routers or switches with
redundant Routing Engines only, switch to backup media if a process fails repeatedly.
If a process fails four times within 30 seconds, the router or switch reboots from
the alternate media or the other Routing Engine.

process-name—One of the valid process names. You can obtain a complete list of process
names by using the CLI command completion feature. After specifying a process
name, command completion also indicates any additional options for that process.

timeout seconds—(Optional) How often the system checks the watchdog timer, in seconds.
If the watchdog timer has not been checked in the specified number of seconds, the
system reloads. If you set the time value too low, it is possible for the system to
reboot immediately after it loads.

Values: 15, 60, or 180

Default: 180 seconds (rounded up to 291 seconds by the Junos kernel)

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation

• Disabling Junos OS Processes
server (NTP)

Syntax

server address <key key-number> <version value> <prefer>;

Hierarchy Level

[edit system ntp]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

For NTP, configure the local router or switch to operate in client mode with the remote system at the specified address. In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.

Options

address—Address of the remote system. You must specify an address, not a hostname.

key key-number—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.

Range: Any unsigned 32-bit integer

prefer—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version value—(Optional) Specify the version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege

Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation

**tcp-drop-synfin-set**

**Syntax**
tcp-drop-synfin-set;

**Hierarchy Level**
[edit system internet-options]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the router or switch to drop packets that have both the SYN and FIN bits set.

**Required Privilege**
- **Level**
  - admin—To view this statement in the configuration.
  - admin-control—To add this statement to the configuration.

**Related Documentation**
- Configuring the Junos OS to Enable the Router or Switch to Drop Packets with the SYN and FIN Bits Set
- TCP Headers with SYN and FIN Flags Set
traceoptions (SBC Configuration Process)

Syntax

```plaintext
traceoptions {
    file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

[edit system processes sbc-configuration-process]

Release Information

Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 9.5 for EX Series switches.

Description

Configure trace options for the session border controller (SBC) process of the border signaling gateway (BSG).

Options

- `file filename`—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory `/var/log`. You can include the following file options:
  - `files number`—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
    If you specify a maximum number of files, you must also specify a maximum file size with the `size` option and a filename.
    **Range:** 2 through 1000
    **Default:** 3 files
  - `match regex`—(Optional) Refine the output to include lines that contain the regular expression.
  - `no-world-readable`—(Optional) Disable unrestricted file access.
  - `size size`—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the trace-file again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.
    **Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB.
    **Range:** 10 KB through 1 GB
    **Default:** 128 KB
  - `world-readable`—(Optional) Enable unrestricted file access.
**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all** trace-level—Trace all SBC process operations.
- **common** trace-level—Trace common events.
- **configuration** trace-level—Trace configuration events.
- **device-monitor** trace-level—Trace device monitor events.
- **ipc** trace-level—Trace IPC events.
- **memory**—pool trace-level—Trace memory pool events.
- **trace-level**—Trace level options are related to the severity of the event being traced. When you choose a trace level, messages at that level and higher levels are captured. Enter one of the following trace levels as the **trace-level**:
  - **debug**—Log all code flow of control.
  - **error**—Log failures with a short-term effect.
  - **info**—Log summary for normal operations, such as the policy decisions made for a call.
  - **trace**—Log program trace START and EXIT macros.
  - **warning**—Log failure recovery events or failure of an external entity.
- **ui** trace-level—Trace user interface operations.

**Required Privilege**

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

**Related Documentation**

trusted-key

Syntax
trusted-key [ key-numbers ];

Hierarchy Level
[edit system ntp]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
For NTP, configure the keys you are allowed to use when you configure the local router or switch to synchronize its time with other systems on the network.

Options
key-numbers—One or more key numbers. Each key can be any 32-bit unsigned integer except 0.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

**Release Information**

- Command introduced in Junos OS Release 7.5.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

**Options**

- **none**—Clear or stop a text message on the craft interface display.
- **interconnect-device name**—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.
- **lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number. Replace number with the following values depending on the LCC configuration:
  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
**node-device name**—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

**scc**—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace number with 0.

**Required Privilege Level**

clear

<node-group name>
```

### Release Information

- **Command introduced before Junos OS Release 7.4.**
- **Command introduced in Junos OS Release 9.0 for EX Series switches.**
- **sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.**
- **Command introduced in Junos OS Release 11.1 for the QFX Series.**

### Description

Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.

### Options

- **none**—Clear all pending system software reboots or halts.
  - **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.
  - **all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.
  - **all-members**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.
  - **both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix
Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

**infrastructure name**—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device name**—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router. Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

**member member-id**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace `member-id` with a value from 0 through 9.

**node-group name**—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

**scc**—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace `number` with 0.

**Required Privilege Level**

- maintenance

- clear system reboot (TX Matrix Router) on page 166
- clear system reboot (QFX Series) on page 166

Output Fields

- When you enter this command, you are provided feedback on the status of your request.
Sample Output

clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

clear system reboot (TX Matrix Router)

```
user@host> clear system reboot
scc-re0:
---------------------------------------------------------------
No shutdown/reboot scheduled.
lcc0-re0:
---------------------------------------------------------------
No shutdown/reboot scheduled.
lcc2-re0:
---------------------------------------------------------------
No shutdown/reboot scheduled.
```

clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```
configure

Syntax

configure
<dynamic>
<exclusive>
<private>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Enter configuration mode. When this command is entered without any optional keywords, everyone can make configuration changes and commit all changes made to the configuration.

Options
none—Enter configuration mode.

dynamic—(Optional) Configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database. As a result, the time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can then reference these policies and policy objects in routing policies you configure in the standard database.

exclusive—(Optional) Lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot change the configuration.

private—(Optional) Allow multiple users to edit different parts of the configuration at the same time and to commit only their own changes, or to roll back without interfering with one another's changes. You cannot commit changes in configure private mode when another user is in configure exclusive mode.

Additional Information
For more information about the different methods of entering configuration mode and the restrictions that apply, see the Junos OS Administration Library for Routing Devices.

Required Privilege
configure

List of Sample Output
configure on page 168

Output Fields
When you enter this command, you are placed in configuration mode and the system prompt changes from hostname> to hostname#.
Sample Output

```
configure

user@host> configure
Entering configuration mode
[edit]
user@host#
```
op

Syntax

```
Syntax
op filename
<detail>
<argument-name argument-value>
<key (md5 | sha-256 | sha1) key-value
<url url>
```

Release Information

Command introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
key option introduced in Junos OS Release 10.0.
url option introduced in Junos OS Release 10.0.

Description

Execute an op script stored in one of the following locations:

- On the router or switch in the `/var/db/scripts/op` directory
- At a remote URL

Options

detail—(Optional) Display detailed output.

`argument-name argument-value`—(Optional) Specify one or more arguments to the script. For each argument you include on the command line, you must specify a corresponding value for the argument.

`key (md5 | sha-256 | sha1) key-value`—(Optional) With the `<url>` option, specify a checksum hash to verify the integrity of the script. You can include the `<key>` option if the checksum statement is included at the `[edit system scripts op file filename]` hierarchy level.

`url url`—(Optional) Specify a URL where the script is located.

Additional Information

For more information about Junos op scripts, see the *Junos OS Automation Library*.

Required Privilege

request chassis pic

Syntax

request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number

Syntax (ACX4000 Series Routers)

request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number

Syntax (TX Matrix and TX Matrix Plus Routers)

request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number <lcc number>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.3 for ACX4000 Routers.

Description

Control the operation of the PIC.

NOTE: The request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the show chassis hardware command.

NOTE: T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only online and offline command options to PIC slot 0 are allowed. Use of the online and offline command options for PIC slot 1 with the described router and PIC combination is not allowed.

NOTE: In T Series routers, when the PIC state is set from offline to online or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC offline or online:

user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify

user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
Options

- **offline**—Take the PIC offline.
- **online**—Bring the PIC online.
- **fpc-slot slot-number**—Flexible PIC Concentrator (FPC) slot number. Replace `slot-number` with a value appropriate for your router or switch:
  - ACX4000 routers—1 or 2.
  - EX Series switches:
    - EX3200 switches and EX4200 standalone switches—0.
    - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch’s member ID).
    - EX8208 switches—0 through 7 (line card).
    - EX8216 switches—0 through 15 (line card).
  - M5, M7i, M10, and M10i routers—0 or 1.
  - M20 routers—0 through 3.
  - M40 and M40e routers—0 through 7.
  - M120 routers—0 through 5.
  - M160 routers—0 through 7.
  - M320 routers—0 through 7.
  - MX 5, MX10, and MX40 routers—0 or 1.
  - MX80 routers—0 or 1.
  - MX240 routers—0 through 2
  - MX480 routers—0 through 5
  - MX2020 routers—0 through 19.
  - MX2010 routers—0 through 9.
  - MX960 routers—0 through 11.
  - PTX5000 routers—0 or 1.
  - T Series routers—0 through 7.
  - TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace `slot-number` with a value from 0 through 7. Otherwise, replace `slot-number` with a value from 0 through 31.
    - Likewise, on a TX Matrix Plus router, if you specify the **number** of the T1600 or T4000 router by using the lcc number option (the recommended method), replace `slot-number` with a value from 0 through 7. Otherwise, for the FPC slot number, replace `slot-number` with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace `slot-number` with a value from 0 through 63. For example, the following commands have the same result:
user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline

**pic-slot slot-number**—PIC slot number.
- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—**slot-number** corresponds to the slot number of the Packet Forwarding Engine.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- TI600 router —0, 1, 2, or 3.
- T4000 router—0, 1, 2, or 3.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.
Replace number with the following values depending on the LCC configuration:
- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SiBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SiBs in a routing matrix.

**Required Privilege Level**
- maintenance

**Related Documentation**

- *show chassis pic on page 1056*
- *Configuring the PIC Type*

**List of Sample Output**
- request chassis pic on page 174

**Output Fields**
- When you enter this command, you are provided feedback on the status of your request.
Sample Output
request chassis pic

user@host> request chassis pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
### request chassis routing-engine master

**Syntax**

```bash
request chassis routing-engine master (acquire | release | switch)
<force>
<no-confirm>
```

**Syntax (TX Matrix Routers)**

```bash
request chassis routing-engine master (acquire | release | switch) (lcc number | scc | all-chassis)
<force>
<no-confirm>
```

**Syntax (TX Matrix Plus Routers)**

```bash
request chassis routing-engine master (acquire | release | switch) (lcc number | sfc | all-chassis | all-lcc)
<force>
<no-confirm>
```

**Syntax (MX Series Routers)**

```bash
request chassis routing-engine master (acquire | release | switch)
<all-members>
<force>
<local>
<member member-id>
<no-confirm>
```

**Syntax (MX104 3D Universal Edge Routers)**

```bash
request chassis routing-engine master (acquire | release | switch)
<no-confirm>
```

**Syntax (MX2010 and MX2020 3D Universal Edge Routers)**

```bash
request chassis routing-engine master (acquire | release | switch <check>)
<no-confirm>
```

**Syntax (QFX Series)**

```bash
request chassis routing-engine master (release | switch)
<check>
<interconnect-device name>
<node-group name>
<no-confirm>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- `all-chassis` option added in Junos OS Release 8.0.
- `sfc` option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.3 for QFX Series.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
- Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description**

For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

---

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run...
the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the TX Matrix Router Hardware Guide or the Junos OS High Availability Library for Routing Devices.

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

**Options**

- **acquire**—Attempt to become the master Routing Engine.
- **release**—Request that the other Routing Engine become the master.
- **switch**—Toggle mastership between Routing Engines.

The acquire, release, and switch options have the following suboptions:

- **all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.
**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX240, MX480, MX960, MX2010, and MX2020 routers only) (Optional) Available only with the `switch` option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device name**—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number. Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace `member-id` with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group name**—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**force**—(Optional) Available only with the `acquire` option. Force the change to a new master Routing Engine.

---

**NOTE:** The force option is not supported on the MX104 router.
Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (RE0) is the master and the Routing Engine in slot 1 (RE1) is the backup. To change the default master Routing Engine, include the routing-engine statement at the [edit chassis redundancy] hierarchy level in the configuration. For more information, see the Junos OS Administration Library for Routing Devices.

To have the backup Routing Engine become the master Routing Engine, use the request chassis routing-engine master switch command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

NOTE: Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

Required Privilege Level
 maintenance

List of Sample Output
request chassis routing-engine master acquire on page 178
request chassis routing-engine master switch on page 178

Sample Output
request chassis routing-engine master acquire

user@host> request chassis routing-engine master acquire
warning: Traffic will be interrupted while the PFE is re-initialized
warning: The other routing engine's file system could be corrupted
Reset other routing engine and become master ? [yes,no] (no)

request chassis routing-engine master switch

user@host> request chassis routing-engine master switch
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines? [yes,no] (no) yes
Resolving mastership...
Complete. The other Routing Engine becomes the master.

Switch mastership back to the local Routing Engine:

user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized

Toggle mastership between routing engines? [yes,no] (no) yes
Resolving mastership...
Complete. The local routing engine becomes the master.

<director-device director-device-id>
<in minutes>
<local>
<media>
<member member-id>
<message "text">
<slice slice>

Release Information
Command introduced before Junos OS Release 7.4.
other-routing-engine option introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
director-device option introduced for QFabric systems in Junos OS Release 12.2.

Description
Stop the router or switch software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, use the member option from the Node group CLI. You cannot issue this command from the QFabric CLI.

Options
none—Stop the router or switch software immediately.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.
at time — (Optional) Time at which to stop the software, specified in one of the following ways:

- now—Stop the software immediately. This is the default.
- +minutes—Number of minutes from now to stop the software.
- yymmdthhm—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- hh:mm—Absolute time on the current day at which to stop the software.

backup-routing-engine — (Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

both-routing-engines— (Optional) Halt both Routing Engines at the same time.

director-device director-device-id— (QFabric systems only) Halt a specific Director device.

lcc number— (TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local— (EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

in minutes— (Optional) Number of minutes from now to stop the software. This option is an alias for the at +minutes option.

media (compact-flash | disk | removable-compact-flash | usb) — (Optional) Boot medium for the next boot. (The options removable-compact-flash and usb pertain to J Series routers only.)

media (external | internal) — (EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- external—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace `member-id` with a value from 0 through 9. For an MX Series Virtual Chassis, replace `member-id` with a value of 0 or 1.

**message "text"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace `number` with 0.

**slice slice**—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:
  - 1—Halt partition 1.
  - 2—Halt partition 2.
  - **alternate**—Reboot from the alternate partition.

**Additional Information**

On the M7i router, the `request system halt` command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the `request system halt` command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the `request system halt` command. You can also halt both Routing Engines at the same time by issuing the `request system halt both-routing-engines` command.

**Required Privilege Level**

- maintenance

**Related Documentation**

- `clear system reboot` on page 163
- request system power-off on page 187
- Rebooting and Halting a QFX Series Product

List of Sample Output

- request system halt on page 185
- request system halt (In 2 Hours) on page 185
- request system halt (Immediately) on page 185
- request system halt (At 1:20 AM) on page 185

Output Fields

When you enter this command, you are provided feedback on the status of your request.
Sample Output
request system halt

user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.

request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00

request system halt (Immediately)

user@host> request system halt at now

request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

user@host> request system halt at yymmdh120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
request system logout

Syntax  
request system logout (pid pid | terminal terminal | user username)  
<all>

Release Information
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Log out users from the router or switch and the configuration database. If a user held the configure exclusive lock, this command clears the exclusive lock.

Options
all—(Optional) Log out all sessions owned by a particular PID, terminal session, or user.  
(On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.)  

pid pid—Log out the user session using the specified management process identifier (PID). The PID type must be management process.  

terminal terminal—Log out the user for the specified terminal session.  

user username—Log out the specified user.

Required Privilege
configure

List of Sample Output
request system logout on page 186

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output
request system logout

user@host> request system logout user tammy all  
Connection closed by foreign host.
## request system power-off

**Syntax**
```
request system power-off
<both-routing-engines>
<other-routing-engine>
<at time>
<in minutes>
<media (compact-flash | disk | removable-compact-flash | usb)>
<message "text"/>
```

### Syntax (EX Series Switches)
```
request system power-off
<all-members>
<at time>
<both-routing-engines>
<in minutes>
<local>
<media (external | internal)>
<message member-member-id>
<message "text"/>
<other-routing-engine>
<slice slice>
```

### Syntax (TX Matrix Router)
```
request system power-off
<all-chassis | all-lcc | lcc number | scc>
<both-routing-engines>
<other-routing-engine>
<at time>
<in minutes>
<media (compact-flash | disk)>
<message "text"/>
```

### Syntax (TX Matrix Plus Router)
```
request system power-off
<all-chassis | all-lcc | lcc number | sfc number>
<both-routing-engines>
<other-routing-engine>
<at time>
<in minutes>
<media (compact-flash | disk)>
<message "text"/>
```

### Syntax (MX Series Router)
```
request system power-off
<all-members>
<at time>
<both-routing-engines>
<in minutes>
<local>
<media (external | internal)>
<message member-member-id>
<message "text"/>
<other-routing-engine>
```

### Syntax (QFX Series)
```
request system power-off
<at time>
```
Release Information
Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Power off the software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Options
none—Power off the router or switch software immediately.

all-chassis—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.

all-lcc—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.

at time—(Optional) Time at which to power off the software, specified in one of the following ways:

  • now—Power off the software immediately. This is the default.
  • +minutes—Number of minutes from now to power off the software.
  • yymmdthhmm—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
  • hh:mm—Absolute time on the current day at which to power off the software.

both-routing-engines—(Optional) Power off both Routing Engines at the same time.

in minutes—(Optional) Number of minutes from now to power off the software. This option is an alias for the at +minutes option.

lcc number—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for the next boot. (The options removable-compact-flash and usb pertain to the J Series routers only.)

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:
- external—Power off the external mass storage device.
- internal—Power off the internal flash device.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

message "text"—(Optional) Message to display to all system users before powering off the software.

other-routing-engine—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

sfc number—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace number with zero.
slice slice—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:
  • 1—Power off partition 1.
  • 2—Power off partition 2.
  • alternate—Reboot from the alternate partition.

Additional Information
On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the request system power-off command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the request system power-off command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the request system power-off both-routing-engines command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

Release Information  
Command introduced before Junos OS Release 7.4.
Option **other-routing-engine** introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Option **both-routing-engines** introduced in Junos OS Release 12.1.

**Description**
Reboot the software.

**Options**

- **none**—Reboot the software immediately.
- **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.
- **all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.
- **all-members**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.
- **at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:
  - **now**—Stop or reboot the software immediately. This is the default.
  - **+minutes**—Number of minutes from now to reboot the software.
  - **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
  - **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.
- **both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.
- **in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.
- **lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.
  Replace **number** with the following values depending on the LCC configuration:
  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
local—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options removable-compact-flash and usb pertain to the J Series routers only.)

media (external | internal)—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

  • external—Reboot the external mass storage device.
  • internal—Reboot the internal flash device.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

message "text”—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

partition—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

  • 1—Reboot from partition 1.
  • 2—Reboot from partition 2.
  • alternate—Reboot from the alternate partition.

scc—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

sfc number—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace number with 0.
	slice slice—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

  • 1—Power off partition 1.
  • 2—Power off partition 2.
  • alternate—Reboot from the alternate partition.
Additional Information

Reboot requests are recorded in the system log files, which you can view with the `show log` command (see `show log`). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the `show system processes` command (see `show system processes`).

On a TX Matrix or TX Matrix Plus router, if you issue the `request system reboot` command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

---

**NOTE:** Before issuing the `request system reboot` command on a TX Matrix Plus router with no options or the all-chassis, all-lcc, lcc `number`, or sfc options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the `request system reboot` command.

---

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

---

**Required Privilege Level**

maintenance

**Related Documentation**

- clear system reboot on page 163

**List of Sample Output**

- request system reboot on page 195
- request system reboot (at 2300) on page 195
- request system reboot (in 2 Hours) on page 195
- request system reboot (Immediately) on page 195
- request system reboot (at 1:20 AM) on page 195

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.
Sample Output
request system reboot

user@host> request system reboot
Reboot the system ? [yes,no] (no)

request system reboot (at 2300)

user@host> request system reboot at 2300 message?Maintenance time? 
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00

request system reboot (in 2 Hours)
The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00

request system reboot (Immediately)

user@host> request system reboot at now

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
**request system reboot**

**Syntax**

```plaintext
request system reboot
<all-members | local | member member-id>
<at time>
<in minutes>
<media (external | internal)>
<message “text”>
<slice (1 | 2 | alternate)>
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches. Option `partition` changed to `slice` in Junos OS Release 10.0 for EX Series switches.

**Description**

Reboot the Junos OS.

Reboot requests are recorded in the system log files, which you can view with the `show log` command. You can view the process names with the `show system processes` command.

**Options**

- **none**—Reboots the software immediately.
- **all-members | local | member member-id**—(EX4200 switch only) (Optional) Specify which member of the Virtual Chassis to reboot:
  - **all-members**—Reboots each switch that is a member of the Virtual Chassis.
  - **local**—Reboots the local switch, meaning the switch you are logged into, only.
  - **member member-id**—Reboots the specified member switch of the Virtual Chassis.
- **at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:
  - **+minutes**—Number of minutes from now to reboot the software.
  - **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
  - **now**—Stop or reboot the software immediately. This is the default.
  - **yymmdthhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

- **in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the `at +minutes` option.
- **media (external | internal)**—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.
- **message “text”**—(Optional) Message to display to all system users before rebooting the software.
slice (1 | 2 | alternate)—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- alternate—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

Required Privilege Level

maintenance

- clear system reboot on page 163

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system reboot

user@host> request system reboot
Reboot the system? [yes,no] (no)

request system reboot (at 2300)

user@host> request system reboot at 2300 message?Maintenance time!? Reboot the system? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

user@host> request system reboot at+120
user@host> request system reboot in 120
user@host> request system reboot at 19:00

request system reboot (immediately)

user@host> request system reboot at now

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
request system scripts convert

Syntax
```
request system scripts convert (slax-to-xslt | xslt-to-slax) source source/filename
destination destination/ <filename> <partial> <version (1.0 | 1.1)>
```

Release Information
Command introduced in Junos OS Release 8.2.
Command introduced in Junos OS Release 9.0 for EX Series switches.
partial and version options added in Junos OS Release 12.2.

Description
Convert an Extensible Stylesheet Language Transformations (XSLT) script to Stylesheet Language, Alternative syntax (SLAX), or convert a SLAX script to XSLT.

Options
```
destination destination/ <filename>—Specify a destination for the converted file.
```
Optionally, you can specify a filename for the converted file. If you do not specify a filename, the software assigns one automatically. The default destination filename is `SLAX-Conversion-Temp` or `slax-temp` depending on the Junos OS release, with a randomly generated, five-character, alpha-numeric extension. For example, the software converts a source file called `test.xsl` to `slax-temp.kWwQk`. The software converts a source file called `test1.slax` to `slax-temp.zN61h`.

```
partial—(Optional) Convert partial script input.
```

```
slax-to-xslt—Convert a SLAX script to XSLT.
```

```
source source/filename—Specify a source file that you want to convert.
```

```
version—(Optional) Specify the SLAX version listed in the version statement of the generated script for XSLT-to-SLAX conversions. Acceptable values are 1.0 and 1.1. The default is 1.1.
```

```
xslt-to-slax—Convert an XSLT script to SLAX.
```

Required Privilege Level
maintenance

List of Sample Output
request system scripts convert slax-to-xslt on page 198
request system scripts convert xslt-to-slax on page 199

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output
request system scripts convert slax-to-xslt
```
user@host> request system scripts convert slax-to-xslt source /var/db/scripts/op/script1.slax
destination /var/db/scripts/op
conversion complete
```
request system scripts convert xslt-to-slax

user@host> request system scripts convert xslt-to-slax source /var/db/scripts/commit/script1.xsl
destination /var/db/scripts/commit partial version 1.0
conversion complete
**request system scripts refresh-from commit**

**Syntax**

```
request system scripts refresh-from commit file file-name url url-path
```

**Release Information**

Command introduced in Junos OS Release 10.1 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
  <type>commit</type>
  <file>file-name</file>
  <URL>URL</URL>
</request-script-refresh-from>
```

**Options**

- `file file-name` — Name of the file to be downloaded.
- `url url-path` — URL of the file to be downloaded.

**Required Privilege Level**

maintenance

**Related Documentation**

- *Junos OS NETCONF XML Management Protocol Guide*

**List of Sample Output**

```
request system scripts refresh-from commit file config.txt url http://host1.juniper.net on page 200
```

**Sample Output**

```
user@switch> request system scripts refresh-from commit file config.txt url http://host1.juniper.net
http://host1.juniper.net
user@switch>
```
request system scripts refresh-from event

Syntax

request system scripts refresh-from event file file-name url url-path

Release Information

Description

Automatically download the initial Junos OS configuration and a set of standard event scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
  <type>event</type>
  <file>file-name</file>
  <URL>URL</URL>
</request-script-refresh-from>
```

Options

- **file file-name**—Name of the file to be downloaded.
- **url url-path**—URL of the file to be downloaded.

Required Privilege

- Level: maintenance

```
user@switch> request system scripts refresh-from op file config.txt url http://host1.juniper.net
user@switch>
```
request system storage cleanup

Syntax
request system storage cleanup <dry-run>

Syntax (EX Series Switches)
request system storage cleanup
<all-members>
<dry-run>
<local>
<member member-id>

Syntax (MX Series Router)
request system storage cleanup
<all-members>
<dry-run>
<local>
<member member-id>

Syntax (QFX Series)
request system storage cleanup
<component (serial number | UUID | all)>
<director-group name>
<dry-run>
<infrastructure name>
<interconnect-device name>
<name-tag name-tag>
<node-group name>
<prune>
<qfabric (component name) | dry-run | name-tag | repository)>
<repository (core | log)>

Release Information
Command introduced in Junos OS Release 7.4.
dry-run option introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.

Options
all-members—(EX4200 switches and MX Series routers only) (Optional) Delete files on the Virtual Chassis master Routing Engine only.

custom (UUID | serial number | all)—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

director-group name—(QFabric systems only) (Optional) Delete files on the Director group.

NOTE: To delete files on the other members of the Virtual Chassis configuration, log in to each backup Routing Engine and delete the files using the request system storage cleanup local command.
**dry-run**—(Optional) List files proposed for deletion (without deleting them).

**interconnect-device name**—(QFabric systems only) (Optional) Delete files on the Interconnect device.

**local**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace `member-id` with a value from 0 through 9. For an MX Series Virtual Chassis, replace `member-id` with a value of 0 or 1.

**name-tag name-tag**—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

**node-group name**—(QFabric systems only) (Optional) Delete files on the Node group.

**prune**—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

**qfabric component name**—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

**repository (core | log)**—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

**Additional Information**
If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

**Required Privilege Level**
maintenance

**List of Sample Output**
request system storage cleanup dry-run on page 205
request system storage cleanup on page 206
request system storage cleanup director-group (QFabric Systems) on page 206
request system storage cleanup infrastructure device-name (QFabric Systems) on page 208
request system storage cleanup interconnect-device device-name (QFabric Systems) on page 209
request system storage cleanup node-group group-name (QFabric Systems) on page 210
request system storage cleanup qfabric component device-name (QFabric Systems) on page 211
request system storage cleanup qfabric component device-name repository core (QFabric Systems) on page 211
request system storage cleanup qfabric component all (QFabric Systems) on page 211
Output Fields  

Table 65 on page 205 describes the output fields for the request system storage cleanup command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List of files to delete:</td>
<td>Shows list of files available for deletion.</td>
</tr>
<tr>
<td>Size</td>
<td>Size of the core-dump file.</td>
</tr>
<tr>
<td>Date</td>
<td>Last core-dump file modification date and time.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the core-dump file.</td>
</tr>
<tr>
<td>Directory to delete:</td>
<td>Shows list of directories available for deletion.</td>
</tr>
<tr>
<td>Repository scope:</td>
<td>Repository where core-dump files and log files are stored. The core-dump files are located in the core repository, and the log files are located in the log repository. The default Repository scope is shared since both the core and log repositories are shared by all of the QFabric system devices.</td>
</tr>
<tr>
<td>Repository head:</td>
<td>Name of the top-level repository location.</td>
</tr>
<tr>
<td>Repository name:</td>
<td>Name of the repository: core or log.</td>
</tr>
<tr>
<td>Creating list of debug artifacts to be removed under:</td>
<td>Shows location of files available for deletion.</td>
</tr>
<tr>
<td>List of debug artifacts to be removed under:</td>
<td>Shows list of files available for deletion.</td>
</tr>
</tbody>
</table>

Sample Output

request system storage cleanup dry-run

user@host> request system storage cleanup dry-run

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- Command introduced in Junos OS Release 12.2 for ACX Series routers.

Options added:
- `dynamic-flow-capture` in Junos OS Release 7.4.
- `dlsw` in Junos OS Release 7.5.
- `event-processing` in Junos OS Release 7.5.
- `ppp` in Junos OS Release 7.5.
- `l2ald` in Junos OS Release 8.0.
- `link-management` in Release 8.0.
- `pgcp-service` in Junos OS Release 8.4.
- `sbc-configuration-process` in Junos OS Release 9.5.
- `services pgcp gateway` in Junos OS Release 9.6.
- `sfc` and `all-sfc` for the TX Matrix Router in Junos OS Release 9.6.

**Description**
Restart a Junos OS process.

---

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options**
- `none`—Same as `gracefully`. 

---

Copyright © 2013, Juniper Networks, Inc.
**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber’s initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router’s or switch’s CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).
database-replication—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

datapath-trace-service—(Optional) Restart the packet path tracing process.

dhcp—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

dhcp-service—(Optional) Restart the Dynamic Host Configuration Protocol process.

dialer-services—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

diameter-service—(Optional) Restart the diameter process.

disk-monitoring—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

dlsw—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

dot1x-protocol—(EX Series switches only) (Optional) Restart the port-based network access control process.

dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

ethernet-switching—(EX Series switches only) (Optional) Restart the Ethernet switching process.

event-processing—(Optional) Restart the event process (eventd).

fibre-channel—(QFX Series only) (Optional) Restart the Fibre Channel process.

firewall—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.
general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

generously—(Optional) Restart the software process.

iccp-service—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

immediately—(Optional) Immediately restart the software process.

interface-control—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

ipsec-key-management—(Optional) Restart the IPsec key management process.

isdn-signaling—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

kernel-replication—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Restart the Layer 2 address flooding and learning process.

l2cpd-service—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

l2tp-service—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

l2tp-universal-edge—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

l2tp—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**—(TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**—(Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**—(Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member member-id**—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.
multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

network-access-service—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

nfsd-service—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

packet-triggered-subscribers—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Restart the Peer Selection Service process.

pgcp-service—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the `services pgcp gateway` option.

pgm—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

pic-services-logging—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

pki-service—(Optional) Restart the PKI Service process.

ppp—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

pppoe—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

protected-system-domain-service—(Optional) Restart the Protected System Domain (PSD) process.

redundancy-interface-process—(Optional) Restart the ASP redundancy process.
remote-operations—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

root-system-domain-service—(Optional) Restart the Root System Domain (RSD) service.

routing—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

routing <logical-system logical-system-name>—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

sampling—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

sdk-service—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

sfc number—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace number with 0.

service-deployment—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

services—(Optional) Restart a service.

services pgcp gateway gateway-name—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the pgcp-service option.

sflow-service—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

snmp—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router’s or switch’s SNMP master agent.
**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oam**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider’s cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level**

reset

**Related Documentation**

- Overview of Junos OS CLI Operational Mode Commands

**List of Sample Output**

restart interfaces on page 222

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```
**set chassis display message**

**Syntax**

```
set chassis display message "message"
<permanent>
```

**Syntax (TX Matrix Router)**

```
set chassis display message "message" (lcc number | scc)
<permanent>
```

**Syntax (TX Matrix Plus Router)**

```
set chassis display message "message " (fpc-slot slot-number | lcc number | sfc number)
<permanent>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
**sfc** option for TX Matrix Plus router introduced in Junos OS Release 9.6.

**Description**

Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages three times, switching between messages every 60 seconds.

---

**NOTE:** On T Series routers, when this command is executed with the `permanent` option, the display of the text message alternates with that of the standard craft interface message continuously every 60 seconds.

By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

**Options**

"message"—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks (" ") deletes the text message from the craft interface display. On the LCD panel display, the message is limited to 16 characters.

**fpc-slot slot-number**—(TX Matrix Plus routers and EX4200 and QFX Series only) On the router or switch, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace `slot-number` with a value from 0 through 31. On the switch, display the text message for a specific member of a Virtual Chassis, where `fpc-slot slot-number` corresponds to the member ID. Replace `slot-number` with a value from 0 through 9. On the QFX Series, the `slot-number` is always 0. On a TX Matrix Plus router with 3D SIBs replace `slot-number` with a value from 0 through 63.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.
Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**permanent**—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

**scc**—(TX Matrix routers only) Display the text message on the craft interface display of the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) Display the text message on the craft interface display of the TX Matrix Plus router (or switch-fabric chassis).

**List of Sample Output**

- set chassis display message (Creating) on page 224
- set chassis display message (Deleting) on page 225

**Output Fields**

See *show chassis craft-interface* for an explanation of output fields.

**Sample Output**

**set chassis display message (Creating)**

The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
message sent

user@host> show chassis craft-interface
Red alarm: LED off, relay off
Yellow alarm: LED off, relay off
Host OK LED: On
Host fail LED: Off
FPCs 0 1 2 3 4 5 6 7
-------------------------------
Green .. *.. * *
Red ........
```
set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```
user@host> set chassis display message ""
message sent

user@host> show chassis craft-interface
Red alarm: LED off, relay off
Yellow alarm: LED off, relay off
Host OK LED: On
Host fail LED: Off
FPCs  0  1  2  3  4  5  6  7
-------------------------------
Green  .. *.. * *.
Red    ........
LCD screen:
                  +---------------------+
| host              |
| Up: 0+17:05:47    |
| Temperature OK    |
                  +---------------------+
```
set date

Syntax

```
set date (date-time ntp <key authentication-key number> <servers> <source-address source-address>)
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
key option introduced in Junos OS Release 12.1R2

Description

Set the date and time.

Options

- **date-time**—Date and time. Enter this string inside quotation marks.
- **ntp**—Use a Network Time Protocol (NTP) server to synchronize the current date and time setting on the router or switch.
- **key authentication-key number**—(Optional) Specify a key number to authenticate the NTP server used to synchronize the date and time. You must specify the same key number used to authenticate the server configured at the `edit system ntp authentication-key number` hierarchy level.
- **servers**—(Optional) Specify the IP address of one or more NTP servers.
- **source-address source-address**—Specify the source address that the router or switch uses to contact the remote NTP server.

Required Privilege Level

```

### show chassis fan

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show chassis fan</code></td>
<td>Show information about the fan tray and fans.</td>
</tr>
</tbody>
</table>

**Syntax (ACX4000 Series Router)**

- `show chassis fan`

**Syntax (MX Series Router)**

- `<all-members>`
- `<local>`
- `<member member-id>`

**Syntax (T Series Routers)**

- `show chassis fan`

**Syntax (MX104, MX2010, and MX2020 3D Universal Edge Router)**

- `show chassis fan`

**Syntax (QFabric Systems)**

- `<interconnect-device name>`

**Syntax (TX Matrix Router)**

- `show chassis fan`
- `<lcc number | scc>`

**Syntax (TX Matrix Plus Router)**

- `show chassis fan`
- `<lcc number | sfc number>`

**Release Information**

- Command introduced in Junos OS Release 10.0 on MX Series 3D Universal Edge Routers, M120 routers, and M320 routers, T320 routers, T640 routers, T1600 routers, TX Matrix Routers, and TX Matrix Plus routers.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- Command introduced in Junos OS Release 11.4 for EX Series switches.
- Command introduced in Junos OS Release 12.3 for PTX5000 Packet Transport Routers.
- Command introduced in Junos OS Release 12.1 for T4000 routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for ACX Series Routers.
- Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description**

(T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX104 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers, QFX3008-I Interconnect devices, EX Series switches, and PTX Series Packet Transport Routers only) Show information about the fan tray and fans.

**Options**

- `all-members`—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.
- `local`—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.
**member member-id**—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace `member-id` variable with a value 0 or 1.

**interconnect-device name**—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router. Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**scc**—(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

**stc number**—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace `number` variable with 0.

**Required Privilege Level**

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.4 for EX Series switches.
- sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced for EX8200 switches in Junos OS Release 10.2 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for QFX Series.
- Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.
- Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description**
- On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).
- On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version
levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

**Options**

- **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

- **all-members**—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

- **interconnect-device name**—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

- **lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

  Replace `number` with the following values depending on the LCC configuration:

  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

- **local**—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

- **member member-id**—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.

- **node-device**—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

- **scc**—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

- **sfc number**—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace `number` with 0.
**detail**—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

**Output Fields**

Table 67 on page 242 lists the output fields for the show chassis firmware command. Output fields are listed in the approximate order in which they appear.

**Table 67: show chassis firmware Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Part</td>
<td>(MX Series, MX2010, and MX2020 routers) Chassis part name.</td>
</tr>
<tr>
<td>Type</td>
<td>(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: ROM or O/S. On switches: uboot or loader.</td>
</tr>
</tbody>
</table>
Table 67: show chassis firmware Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPC</td>
<td>(detail option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.</td>
</tr>
<tr>
<td>AFEB</td>
<td>(MX104 routers) Version of the compact Forwarding Engine Board.</td>
</tr>
<tr>
<td>Boot</td>
<td>(detail option only) Version of the SYSPLD.</td>
</tr>
<tr>
<td>PoE</td>
<td>(detail option only) Version of the PoE firmware.</td>
</tr>
<tr>
<td>PFE-&lt;number&gt;</td>
<td>(detail option only) Version of the PFE used in the switch.</td>
</tr>
<tr>
<td>PHY-</td>
<td>(detail option only) Version of the physical layer device (PHY) used in the switch.</td>
</tr>
<tr>
<td>microcode</td>
<td>(detail option only) Microcode of the physical layer devices (PHY) used in the switch.</td>
</tr>
<tr>
<td>uboot</td>
<td>(detail option only) Version of the u-boot used in the switch.</td>
</tr>
<tr>
<td>loader</td>
<td>(detail option only) Version of the loader used in the switch.</td>
</tr>
</tbody>
</table>

### show chassis lcd

**show chassis lcd (EX Series)**

```
show chassis lcd
  <fpc-slot fpc-slot-number>
  <menu (all-members | local | member member-id) >>
```

**show chassis lcd (QFX Series and QFabric Systems)**

```
show chassis lcd
  <fpc-slot fpc-slot-number>
  <interconnect-device device-id>
  <node-device device-id>
```

### Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.

*menu* option introduced in Junos OS Release 10.2 for EX Series switches.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Command introduced in Junos OS Release 13.1 for QFabric systems.

### Description

Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.

### Options

**none**—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.

**fpc-slot <fpc-slot-number>**—(Optional) Display the information as follows:

- (EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no *fpc-slot-number* value specified or for the FPC slot specified by *fpc-slot 0*. *fpc-slot* refers to the switch itself and 0 is the only valid value for *fpc-slot-number*. Output for these options is the same as for the *none* option.

  Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no *fpc-slot-number* value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the *none* option. If the *fpc-slot-number* value is specified (it equals the *member-id* value), display the information for the specified member.

  Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the *fpc-slot-number* value.

  Also display the status of the currently selected port parameter of the Status LED for each network port.
interconnect-device device-id—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

menu—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

menu all-members—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

menu local—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

menu member member-id—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

dnode-device device-id—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

Output Fields

Table 68 on page 253 lists the output fields for the show chassis lcd command. Output fields are listed in the approximate order in which they appear.
### Table 68: show chassis lcd Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>member number</strong> (XRE200 External Routing Engine)</td>
<td>Member ID of the device whose content is being displayed.</td>
</tr>
<tr>
<td><strong>Front panel contents for slot</strong></td>
<td>FPC slot number of the switch whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value. On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed. On XRE200 External Routing Engines, this field appears under the <strong>member number</strong> field for each member device in the EX8200 Virtual Chassis.</td>
</tr>
</tbody>
</table>
| **LCD screen** | The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays RE and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:  
  - ADM—Administrative  
  - SPD—Speed  
  - DPX—Duplex  
  - POE—Power over Ethernet (EX3200 and EX4200 switches only) |
| **LEDs status** | Current state of the Alarms, System, and Master LEDs (chassis status LEDs). |
| **Interface** | Names of the interfaces on the switch. |
| **LED (ADM/SPD/DPX/POE)** | State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:  
  **NOTE:** The XRE200 External Routing Engine always displays the **NA** parameter. The QFX Series products do not have any of the port parameters listed below.  
  - ADM—Administrative  
  - SPD—Speed  
  - DPX—Duplex  
  - NA—Not applicable.  
  - POE—Power over Ethernet |
| **fpc** | On standalone EX Series and QFX Series switches, always 0. On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed. |

---

**show configuration**

**Syntax**

show configuration
<statement-path>

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the configuration that currently is running on the router or switch, which is the last committed configuration.

**Options**

- **none**—Display the entire configuration.

- **statement-path**—(Optional) Display one of the following hierarchies in a configuration.
  (Each **statement-path** option has additional suboptions not described here. See the appropriate configuration guide or EX Series switch documentation for more information.)
  - **access**—Network access configuration.
  - **access-profile**—Access profile configuration.
  - **accounting-options**—Accounting data configuration.
  - **applications**—Applications defined by protocol characteristics.
  - **apply-groups**—Groups from which configuration data is inherited.
  - **chassis**—Chassis configuration.
  - **chassis network-services**—Current running mode.
  - **class-of-service**—Class-of-service configuration.
  - **diameter**—Diameter base protocol layer configuration.
  - **ethernet-switching-options**—(EX Series switch only) Ethernet switching configuration.
  - **event-options**—Event processing configuration.
  - **firewall**—Firewall configuration.
  - **forwarding-options**—Options that control packet sampling.
  - **groups**—Configuration groups.
  - **interfaces**—Interface configuration.
  - **jsrc**—JSRC partition configuration.
  - **jsrc-partition**—JSRC partition configuration.
  - **logical-systems**—Logical system configuration.
  - **poe**—(EX Series switch only) Power over Ethernet configuration.
  - **policy-options**—Routing policy option configuration.
  - **protocols**—Routing protocol configuration.
• **routing-instances**—Routing instance configuration.
• **routing-options**—Protocol-independent routing option configuration.
• **security**—Security configuration.
• **services**—Service PIC applications configuration.
• **snmp**—Simple Network Management Protocol configuration.
• **system**—System parameters configuration.
• **virtual-chassis**—(EX Series switch only) Virtual Chassis configuration.
• **vlans**—(EX Series switch only) VLAN configuration.

**Additional Information**
The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text **ACCESS-DENIED** is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the secret permission bit is not set for your user account, the text **SECRET-DATA** is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

Likewise, when you issue the `show configuration` command with the **display set** pipe option to view the configuration as **set** commands, those portions of the configuration that you do not have permissions to view are substituted with the text **ACCESS-DENIED**.

**Required Privilege Level**
```plaintext
view
```

show host

Syntax  show host hostname

Release Information  Command introduced before Junos OS Release 7.4.
                    Command introduced in Junos OS Release 9.0 for EX Series switches.
                    Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  Display Domain Name System (DNS) hostname information.

Options  hostname—Hostname or address.

Additional Information  The show host command displays the raw data received from the DNS server.

Required Privilege  view

Level

List of Sample Output  show host on page 267

Sample Output

show host

user@host> show host snark
snark.boojum.net has address 192.168.1.254

user@host> show host 192.168.1.254
Name: snark.boojum.net
Address: 192.168.1.254
Aliases:
**show ntp associations**

**Syntax**
show ntp associations
<no-resolve>

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Display Network Time Protocol (NTP) peers and their state.

**Options**
none—Display NTP peers and their state.
no-resolve—(Optional) Suppress symbolic addressing.

**Required Privilege**
view

**Output Fields**
Table 69 on page 268 describes the output fields for the show ntp associations command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote</td>
<td>Address or name of the remote NTP peer.</td>
</tr>
<tr>
<td>refid</td>
<td>Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.</td>
</tr>
<tr>
<td>st</td>
<td>Stratum of the remote peer.</td>
</tr>
<tr>
<td>t</td>
<td>Type of peer: b (broadcast), l (local), m (multicast), or u (unicast).</td>
</tr>
<tr>
<td>when</td>
<td>When the last packet from the peer was received.</td>
</tr>
<tr>
<td>poll</td>
<td>Polling interval, in seconds.</td>
</tr>
<tr>
<td>reach</td>
<td>Reachability register, in octal.</td>
</tr>
<tr>
<td>delay</td>
<td>Current estimated delay of the peer, in milliseconds.</td>
</tr>
<tr>
<td>offset</td>
<td>Current estimated offset of the peer, in milliseconds.</td>
</tr>
<tr>
<td>disp</td>
<td>Current estimated dispersion of the peer, in milliseconds.</td>
</tr>
</tbody>
</table>
Table 69: show ntp associations Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>peer-name</strong></td>
<td>Peer name and status of the peer in the clock selection process:</td>
</tr>
<tr>
<td>space</td>
<td>Discarded because of a high stratum value or failed sanity checks.</td>
</tr>
<tr>
<td>x</td>
<td>Designated “falseticker” by the intersection algorithm.</td>
</tr>
<tr>
<td>.</td>
<td>Culled from the end of the candidate list.</td>
</tr>
<tr>
<td>–</td>
<td>Discarded by the clustering algorithm.</td>
</tr>
<tr>
<td>+</td>
<td>Included in the final selection set.</td>
</tr>
<tr>
<td>#</td>
<td>Selected for synchronization, but the distance exceeds the maximum.</td>
</tr>
<tr>
<td>*</td>
<td>Selected for synchronization.</td>
</tr>
<tr>
<td>o</td>
<td>Selected for synchronization, but the packets-per-second (pps) signal is in use.</td>
</tr>
</tbody>
</table>

Sample Output

show ntp associations

```
user@host> show ntp associations
remote   refid   st t when poll reach   delay   offset   disp
[Output truncated for brevity]
* wolfe-gw.junipe.tick.ucla.edu 2 u 43 64 377 1.86 0.319 0.08
```
**show ntp status**

**Syntax**

```
show ntp status
<no-resolve>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display the values of internal variables returned by Network Time Protocol (NTP) peers.

**Options**

- **none**—Display the values of internal variables returned by NTP peers.
- **no-resolve**—(Optional) Suppress symbolic addressing.

**Required Privilege**

Level: view

**Output Fields**

Table 70 on page 270 describes the output fields for the `show ntp status` command. Output fields are listed in the approximate order in which they appear.

**Table 70: show ntp status Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>System status word, a code representing the status items listed.</td>
</tr>
<tr>
<td>leapnone</td>
<td>Indicates a normal synchronized state with no leap seconds imminent. Other options could be <strong>leap_add_sec</strong>, <strong>leap_del_sec</strong>, or <strong>leap_alarm</strong>, indicating a leap second will be added, deleted, or a leap second requirement is upcoming.</td>
</tr>
<tr>
<td>syncntp</td>
<td>Indicates the current synchronization source, in this case, an NTP server. Other options include <strong>sync_alarm</strong> and <strong>sync_unspec</strong>, both indicating that the router has not been synched.</td>
</tr>
<tr>
<td>xevents</td>
<td>Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.</td>
</tr>
<tr>
<td>eventpeerstratchg</td>
<td>Describes the most recent event, in this case, the stratum of the peer server changed.</td>
</tr>
<tr>
<td>version</td>
<td>A detailed description of the version of NTP being used.</td>
</tr>
<tr>
<td>processor</td>
<td>Indicates the current hardware platform and version of the processor.</td>
</tr>
<tr>
<td>system</td>
<td>Detailed description of the name and version of the operating system in use.</td>
</tr>
<tr>
<td>leap</td>
<td>The number of leap seconds in use.</td>
</tr>
</tbody>
</table>
# Table 70: show ntp status Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stratum</td>
<td>The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server. Stratum 1 is a primary reference, such as an atomic clock.</td>
</tr>
<tr>
<td>precision</td>
<td>The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.</td>
</tr>
<tr>
<td>rootdelay</td>
<td>The total roundtrip delay to the primary reference source, in seconds.</td>
</tr>
<tr>
<td>rootdispersion</td>
<td>The maximum error relative to the primary reference source, in seconds.</td>
</tr>
<tr>
<td>peer</td>
<td>An identification number of the peer in use.</td>
</tr>
<tr>
<td>refid</td>
<td>Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.</td>
</tr>
<tr>
<td>reftime</td>
<td>The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.</td>
</tr>
<tr>
<td>poll</td>
<td>The NTP broadcast message polling interval, in seconds.</td>
</tr>
<tr>
<td>clock</td>
<td>The current time on the local router clock.</td>
</tr>
<tr>
<td>state</td>
<td>The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.</td>
</tr>
<tr>
<td>offset</td>
<td>Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.</td>
</tr>
<tr>
<td>frequency</td>
<td>The frequency of the clock.</td>
</tr>
<tr>
<td>jitter</td>
<td>Indicates the magnitude of jitter, in milliseconds, between several time queries.</td>
</tr>
<tr>
<td>stability</td>
<td>A measure of how well this clock can maintain a constant frequency.</td>
</tr>
</tbody>
</table>

## Sample Output

```
show ntp status
```

```
user@host>  show ntp status
assID=0  status=0544  leap=None, sync_local_proto, 4 events, event_peer/strat_chg
version="ntpd 4.2.2p101.1570-0 Tue May 19 13:57:55 UTC 2009 (1)"
processor="x86_64", system="Linux/2.6.18-164.el5", leap=00, stratum=4,
precision=-10, rootdelay=0.000, rootdispersion=11.974, peer=59475,
refid=LOCAL(0),
reftime=d495c32c.0e71eaf2  Mon, Jan  7 2013 13:57:00.056, poll=10,

```
show system firmware

Syntax

```
show system firmware
<compatibility>
```

Release Information

Command introduced in Junos OS Release 7.4.
Command introduced in Junos OS Release 9.4 for EX Series switches.

Description

(J Series routers and EX8200 switches only) Display firmware information.

```
NOTE: On SRX100, SRX210, SRX240, and SRX 650 devices, the show system firmware command now displays all the installed firmware versions, even if the installed firmware versions are earlier than the currently installed firmware version.
```

Options

- `compatibility`—(Optional) Display firmware compatibility information.

Required Privilege Level

- `view`

List of Sample Output

- `show system firmware on page 274`
- `show system firmware compatibility on page 274`

Output Fields

Table 71 on page 273 lists the output fields for the show system firmware command. Output fields are listed in the approximate order in which they appear.

Table 71: show system firmware Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Part</td>
<td>Physical part on the router or switch affected by the firmware.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of firmware on the router or switch.</td>
</tr>
<tr>
<td>Tag</td>
<td>Location of the firmware on the interface.</td>
</tr>
<tr>
<td>Current version</td>
<td>Firmware version on the affected router or switch parts.</td>
</tr>
<tr>
<td>Available version</td>
<td>New versions of firmware for upgrading or downgrading.</td>
</tr>
<tr>
<td>Status</td>
<td>Firmware condition on the router or switch.</td>
</tr>
<tr>
<td>Action</td>
<td>Whether you can upgrade or downgrade, or if no action is available (none).</td>
</tr>
</tbody>
</table>
### Sample Output

#### show system firmware

```
user@host> show system firmware
Part       Type           Tag Current version  Available version Status
FPC 0      ROM Monitor 0  0 6.4.10              0                   OK
Routing Engine 0 RE BIOS  0 0                   0                   OK
```

#### show system firmware compatibility

```
user@host> show system firmware compatibility
Part       Type           Tag Current version  Available version Action
FPC 0      ROM Monitor 0  0 6.4.10              0                   None

<interconnect-device name>
<node-device name>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display pending system reboots or halts.

Options
none—Display pending reboots or halts on the active Routing Engine.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

all-lcc—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers...
connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

**infrastructure name**—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

**interconnect-device name**—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group name**—(QFabric systems only) (Optional) Display reboot request information on the Node group.

**scc**—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

**Additional Information** By default, when you issue the `show system reboot` command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the
same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level**

- maintenance

**Related Documentation**

**List of Sample Output**

- `show system reboot` on page 277
- `show system reboot all-lcc (TX Matrix Router)` on page 277
- `show system reboot sfc (TX Matrix Plus Router)` on page 277
- `show system reboot (QFX3500 Switch)` on page 277

**Sample Output**

`show system reboot`

```
user@host> show system reboot
reboot requested by root at Wed Feb 10 17:40:46 1999
[process id 17885]
```

`show system reboot all-lcc (TX Matrix Router)`

```
user@host> show system reboot all-lcc
lcc0-re0:
-------------------------------------------------
No shutdown/reboot scheduled.

lcc2-re0:
-------------------------------------------------
No shutdown/reboot scheduled.
```

`show system reboot sfc (TX Matrix Plus Router)`

```
user@host> show system sfc 0
No shutdown/reboot scheduled.
```

`show system reboot (QFX3500 Switch)`

```
user@switch> show system reboot
No shutdown/reboot scheduled.
```
**show system software**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show system software</td>
<td>Display the Junos OS extensions loaded on your router or switch.</td>
</tr>
</tbody>
</table>

**Options**

- **none**—Display standard information about all loaded Junos OS extensions.
- **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the routers (TX Matrix Plus Router) in the chassis.
- **all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for all connected TI600 or T4000 LCCs.
- **all-members**—(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.
- **backup**—(J Series routers only) (Optional) Display the status of old system software packages only.

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `sfc` option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
detail—(Optional) Display detailed information about available Junos OS extensions.

infrastructure name—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

interconnect-device name—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific router that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SiBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SiBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

member member-id—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace member-id with a value from 0 through 9.

node-group name—(QFabric systems only) (Optional) Display the system software running on the Node group.

scc—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display statistics about the amount of free disk space in the router’s or switch’s file systems.

Options

none—Display standard information about the amount of free disk space in the router’s or switch’s file systems.

detail—(Optional) Display detailed output.
all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

infrastructure name—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device name—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

node-group name—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

scc—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace number with 0.
Additional Information

By default, when you issue the `show system storage` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Syntax (TX Matrix Plus Router)
show system switchover
<all-chassis | all-lcc | lcc number | sfc number>
Syntax (MX Series Router)
show system switchover
<all-members>
<local>
<member member-id>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.

Description
Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

NOTE: Issue the show system switchover command only on the backup Routing Engine. This command is not supported on the master Routing Engine because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the show system switchover command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the show system switchover command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the show system switchover command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 or T4000 routers in the routing matrix.

Options

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all
Routing Engines on the TX Matrix Plus router and the T1600 or T4000 routers configured in the routing matrix.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all connected T1600 or T4000 LCCs.

Note that in this instance, packets get dropped. The LCCs perform GRES on their own chassis (GRES cannot be handled by one particular chassis for the entire router) and synchronization is not possible as the LCC plane bringup time varies for each LCC. Therefore, when there is traffic on these planes, there may be a traffic drop.

all-members—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific router connected to the TX Matrix Plus router.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router.

Additional Information If you issue the show system switchover command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.
Likewise, if you issue the `show system switchover` command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 or T4000 backup Routing Engines that are connected to it.

If you issue the `show system switchover` command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays an error message that graceful Routing Engine switchover (GRES) is not enabled on this member.

### Required Privilege

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.

Options

none—Show time since the system rebooted and processes started.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.
director-group name—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

infrastructure name—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device name—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

invoke-on—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

node-group name—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

scc—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace number with 0.
**Additional Information**  
By default, when you issue the `show system uptime` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields**
Table 74 on page 298 describes the output fields for the `show system uptime` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current time</td>
<td>Current system time in UTC.</td>
</tr>
<tr>
<td>System booted</td>
<td>Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.</td>
</tr>
<tr>
<td>Protocols started</td>
<td>Date and time when the routing protocols were last started and how long they have been running.</td>
</tr>
<tr>
<td>Last configured</td>
<td>Date and time when a configuration was last committed. Also shows the name of the user who issued the last <code>commit</code> command.</td>
</tr>
<tr>
<td>time and up</td>
<td>Current time, in the local time zone, and how long the router or switch has been operational.</td>
</tr>
<tr>
<td>users</td>
<td>Number of users logged in to the router or switch.</td>
</tr>
<tr>
<td>load averages</td>
<td>Load averages for the last 1 minute, 5 minutes, and 15 minutes.</td>
</tr>
</tbody>
</table>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

List information about the users who are currently logged in to the router or switch.

NOTE: The show system users command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

Options

none—List information about the users who are currently logged in to the router or switch.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.

all-members—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is
connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router. Replace `number` with the following values depending on the LCC configuration:

- **0 through 3**, when T640 routers are connected to a TX Matrix router in a routing matrix.
- **0 through 3**, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- **0 through 7**, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- **0, 2, 4, or 6**, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace `number` with 0.

### Additional Information
By default, when you issue the `show system users` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

<interconnect-device name>
<node-group name>

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the **show system virtual-memory** command for troubleshooting with Juniper Networks Customer Support.

**Options**

**none**—Display kernel dynamic memory usage information.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group name**—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the `show system virtual-memory` command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.
NOTE: The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

**show task replication**

**Syntax**
show task replication

**Release Information**
Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Displays nonstop active routing (NSR) status. When you issue this command on the master Routing Engine, the status of nonstop active routing synchronization is also displayed.

**Options**
This command has no options.

**Required Privilege Level**
view

**List of Sample Output**
show task replication (Issued on the Master Routing Engine) on page 363
show task replication (Issued on the Backup Routing Engine) on page 364

**Output Fields**
Table 77 on page 363 lists the output fields for the show task replication command. Output fields are listed in the approximate order in which they appear.

**Table 77: show task replication Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stateful replication</td>
<td>Displays whether or not graceful Routing Engine switchover is configured. The status can be <strong>Enabled</strong> or <strong>Disabled</strong>.</td>
</tr>
<tr>
<td>RE mode</td>
<td>Displays the Routing Engine on which the command is issued: <strong>Master</strong>, <strong>Backup</strong>, or <strong>Not applicable</strong> (when the router has only one Routing Engine).</td>
</tr>
<tr>
<td>Protocol</td>
<td>Protocols that are supported by nonstop active routing.</td>
</tr>
<tr>
<td>Synchronization Status</td>
<td>Nonstop active routing synchronization status for the supported protocols. States are <strong>NotStarted</strong>, <strong>InProgress</strong>, and <strong>Complete</strong>.</td>
</tr>
</tbody>
</table>

**Sample Output**

show task replication (Issued on the Master Routing Engine)

```
user@host> show task replication
Stateful Replication: Enabled
RE mode: Master

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Synchronization Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPF</td>
<td>NotStarted</td>
</tr>
<tr>
<td>BGP</td>
<td>Complete</td>
</tr>
<tr>
<td>IS-IS</td>
<td>NotStarted</td>
</tr>
<tr>
<td>LDP</td>
<td>Complete</td>
</tr>
<tr>
<td>PIM</td>
<td>Complete</td>
</tr>
</tbody>
</table>
```
show task replication (Issued on the Backup Routing Engine)

user@host> show task replication
Stateful Replication: Enabled
RE mode: Backup

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the hostname and version information about the software running on the router or switch.

Options

none—Display standard information about the hostname and version of the software running on the router or switch.

brief | detail—(Optional) Display the specified level of output.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.

component all—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.

component component-name—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace component-name with the name of the QFabric system.
component. The component-name can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace number with 0.

**Additional Information**

By default, when you issue the `show version` command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.
Required Privilege Level

List of Sample Output

show version on page 368
show version (TX Matrix Plus Router) on page 368
show version (TX Matrix Plus Router with 3D SIBs) on page 371
show version (MX Series Router) on page 374
show version (QFX3500 Switch) on page 374
show version (QFabric System) on page 375
show version component all (QFabric System) on page 375

show version fpc

Syntax

```
show version fpc
<slot-number>
```

Release Information
Command introduced in Junos OS Release 11.4 for EX Series switches.

Description
Display the version of Junos OS for EX Series switches loaded on the line cards in an EX8200 switch.

Options

- `none`—List the version of Junos OS for EX Series switches loaded on the line cards in the EX8200 switch.

- `<slot-number>`—(Optional) Display the version of Junos OS for EX Series switches loaded on the line card slot specified by the slot-number value.

Required Privilege

Level `view`

Troubleshooting Procedures

Troubleshooting Loss of the Root Password

Problem
If you forget the root password for the switch, you can use the password recovery procedure to reset the root password.

NOTE: You need physical access to the switch to recover the root password.

Solution
To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.
2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See Figure 1 on page 379.

Figure 1: Connecting to the Console Port on the EX Series Switch

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
4. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None

5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.

6. When the following prompt appears, press the Spacebar to access the switch’s bootstrap loader command prompt:
   
   Hit [Enter] to boot immediately, or space bar for command prompt.
   Booting [kernel] in 1 second...

7. At the following prompt, type `boot -s` to start up the system in single-user mode:
   
   `loader> boot -s`

8. At the following prompt, type `recovery` to start the root password recovery procedure:
   
   `Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery`
   
   A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:
   
   `user@switch> configure`

10. Set the root password. For example:
    
    `user@switch# set system root-authentication plain-text-password`

11. At the following prompt, enter the new root password. For example:
    
    `New password: juniper!`
    
    Retype new password:

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.
    
    `root@switch# commit`
    
    commit complete

14. Exit configuration mode in the CLI.
    
    `root@switch# exit`

15. Exit operational mode in the CLI.
    
    `root@switch> exit`

16. At the prompt, enter y to reboot the switch.
    
    `Reboot the system? [y/n] y`

---

Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 385
- Junos OS Processes on page 386

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.

- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network.
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

**Junos OS Processes**

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassisd</td>
<td>Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet switching process</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>Forwarding process</td>
<td>pfem</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
<tr>
<td>Management process</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</td>
</tr>
<tr>
<td>Routing protocol process</td>
<td>rpd</td>
<td>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</td>
</tr>
</tbody>
</table>
User Interfaces

You can use two interfaces to monitor, configure, troubleshoot, and manage a Juniper Networks EX Series Ethernet Switch: the J-Web graphical user interface and the Junos operating system (Junos OS) command-line interface (CLI). Both of these user interfaces are shipped with the switch. This topic describes the CLI. For information about the J-Web user interface, see “J-Web User Interface for EX Series Switches Overview” on page 389.

CLI Overview

Junos operating system (Junos OS) CLI is a Juniper Networks specific command shell that runs on top of a UNIX-based operating system kernel. The CLI provides command help and command completion.

The CLI also provides a variety of UNIX utilities, such as Emacs-style keyboard sequences that allow you to move around on a command line and scroll through recently executed commands, regular expression matching to locate and replace values and identifiers in a configuration, filter command output, or log file entries, store and archive router files on a UNIX-based file system, and exit from the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage switch processes, and so on.

CLI Help and Command Completion

To access CLI Help, type a question mark (?) at any level of the hierarchy. The system displays a list of the available commands or statements and a short description of each.

To complete a command, statement, or option that you have partially typed, press the Tab key or the Spacebar. If the partially typed letters uniquely identify a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command and the possible completions are displayed. This completion feature also applies to other strings, such as filenames, interface names, usernames, and configuration statements.
The CLI has two modes, operational mode and configuration mode.

In operational mode, you enter commands to monitor and troubleshoot switch hardware and software and network connectivity. Operational mode is indicated by the > prompt—for example, user@switch>.

In configuration mode, you can define all properties of the Juniper Networks Junos operating system (Junos OS), including interfaces, VLANs, Virtual Chassis information, routing protocols, user access, and several system hardware properties.

To enter configuration mode, enter the configure command: .

user@switch> configure

Configuration mode is indicated by the # prompt, and includes the current location in the configuration hierarchy—for example:

[edit interfaces ge-0/0/12]
user@switch#

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the commit command.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit

You can also activate your configuration changes and exit configuration mode with a single command, commit and-quit. This command succeeds only if there are no mistakes or syntax errors in the configuration.

TIP: When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the commit confirmed command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the commit confirmed command, you must issue another commit command within the defined period of time (10 minutes by default) or the system reverts to the previous configuration.

J-Web User Interface for EX Series Switches Overview

You can use two interfaces to monitor, configure, troubleshoot, and manage a Juniper Networks EX Series Ethernet Switch: the J-Web graphical user interface and the Juniper Networks Junos operating system (Junos OS) command-line interface (CLI). Both of these user interfaces are shipped with the switch. This topic describes the J-Web interface. You can navigate the J-Web interface, scroll pages, and expand and collapse elements as you do in a typical Web browser interface. For information about the CLI user interface, see “CLI User Interface Overview” on page 387.

To access the J-Web interface for the switch, your management device requires the following software:

- Supported browsers—Microsoft Internet Explorer version 7.0 and Mozilla Firefox version 3.0 and later
NOTE: Other browser versions might not work on the switch. The browser and the network must support receiving and processing HTTP 1.1 GZIP compressed data.

- Language support—English-version browsers
- Supported OS—Microsoft Windows XP Service Pack 3

Each page of the J-Web interface is divided into panes.

- Top pane—Displays system identity information and links.
- Main pane—Location where you monitor, configure, diagnose (troubleshoot), and manage (maintain) the switch by entering information in text boxes, making selections, and clicking buttons.
- Side pane—Displays suboptions of the Monitor, Configure, Troubleshoot, or Maintain task currently displayed in the main pane. Click a suboption to access it in the main pane.

The layout of the panes allows you to quickly navigate through the interface. Table 79 on page 390 summarizes the elements of the J-Web interface.

The J-Web interface provides CLI tools that enable you to perform all of the tasks that you can perform from the Junos OS CLI, including a CLI Viewer to view the current configuration, a CLI Editor for viewing and modifying the configuration, and a Point & Click CLI editor that allows you to click through all of the available CLI statements.

<table>
<thead>
<tr>

<td>• Maintain—Manage files and licenses, upgrade software, and reboot the switch.</td>
</tr>
<tr>
<td></td>
<td>• Troubleshoot—Run diagnostic tools to troubleshoot network issues.</td>
</tr>
<tr>
<td><strong>Help (?) icon</strong></td>
<td>Displays useful information—such as the definition, format, and valid range of an option—when you mouse over the question mark.</td>
</tr>
<tr>
<td><strong>Red asterisk (*)</strong></td>
<td>Indicates a required field.</td>
</tr>
</tbody>
</table>
### Understanding J-Web Configuration Tools

The J-Web graphical user interface (GUI) allows you to monitor, configure, troubleshoot, and manage the switching platform by means of a Web browser with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled. The J-Web interface provides access to all the configuration statements supported by the switch.

The J-Web interface provides three methods of configuring the switch:

- Configure menu
- Point & Click CLI Editor
- CLI Editor

Table 80 on page 393 gives a comparison of the three methods of configuration.

---

- Configuration Files Terms on page 499

Understanding J-Web User Interface Sessions
You establish a J-Web session with the switch through an HTTP-enabled or HTTPS-enabled Web browser. The HTTPS protocol, which uses 128-bit encryption, is available only in domestic versions of the Juniper Networks Junos operating system (Junos
OS). To use HTTPS, you must have installed a certificate on the switch and enabled HTTPS. See “Generating SSL Certificates to Be Used for Secure Web Access” on page 418.

When you attempt to log in through the J-Web interface, the switch authenticates your username with the same methods used for Telnet and SSH.

If the switch does not detect any activity through the J-Web interface for 15 minutes, the session times out and is terminated. You must log in again to begin a new session.

To explicitly terminate a J-Web session at any time, click Logout in the top pane.

CHAPTER 8

Configuration

• Configuration Tasks on page 395

Configuration Tasks

• Using the J-Web CLI Terminal on page 395
• Starting the J-Web Interface on page 397

Using the J-Web CLI Terminal

The J-Web CLI terminal provides access to the Junos OS command-line interface (CLI) through the J-Web interface. The functionality and behavior of the CLI available through the CLI Terminal page is the same as that of the Junos OS CLI available through the switch console. The CLI terminal supports all CLI commands and other features such as CLI help and autocompletion. Using the CLI terminal page, you can fully configure, monitor, and manage the switch.

This topic covers:

• Configuring the Web Browser on page 395
• Setting Domain Name, Hostname, and Name Server on page 396
• Enabling SSH on your system on page 396
• Sample Configuration on an EX Series Switch on page 396

Configuring the Web Browser

Configure your Web browser as follows:

• Install Java Runtime Environment (JRE) version 1.4 or later on your system. JRE is a software package that must be installed on the client system to run Java applications. You can download the latest version of JRE from the Java software website http://www.java.com/. Installing JRE installs Java plug-ins, which once installed, load automatically and transparently to render Java applets.

NOTE: By default Mozilla Firefox has blocked JRE versions earlier than 1.6.0_31 and 1.7.0 through 1.7.0_2. However, Mozilla Firefox users can still click Add-ons > Plugin to enable Java.
• Set your browser to support and enable Java applets. To know more about checking the status of Java applets in your browser see http://java.com/en/download/help/enable_browser.xml.

Setting Domain Name, Hostname, and Name Server

Configure the domain name and hostname of the switch on your system. Ensure that the DNS server setting is correct. DNS name resolution must happen properly. Ensure that there is connectivity between the client and the management device.

You can set the domain name, hostname, and the DNS name server either through the J-Web interface or the CLI:

• To set through the J-Web interface:
  See “Configuring System Identity for an EX Series Switch (J-Web Procedure)” on page 118 for more information.

• To set through the CLI:
  
  set system domain-name domain-name
  set system host-name host-name
  set system name-server dns-ip-address

Enabling SSH on your system

SSH provides a secure method of logging in to the switch, and encrypting traffic so that it is not intercepted. If SSH is not enabled on the system, the CLI terminal page displays the error message:

To enable SSH on your system, do the following:

set system services ssh

Sample Configuration on an EX Series Switch

1. Type the configure command to enter the configuration mode:

   user@switch> configure

2. Log in as host:

   user@switch# set system host-name host

3. Configure the encrypted password; for example:

   user@switch# set system root-authentication encrypted-password "$1Smr3D4eVfSmc7y54e6hk4JlpuWPao6."

4. Map the hostname to the IP address:

   user@switch# set system static-host-mapping host inet 10.9.221.31

5. Configure the IP address for the DNS server:

   user@switch# set system name-server 10.0.220.1
6. Enable the system services by using:

   set system services:admin
   set system services ssh

7. Select Troubleshoot > CLI Terminal. The password window is displayed.

8. Enter the password, and click OK. The CLI Terminal window appears on the J-Web page.

   NOTE: If you exit from the CLI terminal, the connection is lost. Click CLI Terminal if you want to connect again.

   Related Documentation
   • CLI User Interface Overview on page 387
   • Understanding J-Web Configuration Tools on page 392

Starting the J-Web Interface

You can use the J-Web graphical interface to configure and manage the EX Series switch.

To start the J-Web interface:

1. Launch your HTTP-enabled or HTTPS-enabled Web browser.

   To use HTTPS, you must have installed a certificate on the switch and enabled HTTPS.

2. After http:// or https:// in your Web browser, type the hostname or IP address of the switch and press Enter.

   The J-Web login page appears.

3. On the login page, type your username and password, and click Log In.

   To correct or change the username or password you typed, click Reset, type the new entry or entries, and click Log In.

   NOTE: The default username is root with no password. You must change this during initial configuration or the system does not accept the configuration.

   The Chassis Dashboard information page appears.

To explicitly terminate a J-Web session at any time, click Logout in the top pane.

Administration

- Operational Commands on page 399

Operational Commands
set cli directory

Syntax

set cli directory directory

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Set the current working directory.

Options
directory—Pathname of the working directory.

Required Privilege

Level view

Related Documentation

• CLI User Interface Overview
• show cli directory

List of Sample Output

set cli directory on page 400

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli directory

user@host> set cli directory /var/home/regress
Current directory: /var/home/regress
set cli idle-timeout

**Syntax**

```
set cli idle-timeout <minutes>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Set the maximum time that an individual session can be idle before the user is logged off the router or switch.

**Options**

- `minutes`—(Optional) Maximum idle time. The range of values, in minutes, is 0 through 100,000. If you do not issue this command, and the user’s login class does not specify this value, the user is never forced off the system after extended idle times. Setting the value to 0 disables the timeout.

**Required Privilege**

- `view`

- [CLI User Interface Overview](#)
- [show cli](#)

**List of Sample Output**

- set cli idle-timeout on page 401

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
set cli idle-timeout

user@host> set cli idle-timeout 60
Idle timeout set to 60 minutes
```
**set cli prompt**

**Syntax**  
set cli prompt string

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Set the prompt so that it is displayed within the CLI.

**Options**  
*string*—CLI prompt string. To include spaces in the prompt, enclose the string in quotation marks. By default, the string is \textit{username@hostname}.

**Required Privilege Level**  
view

**Related Documentation**  
- CLI User Interface Overview
- show cli

**List of Sample Output**  
set cli prompt on page 402

**Output Fields**  
When you enter this command, the new CLI prompt is displayed.

**Sample Output**

set cli prompt

user@host> set cli prompt lab1-router>
lab1-router>
set cli restart-on-upgrade

Syntax
set cli restart-on-upgrade string (off | on)

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
For an individual session, set the CLI to prompt you to restart the router or switch after upgrading the software.

Options
off—Disables the prompt.
on—Enables the prompt.

Required Privilege
view

Related Documentation
• CLI User Interface Overview
• show cli

List of Sample Output
set cli restart-on-upgrade on page 403

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output
set cli restart-on-upgrade

user@host> set cli restart-on-upgrade on
Enabling restart-on-upgrade
**set cli screen-length**

**Syntax**

```
set cli screen-length length
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Set terminal screen length.

**Options**

`length`—Number of lines of text that the terminal screen displays (0 through 10,000). The default is 24.

**Additional Information**

The point at which the ---(more)--- prompt appears on the screen is a function of this setting and the settings for the `set cli screen-width` and `set cli terminal` commands.

**Required Privilege Level**

view

**List of Sample Output**

set cli screen-length on page 404

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
set cli screen-length
user@host> set cli screen-length 75
Screen length set to 75
```
**set cli screen-width**

**Syntax**

```
set cli screen-width width
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Set the terminal screen width.

**Options**

`width`—Number of characters (0 through 1024) in a line. The default is 80.

**Additional Information**

The point at which the ---(more)--- prompt appears on the screen is a function of this setting and the settings for the `set cli screen-length` and `set cli terminal` commands.

`set cli screen-width` on page 405

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
set cli screen-width

user@host> set cli screen-width
Screen width set to 132
```
set cli timestamp

Syntax  set cli timestamp (format timestamp-format | disable)

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description  Set a timestamp for CLI output.

Options  format timestamp-format—Set the date and time format for the timestamp. The
timestamp format you specify can include the following placeholders in any order:
  • %m—Two-digit month
  • %d—Two-digit date
  • %T—Six-digit hour, minute, and seconds

disable—Remove the timestamp from the CLI.

Required Privilege  view

Related Documentation  • CLI User Interface Overview
  • show cli

List of Sample Output  set cli timestamp on page 406

Output Fields  When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli timestamp

user@host> set cli timestamp format '%m-%d-%T'
'04-21-17:39:13'
CLI timestamp set to: '%m-%d-%T'
**start shell**

**Syntax**  
start shell (csh | sh)  
<user username>

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**  
Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type `exit` from the shell.

---

**NOTE:**
- To issue this command, the user must have the required login access privileges configured by including the permissions statement at the `[edit system login class class-name]` hierarchy level.
- UNIX wheel group membership or permissions are no longer required to issue this command.

**Options**
- **csh**—Create a UNIX C shell.
- **sh**—Create a UNIX Bourne shell.
- **user username**—(Optional) Start the shell as another user.

**Additional Information**  
When you are in the shell, the shell prompt has the following format:  
`username@hostname%`

An example of the prompt is:
```
root@host%
```

**Required Privilege Level**  
shell and maintenance

**List of Sample Output**  
start shell csh on page 407

**Output Fields**  
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
start shell csh

user@host> start shell csh
%
exit
```
username@hostname% startshell sh
% exit
user@host>

Software Overview

- Understanding Software Infrastructure and Processes on page 411

Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 411
- Junos OS Processes on page 412

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.

- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network.
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

**Junos OS Processes**

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassisd</td>
<td>Detects hardware on the system that is used to configure network interfaces.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>switching</td>
<td></td>
<td>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>process</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Forwarding</td>
<td>pfem</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>process</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
<tr>
<td>Management</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database.</td>
</tr>
<tr>
<td>process</td>
<td></td>
<td>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</td>
</tr>
<tr>
<td>Routing protocol</td>
<td>rpd</td>
<td>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</td>
</tr>
<tr>
<td>process</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CHAPTER 11

Configuration

- Configuration Tasks on page 415
- Configuration Statements on page 420

Configuration Tasks

- Configuring Management Access for the EX Series Switch (J-Web Procedure) on page 415
- Generating SSL Certificates to Be Used for Secure Web Access on page 418
- Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure) on page 419

Configuring Management Access for the EX Series Switch (J-Web Procedure)

You can manage an EX Series switch remotely through the J-Web interface. To communicate with the switch, the J-Web interface uses Hypertext Transfer Protocol (HTTP). HTTP allows easy Web access but no encryption. The data that is transmitted between the Web browser and the switch by means of HTTP is vulnerable to interception and attack. To enable secure Web access the switch supports HTTP over Secure Sockets Layer (HTTPS). You can enable HTTP or HTTPS access on specific interfaces and ports as needed.

Navigate to the Secure Access Configuration page by selecting Configure > System Properties > Management Access. On this page, you can enable HTTP and HTTPS access on interfaces for managing the EX Series switch through the J-Web interface. You can also install SSL certificates and enable Junos XML management protocol over SSL with the Secure Access page.

1. Click Edit to modify the configuration. Enter information into the Management Access Configuration page as described in Table 82 on page 416.

2. To verify that Web access is enabled correctly, connect to the switch using the appropriate method:
   - For HTTP access—In your Web browser, type http://URL or http://IP address.
   - For HTTPS access—In your Web browser, type https://URL or https://IP address.
For SSL Junos XML management protocol access—To use this option, you must have a Junos XML management protocol client such as Junos Scope. For information about how to log into Junos Scope, see the Junos Scope Software User Guide.

NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

Table 82: Secure Management Access Configuration Summary

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Management Access tab</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Management Port IP/Management Port IPv6 | Specifies the management port IP address. The software supports both IPv4 (displayed as IP) and IPv6 address. | To specify an IPv4 address:  
1. Select the check box **IPv4 address**.  
2. Type an IP address—for example: 10.10.10.10.  
3. Enter the subnet mask or address prefix. For example, 24 bits represents 255.255.255.0.  
4. Click OK.  
To specify an IPv6 address:  
1. Select the check box **IPv6 address**.  
2. Type an IP address—for example: 2001:ab8:85a3::8a2e:370:7334.  
3. Enter the subnet mask or address prefix.  
4. Click OK. |
| Default Gateway | Defines a default gateway through which to direct packets addressed to networks that are not explicitly listed in the bridge table constructed by the switch. | For IPv4 address type a 32-bit IP address, in dotted decimal notation. Type a 128-bit IP address for IPv6 address type. |
| Loopback address | Specifies the IP address of the loopback interface. | Type an IP address. |
| Subnet Mask | Specifies the subnet mask for the loopback interface. | Enter the subnet mask or address prefix. |
| **Services tab** | | |
| Services | Specifies services to be enabled: telnet and SSH. | Select to enable the required services. |
| Enable Junos XML management protocol over Clear Text | Enables clear text access to the Junos XML management protocol XML scripting API. | To enable clear text access, select the **Enable Junos XML management protocol over Clear Text** check box. |
YourActionFunctionField

To enable SSL access, select the **Enable Junos XML management protocol over SSL** check box.

**Enables secure SSL access to the Junos XML management protocol XML scripting API.**

To enable an SSL certificate, select a certificate from the Junos XML management protocol SSL Certificate list—for example, new.

**Specifies SSL certificates to be used for encryption.**

This field is available only after you create at least one SSL certificate.

To enable HTTP access, select the **Enable HTTP access** check box.

**Enables HTTP access on interfaces.**

Select and clear interfaces by clicking the direction arrows:

- To enable HTTP access on an interface, add the interface to the HTTP Interfaces list. You can either select all interfaces or specific interfaces.

To enable HTTPS access, select the **Enable HTTPS access** check box.

**Enables HTTPS access on interfaces.**

Select and deselect interfaces by clicking the direction arrows:

- To enable HTTPS access on an interface, add the interface to the HTTPS Interfaces list. You can either select all interfaces or specific interfaces.

**NOTE:** Specify the certificate to be used for HTTPS access.

To add a certificate:

1. Have a general SSL certificate available. See Generating SSL Certificates for more information.
2. Click Add. The Add a Local Certificate page opens.
3. Type a name in the Certificate Name box—for example, new.
4. Open the certificate file and copy its contents.
5. Paste the generated certificate and RSA private key in the Certificate box.

To edit a certificate, select it and click Edit.

To delete a certificate, select it and click Delete.

<table>
<thead>
<tr>
<th>Field</th>

<tr>
<td>Junos XML management protocol Certificate</td>
<td>Specifies SSL certificates to be used for encryption. This field is available only after you create at least one SSL certificate.</td>
<td>To enable an SSL certificate, select a certificate from the Junos XML management protocol SSL Certificate list—for example, new.</td>
</tr>
<tr>
<td>Enable HTTP</td>
<td>Enables HTTP access on interfaces.</td>
<td>To enable HTTP access, select the <strong>Enable HTTP access</strong> check box. Select and clear interfaces by clicking the direction arrows: To enable HTTP access on an interface, add the interface to the HTTP Interfaces list. You can either select all interfaces or specific interfaces.</td>
</tr>
<tr>
<td>Enable HTTPS</td>
<td>Enables HTTPS access on interfaces.</td>
<td>To enable HTTPS access, select the <strong>Enable HTTPS access</strong> check box. Select and deselect interfaces by clicking the direction arrows: To enable HTTPS access on an interface, add the interface to the HTTPS Interfaces list. You can either select all interfaces or specific interfaces. <strong>NOTE:</strong> Specify the certificate to be used for HTTPS access.</td>
</tr>
</tbody>
</table>

**Certificates tab**

**Certificates**

Displays digital certificates required for SSL access to the switch. Allows you to add and delete SSL certificates.

To add a certificate:

1. Have a general SSL certificate available. See Generating SSL Certificates for more information.
2. Click Add. The Add a Local Certificate page opens.
3. Type a name in the Certificate Name box—for example, new.
4. Open the certificate file and copy its contents.
5. Paste the generated certificate and RSA private key in the Certificate box.

To edit a certificate, select it and click Edit.

To delete a certificate, select it and click Delete.
Generating SSL Certificates to Be Used for Secure Web Access

You can set up secure Web access for an EX Series switch. To enable secure Web access, you must generate a digital Secure Sockets Layer (SSL) certificate and then enable HTTPS access on the switch.

To generate an SSL certificate:

1. Enter the following `openssl` command in your SSH command-line interface on a BSD or Linux system on which `openssl` is installed. The `openssl` command generates a self-signed SSL certificate in the privacy-enhanced mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

   ```
   % openssl req -x509 -nodes -newkey rsa:1024 -keyout filename.pem -out filename.pem
   
   where `filename` is the name of a file in which you want the SSL certificate to be written—for example, `my-certificate.pem`.
   ```

2. When prompted, type the appropriate information in the identification form. For example, type `US` for the country name.

3. Display the contents of the file that you created.

   ```
   cat my-certificate.pem
   ```

You can use the J-Web Configuration page to install the SSL certificate on the switch. To do this, copy the file containing the certificate from the BSD or Linux system to the switch. Then open the file, copy its contents, and paste them into the Certificate box on the J-Web Secure Access Configuration page.

You can also use the following CLI statement to install the SSL certificate on the switch:

```
[edit]
user@switch# set security certificates local my-signed-cert load-key-file my-certificate.pem
```
Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure)

Junos OS for EX Series switches enables you to configure the Microsoft Corporation implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the switch to provide password-change support. Configuring MS-CHAPv2 on the switch provides users accessing a switch the option of changing the password when the password expires, is reset, or is configured to be changed at next login.

See RFC 2433, Microsoft PPP CHAP Extensions, for information about MS-CHAP.

Before you configure MS-CHAPv2 to provide password-change support, ensure that you have:

- Configured RADIUS server authentication. Configure users on the authentication server and set the first-tried option in the authentication order to radius. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.

To configure MS-CHAPv2, specify the following:

```
[edit system radius-options]
user@switch# set password-protocol mschap-v2
```

You must have the required access permission on the switch in order to change your password.

### announcement

**Syntax**

```plaintext
announcement text;
```

**Hierarchy Level**

[edit system login]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure a system login announcement. This announcement appears after a user logs in.

**Options**

- `text`—Text of the announcement. If the text contains any spaces, enclose it in quotation marks.

**Required Privilege Level**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration

**Related Documentation**

- Configuring the Junos OS to Display a System Login Announcement
- message on page 443

### archive-sites

**Syntax**

```plaintext
archive-sites {
  site-name;
}
```

**Hierarchy Level**

[edit accounting-options file filename]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format `router-name_log-filename_timestamp`.

**Options**

- `site-name`—Any valid FTP URL to a destination. For information about specifying valid FTP URLs, see the Junos System Basics: Getting Started Configuration Guide.

**Required Privilege Level**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration

**Related Documentation**

- Configuring Archive Sites
authentication (Login)

Syntax

```
authentication {
  (encrypted-password "password" | plain-text-password);
  load-key-file URL filename;
  ssh-dsa "public-key";
  ssh-ecdsa "public-key";
  ssh-rsa "public-key";
}
```

Hierarchy Level [edit system login user username]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Authentication methods that a user can use to log in to the router or switch. You can assign multiple authentication methods to a single user.

Options

- `encrypted-password "password"`—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.

  You cannot configure a blank password for `encrypted-password` using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

- `load-key-file URL filename`—Load previously-generated RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a named file at a specified URL location. The file contains one or more SSH keys.

- `plain-text-password`—When using this option, the command-line interface (CLI) prompts you for the password and then encrypts it.

- `ssh-dsa "public-key"`—SSH version 2 authentication. Specify the DSA public key. You can specify one or more public keys for each user.

- `ssh-ecdsa "public-key"`—SSH version 2 authentication. Specify the ECDSA public key. You can specify one or more public keys for each user.

- `ssh-rsa "public-key"`—SSH version 1 and SSH version 2 authentication. Specify the RSA public key. You can specify one or more public keys for each user.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Junos OS User Accounts
- root-authentication on page 452
**authentication-order**

**Syntax**
```
authentication-order [ authentication-methods ];
```

**Hierarchy Level**
```
[edit system]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.

**Default**
If you do not include the `authentication-order` statement, users are verified based on their configured passwords.

**Options**
```
authentication-methods—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:
```

- **password**—Use the password configured for the user with the `authentication` statement at the `[edit system login user]` hierarchy level.
- **radius**—Use RADIUS authentication services.
- **tacplus**—Use TACACS+ authentication services.

**Required Privilege Level**
```
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.
```

**Related Documentation**

- `authentication` on page 423
change-type

**Syntax**
change-type (character-sets | set-transitions);

**Hierarchy Level**
[edit system login password]

**Release Information**
Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Set requirements for using character sets in plain-text passwords. When you combine this statement with the `minimum-changes` statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.

**Options**
Specify one of the following:
- `character-sets`—The number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.
- `set-transitions`—The number of transitions between character sets.

**Required Privilege**
- Level system—To view this statement in the configuration.
- Level system-control—To add this statement to the configuration.

**Related Documentation**
- `Special Requirements for Junos OS Plain-Text Passwords`
- `minimum-changes on page 445`

class (Assigning a Class to an Individual User)

**Syntax**
class class-name;

**Hierarchy Level**
[edit system login user username]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure a user's login class. You must configure one class for each user.

**Options**
class-name—One of the classes defined at the [edit system login class] hierarchy level.

**Required Privilege**
- Level admin—To view this statement in the configuration.
- Level admin-control—To add this statement to the configuration.

**Related Documentation**
- `Configuring Junos OS User Accounts`
class (Defining Login Classes)

Syntax

```
class class-name {
    allow-commands "regular-expression";
    ( allow-configuration | allow-configuration-regexps ) "regular expression 1" "regular expression 2";
    configuration-breadcrumbs;
    deny-commands "regular-expression";
    ( deny-configuration | deny-configuration-regexps ) "regular expression 1" "regular expression 2";
    idle-timeout minutes;
    login-script filename;
    login-tip;
    permissions [ permissions ];
}
```

Hierarchy Level  [edit system login]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Define a login class.

Options  class-name—A name you choose for the login class.

The remaining statements are explained separately.

Required Privilege  Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Defining Junos OS Login Classes

class-usage-profile

Syntax

```
class-usage-profile profile-name {
  file filename;
  interval minutes;
  source-classes {
    source-class-name;
  }
  destination-classes {
    destination-class-name;
  }
}
```

Hierarchy Level  [edit accounting-options]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Create a class usage profile, which is used to log class usage statistics to a file in the /var/log directory. The class usage profile logs class usage statistics for the configured source classes on every interface that has destination-class-usage configured.

For information about configuring source classes, see the Junos Routing Protocols Configuration Guide. For information about configuring source class usage, see the Junos Network Management Configuration Guide.

Options  `profile-name`—Name of the destination class profile.

The remaining statements are explained separately.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring Class Usage Profiles
counters

Syntax       counters {
             counter-name;
         }

Hierarchy Level [edit accounting-options filter-profile profile-name]

Release Information Statement introduced before Junos OS Release 7.4,
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Names of counters for which filter profile statistics are collected. The packet and byte counts for the counters are logged to a file in the /var/log directory.

Options counter-name—Name of the counter.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • Configuring the Counters

deny-commands

Syntax       deny-commands "regular-expression";

Hierarchy Level [edit system login class]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the permissions statement would allow it.

Default If you omit this statement and the allow-commands statement, users can issue only those commands for which they have access privileges through the permissions statement.

Options regular-expression—Extended (modern) regular expression as defined in POSIX 1003.2.
If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation • Specifying Access Privileges for Junos OS Operational Mode Commands
• allow-commands on page 420
• user on page 462
deny-configuration

**Syntax**

deny-configuration "regular-expression";

**Hierarchy Level**
[edit system login class]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Explicitly deny configuration access to the specified levels in the hierarchy even if the permissions set with the permissions statement grant such access by default. Note that the user cannot view a particular hierarchy if configuration access is denied for that hierarchy.

**Default**
If you omit this statement and the allow-configuration statement, users can edit those levels in the configuration hierarchy for which they have access privileges through the permissions statement.

**Options**
- **regular-expression**—Extended (modern) regular expression as defined in POSIX 1003.2.
  - If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

**Required Privilege Level**
- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

**Related Documentation**

destination-classes

Syntax

```
destination-classes {  
destination-class-name;  
}
```

Hierarchy Level

[edit accounting-options class-usage-profile profile-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Specify the destination classes for which statistics are collected.

Options

`destination-class-name`—Name of the destination class to include in the source class usage profile.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Configuring a Class Usage Profile
**fields (for Interface Profiles)**

**Syntax**
```
fields {
    field-name;
}
```

**Hierarchy Level**
```
[edit accounting-options interface-profile profile-name]
```

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Statistics to collect in an accounting-data log file for an interface.

**Options**
- `field-name`—Name of the field:
  - `input-bytes`—Input bytes
  - `input-errors`—Generic input error packets
  - `input-multicast`—Input packets arriving by multicast
  - `input-packets`—Input packets
  - `input-unicast`—Input unicast packets
  - `output-bytes`—Output bytes
  - `output-errors`—Generic output error packets
  - `output-multicast`—Output packets sent by multicast
  - `output-packets`—Output packets
  - `output-unicast`—Output unicast packets

**Required Privilege**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- *Configuring the Interface Profile*
# file (Associating with a Profile)

**Syntax**
```
file filename;
```

**Hierarchy Level**
- [edit accounting-options class-usage-profile profile-name]
- [edit accounting-options filter-profile profile-name]
- [edit accounting-options interface-profile profile-name]
- [edit accounting-options mib-profile profile-name]
- [edit accounting-options routing-engine-profile profile-name]

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series Switches.

**Description**
Specify the accounting log file associated with the profile.

**Options**
- `filename`—Name of the log file. You must specify a filename already configured in the `file` statement at the [edit accounting-options] hierarchy level.

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- [Configuring the Interface Profile](#)

file (Configuring a Log File)

Syntax

```
file filename {
  archive-sites {
    site-name;
  }
  files number;
  nonpersistent;
  size bytes;
  source-classes time;
  transfer-interval minutes;
}
```

Hierarchy Level [edit accounting-options]

Description Specify a log file to be used for accounting data.

Options

- `filename`—Name of the file in which to write accounting data.
  
  The remaining statements are explained separately.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Accounting-Data Log Files
files

Syntax files number;

Hierarchy Level [edit accounting-options file filename]

Description Specify the maximum number of log files to be used for accounting data.

Options number—The maximum number of files. When a log file (for example, profilelog) reaches its maximum size, it is renamed profilelog.0, then profilelog.1, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for number is 3 and the default value is 10.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation • Configuring Accounting-Data Log Files
filter-profile

Syntax

filter-profile profile-name {
  counters {
    counter-name;
  }
  file filename;
  interval minutes;
}

Hierarchy Level

[edit accounting-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Create a profile to filter and collect packet and byte count statistics and write them to a file in the /var/log directory. To apply the profile to a firewall filter, you include the accounting-profile statement at the [edit firewall filter filter-name] hierarchy level. For more information about firewall filters, see the Junos Network Management Configuration Guide.

Options

profile-name—Name of the filter profile.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the Filter Profile
format

Syntax format ( md5 | sha1 );

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure the authentication algorithm for plain-text passwords.

Default For Junos OS, the default encryption format is md5. For Junos-FIPS software, the default encryption format is sha1.

Options The hash algorithm that authenticates the password can be one of these algorithms:

- md5—Produces a 128-bit digest.
- sha1—Produces a 160-bit digest.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation • Special Requirements for Junos OS Plain-Text Passwords

full-name

Syntax full-name complete-name ;

Hierarchy Level [edit system login user]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the complete name of a user.

Options complete-name—Full name of the user. If the name contains spaces, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation • Configuring Junos OS User Accounts
• user on page 462
• user
idle-timeout (System-Login)

Syntax  
idle-timeout minutes;

Hierarchy Level  
[edit system login class class-name]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
For a login class, configure the maximum time that a session can be idle before the user is logged out of the router or switch. The session times out after remaining at the CLI operational mode prompt for the specified time.

Default  
If you omit this statement, a user is never forced off the system after extended idle times.

Options  
minutes—Maximum idle time.
Range: 0 through 4294967295 minutes

Required Privilege Level  
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation  
• Configuring the Timeout Value for Idle Login Sessions
• user on page 462
interface-profile

Syntax

```
interface-profile profile-name {
  fields {
    field-name;
  }
  file filename;
  interval minutes;
}
```

Hierarchy Level
[edit accounting-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Create a profile to filter and collect error and packet statistics and write them to a file in the /var/log directory. You can specify an interface profile for either a physical or a logical interface.

Options

- **profile-name**—Name of the interface profile.

  The remaining statements are explained separately.

Required Privilege Level
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

Related Documentation

interval (Accounting Options)

Syntax  
interval minutes;

Hierarchy Level  
[edit accounting-options class-usage-profile profile-name],  
[edit accounting-options filter-profile profile-name],  
[edit accounting-options interface-profile profile-name],  
[edit accounting-options mib-profile profile-name],  
[edit accounting-options routing-engine-profile profile-name]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Specify how often statistics are collected for the accounting profile.

Options  
minutes—Length of time between each collection of statistics.  
Range: 1 through 2880 minutes  
Default: 30 minutes

Required Privilege Level  
interface—to view this statement in the configuration.  
interface-control—to add this statement to the configuration.

login-tip

**Syntax**
```
login-tip;
```

**Hierarchy Level**
```
[edit system login class class-name]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Enable CLI tips at login.

**Default**
Disabled.

**Required Privilege Level**
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

**Related Documentation**
- *Configuring CLI Tips*
maximum-length

Syntax  maximum-length length;

Hierarchy Level  [edit system login passwords]

Release Information  Statement introduced in Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the maximum number of characters allowed in plain-text passwords. Newly
              created passwords must meet this requirement.

Default  For Junos-FIPS software, the maximum number of characters for plain-text passwords
          is 20. For Junos OS, no maximum is set.

Options  length—The maximum number of characters the password can include.
          Range: 1 to 64 characters

Required Privilege Level  system—To view this statement in the configuration.
                          system-control—To add this statement to the configuration.

message

Syntax  message text;

Hierarchy Level  [edit system login]

Release Information  Statement introduced before Junos OS Release 7.4.
  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure a system login message. This message appears before a user logs in.

  You can format the message using the following special characters:

  • \n—New line
  • \t—Horizontal tab
  • \’—Single quotation mark
  • \"—Double quotation mark
  • \\
—Backslash

Options  text—Text of the message.

Required Privilege  system—To view this statement in the configuration.
  system-control—To add this statement to the configuration

### mib-profile

**Syntax**

```
  mib-profile profile-name {
    file filename;
    interval minutes;
    object-names {
      mib-object-name;
    }
    operation operation-name;
  }
```

**Hierarchy Level**

[edit accounting-options]

**Release Information**

Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Create a MIB profile to collect selected MIB statistics and write them to a file in the `/var/log` directory.

---

**NOTE:** Do not configure MIB objects related to interface octets or packets for a MIB profile, because it can cause the SNMP walk or a CLI show command to time out.

---

**Options**

- `profile-name`—Name of the MIB statistics profile.

  The remaining statements are explained separately.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- *Configuring the MIB Profile*
**minimum-changes**

**Syntax**  
minimum-changes number;

**Hierarchy Level**  
[edit system login passwords]

**Release Information**  
Statement introduced in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.

This statement is used in combination with the change-type statement. If the change-type is **character-sets**, then the number of character sets included in the password is checked against the specified minimum. If change-type is **set-transitions**, then the number of character set changes in the password is checked against the specified minimum.

**Default**  
For Junos OS, the minimum number of changes is 1. For Junos-FIPS Software, the minimum number of changes is 3.

**Options**  
number—The minimum number of character sets (or character set changes) required for the password.

**Required Privilege Level**  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- *Special Requirements for Junos OS Plain-Text Passwords*
- *change-type on page 425*
### minimum-length

**Syntax**  
minimum-length length;

**Hierarchy Level**  
[edit system login passwords]

**Release Information**  
Statement introduced in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as `minimum-upper-cases`, `minimum-punctuations`, `minimum-lower-cases`, and so on.

Using several password minimum requirement options will cause the `minimum-length` to be reset if the total sum of the required minimums exceeds the `minimum-length` setting.

**Default**  
For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.

**Options**  
length—The minimum number of characters the password must include.  
Range: 6 to 20 characters

**Required Privilege Level**  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**  
- *Special Requirements for Junos OS Plain-Text Passwords*
- *Example: Changing the Requirements for Junos OS Plain-Text Passwords*
- *maximum-length on page 442*
object-names

Syntax  object-names {
         mib-object-name;
     }

Hierarchy Level  [edit accounting-options mib-profile profile-name]

Release Information  Statement introduced in Junos OS Release 8.2.
                  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the name of each MIB object for which MIB statistics are collected for an
accounting-data log file.

Options  mib-object-name—Name of a MIB object. You can specify more than one MIB object
         name.

Required Privilege Level  interface—To view this statement in the configuration.
                   interface-control—To add this statement to the configuration.

Related Documentation  • Configuring the MIB Profile

operation

Syntax  operation operation-name;

Hierarchy Level  [edit accounting-options mib-profile profile-name]

Release Information  Statement introduced in Junos OS Release 8.2.
                  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the name of the operation used to collect MIB statistics for an accounting-data
log file.

Options  operation-name—Name of the operation to use. You can specify a get, get-next, or walk
         operation.
                   Default: walk

Required Privilege Level  interface—To view this statement in the configuration.
                   interface-control—To add this statement to the configuration.

Related Documentation  • Configuring the MIB Profile
password (Login)

Syntax

```plaintext
password {
  change-type (set-transitions | character-set);
  format (md5 | sha1);
  maximum-length length;
  minimum-changes number;
  minimum-length length;
  minimum-lower-cases number;
  minimum-numerics number;
  minimum-punctuations number;
  minimum-upper-cases number;
}
```

Hierarchy Level

[edit system login]

Release Information

Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.

Using several password minimum requirement options will cause the `minimum-length` to be reset if the total sum of the required minimums exceeds the `minimum-length` setting.

The individual statements are explained separately.

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

radius-options (edit system)

Syntax

```plaintext
radius-options {
  attributes {
    nas-ip-address ip-address;
  }
  password-protocol mschap-v2;
}
```

Hierarchy Level [edit system]

Release Information

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.
MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

NOTE: The radius-options statement is not available on QFabric systems.

Description

Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.

Options

- **nas-ip-address ip-address**—IP address of the network access server (NAS) that requests user authentication.
- **password-protocol mschap-v2**—Protocol MS-CHAPv2, used for password authentication and password changing.

Required Privilege

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

root-authentication

Syntax

```plaintext
root-authentication {
  (encrypted-password "password" | plain-text-password);
  ssh-dsa "public-key";
  ssh-ecdsa "public-key";
  ssh-rsa "public-key";
}
```

Hierarchy Level

[edit system]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure the authentication methods for the root-level user, whose username is `root`.

Options

- **encrypted-password "password"**—MD5 or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password.

  You cannot configure a blank password for encrypted-password using blank quotation marks (`""`). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

- **plain-text-password**—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.

- **ssh-dsa "public-key"**—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.

- **ssh-rsa "public-key"**—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.

Required Privilege

- **admin**—To view this statement in the configuration.
- **admin-control**—To add this statement to the configuration.

Related Documentation

- Configuring the Root Password

root-login

Syntax  root-login (allow | deny | deny-password);

Hierarchy Level  [edit system services ssh]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  Control user access through SSH.

Default  Allow user access through SSH.

Options  allow—Allow users to log in to the router or switch as root through SSH.

deny—Disable users from logging in to the router or switch as root through SSH.

deny-password—Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.

Required Privilege  Level  admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation  • Configuring SSH Service for Remote Access to the Router or Switch
Routing-Engine Profile

Syntax

```
route-engine-profile profile-name { fields { field-name; } file filename; interval minutes; }
```

Hierarchy Level

[edit accounting-options]

Release Information

Description

Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the /var/log directory.

Options

- **profile-name**—Name of the Routing Engine statistics profile.
- The remaining statements are explained separately.

Required Privilege

- Interface—To view this statement in the configuration.
- Interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the Routing Engine Profile
### size

**Syntax**

```
size bytes;
```

**Hierarchy Level**

```
[edit accounting-options file filename]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

**Options**

- `bytes`—Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, `profilelog`) reaches its maximum size, it is renamed `profilelog.0`, then `profilelog.1`, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.

**Syntax:**

```
x to specify bytes, xk to specify KB, xm to specify MB, xg to specify GB
```

**Range:** 256 KB through 1 GB

**Required Privilege**

- **Level**

```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

**Related Documentation**

- Configuring the Maximum Size of the File

### source-classes

**Syntax**

```
source-classes { 
  source-class-name;
}
```

**Hierarchy Level**

```
[edit accounting-options class-usage-profile profile-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Specify the source classes for which statistics are collected.

**Options**

- `source-class-name`—Name of the source class to include in the class usage profile.

**Required Privilege**

- **Level**

```
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
```

**Related Documentation**

- Configuring a Class Usage Profile
### start-time (Log File Transfer)

**Syntax**
```
start-time time;
```

**Hierarchy Level**
```
[edit accounting-options file filename]
```

**Release Information**
- Statement introduced in Junos OS Release 8.2.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify the start time for transfer of an accounting-data log file.

**Options**
- **time**—Start time for file transfer.
  
  **Syntax:**
  ```
  YYYY-MM-DD.hh:mm
  ```

**Required Privilege Level**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- [Configuring the Start Time for File Transfer](#)
**tacplus-options**

**Syntax**

```plaintext
tacplus-options {
    (exclude-cmd-attribute | no-cmd-attribute-value);
    service-name service-name;
    timestamp-and-timezone;
}
```

**Hierarchy Level**

[edit system]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Options for `no-cmd-attribute-value` and `exclude-cmd-attribute` introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.1 for QFX Series.
Option for `timestamp-and-timezone` introduced in Junos OS Release 12.2.

**Description**

Configure TACACS+ options for authentication and accounting.

**Options**

- `exclude-cmd-attribute`—Exclude the `cmd` attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.

- `no-cmd-attribute-value`—Set the `cmd` attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.

- `service-name service-name`—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.

**Default:** `junos-exec`

- `timestamp-and-timezone`—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.

**Required Privilege Level**

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

**Related Documentation**

tacplus-server

Syntax
tacplus-server server-address {
    secret password;
    single-connection;
    source-address source-address;
    timeout seconds;
}

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure the TACACS+ server.

Options server-address—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation • Configuring TACACS+ Authentication
traceoptions (Address-Assignment Pool)

Syntax
```
traceoptions {
    file filename {
        files number;
        size maximum-file-size;
        match regex;
            (world-readable | no-world-readable);
    }
    flag address-assignment;
    flag all;
    flag configuration;
    flag framework;
    flag ldap;
    flag local-authentication;
    flag radius;
}
```

Hierarchy Level
[edit system processes general-authentication-service]

Release Information
Flag for tracing address-assignment pool operations introduced in Junos OS Release 9.0.
option-name option introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Configure tracing options.

Options
- `file filename`—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory `/var/log`.

- `files number`—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- `Range`: 2 through 1000
- `Default`: 3 files

- `flag flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:
  - `address-assignment`—All address-assignment events
  - `all`—All tracing operations
  - `configuration`—Configuration events
  - `framework`—Authentication framework events
  - `ldap`—LDAP authentication events
  - `local-authentication`—Local authentication events

Copyright © 2013, Juniper Networks, Inc.
- **radius**—RADIUS authentication events

**match regex**—(Optional) Refine the output to include lines that contain the regular expression.

**no-world-readable**—(Optional) Restrict access to the originator of the trace operation only.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB
**Range:** 10 KB through 1 GB
**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege**

- **Level**
  - admin—To view this statement in the configuration.
  - admin-control—To add this statement to the configuration.

**Related Documentation**

---

**transfer-interval**

**Syntax**

```plaintext
transfer-interval minutes;
```

**Hierarchy Level**

```plaintext
[edit accounting-options file filename]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Specify the length of time the file remains open and receives new statistics before it is closed and transferred to an archive site.

**Options**

- **minutes**—Time the file remains open and receives new statistics before it is closed and transferred to an archive site.

  **Range:** 5 through 2880 minutes
  **Default:** 30 minutes

**Required Privilege**

- **Level**
  - interface—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring the Transfer Interval of the File*
uid

**Syntax**  
uid uid-value;

**Hierarchy Level**  
[edit system login user]

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Numeric identifier associated with the user account name, either assigned by an administrator or assigned automatically when you commit the user configuration. It is used by applications that request numeric identifiers, such as some RADIUS queries or secure applications such as flow-tap monitoring.

**Options**  
uid-value—Number associated with the login account. This value must be unique on the router or switch.  
**Range:** 100 through 64000

**Required Privilege Level**  
admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**  
- Configuring Junos OS User Accounts
user (Access)

Syntax

```
user username {
  authentication {
    class class-name;
    (encrypted-password "password" | plain-text-password);
    full-name complete-name;
    load-key-file URL filename;
    ssh-dsa "public-key" <from hostname>;
    ssh-rsa "public-key" <from hostname>;
    uid uid-value;
  }
}
```

Hierarchy Level  [edit system login]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure access permission for individual users.

Options  The remaining statements are explained separately.

Required Privilege

- Level  admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

Routine Monitoring

Managing Users (J-Web Procedure)

You can use the Users Configuration page for user information to add new users to an EX Series switch. For each account, you define a login name and password for the user and specify a login class for access privileges.

To configure users:

   The User Management page displays details of users, the authentication order, the RADIUS servers and TACACS servers present.

2. Click Edit.

3. Click any of the following options on the Users tab:
   - **Add**—Select this option to add a user. Enter details as described in Table 83 on page 464.
   - **Edit**—Select this option to edit an existing user’s details. Enter details as described in Table 83 on page 464.
   - **Delete**—Select this option to delete a user.

4. Click an option on the Authentication Methods and Order tab:
   - Authentication Order—Drag and drop the authentication type from the Available Methods section to the Selected Methods. Click the up or down buttons to modify the authentication order.
   - RADIUS server—Click one of the following options:
     - **Add**—Select this option to add an authentication server. Enter details as described in Table 84 on page 465.
- **Edit**—Select this option to modify the authentication server details. Enter details as described in Table 84 on page 465.
- **Delete**—Select this option to delete an authentication server from the list.

- **TACACS server**—Click one of the following options:
  - **Add**—Select this option to add an authentication server. Enter details as described in Table 84 on page 465.
  - **Edit**—Select this option to modify the authentication server details. Enter details as described in Table 84 on page 465.
  - **Delete**—Select this option to delete an authentication server from the list.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

<user-name user-name>
<vci vci-identifier>
<vpi vpi-identifier>
<vlan-id vlan-id>

Release Information
Command introduced in Junos OS Release 9.3.
Command introduced in Junos OS Release 9.3 for EX Series switches.
client-type, mac-address, subscriber-state, and extensive options introduced in Junos OS Release 10.2.
count option usage with other options introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 11.1 for the QFX Series.
The physical-interface and user-name options introduced in Junos OS Release 12.3.
Options vci and vpi introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.
Options vci and vpi supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

Description
Display information for active subscribers.

Options
detail | extensive | terse—(Optional) Display the specified level of output.

aci-interface-set-name—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

address—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, 192.168.17.1). If you specify the IP address as a prefix with a netmask (for example, 192.168.171/32), the router displays a message that the IP address is invalid, and rejects the command.
**agent-circuit-identifier-substring**—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

**client-type**—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

**count**—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the count option alone or with the address, client-type, interface, logical-system, mac-address, profile-name, routing-instance, stacked-vlan-id, subscriber-state, or vlan-id options.

**id**—(Optional) Display a specific subscriber session whose session ID matches the specified subscriber ID. You can display subscriber IDs by using the show subscribers extensive or the show subscribers interface extensive commands.

**interface**—(Optional) Display subscribers whose interface matches the specified interface.

**logical-system**—(Optional) Display subscribers whose logical system matches the specified logical system.

**mac-address**—(Optional) Display subscribers whose MAC address matches the specified MAC address.

**physical-interface-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

**profile-name**—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

**routing-instance**—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**subscriber-state**—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

**user-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

**vci-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is 0 through 255.

**vpi-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is 0 through 65535.

**vlan-id**—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

**stacked-vlan-id**—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.
NOTE: Due to display limitations, logical system and routing instance output values are truncated when necessary.

<td>IPv6 Address</td>
<td>Subscriber IPv6 address, or multiple addresses.</td>
</tr>
<tr>
<td>IPv6 Prefix</td>
<td>Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.</td>
</tr>
<tr>
<td>IPv6 User Prefix</td>
<td>IPv6 prefix obtained through ND/RA.</td>
</tr>
<tr>
<td>IPv6 Address Pool</td>
<td>Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.</td>
</tr>
<tr>
<td>IPv6 Network Prefix Length</td>
<td>Length of the network portion of the IPv6 address.</td>
</tr>
<tr>
<td>IPv6 Prefix Length</td>
<td>Length of the subscriber IPv6 prefix.</td>
</tr>
</tbody>
</table>
Table 85: show subscribers Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical System</td>
<td>Logical system associated with the subscriber.</td>
</tr>
<tr>
<td>Routing Instance</td>
<td>Routing instance associated with the subscriber.</td>

Troubleshooting Procedures

- Troubleshooting Loss of the Root Password on page 485

**Troubleshooting Loss of the Root Password**

**Problem**  
If you forget the root password for the switch, you can use the password recovery procedure to reset the root password.

**Solution**  
To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.

2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See Figure 1 on page 379

**Figure 2: Connecting to the Console Port on the EX Series Switch**

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
4. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None

5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.

6. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:
   Hit [Enter] to boot immediately, or space bar for command prompt.
   Booting [kernel] in 1 second...

7. At the following prompt, type `boot -s` to start up the system in single-user mode:
   ```
   loader> boot -s
   ```

8. At the following prompt, type `recovery` to start the root password recovery procedure:
   ```
   Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
   ```
   A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:
   ```
   user@switch> configure
   ```

10. Set the root password. For example:
    ```
        user@switch# set system root-authentication plain-text-password
    ```

11. At the following prompt, enter the new root password. For example:
    ```
        New password: juniper!
        Retype new password:
    ```

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.
    ```
        root@switch# commit
        commit complete
    ```

14. Exit configuration mode in the CLI.
    ```
        root@switch# exit
    ```

15. Exit operational mode in the CLI.
    ```
        root@switch> exit
    ```

16. At the prompt, enter `y` to reboot the switch.
    ```
        Reboot the system? [y/n] y
    ```

Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 491
- Junos OS Processes on page 492

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.

- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network.
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.

Table 86: Junos OS Processes

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassisd</td>
<td>Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet switching process</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>Forwarding process</td>
<td>pfem</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
<tr>
<td>Management process</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</td>
</tr>
<tr>
<td>Routing protocol process</td>
<td>rpd</td>
<td>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</td>
</tr>
</tbody>
</table>
Configuration Files Overview

- Understanding Autoinstallation of Configuration Files on page 497
- Configuration Files Terms on page 499

Understanding Configuration Files for EX Series Switches

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration. For more information, see “Configuration Files Terms” on page 499.

Juniper Networks Junos operating system (Junos OS) saves the 50 most recently committed configuration files on the switch so that you can return to a previous configuration. The configuration files are named:

- juniper.conf.gz—The current active configuration.
- juniper.conf.1.gz to juniper.conf.49.gz—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI or use the configuration tools in the J-Web interface. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.
Using the CLI Viewer in the J-Web Interface to View Configuration Text

To view the entire configuration file contents in text format, select Configure > CLITools > CLI Viewer. The main pane displays the configuration in text format.

Each level in the hierarchy is indented to indicate each statement’s relative position in the hierarchy. Each level is generally set off with braces, with an open brace ({) at the beginning of each hierarchy level and a closing brace (}) at the end. If the statement at a hierarchy level is empty, the braces are not displayed. Each leaf statement ends with a semicolon (;), as does the last statement in the hierarchy.

This indented representation is used when the configuration is displayed or saved as an ASCII file. However, when you load an ASCII configuration file, the format of the file is not so strict. The braces and semicolons are required, but the indentation and use of new lines are not required in ASCII configuration files.

Related Documentation
- Understanding J-Web Configuration Tools on page 392

Using the CLI Editor in the J-Web Interface to Edit Configuration Text

Use the CLI Editor to edit configuration if you know the Junos OS CLI or prefer a command interface.

To edit the entire configuration in text format:

CAUTION: We recommend that you use this method to edit and commit the configuration only if you have experience editing configurations through the CLI.

1. Select Configure > CLITools > CLI Editor. The main pane displays the configuration in a text editor.

2. Navigate to the hierarchy level you want to edit.

   You can edit the candidate configuration using standard text editor operations—insert lines (by using the Enter key), delete lines, and modify, copy, and paste text.

3. Click Commit to load and commit the configuration.

   The switching platform checks the configuration for the correct syntax before committing it.

- CLI User Interface Overview on page 387
- Understanding J-Web Configuration Tools on page 392

Using the Point and Click CLI Tool in the J-Web Interface to Edit Configuration Text

To edit the configuration on a series of pages of clickable options that steps you through the hierarchy, select Configure > CLITools > Point&Click CLI. The side pane displays the
top level of the configured hierarchy, and the main pane displays configured hierarchy options and the Icon Legend.

To expand or hide the hierarchy of all the statements in the side pane, click **Expand all** or **Hide all**. To expand or hide an individual statement in the hierarchy, click the expand (+) or collapse (−) icon to the left of the statement.

**TIP:** Only those statements included in the committed configuration are displayed in the hierarchy.

The configuration information in the main pane consists of configuration options that correspond to configuration statements. Configuration options that contain subordinate statements are identified by the term **Nested**.

To include, edit, or delete statements in the candidate configuration, click one of the links described in Table 87 on page 495. Then specify configuration information by typing in a field, selecting a value from a list, or clicking a check box (toggle).

### Table 87: J-Web Edit Point & Click Configuration Links

<table>
<thead>
<tr>
<th>Link</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add new entry</td>
<td>Displays fields and lists for a statement identifier, allowing you to add a new identifier to a statement.</td>
</tr>
<tr>
<td>Configure</td>
<td>Displays information for a configuration option that has not been configured, allowing you to include a statement.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the corresponding statement or identifier from the configuration. All subordinate statements and identifiers contained within a deleted statement are also discarded.</td>
</tr>
<tr>
<td>Edit</td>
<td>Displays information for a configuration option that has already been configured, allowing you to edit a statement.</td>
</tr>
<tr>
<td>Identifier</td>
<td>Displays fields and lists for an existing statement identifier, allowing you to edit the identifier.</td>
</tr>
</tbody>
</table>

As you navigate through the configuration, the hierarchy level is displayed at the top of the main pane. You can click a statement or identifier in the hierarchy to display the corresponding configuration options in the main pane.

The main pane includes icons that display information about statements and identifiers when you place your cursor over them. Table 88 on page 495 describes these icons.

### Table 88: J-Web Edit Point & Click Configuration Icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Displays a comment about a statement.</td>
</tr>
<tr>
<td>I</td>
<td>Indicates that a statement is inactive.</td>
</tr>
<tr>
<td>M</td>
<td>Indicates that a statement has been added or modified but has not been committed.</td>
</tr>
</tbody>
</table>
Table 88: J-Web Edit Point & Click Configuration Icons (continued)

<table>
<thead>
<tr>
<th>Icon</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Indicates that the statement or identifier is required in the configuration.</td>
</tr>
<tr>
<td>?</td>
<td>Provides online help information.</td>
</tr>
</tbody>
</table>

After typing or selecting your configuration edits, click a button in the main pane (described in Table 89 on page 496) to apply your changes or cancel them, refresh the display, or discard parts of the candidate configuration. An updated configuration does not take effect until you commit it.

Table 89: J-Web Edit Point & Click Configuration Buttons

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh</td>
<td>Updates the display with any changes to the configuration made by other users.</td>
</tr>
<tr>
<td>Commit</td>
<td>Verifies edits and applies them to the current configuration file running on the switch.</td>
</tr>
<tr>
<td>Discard</td>
<td>Removes edits applied to or deletes existing statements or identifiers from the candidate configuration.</td>
</tr>
</tbody>
</table>

### Understanding Automatic Refreshing of Scripts on EX Series Switches

You can automatically refresh `commit`, `event`, and `op` scripts using operational mode commands on EX Series switches. The commands are:

- `request system scripts refresh-from commit`
- `request system scripts refresh-from event`
- `request system scripts refresh-from op`

The existing Junos operating system (Junos OS) command-line interface (CLI) `refresh` and `refresh-from` configuration mode statements have been extended to work with Junos XML management protocol and NETCONF XML management protocol sessions.

Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

• Typical Uses for Autoinstallation on page 497
• Autoinstallation Configuration Files and IP Addresses on page 497
• Typical Autoinstallation Process on a New Switch on page 498

Typical Uses for Autoinstallation

Typical uses for autoinstallation of the software include:

• To deploy and update multiple devices from a central location in the network.
• To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

Autoinstallation Configuration Files and IP Addresses

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

• network.conf—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
• switch.conf—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
• hostname.conf—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, hostname is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.
Typical Autoinstallation Process on a New Switch

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.
   
   If a DHCP server responds to these requests, it provides the switch with some or all of the following information:
   
   - An IP address and subnet mask for the autoinstallation interface.
   - The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
   - The name of the configuration file to be requested from the TFTP server.
   - The IP address or hostname of the TFTP server.
   
   If the DHCP server provides the server’s hostname, a DNS server must be available on the network to resolve the name to an IP address.
   
   - The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.

2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
   
   a. If the DHCP server specifies the host-specific configuration file `hostname.conf`, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for `hostname.conf`. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
   
   b. If the switch does not locate a `hostname.conf` file, the autoinstallation process sends three unicast TFTP requests for a `network.conf` file that contains the switch’s hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
   
   c. If the switch fails to find a `network.conf` file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch’s IP address to a hostname.
   
   d. If the switch determines its hostname, it sends a TFTP request for the `hostname.conf` file.
   
   e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file `switch.conf`. The TFTP request procedure is the same as for the `network.conf` file.

3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.
## Configuration Files Terms

Table 90 on page 499 lists the various configuration file terms used for EX Series switches and their definitions.

### Table 90: Configuration File Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>active configuration</td>
<td>The current committed configuration of a switch.</td>
</tr>
<tr>
<td>candidate configuration</td>
<td>A working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.</td>
</tr>
<tr>
<td>configuration group</td>
<td>Group of configuration statements that can be inherited by the rest of the configuration.</td>
</tr>
<tr>
<td>commit a configuration</td>
<td>Have the candidate configuration checked for proper syntax, activated, and marked as the current configuration file running on the switching platform.</td>
</tr>
<tr>
<td>configuration hierarchy</td>
<td>The Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.</td>
</tr>
<tr>
<td>default configuration</td>
<td>The default configuration contains the initial values set for each configuration parameter when a switch is shipped.</td>
</tr>
<tr>
<td>rescue configuration</td>
<td>Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the J-Web interface or CLI.</td>
</tr>
<tr>
<td>roll back a configuration</td>
<td>Return to a previously committed configuration.</td>
</tr>
</tbody>
</table>

- Setting or Deleting the Rescue Configuration (J-Web Procedure) on page 509
- Configuring Autoinstallation of Configuration Files (CLI Procedure) on page 509
- Using the Commit Options to Commit Configuration Changes (J-Web Procedure) on page 511

Uploading a Configuration File (CLI Procedure)

You can create a configuration file on your local system, copy the file to the EX Series switch and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the Junos OS System Basics and Services Command Reference.

2. In the configuration text file, use an option to perform the required action when the file is loaded. Table 91 on page 502 lists and describes some options for the load command.
Table 91: Options for the load command

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>merge</strong></td>
<td>Combines the current active configuration and the configuration in <em>filename</em> or the one that you type at the terminal. A <em>merge</em> operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.</td>
</tr>
<tr>
<td><strong>override</strong></td>
<td>Discards the current candidate configuration and loads the configuration in <em>filename</em> or the one that you type at the terminal. When you use the <em>override</em> option and commit the configuration, all system processes reparse the configuration. You can use the <em>override</em> option at any level of the hierarchy.</td>
</tr>
</tbody>
</table>
| **replace** | Searches for the *replace* tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the *replace* operation adds the statements marked with the *replace* tag to the active configuration. 

*NOTE:* For this operation to work, you must include *replace* tags in the text file or in the configuration you type at the terminal. |

3. Press Ctrl+A to select all the text in the configuration file.
4. Press Ctrl+C to copy the contents of the configuration text file to the Clipboard.
5. Log in to the switch using your username and password.
6. To enter configuration mode:
   ```
   user@switch> configure
   ```
   You will see this output, with the hash or pound mark indicating configuration mode.
   ```
   Entering configuration mode
   [edit]
   user@switch#
   ```
7. Load the configuration file:
   ```
   [edit]
   user@switch# load merge terminal
   ```
8. At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:
   ```
   [edit]
   user@switch# load merge terminal
   [Type "D at a new line to end input]
   >Cursor is here. Paste the contents of the clipboard here<
   ```
10. Press Ctrl+D to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the *show* command at the user prompt.

To commit these changes to the active configuration, type the *commit* command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.
Uploading a Configuration File (J-Web Procedure)

You can create a configuration file on your local system, copy the file to the EX Series switch and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Select **Maintain > Config Management > Upload**.
   The main pane displays the File to Upload box.

2. Specify the name of the file to upload using one of the following methods:
   - Type the absolute path and filename in the File to Upload box.
   - Click **Browse** to navigate to the file.

3. Click **Upload and Commit** to upload and commit the configuration.
   The switch checks the configuration for the correct syntax before committing it.

Loading a Previous Configuration File (CLI Procedure)

You can return to a previously committed configuration file if you need to revert to a previous configuration. The EX Series switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the `commit` configuration command.

**Syntax**

```
rollback <number>
```

**Options**

- **none**— Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default**: 0

To return to a configuration prior to the most recently committed one:
1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

- For more information on rollback, see Junos OS CLI User Guide.

## Reverting to the Default Factory Configuration for the EX Series Switch

If for any reason the current active configuration fails, you can revert to the factory-default configuration. You can also roll back to a previous configuration, as described in "Loading a Previous Configuration File (CLI Procedure)" on page 503, or revert to the rescue configuration, as described in “Reverting to the Rescue Configuration for the EX Series Switch” on page 507.

**TIP:** If you have lost the root password, it is not necessary to revert to the factory-default configuration to reset it. See “Troubleshooting Loss of the Root Password” on page 379.

The factory-default configuration contains the basic configuration settings for the switch. This is the first configuration of the switch and it is loaded when the switch is first powered on. For the factory-default configuration file for your switch, see the complete list under the Configuration tab of Configuration File Management on EX Series Switches.

**TIP:** You can run the EZsetup script to complete the initial configuration of the switch after reverting to the factory-default configuration. (The EZsetup script is available only on fixed configuration switches, it is not available on modular switches.) For information on completing the initial configuration using either the CLI or the J-Web interface, see Connecting and Configuring an EX Series Switch (CLI Procedure) or Connecting and Configuring an EX Series Switch (J-Web Procedure).

You can revert to the factory-default configuration by using the Menu button to the right of the LCD panel or by using the request system zeroize operational command or the load factory-default configuration command. (If your switch model does not have an LCD panel, use these commands.) You can also use the load factory-default command to revert to the factory-default configuration file that contains all default settings except
the root password setting, which is retained. These procedures are described in the following sections:

- Reverting to the Factory-Default Configuration by Using the LCD Panel on page 505
- Reverting to the Factory-Default Configuration by Using the request system zeroize Command on page 506
- Reverting to the Factory-Default Configuration by Using the load factory-default Command on page 506

Reverting to the Factory-Default Configuration by Using the LCD Panel

To set the switch to the factory-default configuration, use the LCD panel and buttons on the front panel of the switch shown in Figure 3 on page 505. If the switch model does not have an LCD panel, use one of the CLI commands described in the following sections.

Figure 3: EX Series Switch LCD Panel

NOTE: To revert a member switch of a Virtual Chassis to the factory-default configuration, first disconnect the cables connected to the Virtual Chassis ports (VCPs) to avoid affecting Virtual Chassis configuration parameters (member ID, mastership priority, and setting of VCP uplinks) on other members. See Disconnecting a Fiber-Optic Cable from an EX Series Switch, Disconnecting a Virtual Chassis Cable from an EX4200 Switch, or Disconnecting a Virtual Chassis Cable from an EX4500 Switch.

To revert to the factory-default configuration by using the LCD panel:

1. Press the Menu button until you see MAINTENANCE MENU on the panel.
2. Press the Enter button.
3. Press Menu until you see FACTORY DEFAULT.
4. Press Enter. The display says RESTORE DEFAULT?
5. Press Enter. The screen flashes FACTORY DEFAULT IN PROGRESS and returns to the idle menu.
6. Complete the initial configuration of the switch. See Connecting and Configuring an EX Series Switch (CLI Procedure) or Connecting and Configuring an EX Series Switch (J-Web Procedure)
Reverting to the Factory-Default Configuration by Using the request system zeroize Command

The request system zeroize command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the request system zeroize media command.

CAUTION: Before issuing request system zeroize, use the request system snapshot command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the request system zeroize command:

1. user@switch> request system zeroize
   warning: System will be rebooted and may not boot without configuration
   Erase all data, including configuration and log files? [yes,no] (yes)
2. Type yes to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch. See Connecting and Configuring an EX Series Switch (CLI Procedure) or Connecting and Configuring an EX Series Switch (J-Web Procedure)

Reverting to the Factory-Default Configuration by Using the load factory-default Command

The load factory-default command is a standard Junos OS configuration command that replaces the current active configuration with the factory-default configuration (except the root password setting, which by default is not set but which you must set in order to commit the new configuration in this procedure).

If you want to run the EZsetup script to complete the initial configuration of the switch after you revert to the factory-default configuration, do not use the load factory-default command. Instead do the reversion using either the LCD panel or the request system zeroize. If you use the load factory-default command to revert to the factory-default configuration, the configuration for the root password is retained and the EZsetup script will not run. (The EZsetup script is available only on fixed configuration switches, it is not available on modular switches.)

NOTE: The load factory-default command by itself is not supported on EX3300, EX4200, EX4550 and EX4500 switches configured in a Virtual Chassis.
To revert to the factory-default configuration by using the `load factory-default` command:

1. [edit]
   ```
   user@switch# load factory-default
   ```
2. [edit]
   ```
   user@switch# delete system commit factory-settings
   ```
3. [edit]
   ```
   user@switch# set system root-authentication plain-text-password
   ```
4. [edit]
   ```
   user@switch# commit
   ```
5. Check the member ID and mastership priority with the `show virtual-chassis` command and check to see whether there are remaining settings for uplink VCPs by using the `show virtual-chassis vc-port` command.

- For more information about the `load factory-default` command, see Junos OS CLI User Guide.

### Reverting to the Rescue Configuration for the EX Series Switch

If someone inadvertently commits a configuration that denies management access to an EX Series switch and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration by using the LCD panel on the switch. The rescue configuration is a previously committed, valid configuration.

You can also revert to the default factory configuration, as described in “Reverting to the Default Factory Configuration for the EX Series Switch” on page 504.

Before you begin to revert to the rescue configuration:

- Ensure that you have physical access to the switch.
- A rescue configuration for the switch must have been previously set.

To revert the switch to the rescue configuration:

1. At the LCD panel on the switch, press `Menu` until you see MAINTENANCE MENU.
2. Press `Enter`.
3. Press `Menu` until you see Load Rescue.
4. Press `Enter`.
5. When Commit Rescue is displayed, press `Enter`. 
The LCD panel displays the message **Commit Rescue in Progress**. When the reversion is complete, it displays the idle menu.

**NOTE:** If there is no rescue configuration saved on the switch, the message **Commit rescue failed** is displayed.

**Setting or Deleting the Rescue Configuration (CLI Procedure)**

A rescue configuration is a well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the J-Web interface or CLI.

If someone inadvertently commits a configuration that denies management access to an EX Series switch and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration by using the LCD panel on the switch. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically deploy multiple devices from a central location in the network.

To specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a switch to operate as a DHCP server. For more information, see “Configuring a DHCP Server on Switches (CLI Procedure)” on page 1250.
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
A host-specific file with the name `hostname.conf` for each switch undergoing autoinstallation. Replace `hostname` with the name of a switch. The `hostname.conf` file typically contains all the configuration information necessary for the switch with this hostname.

A default configuration file named `switch.conf` with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.

Physically attach the switch to the network using a Gigabit Ethernet port.

If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.

If the switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the switch.

If you are using `hostname.conf` files for autoinstallation, you must also complete the following tasks:

1. Configure the DHCP server to provide a `hostname.conf` filename to each switch. Each switch uses its `hostname.conf` filename to request a configuration file from the TFTP server. Copy the necessary `hostname.conf` configuration files to the TFTP server.

2. Create a default configuration file named `network.conf`, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a `hostname.conf` filename to a new switch, the switch uses `network.conf` to resolve its hostname based on its IP address.

   Alternatively, you can add the IP-address-to-hostname mapping entry for the switch to a DNS database file.

   The switch uses the hostname to request a `hostname.conf` file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

   ```
   [edit system]
   user@switch# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
   ```

   **NOTE:** You can also use an FTP address, for example, `ftp://user:password@sftpconfig.sp.com`.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

   ```
   [edit system]
   ```
Using the Commit Options to Commit Configuration Changes (J-Web Procedure)

You can use the single-commit feature to commit all outstanding configuration changes in the J-Web interface on EX Series switches simultaneously. This helps in reducing the time J-Web takes for committing configurations because when changes are committed at every step, rollback configurations pile up.

For example, suppose you want to delete a firewall filter and add a new one. With immediate commits, you would need to commit your changes twice for this action. Using single commit, you can decrease the number of commits to one, thus saving time for working on other configurations.

When you edit a configuration, you work on a copy of the current configuration, which is your candidate configuration. The changes you make to the candidate configuration are visible through the user interface immediately, allowing other users to edit those configurations, but they do not take effect on the switch until you commit the changes. When you commit the configuration, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration when you commit the candidate configuration, changes made by all users take effect.

You can configure the commit options to either commit all configuration changes together or commit each configuration change immediately using the J-Web Commit Preference page.

NOTE: There are some pages on which configuration changes must be committed immediately. For such pages, if you configure the commit options for a single commit, the system displays warning notifications that remind you to commit your changes immediately. An example of such a page is the Interface Page (Configure > Interface).

To configure the commit options on an EX Series switch using the J-Web interface:

1. Select Commit Options.

   NOTE: All action links except Preference are disabled unless you edit, add, or delete a configuration.

2. Choose an action. See Table 92 on page 512 for details on the actions.

3. Configure the commit options by selecting Preference. See Table 93 on page 512 for details on preference options.
Table 92: Commit Options

<table>
<thead>
<tr>
<th>Menu Item</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
</table>
| Commit | Commits the candidate configuration of the current user session, along with changes from other user sessions. | 1. Select Commit Options > Commit. Changes are committed after the system validates your configuration. A window displays that the configuration was successfully committed or that the commit failed.  
2. Click OK. Click Details to view the commit log. |
| Compare | Displays the XML log of pending uncommitted configurations on the device. | 1. Select Commit Options > Compare. The XML log of pending configurations on the devices are displayed similar to the CLI interface, in a “human-readable” form.  
2. Click Close. |
| Discard | Discards the candidate configuration of your current session, along with changes from other user sessions. | 1. Select Commit Options > Discard.  
2. Click OK to confirm the discard action. Your changes are discarded after the system validates your configuration. |
| Preference | Indicates your choice of committing all global configurations together or committing each configuration change immediately. | 1. Select Commit Options > Preference. The Commit Preference page is displayed.  
2. Configure the commit options by selecting your preference. See Table 93 on page 512 for details on preference options. |

Table 93: Commit Preference Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validate and commit configuration changes</td>
<td>Sets the system to validate and force an immediate commit on every screen after every configuration change.</td>
</tr>
</tbody>
</table>
| Validate configuration changes | Loads all the configuration changes for an accumulated single commit. If there are errors in loading the configuration, the errors are logged. This is the default mode.  
Once you select this option, you need to select Commit Options > Commit to commit your changes. |

%archive-sites (Configuration File)

Syntax
archive-sites {
    file://<path>/<filename>;
    ftp://username@host:<port>/url-path password password;
    http://username@host:<port>/url-path password password;
    pasvftp://username@host:<port>/url-path password password;
    scp://username@host:<port>/url-path password password;
}

Hierarchy Level
[edit system archival configuration]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, "scp://username:<password>@[ipv6-host-address]:<port>/url-path"

If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.

The destination filename is saved in the following format, where $n$ corresponds to the number of the compressed configuration rollback file that has been archived:

```
router-name_juniper.conf.$n.gz_YYYYMMDD_HHmmss.
```

NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

NOTE: The [edit system archival] hierarchy is not available on QFabric systems.

Options
The prefix used in the configuration statement determines the form of transfer:

- `file://` — transfer on a path to a named file
- `ftp://` — transfer using active FTP server
- `pasvftp://` — transfer to a device that only accepts passive FTP services
scp:// —transfer to a known host using background SCP file transfers

**Required Privilege**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

    }
}

Hierarchy Level
[edit system]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Description
For ACX Series routers, J Series Services routers, and EX Series switches only. Download a configuration file automatically from an FTP, Hypertext Transfer Protocol (HTTP), or Trivial FTP (TFTP) server. When you power on a router or switch configured for autoinstallation, it requests an IP address from a Dynamic Host Configuration Protocol (DHCP) server. Once the router or switch has an address, it sends a request to a configuration server and downloads and installs a configuration.

Options
The remaining statements are explained separately.

Required Privilege Level
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

| Release Information | Statement introduced in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | For devices with multiple Routing Engines only. Configure a commit command to automatically result in a commit synchronize action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the commit command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engines. All Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on all Routing Engines.  
Starting with Junos OS Release 9.3, accounting of events and operations on a backup Routing Engine is not supported on accounting servers such as TACACS+ or RADIUS. Logging of accounting events is supported only for events and operations on a master Routing Engine. |
| Required Privilege | system—To view this statement in the configuration.  
system-control—To add this statement to the configuration. |

CHAPTER 16

Administration

- Routine Monitoring on page 523
- Operational Commands on page 527

Routine Monitoring

- Managing Configuration Files Through the Configuration History (J-Web Procedure) on page 523
- Verifying Autoinstallation Status on page 526

Managing Configuration Files Through the Configuration History (J-Web Procedure)

Use the Configuration History function to manage configuration files.

1. Displaying Configuration History on page 523
2. Displaying Users Editing the Configuration on page 524
3. Comparing Configuration Files with the J-Web Interface on page 525
4. Downloading a Configuration File with the J-Web Interface on page 525
5. Loading a Previous Configuration File with the J-Web Interface on page 525

Displaying Configuration History

To manage configuration files with the J-Web interface, select Maintain > Config Management > History. The main pane displays History — Database Information page.

Table 94 on page 524 summarizes the contents of the display.

The configuration history display allows you to:

- View a configuration.
- Compare two configurations.
- Download a configuration file to your local system.
- Roll back the configuration to any of the previous versions stored on the switch.
Table 94: J-Web Configuration History Summary

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Version of the configuration file.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Date and time the configuration was committed.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user who committed the configuration.</td>
</tr>
<tr>
<td>Client</td>
<td>Method by which the configuration was committed:</td>
</tr>
<tr>
<td></td>
<td>• cli—A user entered a Junos OS CLI command.</td>
</tr>
<tr>
<td></td>
<td>• junoscript—A Junos XML protocol client performed the operation. Commit operations performed by users through the J-Web interface are identified in this way.</td>
</tr>
<tr>
<td></td>
<td>• snmp—An SNMP set request started the operation.</td>
</tr>
<tr>
<td></td>
<td>• other—Another method was used to commit the configuration.</td>
</tr>
<tr>
<td>Comment</td>
<td>Comment.</td>
</tr>
<tr>
<td>Log Message</td>
<td>Method used to edit the configuration:</td>
</tr>
<tr>
<td></td>
<td>• Imported via paste—Configuration was edited and loaded with the Configure &gt; CLI Tools &gt; Edit Configuration Text option.</td>
</tr>
<tr>
<td></td>
<td>• Imported upload [filename]—Configuration was uploaded with the Configure &gt; CLI Tools &gt; Point Click Editor option.</td>
</tr>
<tr>
<td></td>
<td>• Modified via J-Web Configure — Configuration was modified with the J-Web Configure menu.</td>
</tr>
<tr>
<td></td>
<td>• Rolled back via user-interface—Configuration was rolled back to a previous version through the user interface specified by user-interface, which can be Web Interface or CLI.</td>
</tr>
<tr>
<td>Action</td>
<td>Action to perform with the configuration file. The action can be Download or Rollback.</td>
</tr>
</tbody>
</table>

Displaying Users Editing the Configuration

To display a list of users editing the switching platform configuration, select Config Management > History. The list is displayed as Database Information in the main pane. Table 95 on page 524 summarizes the Database Information display.

Table 95: J-Web Configuration Database Information Summary

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>Name of user editing the configuration.</td>
</tr>
<tr>

<tbody>
<tr>
<td>Edit Path</td>
<td>Level of the configuration hierarchy that the user is editing.</td>
</tr>
</tbody>
</table>

### Comparing Configuration Files with the J-Web Interface

To compare any two of the past 50 committed configuration files:

1. Select **Config Management > History**. A list of the current and the previous 49 configurations is displayed as Configuration History in the main pane.
2. Select the check boxes to the left of the two configuration versions you want to compare.
3. Click **Compare**.

The main pane displays the differences between the two configuration files at each hierarchy level as follows:

- Lines that have changed are highlighted side by side in green.
- Lines that exist only in the more recent configuration file are displayed in red on the left.
- Lines that exist only in the older configuration file are displayed in blue on the right.

### Downloading a Configuration File with the J-Web Interface

To download a configuration file from the switch to your local system:

1. Select **Config Management > History**. A list of current and previous 49 configurations is displayed as Configuration History in the main pane.
2. In the Action column, click **Download** for the version of the configuration you want to download.
3. Select the options your Web browser provides that allow you to save the configuration file to a target directory on your local system.

The file is saved as an ASCII file.

### Loading a Previous Configuration File with the J-Web Interface

To load (roll back) and commit a previous configuration file stored on the switching platform:

1. Select **Config Management > History**. A list of current and previous 49 configurations is displayed as Configuration History in the main pane.
2. In the Action column, click **Rollback** for the version of the configuration you want to load.

The main pane displays the results of the rollback operation.
NOTE: When you click Rollback, the switch loads and commits the selected configuration. This behavior is different from the switch's behavior that occurs after you enter the rollback configuration mode command from the CLI. In the latter case, the configuration is loaded but not committed.

Verifying Autoinstallation Status

**Purpose**
Display the status of the autoinstallation feature.

**Action**
From the CLI, enter the `show system autoinstallation status` command.

**Sample Output**

```
user@switch> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 10.25.100.1
Interface:
  Name: ge-0/0/0
  State: Configuration Acquisition
  Acquired:
    Address: 192.168.124.75
    Hostname: host-ge-000
    Hostname source: DNS
    Configuration filename: switch-ge-000.conf
    Configuration filename server: 10.25.100.3
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
  Interface:
    Name: ge-0/0/1
    State: None
    Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

**Meaning**
The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

Operational Commands
clear log

Syntax  
clear log filename  
<all>

Release Information  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Remove contents of a log file.

Options  
filename—Name of the specific log file to delete.  
all—(Optional) Delete the specified log file and all archived versions of it.

Required Privilege  
Level clear

Related Documentation  
• show log on page 1091

List of Sample Output  
clear log on page 528

Output Fields  
See file list for an explanation of output fields.

Sample Output

clear log

The following sample commands list log file information, clear the contents of a log file,  
and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-------------------------------------------------------------------------
-rw-r-----  1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1
user@host> clear log lcc0-re0:sampled
lcc0-re0:
-------------------------------------------------------------------------
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-------------------------------------------------------------------------
-rw-r-----  1 root  wheel         57 Sep 15 03:44 /var/log/sampled
total 1
```
clear system commit

Syntax

clear system commit

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Clear any pending commit operation.

Options

This command has no options.

Required Privilege Level

maintenance (or the actual user who scheduled the commit)

Related Documentation

- show system commit on page 557

List of Sample Output

- clear system commit on page 529
- clear system commit (None Pending) on page 529
- clear system commit (User Does Not Have Required Privilege Level) on page 529

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear system commit

user@host> clear system commit
Pending commit cleared.

clear system commit (None Pending)

user@host> clear system commit
No commit scheduled.

clear system commit (User Does Not Have Required Privilege Level)

user@host> clear system commit
error: Permission denied
file archive

Syntax

```
file archive destination destination source source
<compress>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

Options

**destination destination**—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:

- For archived files—The suffix .tar
- For archived and compressed files—The suffix .tgz

**source source**—Source of the original file or files. Specify the source as a URL or filename.

**compress**—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix .tgz.

Required Privilege Level

maintenance

List of Sample Output

- file archive (Multiple Files) on page 530
- file archive (Single File) on page 530
- file archive (with Compression) on page 531

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

**file archive (Multiple Files)**

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar /usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

**file archive (Single File)**

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
```
The following sample command archives and compresses all message files in the local directory `/var/log/messages` as the single file `messages-archive.tgz`.

```
user@host> file archive compress source /var/log/messages* destination /var/log/messages-archive.tgz
```

/usr/bin/tar: Removing leading / from absolute path names in the archive.
**file checksum md5**

**Syntax**

```
file checksum md5 <pathname> filename
```

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Calculate the Message Digest 5 (MD5) checksum of a file.

**Options**

- `pathname`—(Optional) Path to a filename.
- `filename`—Name of a local file for which to calculate the MD5 checksum.

**Required Privilege Level**

maintenance

**Related Documentation**

- op on page 169

**List of Sample Output**

file checksum md5 on page 532

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```
file checksum sha1

Syntax

file checksum sha1 <pathname> filename

Release Information

Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.

Options

pathname—(Optional) Path to a filename.
filename—Name of a local file for which to calculate the SHA-1 checksum.

Required Privilege

maintenance

Related Documentation

List of Sample Output  file checksum sha-256 on page 534

Output Fields  When you enter this command, you are provided feedback on the status of your request.

Sample Output

file checksum sha-256

user@host> file checksum sha-256 /var/db/scripts/commitscript.slax
SHA256 (/var/db/scripts/commitscript.slax) = 94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
**file compare**

**Syntax**  
```  
file compare (files filename filename)  
<context | unified>  
<ignore-white-space>  
```

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**  
Compare two local files and describe the differences between them in default, context, or unified output styles:

- **Default**—In the first line of output, c means lines were changed between the two files, d means lines were deleted between the two files, and a means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (<) in front of output lines refers to the first file. A right angle bracket (>) in front of output lines refers to the second file.

- **Context**—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).

- **Unified**—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

**Options**
```
files filename—Names of two local files to compare.  
context—(Optional) Display output in context format.  
ignore-white-space—(Optional) Ignore changes in the amount of white space.  
unified—(Optional) Display output in unified format.  
```

**Required Privilege Level**  
none

**List of Sample Output**

**file copy**

**Syntax**

```
file copy source destination
<source-address address>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
`source-address` option added in Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series switches.

**Description**

Copy files from one location to another location on the local device or to a location on a remote device reachable by the local device.

**Required Privilege Level**

maintenance

**Related Documentation**

- Format for Specifying Filenames and URLs in Junos OS CLI Commands
- Default Directories for Junos OS File Storage on the Router or Switch
- Copying a Configuration File from One Routing Engine to the Other

**List of Sample Output**

Copy a File from the Local Device to a Personal Computer on page 538
Copy a Configuration File between Routing Engines on page 538
Copy a Log File between Routing Engines on page 538
Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus on page 539
Copy a File Using File Transfer Protocol on page 539
Copy a File Using File Transfer Protocol and Requiring a Password on page 539
Copy a File Using Secure Copy Protocol (scp) on page 539

**Sample Output**

The following are examples of a variety of file copy scenarios.

**Copy a File from the Local Device to a Personal Computer**

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/c/junipero/tmp
...transferring.file...... | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
```

**Copy a Configuration File between Routing Engines**

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

**Copy a Log File between Routing Engines**

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassis lcc0-re1:/var/tmp
```
Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus

The following sample command copies a text file from Routing Engine 1 on the switch-fabric chassis sfc0 to Routing Engine 1 on the line-card chassis lcc0:

```
user@host> filecopy sfc0-re1:/tmp/sample.txt lcc0-re1:/var/tmp
```

Copy a File Using File Transfer Protocol

To use anonymous FTP to copy a local file to a remote system, enter the following command:

```
user@host> filecopy filename ftp://hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
user@host> filecopy /config/juniper.conf ftp://hostname/juniper.conf
Receiving ftp: //hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

Copy a File Using File Transfer Protocol and Requiring a Password

To use FTP where you require more privacy and are prompted for a password, enter the following command:

```
root@host> filecopy filename ftp://user@hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
root@host> filecopy /config/juniper.conf ftp://user@hostname/juniper.conf
Password for user@hostname: ******
Receiving ftp: //user@hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

Copy a File Using Secure Copy Protocol (scp)

To use scp to copy a local file to a remote system, enter the following command:

```
root@host> filecopy filename scp://user@hostname/path/filename
```

In the following example, `/config/juniper.conf` is the local file, user is the username, and `ssh-host` is the scp server:

```
root@host> filecopy /config/juniper.conf scp://user@ssh-host/tmp/juniper.conf
user@ssh-host's password: ******
juniper.conf         100%
|*********************************************************************************|
|00:00|
```

2198 bytes transferred in 0.0 seconds (2.69 MBps)
file delete

Syntax

```
file delete filename
<purge>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Delete a file on the local router or switch.

Options

- `filename`—Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.
- `purge`—(Optional) Overwrite regular files before deleting them.

Required Privilege

```
maintenance
```

List of Sample Output

- file delete on page 540
- file delete (Routing Matrix) on page 540

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
file delete

user@host> file list /var/tmp
dcd.core
rpdp.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpdp.core

file delete (Routing Matrix)

user@host> file list lcc0-re0:/var/tmp
dcd.core
rpdp.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpdp.core
```
file list

Syntax

file list
<detail | recursive>
<filename>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display a list of files on the local router or switch.

Options
none—Display a list of all files for the current directory.

detail | recursive—(Optional) Display detailed output or descend recursively through the
directory hierarchy, respectively.

filename—(Optional) Display a list of files. For a routing matrix, the filename must include
the chassis information.

Additional Information
The default directory is the home directory of the user logged in to the router or switch.
To view available directories, enter a space and then a backslash (/) after the file list
command. To view files within a specific directory, include a backslash followed by the
directory and, optionally, subdirectory name after the file list command.

Required Privilege
Level
maintenance

file rename

**Syntax**

```
file rename source destination
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Rename a file on the local router or switch.

**Options**

- **destination**—New name for the file.
- **source**—Original name of the file. For a routing matrix, the filename must include the chassis information.

**Required Privilege Level**

maintenance

**List of Sample Output**

- file rename on page 543
- file rename (Routing Matrix) on page 543

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

The following example lists the files in /var/tmp, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

The following example lists the files in /var/tmp, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-rel:/var/tmp
lcc0-rel:
------------------------------------------------------------
/var/tmp:
.pccardd
sartre.conf
```
snmpd
syslogd.core-tarball.0.tgz

user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-rel:/var/tmp
lcc0-rel:
--------------------------------------------------------------------------
/var/tmp:
.pccardd
.sartre.conf
.snmpd.rr
.syslogd.core-tarball.0.tgz
file show

Syntax
file show filename
<encoding (base64 | raw)>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display the contents of a file.

Options
filename—Name of a file. For a routing matrix, the filename must include the chassis information.
encoding (base64 | raw)—(Optional) Encode file contents with base64 encoding or show raw text.

Required Privilege
maintenance

List of Sample Output
file show on page 545
file show (Routing Matrix) on page 545

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

file show

user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...

file show (Routing Matrix)

user@host> file show lcc0-re0:/var/tmp/.gdbinit
lcc0-re0:
--------------------------------------------------------------------------
# Settings
--------------------------------------------------------------------------
set print pretty
--------------------------------------------------------------------------
# Basic stuff
--------------------------------------------------------------------------
#define msgbuf
   printf "%s", msgbufp->msg_ptr
end
# hex dump of a block of memory
# usage: dump address length
define dump
  p $arg0, $arg1
  set $ch = $arg0
  set $j = 0
  set $n = $arg1
  while ($j < $n)
    #printf "%x %x ",&$ch[$j],$ch[$j]
    printf "%x ",$ch[$j]
    set $j = $j + 1
    if (!$j % 16)
      printf "\n"
  end
end
end
**request system configuration rescue delete**

**Syntax**
request system configuration rescue delete

**Release Information**
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Delete an existing rescue configuration.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

**Options**
This command has no options.

**Required Privilege Level**
maintenance

**Related Documentation**
- request system configuration rescue save on page 548
- request system software rollback on page 633
- show system commit on page 557

**List of Sample Output**
request system configuration rescue delete on page 547

**Output Fields**
This command produces no output.

**Sample Output**
request system configuration rescue delete

user@host> request system configuration rescue delete
**request system configuration rescue save**

**Syntax**

request system configuration rescue save

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Save the most recently committed configuration as the rescue configuration so that you can return to it at any time by using the `rollback` command.

**NOTE:** The `[edit system configuration]` hierarchy is not available on QFabric systems.

**Options**

This command has no options.

**Required Privilege Level**

maintenance

**Related Documentation**

- request system software delete on page 629
- request system software rollback on page 633

**Output Fields**

This command produces no output.

**Sample Output**

request system configuration rescue save

user@host> request system configuration rescue save
request system scripts refresh-from commit

**Syntax**
```
request system scripts refresh-from commit file file-name url url-path
```

**Release Information**
Command introduced in Junos OS Release 10.1 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:
```
<request-script-refresh-from>
  <type>commit</type>
  <file>file-name</file>
  <URL>URL</URL>
</request-script-refresh-from>
```

**Options**
- **file** `file-name`—Name of the file to be downloaded.
- **url** `url-path`—URL of the file to be downloaded.

**Required Privilege**
```
Level maintenance
```

**Related Documentation**

**List of Sample Output**
```
request system scripts refresh-from commit file config.txt url http://host1.juniper.net on page 549
```

**Sample Output**
```
user@switch> request system scripts refresh-from commit file config.txt url http://host1.juniper.net
user@switch>
```
request system scripts refresh-from event

Syntax  
request system scripts refresh-from event file file-name url url-path

Release Information  
Command introduced in Junos OS Release 10.1 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Automatically download the initial Junos OS configuration and a set of standard event scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
  <type>event</type>
  <file>file-name</file>
  <URL>URL</URL>
</request-script-refresh-from>
```

Options  
- file file-name—Name of the file to be downloaded.
- url url-path—URL of the file to be downloaded.

Required Privilege Level  
maintenance

Sample Output  
request system scripts refresh-from event file config.txt url http://host1.juniper.net

```
user@switch> request system scripts refresh-from event file config.txt url http://host1.juniper.net
user@switch>
```
request system scripts refresh-from op

Syntax

```
request system scripts refresh-from op file file-name url url-path
```

Release Information

Command introduced in Junos OS Release 10.1 for EX Series switches.

Description

Automatically download the initial Junos OS configuration and a set of standard op scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
  <type>op</type>
  <file>file-name</file>
  <URL>URL</URL>
</request-script-refresh-from>
```

Options

- **file** *file-name*—Name of the file to be downloaded.
- **url** *url-path*—URL of the file to be downloaded.

Required Privilege Level

maintenance

List of Sample Output

```
request system scripts refresh-from op file config.txt url http://host1.juniper.net on page 551
```

Sample Output

```
user@switch> request system scripts refresh-from op file config.txt url http://host1.juniper.net
user@switch>
```
request system zeroize

Syntax

```
request system zeroize
<media>
```

Release Information

Command introduced before Junos OS Release 9.0.
Command introduced in Junos OS Release 11.2 for EX Series switches.
Option media added in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 12.2 for MX Series devices.
Command introduced in Junos OS Release 12.3 for the QFX Series.

Description

NOTE: The media option is not available on the QFX Series.

Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as root and start the Junos OS command-line interface (CLI) by typing cli at the prompt.

To completely erase user-created data so that it is unrecoverable, use the media option.

Options

```
media—(Optional) In addition to removing all configuration and log files, the media option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the request system zeroize media operation can take considerably more time than the request system zeroize operation. However, the critical security parameters are all removed at the beginning of the process.
```

Required Privilege Level

maintenance

**Output Fields**
Table 96 on page 557 describes the output fields for the `show system commit` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Junos XML protocol</td>
<td>Displays the last 50 commit operations listed, most recent to first. The identifier <strong>Junos XML protocol</strong> designates a configuration created for recovery using the <strong>request system configuration rescue save</strong> command.</td>
</tr>
<tr>
<td>Junos XML protocol</td>
<td>Date and time of the commit operation.</td>
</tr>
<tr>
<td>Junos XML protocol</td>
<td>User who executed the commit operation.</td>
</tr>
<tr>
<td>Junos XML protocol</td>
<td>Method used to execute the commit operation:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Junos XML protocol</strong>—CLI interactive user performed the commit operation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Junos XML protocol</strong>—Junos XML protocol client performed the commit operation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>synchronize</strong>—The <strong>commit synchronize</strong> command was performed on the other Routing Engine.</td>
</tr>
<tr>
<td></td>
<td>• <strong>snmp</strong>—An SNMP <strong>set</strong> request caused the commit operation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>button</strong>—A button on the router or switch was pressed to commit a rescue configuration for recovery.</td>
</tr>
<tr>
<td></td>
<td>• <strong>autoinstall</strong>—A configuration obtained through autoinstallation was committed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>other</strong>—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.</td>
</tr>
</tbody>
</table>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

NOTE: The show system rollback command is a purely operational mode command and cannot be issued with run from the configuration mode.

Options
number—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

compare number—(Optional) Number of another previously committed (rollback) configuration to compare to rollback number. The output displays the differences between the two configurations. The range of values is 0 through 49.

Required Privilege
view

test configuration

**Syntax**

```plaintext
test configuration filename
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found.

**Options**

- `filename`—Name of the configuration file.
- `syntax-only`—Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.

**Required Privilege**

- Level: `view`

**List of Sample Output**

`test configuration on page 564`

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```plaintext
user@host> test configuration terminal
[Type ^D to end input]
system {
  host-name bluesky;
  paris-23;
  login;
}
terminal:3:(8) syntax error: paris
[edit system]
  'paris-23;'
syntax error
terminal:4:(11) statement must contain additional statements: ;
[edit system login]
  'login ;'
  statement must contain additional statements
configuration syntax failed
```
Troubleshooting Procedures

- Troubleshooting Loss of the Root Password on page 565

**Troubleshooting Loss of the Root Password**

**Problem**

If you forget the root password for the switch, you can use the password recovery procedure to reset the root password.

**NOTE:** You need physical access to the switch to recover the root password.

**Solution**

To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.

2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See Figure 1 on page 379

**Figure 4: Connecting to the Console Port on the EX Series Switch**

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
4. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None

5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.

6. When the following prompt appears, press the Spacebar to access the switch’s bootstrap loader command prompt:
   Hit [Enter] to boot immediately, or space bar for command prompt.
   Booting [kernel] in 1 second...

7. At the following prompt, type `boot -s` to start up the system in single-user mode:
   `loader> boot -s`

8. At the following prompt, type `recovery` to start the root password recovery procedure:
   Enter full path name of shell or 'recovery' for root password recovery or RETURN for `/bin/sh: recovery`
   A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:
   `user@switch> configure`

10. Set the root password. For example:
    `user@switch# set system root-authentication plain-text-password`

11. At the following prompt, enter the new root password. For example:
    `New password: juniper1`
        Retype new password:

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.
    `root@switch# commit`
        commit complete

14. Exit configuration mode in the CLI.
    `root@switch# exit`

15. Exit operational mode in the CLI.
    `root@switch> exit`

16. At the prompt, enter `y` to reboot the switch.
    `Reboot the system? [y/n] y`

Understanding Software Installation on EX Series Switches

A Juniper Networks EX Series Ethernet Switch is delivered with the Juniper Networks Junos operating system (Junos OS) preinstalled. As new features and software fixes become available, you must upgrade your software to use them. You can also downgrade Junos OS to a previous release.

This topic covers:

- Overview of the Software Installation Process on page 571
- Software Package Security on page 572
- Installing Software on a Virtual Chassis on page 572
- Installing Software on Switches with Redundant Routing Engines on page 572
- Installing Software Using Automatic Software Download on page 573
- Troubleshooting Software Installation on page 573

Overview of the Software Installation Process

An EX Series switch is delivered with Junos OS preinstalled. When you connect power to the switch, it starts (boots) from the installed software.

You upgrade Junos OS on an EX Series switch by copying a software package to your switch or another system on your local network, then use either the J-Web interface or the command-line interface (CLI) to install the new software package on the switch.
Finally, you reboot the switch; it boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the upgrade package removes all files from /var/tmp and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert back to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

**Software Package Security**

All Junos OS releases are delivered in signed packages that contain digital signatures to ensure official Juniper Networks software. For more information about signed software packages, see the [Junos OS Installation and Upgrade Guide](#).

**Installing Software on a Virtual Chassis**

You can connect individual EX Series switches together to form one unit and manage the unit as a single device, called a Virtual Chassis. The Virtual Chassis operates as a single network entity composed of member switches. Each member switch in a Virtual Chassis must be running the same version of Junos OS. See “EX Series Switch Software Features Overview” on page 27 for a list of switches that can be used in a Virtual Chassis.

For ease of management, a Virtual Chassis provides flexible methods to upgrade software releases. You can deploy a new software release to all member switches of a Virtual Chassis or to only a particular member switch.

You can also upgrade the software on an EX4200, EX4500, mixed EX4200 and EX4500, and EX8200 Virtual Chassis using nonstop software upgrade (NSSU). NSSU takes advantage of graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) to ensure no disruption to the control plane during the upgrade. You can minimize disruption to network traffic by defining link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards (on EX8200 Virtual Chassis) or on different members (on EX4200, EX4500, mixed EX4200 and EX4500 Virtual Chassis). During an NSSU, the line cards and Virtual Chassis members are upgraded one at a time, so that traffic continues to flow through the other line cards or members while that line card or member is being upgraded.

**Installing Software on Switches with Redundant Routing Engines**

You can install software on a switch with redundant Routing Engines in one of two ways:

- **Perform an NSSU**—An NSSU upgrades both Routing Engines with a single command and with a minimum of network disruption. An NSSU takes advantage of GRES and NSR to ensure no disruption to the control plane. You can minimize disruption to network traffic by defining LAGs such that the member links of each LAG reside on different line cards. The line cards are upgraded one at a time, so that traffic continues to flow through the other line cards while a line card is being upgraded.

  You cannot use NSSU to downgrade the software running on a switch.
For more information about NSSU, see *Understanding Nonstop Software Upgrade on EX Series Switches*. See “EX Series Switch Software Features Overview” on page 27 for a list of switches that support NSSU.

- Upgrade each Routing Engine manually—You can perform a Junos OS installation on each Routing Engine separately, starting with the backup Routing Engine. You can use this procedure to downgrade the software running on a switch. See *Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)*.

**Installing Software Using Automatic Software Download**

The automatic software download feature uses the DHCP message exchange process to download and install software packages. Users can define a path to a software package on the DHCP server and then the DHCP server communicates this path to EX Series switches acting as DHCP clients as part of the DHCP message exchange process. The DHCP clients that have been configured for automatic software download receive these messages and, when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, download and install the software package. See *Upgrading Software Using Automatic Software Download*.

**Troubleshooting Software Installation**

If Junos OS loads but the CLI is not working for any reason, or if the switch has no software installed, you can use the recovery installation procedure to install the software on the switch. See “Troubleshooting Software Installation” on page 657.

---

**NOTE:** You can also use this procedure to load two versions of Junos OS in separate partitions on the switch.

**Understanding System Snapshot on EX Series Switches**

You can create copies of the software running a Juniper Networks EX Series Ethernet Switch using the system snapshot feature. The system snapshot feature takes a “snapshot” of the files currently used to run the switch and copies them to an alternate storage location. You can then use this snapshot to boot the switch at the next bootup or as a backup boot option.

The switch can boot from either internal flash media or external (USB) flash media. The contents of the snapshot vary depending on whether you create the snapshot on the media that the switch booted from or on the media that it did not boot from:
Snapshots are particularly useful for moving files onto USB flash drives. You cannot use the `copy` command or any other file-moving technique to move files from an internal memory source to USB memory on the switch.

- If you create the snapshot on the media that the switch did not boot from, the following partitions on the boot media are included in the snapshot: `root`, `altroot`, `var`, `var/tmp`, `config`.

  The `root` partition is the primary boot partition, and the `altroot` partition is the backup boot partition.

- If you create the snapshot on the media that the switch booted from, the root partition that the switch booted from is copied to the alternate root partition. The `var`, `var/tmp`, and `config` partitions are not copied as part of the snapshot because they already exist on the boot media.

The system snapshot feature has the following limitations:

- You cannot use snapshots to move files to any destination outside the switch other than an installed external USB flash drive or switches that are members of the same Virtual Chassis as the switch on which you created the snapshot.

- Snapshot commands, like all commands executed on a Virtual Chassis, are executed on the local member switch. If different member switches request the snapshot, the snapshot command is pushed to the Virtual Chassis member creating the snapshot and is executed on that member, and the output is then returned to the switch that initiated the process. For instance, if the command to create an external snapshot on member 3 is entered on member 1, the snapshot of internal memory on member 3 is taken on external memory on member 3. The output of the process is seen on member 1. No files move between the switches.

Understanding Resilient Dual-Root Partitions on Switches

Resilient dual-root partitioning, introduced on Juniper Networks EX Series Ethernet Switches in Juniper Networks Junos operating system (Junos OS) Release 10.4R3, provides additional resiliency to switches in the following ways:

- Allows the switch to boot transparently from the second (alternate) root partition if the system fails to boot from the primary root partition.
- Provides separation of the root Junos OS file system from the /var file system. If corruption occurs in the /var file system (a higher probability than in the root file system because of the greater frequency in /var of reads and writes), the root file system is insulated from the corruption.

NOTE: For instructions on upgrading Junos OS (from a release prior to Release 10.4R3) to a release that supports resilient dual-root partitions, see the release notes (New Features in Junos OS Release 11.2 for EX Series Switches).

This topic covers:

- Resilient Dual-Root Partition Scheme (Junos OS Release 10.4R3 and Later) on page 575
- Automatic Fixing of Corrupted Primary Root Partition with the Automatic Snapshot Feature on page 576
- Earlier Partition Scheme (Junos OS Release 10.4R2 and Earlier) on page 577
- Understanding Upgrading or Downgrading Between Resilient Dual-Root Partition Releases and Earlier Releases on page 577

Resilient Dual-Root Partition Scheme (Junos OS Release 10.4R3 and Later)

EX Series switches that ship with Junos OS Release 10.4R3 or later are configured with a root partition scheme that is optimized for resiliency, as shown in Table 97 on page 575.

Table 97: Resilient Dual-Root Partition Scheme

<table>
<thead>
<tr>
<th>Slice 1</th>
<th>Slice 2</th>
<th>Slice 3</th>
<th>Slice 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1a</td>
<td>s2a</td>
<td>s3e</td>
<td>s3d</td>
</tr>
<tr>
<td>/</td>
<td>/</td>
<td>/var</td>
<td>/var/tmp</td>
</tr>
</tbody>
</table>

(root Junos OS) (root Junos OS)

In the resilient dual-root partition scheme, the /var file system is contained in a separate slice (Slice 3) from the root file systems; the /config directory is contained in its own slice (Slice 4), and switches ship from the factory with identical Junos OS images in Slice 1 and Slice 2. The /var file system, which has a greater frequency of reads and writes than the root file systems and is therefore more likely to have corruption issues, is isolated from the root directories and the /config directory. If the switch fails to boot from the
active partition, the switch automatically boots from the alternate root partition and triggers an alarm.

**Automatic Fixing of Corrupted Primary Root Partition with the Automatic Snapshot Feature**

Resilient dual-root partitioning also provides the *automatic snapshot* feature. You can enable the automatic snapshot feature for the system to automatically fix the corrupt Junos OS file in the primary root partition. If you enable the automatic snapshot feature, the switch automatically takes a snapshot of the Junos OS root file system in the alternate root partition and copies it onto the primary root partition, thereby repairing the corrupt file in the primary root partition. The automatic snapshot procedure takes place whenever the system reboots from the alternate root partition, regardless of whether the reboot is due to a command or due to a corruption of the primary root partition.

**NOTE:**
- On EX4550 switches, the automatic snapshot feature is enabled by default.
- On other EX Series switches, you can enable the automatic snapshot feature by configuring the `auto-snapshot` statement at the `[edit system]` hierarchy level.
- If the automatic snapshot feature is enabled in a Virtual Chassis configuration, the automatic snapshot procedure takes place whenever any member of the Virtual Chassis has rebooted from its alternate root partition.

The automatic snapshot feature provides an additional layer of fault protection if you maintain the same version of Junos OS in both partitions of resilient dual-root partitions. The repair happens automatically. Therefore, when `auto-snapshot` is enabled, the switch does not issue an alarm to indicate that the system has been rebooted from the alternate partition. However, it does log the event. You cannot execute a manual snapshot when an automatic snapshot procedure is in process. The login banner indicates that an automatic snapshot operation is in progress and that banner is removed when the snapshot operation is complete. The next reboot happens from the primary partition.

**NOTE:** EX Series switches that ship with Junos OS Release 10.4R3 or later are configured with identical Junos OS images in the primary root partition (Slice 1) and the alternate root partition (Slice 2).

However, if you do *not* maintain the same version of Junos OS in both partitions, you might want to disable the automatic snapshot feature. If you have an older version of Junos OS in the alternate partition and the system reboots from the alternate root partition, the automatic snapshot feature replaces the newer Junos OS version with the older version.

When automatic snapshot is disabled and the system reboots from the alternate root partition, it also triggers an alarm indicating that the system has rebooted from its alternate partition.
Earlier Partition Scheme (Junos OS Release 10.4R2 and Earlier)

The partition scheme used in Junos OS 10.4R2 and earlier is shown in Table 98 on page 577.

Table 98: Earlier Partition Scheme

<table>
<thead>
<tr>
<th>Slice 1</th>
<th>Slice 2</th>
<th>Slice 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1a</td>
<td>s2a</td>
<td>s3a</td>

<tr>
<td>/</td>
<td>/var</td>
<td>/var</td>
</tr>
<tr>
<td>(root Junos OS)</td>
<td>(empty until initial software upgrade)</td>
<td>(empty until initial software upgrade)</td>
</tr>
</tbody>
</table>

This is the partitioning scheme for a switch shipped with Release 10.4R2 or earlier (or after you reformat the disk during a downgrade from Release 10.4R3 or later to Release 10.4R2 or earlier). In this partitioning scheme, the switch comes from the factory with only one Junos OS image installed in the root Junos OS partition of Slice 1. The first time that you perform a software upgrade, the new Junos OS image is installed in Slice 2. If the switch fails to boot, you must manually trigger it to boot from the alternate partition (rebooting from the alternate partition does not occur automatically).

Understanding Upgrading or Downgrading Between Resilient Dual-Root Partition Releases and Earlier Releases

Upgrading from Release 10.4R2 or earlier to Release 10.4R3 or later differs from other upgrades in two important ways:

- You must install a new loader software package in addition to installing the new Junos OS image.
- Rebooting after the upgrade reformats the disk from three partitions to four partitions. See Table 97 on page 575.

You can perform all operations for this special software upgrade from the CLI.

CAUTION: Back up any important log files because the /var/log files are not saved or restored during an upgrade from Release 10.4R2 or earlier to a release that supports resilient dual-root partitions (Release 10.4R3 or later).

We recommend that you also save your /config files and any important log files to an external medium because if there is a power interruption during the upgrade process, they might be lost.

Junos OS Package Names

You upgrade the Juniper Networks Junos operating system (Junos OS) on a Juniper Networks EX Series Ethernet Switch by copying a software package to your switch or another system on your local network, then install the new software package on the switch.

A software package name is in the following format:

\texttt{package-name-m.nZx.y-domestic-signed.tgz}

where:

- \texttt{package-name} is the name of the package—for example, \texttt{jinstall-ex-4200}.
- \texttt{m.n} is the software release, with \texttt{m} representing the major release number and \texttt{n} representing the minor release number—for example, \texttt{9.5}.
- \texttt{Z} indicates the type of software release, where \texttt{R} indicates released software and \texttt{B} indicates beta-level software.
- \texttt{x.y} represents the version of the major software release (\texttt{x}) and an internal tracking number (\texttt{y})—for example, \texttt{1.6}.
- \texttt{domestic-signed} is appended to all EX Series package names. For most Junos packages, \texttt{domestic} is used for the United States and Canada and \texttt{export} for worldwide distribution. However, for EX Series software, \texttt{domestic} is used for worldwide distribution as well.

A sample EX Series software package name is:

\texttt{jinstall-ex-4200-9.5R1.6-domestic-signed.tgz}

Software Overview

- \textit{Understanding Software Infrastructure and Processes on page 579}
Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 579
- Junos OS Processes on page 579

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
  - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.
### Table 99: Junos OS Processes

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassisd</td>
<td>Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet switching process</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</td>
</tr>
<tr>
<td>Forwarding process</td>
<td>pfern</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
<tr>
<td>Management process</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</td>
</tr>
<tr>
<td>Routing protocol process</td>
<td>rpd</td>
<td>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</td>
</tr>
</tbody>
</table>

**Licenses Overview**

- Understanding Software Licenses for EX Series Switches on page 581
Understanding Software Licenses for EX Series Switches

To enable and use some of the Juniper Networks operating system (Junos OS) features, you must purchase, install, and manage separate software licenses. If the switch has the appropriate software license, you can configure and use these features.

The Junos OS feature license (that is, the purchased authorization code) is universal. However, to conform to Junos OS feature licensing requirements, you must install a unique license key (a combination of the authorization code and the switch’s serial number) on each switch.

For a Virtual Chassis deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role:

- In an EX8200 Virtual Chassis, the devices in the master and backup roles are always XRE200 External Routing Engines.
- In all other Virtual Chassis, the devices in the master and backup roles are switches.

You do not need additional license keys for Virtual Chassis member switches that are in the linecard role or for the redundant Routing Engine (RE) modules or the redundant Switch Fabric and Routing Engine (SRE) modules in an EX8200 member switch.

This topic describes:

- Purchasing a Software Feature License on page 581
- Features Requiring a License on EX2200 Switches on page 582
- Features Requiring a License on EX3300 Switches on page 583
- Features Requiring a License on EX4300 Switches on page 584
- Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches on page 585
- License Warning Messages on page 586

Purchasing a Software Feature License

The following sections list features that require separate licenses. To purchase a software license, contact your Juniper Networks sales representative (http://www.juniper.net/us/en/contact-us/sales-offices). You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the show chassis hardware command.
NOTE: You are required to provide the 12-digit serial number when purchasing a license for an XRE200 External Routing Engine in an EX8200 Virtual Chassis.

The serial number listed on the XRE200 External Routing Engine serial ID label is 16 digits long. Use the last 12 digits of the 16-digit serial number to purchase the license.

You can use the `show chassis hardware` command output to display the 12-digit serial number of the XRE200 External Routing Engine.

**Features Requiring a License on EX2200 Switches**

For EX2200 switches, the following features can be added to basic Junos OS by installing an enhanced feature license (EFL):

- Bidirectional Forwarding Detection (BFD)
- Connectivity fault management (IEEE 802.1ag)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- OSPFv1/v2 (with four active interfaces)
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Q-in-Q tunneling (IEEE 802.1ad)
- Real-time performance monitoring (RPM)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

Table 100 on page 582 lists the EFLs that you can purchase for EX2200 switch models. If you have the license, you can run all of the enhanced software features mentioned above on your EX2200 switch.

**Table 100: Junos OS EFL Part Number on EX2200 Switches**

Features Requiring a License on EX3300 Switches

Two types of licenses are available on EX3300 switches: enhanced feature licenses (EFLs) and advanced feature licenses (AFLs).

To use the following features on the EX3300 switches, you must install an EFL:

- Bidirectional Forwarding Detection (BFD)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- IPv6 routing protocols: Multicast Listener Discovery version 1 and 2 (MLD v1/v2), OSPFv3, PIM multicast, VRRPv6, virtual router support for unicast and filter-based forwarding (FBF)
- OSPFv1/v2
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Q-in-Q tunneling (IEEE 802.1ad)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

Table 101 on page 583 lists the EFLs that you can purchase for EX3300 switch models. If you have the license, you can run all of the enhanced software features mentioned above on your EX3300 switch.

<td>EX3300-48T-BF</td>
<td>EX-48-EFL</td>
</tr>
<tr>
<td>EX3300-48P</td>
<td>EX-48-EFL</td>
</tr>
</tbody>
</table>

To use the following feature on EX3300 switches, you must install an AFL:

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- IPv6 routing protocols: IPv6 BGP and IPv6 for MBGP
- Virtual routing and forwarding (VRF) BGP

Table 102 on page 584 lists the AFLs that you can purchase for EX3300 switch models. For EX3300 switches, you must purchase and install a corresponding EFL along with the AFL to enable the advanced license features. If you have both these licenses, you can run all of the advanced software features mentioned above on your EX3300 switch.
### Features Requiring a License on EX4300 Switches

Two types of licenses are available on EX4300 switches: enhanced feature licenses (EFLs) and advanced feature licenses (AFLs).

To use the following features on the EX4300 switches, you must install an EFL:

- Bidirectional Forwarding Detection (BFD)
- Connectivity fault management (IEEE 802.1ag)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- Multicast Source Discovery Protocol (MSDP)
- OSPFv2/v3
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Real-time performance monitoring (RPM)
- RIPng (RIP next generation)
- Unicast reverse-path forwarding (RPF)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

Table 103 on page 584 lists the EFLs that you can purchase for EX4300 switch models. If you have the license, you can run all of the enhanced software features mentioned above on your EX4300 switch.

**Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches**

To use the following features on EX3200, EX4200, EX4500, EX4550, EX8200, and EX9200 switches, you must install an advanced feature license (AFL):

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing protocols: IS-IS for IPv6, IPv6 BGP, IPv6 for MBGP
- Logical systems (available only on EX9200 switches)
- MPLS with RSVP-based label-switched paths (LSPs) and MPLS-based circuit cross-connects (CCC) (Not supported on EX9200 switches)

To use the following features on Juniper Networks EX6200 Ethernet Switches, you must install an advanced feature license (AFL):

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing protocols: IS-IS for IPv6, IPv6 BGP

**Table 105 on page 586** lists the AFLs that you can purchase for EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 switches. If you have the license, you can run all of the advanced software features mentioned above on your EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, or EX9200 switch.

License Warning Messages

For using features that require a license, you must install and configure a license key. To obtain a license key, use the contact information provided in your certificate.

If you have not purchased the AFL or EFL and installed the license key, you receive warnings when you try to commit the configuration:

```
[edit protocols]
  'bgp'
    warning: requires 'bgp' license
error: commit failed: (statements constraint check failed)
```
The system generates system log (syslog) alarm messages notifying you that the feature requires a license—for example:

Sep 3 05:59:11   craftd[806]:  Minor alarm set, BGP Routing Protocol usage requires a license
Sep 3 05:59:11   alarmd[805]:  Alarm set: License color=Yellow, class=CHASSIS, reason=BGP Routing Protocol usage requires a license
Sep 3 05:59:11   alarmd[805]:  LICENSE_EXPIRED: License for feature bgp(47) expired

Output of the `show system alarms` command displays the active alarms:

```
user@switch> show system alarms
1 alarm currently active
  Alarm time  Class  Description
2009-09-03 06:00:11 UTC  Minor  BGP Routing Protocol usage requires a license
```

Registering the Switch

Registering the EX Series Switch with the J-Web Interface on page 589

Registering the EX Series Switch with the J-Web Interface

You can register your EX Series switch with the J-Web interface so that you can request technical assistance as and when required. To register an EX Series switch:

1. In the J-Web interface, select Maintain > Customer Support > Product Registration. For an EX8200 Virtual Chassis configuration, select the member from the list.

2. Click Register. Enter the serial number in the page that is displayed.

Booting the Switch

- Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive on page 590
- Creating a Snapshot and Using It to Boot an EX Series Switch on page 591
Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive

There are two methods of getting Junos OS onto a USB flash drive before using the software to boot the switch. You can pre-install the software onto the USB flash drive before inserting the USB flash drive into the USB port, or you can use the system snapshot feature to copy files from internal switch memory to the USB flash drive.

To move files into USB flash memory using a system snapshot and use those files to boot the switch, see “Creating a Snapshot and Using It to Boot an EX Series Switch” on page 591. We recommend that you use this method to boot the switch from a USB flash drive if your switch is running properly.

If you need to pre-install the software onto the USB flash drive, you can use the method described in this topic. Pre-installing the Junos OS onto a USB flash drive to boot the switch can be done at any time and is particularly useful when the switch boots to the loader prompt because the switch cannot locate the Junos OS in internal flash memory.

Ensure that you have the following tools and parts available to boot the switch from a USB flash drive:

- A USB flash drive that meets the EX Series switch USB port specifications. See USB Port Specifications for an EX Series Switch.
- A computer or other device that you can use to download the software package from the Internet and copy it to the USB flash drive.

To download a Junos OS package onto a USB flash drive before inserting the USB flash drive:

1. Download the Junos OS package that you would like to place onto the EX Series switch from the Internet onto the USB flash drive using your computer or other device. See Downloading Software Packages from Juniper Networks.
2. Remove the USB flash drive from the computer or other device.
3. Insert the USB flash drive into the USB port on the switch.
4. This step can only be performed when the prompt for the loader script (loader>) is displayed. The loader script starts when the Junos OS loads but the CLI is not working for any reason or if the switch has no software installed.

Install the software package onto the switch:

```plaintext
loader> install source
```

where source represents the name and location of the Junos OS package on the USB flash drive. The Junos OS package on a flash drive is commonly stored in the root drive as the only file—for example, `file:///jinstall-ex-4200-9.4R1.5-domestic-signed.tgz`.

Understanding Software Installation on EX Series Switches on page 571

Creating a Snapshot and Using It to Boot an EX Series Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the switch and copies them to an alternate storage location. You can then use this snapshot to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

- Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 591
- Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 591
- Creating a Snapshot on the Alternate Slice of the Boot Media on page 592

Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

You can create a snapshot on USB flash memory after a switch is booted by using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB flash drive:

- A USB flash drive that meets the switch USB port specifications. See USB Port Specifications for an EX Series Switch.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

   user@switch> request system snapshot partition media external

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the USB flash drive. If you created the snapshot as a backup, do not perform this step.

   - To reboot the switch using the most recently created snapshot:

     user@switch> request system reboot media external

   - To reboot the switch using a snapshot in a specific partition on the USB flash drive:

     user@switch> request system reboot media external slice alternate

Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

You can create a snapshot in internal memory after a switch is booted by using files stored in external memory.
To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:
   
   ```
   user@switch> request system snapshot partition media internal
   ```

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.
   
   - To reboot the switch using the most recently created snapshot:
     
     ```
     user@switch> request system reboot media internal
     ```
   
   - To reboot the switch using a snapshot in a specific partition in internal memory:
     
     ```
     user@switch> request system reboot media internal slice alternate
     ```

### Creating a Snapshot on the Alternate Slice of the Boot Media

The alternate slice of the boot media contains a backup software image that the switch can boot from if it is unable to boot from the primary slice. When you upgrade software, the new software image gets copied only to the primary slice of the boot media.

To create a snapshot of the currently booted software image on the backup slice of the boot media:

```
user@switch> request system reboot slice alternate
```

### Managing Licenses

- Managing Licenses for the EX Series Switch (CLI Procedure) on page 592
- Managing Licenses for the EX Series Switch (J-Web Procedure) on page 593

**Managing Licenses for the EX Series Switch (CLI Procedure)**

To enable and use some Junos OS features on an EX Series switch, you must purchase, install, and manage separate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy. After you have configured the features, you see a warning message if the switch does not have a license for the feature.

Before you begin managing licenses, be sure that you have:

- Obtained the needed licenses. For information about how to purchase software licenses, contact your Juniper Networks sales representative.
• Understand what makes up a license key. For more information, see “License Key Components for the EX Series Switch” on page 601.

This topic includes the following tasks:

• Adding New Licenses on page 593
• Deleting Licenses on page 593
• Saving License Keys on page 593

Adding New Licenses

To add one or more new license keys on the switch, with the CLI:

1. Add the license key or keys:
   • To add one or more license keys from a file or URL, specify the filename of the file or the URL where the key is located:
     
     user@switch> request system license add filename | url

   • To add a license key from the terminal:
     
     user@switch> request system license add terminal

2. When prompted, enter the license key, separating multiple license keys with a blank line.
   
   If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit the license entry mode.

Deleting Licenses

To delete one or more license keys from the switch with the CLI, specify the license ID:

user@switch> request system license delete license-id

You can delete only one license at a time.

Saving License Keys

To save the installed license keys to a file (which can be a URL) or to the terminal:

user@switch> request system license save filename | url

For example, the following command saves the installed license keys to a file named license.conf:

user@switch> request system license save ftp://user@switch/license.conf

Managing Licenses for the EX Series Switch (J-Web Procedure)

To enable and use some Junos OS features on an EX Series switch, you must purchase, install, and manage separate software licenses. Each switch requires one license. For a
Virtual Chassis deployment, two licenses are recommended for redundancy. After you have configured the features, you see a warning message if the switch does not have a license for the feature.

Before you begin managing licenses, be sure that you have:

- Obtained the needed licenses. For information about how to purchase software licenses, contact your Juniper Networks sales representative.
- Understand what makes up a license key. For more information, see "License Key Components for the EX Series Switch" on page 601.

This topic includes the following tasks:

- Adding New Licenses on page 594
- Deleting Licenses on page 594
- Displaying License Keys on page 594
- Downloading Licenses on page 595

Adding New Licenses

To add one or more new license keys on the switch, with the J-Web license manager:

1. In the J-Web interface, select Maintain > Licenses.
2. Under Installed Licenses, click Add to add a new license key or keys.
3. Do one of the following, using a blank line to separate multiple license keys:
   - In the License File URL box, type the full URL to the destination file containing the license key or keys to be added.
   - In the License Key Text box, paste the license key text, in plain-text format, for the license to be added.
4. Click OK to add the license key or keys.

A list of features that use the license key is displayed. The table also lists the ID, state, and version of the license key.

Deleting Licenses

To delete one or more license keys from a switch with the J-Web license manager:

1. In the J-Web interface, select Maintain > Licenses.
2. Select the check box of the license or licenses you want to delete.
3. Click Delete.

Displaying License Keys

To display the license keys installed on a switch with the J-Web license manager:

1. In the J-Web interface, select Maintain > Licenses.
2. Under Installed Licenses, click **Display Keys** to display all the license keys installed on the switch.

A screen displaying the license keys in text format appears. Multiple licenses are separated by a blank line.

**Downloading Licenses**

To download the license keys installed on the switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain > Licenses**.

2. Under Installed Licenses, click **Download Keys** to download all the license keys installed on the switch to a single file.

3. Select **Save it to disk** and specify the file to which the license keys are to be written. You can also download the license file to your system.

Routine Monitoring

- Verifying That a System Snapshot Was Created on an EX Series Switch on page 597
- Verifying Junos OS and Boot Loader Software Versions on an EX Series Switch on page 598

Verifying That a System Snapshot Was Created on an EX Series Switch

**Purpose**   Verify that a system snapshot was created with the proper files on an EX Series switch.

**Action**   View the snapshot:

```
user@switch> show system snapshot media external
Information for snapshot on   external (/dev/da1s1a) (backup)
Creation date: Mar 19 03:37:18 2012
JUNOS version on snapshot:
  jbase  : ex-12.1I20120111_0048_user
  jcrypto-ex: 12.1I20120111_0048_user
  jdocs-ex: 12.1I20120111_0048_user
  jroute-ex: 12.1I20120111_0048_user
  jswitch-ex: 12.1I20120111_0048_user
  jweb-ex: 12.1I20120111_0048_user
Information for snapshot on   external (/dev/da1s2a) (primary)
Creation date: Mar 19 03:38:25 2012
JUNOS version on snapshot:
  jbase  : ex-12.2I20120305_2240_user
  jcrypto-ex: 12.2I20120305_2240_user
  jdocs-ex: 12.2I20120305_2240_user
  jroute-ex: 12.2I20120305_2240_user
  jswitch-ex: 12.2I20120305_2240_user
  jweb-ex: 12.2I20120305_2240_user
```

**Meaning**   The output shows the date and time when the snapshot was created and the packages that are part of the snapshot. Check to see that the date and time match the time when you created the snapshot.
You can compare the output of this command to the output of the `show system software` command to ensure that the snapshot contains the same packages as the software currently running the switch.

**Related Documentation**
- Creating a Snapshot and Using It to Boot an EX Series Switch on page 591

**Verifying Junos OS and Boot Loader Software Versions on an EX Series Switch**

Before or after upgrading or downgrading Junos OS, you might need to verify the Junos OS version. You might also need to verify the boot loader software version if you are upgrading to or downgrading from a release that supports resilient dual-root partitions (Junos OS Release 10.4R3 and later).

This topic includes:
- Verifying the Number of Partitions and File System Mountings on page 598
- Verifying the Loader Software Version on page 599
- Verifying Which Root Partition Is Active on page 600
- Verifying the Junos OS Version in Each Root Partition on page 600

**Verifying the Number of Partitions and File System Mountings**

**Purpose**
Between Junos OS Release 10.4R2 and Release 10.4R3, upgrades were made to further increase resiliency of root partitions, which required reformating the disk from three partitions to four partitions. If your switch is running Release 10.4R2 or earlier, it has three partitions, and if it is running Release 10.4R3 or later, it has four partitions.

**Action**
Verify how many partitions the disk has, as well as where each file system is mounted, by using the following command:

```
user@switch> show system storage
fpc0:
-----------------------------------------------------------------------
Filesystem  Size  Used  Avail  Capacity Mounted on

```
Meaning  The presence of the partition name containing s4d indicates that there is a fourth slice. If this were a three-slice partition scheme, in place of s1a, s2f, s2a, s2f, s3d, and s3e, you would see s1a, s1f, s2a, s2f, s3d, and s3e and you would not see s4d.

Verifying the Loader Software Version

Purpose  For the special case of upgrading from Junos OS Release 10.4R2 or earlier to Release 10.4R3 or later, you must upgrade the loader software.

Action  For EX Series switches except EX8200 switches:

user@switch> show chassis firmware
<table>
<thead>
<tr>
<th>Part</th>
<th>Type</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPC 0</td>
<td>uboot</td>
<td>U-Boot 1.1.6 (Jan 3 2011 - 16:14:58) 1.0.0</td>
</tr>
<tr>
<td></td>
<td>loader</td>
<td>FreeBSD/PowerPC U-Boot bootstrap loader 2.4</td>
</tr>
</tbody>
</table>

For EX8200 switches:

user@switch> show chassis firmware
<table>
<thead>
<tr>
<th>Part</th>
<th>Type</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPC 0</td>
<td>uboot</td>
<td>U-Boot 1.1.6 (Jan 3 2011 - 16:14:58) 3.5.0</td>
</tr>
<tr>
<td></td>
<td>loader</td>
<td>FreeBSD/PowerPC U-Boot bootstrap loader 2.4</td>
</tr>
</tbody>
</table>

Meaning  For EX Series switches other than EX8200 switches, with Junos OS Release 10.4R3 or later installed:

- If there is version information following the timestamp for U-Boot (1.0.0 in the preceding example), then the loader software does not require upgrading.
- If there is no version number following the timestamp for U-boot, then the loader software requires upgrading.

NOTE: If the software version is Release 10.4R2 or earlier, no version number is displayed following the timestamp for U-boot, regardless of the loader software version installed. If you do not know whether you have installed the new loader software, we recommend that you upgrade the loader software when you upgrade the software version.
For EX8200 switches, if the version number following the timestamp for U-Boot is earlier than 3.5.0, you must upgrade the loader software when you upgrade the software version.

**Verifying Which Root Partition Is Active**

**Purpose**
Switches running Release 10.4R3 or later have resilient dual-root partition functionality, which includes the ability to boot transparently from the inactive partition if the system fails to boot from the primary root partition.

You can verify which root partition is active using the following command:

```
user@switch> show system storage partitions
```

```
fpc0:
--------------------------------------------------------------------------
Boot Media: internal (da0)
Active Partition: da0s1a
Backup Partition: da0s2a
Currently booted from: active (da0s1a)
```

**Meaning**
The `Currently booted from:` field shows which root partition is active.

**Verifying the Junos OS Version in Each Root Partition**

**Purpose**
Each switch contains two root partitions. We recommend that you copy the same Junos OS version in each partition when you upgrade. In Junos OS Release 10.4R2 and earlier, you might choose to have different Junos OS release versions in each partition. You might have different versions during a software upgrade and before you have finished verifying the new software installation. To enable a smooth reboot if corruption is found in the primary root file system, ensure that the identical Junos OS images are in each root partition. For Release 10.4R2 and earlier, you must manually reboot the switch from the backup root partition. However, for Release 10.4R3 and later, the switch reboots automatically from the backup root partition if it fails to reboot from the active root partition.

**Action**
Verify whether both root partitions contain the same image by using the following command:

```
user@switch> show system snapshot media internal
```

```
Information for snapshot on internal (/dev/da0s1a) (backup)
Creation date: Jan 11 03:02:59 2012
JUNOS version on snapshot:
  jbase  : ex-12.2120120305_2240_user
  jcrypto-ex: 12.2120120305_2240_user
  jdocs-ex: 12.2120120305_2240_user
```

Copyright © 2013, Juniper Networks, Inc.
The command shows which Junos OS version is installed on each media partition. Verify that the same version is installed on both partitions.

### Monitoring Licenses

- License Key Components for the EX Series Switch on page 601
- Monitoring Licenses for the EX Series Switch on page 602

**License Key Components for the EX Series Switch**

When you purchase a license for a Junos OS feature that requires a separate license, you receive a license key.

A license key consists of two parts:

- **License ID**—Alphanumeric string that uniquely identifies the license key. When a license is generated, it is given a license ID.
- **License data**—Block of binary data that defines and stores all license key objects.

For example, in the following typical license key, the string Junos204558 is the license ID, and the trailing block of data is the license data:

Junos204558 aeqa qaemjhd amroqha ztfmbu qgqama uqceds ra32rz lsevki ftvjad o4jy5u fynzzj mgviyl kgioyf ardb5g sj7wnt rsfked wbj65a sg

The license data defines the device ID for which the license is valid and the version of the license.

Monitoring Licenses for the EX Series Switch

To enable and use some Junos OS features on the EX Series switch, you must purchase, install, and manage the appropriate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy.

To monitor your installed licenses, perform the following tasks:

- Displaying Installed Licenses and License Usage Details on page 602
- Displaying Installed License Keys on page 603

### Displaying Installed Licenses and License Usage Details

**Purpose**
Verify that the expected license is installed and active on the switch and fully covers the switch configuration.

**Action**
From the CLI, enter the `show system license` command. (To display only the License usage list, enter the `show system license usage` command. To display only the Licenses installed output, enter `show system license installed`.)

```
user@switch> show system license
License usage:

<table>
<thead>
<tr>
<th>Feature name</th>
<th>Licenses</th>
<th>Licenses</th>
<th>Licenses</th>
<th>Expiry</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>permanent</td>
</tr>
<tr>
<td>isis</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>permanent</td>
</tr>
<tr>
<td>ospf3</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>permanent</td>
</tr>
<tr>
<td>ripng</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>permanent</td>
</tr>
<tr>
<td>mpls</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>permanent</td>
</tr>
</tbody>
</table>
```

**Licenses installed:**

License identifier: JUNOS204558

License version: 2

Valid for device: BN0208380000

Features:

- ex-series - Licensed routing protocols in ex-series
  permanent
Meaning  The output shows the license or licenses (for Virtual Chassis deployments) installed on the switch and license usage. Verify the following information:

- If a feature that requires a license is configured (used), a license is installed on the switch. The Licenses needed column must show that no licenses are required.
- The appropriate number of licenses is installed. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy.
- The expected license is installed.

Displaying Installed License Keys

Purpose  Verify that the expected license keys are installed on the switch.

Action  From the CLI, enter the `show system license keys` command.

```
user@switch> show system license keys
JUNOS204558 abcd efghij klmnop qrstuv wzyzab cdefgh ijklmn opqrst
     klmnop qrstuv wzyzab cdefgh ijklmn opqrst
     uvwxyz 61abcd efgh21 31efgh yzabcd
```

Meaning  The output shows the license key or keys (for Virtual Chassis deployments) installed on the switch. Verify that each expected license key is present.

Operational Commands
request system license add

Syntax  
request system license add (filename | terminal)

Release Information  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Add a license key.

Options  
filename—License key from a file or URL. Specify the filename or the URL where the key is located.

terminal—License key from the terminal.

Required Privilege Level  
maintenance

Related Documentation  
• Adding New Licenses (CLI Procedure)

List of Sample Output  
request system license add on page 604

Output Fields  
When you enter this command, you are provided feedback on the status of your request.

Sample Output  
request system license add

user@host> request system license add terminal
request system license delete

Syntax  
request system license delete ( license-identifier | license-identifier-list [ licenseid001 licenseid002 licenseid003 ] | all )

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option license-identifier-list introduced in Junos OS Release 13.1.

Description  
Delete a license key. You can choose to delete one license at a time, all licenses at once, or a list of license identifiers enclosed in brackets.

Options  
license-identifier—Text string that uniquely identifies a license key.
license-identifier-list [ licenseid001 licenseid002 licenseid003 .... ]—Delete multiple license identifiers as a list enclosed in brackets.
all—Delete all licenses on the device.

Required Privilege  
Level maintenance

Related Documentation  
• Deleting a License (CLI Procedure)
**request system license save**

**Syntax**
```
request system license save (filename | terminal)
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Save installed license keys to a file or URL.

**Options**
- `filename`—License key from a file or URL. Specify the filename or the URL where the key is located.
- `terminal`—License key from the terminal.

**Required Privilege**
- `maintenance`

**Related Documentation**
- `Saving License Keys`

**List of Sample Output**
request system license save on page 606

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
```
request system license save

user@host> request system license save ftp://user@host/license.conf
```
request system reboot

Syntax  
request system reboot  
<at time>  
<both-routing-engines>  
<in minutes>  
<media (compact-flash | disk | removable-compact-flash | usb)>  
<message "text">

request system reboot  
<all-members>  
<at time>  
<both-routing-engines>  
<in minutes>  
<local>  
<media (external | internal)>  
<member member-id>  
<message "text">  
<other-routing-engine>

Release Information  
Command introduced before Junos OS Release 7.4.
Option **other-routing-engine** introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Option **both-routing-engines** introduced in Junos OS Release 12.1.

**Description**
Reboot the software.

**Options**

- **none**—Reboot the software immediately.
- **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.
- **all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.
- **all-members**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.
- **at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:
  - **now**—Stop or reboot the software immediately. This is the default.
  - **+minutes**—Number of minutes from now to reboot the software.
  - **ymdhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
  - **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.
- **both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.
- **in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.
- **lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.
  Replace **number** with the following values depending on the LCC configuration:
  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
local—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options removable-compact-flash and usb pertain to the J Series routers only.)

media (external | internal)—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- external—Reboot the external mass storage device.
- internal—Reboot the internal flash device.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

message "text"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

partition—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- alternate—Reboot from the alternate partition.

scc—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

sfc number—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace number with 0.

slice slice—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- 1—Power off partition 1.
- 2—Power off partition 2.
- alternate—Reboot from the alternate partition.
Additional Information  Reboot requests are recorded in the system log files, which you can view with the `show log` command (see `show log`). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the `show system processes` command (see `show system processes`).

On a TX Matrix or TX Matrix Plus router, if you issue the `request system reboot` command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the `request system reboot` command on a TX Matrix Plus router with no options or the all-chassis, all-lcc, lcc `number`, or `sfc` options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the `request system reboot` command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

Required Privilege Level  maintenance

Related Documentation  • clear system reboot on page 163  
• request system halt on page 180  
• request system reboot  
• Rebooting and Halting a QFX Series Product

List of Sample Output  request system reboot on page 611  
request system reboot (at 2300) on page 611  
request system reboot (in 2 Hours) on page 611  
request system reboot (Immediately) on page 611  
request system reboot (at 1:20 AM) on page 611

Output Fields  When you enter this command, you are provided feedback on the status of your request.
Sample Output
request system reboot

user@host> request system reboot
Reboot the system? [yes,no] (no)

request system reboot (at 2300)

user@host> request system reboot at 2300 message? Maintenance time? Yes
Reboot the system? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00

request system reboot (Immediately)

user@host> request system reboot at now

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
request system reboot

Syntax

```
request system reboot
<all-members | local | member member-id>
<at time>
<in minutes>
<media (external | internal)>
<message "text">
<slice (1 | 2 | alternate)>
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
Option `partition` changed to `slice` in Junos OS Release 10.0 for EX Series switches.

Description

Reboot the Junos OS.

Reboot requests are recorded in the system log files, which you can view with the `show log` command. You can view the process names with the `show system processes` command.

Options

```
none—Reboots the software immediately.
```

```
all-members | local | member member-id—(EX4200 switch only) (Optional) Specify which member of the Virtual Chassis to reboot:
```

```
• all-members—Reboots each switch that is a member of the Virtual Chassis.
```

```
• local—Reboots the local switch, meaning the switch you are logged into, only.
```

```
• member member-id—Reboots the specified member switch of the Virtual Chassis.
```

```
at time—(Optional) Time at which to reboot the software, specified in one of the following ways:
```

```
• +minutes—Number of minutes from now to reboot the software.
```

```
• hh:mm—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
```

```
• now—Stop or reboot the software immediately. This is the default.
```

```
• yyyydddhhmm—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
```

```
in minutes—(Optional) Number of minutes from now to reboot the software. This option is an alias for the at +minutes option.
```

```
media (external | internal)—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.
```

```
message "text"—(Optional) Message to display to all system users before rebooting the software.
```
slice (1 | 2 | alternate)—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:
- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- alternate—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level**
- maintenance

**Related Documentation**

Syntax (TX Matrix Plus Routers)  
request system snapshot
<all-chassis | all-lcc | lcc number | sfc number>
<config-partition>
<partition>
[root-partition]

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 12.2 for ACX Series switches.
Options <config-partition> and <root-partition> introduced in Junos OS Release 13.1 for M, MX, T, TX Series switches.
Option media **usb-port-number** introduced in Junos OS Release 13.2 for MX104 routers.

**Description**
- On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to /altroot, and /config is backed up to /altconfig. The root and /config file systems are on the router's flash drive, and the /altroot and /altconfig file systems are on the router's hard drive.
- On the switch, take a snapshot of the files currently used to run the switch—the complete contents of the root (/), /altroot, /config, /var, and /var-tmp directories, which include the running Junos OS, the active configuration, and log files.

**CAUTION:** After you run the request system snapshot command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

**Options**
The specific options available depend upon the router or switch:

- **none**—Back up the currently running software as follows:
  - On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to /altroot, and /config is backed up to /altconfig. The root and /config file systems are on the router's flash drive, and the /altroot and /altconfig file systems are on the router's hard drive.
  - On the switch, take a snapshot of the files currently used to run the switch and copy them to the media that the switch did not boot from. If the switch is booted from internal media, the snapshot is copied to external (USB) media. If the switch is booted from external (USB) media, the snapshot is copied to internal media.
    - If the snapshot destination is external media but a USB flash drive is not connected, an error message is displayed.
    - If the automatic snapshot procedure is already in progress, the command returns the following error: **Snapshot already in progress. Cannot start manual snapshot.**
    For additional information about the automatic snapshot feature, see "Understanding Resilient Dual-Root Partitions on Switches" on page 575.

- **all-chassis | all-lcc | lcc number**—(TX Matrix and TX Matrix Plus router only) (Optional)
  - **all-chassis**—On a TX Matrix router, archive data and executable areas for all Routing Engines in the chassis. On a TX Matrix Plus router, archive data and executable areas for all Routing Engines in the chassis.
  - **all-lcc**—On a TX Matrix router, archive data and executable areas for all T640 routers (or line-card chassis) connected to a TX Matrix router. On a TX Matrix Plus router, archive data and executable areas for all routers (or line-card chassis) connected to a TX Matrix Plus router.
- **lcc number**—On a TX Matrix router, archive data and executable areas for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, archive data and executable areas for a specific router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T6600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T6600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**all-members | local | member member-id**—(EX Series switch Virtual Chassis and MX Series routers only) (Optional) Specify where to place the snapshot (archive data and executable areas) in a Virtual Chassis:

- **all-members**—Create a snapshot (archive data and executable areas) for all members of the Virtual Chassis.
- **local**—Create a snapshot (archive data and executable areas) on the member of the Virtual Chassis that you are currently logged into.
- **member member-id**—Create a snapshot (archive data and executable areas) for the specified member of the Virtual Chassis.

**as-primary**—(J Series routers only) (Optional) Create a snapshot that can be used to replace the medium in the primary compact flash drive. This option can be used on the removable compact flash only. The option copies the default files that were loaded on the primary compact flash drive when it was shipped from the factory, plus the rescue configuration if one has been set. This option is useful if you have multiple routers and want to use the same software and configuration on each router. After a boot device is created as a primary compact flash drive, it can operate in only a primary compact flash drive slot. This option causes the boot medium to be partitioned.

**config-partition**—(M, MX, T, TX Series routers only) Create a snapshot of the configuration partition only and store it onto the default /altconfig on the hard disk device or an /altconfig on a USB device.

**config-size size**—(J Series routers only) (Optional) Specify the size of the config partition, in megabytes. The default value is 10 percent of physical memory on the boot partition. The config partition is mounted on /config, and the configuration files are stored in this partition. This option causes the boot medium to be partitioned.

**data-size size**—(J Series routers only) (Optional) Specify the size of the data partition, in megabytes. The default value is 0 MB. The data partition is mounted on /data. This
space is not used by the router, and can be used for extra storage. This option causes
the boot medium to be partitioned.

**factory**—(J Series routers only) (Optional) Copy only default files that were loaded on
the primary compact flash drive when it was shipped from the factory, plus the rescue
configuration if one has been set. After the boot medium is created with the factory
option, it can operate in only the primary compact flash drive.

**media type**—(J Series routers and EX Series switches only) (Optional) Specify the boot
device the software is copied to:

- **compact-flash**—Copy software to the primary compact flash drive.
- **external**—(Switches only) Copy software to an external mass storage device, such
  as a USB flash drive. If a USB drive is not connected, the switch displays an error
  message.
- **internal**—(Switches only) Copy software to an internal flash drive.
- **removable-compact-flash**—Copy software to the removable compact flash drive.
- **usb**—(ACX Series, M320, T640, MX960, and J Series routers only) Copy software
to the device connected to the USB port.
- **usb0**—(MX104 routers only) Copy software to the device connected to the USB0
  port.
- **usb1**—(MX104 routers only) Copy software to the device connected to the USB1
  port.

**partition**—(Optional) Repartition the flash drive before a snapshot occurs. If the partition
(table on the flash drive is corrupted, the request system snapshot command fails
and reports errors. The partition option is only supported for restoring the software
image from the hard drive to the flash drive.

(Routers only) You cannot issue the request system snapshot command when you
enable flash disk mirroring. We recommend that you disable flash disk mirroring
when you upgrade or downgrade the software. For more information, see the Junos
OS Administration Library for Routing Devices.

(EX Series switches only) If the snapshot destination is the media that the switch
did not boot from, you must use the **partition** option.

**re0 | re1 | routing-engine routing-engine-id**—(EX6200 and EX8200 switches only) Specify
where to place the snapshot in a redundant Routing Engine configuration.

- **re0**—Create a snapshot on Routing Engine 0.
- **re1**—Create a snapshot on Routing Engine 1.
- **routing-engine routing-engine-id**—Create a snapshot on the specified Routing
  Engine.

**root-partition**—(M, MX, T, TX Series routers only) Create a snapshot of the root partition
only and store it onto the default /altroot on the hard disk device or an /altroot on a
USB device.
root-size size—(J Series routers only) (Optional) Specify the size of the root partition, in megabytes. The default value is one-third of the physical memory minus the config, data, and swap partitions. The root partition is mounted on / and does not include configuration files. This option causes the boot medium to be partitioned.

slice alternate—(EX Series switches only) (Optional) Take a snapshot of the active root partition and copy it to the alternate slice on the boot media.

scc—(TX Matrix router only) (Optional) Archive data and executable areas for a TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus router only) (Optional) Archive data and executable areas for a TX Matrix Plus router (or switch-fabric chassis). Replace number with 0.

swap-size size—(J Series router only) (Optional) Specify the size of the swap partition, in megabytes. The default value is one-third of the physical memory on a boot medium larger than 128 MB, or 0 MB on a smaller boot device. The swap partition is used for swap files and software failure memory snapshots. Software failure memory snapshots are saved to the boot medium only if it is specified as the dump device in the system dump-device configuration hierarchy. This option causes the boot medium to be partitioned.

Additional Information

• (Routers only) Before upgrading the software on the router, when you have a known stable system, issue the request system snapshot command to back up the software, including the configuration, to the /altroot and /altconfig file systems. After you have upgraded the software on the router and are satisfied that the new packages are successfully installed and running, issue the request system snapshot command again to back up the new software to the /altroot and /altconfig file systems.

• (Routers only) You cannot issue the request system snapshot command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the Junos OS Administration Library for Routing Devices.

• (TX Matrix and TX Matrix Plus router only) On a routing matrix, if you issue the request system snapshot command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are backed up. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are backed up.

<no-copy>
<no-validate>
<partition>
<reboot>
<unlink>
<upgrade-with-config>
<upgrade-with-config-format format>
<validate>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

- **best-effort-load** and **unlink** options added in Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- **sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- **set [package-name package-name]** option added in Junos OS Release 11.1 for EX Series switches.
- **set [package-name package-name]** option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

---

**NOTE:** On EX Series switches, the **set [package-name package-name]** option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the **set [package-name package-name]** option allows you to install multiple software packages and software add-on packages at the same time.

**Description**

NOTE: We recommend that you always download the software image to /var/tmp only. On EX Series and QFX Series switches, you must use the /var/tmp directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

**Options**

`package-name`—Location from which the software package or bundle is to be installed. For example:

- `/var/tmp/package-name`—For a software package or bundle that is being installed from a local directory on the router or switch.

- `protocol://hostname/pathname/package-name`—For a software package or bundle that is to be downloaded and installed from a remote location. Replace `protocol` with one of the following:
  - `ftp`—File Transfer Protocol. Use `ftp://hostname/pathname/package-name`. To specify authentication credentials, use `ftp://<username>:<password>@hostname/pathname/package-name`. To have the system prompt you for the password, specify `prompt` in place of the password. If a password is required and you do not specify the password or `prompt`, an error message is displayed.
  - `http`—Hypertext Transfer Protocol. Use `http://hostname/pathname/package-name`. To specify authentication credentials, use `http://<username>:<password>@hostname/pathname/package-name`. If a password is required and you omit it, you are prompted for it.
NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

- Do not use the *scp* protocol in the request system software add command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support scp.

Use the file `copy` command to copy the software package or bundle from the remote location to the `/var/tmp` directory on the hard disk:
```
file copy scp://source/package-name /var/tmp
```
Then install the software package or bundle using the request system software add command:
```
request system software add /var/tmp/package-name
```

- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the `unlink` option to achieve the same effect and allow the installation to be completed.

---

**best-effort-load**—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

**component all**—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

**delay-restart**—(Optional) Install a software package or bundle, but do not restart software processes.

**force**—(Optional) Force the addition of the software package or bundle (ignore warnings).

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a router that is connected to the TX Matrix Plus router.

Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member member-id—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace member-id with a value of 0 or 1.

partition—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

scc—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router. Replace number with 0.

no-copy—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

no-validate—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the validate option.

re0 | re1—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

reboot—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

set [package-name package-name]—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

set [package-name package-name]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

unlink—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the unlink option to remove the software package from this directory after a successful upgrade is completed.

upgrade-with-config—(Optional) Install one or more configuration files.

upgrade-with-config-format format—(Optional) Specify the configuration file format, text or xml. The default format is text.
The upgrade-with-config and upgrade-with-config-format options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the .failed suffix.

validate—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

The validate option only works on systems that do not have graceful-switchover (GRES) enabled. To use the validate option on a system with GRES, either disable GRES for the duration of the installation, or install using the command request system software in-service-upgrade, which requires nonstop active routing (NSR) to be enabled when using GRES.

Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the request system snapshot command to back up the software, including the configuration, to the /altroot and /altconfig file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the request system snapshot command again to back up the new software to the /altroot and /altconfig file systems.

The request system snapshot command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

After you run the request system snapshot command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, jkernel, last. Add the operating system package, jkernel, first and the routing software package, jroute, last. If you are upgrading all packages at once, delete and add them in the following order:
By default, when you issue the `request system software add package-name` command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the `request system software add package-name` command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Option `sfc` introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- Option `reboot` introduced in Junos OS Release 12.3.

**Description**
Remove a software package or bundle from the router or switch.

---

**CAUTION:** Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

**Options**
- **software-package**—Software package or bundle name. You can delete any or all of the following software bundles or packages:
  - `jbase`—(Optional) Junos base software suite
  - `jcrypto`—(Optional, in domestic version only) Junos security software
  - `jdocs`—(Optional) Junos online documentation file
  - `jkernel`—(Optional) Junos kernel software suite
  - `jpfe`—(Optional) Junos Packet Forwarding Engine support
  - `jroute`—(Optional) Junos routing software suite
  - `junos`—(Optional) Junos base software
NOTE: On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command show system software.

force—(Optional) Ignore warnings and force removal of the software.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific router that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the request system software delete command.

scc—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

set [package-name package-name]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc number—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace number with 0.

Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the request system snapshot command to back up the software, including the configuration, to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the request system snapshot command again to back up the new software to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you run the request system snapshot command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command behavior changed in Junos OS Release 12.1.
Option reboot introduced in Junos OS Release 12.3.

**Description**

For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful `request system software add` command.

As of Junos OS 12.1 and greater, revert to the last known good state before the most recent `request system software (add | delete)` command. For example, using rollback in Junos OS 12.1 after using `request system software add` restores the system to a known good state prior to using the `add` command. Similarly, using rollback in Junos OS 12.1 after using `request system software delete` restores the system to a known good state prior to using the `delete` command.

A software rollback fails if any required package (or a jbundle package containing the required package) cannot be found in `/var/sw/pkg`.

**Additional Information**

- On M Series and T Series routers, if `request system software add <jinstall> reboot` was used for the previous installation, then `request system software rollback` has no effect. In this case, use `jinstall` to reinstall the required package.
On M Series and T Series routers, if `request system software add <sdk1>` was used for the previous installation, then `request system software rollback` removes the last installed SDK package (`sdk1` in this example).

On SRX Series devices with dual root systems, when `request system software rollback` is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.

**Options**

- **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

- **lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.
  
  Replace `number` with the following values depending on the LCC configuration:

  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

- **local**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

- **member member-id**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace `member-id` with a value from 0 through 9. For an MX Series Virtual Chassis, replace `member-id` with a value of 0 or 1.

- **none**—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful `request system software add`. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent `request system software (add | delete)` command.

- **reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the `request system software rollback` command.

- **scc**—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).
**sfc number**—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

**request system software validate**

**Syntax**

```plaintext
request system software validate package-name
<set [package-name package-name]>
<upgrade-with-config>
<upgrade-with-config-format format>
```

**Syntax (TX Matrix Router)**

```plaintext
request system software validate package-name
<lcc number | scc>
<set [package-name package-name]>
<upgrade-with-config>
<upgrade-with-config-format format>
```

**Syntax (TX Matrix Plus Router)**

```plaintext
request system software validate package-name
<lcc number | sfc number>
<set [package-name package-name]>
<upgrade-with-config>
<upgrade-with-config-format format>
```

**Syntax (MX Series Router)**

```plaintext
request system software validate package-name
<member member-id>
<set [package-name package-name]>
<upgrade-with-config>
<upgrade-with-config-format format>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

- `sfc` option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Validate candidate software against the current configuration of the router.

**Options**

- **lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router.

  Replace `number` with the following values depending on the LCC configuration:

  - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member member-id**—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace `member-id` with a value of 0 or 1.

**package-name**—Name of the software bundle or package to test.

**scc**—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

**set [package-name package-name]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc number**—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format format**—(Optional) Specify the configuration file format, text or xml. The default format is text.

---

**NOTE:** The `upgrade-with-config` and `upgrade-with-config-format` options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the `.failed` suffix.

**Additional Information**

By default, when you issue the `request system software validate` command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the `request system software validate` command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

ERROR: Not a valid package: /var/tmp/test
```
show system auto-snapshot

Syntax

```
show system auto-snapshot
```

Release Information

Command introduced in Junos OS Release 12.3 for EX Series switches.

Description

Display automatic snapshot status information. When the automatic snapshot feature is enabled and the system reboots from the alternate root partition, the switch automatically takes a snapshot of the root file system in the alternate root partition and copies it onto the primary root partition. This automatic snapshot procedure takes place whenever the system reboots from the alternate partition, regardless of whether the reboot from the alternate partition is due to a command or due to a corruption of the primary partition.

When the automatic snapshot procedure is in progress, you cannot run the manual snapshot command, `request system snapshot`.

Options

This command has no options.

List of Sample Output

show system auto-snapshot on page 641

Output Fields

Table 106 on page 640 describes the output fields for the `show system auto-snapshot` command. Output fields are listed in the approximate order in which they appear.

### Table 106: show system auto-snapshot status Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| **Auto-snapshot configuration** | Status of the configuration:  
- Enabled—If the system reboots from the alternate partition, the automatic snapshot feature automatically takes a snapshot of the alternate partition and copies it onto the primary partition.  
- Disabled—The system does not automatically take a snapshot of the alternate partition. You must use the manual snapshot command, `request system snapshot`, to take a snapshot of one partition and copy it onto the other. |
| **Auto-snapshot state** | Status of the automatic snapshot procedure:  
- Completed—The automatic snapshot procedure has completed copying the alternate partition to the primary partition and the alarm has been cleared.  
- Disabled—The automatic snapshot procedure is inactive.  
- In progress—The automatic snapshot procedure is in progress. It takes about 10 to 15 minutes to complete, depending upon disk size. |
**Sample Output**

```plaintext
show system auto-snapshot

user@switch> show system auto-snapshot
Auto-snapshot Configuration: Enabled
Auto-snapshot State: Disabled
```
show system boot-messages

Syntax

show system boot-messages

Syntax (EX Series Switches)

show system boot-messages
<all-members>
<local>
<member member-id>

Syntax (TX Matrix Router)

show system boot-messages
<all-chassis | all-lcc | lcc number | scc>

Syntax (TX Matrix Plus Router)

show system boot-messages
<all-chassis | all-lcc | lcc number | sfc number>

Syntax (MX Series Router)

show system boot-messages
<all-members>
<local>
<member member-id>

Syntax (QFX Series)

show system boot-messages
infrastructure name | interconnect-device name | node-group name

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display initial messages generated by the system kernel upon startup. These messages are the contents of /var/run/dmesg.boot.

Options

none—Display all boot time messages.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.

infrastructure name—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.

interconnect-device name—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to
a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace member-id with a value from 0 through 9. For an MX Series Virtual Chassis, replace member-id with a value of 0 or 1.

node-group name—(QFabric systems only) (Optional) Display boot time messages on the Node group.

scc—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace number with 0.

Additional Information

By default, when you issue the show system boot-messages command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system license

**Syntax**

```
show system license
<installed | keys | usage>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display licenses and information about how they are used.

**Options**

- `none`—Display all license information.
- `installed`—(Optional) Display installed licenses only.
- `keys`—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.
- `usage`—(Optional) Display the state of licensed features.

**Required Privilege**

- Level: maintenance

**List of Sample Output**

- `show system license on page 650`
- `show system license installed on page 650`
- `show system license keys on page 651`
- `show system license usage on page 651`
- `show system license (QFX Series) on page 651`

**Output Fields**

Table 107 on page 649 lists the output fields for the `show system license` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Feature name</strong></td>
<td>Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.</td>
</tr>
<tr>
<td><strong>Licenses used</strong></td>
<td>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</td>
</tr>
</tbody>
</table>

**NOTE:** In Junos OS Release 10.1 and later, the **Licenses used** column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (`scale-subscriber`), L2TP (`scale-l2tp`), Mobile IP (`scale-mobile-ip`), and so on.
Table 107: show system license Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Licenses installed</td>
<td>Information about the installed license key:</td>
</tr>
<tr>
<td></td>
<td>• <strong>License identifier</strong>—Identifier associated with a license key.</td>
</tr>
<tr>
<td></td>
<td>• <strong>State</strong>—State of the license key: <strong>valid</strong> or <strong>invalid</strong>. A <strong>invalid</strong> state indicates that the key was entered incorrectly or is not valid for the specific device.</td>
</tr>
<tr>
<td></td>
<td>• <strong>License version</strong>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Valid for device</strong>—Device that can use a license key.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Group defined</strong>—Group membership of a device.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Features</strong>—Feature associated with a license, such as data link switching (DLSw).</td>
</tr>
<tr>
<td>Licenses needed</td>
<td>Number of licenses required for features being used but not yet properly licensed.</td>
</tr>
<tr>
<td>Expiry</td>
<td>Amount of time left within the grace period before a license is required for a feature being used.</td>
</tr>
</tbody>
</table>

Sample Output

show system snapshot

**Syntax**

```
show system snapshot
```

**Syntax (EX Series Switches)**

```
show system snapshot
<all-members|local|member member-id>
<media (external | internal)>
```

**Release Information**

Command introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 10.0 for EX Series switches.

**Description**

Display information about the backup software:

- On the routers, display information about the backup software, which is located in the `/altroot`, and `/altconfig` file systems or on the alternate media.

- On the switches, display information about the backup of the root file system (/) and directories `/altroot`, `/config`, `/var`, and `/var/tmp`, which are located either on an external USB flash drive or in internal flash memory.

**NOTE:** To back up software, use the `request system snapshot` command.

**Options**

- `none`—Display information about the backup software.

- `all-members | local | member member-id`—(EX Series switch Virtual Chassis only) (Optional) Display the snapshot in a Virtual Chassis:
  - `all-members`—Display the snapshot for all members of the Virtual Chassis.
  - `local`—Display the snapshot on the member of the Virtual Chassis that you are currently logged into.
  - `member member-id`—Display the snapshot for the specified member of the Virtual Chassis.

- `media (external | internal)`—(EX Series switch only) (Optional) Display the destination media location for the snapshot. The `external` option specifies the snapshot on an external mass storage device, such as a USB flash drive. The `internal` option specifies the snapshot on an internal memory source, such as internal flash memory. If no additional options are specified, the command displays the snapshot stored in both slices.

**Required Privilege Level**

- `view`

**Related Documentation**

- `request system snapshot on page 614`

**List of Sample Output**

- `show system snapshot (Router) on page 653`
Output Fields  
Table 108 on page 653 lists the output fields for the `show system snapshot` command. Output fields are listed in the approximate order in which they appear.

Table 108: show system snapshot Output Fields

show system storage partitions (EX Series Switches Only)

Syntax

```
show system storage partitions
<all-members>
<local>
<member member-id>
```

Release Information

Command introduced in Junos OS Release 11.1 for EX Series switches.

Description

Display information about the disk partitions on EX Series switches.

Options

- `none`—Display partition information.
- `all-members`—(Virtual Chassis systems only) (Optional) Display partition information for all members of the Virtual Chassis.
- `local`—(Virtual Chassis systems only) (Optional) Display partition information for the local Virtual Chassis member.
- `member member-id`—(Virtual Chassis systems only) (Optional) Display partition information for the specified member of the Virtual Chassis configuration.

Required Privilege

view

Troubleshooting Procedures

- Troubleshooting Software Installation on page 657
- Troubleshooting a Switch That Has Booted from the Backup Junos OS Image on page 660
- Resilient Dual-Root Partitions Frequently Asked Questions on page 661

Troubleshooting Software Installation

This topic describes troubleshooting issues with software installations on EX Series switches.

- Recovering from a Failed Software Upgrade on an EX Series Switch on page 657
- Rebooting from the Inactive Partition on page 658
- Freeing Disk Space for Software Installation on page 659
- Installation from the Boot Loader Generates 'cannot open package' Error on page 659

Recovering from a Failed Software Upgrade on an EX Series Switch

Problem  If Junos OS loads but the CLI is not working, or if the switch has no software installed, use this recovery installation procedure to install Junos OS.

Solution  If there is already a Junos OS image on the system, you can either install the new Junos OS package in a separate partition and have both Junos OS images remain on the system, or you can wipe the disk clean before the new installation proceeds.

If there is no Junos OS image on the system, follow the instructions in "Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive" on page 590 to get an image on the system and boot the switch.

To perform a recovery installation:

1. Power on the switch. The loader script starts.

   After the message Loading /boot/defaults/loader.conf displays, you are prompted with:

   Hit [Enter] to boot immediately, or space bar for command prompt.

2. Press the space bar to enter the manual loader. The loader> prompt displays.

3. Enter the following command:
loader> install [– --format] [– --external] source

where:

- **format**—Use this option to wipe the installation media before installing the software package. If you do not include this option, the system installs the new Junos OS package in a different partition from the partition used by the most recently installed Junos OS package.

- **external**—Use this option to install the software package on an external medium.

- **source**—Represents the name and location of the Junos OS package either on a server on the network or as a file on the USB flash drive:
  - Network address of the server and the path on the server; for example, `tftp://192.17.1.28/junos/jinstall-ex-4200-9.4R1.5-domestic-signed.tgz`
  - The Junos OS package on a USB device is commonly stored in the root drive as the only file; for example, `file:///jinstall-ex-4200-9.4R1.5-domestic-signed.tgz`

The boot process proceeds as normal and ends with a login prompt.

**Rebooting from the Inactive Partition**

**Problem**  EX Series switches shipped with Junos OS Release 10.4R2 or earlier have Junos OS loaded on the system disk in partition 1. The first time you upgrade, the new software package is installed in partition 2. When you finish the installation and reboot, partition 2 becomes the active partition. Similarly, subsequent software packages are installed in the inactive partition, which becomes the active partition when you reboot at the end of the installation process.

On switches shipped with Release 10.4R3 and later, the same Junos OS image is loaded in each of the two root partitions, and you should copy the new software image to the alternate partition each time you upgrade.

If you performed an upgrade and rebooted, the system resets the active partition. You can use this procedure to manually boot from the inactive partition.

**NOTE:** If you have completed the installation of the software image but have not yet rebooted, issue the request system software rollback command to return to the original software installation package.

**Solution**  Reboot from the inactive partition:

```
user@switch> request system reboot slice alternate
```
NOTE: If you cannot access the CLI, you can reboot from the inactive partition using the following procedure from the loader script prompt:

1. Unload and clear the interrupted boot from the active partition:
   
   ```
   loader> unload
   loader> unset vfs_root.mountfrom
   ```

2. Select the new (inactive) partition to boot from:
   
   ```
   loader> set currdev=diskx:y:
   ```
   
   where x is either 0 (internal) or 1 (external) and the y indicates the number of the inactive partition, either 1 or 2.
   
   You must include the colon (:) at the end of this command.

3. Boot Junos OS from the inactive partition:
   
   ```
   loader> boot
   ```

Freeing Disk Space for Software Installation

**Problem** The software installation process requires a certain amount of unused disk space. If there is not enough space, you might receive an error message such as:

```
fetch: /var/tmp/incoming-package.tgz: No space left on device
```

**Solution** Identify and delete unnecessary files by using the `request system storage cleanup` command.

Installation from the Boot Loader Generates 'cannot open package' Error

**Problem** When installing a Junos OS software image from the loader prompt, a “cannot open package error” is generated:

```
loader> install - -format
tftp://10.204.33.248/images/Flash_corr/official/jinstall-ex-4200-10.4I2011012-domestic-signed.tgz
Speed: 1000, full duplex
bootp: no reply
No response for RARP request
net_open: RARP failed
cannot open package (error 5)
```

**Solution** This might be due to the IP address, gateway IP address, netmask address, or server IP address not being properly set. You can set these values either from the shell or from the u-boot prompt.

To set these values from the shell:

```
% nvram setenv ipaddr 10.204.35.235
% nvram setenv netmask 255.255.240.0
% nvram setenv gatewayip 10.204.47.254
% nvram setenv serverip 10.204.33.248
```
To set these values from the u-boot prompt, log in to a console connection, reboot, and stop at the u-boot prompt (Ctrl+c):

```
=> setenv ipaddr 10.204.35.235
=> setenv gatewayip 10.204.47.254
=> setenv serverip 10.204.33.248
=> setenv netmask 255.255.240.0
=> saveenv
=> printenv Verify whether variables are set properly or not
=> boot
```

Troubleshooting a Switch That Has Booted from the Backup Junos OS Image

**Problem**
The switch boots from the backup root file partition. It is possible that the primary copy of JUNOS OS failed to boot properly, which could indicate that it is corrupted. This event is flagged in two ways:

- Upon login through the console or management port, the following warning message is displayed:

```
WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE
```

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

- The following alarm message is generated:

```
user@switch> show chassis alarms
1 alarms currently active
Alarm time     Class    Description
2011-02-17 05:48:49 PST Minor Host 0 Boot from backup root
```

If the switch is in a Virtual Chassis, the switch member number appears in the **Description** field, where the switch is called a host.

**Solution**
Install a new Junos OS image on the partition that had the corruption, or take a snapshot (use `request system snapshot`) of the currently active partition and use it to replace the image in the alternate partition:

If the switch is a standalone switch or a Virtual Chassis master switch, enter this command:

```
user@switch> request system snapshot slice alternate
```
If the switch is a Virtual Chassis member switch (not the master), enter this command on the Virtual Chassis:

```
user@switch> request systemsnapshotslicealternatemember member-id
```

where `member-id` is the Virtual Chassis member ID number.

---

### Resilient Dual-Root Partitions Frequently Asked Questions

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Resilient Dual-Root Partitions Frequently Asked Questions*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

This FAQ addresses questions regarding resilient dual-root partitions on EX Series switches. The resilient dual-root partition feature was introduced on EX Series switches at Junos OS Release 10.4R3. It provides additional resiliency for EX Series switches.

This FAQ covers the following questions:

- What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Enabled? on page 661
- What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Not Enabled? on page 662
- How Will I Be Informed If My Switch Boots from the Alternate Slice Because of Corruption in the Root File System? on page 663

### What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Enabled?

If the automatic snapshot feature is enabled during a reboot, the system automatically takes a snapshot of Junos OS from the alternate root partition (Slice 2) and copies it onto the primary root partition (Slice 1). The system checks each file system partition for corruption. Table 110 on page 662 shows the action the system takes if corruption is detected and the corrective action that you can take.
Table 110: Actions If Corrupt Files Are Found and Automatic Snapshot is Enabled

<table>
<thead>
<tr>
<th>Slice 1</th>
<th>Slice 2</th>
<th>Slice 3</th>
<th>Slice 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1a</td>
<td>s2a</td>
<td>s3e</td>
<td>s3d</td>
</tr>
<tr>
<td>/</td>
<td>/</td>
<td>/var</td>
<td>/var/tmp</td>
</tr>
</tbody>
</table>

(root Junos OS) (root Junos OS)

If a root directory (/) is corrupted, the corrupted file system is not mounted. The switch automatically takes a snapshot of the Junos OS root file system and copies it onto the primary root partition. It boots from the alternate slice, but the next reboot happens from the primary slice.

Corrective action: No corrective action is required.

Corrective action: Restore the /var or /config files from the external backup.

What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Not Enabled?

During a reboot, the system checks each file system partition for corruption. Table 111 on page 662 shows the action the system takes if corruption is detected and the corrective action that you can take.

Table 111: Actions If Corrupt Files Are Found

<table>
<thead>
<tr>
<th>Slice 1</th>
<th>Slice 2</th>
<th>Slice 3</th>
<th>Slice 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1a</td>
<td>s2a</td>
<td>s3e</td>
<td>s3d</td>
</tr>
<tr>
<td>/</td>
<td>/</td>
<td>/var</td>
<td>/var/tmp</td>
</tr>
</tbody>
</table>

(root Junos OS) (root Junos OS)

If a root directory (/) is corrupted, the corrupted file system is not mounted and the switch boots from the alternate slice.

Corrective action: Issue a request system snapshot command from the good root directory to the corrupted slice.

Corrective action: Restore the /var or /config files from the external backup.
How Will I Be Informed If My Switch Boots from the Alternate Slice Because of Corruption in the Root File System?

If the switch detects corruption in the primary root file system, it boots from the alternate root partition. When this occurs, the type of notification depends on whether you have enabled the automatic snapshot feature or not:

• If the automatic snapshot feature is not enabled:
  • If you are logged in through the console port or the management port:
    WARNING: THIS DEVICE HAS BOOTTED FROM THE BACKUP JUNOS IMAGE

    It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted from the backup copy.

    Please re-install JUNOS to recover the primary copy in case it has been corrupted.

    The following message is displayed when you issue `show chassis alarms`:

    user@switch: > show chassis alarms
    1 alarms currently active
    Alarm time               Class  Description
    2011-02-17 05:48:49 PST  Minor  Host 0 Boot from backup root

• If the automatic snapshot feature is enabled:
  • A banner message appears, indicating that an automatic snapshot operation is in progress. The banner message disappears when the snapshot operation is complete.
  • No alarm is issued to indicate that the switch has been rebooted from the alternate partition. However, the switch does log the event.

Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 667
- Junos OS Processes on page 668

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.

- Routing Engine—Provides three main functions:
- Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network.
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 61 on page 112 describes the primary Junos OS processes.

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis process</td>
<td>chassid</td>
<td>Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</td>
</tr>
<tr>
<td>Ethernet switching process</td>
<td>eswd</td>
<td>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANS, and VLAN interfaces. Manages Ethernet switching interfaces, VLANS, and VLAN interfaces.</td>
</tr>
<tr>
<td>Forwarding process</td>
<td>pfem</td>
<td>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</td>
</tr>
<tr>
<td>Interface process</td>
<td>dcd</td>
<td>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</td>
</tr>
</tbody>
</table>
Table 112: Junos OS Processes (continued)

<table>
<thead>
<tr>
<th>Process</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management process</td>
<td>mgd</td>
<td>Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</td>
</tr>
<tr>
<td>Routing protocol process</td>
<td>rpd</td>
<td>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</td>
</tr>
</tbody>
</table>

**Alarms Overview**

- Understanding Alarm Types and Severity Levels on EX Series Switches on page 669

**Understanding Alarm Types and Severity Levels on EX Series Switches**

Before monitoring alarms on the switch, become familiar with the terms defined in Table 113 on page 669.

Table 113: Alarm Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarm</td>
<td>Signal alerting you to conditions that might prevent normal operation. On a switch, the alarm signal is the yellow <strong>ALARM</strong> LED lit on the front of the chassis.</td>
</tr>
<tr>
<td>alarm condition</td>
<td>Failure event that triggers an alarm.</td>
</tr>
<tr>
<td>alarm severity</td>
<td>Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).</td>
</tr>
<tr>
<td>chassis alarm</td>
<td>Predefined alarm triggered by a physical condition on the switch such as a power supply failure, excessive component temperature, or media failure.</td>
</tr>
<tr>
<td>system alarm</td>
<td>Predefined alarm triggered by a missing rescue configuration or failure to install a license for a licensed software feature.</td>
</tr>
</tbody>
</table>

**Alarm Types**
The switch supports these alarms:

- **Chassis alarms** indicate a failure on the switch or one of its components. Chassis alarms are preset and cannot be modified.

- **System alarms** indicate a missing rescue configuration. System alarms are preset and cannot be modified, although you can configure them to appear automatically in the J-Web interface display or CLI display.

### Alarm Severity Levels

Alarms on Juniper Networks EX Series Ethernet Switches have two severity levels:

- **Major (red)**—Indicates a critical situation on the switch that has resulted from one of the following conditions. A red alarm condition requires immediate action.
  - One or more hardware components have failed.
  - One or more hardware components have exceeded temperature thresholds.
  - An alarm condition configured on an interface has triggered a critical warning.

- **Minor (yellow or amber)**—Indicates a noncritical condition on the switch that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

A missing rescue configuration generates a yellow system alarm.

### Dashboard Overview

- Dashboard for EX Series Switches on page 670

### Dashboard for EX Series Switches

When you log in to the J-Web user interface, the dashboard for the Juniper Networks EX Series Ethernet Switches appears. Use the dashboard to view system information.

The dashboard comprises four panels and a graphical chassis viewer. Click **Preferences** to choose which panels are to be displayed and set the refresh interval for chassis viewer information. Click **OK** to save your preference changes and return to the dashboard or click **Cancel** to return to the dashboard without saving changes.

**NOTE:** You can drag the various panels to different locations in the J-Web window.
NOTE: In a Virtual Chassis, the default values are shown on the Dashboard panel when no chassis image is clicked. The panel display changes based on the image clicked.

This topic describes:

- System Information Panel on page 671
- Health Status Panel on page 673
- Capacity Utilization Panel on page 675
- Alarms Panel on page 675

### System Information Panel

Table 114: System Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System name</td>
<td>Indicates the local name of the EX Series switch. The local name of the EX Series switches changes when an individual image is clicked.</td>
</tr>
</tbody>
</table>
| Device model   | Indicates the model of the EX Series switch. In a Virtual Chassis configuration, to indicate the model of a switch, click the image of that switch.  

**NOTE:** In a Virtual Chassis setup for an EX6210, EX8208, or EX8216 switch, the Device model field displays details of the master Routing Engine. To view details of a member, select it.
Table 114: System Information (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inventory details</td>
<td>Indicates the following:</td>
</tr>
<tr>
<td></td>
<td>• For EX3200 switches; and for EX2200, EX2200-C, EX3300, EX4200, EX4300, EX4500, and EX4550 switches that are not configured as Virtual Chassis, the value displayed in Inventory details field is always 1 FPC. FPC is a legacy term for a slot in a large Juniper Networks chassis; which simply refers to the standalone switch.</td>
</tr>
<tr>
<td></td>
<td>• For EX2200 and EX2200-C switches configured as a Virtual Chassis, the value displayed in the Inventory details field is 1–4 FPC, with the number corresponding to the number of member switches.</td>
</tr>
<tr>
<td></td>
<td>• For EX3300 switches configured as a Virtual Chassis, the value displayed in the Inventory details field is 1–6 FPC, with the number corresponding to the number of member switches.</td>
</tr>
<tr>
<td></td>
<td>• For EX4200, EX4300, EX4500, and EX4550 switches configured as a Virtual Chassis, the value displayed in the Inventory details field is 1–10 FPC, with the number corresponding to the number of member switches.</td>
</tr>
<tr>
<td></td>
<td>• For EX6210 switches, the values displayed in the Inventory details field are 1–2 CB and 1–9 FPC. CB, or Control Board, refers to the SRE module. FPC refers to line cards and the FPC within the CB.</td>
</tr>
<tr>
<td></td>
<td>• For an EX8208 switch, the values displayed in Inventory details field are 1–3 CB and 0–8 FPC. CB, or Control Board, refers to SRE and SF modules. FPC refers to line cards.</td>
</tr>
<tr>
<td></td>
<td>• For EX8216 switches, the values displayed in Inventory details field are 1–2 CB and 0–16 FPC. CB, or Control Board, refers to RE modules and FPC refers to line cards.</td>
</tr>
<tr>
<td></td>
<td>• For an XRE200 External Routing Engine in an EX8200 Virtual Chassis, the value displayed in Inventory details is 1 XRE. XRE refers to RE modules. For XRE200 External Routing Engines configured as a Virtual Chassis, the values displayed in Inventory details are 1–2 XRE and 0–4 LCC, where LCC refers to the EX8200 line card chassis.</td>
</tr>
<tr>
<td>Junos image</td>
<td>Indicates the version of the Junos OS image. In a Virtual Chassis configuration, the Junos OS image of the master switch is displayed by default. To display the Junos OS image of a specific switch, click the image of that switch.</td>
</tr>
<tr>
<td>Boot image</td>
<td>Indicates the version of the boot image that is used. In a Virtual Chassis configuration, the boot image of the master switch is displayed by default. To display the boot image of a specific switch, click the image of that switch.</td>
</tr>
<tr>
<td>Device uptime</td>
<td>Indicates the time since the last reboot. In a Virtual Chassis configuration, to display the uptime of the specific switch, click the image of that switch.</td>
</tr>
<tr>
<td>Last configured time</td>
<td>Indicates the time when the switch was last configured.</td>
</tr>
</tbody>
</table>
### Health Status Panel

#### Table 115: Health Status

Alarms Panel

Displays information about the last five alarms raised in the system. For example, if there are 5 major alarms, then details of all 5 major alarms are displayed. If there are 4 major alarms and 3 minor alarms, then details of the 4 major alarms and 1 minor alarm are displayed. Major alarms are displayed in red and minor alarms are displayed in yellow.

In an EX8200 Virtual Chassis, the top 5 alarms for the master external Routing Engine are displayed by default. If you select an EX8200 member switch of the Virtual Chassis, the top 5 alarms for that member switch are displayed.

File System Usage

To display the file system storage details of a switch in the backup or linecard role, click the image of that switch.

Chassis Viewer

Click the Rear View button to see the back of the chassis image. Click the Front View button to see the front of the chassis image. In a Virtual Chassis configuration, the Rear View button is disabled if the switch is not selected.

- Table 117 on page 676—Describes the chassis viewer for EX2200 switches.
- Table 118 on page 676—Describes the chassis viewer for EX2200-C switches.
- Table 119 on page 677—Describes the chassis viewer for EX3200, EX3300, and EX4200 switches.

CHAPTER 23

Configuration

• Configuration Statements on page 689

Configuration Statements

facility-override

Syntax

facility-override facility;

Hierarchy Level

[edit system syslog host]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.

Options

facility—Alternate facility to substitute for the default facilities. For a list of the possible facilities, see Junos OS System Log Alternate Facilities for Remote Logging.

Required Privilege

Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

• Changing the Alternative Facility Name for Remote System Log Messages
• Junos OS System Log Messages Reference
file (System Logging)

Syntax

```
file filename {
    facility severity;
    archive {
        files number;
        size size;
        (no-world-readable | world-readable);
    }
    explicit-priority;
    match "regular-expression";
    structured-data {
        brief;
    }
}
```

Hierarchy Level
[edit system syslog]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure the logging of system messages to a file.

Options
- **facility**—Class of messages to log. To specify multiple classes, include multiple `facility severity` statements. For a list of the facilities, see Junos OS System Logging Facilities and Message Severity Levels.
- **file filename**—File in the severity directory in which to log messages from the specified facility. To log messages to more than one file, include more than one `file` statement.
- **severity**—Severity of the messages that belong to the facility specified by the paired `facility` name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Junos OS System Logging Facilities and Message Severity Levels.

The remaining statements are explained separately.

Required Privilege Level
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Related Documentation

files

**Syntax**

```
files number;
```

**Hierarchy Level**

- [edit system syslog archive].
- [edit system syslog file filename archive]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for EX Series switches.

**Description**

Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file `logfile`, it closes the file, compresses it, and renames it to `logfile.0.gz` (for information about the maximum file size, see `size`). The utility then opens and writes to a new file called `logfile`. When the new file reaches the maximum size, the `logfile.0.gz` file is renamed to `logfile.1.gz`, and the new file is closed, compressed, and renamed `logfile.0.gz`. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

**Options**

- **number**—Maximum number of archived files.
  - **Range:** 1 through 1000
  - **Default:** 10 files

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**host (System)**

**Syntax**

```plaintext
host (hostname | other-routing-engine) {
    facility severity;
    exclude-hostname
    explicit-priority;
    facility-overrides facility;
    log-prefix string;
    match "regular-expression";
    source-address source-address;
    structured-data {
        brief;
    }
}
```

**QFX Series**

```plaintext
host (hostname {
    facility severity;
    explicit-priority;
    facility-overrides facility;
    log-prefix string;
    match "regular-expression";
    port;
    source-address source-address;
}
```

**TX Matrix Router and EX Series Switches**

```plaintext
host (hostname | other-routing-engine | scc-master) {
    facility severity;
    explicit-priority;
    facility-overrides facility;
    log-prefix string;
    match "regular-expression";
    port;
    source-address source-address;
}
```

**TX Matrix Plus Router**

```plaintext
host (hostname | other-routing-engine | sfc0-master) {
    facility severity;
    allow-duplicates;
    explicit-priority;
    facility-overrides facility;
    log-prefix string;
    match "regular-expression";
    port;
    source-address source-address;
}
```

**Hierarchy Level**

[edit logical-systems logical-system-name system syslog],
[edit system syslog]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Configure the logging of system messages to a remote destination.
Options

**facility**—Class of messages to log. To specify multiple classes, include multiple **facility severity** statements. For a list of the facilities, see *Junos OS System Logging Facilities and Message Severity Levels*.

**hostname**—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

**other-routing-engine**—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

---

**NOTE:** The **other-routing-engine** option is not applicable to the QFX Series.

**port**—Port number of the remote syslog server that can be modified.

**scc-master**—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

**severity**—Severity of the messages that belong to the facility specified by the paired **facility** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see *Junos OS System Logging Facilities and Message Severity Levels*.

**sfc0-master**—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

**Required Privilege**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.
**interface (Accounting or Sampling)**

**Syntax**

```plaintext
interface interface-name {
    engine-id number;
    engine-type number;
    source-address address;
}
```

**Hierarchy Level**

- [edit forwarding-options accounting group-name output],
- [edit forwarding-options sampling family family-name output]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Specify the output interface for sending copies of packets elsewhere to be analyzed.

**Options**

- `engine-id number` — Identity of the accounting interface.
- `engine-type number` — Type of this accounting interface.
- `interface-name` — Name of the accounting interface.
- `source-address address` — Address used for generating packets.

**Related Documentation**

### match

**Syntax**

match "regular-expression";

**Hierarchy Level**

- [edit logical-systems logical-system-name system syslog file filename],
- [edit logical-systems logical-system-name system syslog user (username | *)],
- [edit system syslog file filename],
- [edit system syslog host hostname | other-routing-engine| scc-master]),
- [edit system syslog user (username | *)]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

- Using Regular Expressions to Refine the Set of Logged Messages
size (System)

Syntax  
size size;

Hierarchy Level  
[edit system syslog archive],  
[edit system syslog file filename archive]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Configure the maximum amount of data that the Junos OS logging utility writes to a log file logfile before archiving it (closing it, compressing it, and changing its name to logfile.0.gz). The utility then opens and writes to a new file called logfile. For information about the number of archive files that the utility creates in this way, see files.

Options  
size—Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

Syntax:  xk to specify the number of kilobytes, xm for the number of megabytes, or xg for the number of gigabytes

Range:  64 KB through 1 GB

Default:  1 MB for MX Series routers and the QFX Series

Required Privilege Level  
system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Related Documentation  
• Specifying Log File Size, Number, and Archiving Properties
• Junos OS System Log Messages Reference
• files on page 691
structured-data

Syntax

structured-data {
  brief;
}

Hierarchy Level

[edit logical-systems logical-system-name system syslog file filename],
[edit system syslog file filename]

Release Information

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Write system log messages to the log file in structured-data format, which complies with
Internet draft draft-ietf-syslog-protocol-23, The syslog Protocol

NOTE: When this statement is included, other statements that specify the
format for messages written to the file are ignored (the explicit-priority
statement at the [edit system syslog file filename] hierarchy level and the
time-format statement at the [edit system syslog] hierarchy level).

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

}
```

Hierarchy Level
[edit logical-systems logical-system-name system],
[edit system]
Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Support at the [edit logical-systems logical-system-name system] hierarchy level introduced in Junos OS Release 11.4.

Description

Configure the types of system log messages to send to files, to a remote destination, to user terminals, or to the system console.

The remaining statements are explained separately.

Options

archive—Define parameters for archiving log messages.
console—Send log messages of a specified class and severity to the console.
file—Send log messages to a named file.
host—Remote location to be notified of specific log messages.
log-rotate-frequency—Configure the interval for checking logfile size and archiving messages.
server—Name of the system log server in the inet.0 routing instance.
source-address—Include a specified address as the source address for log messages.
time-format—Additional information to include in the system log time stamp.
user—Notify a specific user of the log event.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

### time-format

**Syntax**

time-format (year | millisecond | year millisecond);

**Hierarchy Level**

[edit system syslog]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a `file`, `console`, or `user` statement at the [edit system syslog] hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a `host` statement.

By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, `Aug 21 12:36:30`. However, the timestamp for `traceoption` messages is specified in milliseconds by default, and is independent of the [edit system syslog time-format] statement.

---

**NOTE:** When the `structured-data` statement is included at the [edit system syslog file `filename`] hierarchy level, this statement is ignored for the file.

**Options**

- `millisecond`—Include the millisecond in the timestamp.
- `year`—Include the year in the timestamp.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

- Including the Year or Millisecond in Timestamps
- Junos OS System Log Messages Reference
- structured-data on page 697
time-zone

**Syntax**

time-zone (GMT hour-offset | time-zone);

**Hierarchy Level**

[edit system]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**GMT hour-offset** option added in Junos OS Release 7.4.

**Description**

Set the local time zone. To have the time zone change take effect for all processes running on the router or switch, you must reboot the router or switch.

**Default**

UTC

**Options**

**GMT hour-offset**—Set the time zone relative to UTC time.

**Range:** –14 through +12

**Default:** 0

**time-zone**—Specify the time zone as UTC, which is the default time zone, or as a string such as PDT (Pacific Daylight Time), or use one of the following continents and major cities:

- America/Adak, America/Anchorage, America/Argentina, America/Anguilla, America/Antigua, America/Aruba, America/Asuncion, America/Barbados, America/Belize, America/Bogota, America/Boise, America/Buenos_Aires, America/Caracas, America/Catamarca, America/Cayenne, America/Cayman, America/Chicago, America/Cordoba, America/Costa_Rica, America/Cuaba, America/Curacao, America/Dawson, America/Dawson_Creek, America/Denver, America/Detroit, America/Dominica, America/Edmonton, America/El_Salvador, America/Ensenada, America/Fortaleza, America/Glace_Bay, America/Godthab, America/Goose_Bay, America/Grand_Turk, America/Grenada, America/Guadeloupe, America/Guatemala, America/Guayaquil, America/Guyana, America/Halifax, America/Havana, America/Indiana/Knox, America/Indiana/Marengo, America/Indiana/Peru, America/Indiana/Vevay, America/Indianapolis, America/Inuvik, America/Iqaluit, America/Jamaica, America/Jujuy, America/Juneau, America/La_Paz, America/Lima, America/Los_Angeles, America/Louisville, America/Maceio, America/Managua, America/Manaus, America/Martinique, America/Mazatlan, America/Mendoza, America/Menominee, America/Mexico_City, America/Miquelon, America/Montevideo, America/Montreal, America/Montserrat, America/Nassau, America/New_York, America/Nipigon, America/Nome, America/Noronha, America/Panama, America/Pangnirtung, America/Paramaribo, America/Phoenix, America/Port-au-Prince,

user (System Logging)

Syntax

```
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Hierarchy Level
[edit system syslog]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure the logging of system messages to user terminals.

Options
* (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.

- **facility**—Class of messages to log. To specify multiple classes, include multiple `facility severity` statements. For a list of the facilities, see Junos OS System Logging Facilities and Message Severity Levels.

- **severity**—Severity of the messages that belong to the facility specified by the paired `facility` name. Messages with severities the specified level and higher are logged. For a list of the severities, see Junos OS System Logging Facilities and Message Severity Levels.

- **username**—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user’s terminal session, include more than one `user` statement.

The remaining statement is explained separately.

Required Privilege
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Related Documentation

Monitoring System Log Messages

Purpose Use the monitoring functionality to filter and view system log messages for EX Series switches.

Action To view events in the J-Web interface, select Monitor > Events and Alarms > View Events. Apply a filter or a combination of filters to view messages. You can use filters to display relevant events. Table 128 on page 706 describes the different filters, their functions, and the associated actions.

To view events in the CLI, enter the following command:

show log
### Table 128: Filtering System Log Messages

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Log File</strong></td>
<td>Specifies the name of a system log file for which you want to display the recorded events.</td>
<td>To specify events recorded in a particular file, select the system log filename from the list—for example, messages. Select <strong>include archived files</strong> to include archived files in the search.</td>
</tr>
<tr>
<td></td>
<td>Lists the names of all the system log files that you configure.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>By default, a log file, messages, is included in the /var/log/ directory.</td>
<td></td>
</tr>
<tr>
<td><strong>Process</strong></td>
<td>Specifies the name of the process generating the events you want to display.</td>
<td>To specify events generated by a process, type the name of the process. For example, type <strong>mgd</strong> to list all messages generated by the management process.</td>
</tr>
<tr>
<td></td>
<td>To view all the processes running on your system, enter the CLI command <strong>show system processes</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For more information about processes, see the Junos OS Installation and Upgrade Guide.</td>
<td></td>
</tr>
<tr>
<td><strong>Date From</strong></td>
<td>Specifies the time period in which the events you want displayed are generated.</td>
<td>To specify the time period:</td>
</tr>
<tr>
<td><strong>To</strong></td>
<td>Displays a calendar that allows you to select the year, month, day, and time. It also allows you to select the local time.</td>
<td>• Click the Calendar icon and select the year, month, and date—for example, 02/10/2007.</td>
</tr>
<tr>
<td></td>
<td>By default, the messages generated in the last hour are displayed. End Time shows the current time and Start Time shows the time one hour before End Time.</td>
<td>• Click the Calendar icon and select the year, month, and date—for example, 02/10/2007.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Click to select the time in hours, minutes, and seconds.</td>
</tr>
<tr>
<td><strong>Event ID</strong></td>
<td>Specifies the event ID for which you want to display the messages.</td>
<td>To specify events with a specific ID, type the partial or complete ID—for example, TFTP_D_AF_ERR.</td>
</tr>
<tr>
<td></td>
<td>Allows you to type part of the ID and completes the remainder automatically.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>An event ID, also known as a system log message code, uniquely identifies a system log message. It begins with a prefix that indicates the generating software process or library.</td>
<td></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Specifies text from the description of events that you want to display.</td>
<td>To specify events with a specific description, type a text string from the description with regular expression. For example, type ^Initial+ to display all messages with lines beginning with the term Initial.</td>
</tr>
<tr>
<td></td>
<td>Allows you to use regular expressions to match text from the event description.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Regular expression matching is case-sensitive.</td>
<td></td>
</tr>
<tr>
<td><strong>Search</strong></td>
<td>Applies the specified filter and displays the matching messages.</td>
<td>To apply the filter and display messages, click Search.</td>
</tr>
</tbody>
</table>

**Meaning:** Table 129 on page 707 describes the Event Summary fields.
NOTE: By default, the View Events page in the J-Web interface displays the most recent 25 events, with severity levels highlighted in different colors. After you specify the filters, Event Summary displays the events matching the specified filters. Click the First, Next, Prev, and Last links to navigate through messages.

Table 129: Viewing System Log Messages

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process</td>
<td>Displays the name and ID of the process that generated the system log message.</td>
<td>The information displayed in this field is different for messages generated on the local Routing Engine than for messages generated on another Routing Engine (on a system with two Routing Engines installed and operational). Messages from the other Routing Engine also include the identifiers re0 and re1 to identify the Routing Engine.</td>
</tr>
<tr>
<td>Severity</td>
<td>Severity level of a message is indicated by different colors.</td>
<td>A severity level indicates how seriously the triggering event affects switch functions. When you configure a location for logging a facility, you also specify a severity level for the facility. Only messages from the facility that are rated at that level or higher are logged to the specified file.</td>
</tr>
<tr>
<td></td>
<td>• Unknown—Gray—Indicates no severity level is specified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Debug/Info/Notice—Green—Indicates conditions that are not errors but are of interest or might warrant special handling.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Warning—Yellow—Indicates conditions that warrant monitoring.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Error—Blue—Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Critical—Pink—Indicates critical conditions, such as hard-drive errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Alert—Orange—Indicates conditions that require immediate correction, such as a corrupted system database.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Emergency—Red—Indicates system panic or other conditions that cause the switch to stop functioning.</td>
<td></td>
</tr>
<tr>
<td>Event ID</td>
<td>Displays a code that uniquely identifies the message.</td>
<td>The event ID begins with a prefix that indicates the generating software process. Some processes on a switch do not use codes. This field might be blank in a message generated from such a process. An event can belong to one of the following type categories:</td>
</tr>
<tr>
<td></td>
<td>The prefix on each code identifies the message source, and the rest of the code indicates the specific event or error.</td>
<td>• Error—Indicates an error or failure condition that might require corrective action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Event—Indicates a condition or occurrence that does not generally require corrective action.</td>
</tr>
</tbody>
</table>

Checking Active Alarms with the J-Web Interface

**Purpose**
Use the monitoring functionality to view alarm information for the EX Series switches including alarm type, alarm severity, and a brief description for each active alarm on the switching platform.

**Action**
To view the active alarms:

1. Select **Monitor > Events and Alarms > View Alarms** in the J-Web interface.
2. Select an alarm filter based on alarm type, severity, description, and date range.
3. Click **Go**.

   All the alarms matching the filter are displayed.

**NOTE:** When the switch is reset, the active alarms are displayed.

**Meaning**
Table 130 on page 708 lists the alarm output fields.

Table 130: Summary of Key Alarm Output Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Category of the alarm:</td>
</tr>
<tr>
<td></td>
<td>• Chassis—Indicates an alarm condition on the chassis (typically an environmental alarm such as one related to temperature).</td>
</tr>
<tr>

</tbody>
</table>
Monitoring Chassis Alarms for an EX8200 Switch

Purpose

This document provides information on chassis alarm conditions, and how you should respond when a certain chassis alarm is seen on your switch.

Various conditions related to the chassis components trigger yellow and red alarms. You cannot configure these conditions. See “Understanding Alarm Types and Severity Levels on EX Series Switches” on page 669.

Action

You can monitor chassis alarms by watching the ALM chassis status LED and using the LCD panel to gather information about the alarm. See Chassis Status LEDs in an EX8200 Switch and LCD Panel in an EX8200 Switch.

To display switch chassis alarms in the CLI, use the following command

```
user@host> show chassis alarms
```

The command output displays the number of alarms currently active, the time when the alarm began, the severity level, and an alarm description. Note the date and time of an alarm so that you can correlate it with error messages in the messages system log file.

You can also monitor chassis alarms using the J-Web interface. See “Checking Active Alarms with the J-Web Interface” on page 708.

Table 131 on page 709 lists some of the chassis alarms that an EX8200 switch can generate.

Table 131: Chassis Alarms for EX8200 Switches

Monitoring Switch Control Traffic

Purpose
Use the packet capture feature when you need to quickly capture and analyze switch control traffic on a switch. The packet capture feature allows you to capture traffic destined for or originating from the Routing Engine.

Action
To use the packet capture feature in the J-Web interface, select **Troubleshoot > Packet Capture**.

To use the packet capture feature in the CLI, enter the following CLI command:

```
monitor traffic
```

Meaning
You can use the packet capture feature to compose expressions with various matching criteria to specify the packets that you want to capture. You can decode and view the captured packets in the J-Web interface as they are captured. The packet capture feature does not capture transient traffic.

Table 132: Packet Capture Field Summary

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Specifies the interface on which the packets are captured. If you select default, packets on the Ethernet management port 0, are captured.</td>
<td>From the list, select an interface—for example, ge-0/0/0.</td>
</tr>
<tr>
<td>Detail level</td>
<td>Specifies the extent of details to be displayed for the packet headers.</td>
<td>From the list, select <strong>Detail</strong>.</td>
</tr>
<tr>
<td></td>
<td>• Brief—Displays the minimum packet header information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• This is the default.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Detail—Displays packet header information in moderate detail.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Extensive—Displays the maximum packet header information.</td>
<td></td>
</tr>
<tr>
<td>Packets</td>
<td>Specifies the number of packets to be captured. Values range from 1 to 1000. Default is 10. Packet capture stops capturing packets after this number is reached.</td>
<td>From the list, select the number of packets to be captured—for example, 10.</td>
</tr>
</tbody>
</table>
### Table 132: Packet Capture Field Summary (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addresses</td>
<td>Specifies the addresses to be matched for capturing the packets using a combination of the following parameters:</td>
<td>Select address-matching criteria. For example:</td>
</tr>
<tr>
<td></td>
<td>• Direction—Matches the packet headers for IP address, hostname, or network address of the source, destination or both.</td>
<td>1. From the Direction list, select <code>source</code>.</td>
</tr>
<tr>
<td></td>
<td>• Type—Specifies if packet headers are matched for host address or network address.</td>
<td>2. From the Type list, select <code>host</code>.</td>
</tr>
<tr>
<td></td>
<td>You can add multiple entries to refine the match criteria for addresses.</td>
<td>3. In the Address box, type <code>10.1.40.48</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4. Click <code>Add</code>.</td>
</tr>
<tr>
<td>Protocols</td>
<td>Matches the protocol for which packets are captured. You can choose to capture TCP, UDP, or ICMP packets or a combination of TCP, UDP, and ICMP packets.</td>
<td>From the list, select a protocol—for example, <code>tcp</code>.</td>
</tr>
<tr>
<td>Ports</td>
<td>Matches packet headers containing the specified source or destination TCP or UDP port number or port name.</td>
<td>Select a direction and a port. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• From the Type list, select <code>src</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In the Port box, type <code>23</code>.</td>
</tr>
</tbody>
</table>

#### Advanced Options

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absolute TCP Sequence</td>
<td>Specifies that absolute TCP sequence numbers are to be displayed for the packet headers.</td>
<td>To display absolute TCP sequence numbers in the packet headers, select this check box.</td>
</tr>
<tr>
<td>Layer 2 Headers</td>
<td>Specifies that link-layer packet headers are to be displayed.</td>
<td>To include link-layer packet headers while capturing packets, select this check box.</td>
</tr>
<tr>
<td>Non-Promiscuous</td>
<td>Specifies not to place the interface in promiscuous mode, so that the interface reads only packets addressed to it. In promiscuous mode, the interface reads every packet that reaches it.</td>
<td>To read all packets that reach the interface, select this check box.</td>
</tr>
<tr>
<td>Display Hex</td>
<td>Specifies that packet headers, except link-layer headers, are to be displayed in hexadecimal format.</td>
<td>To display the packet headers in hexadecimal format, select this check box.</td>
</tr>
<tr>
<td>Display ASCII and Hex</td>
<td>Specifies that packet headers are to be displayed in hexadecimal and ASCII format.</td>
<td>To display the packet headers in ASCII and hexadecimal formats, select this check box.</td>
</tr>
<tr>
<td>Header Expression</td>
<td>Specifies the match condition for the packets to be captured. The match conditions you specify for Addresses, Protocols, and Ports are displayed in expression format in this field.</td>
<td>You can enter match conditions directly in this field in expression format or modify the expression composed from the match conditions you specified for Addresses, Protocols, and Ports. If you change the match conditions specified for Addresses, Protocols, and Ports again, packet capture overwrites your changes with the new match conditions.</td>
</tr>
<tr>
<td>Packet Size</td>
<td>Specifies the number of bytes to be displayed for each packet. If a packet header exceeds this size, the display is truncated for the packet header. The default value is 96 bytes.</td>
<td>Type the number of bytes you want to capture for each packet header—for example, 256.</td>
</tr>
</tbody>
</table>

Monitoring System Properties

**Purpose**

Use the monitoring functionality to view system properties such as the name and IP address of the switch and resource usage.

**Action**

To monitor system properties in the J-Web interface, select Monitor > System View > System Information.

To monitor system properties in the CLI, enter the following commands:

- show system uptime
- show system users
- show system storage

**Meaning**

Table 133 on page 714 summarizes key output fields in the system properties display.

Table 133: Summary of Key System Properties Output Fields

Monitoring Chassis Information

Purpose
Use the monitoring functionality to view chassis properties such as general switch information, temperature and fan status, and resource information for the EX Series switch.

Action
To view chassis properties in the J-Web interface, select Monitor > System View > Chassis Information. For an EX8200 Virtual Chassis configuration, select the Virtual Chassis member from the list.

To view chassis properties in the CLI, enter the following commands:
- `show chassis environment`
- `show chassis fpc`
- `show chassis hardware`

Meaning
Table 134 on page 716 gives information about the key output fields for chassis information.

NOTE: For an EX2200, EX2200-C, EX3200, or EX4500 switch or an EX4200, EX4300, or EX4550 standalone switch, the FPC slot number refers to the switch itself and is always 0. In a Virtual Chassis configuration, the FPC slot number refers to the member ID.

**Power and Fan Tray Details**

**Power**

Select the **Power** tab to view details of the power supplies.

**Name/Value**

Displays the status and model number of each power supply.

**Fan**

Select the **Fan** tab to view details about the fans.

**Name/Value**

Displays the status of each fan in the corresponding FPC.

**Chassis Component Details**

**Select component**

Select an FPC to view general, temperature, resource, and subcomponent details.

**General**

Select the **General** tab to view the general information about the chassis components.

**Name/Value**

Displays general information:

- **Version**—Revision level. Supply the version number when reporting hardware problems to customer support.
- **Part number**
- **Serial number**—Supply the serial number when contacting customer support about the switch chassis.
- **Description**—Brief text description.

**Temperature**

Select the **Temperature** tab to view the temperature details of the components in the selected FPC.

**Name/Value**

Displays the temperature details of the sensors present in the selected FPC.

**Resource**

Select the **Resource** tab to view the resource details of the selected FPC.

Managing Log, Temporary, and Crash Files on the Switch (J-Web Procedure)

You can use the J-Web interface to rotate log files and delete unnecessary log, temporary, and crash files on the switch.

1. Cleaning Up Files on page 719
2. Downloading Files on page 720
3. Deleting Files on page 720

Cleaning Up Files

If you are running low on storage space, use the file cleanup procedure to quickly identify files to delete.

The file cleanup procedure performs the following tasks:

- Rotates log files—Archives the current log files, and creates fresh log files.
- Deletes log files in `/var/log`—Deletes files that are not currently being written to.
- Deletes temporary files in `/var/tmp`—Deletes files that have not been accessed within two days.
- Deletes all crash files in `/var/crash`—Deletes core files that the switch has written during an error.

To rotate log files and delete unnecessary files with the J-Web interface:

1. Select Maintain > Files.
2. In the Clean Up Files section, click Clean Up Files. The switching platform rotates log files and identifies files that can be safely deleted.
   - The J-Web interface displays the files that you can delete and the amount of space that will be freed on the file system.
3. Click one of the following options:
To delete the files and return to the Files page, click OK.

To cancel your entries and return to the list of files in the directory, click Cancel.

**Downloading Files**

You can use the J-Web interface to download a copy of an individual log, temporary, or crash file from the switching platform. When you download a file, it is not deleted from the file system.

To download files with the J-Web interface:

1. In the J-Web interface, select Maintain > Files.
2. In the Download and Delete Files section, click one of the following options:
   - Log Files—Log files in the /var/log directory on the switch.
   - Temporary Files—Lists the temporary files in the /var/tmp directory on the switching platform.
   - Jailed Temporary Files (Install, Session, etc)—Lists the files in the /var/jail/tmp directory on the switching platform.
   - Crash (Core) Files—Lists the core files in the /var/crash directory on the switching platform.

   The J-Web interface displays the files located in the directory.
3. Select the files that you want to download and click Download.
4. Choose a location for the saved file.

   The file is saved as a text file, with a .txt file extension.

**Deleting Files**

You can use the J-Web interface to delete an individual log, temporary, and crash file from the switching platform. When you delete the file, it is permanently removed from the file system.

---

**CAUTION:** If you are unsure whether to delete a file from the switching platform, we recommend using the Clean Up Files tool described in Cleaning Up Files. This tool determines which files can be safely deleted from the file system.

To delete files with the J-Web interface:

1. Select Maintain > Files.
2. In the Download and Delete Files section, Click one of the following options:
- Log Files—Lists the log files in the `/var/log` directory on the switching platform.
- Temporary Files—Lists the temporary files in the `/var/tmp` directory on the switching platform.
- Jailed Temporary Files (Install, Session, etc) — Lists the files in the `/var/jail/tmp` directory on the switching platform.
- Crash (Core) Files—Lists the core files in the `/var/crash` directory on the switching platform.

The J-Web interface displays the files in the directory.

3. Select the box next to each file you plan to delete.
4. Click **Delete**.

The J-Web interface displays the files you can delete and the amount of space that will be freed on the file system.

5. Click one of the following buttons on the confirmation page:
   - To delete the files and return to the Files page, click **OK**.
   - To cancel your entries and return to the list of files in the directory, click **Cancel**.

**Operational Commands**
clear log

**Syntax**

```
clear log filename
<all>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Remove contents of a log file.

**Options**

- `filename`—Name of the specific log file to delete.
- `all`—(Optional) Delete the specified log file and all archived versions of it.

**Required Privilege**

- Level: `clear`

**Related Documentation**

- `show log` on page 1091

**List of Sample Output**

- `clear log` on page 722

**Output Fields**

See `file list` for an explanation of output fields.

**Sample Output**

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----------------------------
-rw-r----- 1 root wheel 26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----------------------------

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----------------------------
-rw-r----- 1 root wheel 57 Sep 15 03:44 /var/log/sampled
total 1
```
file archive

Syntax

file archive destination destination source source
<compress>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

Options

destination destination—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:
- For archived files—The suffix .tar
- For archived and compressed files—The suffix .tgz

source source—Source of the original file or files. Specify the source as a URL or filename.

compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix .tgz.

Required Privilege

maintenance

List of Sample Output

file archive (Multiple Files) on page 723
file archive (Single File) on page 723
file archive (with Compression) on page 724

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file archive (Multiple Files)

The following sample command archives all message files in the local directory /var/log/messages as the single file messages-archive.tar.

user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>

file archive (Single File)

The following sample command archives one message file in the local directory /var/log/messages as the single file messages-archive.tar.

user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
file archive (with Compression)

The following sample command archives and compresses all message files in the local directory `/var/log/messages` as the single file `messages-archive.tgz`.

```
user@host> file archive compress source /var/log/messages* destination /var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```
**file checksum md5**

**Syntax**  
`file checksum md5 <pathname> filename`

**Release Information**  
Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**  
Calculate the Message Digest 5 (MD5) checksum of a file.

**Options**  
- `pathname`—(Optional) Path to a filename.  
- `filename`—Name of a local file for which to calculate the MD5 checksum.

**Required Privilege Level**  
maintenance

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
file compare

Syntax
file compare (files filename filename)
<context | unified>
<ignore-white-space>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Compare two local files and describe the differences between them in default, context, or unified output styles:

- **Default**—In the first line of output, c means lines were changed between the two files, d means lines were deleted between the two files, and a means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (<) in front of output lines refers to the first file. A right angle bracket (>) in front of output lines refers to the second file.

- **Context**—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).

- **Unified**—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

Options
files filename—Names of two local files to compare.
context—(Optional) Display output in context format.
ignore-white-space—(Optional) Ignore changes in the amount of white space.
unified—(Optional) Display output in unified format.

Required Privilege
none

List of Sample Output
file compare files on page 729
file compare files context on page 729
file compare files unified on page 729
file compare files unified ignore-white-space on page 729

Output Fields
When you enter this command, you are provided feedback on the status of your request.
Sample Output

file compare files

```shell
user@host> file compare files /tmp/one /tmp/two

- Copy a File Using File Transfer Protocol on page 732
- Copy a File Using File Transfer Protocol and Requiring a Password on page 732
- Copy a File Using Secure Copy Protocol (scp) on page 732

**Sample Output**

The following are examples of a variety of file copy scenarios.

**Copy a File from the Local Device to a Personal Computer**

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/c/junipero/tmp

...transferring.file...... |          0 KB |   0.3 kB/s | ETA: 00:00:00 | 100%
```

**Copy a Configuration File between Routing Engines**

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

**Copy a Log File between Routing Engines**

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```
Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus

The following sample command copies a text file from Routing Engine 1 on the switch-fabric chassis sfc0 to Routing Engine 1 on the line-card chassis lcc0:

```
user@host> filecopy sfc0-re1:/tmp/sample.txt lcc0-re1:/var/tmp
```

Copy a File Using File Transfer Protocol

To use anonymous FTP to copy a local file to a remote system, enter the following command:

```
user@host> filecopy filename ftp://hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
user@host> filecopy /config/juniper.conf ftp://hostname/juniper.conf
Receiving ftp://hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

Copy a File Using File Transfer Protocol and Requiring a Password

To use FTP where you require more privacy and are prompted for a password, enter the following command:

```
root@host> filecopy filename ftp://user@hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
root@host> filecopy /config/juniper.conf ftp://user@hostname/juniper.conf
Password for user@hostname: ******
Receiving ftp://user@hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

Copy a File Using Secure Copy Protocol (scp)

To use scp to copy a local file to a remote system, enter the following command:

```
root@host> filecopy filename scp://user@hostname/path/filename
```

In the following example, `/config/juniper.conf` is the local file, user is the username, and ssh-host is the scp server:

```
root@host> filecopy /config/juniper.conf scp://user@ssh-host/tmp/juniper.conf
user@ssh-host's password: ******
juniper.conf 100%
|*************************************************************************|
2198 00:00
```
file delete

Syntax  
file delete filename
<purge>

Release Information  
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Delete a file on the local router or switch.

Options  
filename—Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.

purge—(Optional) Overwrite regular files before deleting them.

Required Privilege  
Level  
maintenance

List of Sample Output  
file delete on page 733
file delete (Routing Matrix) on page 733

Output Fields  
When you enter this command, you are provided feedback on the status of your request.

Sample Output  
file delete

user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core

file delete (Routing Matrix)

user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
file list

Syntax

```
file list
<detail | recursive>
<filename>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display a list of files on the local router or switch.

Options

```
none—Display a list of all files for the current directory.

detail | recursive—(Optional) Display detailed output or descend recursively through the
directory hierarchy, respectively.

filename—(Optional) Display a list of files. For a routing matrix, the filename must include
the chassis information.
```

Additional Information

The default directory is the home directory of the user logged in to the router or switch.
To view available directories, enter a space and then a backslash (/) after the `file list`
command. To view files within a specific directory, include a backslash followed by the
directory and, optionally, subdirectory name after the `file list` command.

Required Privilege

Level

maintenance

List of Sample Output

file list on page 734
file list (Routing Matrix) on page 734

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file list

```
user@host> file list /var/tmp
dcd.core
rpdp.core
snmpd.core
```

file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp
lcc0-re0:
-------------------------------------------------------------------
/var/tmp/:
  .gdbinit
  .pccardd
  Test/

### Rename

**Syntax**

file rename source destination

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Rename a file on the local router or switch.

**Options**

- **destination**—New name for the file.
- **source**—Original name of the file. For a routing matrix, the filename must include the chassis information.

**Required Privilege**

maintenance

**List of Sample Output**

file rename on page 736
file rename (Routing Matrix) on page 736

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

**file rename**

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

**file rename (Routing Matrix)**

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-rel:/var/tmp
lcc0-rel:
-----------------------------------------------
/var/tmp:
.pccardd
sartre.conf
```
snmpd
syslogd.core-tarball.0.tgz

user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:

/var/tmp:
  .pccardd
  sartre.conf
  snmpd.rr
  syslogd.core-tarball.0.tgz
### file show

**Syntax**

```
file show filename
<encoding (base64 | raw)>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display the contents of a file.

**Options**

- `filename`—Name of a file. For a routing matrix, the filename must include the chassis information.

- `encoding (base64 | raw)`—(Optional) Encode file contents with base64 encoding or show raw text.

**Required Privilege**

- `maintenance`

**List of Sample Output**

- file show on page 738
- file show (Routing Matrix) on page 738

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

#### Sample Output

**file show**

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
```

**file show (Routing Matrix)**

```
user@host> file show lcc0-re0:/var/tmp/.gdbinit
lcc0-re0:
------------------------------------------------------------------------
# Settings
------------------------------------------------------------------------
set print pretty

# Basic stuff
------------------------------------------------------------------------
define msgbuf
    printf "%s", msgbufp->msg_ptr
end
```
# hex dump of a block of memory
# usage: dump address length
define dump
  p $arg0, $arg1
  set $ch = $arg0
  set $j = 0
  set $n = $arg1
  while ($j < $n)
    printf "%x %x ",&$ch[$j],$ch[$j]
    printf "%x ",$ch[$j]
    set $j = $j + 1
    if (!($j % 16))
      printf "\n"
  end
end
end
monitor list

Syntax

monitor list

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display the status of monitored log and trace files.

Options
This command has no options.

Additional Information
Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options], [edit interfaces], and [edit protocols protocol] hierarchy levels.

Required Privilege Level
trace

List of Sample Output
monitor list on page 740

Output Fields
Table 136 on page 740 describes the output fields for the monitor list command. Output fields are listed in the approximate order in which they appear.

Table 136: monitor list Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor start</td>
<td>Indicates the file is being monitored.</td>
</tr>
<tr>
<td>&quot;filename&quot;</td>
<td>Name of the file that is being monitored.</td>
</tr>
<tr>
<td>Last changed</td>
<td>Date and time at which the file was last modified.</td>
</tr>
</tbody>
</table>

Sample Output

guest@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
**monitor start**

**Syntax**

```plaintext
monitor start filename
```

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Start displaying the system log or trace file and additional entries being added to those files.

**Options**

`filename`—Specific log or trace file.

**Additional Information**

Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the `syslog` statement at the `[edit system]` hierarchy level and the `options` statement at the `[edit routing-options]` hierarchy level. The trace files generated by the routing protocol process are configured with `traceoptions` statements at the `[edit routing-options]`, `[edit interfaces]`, and `[edit protocols protocol]` hierarchy levels.

![NOTE:](image)

**NOTE:** To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

**Required Privilege Level**

`trace`

</tbody>
</table>
Sample Output

monitor start

user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from trip.jcmax.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
**monitor stop**

**Syntax**

```
monitor stop filename
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Stop displaying the system log or trace file.

**Options**

`filename`—Specific log or trace file.

**Additional Information**

Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the `syslog` statement at the `[edit system]` hierarchy level and the `options` statement at the `[edit routing-options]` hierarchy level. The trace files generated by the routing protocol process are those configured with `traceoptions` statements at the `[edit routing-options]`, `[edit interfaces]`, and `[edit protocols protocol]` hierarchy levels.

**Output Fields**

This command produces no output.

**Sample Output**

```
monitor stop

user@host> monitor stop
```
request chassis cb

Syntax  request chassis cb (offline | online) slot slot-number

Syntax (TX Matrix Router)  request chassis cb (offline | online) < slot slot-number | lcc number slot cb-slot-number | scc number slot cb-slot-number>

Syntax (TX Matrix Plus Router)  request chassis cb (offline | online) < slot slot-number | lcc number slot cb-slot-number | sfc number slot cb-slot-number>

Syntax (QFabric System)  request chassis cb (offline | online) interconnect-device name slot slot-number < interconnect-device name slot slot-number (offline | online)>

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS 9.4 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS 11.3 for QFX Series.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description  (M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB). For information about the meaning of “CBs” on the switches, see “EX Series Switches Hardware and CLI Terminology Mapping” on page 389.

Options  offline—Take the Control Board offline.

NOTE: On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the request chassis cb slot backup-slot-number offline command.

NOTE: Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.

online—Bring the Control Board online.

interconnect-device name—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:

slot slot-number—Control Board slot number:
• (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the lcc number option (the recommended method), replace cb-slot-number with a value from 0 through 1.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the lcc number option (the recommended method), replace cb-slot-number with a value from 0 through 1.

• M320 router—Replace slot-number with a value from 0 through 1.
• MX480/MX240 routers—Replace slot-number with a value from 0 through 1.
• MX960 router—Replace slot-number with a value from 0 through 2.
• MX2020 and MX2010 routers—Replace slot-number with 0 or 1.
• EX8208 switch—Replace slot-number with a value from 0 through 2.
• EX8216 switch—Replace slot-number with a value from 0 through 1.
• QFabric System—Replace slot-number with a value from 0 through 1.

lcc number—(TX Matrix, TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace number with the following values depending on the LCC configuration:

• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc number—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (switch-fabric chassis). Replace number with 0.

Required Privilege Level maintenance

Output Fields When you enter this command, you are provided feedback on the status of your request.
Sample Output

request chassis cb

user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online

request chassis cb interconnect-device (QFabric System)

user@switch> request chassis cb interconnect-device interconnect1 offline slot 1
Backup CB 1 cannot be set offline, backup RE is online

request chassis cb (MX2020 Router)

user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online

request chassis cb (MX2010 Router)

user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
request chassis fabric plane

Syntax
request chassis fabric plane plane-number (offline | online)

Release Information
Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.4 for EX Series switches.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description
Control the operation of the specified fabric plane.

Options
offline—Take the fabric plane offline. Use the request chassis fabric plane plane-number offline command to clear a FAULT state on a fabric plane. To bring the fabric plane back online, use the request chassis fabric plane plane-number online command.
online—Bring the fabric plane online.

plane plane-number—Fabric plane number.
  • For the M120 router, replace plane-number with a value from 0 through 3.
  • For the MX480 and MX240 routers, replace plane-number with a value from 0 through 7.
  • For the MX2020 and MX2010 routers, replace plane-number with a value from 0 through 7.
  • For the MX960 router, replace plane-number with a value from 0 through 5.
  • For the EX8208 switch, replace plane-number with a value from 0 through 11.
  • For the EX8216 switch, replace plane-number with a value from 0 through 7.

<local><member member-id>

**Syntax (MX2020 3D Universal Edge Routers)**

request chassis fpc (offline | online | restart) slot *slot-number*

**Syntax (MX2010 3D Universal Edge Routers)**

request chassis fpc (offline | online | restart) slot *slot-number*

**Syntax (QFabric System)**

request chassis fpc<interconnect-device name slot *slot-number* (offline | online)>
<(offline | online) interconnect-device name slot *slot-number*>
<slot *slot-number* interconnect-device name (offline | online)>

**Syntax (PTX Series Packet Transport Routers)**

request chassis fpc (offline | online | restart) slot *slot-number*

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS 11.3 for QFX Series.
- Command introduced in Junos OS 12.1x48 for PTX Series Packet Transport Routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**Description**

(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see "EX Series Switches Hardware and CLI Terminology Mapping" on page 389.

**Options**

- **offline**—Take the FPC offline.
- **online**—Bring the FPC online.
- **interconnect-device name**—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:
• (QFabric System) On a QFabric system, specify the name of the QFX3008-I interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

restart—Restart the FPC.

slot slot-number—FPC slot number:
  • M20 router—0 through 3.
  • M120 router—0 through 5.
  • MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
  • MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
  • MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
  • MX2020 router—0 through 19.
  • MX2010 router—0 through 9.
  • TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the lcc number option (the recommended method), replace slot-number with a value from 0 through 7. Otherwise, replace slot-number with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the lcc number option (the recommended method), replace slot-number with a value from 0 through 7. Otherwise, replace slot-number with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace slot-number with a value from 0 through 63. For example, the following commands have the same result:

        user@host> request chassis fpc lcc 1 slot 1 offline
        user@host> request chassis fpc slot 9 offline
  • Other routers—0 through 7.
  • QFabric System—Replace slot-number with a value from 0 through 2.
  • EX Series switches:
    • EX4200 switches in a Virtual Chassis configuration—Replace slot-number with a value from 0 through 9.
    • EX6210 switches—Replace slot-number with a value from 0 through 9.
NOTE: These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace `slot-number` with a value from 0 through 7.
- EX8216 switches—Replace `slot-number` with a value from 0 through 15.
- PTX5000 Packet Transport Router—Replace `slot-number` with a value from 0 through 7.

`all-members`—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

`local`—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

`member member-id`—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.

`lcc number`—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.
Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

List of Sample Output

request chassis fpc on page 752
request chassis fpc (MX Series Routers with Media Services Blade [MSB]) on page 752
request chassis fpc (MX2020 Router) on page 752
request chassis fpc (MX2010 Router) on page 752

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis fpc

user@host> request chassis fpc online slot 0
FPC 0 already online

request chassis fpc (MX Series Routers with Media Services Blade [MSB])

user@host> request chassis fpc slot 0
Possible completions:
    offline    Take FPC offline
    online     Bring FPC online
    restart    Restart FPC

request chassis fpc (MX2020 Router)

user@host >request chassis fpc online slot 2
FPC 2 already online

request chassis fpc (MX2010 Router)

user@host >request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
request system configuration rescue delete

**Syntax**
request system configuration rescue delete

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Delete an existing rescue configuration.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

**Options**
This command has no options.

**Required Privilege Level**
maintenance

**Related Documentation**
- request system configuration rescue save on page 548
- request system software rollback on page 633
- show system commit on page 557

**List of Sample Output**
request system configuration rescue delete on page 753

**Output Fields**
This command produces no output.

**Sample Output**

request system configuration rescue delete

user@host> request system configuration rescue delete
request system configuration rescue save

Syntax  request system configuration rescue save

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  Save the most recently committed configuration as the rescue configuration so that you can return to it at any time by using the rollback command.

NOTE:  The [edit system configuration] hierarchy is not available on QFabric systems.

Options  This command has no options.

Required Privilege Level  maintenance

Related Documentation  • request system software delete on page 629
• request system software rollback on page 633
• show system commit on page 557

List of Sample Output  request system configuration rescue save on page 754

Output Fields  This command produces no output.

Sample Output  request system configuration rescue save

  user@host> request system configuration rescue save
request system scripts refresh-from commit

Syntax
request system scripts refresh-from commit file file-name url url-path

Release Information
Command introduced in Junos OS Release 10.1 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Automatically download the initial Junos OS configuration and a set of standard commit
scripts during a Junos XML management protocol/NETCONF session when a switch is
brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command
is:

```xml
<request-script-refresh-from>
  <type>commit</type>
  <file>file-name</file>
  <URL>URL</URL>
</request-script-refresh-from>
```

Options
- **file file-name**—Name of the file to be downloaded.
- **url url-path**—URL of the file to be downloaded.

Required Privilege Level
maintenance

### show chassis alarms

**Syntax**

- **show chassis alarms**
- **Syntax (TX Matrix Routers)**
  ```
  show chassis alarms
  <lcc number | scc>
  ```
- **Syntax (TX Matrix Plus Routers)**
  ```
  show chassis alarms
  <lcc number | sfc number>
  ```
- **Syntax (MX Series Routers)**
  ```
  show chassis alarms
  <all-members>
  <local>
  <member member-id>
  ```
- **Syntax (MX104, MX2010, and MX2020 3D Universal Edge Routers)**
  ```
  show chassis alarms
  ```
- **Syntax (QFX Series)**
  ```
  show chassis alarms
  <interconnect-device name>
  <node-device name>
  ```
- **Syntax (PTX Series Packet Transport Routers)**
  ```
  show chassis alarms
  ```
- **Syntax (ACX Series Universal Access Routers)**
  ```
  show chassis alarms
  ```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- **sfc** option for the TX Matrix Plus router introduced in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.
- Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
- Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description**

Display information about the conditions that have been configured to trigger alarms.

**Options**

- **none**—Display information about the conditions that have been configured to trigger alarms.
- **all-members**—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.
interconnect-device name—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.
   Replace number with the following values depending on the LCC configuration:
   • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
   • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
   • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
   • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace member-id variable with a value of 0 or 1.

node-device name—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

scc—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

sfc number—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace number variable with 0.

Additional Information

You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (Plane/FPC/PFE) for link errors in the chassis.
In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: redalarmset, device FPC 6, reason FPC 6 Major Errors - Error code: 257
Apr 12 08:04:19 send: redalarmset, device FPC 1, reason FPC 1 Major Errors - Error code: 559
```

To understand what CM_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM_ALARM code has the following structure:

<table>
<thead>
<tr>
<th>Bits:</th>
<th>Error type:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-31</td>
<td>Major (1)</td>
</tr>
<tr>
<td>0</td>
<td>Minor (0)</td>
</tr>
</tbody>
</table>

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559
```

First, you have to convert 559 to binary; that is **100010111**. The LSB in this case is **1**, which means that this is a major alarm. After removing the LSB, you are left with **10001011**. This is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

<table>
<thead>
<tr>
<th>Chip Type: L Chip</th>

<td>625</td>
</tr>
<tr>
<td>CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR</td>
<td>626</td>
</tr>
<tr>
<td>CMALARM_ICHIP_RLDREAM_BIST_ERR</td>
<td>630</td>
</tr>
<tr>
<td>CMALARM_ICHIP_SDRAM_BIST_ERR</td>
<td>631</td>
</tr>
</tbody>
</table>
According to the table above, the 279 error code corresponds to **CMALARM_NCHIP_DBUF_CRC_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the Actual Error Code = (Error Code - 1)/2, where Error Code is the code that you get in the log message. For example, if you get the following log:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257
```

Actual Error Code = (257-1)/2 = 128. Similarly, for minor alarms, Actual Error Code = (Error Code)/2

show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the `enhanced-mode` statement at the `edit chassis network-services` hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The `show chassis alarm` command output displays FPC misconfiguration (FPC `fpc-slot misconfig`) as the reason for the generation of the alarms.

```

Release Information  Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
monitored option added in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
pem option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

Description  Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.
In addition on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

**Options**

none—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

adc adc-slot-number—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace `adc-slot-number` with a value from 0 through 19. For MX2010 routers, replace `adc-slot-number` with a value from 0 through 9.

cb cb-slot-number—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace `cb-slot` with 0 or 1. For the EX Series switches, see “EX Series Switches Hardware and CLI Terminology Mapping” on page 389 for information on CB slot numbering.

cip cip-slot-number—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the `cip-slot-number` variable with a value of 0 or 1.

cb interconnect-device name—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

ccg ccg-slot-number—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace `cb-slot` with a value of 0 or 1.

fpc fpc-slot—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace `fpc-slot` with a value from 0 through 9. For MX2020 routers, replace `fpc-slot` with a value from 0 through 19. For information about FPC numbering, see `show chassis environment fpc`. On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see “EX Series Switches Hardware and CLI Terminology Mapping” on page 389 for information on FPC numbering. On a TX Matrix Plus router with 3D SiBs replace `fpc-slot` with a value from 0 through 63.
fpm—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

interconnect-device name—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

monitored—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

member member-id—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace member-id variable with a value of 0 or 1. For EX Series switches, see member for member ID values.

node-device name—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

pdu pdu-slot-number—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

pem—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

pem pem-slot-number—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see show chassis environment pem.
**psm psm-slot-number**—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace `psm-slot-number` with a value from 0 through 17. For MX2010 routers, replace `psm-slot-number` with a value from 0 through 8.

**psupu-slot-number**—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See “EX Series Switches Hardware and CLI Terminology Mapping” on page 389 for detailed information.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine re-slot-number**—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see `show chassis environment routing-engine`.

**scg**—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc**—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

**sfb sfb-slot-number**—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace `sfb-slot-number` with a value from 0 through 7.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router (switch-fabric chassis). Replace `number` variable with 0.

**sib sib-slot-number**—(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see `show chassis environment sib`.

<td>• <strong>Power</strong>: Power information:</td>
</tr>
<tr>
<td></td>
<td>• (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: <strong>OK</strong>, <strong>Testing</strong>, (during initial power-on), <strong>Failed</strong>, or <strong>Absent</strong>.</td>
</tr>
<tr>
<td></td>
<td>• (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: <strong>OK</strong>, <strong>Testing</strong>, (during initial power-on), <strong>Check</strong>, <strong>Failed</strong>, or <strong>Absent</strong>.</td>
</tr>
<tr>
<td></td>
<td>• (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: <strong>OK</strong>, <strong>Testing</strong>, (during initial power-on), <strong>Check</strong>, <strong>Failed</strong>, or <strong>Absent</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Temp</strong>: Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Pic</strong>: On ACX4000 Routers, multiple temperature channels on a MIC. The status is: <strong>OK</strong> and the <strong>Measurement</strong> is in degrees Celsius (C) and Fahrenheit (F).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fan</strong>: Fan status: <strong>OK</strong>, <strong>Testing</strong> (during initial power-on), <strong>Failed</strong>, or <strong>Absent</strong>. On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. <strong>Measurement</strong> indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Misc</strong>: Information about other components of the chassis.</td>
</tr>
<tr>
<td></td>
<td>• On some routers, this field indicates the status of one or more additional components.</td>
</tr>
<tr>
<td></td>
<td>• On the M40e, M160, and M320 router, <strong>Misc</strong> includes <strong>CIP</strong> (Connector Interface Panel). <strong>OK</strong> indicates that the CIP is present. <strong>Absent</strong> indicates that the CIP is not present.</td>
</tr>
<tr>
<td></td>
<td>• On T Series routers, <strong>Misc</strong> includes <strong>CIP</strong> and <strong>SPMB</strong> (Switch Processor Mezzanine Board). <strong>OK</strong> indicates that the <strong>CIP</strong> or <strong>SPMB</strong> is present. <strong>Absent</strong> indicates that the <strong>CIP</strong> or <strong>SPMB</strong> is not present.</td>
</tr>
<tr>
<td></td>
<td>• On PTX Series Packet Transport Routers, <strong>Misc</strong> includes the <strong>SPMB</strong> (Switch Processor Mezzanine Board). The SPMB is located on the control boards. <strong>OK</strong> indicates that the control board is present. <strong>Absent</strong> indicates that the control board is not present.</td>

</tr>
<tr>
<td>Item</td>
<td>(MX104 Routers) Information about the chassis components: Routing Engines, Control Board (CB), Power Entry Module (PEM), and Compact Forwarding Engine Board (AFEB).</td>
</tr>
</tbody>
</table>
### Table 139: show chassis environment Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Status** | (MX104, MX2010, and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:
- **OK**: The fans are operational.
- **Testing**: The fans are being tested during initial power-on.
- **Failed**: The fans have failed or the fans are not spinning.
- **Absent**: The fan tray is not installed.

If the Class is Power, the power supply status can be:

- **OK**: The power component is operational.
- **Testing**: The power component is being tested during initial power-on.
- **Check**: There is insufficient power—-that is, fewer than the minimum required feeds are connected.
- **Failed**: The inputs leads have failed.
- **Absent**: The power component is not installed. |

| **Measurement** | (MX104, MX2010, and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM. |

### Sample Output

**show chassis environment (J2300 Router)**

```
user@host> show chassis environment
Class Item                   Status     Measurement
Temp  Routing Engine         OK         40 degrees C / 104 degrees F
Fan   Fan                    OK         |
```

**show chassis environment (J4300 or J6300 Router)**

```
user@host> show chassis environment
Class Item                   Status     Measurement
Temp  Routing Engine         OK         41 degrees C / 105 degrees F
Fan   Fan 0                  OK         10
Fan   Fan 1                  OK         |
```

**show chassis environment (M5 Router)**

```
user@host> show chassis environment
Class Item                   Status     Measurement
Power Power Supply A         OK         30 degrees C / 86 degrees F
Power Supply B               Absent    |
Temp  FPC 0                  OK         33 degrees C / 91 degrees F
      FEB                    OK         27 degrees C / 80 degrees F
      PS Intake              OK         27 degrees C / 80 degrees F
      PS Exhaust             OK         34 degrees C / 93 degrees F
      Routing Engine         OK         |
Fans  Left Fan 1             OK         Spinning at normal speed
      Left Fan 2             OK         Spinning at normal speed
      Left Fan 3             OK         Spinning at normal speed
      Left Fan 4             OK         Spinning at normal speed
```
### show chassis environment (M7i Router)

```bash
user@host> show chassis environment
Class Item                   Status     Measurement
Power  Power Supply 0         OK
       Power Supply 1         Absent
Temp   Intake                 OK         22 degrees C / 71 degrees F
       FPC 0                  OK         23 degrees C / 73 degrees F
       Power Supplies        OK         23 degrees C / 73 degrees F
       CFEB Intake            OK         29 degrees C / 84 degrees F
       CFEB Exhaust           OK         29 degrees C / 84 degrees F
       Routing Engine         OK         26 degrees C / 78 degrees F
Fans   Fan 1                  OK         Spinning at normal speed
       Fan 2                  OK         Spinning at normal speed
       Fan 3                  OK         Spinning at normal speed
       Fan 4                  OK         Spinning at normal speed
Misc   Craft Interface        OK
```

### show chassis environment (M10 Router)

```bash
user@host> show chassis environment
Class Item                   Status     Measurement
Power  Power Supply A         OK
       Power Supply B         Failed
Temp   FPC 0                  OK         36 degrees C / 96 degrees F
       FPC 1                  OK         35 degrees C / 95 degrees F
       FEB                    OK         34 degrees C / 93 degrees F
       PS Intake              OK         31 degrees C / 87 degrees F
       PS Exhaust             OK         34 degrees C / 93 degrees F
       Routing Engine         OK         35 degrees C / 95 degrees F
Fans   Left Fan 1             OK         Spinning at normal speed
       Left Fan 2             OK         Spinning at normal speed
       Left Fan 3             OK         Spinning at normal speed
       Left Fan 4             OK         Spinning at normal speed
Misc   Craft Interface        OK
```

### show chassis environment (M10i Router)

Release Information

Command introduced before Junos Release 7.4.
Command introduced in Junos OS Release 9.4 for EX Series switches.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
sfc option introduced for the TX Matrix Plus router in Junos Release 9.6.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

Description

(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Routers only) Display environmental information about the Control Boards (CBs). For information about the meaning of “CBs” on the switches, see “EX Series Switches Hardware and CLI Terminology Mapping” on page 389.

Options

none—Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 or T4000 routers.
all-members—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

interconnect-device—(QFabric systems only) Display environmental information about CBs on the Interconnect device.

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (switch-card chassis).

sfc number—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Routers, replace slot with 0 or 1. On EX Series switches replace slot with 0, 1, or 2. On QFX Series switches, replace slot with 0 or 1.

**Output Fields**

Table 140 on page 826 lists the output fields for the `show chassis environment cb` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>State</strong></td>
<td>Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby.</td>
</tr>
</tbody>
</table>
|                | • **Online**—CB is online and running.  
|                | • **Offline**—CB is powered down.                                                                                                                                                                                                                                                                                                                 |
| **NOTE:**      | On the EX8208 switch, the installation can include three CBs. See “EX Series Switches Hardware and CLI Terminology Mapping” on page 389.                                                                                                                                                                                                                  |
| **Temperature**| Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB.                                                                                                                                                                                                                                                                                                                            |
|                | • **Temperature Intake**—Measures the temperature of the air intake to cool the power supplies.  
|                | • **Temperature Exhaust**—Measures the temperature of the hot air exhaust.                                                                                                                                                                                                                                                                                                                             |
| **NOTE:**      | On the MX2010 and MX2020 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010 and MX2020 routers include intake and exhaust temperatures for multiple zones (Intake A, Intake B, Intake C, Exhaust A, Exhaust B, and TCBC). |
| **Power**      | Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.                                                                                                                                                                                               |
|                | **BUS Revision**—Revision level of the generic bus device. (Not on switches.)                                                                                                                                                                                                                                                                                                                                 |
| **FPGA Revision**| Revision level of the field-programmable gate array (FPGA). (Not on switches.)                                                                                                                                                                                                                                                                                                                               |

<tr>
<td>PMBus device (on MX240, MX480, and MX960 routers with Enhanced MX SCB)</td>
<td>Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB:</td>

**Syntax (QFX Series)**

```
show chassis environment fpc
<fpc-slot>
interconnect-device name
```

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for QFX Series.  
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.  
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.  
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.  
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**Description**

(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).

**Options**

- **none**—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.

- **all-members**—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.

- **interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.
**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.
Replace number with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.

**slot or fpc-slot**—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the lcc number option (the recommended method), replace slot with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. For example, the following commands have the same result:

  ```
  user@host> show chassis environment fpc 1 lcc 1
  user@host> show chassis environment fpc 9
  ```

- M120 router—Replace slot with a value from 0 through 5.
- MX240 router—Replace slot with a value from 0 through 2.
- MX480 router—Replace slot with a value from 0 through 5.
- MX960 router—Replace slot with a value from 0 through 11.
- MX2010 router—Replace slot with a value from 0 through 9.
- MX2020 router—Replace slot with a value from 0 through 19.
- Other routers—Replace slot with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace slot with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace slot with a value from 0 through 9 (switch's member ID).
• EX6210 switches—Replace slot with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Routing Engine (SRE) module), or 6 through 9 (line card only).

• EX8208 switches—Replace slot with a value from 0 through 7 (line card).

• EX8216 switches—Replace slot with a value from 0 through 15 (line card).

• QFX3500 switches —Replace fpc-slot with 0 through 15.

• PTX5000 Packet Transport Router—Replace fpc-slot with 0 through 7.

### Output Fields
Table 141 on page 845 lists the output fields for the show chassis environment fpc command. Output fields are listed in the approximate order in which they appear.
Table 141: show chassis environment fpc Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>State</strong></td>
<td>Status of the FPC:</td>
</tr>
<tr>
<td>• Unknown</td>
<td>FPC is not detected by the router.</td>
</tr>
<tr>
<td>• Empty</td>
<td>No FPC is present.</td>
</tr>
<tr>
<td>• Present</td>
<td>FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online.</td>
</tr>
<tr>
<td>• Ready</td>
<td>FPC is in intermediate or transition state.</td>
</tr>
<tr>
<td>• Announce online</td>
<td>Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative.</td>
</tr>
<tr>
<td>• Online</td>
<td>FPC is online and running.</td>
</tr>
<tr>
<td>• Offline</td>
<td>FPC is powered down.</td>
</tr>
<tr>
<td>• Diagnostics</td>
<td>FPC is set to operate in diagnostics mode.</td>
</tr>
<tr>
<td><strong>Temperature</strong></td>
<td>(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.</td>
</tr>
<tr>
<td><strong>PMB Temperature</strong></td>
<td>(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).</td>
</tr>
<tr>
<td><strong>Temperature Intake</strong></td>
<td>(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.</td>
</tr>
<tr>
<td><strong>Temperature Top</strong></td>
<td>(T Series routers only) Temperature of the air flowing past the top of the FPC.</td>
</tr>
<tr>
<td><strong>Temperature Exhaust</strong></td>
<td>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis. The PTX Series Packet Transport Routers, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</td>
</tr>
<tr>
<td><strong>Temperature Bottom</strong></td>
<td>(T Series routers only) Temperature of the air flowing past the bottom of the FPC.</td>
</tr>
<tr>
<td><strong>TL n Temperature</strong></td>
<td>(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.</td>
</tr>
<tr>
<td><strong>TQ n Temperature</strong></td>
<td>(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.</td>
</tr>
<tr>
<td><strong>Temperature MMBO</strong></td>
<td>(T640 router only) Temperature of the air flowing past the type 3 FPC.</td>
</tr>
<tr>
<td><strong>Temperature MMB1</strong></td>
<td>(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.</td>
</tr>
<tr>
<td><strong>Power</strong></td>
<td>Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</td>
</tr>
<tr>
<td><strong>CMB Revision or BUS revision</strong></td>
<td>Revision level of the chassis management bus device (M Series router) or bus (T Series routers).</td>
</tr>

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
- Command introduced in Junos OS Release 11.1 for the QFX Series.
- Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.
- Command introduced in Junos OS Release 12.1 for the T4000 Core Routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
- Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Options**
- **none**—Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.
- **all-members**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.
- **interconnect-device name**—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.
**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX104 routers, MX2010 routers, MX2020 routers, and T Series routers, replace *slot* with 0 or 1. On M5, M7i, M10, and M40 routers and on the J Series router, replace *slot* with 0. On EX3200 and EX4200 standalone switches, replace *slot* with 0. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with 0 or 1. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Routers, replace *slot* with 0 or 1.

Sample Output

**show chassis environment routing-engine (Nonredundant)**

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                        Online Master
  Temperature                 27 degrees C / 80 degrees
```

**show chassis environment routing-engine (Redundant)**

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State:                      Online Master
  Temperature:               26 degrees C / 78 degrees F

Routing Engine 1 status:
  State:                      Online Standby
  Temperature:               26 degrees C / 78 degrees F
```

**show chassis environment routing-engine (MX104 Router)**

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                        Online Master
  Temperature                 34 degrees C / 93 degrees F
  CPU Temperature             43 degrees C / 109 degrees F

#### Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.4 for EX Series switches.
- sfc option introduced in Junos OS Release 9.6 for the TX Matrix Plus router.
- Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

#### Description

(M10i, M40e, M120, M160, M320, MX Series, and T Series routers and EX8200 and PTX Series routers only) Display information about the ports on the Control Board (CB) Ethernet switch.

#### Options

- **none**—Display information about each connected port on the Ethernet switch. On a TX Matrix router, display information about each connected port on the Ethernet switch on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router,
display information about each connected port on the Ethernet switch on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on all the members of the Virtual Chassis configuration.

**errors**—(Optional) Display the numbers and types of errors accumulated on all ports of the Ethernet switch.

**errors port**—(Optional) Display the numbers and types of errors accumulated on the specified port (0 through 15) of the Ethernet switch. On the TX Matrix router, replace `port` with a value from 0 through 15. On the TX Matrix Plus router and EX8200 switch, replace `port` with a value from 0 through 27. On the PTX Series Packet Transport Routers, replace `port` with a value from 0 through 27. On the T4000 routers, MX2020 routers, and MX2010 routers, replace `port` with a value from 0 through 27.

**errors switch number**—(TX Matrix Plus router only) (Optional) Display the numbers and types of errors accumulated on the specified switch. Replace `number` with a value from 0 through 2.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number. Replace `number` with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on the specified member of the Virtual Chassis configuration. Replace `member-id` with a value of 0 or 1.

**old-rom-packet-count**—(MX 2020 Routers only) (Optional) Display information about installed linecards. A non-zero number indicates that the bootrom on that linecard needs to be updated.

**port-state**—(PTX Series only) (Optional) Display information about current port operation (Blocking, Listening, or Disabled).

**scc**—(TX Matrix router only) (Optional) Display information about the ports on the CB's Ethernet switch on the TX Matrix router (switch-card chassis).
**sfc number**—(TX Matrix Plus router only) (Optional) Display information about the ports on the CB's Ethernet switch on the TX Matrix Plus router (or switch-fabric chassis). Replace `number` with 0.

**statistics**—(Optional) Display traffic statistics for each connected port on the Ethernet switch.

**statistics port**—(Optional) Display traffic statistics for the specified port on the Ethernet switch. On the TX Matrix router, replace `port` with a value from 0 through 25. On the TX Matrix Plus router or EX8200 switch, replace `port` with a value from 0 through 27. On the PTX Series Packet Transport Routers, replace `port` with a value from 0 through 25. On the T4000 routers, MX2020 routers, and MX2010 routers, replace `port` with a value from 0 through 27.

**statistics switch number**—(TX Matrix Plus routers and EX8200 switch only) (Optional) Display traffic statistics for the specified Ethernet switch number. On the TX Matrix Plus router and EX8216 switch, replace `number` with a value from 0 through 2. On the EX8208 switch, replace `number` with a value from 0 through 1.

- show chassis ethernet-switch errors (T4000 Router) on page 910
- show chassis ethernet-switch (PTX5000 Packet Transport Router) on page 911
- show chassis ethernet-switch statistics (PTX5000 Packet Transport Router) on page 912
- show chassis ethernet-switch port-state (PTX5000 Packet Transport Router) on page 915

**Output Fields**

Table 143 on page 875 lists the output fields for the `show chassis ethernet-switch` command. Output fields are listed in the approximate order in which they appear.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| Link is good on port n connected to device | Information about the link between each port on the CB's Ethernet switch and one of the following devices:  
- FPC0 (Flexible PIC Concentrator 0) through FPC7  
- Local controller  
- Routing Engine  
- Other Routing Engine (on a system with two Routing Engines)  
- SPMB (Switch Processor Mezzanine Board)  
- (TX Matrix router only) LCC0 (line-card chassis 0) through LCC3 |
| Link is good on Fast Ethernet port n connected to device | or  
| Link is good on Gigabit Ethernet port n connected to device | or  
| Link is down on Gigabit Ethernet port connected to device | or  
| Speed is                               | Speed at which the Ethernet link is running: 10 Mb or 100 Mb. When the device is RE or Other RE on the TX Matrix router, the speed is 1000 Mb.  
**NOTE:** Irrespective of the device, the speed is 1000 Mb on the MX2010 and MX2020 routers. |
| Duplex is                              | Duplex type of the Ethernet link: full or half. |
| Autonegotiate is Enabled (or Disabled) | By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the no-concatenate statement at the [edit chassis] hierarchy level, as described in the Junos OS System Basics Configuration Guide). |
| Flow Control TX is Enabled (or Disabled) | (MX2010 routers, MX2020 routers, and PTX Series) Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection. |
| Flow Control RX is Enabled (or Disabled) | (MX2010 routers, MX2020 routers, and PTX Series) Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch. |
| MLT3                                   | Number of multilevel threshold-3 (MLT-3) Fast Ethernet errors detected. |
| Accumulated error counts for port n connected to device FPCn: (error output only) |  
- Lock                                    | Number of lock errors detected.  
- Xmit                                     | Number of transmission errors detected.  
- ESD                                      | Number of electrostatic discharge (ESD) errors detected.  
- False Carrier                           | Number of false carrier errors detected. |

user@host> show chassis ethernet-switch port-state
Displaying port state for switch 0
Port : 02
Target : SPMB

Error reading port 2 connected to device: SPMB
**show chassis fabric fpcs**

**Syntax**

```
show chassis fabric fpcs
<lcc number>
```

**Syntax (MX Series Routers)**

```
show chassis fabric fpcs
<all-members>
<local>
<member member-id>
```

**Syntax (MX2010 and MX2020 3D Universal Edge Routers)**

```
show chassis fabric fpcs
```

**Syntax (T4000 Core Router)**

```
show chassis fabric fpcs
```

**Syntax (PTX Series Packet Transport Routers)**

```
show chassis fabric fpcs <slot fpc-slot>
```

**Syntax (TX Matrix Plus Router)**

```
show chassis fabric fpcs
<lcc number>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.4 for EX Series switches.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**Description**

(M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Routers only) Display the state of the electrical switch fabric links between the Flexible PIC Concentrators (FPCs) and the Switch Interface Boards (SIBs).

**Options**

- **none**—Display the switch fabric link state. On a TX Matrix router, display the switching fabric link states for the FPCs in all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display the switching fabric link states for the FPCs in all routers connected to the TX Matrix Plus router.

- **all-members**—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in all members of the Virtual Chassis configuration.

- **lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the switch fabric link state for the FPCs in the specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the switch fabric link state for the FPCs in the specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace *number* with a following value depending on the LCC configurations:
• From 0 through 3 on a T640 router on the routing matrix with TX Matrix routers.

• From 0 through 3 on a T1600 router on the routing matrix with TX Matrix Plus routers.

• From 0 through 7 on a T1600 router in a routing matrix with TX Matrix Plus router with 3D SIBs.

• 0, 2, 4, 6 on a T4000 router in a routing matrix with TX Matrix Plus router with 3D SIBs.

**local**—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**slot fpc-slot**—(PTX Series Packet Transport Routers only) (Optional) Display the fabric state of the specified FPC slot. If no value is provided, display the status of all FPCs.

**Required Privilege Level**

**view**

**List of Sample Output**

- show chassis fabric fpacs (M320 Router) on page 918
- show chassis fabric fpacs (MX240 Router) on page 919

- show chassis fabric fpacs (MX960 Router) on page 920
- show chassis fabric fpacs (MX240 with AS MLC Modular Carrier Card) on page 922
- show chassis fabric fpacs (MX480 with AS MLC Modular Carrier Card) on page 922
- show chassis fabric fpacs (MX480 Router with MPC4E) on page 923
- show chassis fabric fpacs (MX960 with AS MLC Modular Carrier Card) on page 924
- show chassis fabric fpacs (MX2010 Router) on page 926
- show chassis fabric fpacs (MX2020 Router) on page 929
- show chassis fabric fpacs (MX2020 Router with MPC4E) on page 932
- show chassis fabric fpacs (T320 Router) on page 933
- show chassis fabric fpacs (T640 Router) on page 934
- show chassis fabric fpacs (TX Matrix Router) on page 934
- show chassis fabric fpacs (TX Matrix Router with 3D SIBs) on page 936
- show chassis fabric fpacs lcc (TX Matrix Router with 3D SIBs) on page 939
- show chassis fabric fpacs (T1600 Router) on page 939
- show chassis fabric fpacs (T4000 Core Router) on page 941
- show chassis fabric fpacs (TX Matrix Plus Router) on page 942
- show chassis fabric fpacs lcc (TX Matrix Plus Router) on page 950
- show chassis fabric fpacs (EX8200 Switch) on page 950
- show chassis fabric fpacs (PTX Series Packet Transport Routers) on page 951

**Output Fields**

Table 144 on page 918 lists the output fields for the **show chassis fabric fpacs** command. Output fields are listed in the approximate order in which they appear.
Table 144: show chassis fabric fpcs Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Fabric management FPC state</strong></td>
<td>Switching fabric link (link from SIB to FPC) state for each FPC:</td>
</tr>
<tr>
<td><strong>Unused</strong></td>
<td>FPC is not present.</td>
</tr>
<tr>
<td></td>
<td>(On MX240 and MX480 routers with AS- MLC modular carrier card or MPC4E only) the fabric plane from the pair that share physical links (1 and 5, and 3 and 7) is inactive.</td>
</tr>
<tr>
<td><strong>Destination error on PFEs list of PFEnumbers</strong></td>
<td>Destination errors to the listed Packet Forwarding Engines. Indicates that the link is not carrying traffic to the listed Packet Forwarding Engines.</td>
</tr>
<tr>
<td><strong>Links ok</strong></td>
<td>Link between the spare SIB and FPC is eligible to carry traffic.</td>
</tr>
<tr>
<td><strong>Link error</strong></td>
<td>Link between the SIB and FPC has CRC errors. However, the link is still eligible to carry traffic.</td>
</tr>
<tr>
<td><strong>Plane disabled</strong></td>
<td>Fabric plane has been disabled for the following reasons:</td>
</tr>
<tr>
<td></td>
<td>- Destination errors have exceeded the thresholds.</td>
</tr>
<tr>
<td></td>
<td>- Run-time link errors have exceeded the thresholds.</td>
</tr>
<tr>
<td></td>
<td>- Initialization time link errors detected, and link training was unsuccessful.</td>
</tr>
<tr>
<td><strong>Plane Disabled, Links Error</strong> (PTX Series Packet Transport Routers only)</td>
<td>The plane is disabled because of link errors detected at the FPC RX.</td>
</tr>
<tr>
<td><strong>Plane Disabled, Links Down</strong> (PTX Series Packet Transport Routers only)</td>
<td>The plane is disabled because of link errors detected at the SIB RX.</td>
</tr>
<tr>
<td><strong>Plane enabled</strong></td>
<td>Link between the active SIB and FPC is eligible to carry traffic.</td>
</tr>
</tbody>
</table>

**NOTE:** In Junos OS Release 9.6 and later, the list of Packet Forwarding Engines with destination errors is displayed in the output. In Junos OS Releases before 9.6, the output only indicates that there are destination errors. However, the list of Packet Forwarding Engines with destination errors is not displayed.

- **Links ok**—Link between the spare SIB and FPC is eligible to carry traffic.
- **Link error**—Link between the SIB and FPC has CRC errors. However, the link is still eligible to carry traffic.
- **Plane disabled**—Fabric plane has been disabled for the following reasons:
  - Destination errors have exceeded the thresholds.
  - Run-time link errors have exceeded the thresholds.
  - Initialization time link errors detected, and link training was unsuccessful.
  - **Plane Disabled, Links Error** (PTX Series Packet Transport Routers only)—The plane is disabled because of link errors detected at the FPC RX.
  - **Plane Disabled, Links Down** (PTX Series Packet Transport Routers only)—The plane is disabled because of link errors detected at the SIB RX.
  - **Plane enabled**—Link between the active SIB and FPC is eligible to carry traffic.

**NOTE:** On the Enhanced MX SCB with MPC, a maximum of 4 planes are operational and running. On all the other SCBs with MPC, all the planes are operational and running.

- **Plane Enabled, Links OK** (PTX Series Packet Transport Routers only)—The FPC CCL RX link is eligible to carry traffic.
- **Plane Enabled, Links OK** (TX Matrix and TX Matrix Plus routers only)—The FPC HSL RX link is eligible to carry traffic.

## show chassis fabric map

### Syntax

```
show chassis fabric map
plane <plane-number>
```

### Syntax (MX Series Router)

```
show chassis fabric map
<all-members>
<local>
<member member-id>
<plane plane-number>
```

### Release Information

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.4 for EX Series switches.

### Description

(M120 and MX Series routers and EX8200 switches only) On the M120 router, display the state of the switching fabric map for connections from the Forwarding Engine Boards (FEBs) to the ports on the fabric planes, as interpreted by the fabric plane. On the MX Series router and the EX8200 switch, display the state of the switching fabric map for connections from each Packet Forwarding Engine on the Dense Port Concentrators (DPCs) to the ports on the fabric planes, as interpreted by the fabric plane. For information about the meaning of “fabric plane”, “DPCs”, and “SIBs” on the switches, see “EX Series Switches Hardware and CLI Terminology Mapping” on page 389.

### Options

- **none**—Display the switching fabric map state for the M120 or MX Series router or EX8200 switch.
- **all-members**—(MX Series routers only) (Optional) Display the switching fabric map state for all the members of the Virtual Chassis configuration.
- **local**—(MX Series routers only) (Optional) Display the switching fabric map state for the local Virtual Chassis member.
- **member member-id**—(MX Series routers only) (Optional) Display the switching fabric map state for the specified member of the Virtual Chassis configuration. Replace the `member-id` with a value of 0 or 1.
- **plane plane-number**—(Optional) Display the state of the fabric link for the specified plane number.
  - For the M120 router, replace `plane-number` with a value from 0 through 3.
  - For the MX480 and MX240 routers, replace `plane-number` with a value from 0 through 7.
  - For the MX960 router, replace `plane-number` with a value from 0 through 5.
  - For the EX8208 switch, replace `plane-number` with a value from 0 through 11.
  - For the EX8216 switch, replace `plane-number` with a value from 0 through 7.

### Required Privilege

- **view**
List of Sample Output

show chassis fabric map (M120 Router) on page 954
show chassis fabric map (MX Series Routers) on page 954
show chassis fabric map plane 1 (EX8200 Switch) on page 958

Output Fields

Table 145 on page 954 lists the output fields for the show chassis fabric map command. Output fields are listed in the approximate order in which they appear.

Table 145: show chassis fabric map Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in-links</td>
<td>Fabric map for receive side links.</td>
</tr>
<tr>
<td>out-links</td>
<td>Fabric map for transmit side links.</td>
</tr>
<tr>
<td>state</td>
<td>State of the fabric link:</td>
</tr>
<tr>
<td></td>
<td>• RESET—Link between SIB and FPC/DPC is powered down on purpose. This is done in all non-dual PFE based boards.</td>
</tr>
<tr>
<td></td>
<td>• UP—Link between SIB and FPC/DPC is up and running.</td>
</tr>
<tr>
<td></td>
<td>• DOWN—Link between SIB and FPC/DPC is powered down.</td>
</tr>
<tr>
<td></td>
<td>• FAULT—SIB is in alarmed state where the SIB's plane is not operational for the following reasons:</td>
</tr>
<tr>
<td></td>
<td>• On-board F-chip is not operational.</td>
</tr>
<tr>
<td></td>
<td>• Fiber optic connector faults.</td>
</tr>
<tr>
<td></td>
<td>• FPC connector faults.</td>
</tr>
<tr>
<td></td>
<td>• SIB midplane connector faults.</td>
</tr>
</tbody>
</table>

**show chassis fabric plane**

**Syntax**

```
show chassis fabric plane
```

**Syntax (TX Matrix Plus Router)**

```
show chassis fabric plane
<detail | extensive | terse>
<lcc number | sfc number>
```

**Syntax (MX Series Routers)**

```
show chassis fabric plane
<detail | extensive | terse>
<all-members>
<local>
<member member-id>
```

**Syntax (MX2010 and MX2020 3D Universal Edge Routers)**

```
show chassis fabric plane
```

**Release Information**

- Command introduced in Junos OS Release 8.0.
- Command introduced in Junos OS Release 9.4 for EX Series switches.
- Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
- Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**Description**

(TX Matrix Plus router, T4000, T1600, M120, and MX Series routers and EX8200 switches only) On the M120 router, display the state of all fabric plane connections to the Forwarding Engine Boards (FEBs). On MX Series routers, display the state of all fabric plane connections to the Dense Port Concentrators (DPCs) and Packet Forwarding Engines (PFEs) on the Flexible PIC Concentrators (FPCs). On the TX Matrix Plus router, and on T1600 or T4000 routers in a routing matrix, display the state of the fabric management plane and the logical planes on the switch-fabric chassis (SFC) and line-card chassis (LCC). On EX8200 switches, display the state of all fabric planes. This command can be used on the master Routing Engine only.

**Options**

- **none**—(MX2010 and MX2020 Routers only) (Optional) Display the state of the fabric management plane.

- **detail**—(TX Matrix Plus routers, T1600 or T4000 routers in a routing matrix, and MX Series routers only) (Optional) Display detailed output for the fabric management plane. Show Switch Interface Board (SIB) states for the TXP-F13 SIB and the TXP-F2S SIB.

- **extensive**—(TX Matrix Plus routers, T1600 or T4000 routers in a routing matrix, and MX Series routers only) (Optional) Display extensive output for the fabric management plane.

- **terse**—(TX Matrix Plus routers and MX Series routers only) (Optional) Display terse output for the fabric management plane.

- **all-members**—(MX Series routers only) (Optional) Display the state of all fabric plane connections on all members of the Virtual Chassis configuration.
**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when TI600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when TI600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the state of all fabric plane connections on the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display the state of all fabric plane connections on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**sfc number**—(TX Matrix Plus router only) (Optional) Show information about the TX Matrix Plus router (SFC). Replace *number* with 0.

**Required Privilege Level**

- `view`

Output Fields

Table 146 on page 962 lists the output fields for the `show chassis fabric plane` command. Output fields are listed in the approximate order in which they appear.

### Table 146: show chassis fabric plane Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plane</td>
<td>(TX Matrix Plus, MX Series routers, M120 routers, and EX8200 switches only) Number of the plane.</td>
<td>none</td>
</tr>
<tr>
<td>Plane state</td>
<td>(MX Series and M120 routers and EX8200 switches only) State of each plane:</td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>• <strong>ACTIVE</strong>—SIB is operational and running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> On the Enhanced MX SCB with MPCs, a maximum of 4 planes are operational and running. On all the other SCBs with MPCs, all the planes are operational and running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FAULTY</strong>—SIB is in alarmed state where the SIB's plane is not operational for the following reasons:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• On-board fabric ASIC is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fiber optic connector faults.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FPC connector faults.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• SIB midplane connector faults.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(MX2010 and MX2020 Routers only) State of each plane:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>ACTIVE</strong>—SFB is operational and running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>OFFLINE</strong>—SFB is in offline.</td>
<td></td>
</tr>
<tr>
<td>FEB</td>
<td>(M120 routers only) FEB number and state of links to each FEB:</td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>• <strong>Link error</strong>—Link between SIB and FPC is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Links ok</strong>—Link between SIB and FPC is active.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unused</strong>—No FPC is present.</td>
<td></td>
</tr>
<tr>
<td>FPC</td>
<td>(MX Series routers only) Slot number of each Dense Port Concentrator (DPC) or Flexible PIC Concentrator (FPC). An FPC occupies two DPC slots on an MX Series router. The interface corresponds to the lowest numbered DPC slot for which the FPC is installed.</td>
<td>none</td>
</tr>
</tbody>
</table>
Table 146: show chassis fabric plane Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of output</th>
</tr>
</thead>
<tbody>
<tr>
<td>PFE</td>
<td>(MX Series and M120 routers only) Slot number of each Packet Forwarding Engine and the state of the links to the DCP: Links ok, Link error, or Unused. Each DPC includes four Packet Forwarding Engines.</td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>• Links ok: Link between SIB and FPC is active.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link error: Link between SIB and FPC is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Unused: No FPC is present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(On MX240 and MX480 routers with AS MLC modular carrier card and MPC4E only) Indicates that the link between the fabric plane and the hardware link on the modular carrier card or MPC4E is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(MX2010 and MX2020 routers only) Slot number of each Packet Forwarding Engine and the state of the links to the DPC: Links ok, Link error, or Unused. Each DPC includes four Packet Forwarding Engines.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Links ok: Link between SFB and FPC is active.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link error: Link between SFB and FPC is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Unused: No FPC is present.</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>(TX Matrix Plus, and T1600 or T4000 routers in a routing matrix only)—State of the fabric plane:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Online: Fabric plane is operational and running and links on the SIB are operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Offline: Fabric plane state is Offline because the plane does not have four or more F2S and one F13 online.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Empty: Fabric plane state is Empty if all SIBs in the plane are absent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Spare: Fabric plane is redundant and can be operational if the operational fabric plane encounters an error.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Check: Fabric plane is in alarmed state due to the following reason and the cause of the error must be resolved:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• One or more SIBs (belonging to the fabric plane) in the Online or Spare states has transitioned to the Check state. Check state of the SIB can be caused by link errors or destination errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fault: Fabric plane is in alarmed state if one or more SIBs belonging to the plane are in the Fault state. A SIB can be in the Fault state because of the following reasons:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• On-board fabric ASIC is not operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fiber optic connector faults.</td>
<td></td>

Fabric Management Plane State Output Fields for the show chassis fabric plane extensive Command on a TX Matrix Plus Router

<table>
<thead>
<tr>
<th>PLANE number</th>
<th>State of the fabric plane:</th>
<th>extensive</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Online: Fabric plane is operational and running and links on the SIB are operational.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Offline: Fabric plane state is Offline because the plane does not have 4 or more F2S and 1 F13 online.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Empty: Fabric plane state is Empty if all SIBs in the plane are absent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Spare: Fabric plane is redundant and can be operational if the operational fabric plane encounters an error.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Check: Fabric plane is in alarmed state due to the following reasons and the cause of the error must be resolved:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• One or more SIBs (belonging to the fabric plane) in the Online or Spare states has transitioned to the Check state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Check state of the SIB can be caused because of link errors or destination errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fault: Fabric plane is in alarmed state if one or more SIBs belonging to the plane are in the Fault state. A SIB can be in the Fault state because of the following reasons:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• On-board fabric ASIC is not operational.</td>
<td></td>
