show route brief

Syntax
show route brief
<destination-prefix>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)
show route brief
<destination-prefix>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display brief information about the active entries in the routing tables.

Options
none—Display all active entries in the routing table.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
view

**show route community**

**Syntax**
```
show route community as-number:community-value
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route community as-number:community-value
<brief | detail | extensive | terse>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

**Options**
- **as-number:community-value**—One or more community identifiers. **as-number** is the AS number, and **community-value** is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information**
Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

**Required Privilege**
view

**Related Documentation**
- show route detail on page 3175
- show route community on page 3166

**List of Sample Output**
show route community on page 3166

**Output Fields**
For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**

```

show route damping

**Syntax**

```
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and QFX Series)**

```
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Display the BGP routes for which updates might have been reduced because of route flap damping.

**Options**

- **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
  - **decayed**—Display route damping entries that might no longer be valid, but are not suppressed.
  - **history**—Display entries that have already been withdrawn, but have been logged.
  - **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
  - **suppressed**—Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.

**Required Privilege**

- **view**

**Related Documentation**

- clear bgp damping on page 2652
- show policy damping on page 2685

**Output Fields**

Table 386 on page 3170 lists the output fields for the `show route damping` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table—for example, inet.0.</td>
<td>All levels</td>
</tr>
<tr>
<td>destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 386: show route damping Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• active</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• holdown (routes that are in a pending state before being declared inactive)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• hidden (the routes are not used because of a routing policy)</td>
<td></td>
</tr>
<tr>
<td>destination-prefix</td>
<td>Destination prefix. The <strong>entry</strong> value is the number of routes for this destination, and the <strong>announced</strong> value is the number of routes being announced for this destination.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>(entry, announced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>[protocol, preference]</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• −—A hyphen indicates the last active route.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</td>
<td></td>
</tr>
<tr>
<td>Next-hop reference count</td>
<td>Number of references made to the next hop.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>Source</td>
<td>IP address of the route source.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>Next hop</td>
<td>Network layer address of the directly reachable neighboring system.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>Protocol next hop</td>
<td>Network layer address of the remote routing device that advertised the prefix.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>This address is used to derive a forwarding next hop.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Indirect next hop</td>
<td>Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>State</td>
<td>Flags for this route. For a description of possible values for this field, see the output field table for the <code>show route detail</code> command.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>Local AS</td>
<td>AS number of the local routing device.</td>
<td>Detail extensive</td>
</tr>
<tr>
<td>Peer AS</td>
<td>AS number of the peer routing device.</td>
<td>Detail extensive</td>
</tr>
</tbody>
</table>
### Table 386: show route damping Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Age</strong></td>
<td>How long the route has been known.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td>Metric for the route.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Task</strong></td>
<td>Name of the protocol that has added the route.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Announcement bits</strong></td>
<td>List of protocols that announce this route. <strong>n-Resolve inet</strong> indicates that the route is used for route resolution for next hops found in the routing table. <strong>n</strong> is an index used by Juniper Networks customer support only.</td>
<td>detail extensive</td>
</tr>
</tbody>
</table>
| **AS path** | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
- I—IGP.  
- E—EGP.  
- ?—Incomplete; typically, the AS path was aggregated.  
When AS path numbers are included in the route, the format is as follows:  
- [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.  
- { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.  
- ()—Parentheses enclose a confederation.  
- ([ ])—Parentheses and brackets enclose a confederation set.  
**NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance. | All levels |
| **to**      | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route. | brief none |
| **via**     | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected. | brief none |
| **Communities** | Community path attribute for the route. See the output field table for the show route detail command. | detail extensive |
| **Localpref** | Local preference value included in the route.                                      | All levels |
| **Router ID** | BGP router ID as advertised by the neighbor in the open message.                   | detail extensive |
| **Merit (last update/now)** | Last updated and current figure-of-merit value. | detail extensive |
Table 386: show route damping Output Fields (continued)

show route detail

Syntax
show route detail
<destination-prefix>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)
show route detail
<destination-prefix>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display detailed information about the active entries in the routing tables.

Options
none—Display all active entries in the routing table on all systems.

<destination-prefix>—(Optional) Display active entries for the specified address or range of addresses.

<logical-system (all | logical-system-name)>—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
view

List of Sample Output
- show route detail on page 3183
- show route detail (with BGP Multipath) on page 3189
- show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 3189

Output Fields
Table 387 on page 3175 describes the output fields for the show route detail command. Output fields are listed in the approximate order in which they appear.

Table 387: show route detail Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• active (routes that are active)</td>
</tr>
<tr>
<td></td>
<td>• holdown (routes that are in the pending state before being declared inactive)</td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy)</td>
</tr>
</tbody>
</table>
Table 387: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>route-destination</strong></td>
<td>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</td>
</tr>
<tr>
<td></td>
<td>• <strong>MPLS-label</strong> (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface-name</strong> (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address:control-word-status:encapsulation type:vc-id:source</strong> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</td>
</tr>
<tr>
<td></td>
<td>- <strong>neighbor-address</strong>—Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>- <strong>control-word-status</strong>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</td>
</tr>
<tr>
<td></td>
<td>- <strong>encapsulation type</strong>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>- <strong>vc-id</strong>—Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>- <strong>source</strong>—Source of the advertisement: Local or Remote.</td>
</tr>
<tr>
<td><strong>label stacking</strong></td>
<td>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</td>
</tr>
<tr>
<td></td>
<td>• S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</td>
</tr>
<tr>
<td></td>
<td>• If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</td>
</tr>
<tr>
<td><strong>[protocol, preference]</strong></td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>- +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>- -—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>- *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
<tr>
<td></td>
<td>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101.</td>
</tr>
<tr>
<td></td>
<td>If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</td>
</tr>
<tr>
<td><strong>Level</strong></td>
<td>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td><strong>Route Distinguisher</strong></td>
<td>IP subnet augmented with a 64-bit prefix.</td>
</tr>
<tr>
<td><strong>Next-hop type</strong></td>
<td>Type of next hop. For a description of possible values for this field, see Table 388 on page 3179.</td>
</tr>
</tbody>
</table>
Table 387: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Next-hop reference count</strong></td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td><strong>Flood nexthop branches exceed maximum message</strong></td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td><strong>Next hop</strong></td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
<tr>
<td><strong>via</strong></td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <strong>Selected</strong>. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td><strong>Label-switched-path lsp-path-name</strong></td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td><strong>Label operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td><strong>Protocol next hop</strong></td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.</td>
</tr>
<tr>
<td><strong>Indirect next hop</strong></td>
<td>Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>State of the route (a route can be in more than one state). See Table 389 on page 3181.</td>
</tr>
<tr>
<td><strong>Local AS</strong></td>
<td>AS number of the local routing device.</td>
</tr>
<tr>
<td><strong>Age</strong></td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td><strong>AIGP</strong></td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
</tbody>
</table>
### Table 387: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MED-plus-IGP</td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td>TTL-Action</td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances. For sample output, see show route table.</td>
</tr>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
</tr>
<tr>
<td>Announcement bits</td>
<td>List of protocols that announce this route. (n)-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. (n) is an index used by Juniper Networks customer support only.</td>
</tr>
</tbody>
</table>
| AS path          | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  

- I—IGP.
- E—EGP.
- Recorded—The AS path is recorded by the sample process (sampled).
- ?—Incomplete; typically, the AS path was aggregated.

When AS path numbers are included in the route, the format is as follows:

- []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.
- []—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.
- {}—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.
- ()—Parentheses enclose a confederation.
- ([ ])—Parentheses and brackets enclose a confederation set.

**NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.

<table>
<thead>
<tr>
<th>FECs bound to route</th>
<th>Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VC Label</td>
<td>MPLS label assigned to the Layer 2 circuit virtual connection.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) of the Layer 2 circuit.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier of the Layer 2 circuit.</td>
</tr>
<tr>
<td>Prefixes bound to route</td>
<td>Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.</td>
</tr>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See Table 390 on page 3183 for all possible values for this field.</td>
</tr>
</tbody>
</table>
Table 387: show route detail Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer 2-info: encaps</td>
<td>Layer 2 encapsulation (for example, VPLS).</td>
</tr>
<tr>
<td>control flags</td>
<td>Control flags: none or Site Down.</td>
</tr>
<tr>
<td>mtu</td>
<td>Maximum transmission unit (MTU) information.</td>
</tr>
<tr>
<td>Label-Base, range</td>
<td>First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.</td>
</tr>
<tr>
<td>status vector</td>
<td>Layer 2 VPN and VPLS network layer reachability information (NLRI).</td>
</tr>
<tr>
<td>Accepted Multipath</td>
<td>Current active path when BGP multipath is configured.</td>
</tr>
<tr>
<td>Accepted MultipathContrib</td>
<td>Path currently contributing to BGP multipath.</td>
</tr>
<tr>
<td>Localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>Router ID</td>
<td>BGP router ID as advertised by the neighbor in the open message.</td>
</tr>
<tr>
<td>Primary Routing Table</td>
<td>In a routing table group, the name of the primary routing table in which the route resides.</td>
</tr>
<tr>
<td>Secondary Tables</td>
<td>In a routing table group, the name of one or more secondary tables in which the route resides.</td>
</tr>
</tbody>
</table>

Table 388 on page 3179 describes all possible values for the Next-hop Types output field.

Table 388: Next-hop Types Output Field Values

<table>
<thead>
<tr>
<th>Next-Hop Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadcast (bcast)</td>
<td>Broadcast next hop.</td>
</tr>
<tr>
<td>Deny</td>
<td>Deny next hop.</td>
</tr>
<tr>
<td>Discard</td>
<td>Discard next hop.</td>
</tr>
<tr>
<td>Flood</td>
<td>Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.</td>
</tr>
<tr>
<td>Hold</td>
<td>Next hop is waiting to be resolved into a unicast or multicast type.</td>
</tr>
<tr>
<td>Indexed (idxd)</td>
<td>Indexed next hop.</td>
</tr>
<tr>
<td>Next-Hop Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Indirect (indr)</td>
<td>Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (iBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.</td>
</tr>
<tr>
<td>Interface</td>
<td>Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.</td>
</tr>
<tr>
<td>Local (locl)</td>
<td>Local address on an interface. This next-hop type causes packets with this destination address to be received locally.</td>
</tr>
<tr>
<td>Multicast (mcst)</td>
<td>Wire multicast next hop (limited to the LAN).</td>
</tr>
<tr>
<td>Multicast discard (mdsc)</td>
<td>Multicast discard.</td>
</tr>
<tr>
<td>Multicast group (mgrp)</td>
<td>Multicast group member.</td>
</tr>
<tr>
<td>Receive (recv)</td>
<td>Receive.</td>
</tr>
<tr>
<td>Reject (rjct)</td>
<td>Discard. An ICMP unreachable message was sent.</td>
</tr>
<tr>
<td>Resolve (rslv)</td>
<td>Resolving next hop.</td>
</tr>
<tr>
<td>Routed multicast (mcrt)</td>
<td>Regular multicast next hop.</td>
</tr>
<tr>
<td>Router</td>
<td>A specific node or set of nodes to which the routing device forwards packets that match the route prefix. To qualify as next-hop type router, the route must meet the following criteria:</td>
</tr>
<tr>
<td></td>
<td>• Must not be a direct or local subnet for the routing device.</td>
</tr>
<tr>
<td></td>
<td>• Must have a next hop that is directly connected to the routing device.</td>
</tr>
<tr>
<td>Table</td>
<td>Routing table next hop.</td>
</tr>
<tr>
<td>Unicast (ucst)</td>
<td>Unicast.</td>
</tr>
<tr>
<td>Unilist (ulst)</td>
<td>List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</td>
</tr>
</tbody>
</table>

Table 389 on page 3181 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvt Int Ext>).
### Table 389: State Output Field Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting</td>
<td>Route needs accounting.</td>
</tr>
<tr>
<td>Active</td>
<td>Route is active.</td>
</tr>
<tr>
<td>Always Compare MED</td>
<td>Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td>AS path</td>
<td>Shorter AS path is available.</td>
</tr>
<tr>
<td>Cisco Non-deterministic MED selection</td>
<td>Cisco nondeterministic MED is enabled, and a path with a lower MED is available.</td>
</tr>
<tr>
<td>Clone</td>
<td>Route is a clone.</td>
</tr>
<tr>
<td>Cluster list length</td>
<td>Length of cluster list sent by the route reflector.</td>
</tr>
<tr>
<td>Delete</td>
<td>Route has been deleted.</td>
</tr>
<tr>
<td>Ex</td>
<td>Exterior route.</td>
</tr>
<tr>
<td>Ext</td>
<td>BGP route received from an external BGP neighbor.</td>
</tr>
<tr>
<td>FlashAll</td>
<td>Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.</td>
</tr>
<tr>
<td>Hidden</td>
<td>Route not used because of routing policy.</td>
</tr>
<tr>
<td>IfCheck</td>
<td>Route needs forwarding RPF check.</td>
</tr>
<tr>
<td>IGP metric</td>
<td>Path through next hop with lower IGP metric is available.</td>
</tr>
<tr>
<td>Inactive reason</td>
<td>Flags for this route, which was not selected as best for a particular destination.</td>
</tr>
<tr>
<td>Initial</td>
<td>Route being added.</td>
</tr>
<tr>
<td>Int</td>
<td>Interior route.</td>
</tr>
<tr>
<td>Int Ext</td>
<td>BGP route received from an internal BGP peer or a BGP confederation peer.</td>
</tr>
<tr>
<td>Interior &gt; Exterior &gt; Exterior via Interior</td>
<td>Direct, static, IGP, or EBGP path is available.</td>
</tr>
<tr>
<td>Local Preference</td>
<td>Path with a higher local preference value is available.</td>
</tr>
<tr>
<td>Martian</td>
<td>Route is a martian (ignored because it is obviously invalid).</td>
</tr>
</tbody>
</table>
Table 389: State Output Field Values (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MartianOK</td>
<td>Route exempt from martian filtering.</td>
</tr>
<tr>
<td>Next hop address</td>
<td>Path with lower metric next hop is available.</td>
</tr>
<tr>
<td>No difference</td>
<td>Path from neighbor with lower IP address is available.</td>
</tr>
<tr>
<td>NoReadvrt</td>
<td>Route not to be advertised.</td>
</tr>
<tr>
<td>NotBest</td>
<td>Route not chosen because it does not have the lowest MED.</td>
</tr>
<tr>
<td>Not Best in its group</td>
<td>Incoming BGP AS is not the best of a group (only one AS can be the best).</td>
</tr>
<tr>
<td>NotInstall</td>
<td>Route not to be installed in the forwarding table.</td>
</tr>
<tr>
<td>Number of gateways</td>
<td>Path with a greater number of next hops is available.</td>
</tr>
<tr>
<td>Origin</td>
<td>Path with a lower origin code is available.</td>
</tr>
<tr>
<td>Pending</td>
<td>Route pending because of a hold-down configured on another route.</td>
</tr>
<tr>
<td>Release</td>
<td>Route scheduled for release.</td>
</tr>
<tr>
<td>RIB preference</td>
<td>Route from a higher-numbered routing table is available.</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td>Route Metric or MED comparison</td>
<td>Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td>Route Preference</td>
<td>Route with lower preference value is available</td>
</tr>
<tr>
<td>Router ID</td>
<td>Path through a neighbor with lower ID is available.</td>
</tr>
<tr>
<td>Secondary</td>
<td>Route not a primary route.</td>
</tr>
<tr>
<td>Unusable path</td>
<td>Path is not usable because of one of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• The route is damped.</td>
</tr>
<tr>
<td></td>
<td>• The route is rejected by an import policy.</td>
</tr>
<tr>
<td></td>
<td>• The route is unresolved.</td>
</tr>
<tr>
<td>Update source</td>
<td>Last tiebreaker is the lowest IP address value.</td>
</tr>
</tbody>
</table>

Table 390 on page 3183 describes the possible values for the Communities output field.
### Table 390: Communities Output Field Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>area-number</em></td>
<td>4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.</td>
</tr>
<tr>
<td><em>bandwidth:</em> <em>local AS number:</em> <em>link-bandwidth-number</em></td>
<td>Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.</td>
</tr>
<tr>
<td><em>domain-id</em></td>
<td>Unique configurable number that identifies the OSPF domain.</td>
</tr>
<tr>
<td><em>domain-id-vendor</em></td>
<td>Unique configurable number that further identifies the OSPF domain.</td>
</tr>
<tr>
<td><em>link-bandwidth-number</em></td>
<td>Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).</td>
</tr>
<tr>
<td><em>local AS number</em></td>
<td>Local AS number: from 1 through 65,535.</td>
</tr>
<tr>
<td><em>options</em></td>
<td>1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.</td>
</tr>
<tr>
<td><em>origin</em></td>
<td>(Used with VPNs) Identifies where the route came from.</td>
</tr>
<tr>
<td><em>ospf-route-type</em></td>
<td>1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.</td>
</tr>
<tr>
<td><em>route-type-vendor</em></td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is <em>area-number:</em> <em>ospf-route-type:</em> <em>options</em>.</td>
</tr>
<tr>
<td><em>rte-type</em></td>
<td>Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is <em>area-number:</em> <em>ospf-route-type:</em> <em>options</em>.</td>
</tr>
<tr>
<td><em>target</em></td>
<td>Defines which VPN the route participates in; <em>target</em> has the format 32-bit <em>IP address</em>:16-bit <em>number</em>. For example, 10.19.0.0:100.</td>
</tr>
<tr>
<td><em>unknown IANA</em></td>
<td>Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
<tr>
<td><em>unknown OSPF vendor community</em></td>
<td>Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.</td>
</tr>
</tbody>
</table>

**show route exact**

**Syntax**

```
show route exact destination-prefix
<brief | detail | extensive | terse>
logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**

```
show route exact destination-prefix
<brief | detail | extensive | terse>
```

**Release Information**

Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display only the routes that exactly match the specified address or range of addresses.

**Options**

- **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

  - **destination-prefix**—Address or range of addresses.

  - **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

- **view**

**List of Sample Output**

show route export

**Syntax**
show route export
<brief | detail>
<instance <instance-name> | routing-table-name>
<logical-system (all | logical-system-name)>

**Syntax (EX Series Switches)**
show route export
<brief | detail>
<instance <instance-name> | routing-table-name>

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.

**Options**
- none—(Same as brief.) Display standard information about policy-based export for all instances and routing tables on all systems.
- brief | detail—(Optional) Display the specified level of output.
- instance <instance-name>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.
- logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
- routing-table-name—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route export inet command).

**Required Privilege**
view

**List of Sample Output**
- show route export on page 3194
- show route export detail on page 3194
- show route export instance detail on page 3194

**Output Fields**
Table 391 on page 3193 lists the output fields for the show route export command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table or table-name</td>
<td>Name of the routing tables that either import or export routes.</td>
<td>All levels</td>
</tr>
<tr>
<td>Routes</td>
<td>Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.</td>
<td>brief none</td>
</tr>
<tr>
<td>Export</td>
<td>Whether the table is currently exporting routes to other tables: Y or N (Yes or No).</td>
<td>brief none</td>
</tr>
</tbody>
</table>
Table 391: show route export Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import</td>
<td>Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)</td>
<td>detail</td>
</tr>
<tr>
<td>Flags</td>
<td>(instance keyword only) Flags for this feature on this instance:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• config auto-policy—The policy was deduced from the configured IGP export policies.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• cleanup—Configuration information for this instance is no longer valid.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• config—The instance was explicitly configured.</td>
<td></td>
</tr>
<tr>
<td>Options</td>
<td>(instance keyword only) Configured option displays the type of routing tables the feature handles:</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• unicast—Indicates instance.inet.0.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• multicast—Indicates instance.inet.2.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unicast multicast—Indicates instance.inet.0 and instance.inet.2.</td>
<td></td>
</tr>
<tr>
<td>Import policy</td>
<td>(instance keyword only) Policy that route export uses to construct the import-export matrix. Not displayed if the instance type is vrf.</td>
<td>detail</td>
</tr>
<tr>
<td>Instance</td>
<td>(instance keyword only) Name of the routing instance.</td>
<td>detail</td>
</tr>
<tr>
<td>Type</td>
<td>(instance keyword only) Type of routing instance: forwarding, non-forwarding, or vrf.</td>
<td>detail</td>
</tr>
</tbody>
</table>

Sample Output

show route export

```
user@host> show route export
Table                  Export Routes
inet.0                 N 0
black.inet.0           Y 3
red.inet.0             Y 4
```

show route export detail

```
user@host> show route export detail
inet.0 Routes: 0
black.inet.0 Routes: 3
  Import: [ inet.0 ]
red.inet.0 Routes: 4
  Import: [ inet.0 ]
```

show route export instance detail

```
user@host> show route export instance detail
Instance: master Type: forwarding
  Flags: <config auto-policy> Options: <unicast multicast>
  Import policy: [ (ospf-master-from-red || isis-master-from-black) ]
```
Instance: black
Type: non-forwarding

Instance: red
Type: non-forwarding
**show route extensive**

**Syntax**
```
show route extensive
<destination-prefix>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route extensive
<destination-prefix>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display extensive information about the active entries in the routing tables.

**Options**
- **none**—Display all active entries in the routing table.
- **destination-prefix**—(Optional) Display active entries for the specified address or range of addresses.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**
view

**List of Sample Output**
- show route extensive on page 3202
- show route extensive (Access Route) on page 3208
- show route extensive (BGP PIC Edge) on page 3209
- show route extensive (FRR and LFA) on page 3209
- show route extensive (Route Reflector) on page 3210
- show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 3210

**Output Fields**
Table 190 on page 1594 describes the output fields for the `show route extensive` command. Output fields are listed in the approximate order in which they appear.

**Table 392: show route extensive Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
</tbody>
</table>
| number routes     | Number of routes in the routing table and total number of routes in the following states:  
  - active (routes that are active).  
  - holdown (routes that are in the pending state before being declared inactive).  
  - hidden (routes that are not used because of a routing policy). |
Table 392: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-destination (entry, announced)</td>
<td>Route destination (for example: 10.0.0.1/24). The entry value is the number of route for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>• <strong>MPLS-label</strong> (for example, 80001).</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface-name</strong> (for example, ge-1/0/2).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong>:control-word-status:encapsulation type:vc-id:source** (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local:/96).</td>
</tr>
<tr>
<td></td>
<td>• <strong>neighbor-address</strong>—Address of the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>control-word-status</strong>—Whether the use of the control word has been negotiated for this virtual circuit: <strong>NoCtrlWord</strong> or <strong>CtrlWord</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>encapsulation type</strong>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</td>
</tr>
<tr>
<td></td>
<td>• <strong>vc-id</strong>—Virtual circuit identifier.</td>
</tr>
<tr>
<td></td>
<td>• <strong>source</strong>—Source of the advertisement: <strong>Local</strong> or <strong>Remote</strong>.</td>
</tr>
<tr>
<td>TSI</td>
<td>Protocol header information.</td>
</tr>
<tr>
<td>label stacking</td>
<td>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</td>
</tr>
<tr>
<td></td>
<td>• <strong>S=0 route</strong> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</td>
</tr>
<tr>
<td></td>
<td>• If there is no <strong>S=</strong> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</td>
</tr>
<tr>
<td>[protocol, preference]</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• - —A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
<tr>
<td></td>
<td>In every routing metric except for the BGP <strong>LocalPref</strong> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <strong>LocalPref</strong> value in the <strong>Preference2</strong> field. For example, if the <strong>LocalPref</strong> value for Route 1 is 100, the <strong>Preference2</strong> value is -101. If the <strong>LocalPref</strong> value for Route 2 is 155, the <strong>Preference2</strong> value is -156. Route 2 is preferred because it has a higher <strong>LocalPref</strong> value and a lower <strong>Preference2</strong> value.</td>
</tr>
<tr>
<td>Level</td>
<td>(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>IP subnet augmented with a 64-bit prefix.</td>
</tr>
</tbody>
</table>
### Table 392: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Next-hop type</strong></td>
<td>Type of next hop. For a description of possible values for this field, see the Output Field table in the <code>show route detail</code> command.</td>
</tr>
<tr>
<td><strong>Next-hop reference count</strong></td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td><strong>Flood next-hop branches exceed maximum message</strong></td>
<td>Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>IP address of the route source.</td>
</tr>
<tr>
<td><strong>Next hop</strong></td>
<td>Network layer address of the directly reachable neighboring system.</td>
</tr>
<tr>
<td><strong>via</strong></td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <em>Selected</em>. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Weight</strong>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Balance</strong>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td><strong>Label-switched-path</strong></td>
<td>Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td><strong>lsp-path-name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Label operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
<tr>
<td><strong>Offset</strong></td>
<td>Whether the metric has been increased or decreased by an offset value.</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>(Local only) Local interface name.</td>
</tr>
<tr>
<td><strong>Protocol next hop</strong></td>
<td>Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.</td>
</tr>
<tr>
<td><strong>label-operation</strong></td>
<td>MPLS label and operation occurring at this routing device. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label).</td>
</tr>
</tbody>
</table>
### Table 392: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| **Indirect next hops**| When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved. When BGP PIC Edge is enabled, the output lines that contain *Indirect next hop: weight* follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:  
  - 0x1 indicates active next hops.  
  - 0x4000 indicates passive next hops. |
| **State**             | State of the route (a route can be in more than one state). See the Output Field table in the `show routetable detail` command. |
| **Session ID**        | The BFD session ID number that represents the protection using MPLS fast route (FRR) and loop-free alternate (LFA). |
| **Weight**            | Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown. For sample output, see `show routetable`. |
Table 392: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Inactive reason</strong></td>
<td>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Active preferred</strong>—Currently active route was selected over this route.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Always compare MED</strong>—Path with a lower multiple exit discriminator (MED) is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>AS path</strong>—Shorter AS path is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Cisco Non-deterministic MED selection</strong>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Cluster list length</strong>—Path with a shorter cluster list length is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Forwarding use only</strong>—Path is only available for forwarding purposes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>IGP metric</strong>—Path through the next hop with a lower IGP metric is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>IGP metric type</strong>—Path with a lower OSPF link-state advertisement type is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Interior &gt; Exterior &gt; Exterior via Interior</strong>—Direct, static, IGP, or EBGP path is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Local preference</strong>—Path with a higher local preference value is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Next hop address</strong>—Path with a lower metric next hop is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>No difference</strong>—Path from a neighbor with a lower IP address is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Not Best in its group</strong>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Number of gateways</strong>—Path with a higher number of next hops is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Origin</strong>—Path with a lower origin code is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>OSPF version</strong>—Path does not support the indicated OSPF version.</td>
</tr>
<tr>
<td></td>
<td>• <strong>RIB preference</strong>—Route from a higher-numbered routing table is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Route destinguisher</strong>—64-bit prefix added to IP subnets to make them unique.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Route metric or MED comparison</strong>—Route with a lower metric or MED is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Route preference</strong>—Route with a lower preference value is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Router ID</strong>—Path through a neighbor with a lower ID is available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unusable path</strong>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Update source</strong>—Last tiebreaker is the lowest IP address value.</td>
</tr>
<tr>
<td><strong>Local AS</strong></td>
<td>Autonomous system (AS) number of the local routing device.</td>
</tr>
<tr>
<td><strong>Age</strong></td>
<td>How long the route has been known.</td>
</tr>
<tr>
<td><strong>AIGP</strong></td>
<td>Accumulated interior gateway protocol (AIGP) BGP attribute.</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td><strong>MED-plus-IGP</strong></td>
<td>Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.</td>
</tr>
<tr>
<td><strong>TTL-Action</strong></td>
<td>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</td>
</tr>
</tbody>
</table>

For sample output, see [show route table](#).
Table 392: show route extensive Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>Name of the protocol that has added the route.</td>
</tr>
<tr>
<td>Announcement bits</td>
<td>List of protocols that announce this route. \textit{n-Resolve inet} indicates that the route is used for route resolution for next hops found in the routing table. \textit{n} is an index used by Juniper Networks customer support only.</td>
</tr>
<tr>
<td>AS path</td>
<td>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</td>
</tr>
<tr>
<td></td>
<td>• I—IGP.</td>
</tr>
<tr>
<td></td>
<td>• E—EGP.</td>
</tr>
<tr>
<td></td>
<td>• \textit{Recorded}—The AS path is recorded by the sample process (sampled).</td>
</tr>
<tr>
<td></td>
<td>• ?—Incomplete; typically, the AS path was aggregated.</td>
</tr>
<tr>
<td></td>
<td>When AS path numbers are included in the route, the format is as follows:</td>
</tr>
<tr>
<td></td>
<td>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</td>
</tr>
<tr>
<td></td>
<td>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</td>
</tr>
<tr>
<td></td>
<td>• ()—Parentheses enclose a confederation.</td>
</tr>
<tr>
<td></td>
<td>• ( [ ] )—Parentheses and brackets enclose a confederation set.</td>
</tr>
<tr>
<td></td>
<td>\textbf{NOTE:} In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</td>
</tr>
<tr>
<td>FECs bound to route</td>
<td>Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</td>
</tr>
<tr>
<td>AS path: I &lt;Originator&gt;</td>
<td>(For route reflected output only) Originator ID attribute set by the route reflector.</td>
</tr>
<tr>
<td>VC Label</td>
<td>MPLS label assigned to the Layer 2 circuit virtual connection.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit (MTU) of the Layer 2 circuit.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier of the Layer 2 circuit.</td>
</tr>
<tr>
<td>Cluster list</td>
<td>(For route reflected output only) Cluster ID sent by the route reflector.</td>
</tr>
<tr>
<td>Originator ID</td>
<td>(For route reflected output only) Address of router that originally sent the route to the route reflector.</td>
</tr>
<tr>
<td>Prefixes bound to route</td>
<td>Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.</td>
</tr>
<tr>
<td>Communities</td>
<td>Community path attribute for the route. See the Output Field table in the \texttt{show route detail} command for all possible values for this field.</td>
</tr>
<tr>
<td>Layer2-info: encaps</td>
<td>Layer 2 encapsulation (for example, VPLS).</td>
</tr>
</tbody>
</table>

**show route flow validation**

**Syntax**

```
show route flow validation
<brief | detail>
<ip-prefix>
<table table-name>
logical-system (all | logical-system-name)
```

**Syntax (EX Series Switches)**

```
show route flow validation
<brief | detail>
<ip-prefix>
<table table-name>
```

**Release Information**

**Description**

Display flow route information.

**Options**

none—Display flow route information.

brief | detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

ip-prefix—(Optional) IP address for the flow route.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table table-name—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

**Required Privilege**

Level view

**List of Sample Output**

`show route flow validation on page 3213`

**Output Fields**

Table 393 on page 3212 lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

**Table 393: show route flow validation Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>routing-table-name</code></td>
<td>Name of the routing table (for example, inet.0).</td>
<td>All levels</td>
</tr>
<tr>
<td><code>prefix</code></td>
<td>Route address.</td>
<td>All levels</td>
</tr>
<tr>
<td>Active unicast route</td>
<td>Active route in the routing table.</td>
<td>All levels</td>
</tr>
<tr>
<td>Dependent flow</td>
<td>Number of flows for which there are</td>
<td>All levels</td>
</tr>
<tr>
<td>destinations</td>
<td>routes in the routing table.</td>
<td></td>
</tr>
</tbody>
</table>
Table 393: show route flow validation Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin</td>
<td>Source of the route flow.</td>
<td>All levels</td>
</tr>
<tr>
<td>Neighbor AS</td>
<td>Autonomous system identifier of the neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Flow destination</td>
<td>Number of entries and number of destinations that match the route flow.</td>
<td>All levels</td>
</tr>
<tr>
<td>Unicast best match</td>
<td>Destination that is the best match for the route flow.</td>
<td>All levels</td>
</tr>
<tr>
<td>Flags</td>
<td>Information about the route flow.</td>
<td>All levels</td>
</tr>
</tbody>
</table>

Sample Output

show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24 Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```
**show route inactive-path**

**Syntax**
```
show route inactive-path
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route inactive-path
  <brief | detail | extensive | terse>
```

**Release Information**

**Description**
Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path.

**Options**
- **none**—Display all inactive routes.
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

show route instance

Syntax

`show route instance <brief | detail | summary> <instance-name> <logical-system (all | logical-system-name)> <operational>`

Syntax (EX Series Switches and QFX Series)

`show route instance <brief | detail | summary> <instance-name> <operational>`

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display routing instance information.

Options

`none`—(Same as `brief`) Display standard information about all routing instances.

`brief | detail | summary`—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to `brief`. (These options are not available with the `operational` keyword.)

`instance-name`—(Optional) Display information for all routing instances whose name begins with this string (for example, `cust1`, `cust11`, and `cust111` are all displayed when you run the `show route instance cust1` command).

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`operational`—(Optional) Display operational routing instances.

Required Privilege Level

`view`

List of Sample Output

`show route instance on page 3220`
`show route instance detail (Graceful Restart Complete) on page 3221`
`show route instance detail (Graceful Restart Incomplete) on page 3222`
`show route instance detail (VPLS Routing Instance) on page 3224`
`show route instance operational on page 3225`
`show route instance summary on page 3225`

Output Fields

Table 394 on page 3219 lists the output fields for the `show route instance` command. Output fields are listed in the approximate order in which they appear.

Table 394: show route instance Output Fields

**show route label**

**Syntax**

```
show route label
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**

```
show route label label
<brief | detail | extensive | terse>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**

Display the routes based on a specified Multiprotocol Label Switching (MPLS) label value.

**Options**

- **label**—Value of the MPLS label.
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

- Level: view

**List of Sample Output**

- show route label on page 3226
- show route label detail on page 3226
- show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 3227
- show route label extensive on page 3227
- show route label terse on page 3227

**Output Fields**

For information about output fields, see the output field table for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**

**show route label**

```
user@host> show route label 100016

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
100016  *[VPN/170] 03:25:41
     > to 10.12.80.1 via ge-6/3/2.0, Pop
```

**show route label detail**

```
user@host> show route label 100016 detail

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
```
Restart Complete
100016 (1 entry, 1 announced)

mpls.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
show route martians

**Syntax**

```
show route martians
<logical-system (all | logical-system-name)>
<table routing-table-name>
```

**Syntax (EX Series Switches)**

```
show route martians
<table routing-table-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the martian (invalid and ignored) entries associated with each routing table.

**Options**

- `none`—Display standard information about route martians for all routing tables.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `table routing-table-name`—(Optional) Display information about route martians for all routing tables whose name begins with this string (for example, `inet.0` and `inet6.0` are both displayed when you run the `show route martians table inet` command).

**Required Privilege Level**

view

**Related Documentation**

- Example: Configuring Martian Addresses

**List of Sample Output**

show route martians on page 3230

**Output Fields**

Table 395 on page 3230 lists the output fields for the `show route martians` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table-name</code></td>
<td>Name of the route table in which the route martians reside.</td>
</tr>
<tr>
<td><code>destination-prefix</code></td>
<td>Route destination.</td>
</tr>
<tr>
<td><code>match-value</code></td>
<td>Route match parameter.</td>
</tr>
<tr>
<td><code>status</code></td>
<td>Status of the route: <code>allowed</code> or <code>disallowed</code>.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
show route martians
```

```
user@host> show route martians
```

show route next-hop

**Syntax**
```
show route next-hop next-hop
   <brief | detail | extensive | terse>
   <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**
```
show route next-hop next-hop
   <brief | detail | extensive | terse>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display the entries in the routing table that are being sent to the specified next-hop address.

**Options**
- `brief` | `detail` | `extensive` | `terse`—(Optional) Display the specified level of output.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**next-hop**—Next-hop address.

**Required Privilege Level**
```
view
```

**List of Sample Output**
- show route next-hop on page 3232
- show route next-hop detail on page 3233
- show route next-hop extensive on page 3235
- show route next-hop terse on page 3236

**Output Fields**
For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**
show route next-hop

show route no-community

Syntax

show route no-community

Syntax (EX Series Switches)

show route no-community

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the route entries in each routing table that are not associated with any community.

Options

none—(Same as brief) Display the route entries in each routing table that are not associated with any community.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

Level

show route protocol

Syntax

show route protocol protocol
   <brief | detail | extensive | terse>
   <logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show route protocol protocol
   <brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
opsf2 and ospf3 options introduced in Junos OS Release 9.2.
opsf2 and ospf3 options introduced in Junos OS Release 9.2 for EX Series switches.
flow option introduced in Junos OS Release 10.0.
flow option introduced in Junos OS Release 10.0 for EX Series switches.

Description

Display the route entries in the routing table that were learned from a particular protocol.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

protocol—Protocol from which the route was learned:

- access—Access route for use by DHCP application
- access-internal—Access-internal route for use by DHCP application
- aggregate—Locally generated aggregate route
- arp—Route learned through the Address Resolution Protocol
- atmvpn—Asynchronous Transfer Mode virtual private network
- bgp—Border Gateway Protocol
- ccc—Circuit cross-connect
- direct—Directly connected route
- dvmrp—Distance Vector Multicast Routing Protocol
- eisis—End System-to-Intermediate System
- flow—Locally defined flow-specification route
- frf—Precomputed protection route or backup route used when a link goes down
- isis—Intermediate System-to-Intermediate System
- ldp—Label Distribution Protocol
- l2circuit—Layer 2 circuit
- l2vpn—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

---

**NOTE:** EX Series switches run a subset of these protocols. See the switch CLI for details.

**show route range**

**Syntax**

```
show route range
  <brief | detail | extensive | terse>
  <destination-prefix>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**

```
show route range
  <brief | detail | extensive | terse>
  <destination-prefix>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display routing table entries using a prefix range.

**Options**

- **none**—Display standard information about all routing table entries using a prefix range.
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.
- **destination-prefix**—(Optional) Destination and prefix mask for the range.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

- view

**List of Sample Output**

- `show route range on page 3253`
- `show route range destination-prefix on page 3254`
- `show route range detail on page 3254`
- `show route range extensive on page 3255`
- `show route range terse on page 3256`

**Output Fields**

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**

```

**show route receive-protocol**

**Syntax**

```
show route receive-protocol protocol neighbor-address

<b brief | detail | extensive | terse>

<logical-system (all | logical-system-name)
```

**Syntax (EX Series Switches)**

```
show route receive-protocol protocol neighbor-address

<b brief | detail | extensive | terse>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.

**Options**

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`protocol neighbor-address`—Protocol transmitting the route (`bgp`, `dvmrp`, `msdp`, `pim`, `rip`, or `ripng`) and address of the neighboring router from which the route entry was received.

**Additional Information**

The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.

**Required Privilege**

`view`

**List of Sample Output**

- show route receive-protocol bgp on page 3260
- show route receive-protocol bgp extensive on page 3260
- show route receive-protocol bgp table extensive on page 3260
- show route receive-protocol bgp logical-system extensive on page 3261
- show route receive-protocol bgp detail (Layer 2 VPN) on page 3262
- show route receive-protocol bgp extensive (Layer 2 VPN) on page 3262
- show route receive-protocol bgp (Layer 3 VPN) on page 3263
- show route receive-protocol bgp detail (Layer 3 VPN) on page 3263
- show route receive-protocol bgp extensive (Layer 3 VPN) on page 3264

**Output Fields**

Table 396 on page 3257 describes the output fields for the `show route receive-protocol` command. Output fields are listed in the approximate order in which they appear.

**Table 396: show route receive-protocol Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table—for example, inet.0.</td>
<td>All levels</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 396: show route receive-protocol Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• active</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• holddown (routes that are in pending state before being declared inactive)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy)</td>
<td></td>
</tr>
<tr>
<td>Prefix</td>
<td>Destination prefix.</td>
<td>none brief</td>
</tr>
<tr>
<td>MED</td>
<td>Multiple exit discriminator value included in the route.</td>
<td>none brief</td>
</tr>
<tr>
<td>destination-prefix (entry, announced)</td>
<td>Destination prefix. The <em>entry</em> value is the number of routes for this destination, and the <em>announced</em> value is the number of routes being announced for this destination.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Route Distinguisher</td>
<td>64-bit prefix added to IP subnets to make them unique.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Label-Base, range</td>
<td>First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>VPN Label</td>
<td>Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Next hop</td>
<td>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</td>
<td>All levels</td>
</tr>
<tr>
<td>Localpref or Lclpref</td>
<td>Local preference value included in the route.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 396: show route receive-protocol Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
</table>
| AS path    | Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
  • I—IGP.  
  • E—EGP.  
  • ?—Incomplete; typically, the AS path was aggregated.  
  When AS path numbers are included in the route, the format is as follows:  
  • [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.  
  • [ ]—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.  
  • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.  
  • ( )—Parentheses enclose a confederation.  
  • ( [ ] )—Parentheses and brackets enclose a confederation set.  
  NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance. | All levels |
| Cluster list | (For route reflected output only) Cluster ID sent by the route reflector. | detail extensive |
| Originator ID | (For route reflected output only) Address of routing device that originally sent the route to the route reflector. | detail extensive |
| Communities | Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field. | detail extensive |
| AIGP | Accumulated interior gateway protocol (AIGP) BGP attribute. | detail extensive |
| Attrset AS | Number, local preference, and path of the AS that originated the route. These values are stored in the Attrset attribute at the originating routing device. | detail extensive |
| Layer2-info: encaps | Layer 2 encapsulation (for example, VPLS). | detail extensive |
| control flags | Control flags: none or Site Down. | detail extensive |
| mtu | Maximum transmission unit (MTU) of the Layer 2 circuit. | detail extensive |

**show route resolution**

**Syntax**

```
show route resolution
<brief | detail | extensive | summary>
<index index>
<logical-system (all | logical-system-name)>
<prefix>
<table routing-table-name>
<unresolved>
```

**Syntax (EX Series Switches)**

```
show route resolution
<brief | detail | extensive | summary>
<index index>
<prefix>
<table routing-table-name>
<unresolved>
```

**Release Information**

**Description**

Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

**Options**

`none`—Display standard information about all entries in the next-hop resolution database.

`brief | detail | extensive | summary`—(Optional) Display the specified level of output.

`index index`—(Optional) Show the index of the resolution tree.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`prefix network/destination-prefix`—(Optional) Display database entries for the specified address.

`table routing-table-name`—(Optional) Display information about a particular routing table (for example, `inet.0`) where policy-based export is currently enabled.

`unresolved`—(Optional) Display routes that could not be resolved.

**Required Privilege Level**

view

- show route resolution unresolved on page 3267
**Output Fields**  
Table 397 on page 3266 describes the output fields for the `show route resolution` command. Output fields are listed in the approximate order in which they appear.

### Table 397: show route resolution Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>routing-table-name</code></td>
<td>Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.</td>
</tr>
<tr>
<td>Tree index</td>
<td>Tree index identifier.</td>
</tr>
<tr>
<td>Nodes</td>
<td>Number of nodes in the tree.</td>
</tr>
<tr>
<td>Reference count</td>
<td>Number of references made to the next hop.</td>
</tr>
<tr>
<td>Contributing routing tables</td>
<td>Routing tables used for next-hop resolution.</td>
</tr>
<tr>
<td>Originating RIB</td>
<td>Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <code>inet.0</code> resolving through <code>inet.0</code> and <code>inet.3</code>, this field indicates which routing table, <code>inet.0</code> or <code>inet.3</code>, provided the best path for a particular prefix.</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric associated with the forwarding next hop.</td>
</tr>
<tr>
<td>Node path count</td>
<td>Number of nodes in the path.</td>
</tr>
<tr>
<td>Forwarding next hops</td>
<td>Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.</td>
</tr>
</tbody>
</table>

**Sample Output**

table route resolution detail

```
user@host> show route resolution detail
Tree Index: 1, Nodes 0, Reference Count 1
Contributing routing tables: inet.3
Tree Index: 2, Nodes 23, Reference Count 1
Contributing routing tables: inet.0 inet.3
10.10.0.0/16 Originating RIB: inet.0
   Node path count: 1
   Forwarding nexthops: 1
10.31.1.0/30 Originating RIB: inet.0
   Node path count: 1
   Forwarding nexthops: 1
10.31.1.1/32 Originating RIB: inet.0
   Node path count: 1
   Forwarding nexthops: 0
10.31.1.4/30 Originating RIB: inet.0
   Node path count: 1
   Forwarding nexthops: 1
10.31.1.5/32 Originating RIB: inet.0
```
show route resolution summary

user@host> show route resolution summary
Tree Index: 1, Nodes 24, Reference Count 1
Contributing routing tables: :voice.inet.0 :voice.inet.3
Tree Index: 2, Nodes 2, Reference Count 1
Contributing routing tables: inet.3
Tree Index: 3, Nodes 43, Reference Count 1
Contributing routing tables: inet.0 inet.3

show route snooping

Syntax
 show route snooping
  <brief | detail | extensive | terse>
  <all>
  <best address/prefix>
  <exact address>
  <range prefix-range>
  <summary>
  <table table-name>

Release Information
 Command introduced in Junos OS Release 8.5.
 Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
 Display the entries in the routing table that were learned from snooping.

Options
 none—Display the entries in the routing table that were learned from snooping.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

all—(Optional) Display all entries, including hidden entries.

best address/prefix—(Optional) Display the longest match for the provided address and optional prefix.

exact address/prefix—(Optional) Display exact matches for the provided address and optional prefix.

range prefix-range—(Optional) Display information for the provided address range.

summary—(Optional) Display route snooping summary statistics.

table table-name—(Optional) Display information for the named table.

Required Privilege
 view

List of Sample Output
 show route snooping detail on page 3268

Output Fields
 For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

**show route source-gateway**

**Syntax**

```plaintext
show route source-gateway address
  <brief | detail | extensive | terse>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**

```plaintext
show route source-gateway address
  <brief | detail | extensive | terse>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the entries in the routing table that were learned from a particular address. The `Source` field in the `show route detail` command output lists the source for each route, if known.

**Options**

`brief | detail | extensive | terse`—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to `brief`.

`address`—IP address of the system.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

`view`

**List of Sample Output**

- show route source-gateway on page 3276
- show route source-gateway detail on page 3277
- show route source-gateway extensive on page 3279

**Output Fields**

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**

```
show route source-gateway

show route summary

**Syntax**
```
show route summary
<logical-system (all | logical-system-name)>
<table routing-table-name>
```

**Syntax (EX Series Switches)**
```
show route summary
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display summary statistics about the entries in the routing table.

CPU utilization might increase while the device learns routes. We recommend that you use the `show route summary` command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the `show route summary` command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).

**Options**

- **none**—Display summary statistics about the entries in the routing table.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **table routing-table-name**—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, `inet.0` and `inet6.0` are both displayed when you run the `show route summary table inet` command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.

**Required Privilege Level**
`view`

**List of Sample Output**
- `show route summary on page 3283`
- `show route summary table on page 3284`
- `show route summary table (with Route Limits Configured for the Routing Table) on page 3284`

**Output Fields**
Table 398 on page 3282 lists the output fields for the `show route summary` command. Output fields are listed in the approximate order in which they appear.

**Table 398: show route summary Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>router-id</code></td>
<td>Address of the local routing device.</td>
</tr>
<tr>
<td><code>routing-table-name</code></td>
<td>Name of the routing table (for example, <code>inet.0</code>).</td>
</tr>
</tbody>
</table>
### Table 398: show route summary Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
</tbody>
</table>
| routes | Number of routes in the routing table:  
- **active**—Number of routes that are active.  
- **holddown**—Number of routes that are in the hold-down state before being declared inactive.  
- **hidden**—Number of routes that are not used because of routing policy. |
| Limit/Threshold | Displays the configured route limits for the routing table set with the `maximum-prefixes` and the `maximum-paths` statements. If you do not configure route limits for the routing table, the show output does not display this information.  
- **destinations**—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message.  
- **routes**—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message. |

### Direct
- Routes on the directly connected network.

### Local
- Local routes.

### protocol-name
- Name of the protocol from which the route was learned. For example, **OSPF**, **RSVP**, and **Static**.

---

**Sample Output**

```

show route terse

Syntax

show route terse
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show route terse

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display a high-level summary of the routes in the routing table.

NOTE: For BGP routes, the show route terse command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the show route extensive command.

Options

none—Display a high-level summary of the routes in the routing table.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route terse on page 3301

Output Fields

Table 399 on page 3299 describes the output fields for the show route terse command. Output fields are listed in the approximate order in which they appear.

Table 399: show route terse Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routing-table-name</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>number destinations</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
<tr>
<td>number routes</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>• active (routes that are active)</td>
</tr>
<tr>
<td></td>
<td>• holddown (routes that are in the pending state before being declared inactive)</td>
</tr>
<tr>
<td></td>
<td>• hidden (routes that are not used because of a routing policy)</td>
</tr>
</tbody>
</table>
### Table 399: show route terse Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>route key</strong></td>
<td>Key for the state of the route:</td>
</tr>
<tr>
<td></td>
<td>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</td>
</tr>
<tr>
<td></td>
<td>• -—A hyphen indicates the last active route.</td>
</tr>
<tr>
<td></td>
<td>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</td>
</tr>
<tr>
<td><strong>A</strong></td>
<td>Active route. An asterisk (*) indicates this is the active route.</td>
</tr>
<tr>
<td><strong>V</strong></td>
<td>Validation status of the route:</td>
</tr>
<tr>
<td></td>
<td>• ?—Not evaluated. Indicates that the route was not learned through BGP.</td>
</tr>
<tr>
<td></td>
<td>• I—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</td>
</tr>
<tr>
<td></td>
<td>• N—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</td>
</tr>
<tr>
<td></td>
<td>• V—Valid. Indicates that the prefix and autonomous system pair are found in the database.</td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td>Destination of the route.</td>
</tr>
<tr>
<td><strong>P</strong></td>
<td>Protocol through which the route was learned:</td>
</tr>
<tr>
<td></td>
<td>• A—Aggregate</td>
</tr>
<tr>
<td></td>
<td>• B—BGP</td>
</tr>
<tr>
<td></td>
<td>• C—CCC</td>
</tr>
<tr>
<td></td>
<td>• D—Direct</td>
</tr>
<tr>
<td></td>
<td>• G—GMPLS</td>
</tr>
<tr>
<td></td>
<td>• I—IS-IS</td>
</tr>
<tr>
<td></td>
<td>• L—L2CKT, L2VPN, LDP, Local</td>
</tr>
<tr>
<td></td>
<td>• K—Kernel</td>
</tr>
<tr>
<td></td>
<td>• M—MPLS, MSDP</td>
</tr>
<tr>
<td></td>
<td>• O—OSPF</td>
</tr>
<tr>
<td></td>
<td>• P—PIM</td>
</tr>
<tr>
<td></td>
<td>• R—RIP, RIPng</td>
</tr>
<tr>
<td></td>
<td>• S—Static</td>
</tr>
<tr>

PART 21

Multicast

- Overview on page 3305
- Configuration on page 3315
- Administration on page 3407
Internet Group Management Protocol (IGMP) snooping constrains the flooding of IPv4 multicast traffic on VLANs on a switch. When IGMP snooping is enabled on a VLAN, a Juniper Networks EX Series Ethernet Switch examines IGMP messages between hosts and multicast routers and learns which hosts are interested in receiving traffic for a multicast group. Based on what it learns, the switch then forwards multicast traffic only to those interfaces in the VLAN that are connected to interested receivers instead of flooding the traffic to all interfaces.

IGMP snooping on EX Series switches supports IGMP version 1 (IGMPv1), IGMPv2, and IGMPv3. For details on IGMP, see the following standards:

- IGMPv1—See RFC 1112, Host extensions for IP multicasting.

This topic covers:

- How IGMP Snooping Works on page 3306
- IGMP Message Types on page 3306
- How Hosts Join and Leave Multicast Groups on page 3307
- Support for IGMPv3 Multicast Sources on page 3307
- IGMP Snooping and Forwarding Interfaces on page 3308
- General Forwarding Rules on page 3308
- Examples of IGMP Snooping Multicast Forwarding on page 3309
How IGMP Snooping Works

A Layer 2 switch usually learns *unicast* media access control (MAC) addresses by checking the source address field of the frames it receives. However, a *multicast* MAC address can never be the source address for a packet. As a result, the switch floods multicast traffic on the VLAN, consuming significant amounts of bandwidth.

You can enable IGMP snooping on a switch to avoid this flooding. When IGMP snooping is enabled, the switch monitors IGMP messages between receivers and multicast routers and uses the content of the messages to build an IPv4 multicast forwarding table—a database of multicast groups and the interfaces that are connected to members of the groups. When the switch receives multicast traffic for a multicast group, it uses the forwarding table to forward the traffic only to interfaces that are connected to receivers that belong to the multicast group.

Figure 38 on page 3306 shows an example of multicast traffic flow with IGMP snooping enabled.

**Figure 38: Multicast Traffic Flow with IGMP Snooping Enabled**

- Multicast routers use IGMP to learn, for each of their attached physical networks, which groups have interested listeners. In any given subnet, one multicast router acts as an IGMP querier. The IGMP querier sends out the following types of queries to hosts:
  - General query—Asks whether any host is listening to any group.
  - Group-specific query—(IGMPv2 and IGMPv3 only) Asks whether any host is listening to a specific multicast group. This query is sent in response to a host leaving the multicast group and allows the router to quickly determine if any remaining hosts are interested in the group.
• Group-and-source-specific query—(IGMPv3 only) Asks whether any host is listening to group multicast traffic from a specific multicast source. This query is sent in response to a host indicating that it is no longer interested in receiving group multicast traffic from the multicast source and allows the router to quickly determine any remaining hosts are interested in receiving group multicast traffic from that source.

Hosts that are multicast listeners send the following kinds of messages:

• Membership report—Indicates that the host wants to join a particular multicast group.
• Leave report—(IGMPv2 and IGMPv3 only) Indicates that the host wants to leave a particular multicast group.

How Hosts Join and Leave Multicast Groups

Hosts can join multicast groups in either of two ways:

• By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast group that the host is attempting to join.
• By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

Hosts can leave a multicast group in either of two ways:

• By not responding to periodic queries within a set interval of time. This results in what is known as a “silent leave.” This is the only method available to IGMPv1 hosts.
• By sending a leave report. This method can be used by IGMPv2 and IGMPv3 hosts.

**NOTE:** If a host is connected to the switch through a hub, the host does not automatically leave the multicast group if it disconnects from the hub. The host remains a member of the group until group membership times out and a silent leave occurs. If another host connects to the hub port before the silent leave occurs, the new host might receive the group multicast traffic until the silent leave, even though it never sent an membership report.

Support for IGMPv3 Multicast Sources

In IGMPv3, a host can send a membership report that includes a list of source addresses. When the host sends a membership report in INCLUDE mode, the host is interested in group multicast traffic only from those sources in the source address list. If host sends a membership report in EXCLUDE mode, the host is interested in group multicast traffic from any source except the sources in the source address list. A host can also send an EXCLUDE report in which the source-list parameter is empty, which is known as an
EXCLUDE NULL report. An EXCLUDE NULL report indicates that the host wants to join the multicast group and receive packets from all sources.

EX Series switches support IGMPv3 membership reports that are in INCLUDE and EXCLUDE mode. However, EX Series switches do not support forwarding on a per-source basis. Instead, a switch consolidates all INCLUDE and EXCLUDE mode reports it receives on a VLAN for a specified group into a single route that includes all multicast sources for that group, with the next hop being all interfaces that have interested receivers for the group. As a result, interested receivers on the VLAN can receive traffic from a source that they did not include in their INCLUDE report or from a source they excluded in their EXCLUDE report. For example, if Host 1 wants traffic for G from Source A and Host 2 wants traffic for G from Source B, they both receive traffic for G regardless of whether A or B sends the traffic.

**IGMP Snooping and Forwarding Interfaces**

To determine how to forward multicast traffic, a switch with IGMP snooping enabled maintains information about the following interfaces in its multicast forwarding table:

- Multicast-router interfaces—These interfaces lead toward multicast routers or IGMP queriers.
- Group-member interfaces—These interfaces lead toward hosts that are members of multicast groups.

The switch learns about these interfaces by monitoring IGMP traffic. If an interface receives IGMP queries or Protocol Independent Multicast (PIM) updates, the switch adds the interface to its multicast forwarding table as a multicast-router interface. If an interface receives membership reports for a multicast group, the switch adds the interface to its multicast forwarding table as a group-member interface.

Table entries for interfaces that the switch learns about are subject to aging. For example, if a learned multicast-router interface does not receive IGMP queries or PIM hellos within a certain interval, the switch removes the entry for that interface from its multicast forwarding table.

**NOTE:** For a switch to learn multicast-router interfaces and group-member interfaces, an IGMP querier must exist in the network. For the switch itself to function as an IGMP querier, IGMP must be enabled on the switch.

You can statically configure an interface to be a multicast-router interface or a group-member interface. The switch adds a static interface to its multicast forwarding table without having to learn about the interface, and the entry in the table is not subject to aging. You can have a mix of statically configured and dynamically learned interfaces on a switch.

**General Forwarding Rules**

Multicast traffic received on a switch interface in a VLAN on which IGMP snooping is enabled is forwarded according to the following rules.
IGMP traffic is forwarded as follows:

- IGMP general queries received on a multicast-router interface are forwarded to all other interfaces in the VLAN.
- IGMP group-specific queries received on a multicast-router interface are forwarded to only those interfaces in the VLAN that are members of the group.
- IGMP reports received on a host interface are forwarded to multicast-router interfaces in the same VLAN, but not to the other host interfaces in the VLAN.

Multicast traffic that is not IGMP traffic is forwarded as follows:

- A multicast packet with a destination address of 224.0.0.0/24 is flooded to all other interfaces on the VLAN.
- An unregistered multicast packet—that is, a packet for a group that has no current members—is forwarded to all multicast-router interfaces in the VLAN.
- A registered multicast packet is forwarded only to those host interfaces in the VLAN that are members of the multicast group and to all multicast-router interfaces in the VLAN.

Examples of IGMP Snooping Multicast Forwarding

The following examples are provided to illustrate how IGMP snooping forwards multicast traffic in different topologies:

- Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts on page 3309
- Scenario 2: Switch Forwarding Multicast Traffic to Another Switch on page 3310
- Scenario 3: Switch Connected to Hosts Only (No IGMP Querier) on page 3311
- Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs on page 3312

**Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts**

In the topology shown in Figure 39 on page 3310, a switch acting as a Layer 2 device receives multicast traffic belonging to multicast group 239.10.1.1 from Source A, which is connected to the multicast router. It also receives multicast traffic belonging to multicast group 225.100.100.1 from Source B, which is connected directly to the switch. All interfaces on the switch belong to the same VLAN.

Because the switch receives IGMP queries from the multicast router on interface P1, IGMP snooping learns that interface P1 is a multicast-router interface and adds the interface to its multicast cache table. It forwards any IGMP general queries it receives on this interface to all host interfaces on the switch, and, in turn, forwards membership reports it receives from hosts to the multicast-router interface.

In the example, Hosts A and C have responded to the membership queries with membership reports for group 239.10.1.1. IGMP snooping adds interfaces P2 and P4 to its multicast cache table as member interfaces for group 239.10.1.1. It forwards the group multicast traffic received from Source A to Hosts A and C, but not to Hosts B and D.
Host B has responded to the membership queries with a membership report for group 225.100.100.1. The switch adds interface P3 to its multicast cache table as a member interface for group 225.100.100.1 and forwards multicast traffic it receives from Source B to Host B. The switch also forwards the multicast traffic it receives from Source B to the multicast-router interface P1.

Figure 39: Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts

Scenario 2: Switch Forwarding Multicast Traffic to Another Switch

In the topology show in Figure 40 on page 3311, a multicast source is connected to Switch A. Switch A in turn is connected to another switch, Switch B. Hosts on both Switch A and B are potential members of the multicast group. Both switches are acting as Layer 2 devices and all interfaces on the switches are members of the same VLAN.

Switch A receives IGMP queries from the multicast router on interface P1, making interface P1 a multicast-router interface for Switch A. Switch A forwards all general IGMP queries it receives on this interface to the other interfaces on the switch, including the interface connecting Switch B. Because Switch B receives the forwarded IGMP queries on interface P6, P6 is the multicast-router interface for Switch B. Switch B forwards the group membership report it receives from Host C to Switch A through its multicast-router interface. Switch A forwards the membership report to its multicast-router interface, includes interface P5 in its multicast cache table as a group-member interface, and forwards multicast traffic from the source to Switch B.
In certain implementations, you might have to configure P6 on Switch B as a static multicast-router interface to avoid a delay in a host receiving multicast traffic. For example, if Switch B receives unsolicited membership reports from its hosts before it learns which interface is its multicast-router interface, it does not forward those reports to Switch A. If Switch A then receives multicast traffic, it does not forward the traffic to Switch B, because it has not received any membership reports on interface P5. This issue will resolve when the multicast router sends out its next general query; however, it can cause a delay in the host receiving multicast traffic. You can statically configure interface P6 as a multicast-router interface to solve this issue.

**Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)**

In the topology shown in Figure 41 on page 3312, a switch is connected to a multicast source and to hosts. There is no multicast router in this topology—hence there is no IGMP querier. Without an IGMP querier to respond to, a host does not send periodic membership reports. As a result, even if the host sends an unsolicited join to join a multicast group, its membership in the multicast group times out.

For IGMP snooping to work correctly in this network so that the switch forwards multicast traffic to Hosts A and C only, you can either:

- Configure interfaces P2 and P4 as static group-member interfaces.
- Configure a routed VLAN interface (RVI) on the VLAN and enable IGMP on it. In this case, the switch itself acts as an IGMP querier, and the hosts can dynamically join the multicast group and refresh their group membership by responding to the queries.
Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)

Figure 41: Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)

Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs

In the topology shown in Figure 42 on page 3313, a multicast source, Multicast Router A, and Hosts A and B are connected to the switch and are in VLAN 10. Multicast Router B and Hosts C and D are also connected to the switch and are in VLAN 20.

In a pure Layer 2 environment, traffic is not forwarded between VLANs. For Host C to receive the multicast traffic from the source on VLAN 10, RVIs must be created on VLAN 10 and VLAN 20 to permit routing of the multicast traffic between the VLANs. In addition, PIM must be enabled on the switch to perform the multicast routing.

Configuration Examples

- Example: Configuring IGMP Snooping on page 3315

Example: Configuring IGMP Snooping

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see, Example: Configuring IGMP Snooping on EX Series Switches. For ELS details, see, “Getting Started with Enhanced Layer 2 Software” on page 3.

You can enable IGMP snooping on a VLAN to constrain the flooding of IPv4 multicast traffic on a VLAN. When IGMP snooping is enabled, a switch examines IGMP messages between hosts and multicast routers and learns which hosts are interested in receiving multicast traffic for a multicast group. Based on what it learns, the switch then forwards multicast traffic only to those interfaces that are connected to relevant receivers instead of flooding the traffic to all interfaces.

This example describes how to configure IGMP snooping:

- Requirements on page 3315
- Overview and Topology on page 3316
- Configuration on page 3317
- Verifying IGMP Snooping Operation on page 3318

Requirements

This example uses the following hardware and software components:

- One EX4300 Series switch
Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you configure IGMP snooping, be sure you have:

- Configured a VLAN, vlan100, on the switch
- Assigned interfaces ge-0/0/0, ge-0/0/1, ge-0/0/2, and ge-0/0/12 to vlan100
- Configured ge-0/0/12 as a trunk interface

See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

Overview and Topology

In this example, interfaces ge-0/0/0, ge-0/0/1, and ge-0/0/2 on the switch are in vlan100 and are connected to hosts that are potential multicast receivers. Interface ge-0/0/12, a trunk interface also in vlan100, is connected to a multicast router. The router acts as the IGMP querier and forwards multicast traffic for group 225.100.100.100 to the switch from a multicast source.

The sample topology is illustrated in Figure 43 on page 3316.

In this sample topology, the multicast router forwards multicast traffic to the switch from the source when it receives a membership report for group 225.100.100.100 from one of the hosts—for example, Host B. If IGMP snooping is not enabled on vlan100, the switch floods the multicast traffic on all interfaces in vlan100 (except for interface ge-0/0/12). If IGMP snooping is enabled on vlan100, the switch monitors the IGMP messages between the hosts and router, allowing it to determine that only Host B is interested in receiving the multicast traffic. The switch then forwards the multicast traffic only to interface ge-0/0/1.
This example shows how to perform the following optional configurations, which can reduce group join and leave latency:

- Configure immediate leave on the VLAN. When immediate leave is configured, the switch stops forwarding multicast traffic on an interface when it detects that the last member of the multicast group has left the group. If immediate leave is not configured, the switch waits until the group-specific queries time out before it stops forwarding traffic.

  Immediate leave is supported by IGMP version 2 (IGMPv2) and IGMPv3. With IGMPv2, we recommend that you configure immediate leave only when there is only one IGMP host on an interface. In IGMPv2, only one host on a interface sends a membership report in response to a group-specific query—any other interested hosts suppress their reports to avoid a flood of reports for the same group. This report-suppression feature implies that the switch knows about only one interested host at any given time.

- Configure ge-0/0/12 as a static multicast-router interface. In this topology, ge-0/0/12 always leads to the multicast router. By statically configuring ge-0/0/12 as a multicast-router interface, you avoid any delay imposed by the switch having to learn that ge-0/0/12 is a multicast-router interface.

### Configuration

To configure IGMP snooping on a switch:

**CLI Quick Configuration**

To quickly configure IGMP snooping, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols igmp-snooping vlan vlan100 immediate-leave
set protocols igmp-snooping vlan vlan100 interface ge-0/0/12 multicast-router-interface
```

**Step-by-Step Procedure**

To configure IGMP snooping on vlan100:

1. Configure the switch to immediately remove a group membership from an interface when it receives a leave report from the last member of the group on the interface:

   ```
   [edit protocols]
   user@switch# set igmp-snooping vlan vlan100 immediate-leave
   ```

2. Statically configure interface ge-0/0/12 as a multicast-router interface:

   ```
   [edit protocols]
   user@switch# set igmp-snooping vlan vlan100 interface ge-0/0/12 multicast-router-interface
   ```

**Results**

Check the results of the configuration:

```
[edit protocols]
user@switch# show igmp-snooping
vlan vlan100 {
  immediate-leave;
  interface ge-0/0/12.0 {
    multicast-router-interface;
  }
}
```
Verifying IGMP Snooping Operation

To verify that IGMP snooping is operating as configured, perform the following task:

- Displaying IGMP Snooping Information for VLAN vlan100 on page 3318

Displaying IGMP Snooping Information for VLAN vlan100

Purpose

Verify that IGMP snooping is enabled on vlan100 and that ge-0/0/12 is recognized as a multicast-router interface.

Action

Enter the following command:

```
user@switch> show igmp snooping membership
VLAN: vlan100
   Interfaces: ge-0/0/12.0,
```

Meaning

By showing information for vlan100, the command output confirms that IGMP snooping is configured on the VLAN. Interface ge-0/0/12.0 is listed as a multicast-router interface, as configured. Because none of the host interfaces are listed, none of the hosts are currently receivers for the multicast group.

Configuring IGMP Snooping (CLI Procedure)

NOTE: This topic uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see: Configuring IGMP Snooping. For ELS details see, “Getting Started with Enhanced Layer 2 Software” on page 3.

Internet Group Management Protocol (IGMP) snooping constrains the flooding of IPv4 multicast traffic on a VLAN. When IGMP snooping is enabled, a switch examines IGMP messages between hosts and multicast routers and learns which hosts are interested in receiving multicast traffic for a multicast group. Based on what it learns, the switch then forwards multicast traffic only to those interfaces connected to interested receivers instead of flooding the traffic to all interfaces. In IGMPv2, only one host on a interface sends a membership report in response to a group-specific query—any other interested
hosts suppress their reports to avoid a flood of reports for the same group. This
report-suppression feature means that the switch only knows about only one interested
host at any given time.

By default, IGMP snooping is enabled on the default VLAN. For many networks, IGMP
snooping requires no further configuration.

You can perform the following optional configurations for each VLAN:

- Selectively enable IGMP snooping on specific VLANs.
- Enable immediate leave on a VLAN or all VLANs. Enabling immediate leave ensures
  that the switch stops forwarding multicast traffic immediately after the last member
  host on the interface leaves the group.
- Configure an interface as a static multicast-router interface for a VLAN so that the
  switch does not need to dynamically learn that the interface is a multicast-router
  interface.
- Configure an interface as a static member of a multicast group so that the switch does
  not need to dynamically learn the interface’s membership.
- Change the value for certain timers and counters to match the values configured on
  the multicast router serving as the IGMP querier.

This topic covers:

- Enabling IGMP Snooping on VLANs on page 3319
- Enabling Immediate Leave on page 3319
- Configuring an Interface as a Multicast-Router Interface on page 3320
- Configuring Static Group Membership on an Interface on page 3321
- Changing the Timer and Counter Values on page 3322

### Enabling IGMP Snooping on VLANs

This topic describes how you can selectively enable IGMP snooping on VLANs. It assumes
that you are beginning with the factory default configuration.

To enable IGMP snooping on a VLAN:

```
[edit protocols igmp-snooping]
user@switch# set vlan vlan-name
```

You can also deactivate the IGMP snooping protocol on the switch without changing the
IGMP snooping VLAN configurations:

```
[edit]
user@switch# deactivate protocols igmp-snooping
```

### Enabling Immediate Leave

By default, when a switch with IGMP snooping enabled receives an IGMP leave report
on a member interface, it waits for hosts on the interface to respond to IGMP
group-specific queries to determine whether there still are hosts on the interface interested
in receiving the group multicast traffic. If the switch does not see any membership reports for the group within a set interval of time, it removes the interface’s group membership from the multicast forwarding table and stops forwarding multicast traffic for the group to the interface.

You can decrease the leave latency created by this default behavior by enabling immediate leave on a VLAN.

When you enable immediate leave on a VLAN, host tracking is also enabled, which allows the switch to keep track of the hosts on an interface that have joined a multicast group. When the switch receives a leave report from the last member of the group, it immediately stops forwarding traffic to the interface and does not wait for the interface group membership to time out.

Immediate leave is supported for both IGMP version 2 (IGMPv2) and IGMPv3. However, with IGMPv2, we recommend that you configure immediate leave only when there is only one IGMP host on an interface.

To enable immediate leave on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name immediate-leave
```

### Configuring an Interface as a Multicast-Router Interface

When IGMP snooping is enabled on a switch, the switch determines which interfaces face a multicast router by monitoring interfaces for IGMP queries. If the switch receives these messages on an interface, it adds the interface to its multicast forwarding table as a multicast-router interface.

In addition to dynamically learned interfaces, the multicast forwarding table can include interfaces that you explicitly configure to be multicast-router interfaces. Unlike the table entries for dynamically learned interfaces, table entries for statically configured interfaces are not subject to aging and deletion from the forwarding table.

Examples of when you might want to configure a static multicast-router interface include:

- You have an unusual network configuration that prevents IGMP snooping from reliably learning about a multicast-router interface through monitoring IGMP queries.
- Your implementation does not require an IGMP querier.
- You have a stable topology and want to avoid the delay the dynamic learning process entails.

**NOTE:** All unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded only to the multicast-router interface.

To configure an interface as a static multicast-router interface:

```
[edit protocols]
```
user@switch# set igmp-snooping vlan vlan-name interface interface-name multicast-router-interface

For example, to configure ge-0/0/5.0 as a multicast-router interface on a VLAN vlan100 on the switch:

[edit protocols]
user@switch# set igmp-snooping vlan vlan100 interface ge-0/0/5.0 multicast-router-interface

Configuring Static Group Membership on an Interface

To determine how to forward multicast packets, a switch with IGMP snooping enabled maintains a multicast forwarding table containing a list of host interfaces that have interested listeners for a specific multicast group. The switch learns which host interfaces to add or delete from this table by examining IGMP membership reports as they arrive on interfaces on which IGMP snooping is enabled.

In addition to such dynamically learned interfaces, the multicast forwarding table can include interfaces that you statically configure to be members of multicast groups. When you configure a static group interface, the switch adds the interface to the forwarding table as a host interface for the group. Unlike an entry for a dynamically learned interface, a static interface entry is not subject to aging and deletion from the forwarding table.

Examples of when you might want to configure static group membership on an interface include:

- You want to simulate an attached multicast receiver for testing purposes.
- The interface has receivers that cannot send IGMP membership reports.
- You want the multicast traffic for a specific group to be immediately available to a receiver without any delay imposed by the dynamic join process.

NOTE: The switch does not simulate IGMP membership reports on behalf of a statically configured interface. Thus a multicast router might be unaware that the switch has an interface that is a member of the multicast group. You can configure a static group interface on the router to ensure that the switch receives the group multicast traffic.

To configure a host interface as a static member of a multicast group:

[edit protocols]
user@switch# set igmp-snooping vlan vlan-name interface interface-name static group ip-address

For example, to configure interface ge-0/0/11.0 in vlan100 as a static member of multicast group 225.0.0.1:

[edit protocols]
user@switch# set igmp-snooping vlan vlan100 interface ge-0/0/11.0 static group 225.0.0.1
Changing the Timer and Counter Values

IGMP uses various timers and counters to determine how often an IGMP querier sends out membership queries and when group memberships time out. On EX Series switches, the default values of the IGMP and IGMP snooping timers and counters are set to the values recommended in RFC 2236, *Internet Group Management Protocol, Version 2*. These values work well for most multicast implementations.

There might be cases, however, where you might want to modify the timer and counter values—for example, to reduce burstiness, to reduce leave latency, or to adjust for expected packet loss on a subnet. If you change a timer or counter value for the IGMP querier on a VLAN, we recommend that you change the value for all multicast routers and switches on the VLAN so that all devices time out group memberships at approximately the same time.

You can configure the following timers and counters on a switch:

- **query-interval**—The length of time the IGMP querier waits between sending general queries (the default is 125 seconds). You can change this interval to tune the number of IGMP messages on the subnet; larger values cause general queries to be sent less often.

  You cannot configure this value directly for IGMP snooping. IGMP snooping inherits the value from the IGMP value configured on the switch, which is applied to all VLANs on the switch.

  To configure the IGMP query-interval:

  ```
  [edit protocols]
  user@switch# set igmp-snooping vlan vlan-name query-interval seconds
  ```

- **query-response-interval**—The maximum length of time the host can wait until it responds (the default is 10 seconds). You can change this interval to adjust the burst peaks of IGMP messages on the subnet. Set a larger interval to make the traffic less bursty.

  You cannot configure this value directly for IGMP snooping. IGMP snooping inherits the value from the IGMP value configured on the switch, which is applied to all VLANs on the switch.

  To configure the IGMP query-response-interval:

  ```
  [edit protocols]
  user@switch# set igmp-snooping vlan vlan-name query-response-interval seconds
  ```

- **query-last-member-interval**—The length of time the IGMP querier waits between sending group-specific membership queries (the default is 1 second). The IGMP querier sends a group-specific query after receiving a leave report from a host. You can decrease this interval to reduce the amount of time it takes for multicast traffic to stop forwarding traffic after the last member leaves a group.
You cannot configure this value directly for IGMP snooping. IGMP snooping inherits the value from the IGMP value configured on the switch, which is applied to all VLANs on the switch.

To configure the IGMP query-last-member-interval:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name query-last-member-interval seconds
```

- **robust-count**—The number of times the querier resends a general membership query or a group-specific membership query (the default is 2 times). You can increase this count to tune for higher expected packet loss.

For IGMP snooping, you can configure `robust-count` for a specific VLAN. If a VLAN does not have `robust-count` configured, the robust-count value is the value configured for IGMP.

To configure `robust-count` for IGMP snooping on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name robust-count number
```

The values configured for `query-interval`, `query-response-interval`, and `robust-count` determine the multicast listener interval—the length of time the switch waits for a group membership report after a general query before removing a multicast group from its multicast forwarding table. The switch calculates the multicast listener interval by multiplying `query-interval` by the `robust-count` and then adding `query-response-interval` to the product:

\[(query-interval \times robust-count) + query-response-interval = multicast listener interval.\]

For example, the multicast listener interval is 260 seconds when the default settings for `query-interval`, `query-response-interval`, and `robust-count` are used:

\[(125 \times 2) + 10 = 260\]

You can display the time remaining in the multicast listener interval before a group times out by using the `show igmp-snooping membership` command.

### Configuring IGMP Snooping (J-Web Procedure)

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, the EX Series switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member interfaces. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.
You can configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on EX Series switches.

To enable IGMP snooping and configure individual options by using the J-Web interface:

1. Select **Configure > Switching > IGMP Snooping**.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Creates an IGMP snooping configuration for the VLAN.
   - **Edit**—Modifies an IGMP snooping configuration for the VLAN.
   - **Delete**—Deletes a selected VLAN from the IGMP snooping configuration.

   When you are adding or editing an IGMP snooping configuration, enter information as described in Table 400 on page 3324.

3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

To disable IGMP snooping on a VLAN, select the VLAN from the list and click **Disable**.

**NOTE:** The Disable option is not available for EX4300 switches.

Configuring IGMP Snooping Tracing Operations (CLI Procedure)

By enabling tracing operations for IGMP snooping, you can record detailed messages about the operation of the protocol, such as the various types of protocol packets sent and received. Table 401 on page 3325 describes the tracing operations you can enable and the flags used to specify them in the tracing configuration.

Table 401: Supported Tracing Operations for IGMP Snooping

</table>

This topic covers:

- Configuring Tracing Operations on page 3326
- Viewing, Stopping, and Restarting Tracing Operations on page 3327

**Configuring Tracing Operations**

To configure tracing operations for IGMP snooping:

1. Configure the filename for the trace file:

   ```
   [edit protocols igmp-snooping ]
   user@switch# set traceoptions file filename
   ```

   For example:

   ```
   [edit protocols igmp-snooping ]
   user@switch# set traceoptions file mld-snoop-trace
   ```

2. (Optional) Configure the maximum number of trace files and size of the trace files:

   ```
   [edit protocols igmp-snooping ]
   user@switch# set traceoptions file files number size size
   ```

   For example:

   ```
   [edit protocols igmp-snooping ]
   user@switch# set traceoptions file files 5 size 1m
causes the contents of the trace file to be emptied and archived in a .gz file when the file reaches 1 MB. Four archive files are maintained, the contents of which are rotated whenever the current active trace file is archived.

If you omit this step, the maximum number of trace files defaults to 10, with the maximum file size defaulting to 128 K.

3. Specify one of the tracing flags shown in Table 401 on page 3325:

```
[edit protocols igmp-snooping ]
user@switch# set traceoptions flag flagname
```

For example, to perform trace operations on VLAN-related events and IGMP query messages:

```
[edit protocols igmp-snooping ]
user@switch# set traceoptions flag vlan
[edit protocols igmp-snooping ]
user@switch# set traceoptions flag query
```

**Viewing, Stopping, and Restarting Tracing Operations**

When you commit the configuration, tracing operations begin. You can view the trace file in the `/var/log` directory. For example:

```
user@switch> file show /var/log/igmp-snoop-trace
```

You can stop and restart tracing operations by deactivating and reactivating the configuration:

```
[edit]
user@switch# deactivate protocols igmp-snooping traceoptions

[edit]
user@switch# activate protocols igmp-snooping traceoptions
```

[edit protocols igmp-snooping] Configuration Statement Hierarchy

This topic lists supported and unsupported configuration statements in the [edit protocols igmp-snooping] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.

- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit protocols igmp-snooping] Hierarchy Level on page 3329
- Unsupported Statements in the [edit protocols igmp-snooping] Hierarchy Level on page 3330

**Supported Statements in the [edit protocols igmp-snooping] Hierarchy Level**

The following hierarchy shows the [edit protocols igmp-snooping] configuration statements supported on EX Series switches:

```c
protocols {
    igmp-snooping {
        vlan vlan-name {
            immediate-leave;
            interface interface-name {
                group-limit <1..65535>
                host-only-interface
                multicast-router-interface;
                immediate-leave;
                static {
                    group multicast-ip-address {
                        source <>
                    }
                }
            }
        }
    }
}
```
l2-querier {
  source-address ip-address;
}
proxy {
  source-address ip-address;
}
query-interval number;
query-last-member-interval number;
query-response-interval number;
robust-count number;
traceoptions {
  file filename <files number> <no-stamp> <replace> <size maximum-file-size> <world-readable | no-world-readable>;
  flag flag <flag-modifier>;
}
}
}

Unsupported Statements in the [edit protocols igmp-snooping] Hierarchy Level

All statements in the [edit protocols igmp-snooping] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

### assert-timeout

**Syntax**

```plaintext
assert-timeout seconds;
```

**Hierarchy Level**

```plaintext
[edit logical-systems logical-system-name protocols pim],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim],
[edit protocols pim],
[edit routing-instances routing-instance-name protocols pim]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds.

**Options**

- `seconds`—Time for routing device to wait before another assert message cycle.
  - **Range:** 5 through 210 seconds
  - **Default:** 180 seconds

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

**bootstrap-priority**

**Syntax**

```
bootstrap-priority number;
```

**Hierarchy Level**

- [edit logical-systems logical-system-name protocols pim rp],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim rp],
- [edit protocols pim rp],
- [edit routing-instances routing-instance-name protocols pim rp]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure whether this routing device is eligible to be a bootstrap router. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap router.

**Options**

- `number`—Priority for becoming the bootstrap router. A value of 0 means that the routing device is not eligible to be the bootstrap router.
  - **Range:** 0 through 255
  - **Default:** 0

**Required Privilege**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

data-forwarding

Syntax

```
data-forwarding {
    receiver {
        source-vlans vlan-list;
        install;
    }
    source {
        groups group-prefix;
    }
}
```

Hierarchy Level

[edit protocols igmp-snooping vlan (all | vlan-name )]

Release Information

Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description

Configure the VLAN to be a multicast source VLAN (MVLAN) or a multicast VLAN registration (MVR) receiver VLAN. Each data-forwarding VLAN, which can be a multicast source VLAN (MVLAN) or a multicast receiver VLAN, must have exactly one source statement or exactly one receiver statement. A data-forwarding VLAN can operate only in IGMP version 2 (IGMPv2) mode.

The remaining statements are explained separately.

Default

Disabled

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

disable (IGMP Snooping)

Syntax
disable;

Hierarchy Level
[edit protocols igmp-snooping vlan (all | vlan-name)]

Release Information
Statement introduced in Junos OS Release 9.2 for EX Series switches.

Description
Disable IGMP snooping on the VLAN. Multicast traffic will be flooded to all interfaces on the VLAN except the source interface.

Default
If you do not include this statement in the configuration for a VLAN, IGMP snooping is enabled on the VLAN.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

### immediate-leave (Protocols IGMP)

**Syntax**

immediate-leave;

**Hierarchy Level**

[edit logical-systems logical-system-name protocols igmp]
[edit protocols igmp interface interface-name]

**Release Information**

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.

Starting in Junos OS Release 9.3, both IGMP version 2 and IGMP version 3 do host tracking when the `immediate-leave` statement is configured. This means that the multicast group leaves only when the last host leaves. The routing device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.

When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group.

Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.

**Note:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.

**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
Related Documentation

• Specifying Immediate-Leave Host Removal for IGMP

immediate-leave (IGMP Snooping)

Syntax
immediate-leave;

Hierarchy Level
[edit protocols igmp-snooping vlan (all | vlan-name)]

Release Information
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description
Configure IGMP snooping immediate leave for the specified VLAN. When you configure immediate leave, host tracking is enabled, which allows the switch to track the hosts that send membership reports. The switch can then determine when the last host on an interface leaves the multicast group and immediately stop forwarding multicast traffic to the interface.

Configuring immediate leave reduces the amount of time it takes for the switch to stop sending multicast traffic to an interface when the last host leaves the group. When immediate leave is disabled, the switch no longer tracks hosts. Instead, whenever it receives a leave report from a host, it sends out a group-specific query to all hosts. If it does not receive any membership reports on the interface in response to the group-specific query within a set interval, it stops forwarding multicast traffic to the interface.

NOTE: Immediate leave is supported for both IGMP version 2 (IGMPv2) and IGMPv3. However, with IGMPv2, we recommend that you configure immediate leave only when there is only one IGMP host on an interface. In IGMPv2, only one host on an interface sends a membership report in response to a general query—any other interested hosts suppress their reports. Report suppression avoids a flood of reports for the same group, but it also interferes with host tracking because the switch knows only about one interested host on the interface at any given time.

Default
The immediate-leave feature is disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols pim]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Enable PIM on an interface and configure interface-specific properties.

Options

interface-name—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify all.

The remaining statements are explained separately.

Required Privilege
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

    ssm-map-policy ssm-map-policy-name;
    static {
        group multicast-group-address {
            exclude;
            group-count number;
            group-increment increment;
            source ip-address {
                source-count number;
                source-increment increment;
            }
        }
    }
    version version;
}
```

Hierarchy Level

[edit logical-systems logical-system-name protocols igmp],
[edit protocols igmp]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Enable IGMP on an interface and configure interface-specific properties.

Options

- `interface-name`—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify all.

  The remaining statements are explained separately.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP
join-load-balance

Syntax

```
join-load-balance {
    automatic;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim],
[edit protocols pim],
[edit routing-instances routing-instance-name protocols pim]
```

Release Information

Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Enable load balancing of PIM join messages across interfaces and routing devices.

Options

automatic—Enables automatic load balancing of PIM join messages. When a new interface or neighbor is introduced into the network, ECMP joins are redistributed with minimal disruption to traffic.

Required Privilege Level

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

## local-address (Protocols PIM)

**Syntax**

```
local-address address;
```

**Hierarchy Level**

- `[edit logical-systems logical-system-name protocols pim rp local family (inet inet6) anycast-pim]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim rp local family (inet inet6) anycast-pim]`
- `[edit protocols pim rp local family (inet inet6) anycast-pim]`
- `[edit routing-instances routing-instance-name protocols pim rp local family (inet inet6) anycast-pim]`

**Release Information**

- Statement introduced in Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure the routing device local address for the anycast rendezvous point (RP). If this statement is omitted, the router ID is used as this address.

**Options**

- `address`—Anycast RP IPv4 or IPv6 address, depending on `family` configuration.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- *Example: Configuring PIM Anycast With or Without MSDP*
mapping-agent-election

Syntax  (mapping-agent-election | no-mapping-agent-election);

Hierarchy Level  [edit logical-systems logical-system-name protocols pim rp auto-rp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim rp auto-rp],
[edit protocols pim rp auto-rp],
[edit routing-instances routing-instance-name protocols pim rp auto-rp]

Release Information  Statement introduced in Junos OS Release 7.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  Configure the routing device mapping announcements as a mapping agent.

Options  mapping-agent-election—Mapping agents do not announce mappings when receiving mapping messages from a higher-addressed mapping agent.

no-mapping-agent-election—Mapping agents always announce mappings and do not perform mapping agent election.

Default: mapping-agent-election

Required Privilege  routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

Related Documentation  • Configuring PIM Auto-RP
maximum-rps

Syntax  maximum-rps limit;

Hierarchy Level  [edit logical-systems logical-system-name protocols pim rp embedded-rp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim rp embedded-rp],
[edit protocols pim rp embedded-rp],
[edit routing-instances routing-instance-name protocols pim rp embedded-rp]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  Limit the number of RPs that the routing device acknowledges.

Options  limit—Number of RPs.
  Range:  1 through 500
  Default:  100

Required Privilege  routing—To view this statement in the configuration.
  routing-control—To add this statement to the configuration.

Related Documentation  • Configuring PIM Embedded RP for IPv6
mode (Protocols PIM)

Syntax
mode (bidirectional-sparse | bidirectional-sparse-dense | dense | sparse | sparse-dense);

Hierarchy Level
[edit logical-systems logical-system-name protocols pim interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim interface interface-name],
[edit protocols pim interface interface-name],
[edit routing-instances routing-instance-name protocols pim interface interface-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
bidirectional-sparse and bidirectional-sparse-dense options introduced in Junos OS Release 12.1.

Description
Configure the PIM mode on the interface.

Options
The choice of PIM mode is closely tied to controlling how groups are mapped to PIM modes, as follows:

- **bidirectional-sparse**—Use if all multicast groups are operating in bidirectional, sparse, or SSM mode.
- **bidirectional-sparse-dense**—Use if multicast groups, except those that are specified in the dense-groups statement, are operating in bidirectional, sparse, or SSM mode.
- **dense**—Use if all multicast groups are operating in dense mode.
- **sparse**—Use if all multicast groups are operating in sparse mode or SSM mode.
- **sparse-dense**—Use if multicast groups, except those that are specified in the dense-groups statement, are operating in sparse mode or SSM mode.

Default: Sparse mode

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

**multicast-router-interface (IGMP Snooping)**

**Syntax**

```
multicast-router-interface;
```

**Hierarchy Level**

```
[edit bridge-domains bridge-domain-name protocols igmp-snooping interface interface-name],
[edit bridge-domains bridge-domain-name protocols igmp-snooping vlan vlan-id interface interface-name],
[edit protocols igmp-snooping vlan (all | vlan-name) interface (all | interface-name)]
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols igmp-snooping interface interface-name],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols vlan vlan-id igmp-snooping interface interface-name]
```

**Release Information**

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description**

Statically configure the interface as an IGMP snooping multicast-router interface—that is, an interface that faces toward a multicast router or other IGMP querier.

---

**NOTE:** If the specified interface is a trunk port, the interface becomes a multicast-routing device interface for all VLANs configured on the trunk port. In addition, all unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded to the multicast routing device interface, even if the interface is configured as a multicast routing device interface only for IGMP snooping.

Configure an interface as a bridge interface toward other multicast routing devices.

**Default**

The interface can either be a host-side or multicast-routing device interface.

**Required Privilege Level**

route—To view this statement in the configuration.
route-control—To add this statement to the configuration.

[edit routing-instances instance-name protocols pim rp bidirectional address address],
[edit routing-instances routing-instance-name protocols pim rp local family (inet | inet6)]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional RP addresses introduced in Junos OS Release 12.1.

**Description**

For PIM-SM, configure this routing device’s priority for becoming an RP.

For bidirectional PIM, configure this RP address’ priority for becoming an RP.

The bootstrap router uses this field when selecting the list of candidate rendezvous points to send in the bootstrap message. A smaller number increases the likelihood that the routing device or RP address becomes the RP. A priority value of 0 means that bootstrap router can override the group range being advertised by the candidate RP.

**Options**

- `number`—Priority for becoming an RP. A lower value corresponds to a higher priority.
  - **Range:** 0 through 255
  - **Default:** 1

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

query-response-interval (Protocols IGMP)

Syntax

query-response-interval seconds;

Hierarchy Level
[edit logical-systems logical-system-name protocols igmp],
[edit protocols igmp]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Specify how long the querier routing device waits to receive a response to a host-query message from a host.

Options
seconds—The query response interval must be less than the query interval.
Range: 1 through 1024
Default: 10 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
• Modifying the IGMP Query Response Interval
• query-interval (Protocols IGMP) on page 3378
• query-last-member-interval (Protocols IGMP) on page 3379
receiver

Syntax  
receiver {  
  source-vlans vlan-list;  
install;  
}  

Hierarchy Level  
[edit protocols igmp-snooping vlan (all | vlan-name) data-forwarding]

Release Information  
- Statement introduced in Junos OS Release 9.6 for EX Series switches.  
- Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description  
Configure a VLAN as a multicast receiver VLAN of the multicast VLAN (MVLAN).  
The remaining statements are explained separately.

Default  
Disabled

Required Privilege Level  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

Related Documentation  
- Example: Configuring Multicast VLAN Registration  
- Configuring Multicast VLAN Registration (CLI Procedure)
restart-duration (Protocols PIM)

Syntax

restart-duration seconds;

Hierarchy Level

[edit logical-systems logical-system-name protocols pim graceful-restart],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim graceful-restart],
[edit protocols pim graceful-restart],
[edit routing-instances routing-instance-name protocols pim graceful-restart]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure the duration of the graceful restart interval.

Options

seconds—Time that the routing device waits (in seconds) to complete PIM sparse mode graceful restart.
Range: 30 through 300
Default: 60

Required Privilege

Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

### rib-group (Protocols PIM)

**Syntax**

```
rib-group {
    inet group-name;
    inet6 group-name;
}
```

**Hierarchy Level**

- [edit logical-systems logical-system-name protocols pim],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim],
- [edit protocols pim],
- [edit routing-instances routing-instance-name protocols pim]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Associate a routing table group with PIM.

**Options**

- `table-name`—Name of the routing table. The name must be one that you defined with the `rib-groups` statement at the [edit routing-options] hierarchy level.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

- Example: Configuring a Dedicated PIM RPF Routing Table
robust-count (IGMP Snooping)

Syntax

```
robust-count number;
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan (all | vlan-name)]
```

Release Information

Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description

Configure the number of queries the switch sends before removing a multicast group from the multicast forwarding table. We recommend that the robust count be set to the same value on all multicast routers and switches in the VLAN.

Default

The default is the value of the `robust-count` statement configured for IGMP. The default for the IGMP `robust-count` statement is 2.

Options

- `number`—Number of queries the switch sends before timing out a multicast group.
  - Range: 2 through 10

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

- Configuring IGMP Snooping (CLI Procedure)

---

robust-count (Protocols IGMP)

Syntax

```
robust-count number;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols igmp],
[edit protocols igmp]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Tune the expected packet loss on a subnet. This factor is used to calculate the group member interval, other querier present interval, and last-member query count.

Options

- `number`—Robustness variable.
  - Range: 2 through 10
  - Default: 2

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

Hierarchy Level
[edit logical-systems logical-system-name protocols pim],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim],
[edit protocols pim],
[edit routing-instances routing-instance-name protocols pim]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure the routing device as an actual or potential RP. A routing device can be an RP for more than one group.

The remaining statements are explained separately.

Default
If you do not include the rp statement, the routing device can never become the RP.

Required Privilege
routing—to view this statement in the configuration.

Level
routing-control—to add this statement to the configuration.
Related Documentation

- Understanding PIM Sparse Mode

rp-register-policy

Syntax

rp-register-policy [ policy-names ];

Hierarchy Level

- [edit logical-systems logical-system-name protocols pim rp],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim rp],
- [edit protocols pim rp],
- [edit routing-instances routing-instance-name protocols pim rp]

Release Information

Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Apply one or more policies to control incoming PIM register messages.

Options

- policy-names—Name of one or more import policies.

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Register Message Filters on a PIM RP and DR
- dr-register-policy on page 3343
rp-set

Syntax

rp-set {
  address address <forward-msdp-sa>;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols pim local family (inet | inet6) anycast-pim],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim local family (inet | inet6) anycast-pim],
[edit protocols pim local family (inet | inet6) anycast-pim],
[edit routing-instances routing-instance-name protocols pim local family (inet | inet6) anycast-pim]

Release Information

Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure a set of rendezvous point (RP) addresses for anycast RP. You can configure up to 15 RPs.

The remaining statements are explained separately.

Required Privilege

Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

• Example: Configuring PIM Anycast With or Without MSDP
source (Protocols IGMP)

Syntax

```plaintext
source ip-address {
    source-count number;
    source-increment increment;
}
```

Hierarchy Level

[edit logical-systems logical-system-name protocols igmp interface interface-name static group multicast-group-address],
[edit protocols igmp interface interface-name static group multicast-group-address]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Specify the IP version 4 (IPv4) unicast source address for the multicast group being statically configured on an interface.

Options

`ip-address`—IPv4 unicast address.

The remaining statements are explained separately.

Required Privilege

Level: routing—to view this statement in the configuration.
Level: routing-control—to add this statement to the configuration.

Related Documentation

• Enabling IGMP Static Group Membership
source-vlans

Syntax
source-vlans vlan-list;

Hierarchy Level
[edit protocols igmp-snooping vlan (all | vlan-name) data-forwarding receiver]

Release Information
Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description
Specify a list of multicast VLANs (MVLANs) from which this multicast receiver VLAN receives multicast traffic. Either all of these MVLANs must be in proxy mode or none of them can be in proxy mode.

Default
Disabled

Options
vlan-list—Names of the MVLANs.

Required Privilege
Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
• Example: Configuring Multicast VLAN Registration
• Configuring Multicast VLAN Registration (CLI Procedure)
spt-threshold

Syntax

```plaintext
spt-threshold { infinity [ policy-names ]; }
```

Hierarchy Level

- `edit logical-systems logical-system-name protocols pim`
- `edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim`
- `edit protocols pim`
- `edit routing-instances routing-instance-name protocols pim`

Release Information

Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.

The remaining statements are explained separately.

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Related Documentation

- Example: Configuring the PIM SPT Threshold Policy
### ssm-map (Protocols IGMP)

**Syntax**

```
ssm-map ssm-map-name;
```

**Hierarchy Level**

[edit logical-systems logical-system-name protocols igmp interface interface-name],
[edit protocols igmp interface interface-name]

**Release Information**

Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Apply an SSM map to an IGMP interface.

**Options**

- `ssm-map-name`—Name of SSM map.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

- Example: Configuring SSM Mapping

### static (IGMP Snooping)

**Syntax**

```
static {  
    group ip-address;
  }
```

**Hierarchy Level**

[edit protocols igmp-snooping vlan (all | vlan-name) interface (all | interface-name)]

**Release Information**

Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description**

Statically define multicast groups on an interface.

The remaining statement is explained separately.

**Default**

No multicast groups are statically defined.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

- Configuring IGMP Snooping (CLI Procedure)
- show igmp-snooping membership on page 3453
static (Protocols PIM)

Syntax
static {
  address address {
    group-ranges {
      destination-ip-prefix</prefix-length>;
    }
    override:
    version version;
  }
}

Hierarchy Level
[edit logical-systems logical-system-name protocols pim rp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim rp],
[edit protocols pim rp],
[edit routing-instances routing-instance-name protocols pim rp]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure static RP addresses. The default static RP address is 224.0.0.0/4. To configure other addresses, include one or more address statements. You can configure a static RP in a logical system only if the logical system is not directly connected to a source.

For each static RP address, you can optionally specify the PIM version and the groups for which this address can be the RP. The default PIM version is version 1.

The remaining statements are explained separately.

Required Privilege
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Static PIM RP Address on the Non-RP Routing Device
**static (Protocols IGMP)**

**Syntax**

```plaintext
static {
  group multicast-group-address {
    exclude;
    group-count number;
    group-increment increment;
    source ip-address {
      source-count number;
      source-increment increment;
    }
  }
}
```

**Hierarchy Level**

- [edit logical-systems logical-system-name protocols igmp interface interface-name]
- [edit protocols igmp interface interface-name]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Test multicast forwarding on an interface without a receiver host.

The `static` statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

**NOTE:** To prevent joining too many groups accidentally, the `static` statement is not supported with the `interface all` statement.

The remaining statements are explained separately.

**Required Privilege Level**

- routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**

- [Enabling IGMP Static Group Membership](#)
traceoptions (Protocols PIM)

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

- [edit logical-systems logical-system-name protocols pim],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim],
- [edit protocols pim],
- [edit routing-instances routing-instance-name protocols pim]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure PIM tracing options.
To specify more than one tracing operation, include multiple `flag` statements.

Default

The default PIM trace options are those inherited from the routing protocol’s `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

- `disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

  - `file filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. We recommend that you place tracing output in the `pim-log` file.

  - `files number`—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

  - `Range:` 2 through 1000 files
  - `Default:` 2 files

  - `flag flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

PIM Tracing Flags

- `assert`—Assert messages

- `bidirectional-df-election`—Bidirectional PIM designated-forwarder (DF) election events
- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache
- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:
- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.
no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When `trace-file` again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 0 KB through the maximum file size supported on your system

**Default:** 1 MB

world-readable—(Optional) Allow any user to read the log file.

**Required Privilege Level**
- **routing and trace**—To view this statement in the configuration.
- **routing-control and trace-control**—To add this statement to the configuration.

**Related Documentation**

traceoptions (Protocols IGMP)

Syntax
traceoptions {
  file filename <files number> <size> <world-readable | no-world-readable>;  
  flag flag <flag-modifier> <disable>;
}

Hierarchy Level
[edit logical-systems logical-system-name protocols igmp],  
[edit protocols igmp]

Release Information
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Configure IGMP tracing options.

To specify more than one tracing operation, include multiple flag statements.

To trace the paths of multicast packets, use the mtrace command.

Default
The default IGMP trace options are those inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level.

Options
disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

file filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place tracing output in the file igmp-log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.

Range: 2 through 1000 files

Default: 2 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

IGMP Tracing Flags
- leave—Leave group messages (for IGMP version 2 only).
- mtrace—Mtrace packets. Use the mtrace command to troubleshoot the software.
- packets—All IGMP packets.
• **query**—IGMP membership query messages, including general and group-specific queries.

• **report**—Membership report messages.

**Global Tracing Flags**

• **all**—All tracing operations

• **general**—A combination of the **normal** and **route** trace operations

• **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

• **policy**—Policy operations and actions

• **route**—Routing table changes

• **state**—State transitions

• **task**—Interface transactions and processing

• **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

• **detail**—Detailed trace information

• **receive**—Packets being received

• **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of trace files.

**Syntax:**  `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

`world-readable`—(Optional) Allow any user to read the log file.

**Required Privilege**
- **Level:** routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**
- *Tracing IGMP Protocol Traffic*
traceoptions (IGMP Snooping)

Syntax

```
traceoptions {
    file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier>;
}
```

Hierarchy Level

[edit protocols igmp-snooping]

Release Information

Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description

Define tracing operations for IGMP snooping.

Default

The traceoptions feature is disabled by default.

Options

- **file** `filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

- **files number**—(Optional) Maximum number of trace files, including the active trace file. When a trace file reaches its maximum size, its contents are archived into a compressed file named `filename.0` and the trace file is emptied. When the trace file reaches its maximum size again, the `filename.0` archive file is renamed `filename.1` and a new `filename.0` archive file is created from the contents of the trace file. This process continues until the maximum number of trace files is reached, at which point the system starts overwriting the oldest archive file each time the trace file is archived. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

  Range: 2 through 1000

  Default: 10 files

- **flag** `flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

  - all—All tracing operations.
  - general—Trace general IGMP snooping protocol events.
  - krt—Trace communication over routing socket.
  - leave—Trace leave group messages (IGMPv2 and IGMPv3 only).
  - nexthop—Trace nexthop-related events.
  - normal—Trace normal IGMP snooping protocol events. If you do not specify this flag, only unusual or abnormal operations are traced.
  - packets—Trace all IGMP packets.
  - policy—Trace policy processing.
  - query—Trace IGMP membership query messages.
  - report—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.
- **vlan**—Trace VLAN-related events.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers per flag:

- **detail**—Provide detailed trace information
- **disable**—Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**no-stamp**—(Optional) Omit the timestamp at the beginning of each line in the trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one. If you do not include this option, tracing output is appended to an existing trace file.

**size**—(Optional) Maximum size of each trace file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is zipped and renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum size, you also must specify a maximum number of files with the `files` option.

**Syntax:** `x` to specify bytes, `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10240 through 4294967295 bytes

**Default:** 128 KB

**world-readable**—(Optional) Allow unrestricted file access.

**Required Privilege Level**
- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

version (IGMP Snooping)

**Syntax**  
version number;

**Hierarchy Level**  
[edit protocols igmp-snooping vlan (all | vlan-name)]

**Release Information**  
Statement introduced in Junos OS Release 11.1 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**  
Specify the IGMP version for the IGMP general query that the switch sends to hosts when  
an interface comes up. The configured IGMP version affects only the version of the general  
queries sent by a switch. It does not affect the version of IGMP messages that the switch  
can snoop. For example, if the switch is configured for IGMP version 1 (IGMPv1), it can  
snoop IGMPv2 and IGMPv3 messages.

**Default**  
If you do not configure the version statement, the default is IGMPv2.

**Options**  
version—IGMP version number.  
Range: 1 through 3

**Required Privilege**  
level  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

vlan (IGMP Snooping)

Syntax

```
vlan (all | vlan-name) {
  data-forwarding {
    source {
      groups group-prefix;
    }
    receiver {
      source-vlans vlan-list;
      install;
    }
  }
  disable;
  immediate-leave;
  interface (all | interface-name) {
    multicast-router-interface;
    static {
      group ip-address;
    }
    proxy {
      source-address ip-address;
    }
    robust-count number;
    version version;
  }
}
```

Hierarchy Level
[edit protocols igmp-snooping]

Release Information
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement updated with enhanced (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

Description
Configure IGMP snooping parameters for a VLAN.

When the `vlan` configuration statement is used without the `disable` statement, IGMP snooping is enabled on the specified VLAN or on all VLANs.

NOTE: You cannot configure IGMP snooping on a secondary VLAN.

Default
If the `vlan` statement is not included in the configuration, IGMP snooping is disabled.

Options
- **all**—All VLANs on the switch
- **vlan-name**—Name of a VLAN.

TIP: When you configure IGMP snooping parameters using the `vlan all` statement, any VLAN that is not individually configured for IGMP snooping
inherits the vlan all configuration. Any VLAN that is individually configured for IGMP snooping, on the other hand, inherits none of its configuration from vlan all. Any parameters that are not explicitly defined for the individual VLAN assume their default values, not the values specified in the vlan all configuration.

For example, in the following configuration:

```plaintext
protocols {
    igmp-snooping {
        vlan all {
            robust-count 8;
        }
        vlan employee {
            interface ge-0/0/8.0 {
                static {
                    group 239.0.10.3
                }
            }
        }
    }
}
```

all VLANs, except employee, have a robust count of 8. Because employee has been individually configured, its robust count value is not determined by the value set under vlan all. Instead, its robust count is the default value of 2.

The remaining statements are explained separately.

**Required Privilege**
- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

Routine Monitoring

- Monitoring IGMP Snooping on page 3407
- Verifying IGMP Snooping (CLI Procedure) on page 3410

Monitoring IGMP Snooping

**Purpose**  
Use the monitoring feature to view status and information about IGMP snooping configuration on your EX Series switch.

**Action**  
To display IGMP snooping details in the J-Web interface, select Monitor > Switching > IGMP Snooping.

To display IGMP snooping details in the CLI, enter the following commands:

- `show igmp-snooping route`
- `show igmp-snooping statistics`
- `show igmp-snooping vlans`

**NOTE:** On EX4300 switches, to display IGMP snooping details in the CLI, enter the following commands:

- `show igmp snooping interface`
- `show igmp snooping statistics`
- `show multicast snooping next-hops`
- `show multicast snooping route`

**Meaning**  
Table 402 on page 3408 summarizes the IGMP snooping details displayed.

Verifying IGMP Snooping (CLI Procedure)

Internet Group Management Protocol (IGMP) snooping constrains the flooding of IPv4 multicast traffic on VLANs on a switch. This topic describes how to verify IGMP snooping operation on the switch.

It covers:

- Verifying IGMP Snooping Memberships on page 3410
- Viewing IGMP Snooping Statistics on page 3411
- Viewing IGMP Snooping Routing Information on page 3411

Verifying IGMP Snooping Memberships

Purpose

Determine group memberships, multicast-router interfaces, host IGMP versions, and the current values of timeout counters.

Action

Enter the following command:

```
user@switch> show igmp-snooping membership detail
VLAN: vlan2 Tag: 2 (Index: 3)
  Router interfaces:
    ge-1/0/0.0 dynamic Uptime: 00:14:24 timeout: 253
    Group: 225.0.0.1
    ge-1/0/17.0 259 Last reporter: 13.0.0.90 Receiver count: 1
    Uptime: 00:00:19 timeout: 259 Flags: <V3-hosts>
    Include source: 10.2.11.5, 10.2.11.12
```

Meaning

The switch has multicast membership information for one VLAN on the switch, vlan2. IGMP snooping might be enabled on other VLANs, but the switch does not have any multicast membership information for them. The following information is provided:

- Information on the multicast-router interfaces for the VLAN—in this case, ge-1/0/0.0. The multicast-router interface has been learned by IGMP snooping, as indicated by the dynamic value. The timeout value shows how many seconds from now the interface

Table 402: Summary of IGMP Snooping Output Fields (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Downstream Interface</td>
<td>Interface names associated with each multicast next-hop ID.</td>
</tr>
</tbody>
</table>

**NOTE:** This option is supported only on EX4300 switches.
will be removed from the multicast forwarding table if the switch does not receive IGMP queries or Protocol Independent Multicast (PIM) updates on the interface.

- Information about the group memberships for the VLAN:
  - Currently, the VLAN has membership in only one multicast group, 225.0.0.1.
  - The host or hosts that have reported membership in the group are on interface ge-1/0/17.0. The last host that reported membership in the group has address 13.0.0.90. The number of hosts belonging to the group on the interface is shown in the Receiver count field, which is displayed only when host tracking is enabled if immediate leave is configured on the VLAN.
  - The Uptime field shows that the multicast group has been active on the interface for 19 seconds. The interface group membership will time out in 259 seconds if no hosts respond to membership queries during this interval. The Flags field shows the lowest version of IGMP used by a host that is currently a member of the group, which in this case is IGMP version 3 (IGMPv3).
  - Because the interface has IGMPv3 hosts on it, the source addresses from which the IGMPv3 hosts want to receive group multicast traffic are shown (addresses 10.2.11.5 and 10.2.11.12). The timeout value for the interface group membership is derived from the largest timeout value for all sources addresses for the group.

**Viewing IGMP Snooping Statistics**

**Purpose**
Display IGMP snooping statistics, such as number of IGMP queries, reports, and leaves received and how many of these IGMP messages contained errors.

**Action**
Enter the following command:

```
user@switch> show igmp-snooping statistics
```

Bad length: 0  Bad checksum: 0  Invalid interface: 0
Not local: 0  Receive unknown: 0  Timed out: 0

<table>
<thead>
<tr>
<th>IGMP Type</th>
<th>Received</th>
<th>Transmitted</th>
<th>Recv Errors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queries:</td>
<td>74295</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Reports:</td>
<td>18148423</td>
<td>0</td>
<td>16333523</td>
</tr>
<tr>
<td>Leaves:</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Other:</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Meaning**
The output shows how many IGMP messages of each type—Queries, Reports, Leaves—the switch received or transmitted on interfaces on which IGMP snooping is enabled. For each message type, it also shows the number of IGMP packets the switch received that had errors—for example, packets that do not conform to the IGMPv1, IGMPv2, or IGMPv3 standards. If the Recv Errors count increases, verify that the hosts are compliant with IGMP standards. If the switch is unable to recognize the IGMP message type for a packet, it counts the packet under Receive unknown.

**Viewing IGMP Snooping Routing Information**

**Purpose**
Display the next-hop information maintained in the multicast forwarding table.
**Action**
Enter the following command:

```
user@switch> show igmp-snooping route detail
```

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Group</th>
<th>Next-hop</th>
</tr>
</thead>
<tbody>
<tr>
<td>v100</td>
<td>224.0.0.0, *</td>
<td>1323</td>
</tr>
<tr>
<td></td>
<td>Interfaces: ge-0/0/0.0</td>
<td></td>
</tr>
<tr>
<td>v100</td>
<td>226.0.0.1, *</td>
<td>1322</td>
</tr>
<tr>
<td></td>
<td>Interfaces: ge-0/0/0.0, ge-0/0/1.0, ge-0/0/47.0</td>
<td></td>
</tr>
</tbody>
</table>

**Meaning**
The output shows the next-hop interfaces for a given multicast group on a VLAN. For example, route 226.0.0.1 on v100 has next-hop interfaces ge-0/0/0.0, ge-0/0/1.0, and ge-0/0/47.0.

**Operational Commands**
clear igmp membership

**Syntax**
```
clear igmp membership
  <group address-range>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**
```
clear igmp membership
  <group address-range>
  <interface interface-name>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Clear Internet Group Management Protocol (IGMP) group members.

**Options**
- **none**—Clear all IGMP members on all interfaces and for all address ranges.
- **group address-range**—(Optional) Clear all IGMP members that are in a particular address range. An example of a range is `224.2/16`. If you omit the destination prefix length, the default is `/32`.
- **interface interface-name**—(Optional) Clear all IGMP group members on an interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**
```
clear
```

clear igmp statistics

Syntax
<interface interface-name>
logical-system (all | logical-system-name)>

Syntax (EX Series Switches)
clear igmp statistics
<interface interface-name>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Clear Internet Group Management Protocol (IGMP) statistics.

Options
none—Clear IGMP statistics on all interfaces.
interface interface-name—(Optional) Clear IGMP statistics for the specified interface only.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
Level
clear

### clear igmp-snooping membership

**Syntax**
```plaintext
clear igmp-snooping membership
<vlan vlan-name>
```

**Release Information**
Command introduced in Junos OS Release 9.1 for EX Series switches.

**Description**
Clear IGMP snooping dynamic membership information from the multicast forwarding table.

**Options**
- **none**—Clear dynamic membership information for all VLANs.
- **vlan vlan-name**—(Optional) Clear dynamic membership information for the specified VLAN.

**Required Privilege Level**
- view

**Related Documentation**
- show igmp-snooping membership on page 3453
- clear igmp-snooping statistics on page 3419

**List of Sample Output**
clear igmp-snooping membership on page 3418

**Sample Output**
clear igmp-snooping membership
```
user@switch> clear igmp-snooping membership vlan employee-vlan
```
### clear igmp-snooping statistics

**Syntax**
```plaintext
clear igmp-snooping statistics
```

**Release Information**
Command introduced in Junos OS Release 9.1 for EX Series switches.

**Description**
Clear IGMP snooping statistics.

**Required Privilege Level**
`view`

**Related Documentation**
- [show igmp-snooping statistics on page 3458](#)
- [clear igmp-snooping membership on page 3418](#)

**List of Sample Output**
`clear igmp-snooping statistics on page 3419`

**Sample Output**
clear igmp-snooping statistics

```
user@switch> clear igmp-snooping statistics
```
clear multicast bandwidth-admission

Syntax clear multicast bandwidth-admission
    <group group-address>
    <inet | inet6>
    <instance instance-name>
    <interface interface-name>
    <source source-address>

Release Information
Command introduced in Junos OS Release 8.3.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Reapply IP multicast bandwidth admissions.

Options
none—Reapply multicast bandwidth admissions for all IPv4 forwarding entries in the master routing instance.

group group-address—(Optional) Reapply multicast bandwidth admissions for the specified group.

inet—(Optional) Reapply multicast bandwidth admission settings for IPv4 flows.

inet6—(Optional) Reapply multicast bandwidth admission settings for IPv6 flows.

instance instance-name—(Optional) Reapply multicast bandwidth admission settings for the specified instance. If you do not specify an instance, the command applies to the master routing instance.

interface interface-name—(Optional) Examines the corresponding outbound interface in the relevant entries and acts as follows:
- If the interface is congested, and it was admitted previously, it is removed.
- If the interface was rejected previously, the clear multicast bandwidth-admission command enables the interface to be admitted as long as enough bandwidth exists on the interface.
- If you do not specify an interface, issuing the clear multicast bandwidth-admission command readmits any previously rejected interface for the relevant entries as long as enough bandwidth exists on the interface.

To manually reject previously admitted outbound interfaces, you must specify the interface.

source source-address—(Optional) Use with the group option to reapply multicast bandwidth admission settings for the specified (source, group) entry.

Required Privilege
Level clear
When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear multicast bandwidth-admission

user@host> clear multicast bandwidth-admission
```
clear multicast scope

Syntax

```
clear multicast scope
  <inet | inet6>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
```

Syntax (EX Series Switch and the QFX Series)

```
clear multicast scope
  <inet | inet6>
  <interface interface-name>
```

Release Information

Command introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 option introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Clear IP multicast scope statistics.

Options

- `none`—(Same as `logical-system all`) Clear multicast scope statistics.
- `inet`—(Optional) Clear multicast scope statistics for IPv4 family addresses.
- `inet6`—(Optional) Clear multicast scope statistics for IPv6 family addresses.
- `interface interface-name`—(Optional) Clear multicast scope statistics on a specific interface.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

`clear`

Related Documentation

- `show multicast scope` on page 3483

List of Sample Output

- `clear multicast scope` on page 3422

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear multicast scope

user@host> clear multicast scope
```
clear multicast sessions

**Syntax**

```plaintext
clear multicast sessions
<logical-system (all | logical-system-name)>
<regular-expression>
```

**Syntax (EX Series Switch and the QFX Series)**

```plaintext
clear multicast sessions
<regular-expression>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Clear IP multicast sessions.

**Options**

- `none`—(Same as `logical-system all`) Clear multicast sessions.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `regular-expression`—(Optional) Clear only multicast sessions that contain the specified regular expression.

**Required Privilege Level**

`clear`

**Related Documentation**

clear multicast statistics

Syntax

```
clear multicast statistics
<inet | inet6>
<instance instance-name>
<interface interface-name>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switch and the QFX Series)

```
clear multicast statistics
<inet | inet6>
<instance instance-name>
<interface interface-name>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Clear IP multicast statistics.

Options

```
none—Clear multicast statistics for all supported address families on all interfaces.
inet—(Optional) Clear multicast statistics for IPv4 family addresses.
inet6—(Optional) Clear multicast statistics for IPv6 family addresses.
instance instance-name—(Optional) Clear multicast statistics for the specified instance.
interface interface-name—(Optional) Clear multicast statistics on a specific interface.
logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.
```

Required Privilege Level clear

Related Documentation

- `show multicast statistics`

List of Sample Output

Sample Output

```
clear multicast statistics

user@host> clear multicast statistics
```
### clear pim join

**Syntax**

```
clear pim join
<group-address>
<bidirectional | dense | sparse>
<exact>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

**Syntax (EX Series Switch and the QFX Series)**

```
clear pim join
<group-address>
<dense | sparse>
<exact>
<inet | inet6>
<instance instance-name>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- *inet6* and *instance* options introduced in Junos OS Release 10.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Multiple new filter options introduced in Junos OS Release 13.2.

**Description**

Clear the Protocol Independent Multicast (PIM) join and prune states.

**Options**

- **none**—Clear the PIM join and prune states for all groups, family addresses, and instances.
- **group-address**—(Optional) Clear the PIM join and prune states for a group address.
- **bidirectional | dense | sparse**—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.
- **exact**—(Optional) Clear only the group that exactly matches the specified group address.
- **inet | inet6**—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.
- **instance instance-name**—(Optional) Clear the entries for a specific PIM-enabled routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **rp ip-address/prefix | source ip-address/prefix**—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.
- **sg | star-g**—(Optional) Clear PIM *(S,G)* or *(G)* entries.
The `clear pim join` command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

**Required Privilege Level**
clear

**Related Documentation**
- show pim join on page 3496

**List of Sample Output**
clear pim join on page 3426
clear pim join inet6 on page 3426
clear pim join inet6 star-g on page 3426

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
clear pim join

```
user@host> clear pim join
Cleared 8 Join/Prune states
```

clear pim join inet6

```
user@host> clear pim join inet6
Cleared 4 Join/Prune states
```

clear pim join inet6 star-g

```
user@host> clear pim join inet6 star-g
Cleared 1 Join/Prune states
```
clear pim register

**Syntax**
```
clear pim register
<inet | inet6>
<instance instance-name>
<interface interface-name>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**
```
clear pim register
<inet | inet6>
<instance instance-name>
<interface interface-name>
```

**Syntax (PTX Series)**
```
clear pim register
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Release Information**
Command introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
*inet6* and *instance* options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Clear Protocol Independent Multicast (PIM) register message counters.

**Options**
- **none**—Clear PIM register message counters for all family addresses, instances, and interfaces.
- **inet | inet6**—(Optional) Clear PIM register message counters for IPv4 or IPv6 family addresses, respectively.
- **instance instance-name**—(Optional) Clear register message counters for a specific PIM-enabled routing instance.
- **interface interface-name**—(Optional) Clear PIM register message counters for a specific interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information**
The `clear pim register` command cannot be used to clear the PIM register state on a backup Routing Engine when nonstop active routing is enabled.

**Required Privilege Level**
clear

...```
**mtrace**

**Syntax**

```
mtrace source
<logical-system logical-system-name>
<routing-instance routing-instance-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 9.5 for SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 12.3 for the PTX Series.

**Description**

Display trace information about an IP multicast path.

**Options**

- `source`—Source hostname or address.

- `logical-system (logical-system-name)`—(Optional) Perform this operation on a logical system.

- `routing-instance routing-instance-name`—(Optional) Trace a particular routing instance.

**Additional Information**

The `mtrace` command for multicast traffic is similar to the `traceroute` command used for unicast traffic. Unlike `traceroute`, `mtrace` traces traffic backwards, from the receiver to the source.

**Required Privilege Level**

`view`

**List of Sample Output**

`mtrace source on page 3433`

**Output Fields**

Table 403 on page 3431 describes the output fields for the `mtrace` command. Output fields are listed in the approximate order in which they appear.

<group group>
<interval interval>
<loop>
<max-hops max-hops>
<max-queries max-queries>
<multicast-response | unicast-response>
<no-resolve>
<no-router-alert>
=response response>
<routing-instance routing-instance-name>
<ttl ttl>
<wait-time wait-time>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display trace information about an IP multicast path from a source to this router or switch.
If you specify a group address with this command, Junos OS returns additional information,
such as packet rates and losses.

Options

brief | detail—(Optional) Display the specified level of output.
extra-hops extra-hops—(Optional) Number of hops to take after reaching a nonresponsive
router. You can specify a number between 0 and 255.
group group—(Optional) Group address for which to trace the path. The default group
address is 0.0.0.0.
interval interval—(Optional) Number of seconds to wait before gathering statistics again.
The default value is 10 seconds.
loop—(Optional) Loop indefinitely, displaying rate and loss statistics.
max-hops max-hops—(Optional) Maximum hops to trace toward the source. The range
of values is 0 through 255. The default value is 32 hops.
max-queries max-queries—(Optional) Maximum number of query attempts for any hop.
The range of values is 1 through 32. The default is 3.
multicast-response—(Optional) Always request the response using multicast.
no-resolve—(Optional) Do not attempt to display addresses symbolically.
no-router-alert—(Optional) Do not use the router-alert IP option.
response response—(Optional) Send trace response to a host or multicast address.
routing-instance routing-instance-name—(Optional) Trace a particular routing instance.

source source—Source hostname or address.

ttl ttl—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

unicast-response—(Optional) Always request the response using unicast.

wait-time wait-time—(Optional) Number of seconds to wait for a response. The default value is 3.

       <response response>
       <routing-instance routing-instance-name>
       < ttl ttl>
       <unicast-response>
       <wait-time wait-time>
```  

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Display trace information about a multicast path from this router or switch to a gateway router or switch.

**Options**

- `gateway gateway`—Send the trace query to a gateway multicast address.
- `brief | detail`—(Optional) Display the specified level of output.
- `extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between 0 and 255.
- `group group`—(Optional) Group address for which to trace the path. The default group address is 0.0.0.0.
- `interface interface-name`—(Optional) Source address for sending the trace query.
- `interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is 10.
- `loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.
- `max-hops max-hops`—(Optional) Maximum hops to trace toward the source. You can specify a number between 0 and 255. The default value is 32.
- `max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. You can specify a number between 0 and 255. The default value is 3.
- `no-resolve`—(Optional) Do not attempt to display addresses symbolically.
no-router-alert—(Optional) Do not use the router-alert IP option.

response response—(Optional) Send trace response to a host or multicast address.

routing-instance routing-instance-name—(Optional) Trace a particular routing instance.

ttl ttl—(Optional) IP time-to-live value. You can specify a number between 0 and 225.
Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

unicast-response—(Optional) Always request the response using unicast.

wait-time wait-time—(Optional) Number of seconds to wait for a response. The default value is 3.

<td>• IGMP Other Querier Present Timeout—Time (in seconds) that the router waits for the IGMP querier to send a query.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Sample Output

```bash
show igmp interface

user@host> show igmp interface
Interface: at-0/3/1.0
   Querier: 10.111.30.1
   State:    Up Timeout:    None Version:  2 Groups:      4
   SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
   Querier: 10.111.10.1
   State:    Up Timeout:    None Version:  2 Groups:      2
   SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
   Querier: 10.111.20.1
   State:    Up Timeout:    None Version:  2 Groups:      4
   SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

show igmp interface brief

The output for the show igmp interface brief command is identical to that for the show igmp interface command. For sample output, see show igmp interface on page 3448.
show igmp interface detail

The output for the `show igmp interface detail` command is identical to that for the `show igmp interface` command. For sample output, see `show igmp interface` on page 3448.

```
show igmp interface <interface-name>
```

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
    Querier: 20.1.1.1
    State: Up Timeout: None Version: 3 Groups: 1
    Group limit: 8
    Group threshold: 60
    Group log-interval: 10
    Immediate leave: Off
    Promiscuous mode: Off
```
show igmp statistics

Syntax

show igmp statistics

Syntax (EX Series Switch and the QFX Series)

show igmp statistics

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display Internet Group Management Protocol (IGMP) statistics.

Options

none—Display IGMP statistics for all interfaces.

brief | detail—(Optional) Display the specified level of output.

interface interface-name—(Optional) Display IGMP statistics about the specified interface only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

<tr>
<td>Rx errors</td>
<td>Number of received packets that contained errors.</td>
</tr>
</tbody>
</table>

IGMP Global Statistics: Summary of IGMP statistics for all interfaces.

- **Bad Length**—Number of messages received with length errors so severe that further classification could not occur.
- **Bad Checksum**—Number of messages received with a bad IP checksum. No further classification was performed.
- **Bad Receive If**—Number of messages received on an interface not enabled for IGMP.
- **Rx non-local**—Number of messages received from senders that are not local.
- **Timed out**—Number of groups that timed out as a result of not receiving an explicit leave message.
- **Rejected Report**—Number of reports dropped because of the IGMP group policy.
- **Total Interfaces**—Number of interfaces configured to support IGMP.

Sample Output

```
show igmp statistics
IGMP packet statistics for all interfaces
IGMP Message type        Received Sent  Rx errors
Membership Query          8883    459    0
V1 Membership Report      0       0      0
```
<table>
<thead>

<td></td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**IGMP Global Statistics**

- Bad Length: 0
- Bad Checksum: 0
- Bad Receive If: 0
- Rx non-local: 1227
- Timed out: 0
- Rejected Report: 0
- Total Interfaces: 2

**show igmp statistics interface**

```
user@host> show igmp statistics interface fe-1/0/1.0
IGMP interface packet statistics for fe-1/0/1.0
IGMP Message type    Received  Sent  Rx errors
Membership Query      0        230  0
V1 Membership Report  0        0    0
```
show igmp-snooping membership

Syntax

show igmp-snooping membership
  <brief | detail>
  <interface interface-name>
  <vlan (vlan-id | vlan-name)>

Release Information

Command introduced in Junos OS Release 9.1 for EX Series switches.

Description

Display the multicast group membership information maintained by IGMP snooping.

Options

none—Display the multicast group membership information about all VLANs on which IGMP snooping is enabled.

brief | detail—(Optional) Display the specified level of output. The default is brief.

interface interface-name—(Optional) Display the multicast group membership information about the specified interface.

vlan (vlan-id | vlan-name)—(Optional) Display the multicast group membership for the specified VLAN.

Required Privilege

show igmp-snooping route

Syntax

```
show igmp-snooping route
  <brief | detail>
  <ethernet-switching | inet>
  <vlan (vlan-id | vlan-name)>
```

Release Information

Command introduced in Junos OS Release 9.1 for EX Series switches.

Description

Display IGMP snooping route information.

Options

- `none`—Display route information for all VLANs on which IGMP snooping is enabled.
- `brief | detail`—(Optional) Display the specified level of output. The default is `brief`.
- `ethernet-switching`—(Optional) Display information on Layer 2 multicast routes. This is the default.
- `inet`—(Optional) Display information for Layer 3 multicast routes.
- `vlan (vlan-id | vlan-name)`—(Optional) Display route information for the specified VLAN.

Required Privilege

`view`

fe-0/0/3.230                            20000000                      18000000
fe-0/0/2.200                            100000000                     100000000
```

**Copyright © 2013, Juniper Networks, Inc.**
**show multicast mrinfo**

**Syntax**
```
show multicast mrinfo
<host>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Display configuration information about IP multicast networks, including neighboring multicast router addresses.

**Options**
- `none`—Display configuration information about all multicast networks.
- `host`—(Optional) Display configuration information about a particular host. Replace `host` with a hostname or IP address.

**Required Privilege Level**
`view`

**List of Sample Output**
`show multicast mrinfo on page 3465`

**Output Fields**
Table 415 on page 3464 describes the output fields for the `show multicast mrinfo` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-address</td>
<td>Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.</td>
</tr>
<tr>
<td>ip-address-1→ip-address-2</td>
<td>Queried router interface address and directly attached neighbor interface address, respectively.</td>
</tr>
<tr>
<td>(name or ip-address)</td>
<td>Name or IP address of neighbor.</td>
</tr>
<tr>
<td>[metric/threshold/type/flags]</td>
<td>Neighbor’s multicast profile:</td>
</tr>
<tr>
<td></td>
<td>• metric—Always has a value of 1, because <code>mrinfo</code> queries the directly connected interfaces of a device.</td>
</tr>
<tr>
<td></td>
<td>• threshold—Multicast threshold time-to-live (TTL). The range of values is 0 through 255.</td>
</tr>
<tr>
<td></td>
<td>• type—Multicast connection type: <code>pim</code> or <code>tunnel</code>.</td>
</tr>
<tr>
<td></td>
<td>• flags—Flags for this route:</td>
</tr>
<tr>
<td></td>
<td>• querier—Queried router is the designated router for the neighboring session.</td>
</tr>
<tr>
<td></td>
<td>• leaf—Link is a leaf in the multicast network.</td>
</tr>
<tr>
<td></td>
<td>• down—Link status indicator.</td>
</tr>
</tbody>
</table>
Sample Output

show multicast mrinfo

user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
  0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
**show multicast next-hops**

**Syntax**

```
show multicast next-hops
   <brief | detail>
   <identifier-number>
   <inet | inet6>
   <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**

```
show multicast next-hops
   <brief | detail>
   <identifier-number>
   <inet | inet6>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`inet6` option introduced in Junos OS Release 10.0 for EX Series switches.
`detail` option display of next-hop ID number introduced in Junos OS Release 11.1 for M Series and T Series routers and EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.

**Description**

Display the entries in the IP multicast next-hop table.

**Options**

- **none**—Display standard information about all entries in the multicast next-hop table for all supported address families.
- **brief | detail**—(Optional) Display the specified level of output.
  
  When you include the `detail` option on M Series and T Series routers and EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form `fe-0/1/2.0-(1048574)` where 1048574 is the next-hop ID number.

- **identifier-number**—(Optional) Show a particular next hop by ID number. The range of values is 1 through 65,535.

- **inet | inet6**—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

- show multicast next-hops on page 3467
- show multicast next-hops (Bidirectional PIM on page 3467
- show multicast next-hops brief on page 3468
- show multicast next-hops detail on page 3468

**Output Fields**

Table 416 on page 3467 describes the output fields for the `show multicast next-hops` command. Output fields are listed in the approximate order in which they appear.
Table 416: show multicast next-hops Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Family</td>
<td>Protocol family (such as INET).</td>
</tr>
<tr>
<td>ID</td>
<td>Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.</td>
</tr>
<tr>
<td>Refcount</td>
<td>Number of cache entries that are using this next hop.</td>
</tr>
<tr>
<td>KRefcount</td>
<td>Kernel reference count for the next hop.</td>
</tr>
<tr>
<td>Downstream interface</td>
<td>Interface names associated with each multicast next-hop ID.</td>
</tr>
<tr>
<td>Incoming interface list</td>
<td>List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.</td>
</tr>
</tbody>
</table>

Sample Output

show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
262142          4          2 so-1/0/0.0
262143          2          1 mt-1/1/0.49152
262148          2          1 mt-1/1/0.32769
```

show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
2097151            8         4 ge-0/0/1.0

Family: INET6

544                1         0 lo0.0  xe-4/1/0.0
```
show multicast next-hops brief

The output for the show multicast next-hops brief command is identical to that for the show multicast next-hops command. For sample output, see show multicast next-hops on page 3467.

show multicast next-hops detail

```
user@host> show multicast next-hops detail  
Family: INET  
ID          Refcount KRefcount Downstream interface  
1048577         2             1 fe-0/1/2.0-(1048574)   
                 ge-0/2/3.0-(1048576)
```
show multicast pim-to-igmp-proxy

Syntax

show multicast pim-to-igmp-proxy
<instance instance-name>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switch and the QFX Series)

show multicast pim-to-igmp-proxy
<instance instance-name>

Release Information
Command introduced in Junos OS Release 9.6 for EX Series switches.
instance option introduced in Junos OS Release 10.3.
instance option introduced in Junos OS Release 10.3 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Display configuration information about PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy.

Options

none—Display configuration information about PIM-to-IGMP message translation for all routing instances.

instance instance-name—(Optional) Display configuration information about PIM-to-IGMP message translation for a specific multicast instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show multicast route

Syntax

show multicast route
   <brief | detail | extensive | summary>
   <active | all | inactive>
   <group group>
   <inet | inet6>
   <instance instance name>
   <logical-system (all | logical-system-name)>
   <regular-expression>
   <source-prefix source-prefix>

Syntax (EX Series Switch and the QFX Series)

show multicast route
   <brief | detail | extensive | summary>
   <active | all | inactive>
   <group group>
   <inet | inet6>
   <instance instance name>
   <regular-expression>
   <source-prefix source-prefix>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.

Description

Display the entries in the IP multicast forwarding table. You can display similar information with the show route table inet.1 command.

Options

none—Display standard information about all entries in the multicast forwarding table for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

active | all | inactive—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

group group—(Optional) Display the cache entries for a particular group.

inet | inet6—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.
**source-prefix source-prefix**—(Optional) Display the cache entries for a particular source prefix.

**Required Privilege**

- show multicast rpf summary on page 3482
Output Fields  
Table 420 on page 3480 describes the output fields for the `show multicast rpf` command. Output fields are listed in the approximate order in which they appear.

### Table 420: show multicast rpf Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance. (Displayed when multicast is configured within a routing instance.)</td>
</tr>
<tr>
<td>Source prefix</td>
<td>Prefix and length of the source as it exists in the multicast forwarding table.</td>
</tr>
<tr>
<td>Protocol</td>
<td>How the route was learned.</td>
</tr>
<tr>
<td>Interface</td>
<td>Upstream RPF interface.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>Upstream RPF neighbor.</td>
</tr>
</tbody>
</table>

**NOTE:** The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the `show multicast rpf` command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the `show pim join extensive` command when bidirectional PIM is configured.

**NOTE:** The displayed neighbor information does not apply to bidirectional PIM. This is because the `show multicast rpf` command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the `show pim join extensive` command when bidirectional PIM is configured.

show multicast scope

Syntax

show multicast scope
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switch and the QFX Series)

show multicast scope
<inet | inet6>
<instance instance-name>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display administratively scoped IP multicast information.

Options

none—Display standard information about administratively scoped multicast information for all supported address families in all routing instances.

inet | inet6—(Optional) Display scoped multicast information for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display administratively scoped information for a specific multicast instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show pim bootstrap

Syntax

show pim bootstrap

<instance instance-name>

<logical-system (all | logical-system-name)>

Syntax (EX Series Switch and the QFX Series)

show pim bootstrap

<instance instance-name>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
instance option introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.

Options

none—Display PIM bootstrap router information for all routing instances.

instance instance-name—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show pim interfaces

Syntax

```
show pim interfaces
  <inet | inet6>
  <instance (instance-name | all)>
  <logical-system (all | logical-system-name)>
```

Syntax (EX Series Switch and the QFX Series)

```
show pim interfaces
  <inet | inet6>
  <instance (instance-name | all)>
```

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Support for bidirectional PIM added in Junos OS Release 12.1.
- Support for the `instance all` option added in Junos OS Release 12.1.

Description

Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.

Options

- `none`—Display interface information for all family addresses for the main instance.
- `inet | inet6`—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.
- `instance (instance-name | all)`—(Optional) Display information about interfaces for a specific PIM-enabled routing instance or for all routing instances.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Output Fields

Table 425 on page 3493 describes the output fields for the `show pim interfaces` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Interface name.</td>
</tr>
<tr>
<td>State</td>
<td>State of the interface. The state also is displayed in the <code>show interfaces</code> command.</td>
</tr>
</tbody>
</table>
Table 425: show pim interfaces Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>PIM mode running on the interface:</td>
</tr>
<tr>
<td></td>
<td>• B—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</td>
</tr>
<tr>
<td></td>
<td>• S—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</td>
</tr>
<tr>
<td></td>
<td>• Dense—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</td>
</tr>
<tr>
<td></td>
<td>• Sparse-Dense—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as dense is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as sparse is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. (Not supported on QFX Series.)</td>
</tr>
<tr>
<td></td>
<td>When sparse-dense mode is configured, the output includes both S and D. When bidirectional-sparse mode is configured, the output includes S and B. When bidirectional-sparse-dense mode is configured, the output includes B, S, and D.</td>
</tr>
<tr>
<td>IP</td>
<td>Version number of the address family on the interface: 4 (IPv4) or 6 (IPv6).</td>
</tr>
<tr>
<td>V</td>
<td>PIM version running on the interface: 1 or 2.</td>
</tr>
<tr>
<td>State</td>
<td>State of PIM on the interface:</td>
</tr>
<tr>
<td></td>
<td>• Active—Bidirectional mode is enabled on the interface and on all PIM neighbors.</td>
</tr>
<tr>
<td></td>
<td>• DR—Designated router.</td>
</tr>
<tr>
<td></td>
<td>• NotCap—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol.</td>
</tr>
<tr>
<td></td>
<td>• NotDR—Not the designated router.</td>
</tr>
<tr>
<td></td>
<td>• P2P—Point to point.</td>
</tr>
<tr>
<td>NbrCnt</td>
<td>Number of neighbors that have been seen on the interface.</td>
</tr>
<tr>
<td>JoinCnt(sg)</td>
<td>Number of (s,g) join messages that have been seen on the interface.</td>
</tr>
<tr>
<td>JointCnt(*g)</td>
<td>Number of (*g) join messages that have been seen on the interface.</td>
</tr>
<tr>
<td>DR address</td>
<td>Address of the designated router.</td>
</tr>
</tbody>
</table>

Syntax (EX Series Switch and the QFX Series)

show pim join
<brief | detail | extensive | summary>
<dense | sparse>
<exact>
/inet | inet6>
<instance instance-name>
<range>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
summary option introduced in Junos OS Release 9.6.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Multiple new filter options introduced in Junos OS Release 13.2.

Description

Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (*G-range) for each active bidirectional RP group range, in addition to each of the joined (*G) routes.

Options

none—Display the standard information about PIM groups for all supported family addresses for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

bidirectional | dense | sparse—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

exact—(Optional) Display information about only the group that exactly matches the specified group address.

inet | inet6—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.
instance instance-name—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Address range of the group, specified as prefix/prefix-length.

rp ip-address/prefix | source ip-address/prefix—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | star-g—(Optional) Display information about PIM (S,G) or (*,G) entries.

</table>
### Table 426: show pim join Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Upstream neighbor</strong></td>
<td>Information about the upstream neighbor: Direct, Local, Unknown, or a specific IP address. For bidirectional PIM, Direct means that the interface is directly connected to a subnet that contains a phantom RP address. The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</td>
<td>extensive</td>
</tr>
<tr>
<td><strong>Upstream state</strong></td>
<td>Information about the upstream interface:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>- <strong>Join to RP</strong>—Sending a join to the rendezvous point.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Join to Source</strong>—Sending a join to the source.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Local RP</strong>—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Local Source</strong>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Prune to RP</strong>—Sending a prune to the rendezvous point.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <strong>Prune to Source</strong>—Sending a prune to the source.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** RP group range entries have **None** in the **Upstream state** field because RP group ranges do not trigger actual PIM join messages between routing devices.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Support for the instance all option added in Junos OS Release 12.1.

Description

Display information about Protocol Independent Multicast (PIM) neighbors.

Options

none—(Same as brief) Display standard information about PIM neighbors for all supported family addresses for the main instance.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information about PIM neighbors for IPv4 or IPv6 family addresses, respectively.

instance (instance-name | all)—(Optional) Display information about neighbors for the specified PIM-enabled routing instance or for all routing instances.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

view

List of Sample Output

show pim neighbors on page 3512
show pim neighbors brief on page 3512
show pim neighbors instance on page 3512
show pim neighbors detail on page 3512
show pim neighbors detail (With BFD) on page 3513

Output Fields

Table 427 on page 3511 describes the output fields for the show pim neighbors command. Output fields are listed in the approximate order in which they appear.
### Table 427: show pim neighbors Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance.</td>
<td>All levels</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface through which the neighbor is reachable.</td>
<td>All levels</td>
</tr>
<tr>
<td>Neighbor addr</td>
<td>Address of the neighboring PIM routing device.</td>
<td>All levels</td>
</tr>
<tr>
<td>IP</td>
<td>IP version: 4 or 6.</td>
<td>All levels</td>
</tr>
<tr>
<td>V</td>
<td>PIM version running on the neighbor: 1 or 2.</td>
<td>All levels</td>
</tr>
<tr>
<td>Mode</td>
<td>PIM mode of the neighbor: Sparse, Dense, SparseDense, or Unknown. When the neighbor is running PIM version 2, this mode is always Unknown.</td>
<td>All levels</td>
</tr>
<tr>
<td>Option</td>
<td>Can be one or more of the following:</td>
<td>brief none</td>
</tr>
<tr>
<td></td>
<td>• B—Bidirectional Capable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• H—Hello Option Holdtime.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• G—Generation Identifier.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• P—Hello Option DR Priority.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• L—Hello Option LAN Prune Delay.</td>
<td></td>
</tr>
<tr>
<td>Uptime</td>
<td>Time the neighbor has been operational since the PIM process was last initialized, in the format $dd:hh:mm:ss$ ago for less than a week and $nwnd:hh:mm:ss$ ago for more than a week.</td>
<td>All levels</td>
</tr>
<tr>
<td>Address</td>
<td>Address of the neighboring PIM routing device.</td>
<td>detail</td>
</tr>
<tr>
<td>BFD</td>
<td>Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: Enabled, Operational state is up, or Disabled.</td>
<td>detail</td>
</tr>
<tr>
<td>Hello Option Holdtime</td>
<td>Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.</td>
<td>detail</td>
</tr>
<tr>
<td>Hello Default Holdtime</td>
<td>Default holdtime and the time remaining if the holdtime option is not in the received hello message.</td>
<td>detail</td>
</tr>
<tr>
<td>Hello Option DR Priority</td>
<td>Designated router election priority. The range of values is 0 through 255.</td>
<td>detail</td>
</tr>
<tr>
<td>Hello Option Generation ID</td>
<td>9-digit or 10-digit number used to tag hello messages.</td>
<td>detail</td>
</tr>
<tr>
<td>Hello Option Bi-Directional PIM supported</td>
<td>Neighbor can process bidirectional PIM messages.</td>
<td>detail</td>
</tr>
<tr>
<td>Hello Option LAN Prune Delay</td>
<td>Time to wait before the neighbor receives prune messages, in the format delay $nnn$ ms override $nnn$ ms.</td>
<td>detail</td>
</tr>
</tbody>
</table>
Table 427: show pim neighbors Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Suppression supported</td>
<td>Neighbor is capable of join suppression.</td>
<td>detail</td>
</tr>
<tr>
<td>Rx Join</td>
<td>Information about joins received from the neighbor.</td>
<td>detail</td>
</tr>
<tr>
<td></td>
<td>• Group—Group addresses in the join message.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Source—Address of the source in the join message.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Timeout—Time for which the join is valid.</td>
<td></td>
</tr>
</tbody>
</table>

Sample Output

show pim neighbors

```
user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface           IP V Mode     Option      Uptime Neighbor addr
so-1/0/0.0           4 2             HPLG      00:07:10 10.111.10.2
```

show pim neighbors brief

The output for the `show pim neighbors brief` command is identical to that for the `show pim neighbors` command. For sample output, see `show pim neighbors on page 3512`.

show pim neighbors instance

```
user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface           IP V Mode     Option      Uptime Neighbor addr
at-0/3/1.0           4 2             HPLG      00:07:54 10.111.30.2

```

show pim neighbors detail

```
user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsg Join Count: 2
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```
Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
BFD: Disabled
Hello Option Holdtime: 105 seconds 93 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 1734018161
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

Interface: lo0.0

Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsg Join Count: 0
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 1997462267
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

show pim neighbors detail (With BFD)

user@host> show pim neighbors detail
Instance: PIM.master
Interface: fe-1/0/0.0
Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 836607909
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

Address: 192.168.11.2, IPv4, PIM v2
BFD: Enabled, Operational state is up
Hello Default Holdtime: 105 seconds 104 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 1907549685
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

Interface: fe-1/0/1.0
Address: 192.168.12.1, IPv4, PIM v2
BFD: Disabled
Hello Default Holdtime: 105 seconds 80 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 1971554705
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
**show pim rps**

**Syntax**
```
show pim rps
<brief | detail | extensive>
<group-address>
/inet | inet6>
<instance instance-name>
/logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)**
```
show pim rps
<brief | detail | extensive>
<group-address>
/inet | inet6>
<instance instance-name>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.

**Description**
Display information about Protocol Independent Multicast (PIM) rendezvous points (RPs).

**Options**

- **none**—Display standard information about PIM RPs for all groups and family addresses for all routing instances.

- **brief | detail | extensive**—(Optional) Display the specified level of output.

- **group-address**—(Optional) Display the RPs for a particular group. If you specify a group address, the output lists the routing device that is the RP for that group.

- **inet | inet6**—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

- **instance instance-name**—(Optional) Display information about RPs for a specific PIM-enabled routing instance.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**
`view`

**show pim source**

**Syntax**

show pim source

- `<brief | detail>`
- `<inet | inet6>`
- `<instance instance-name>`
- `<logical-system (all | logical-system-name)>`
- `<source-prefix>`

**Syntax (EX Series Switch and the QFX Series)**

show pim source

- `<brief | detail>`
- `<inet | inet6>`
- `<instance instance-name>`
- `<source-prefix>`

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.

**Options**

- **none**—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.

  - `<brief | detail>`—(Optional) Display the specified level of output.

  - `<inet | inet6>`—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

  - `<instance instance-name>`—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.

  - `<logical-system (all | logical-system-name)>`—(Optional) Perform this operation on all logical systems or on a particular logical system.

  - `<source-prefix>`—(Optional) Display the state for source RPF states in the given range.

**Required Privilege**

- **view**

**List of Sample Output**

- show pim source on page 3522
- show pim source brief on page 3522
- show pim source detail on page 3522
- show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 3523

**Output Fields**

Table 429 on page 3522 describes the output fields for the `show pim source` command. Output fields are listed in the approximate order in which they appear.
### Table 429: show pim source Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance.</td>
</tr>
<tr>
<td>Source</td>
<td>Address of the source or reverse path.</td>
</tr>
<tr>
<td>Prefix/length</td>
<td>Prefix and prefix length for the route used to reach the RPF address.</td>
</tr>
<tr>
<td>Upstream Protocol</td>
<td>RPF interface toward the source address.</td>
</tr>
<tr>
<td>Upstream interface</td>
<td>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</td>
</tr>
<tr>
<td>Upstream Neighbor</td>
<td>Address of the RPF neighbor used to reach the source address.</td>
</tr>
<tr>
<td></td>
<td>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</td>
</tr>
</tbody>
</table>

### Sample Output

**show pim source**

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

**show pim source brief**

The output for the `show pim source brief` command is identical to that for the `show pim source` command. For sample output, see `show pim source on page 3522`.

**show pim source detail**

```
user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local
  Active groups: 228.0.0.0
                  239.1.1.1
```

### show pim statistics

**Syntax**

```
show pim statistics
<inet | inet6>
<instance instance-name>
<interface interface-name>
logical-system (all | logical-system-name)
```

**Syntax (EX Series Switch and the QFX Series)**

```
show pim statistics
<inet | inet6>
<instance instance-name>
<interface interface-name>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `inet6` and `instance` options introduced in Junos OS Release 10.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- Support for bidirectional PIM added in Junos OS Release 12.1.

**Description**

Display Protocol Independent Multicast (PIM) statistics.

**Options**

- `none`—Display PIM statistics.
- `inet | inet6`—(Optional) Display IPv4 or IPv6 PIM statistics, respectively.
- `instance instance-name`—(Optional) Display statistics for a specific routing instance enabled by Protocol Independent Multicast (PIM).
- `interface interface-name`—(Optional) Display statistics about the specified interface.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

- `view`

**Related Documentation**

- [clear pim statistics on page 3429](#)

**List of Sample Output**

- `show pim statistics on page 3531`
- `show pim statistics inet interface <interface-name> on page 3533`
- `show pim statistics inet6 interface <interface-name> on page 3533`
- `show pim statistics instance <instance-name> on page 3534`
- `show pim statistics interface <interface-name> on page 3535`

**Output Fields**

Table 430 on page 3525 describes the output fields for the `show pim statistics` command. Output fields are listed in the approximate order in which they appear.
### Table 430: show pim statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td>Name of the routing instance. This field only appears if you specify an interface, for example:</td>
</tr>
<tr>
<td></td>
<td>- <code>inet interface interface-name</code></td>
</tr>
<tr>
<td></td>
<td>- <code>inet6 interface interface-name</code></td>
</tr>
<tr>
<td></td>
<td>- <code>interface interface-name</code></td>
</tr>
<tr>
<td>Family</td>
<td>Output is for IPv4 or IPv6 PIM statistics. <code>INET</code> indicates IPv4 statistics, and <code>INET6</code> indicates IPv6 statistics. This field only appears if you specify an interface, for example:</td>
</tr>
<tr>
<td></td>
<td>- <code>inet interface interface-name</code></td>
</tr>
<tr>
<td></td>
<td>- <code>inet6 interface interface-name</code></td>
</tr>
<tr>
<td></td>
<td>- <code>interface interface-name</code></td>
</tr>
<tr>
<td>PIM statistics</td>
<td>PIM statistics for all interfaces or for the specified interface.</td>
</tr>
<tr>
<td>PIM message type</td>
<td>Message type for which statistics are displayed.</td>
</tr>
<tr>
<td>Received</td>
<td>Number of received statistics.</td>
</tr>
<tr>
<td>Sent</td>
<td>Number of messages sent of a certain type.</td>
</tr>
<tr>
<td>Rx errors</td>
<td>Number of received packets that contained errors.</td>
</tr>
<tr>
<td>V2 Hello</td>
<td>PIM version 2 hello packets.</td>
</tr>
<tr>
<td>V2 Register</td>
<td>PIM version 2 register packets.</td>
</tr>
<tr>
<td>V2 Register Stop</td>
<td>PIM version 2 register stop packets.</td>
</tr>
<tr>
<td>V2 Join Prune</td>
<td>PIM version 2 join and prune packets.</td>
</tr>
<tr>
<td>V2 Bootstrap</td>
<td>PIM version 2 bootstrap packets.</td>
</tr>
<tr>
<td>V2 Assert</td>
<td>PIM version 2 assert packets.</td>
</tr>
<tr>
<td>V2 Graft</td>
<td>PIM version 2 graft packets.</td>
</tr>
<tr>
<td>V2 Graft Ack</td>
<td>PIM version 2 graft acknowledgment packets.</td>
</tr>
<tr>
<td>V2 Candidate RP</td>
<td>PIM version 2 candidate RP packets.</td>
</tr>
</tbody>
</table>
Table 430: show pim statistics Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V2 State Refresh</td>
<td>PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh. State refresh is an extension to PIM-DM. It is not supported in Junos OS.</td>
</tr>
<tr>
<td>V2 DF Election</td>
<td>PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.</td>
</tr>
<tr>
<td>V1 Query</td>
<td>PIM version 1 query packets.</td>
</tr>
<tr>
<td>V1 Register</td>
<td>PIM version 1 register packets.</td>
</tr>
<tr>
<td>V1 Register Stop</td>
<td>PIM version 1 register stop packets.</td>
</tr>
<tr>
<td>V1 Join Prune</td>
<td>PIM version 1 join and prune packets.</td>
</tr>
<tr>
<td>V1 RP Reachability</td>
<td>PIM version 1 RP reachability packets.</td>
</tr>
<tr>
<td>V1 Assert</td>
<td>PIM version 1 assert packets.</td>
</tr>
<tr>
<td>V1 Graft</td>
<td>PIM version 1 graft packets.</td>
</tr>
<tr>
<td>V1 Graft Ack</td>
<td>PIM version 1 graft acknowledgment packets.</td>
</tr>
<tr>
<td>AutoRP Announce</td>
<td>Auto-RP announce packets.</td>
</tr>
<tr>
<td>AutoRP Mapping</td>
<td>Auto-RP mapping packets.</td>
</tr>
<tr>
<td>AutoRP Unknown type</td>
<td>Auto-RP packets with an unknown type.</td>
</tr>
<tr>
<td>Anycast Register</td>
<td>Auto-RP announce packets.</td>
</tr>
<tr>
<td>Anycast Register Stop</td>
<td>Auto-RP announce packets.</td>
</tr>
<tr>
<td>Global Statistics</td>
<td>Summary of PIM statistics for all interfaces.</td>
</tr>
<tr>
<td>Hello dropped on neighbor policy</td>
<td>Number of hello packets dropped because of a configured neighbor policy.</td>
</tr>
<tr>
<td>Unknown type</td>
<td>Number of PIM control packets received with an unknown type.</td>
</tr>
<tr>
<td>V1 Unknown type</td>
<td>Number of PIM version 1 control packets received with an unknown type.</td>
</tr>
<tr>
<td>Unknown Version</td>
<td>Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.</td>
</tr>
</tbody>
</table>
Table 430: show pim statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor unknown</td>
<td>Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.</td>
</tr>
<tr>
<td>Bad Length</td>
<td>Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.</td>
</tr>
<tr>
<td>Bad Checksum</td>
<td>Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet.</td>
</tr>
<tr>
<td>Bad Receive If</td>
<td>Number of PIM control packets received on an interface that does not have PIM configured.</td>
</tr>
<tr>
<td>Rx Bad Data</td>
<td>Number of PIM control packets received that contain data for TCP Bad register packets.</td>
</tr>
<tr>
<td>Rx intf disabled</td>
<td>Number of PIM control packets received on an interface that has PIM disabled.</td>
</tr>
<tr>
<td>Rx V1 Require V2</td>
<td>Number of PIM version 1 control packets received on an interface configured for PIM version 2.</td>
</tr>
<tr>
<td>Rx V2 Require V1</td>
<td>Number of PIM version 2 control packets received on an interface configured for PIM version 1.</td>
</tr>
<tr>
<td>Rx Register not RP</td>
<td>Number of PIM register packets received when the routing device is not the RP for the group.</td>
</tr>
<tr>
<td>Rx Register no route</td>
<td>Number of PIM register packets received when the RP does not have a unicast route back to the source.</td>
</tr>
<tr>
<td>Rx Register no decap if</td>
<td>Number of PIM register packets received when the RP does not have a de-encapsulation interface.</td>
</tr>
<tr>
<td>Null Register Timeout</td>
<td>Number of NULL register timeout packets.</td>
</tr>
<tr>
<td>RP Filtered Source</td>
<td>Number of PIM packets received when the routing device has a source address filter configured for the RP.</td>
</tr>
<tr>
<td>Rx Unknown Reg Stop</td>
<td>Number of register stop messages received with an unknown type.</td>
</tr>
<tr>
<td>Rx Join/Prune no state</td>
<td>Number of join and prune messages received for which the routing device has no state.</td>
</tr>
<tr>
<td>Rx Join/Prune on upstream if</td>
<td>Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.</td>
</tr>
<tr>
<td>Rx Join/Prune for invalid group</td>
<td>Number of join or prune messages received for invalid multicast group addresses.</td>
</tr>
</tbody>
</table>
### Table 430: show pim statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx Join/Prune messages dropped</td>
<td>Number of join and prune messages received and dropped.</td>
</tr>
<tr>
<td>Rx sparse join for dense group</td>
<td>Number of PIM sparse mode join messages received for a group that is configured for dense mode.</td>
</tr>
<tr>
<td>Rx Graft/Graft Ack no state</td>
<td>Number of graft and graft acknowledgment messages received for which the router or switch has no state.</td>
</tr>
<tr>
<td>Rx Graft on upstream if</td>
<td>Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.</td>
</tr>
<tr>
<td>Rx CRP not BSR</td>
<td>Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.</td>
</tr>
<tr>
<td>Rx BSR when BSR</td>
<td>Number of BSR messages received in which the PIM message type is Bootstrap.</td>
</tr>
<tr>
<td>Rx BSR not RPF if</td>
<td>Number of BSR messages received on an interface that is not the RPF interface.</td>
</tr>
<tr>
<td>Rx unknown hello opt</td>
<td>Number of PIM hello packets received with options that Junos OS does not support.</td>
</tr>
<tr>
<td>Rx data no state</td>
<td>Number of PIM control packets received for which the routing device has no state for the data type.</td>
</tr>
<tr>
<td>Rx RP no state</td>
<td>Number of PIM control packets received for which the routing device has no state for the RP.</td>
</tr>
<tr>
<td>Rx aggregate</td>
<td>Number of PIM aggregate MDT packets received.</td>
</tr>
<tr>
<td>Rx malformed packet</td>
<td>Number of PIM control packets received with a malformed IP unicast or multicast address family.</td>
</tr>
<tr>
<td>No RP</td>
<td>Number of PIM control packets received with no RP address.</td>
</tr>
<tr>
<td>No register encap if</td>
<td>Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.</td>
</tr>
<tr>
<td>No route upstream</td>
<td>Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP.</td>
</tr>
<tr>
<td>Nexthop Unusable</td>
<td>Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.</td>
</tr>
<tr>
<td>RP mismatch</td>
<td>Number of PIM control packets received for which the routing device has an RP mismatch.</td>
</tr>
</tbody>
</table>
### Table 430: show pim statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP mode mismatch</td>
<td>RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.</td>
</tr>
<tr>
<td>RPF neighbor unknown</td>
<td>Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.</td>
</tr>
<tr>
<td>Rx Joins/Prunes filtered</td>
<td>The number of join and prune messages filtered because of configured route filters and source address filters.</td>
</tr>
<tr>
<td>Tx Joins/Prunes filtered</td>
<td>The number of join and prune messages filtered because of configured route filters and source address filters.</td>
</tr>
<tr>
<td>Embedded-RP invalid addr</td>
<td>Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.</td>
</tr>
<tr>
<td>Embedded-RP limit exceed</td>
<td>Number of times the limit configured with the maximum-rps statement is exceeded. The maximum-rps statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.</td>
</tr>
</tbody>
</table>
| Embedded-RP added                 | Number of packets in which the embedded RP for IPv6 is added. The following receive events trigger extraction of an IPv6 embedded RP address on the routing device: 
  - Multicast Listener Discovery (MLD) report for an embedded RP multicast group address 
  - PIM join message with an embedded RP multicast group address 
  - Static embedded RP multicast group address associated with an interface 
  - Packets sent to an embedded RP multicast group address received on the DR 
  An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform. |
| Embedded-RP removed               | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature. |
| Rx Register msgs filtering drop   | Number of received register messages dropped because of a filter configured for PIM register messages. |
| Tx Register msgs filtering drop   | Number of register messages dropped because of a filter configured for PIM register messages. |
| Rx Bidir Join/Prune on non-Bidir if | Error counter for join and prune messages received on non-bidirectional PIM interfaces. |
Table 430: show pim statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx Bidir Join/Prune on non-DF if</td>
<td>Error counter for join and prune messages received on non-designated forwarder interfaces.</td>
</tr>
<tr>
<td>V4 (S,G) Maximum</td>
<td>Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.</td>
</tr>
<tr>
<td>V4 (S,G) Accepted</td>
<td>Number of accepted (S,G) IPv4 multicast routes.</td>
</tr>
<tr>
<td>V4 (S,G) Threshold</td>
<td>Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).</td>
</tr>
<tr>
<td>V4 (S,G) Log Interval</td>
<td>Time (in seconds) between consecutive log messages.</td>
</tr>
<tr>
<td>V6 (S,G) Maximum</td>
<td>Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.</td>

Real-Time Performance Monitoring

- Understanding Real-Time Performance Monitoring on EX Series Switches on page 3540
Understanding Real-Time Performance Monitoring on EX Series Switches

Real-time performance monitoring (RPM) enables you to configure active probes to track and monitor traffic across the network and to investigate network problems. You can use RPM with Juniper Networks EX Series Ethernet Switches.

The ways in which you can use RPM include:

- Monitor time delays between devices.
- Monitor time delays at the protocol level.
- Set thresholds to trigger SNMP traps when values are exceeded.

You can configure thresholds for round-trip time, ingress or egress delay, standard deviation, jitter, successive lost probes, and total lost probes per test. (SNMP trap results are stored in `pingResultsTable`, `jnxPingResultsTable`, `jnxPingProbeHistoryTable`, and `pingProbeHistoryTable`.)

- Determine automatically whether a path exists between a host router or switch and its configured BGP neighbors. You can view the results of the discovery using an SNMP client.
- Use the history of the most recent 50 probes to analyze trends in your network and predict future needs.

RPM provides MIB support with extensions for RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

This topic includes:

- RPM Packet Collection on page 3540
- Tests and Probe Types on page 3540
- Hardware Timestamps on page 3541
- Limitations of RPM on EX Series Switches on page 3543

**RPM Packet Collection**

Probes collect packets per destination and per application, including ping Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets.

**Tests and Probe Types**

A test can contain multiple probes. The probe type specifies the packet and protocol contents of the probe.

EX Series switches support the following tests and probe types:

- Ping tests:
  - ICMP echo probe
- ICMP timestamp probe
- HTTP tests:
  - HTTP get probe (not available for BGP RPM services)
  - HTTP get metadata probe
- UDP and TCP tests with user-configured ports:
  - UDP echo probe
  - TCP connection probe
  - UDP timestamp probe

**Hardware Timestamps**

To account for latency or jitter in the communication of probe messages, you can enable timestamping of the probe packets (hardware timestamps). If hardware timestamps are not configured, then timers are generated at the software level and are less accurate than they would have been with hardware timestamps.

---

**NOTE:** EX Series switches support hardware timestamps for UDP and ICMP probes. EX Series switches do not support hardware timestamps for HTTP or TCP probes.

---

You can timestamp the following RPM probes to improve the measurement of latency or jitter:

- ICMP ping
- ICMP ping timestamp
- UDP ping
- UDP ping timestamp

You should configure the requester (the RPM client) with hardware timestamps (see Figure 44 on page 3542) to get more meaningful results than you would get without the timestamps. The responder (the RPM server) does not need to be configured to support hardware timestamps. If the responder supports hardware timestamps, it timestamps the RPM probes. If the responder does not support hardware timestamps, RPM can only report round-trip measurements that include the processing time on the responder.

---

**NOTE:** Hardware timestamps are supported on all EX Series switches.

---

Figure 44 on page 3542 shows the timestamps:
Figure 44: RPM Timestamps

- T1 is the time the packet leaves the requester port.
- T2 is the time the responder receives the packet.
- T3 is the time the responder sends the response.
- T4 is the time the requester receives the response.

The round-trip time is \((T2 - T1) + (T4 - T3)\). If the responder does not support hardware timestamps, then the round-trip time is \((T4 - T1) / 2\), and thus includes the processing time of the responder.

You can use RPM probes to find the following time measurements:

- Minimum round-trip time
- Maximum round-trip time
- Average round-trip time
- Standard deviation of the round-trip time
- Jitter of the round-trip time—Difference between the minimum and maximum round-trip time

**NOTE:** See “Configuring the Interface for RPM Timestamping for Client/Server on an EX Series Switch (CLI Procedure)” on page 3611 for information on how to configure hardware timestamps on the requester.

The RPM feature provides a configuration option to set one-way hardware timestamps. Use one-way timestamps when you want information about one-way time, rather than round-trip times, for packets to traverse the network between the requester and the responder. As shown in Figure 44 on page 3542, one-way timestamps represent the time \(T2 - T1\) and the time from \(T4 \rightarrow T3\). Use one-way timestamps when you want to gather information about delay in each direction and to find egress and ingress jitter values.

**NOTE:** For correct one-way measurement, the clocks of the requester and responder must be synchronized. If the clocks are not synchronized, one-way jitter measurements and calculations can include significant variations, in some cases orders of magnitude greater than the round-trip times.
When you enable one-way timestamps in a probe, the following one-way measurements are reported:

- Minimum, maximum, standard deviation, and jitter measurements for egress and ingress times
- Number of probes sent
- Number of probe responses received
- Percentage of lost probes

**Limitations of RPM on EX Series Switches**

- Two-Way Active Measurement Protocol (TWAMP) is not supported on EX Series switches.
- EX Series switches do not support user-configured class-of-service (CoS) classifiers or prioritization of RPM packets over regular data packets received on an input interface.
- Timestamps:
  - If the responder does not support hardware timestamps, RPM can only report the round-trip measurements and cannot calculate round-trip jitter.
  - EX Series switches do not support hardware timestamps for HTTP and TCP probes.
  - Timestamps apply only to IPv4 traffic.

**Analyzers and Port Mirroring**

- Understanding Port Mirroring and Analyzers on EX4300 Switches on page 3544
Understanding Port Mirroring and Analyzers on EX4300 Switches

NOTE: This concept uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Understanding Port Mirroring on EX Series Switches. For ELS details, see Getting Started with Enhanced Layer 2 Software.

Mirroring might be needed for traffic analysis on a switch because a switch, unlike a hub, does not broadcast packets to every port on the destination device. The switch sends packets only to the port to which the destination device is connected.

Juniper Networks EX4300 Ethernet Switches support the following mirroring methods: port mirroring and analyzers. You can use port mirroring or analyzers to facilitate analyzing traffic on EX4300 switches at the packet level. You might use analyzers as part of monitoring switch traffic for such purposes as enforcing policies concerning network usage and file sharing and for identifying sources of problems on your network by locating abnormal or heavy bandwidth usage by particular stations or applications.

Mirrored packets can be copied either to a local interface for local monitoring or to a VLAN for remote monitoring. The following packets can be copied:

- **Packets entering or exiting a port**—You can mirror the packets in any combination of packets entering or exiting ports on up to 256 ports. For example, you can send copies of the packets entering some ports and the packets exiting other ports to the same local analyzer port or analyzer VLAN.

- **Packets entering a VLAN**—You can mirror the packets entering a VLAN to either a local analyzer port or to an analyzer VLAN. You can configure multiple VLANs (up to 256 VLANs), including a VLAN range and PVLANs, as ingress input to an analyzer.

- **Policy-based sample packets**—You can mirror a policy-based sample of packets that are entering a port or a VLAN. You configure a firewall filter to establish a policy to select the packets to be mirrored. You can send the sample to a port-mirroring instance or to an analyzer VLAN.

This topic describes:

- Port Mirroring Overview on page 3544
- Analyzer Overview on page 3545
- Port Mirroring and Analyzer Terminologies on page 3545
- Configuration Guidelines for Port Mirroring and Analyzers on EX4300 Switches on page 3546

**Port Mirroring Overview**

You configure port mirroring on an EX4300 switch to send copies of unicast traffic to an output destination such as an interface, a routing-instance, or a VLAN. Then, you can analyze the mirrored traffic by using a protocol analyzer application. The protocol analyzer
application can run either on a computer connected to the analyzer output interface or on a remote monitoring station. For the input traffic, you can configure a firewall filter term to specify whether port mirroring must be applied to all packets at the interface to which the firewall filter is applied. You can apply a firewall filter configured with the action `port-mirror` or `port-mirror-instance name` to the input or output logical interfaces (including aggregated Ethernet logical interfaces), to traffic forwarded or flooded to a VLAN, or traffic forwarded or flooded to a VPLS routing instance. EX4300 switches support port mirroring of VPLS (family ethernet-switching or family vpls) traffic and VPN traffic with family ccc in a Layer 2 environment. Within a firewall filter term, you can specify the port-mirroring properties under the `then` statement in either of the following ways:

- Implicitly reference the port-mirroring properties in effect on the port.
- Explicitly reference a particular named instance of port mirroring.

You can configure port mirroring at the `[edit forwarding-options port-mirroring]` hierarchy level.

**Analyzer Overview**

You can configure an analyzer to define both the input traffic and output traffic in the same analyzer configuration. The input traffic to be analyzed can be traffic that enters or exits an interface, or traffic that enters a VLAN. The analyzer configuration enables you to send this traffic to an output interface, instance, or VLAN. You can configure an analyzer at the `[edit forwarding-options analyzer]` hierarchy.

**Port Mirroring and Analyzer Terminologies**

Table 431 on page 3545 lists some port mirroring terms and their descriptions.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analyzer</td>
<td>In a mirroring configuration (analyzer) on an EX4300 switch, the analyzer includes:</td>
</tr>
<tr>
<td></td>
<td>- The name of the analyzer</td>
</tr>
<tr>
<td></td>
<td>- Source (input) ports or VLAN</td>
</tr>
<tr>
<td></td>
<td>- A destination for mirrored packets (either a monitor port or a monitor VLAN)</td>
</tr>
</tbody>
</table>

**Analyzer output interface**

(Also known as monitor port) Interface to which mirrored traffic is sent and to which a protocol analyzer application is connected.

**NOTE:** Interfaces used as output for an analyzer must be configured under the `ethernet-switching` family.

Analyzer output interfaces have the following limitations:

- Cannot also be a source port.
- Do not participate in Layer 2 protocols, such as Spanning Tree Protocol (STP), when part of a port-mirroring configuration.
- If the bandwidth of the analyzer output interface is not sufficient to handle the traffic from the source ports, overflow packets are dropped.
Table 431: Mirroring Terminologies (continued)

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analyzer VLAN</td>
<td>VLAN to which mirrored traffic is sent. The mirrored traffic can be used by a protocol analyzer application. The member interfaces in the monitor VLAN are spread across the switches in your network.</td>
</tr>
<tr>
<td>Port mirroring</td>
<td>A port-mirroring configuration that does not specify an input source; it specifies only an output destination. A firewall filter configuration must be defined for the input source. A firewall filter configuration must be defined to mirror packets that match the match conditions defined in the firewall filter term. The action item <strong>port-mirror-instance instance-name</strong> in the firewall filter configuration is used to send packets to the analyzer and these packets form the input source.</td>
</tr>
<tr>
<td>Global port mirror</td>
<td>A port mirroring configuration that does not have an instance name. The firewall filter action <strong>port-mirror</strong> will be the action for the firewall filter configuration.</td>
</tr>
<tr>
<td>Input interface</td>
<td>An interface on the switch that is being mirrored. Traffic that is either entering or exiting this interface is mirrored.</td>
</tr>
<tr>
<td>LAG-based analyzer</td>
<td>An analyzer that has a link aggregation group (LAG) specified as the input (ingress) interface in the analyzer configuration.</td>
</tr>
<tr>
<td>Local mirroring</td>
<td>An analyzer configuration in which packets are mirrored to a local analyzer port.</td>
</tr>
<tr>
<td>Monitoring station</td>
<td>A computer running a protocol analyzer application.</td>
</tr>
<tr>
<td>Native analyzer session</td>
<td>An analyzer session that has both input and output definitions in its analyzer configuration.</td>
</tr>
<tr>
<td>Policy-based mirroring</td>
<td>Mirroring of packets that match the match items in the defined firewall filter term. The action item <strong>port-mirror-instance instance-name</strong> is used in the firewall filter to send the packets to the monitor port.</td>
</tr>
<tr>
<td>Port-based analyzer</td>
<td>An analyzer session whose configuration defines interfaces for both input and output.</td>
</tr>
<tr>
<td>Protocol analyzer application</td>
<td>An application used to examine packets transmitted across a network segment. Also commonly called network analyzer, packet sniffer, or probe.</td>
</tr>
<tr>
<td>Remote port mirroring</td>
<td>Functions the same way as local port mirroring, except that the mirrored traffic is not copied to a local analyzer port but is flooded to an analyzer VLAN that you create specifically for the purpose of receiving mirrored traffic.</td>
</tr>
<tr>
<td>VLAN-based analyzer</td>
<td>An analyzer session whose configuration uses VLANs for both input and output or for either input or output.</td>
</tr>
</tbody>
</table>

Configuration Guidelines for Port Mirroring and Analyzers on EX4300 Switches

When you configure port mirroring or analyzers on EX4300 switches, we recommend that you follow certain guidelines to ensure that you obtain optimum benefit from mirroring. Additionally, we recommend that you disable mirroring when you are not using it and that you select specific interfaces for which packets must be mirrored (that is,
select specific interfaces as input to the analyzer) in preference to using the all keyword option, which will enable mirroring on all interfaces. Mirroring only the necessary packets reduces any potential performance impact.

With local mirroring, traffic from multiple ports is replicated to the analyzer output interface. If the output interface for an analyzer reaches capacity, packets are dropped. Thus, while configuring an analyzer, you must consider whether the traffic being mirrored exceeds the capacity of the analyzer output interface.

Table 432 on page 3547 summarizes further configuration guidelines for mirroring on EX4300 switches.

Table 432: Configuration Guidelines for Port Mirroring and Analyzers on EX4300 Switches

<table>
<thead>
<tr>
<th>Guideline</th>
<th>Value or Support Information</th>
<th>Comment</th>

**sFlow Monitoring Technology**

- Understanding How to Use sFlow Technology for Network Monitoring on an EX Series Switch on page 3549
Understanding How to Use sFlow Technology for Network Monitoring on an EX Series Switch

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology randomly samples network packets and sends the samples to a monitoring station. You can configure sFlow technology on a Juniper Networks EX Series Ethernet Switch to continuously monitor traffic at wire speed on all interfaces simultaneously.

This topic describes:

- Sampling Mechanism and Architecture of sFlow Technology on EX Series Switches on page 3549
- Adaptive Sampling on page 3550
- sFlow Agent Address Assignment on page 3551

Sampling Mechanism and Architecture of sFlow Technology on EX Series Switches

sFlow technology uses the following two sampling mechanisms:

- Packet-based sampling: Samples one packet out of a specified number of packets from an interface enabled for sFlow technology.
- Time-based sampling: Samples interface statistics at a specified interval from an interface enabled for sFlow technology.

The sampling information is used to create a network traffic visibility picture. The Juniper Networks Junos operating system (Junos OS) fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks* (see [http://faqs.org/rfcs/rfc3176.html](http://faqs.org/rfcs/rfc3176.html)).

**NOTE:** sFlow technology on the switches samples only raw packet headers. A raw Ethernet packet is the complete Layer 2 network frame.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent’s two main activities are random sampling and statistics gathering. It combines interface counters and flow samples and sends them across the network to the sFlow collector in UDP datagrams, directing those datagrams to the IP address and UDP destination port of the collector. Each datagram contains the following information:

- The IP address of the sFlow agent
- The number of samples
- The interface through which the packets entered the agent
- The interface through which the packets exited the agent
- The source and destination interface for the packets
- The source and destination VLAN for the packets
EX Series switches adopt the distributed sFlow architecture. The sFlow agent has two separate sampling entities that are associated with each Packet Forwarding Engine. These sampling entities are known as subagents. Each subagent has a unique ID that is used by the collector to identify the data source. A subagent has its own independent state and forwards its own sample messages to the sFlow agent. The sFlow agent is responsible for packaging the samples into datagrams and sending them to the sFlow collector. Because sampling is distributed across subagents, the protocol overhead associated with sFlow technology is significantly reduced at the collector.

**NOTE:** If the mastership assignment changes in a Virtual Chassis setup, sFlow technology continues to function.

### Adaptive Sampling

The switches use adaptive sampling to ensure both sampling accuracy and efficiency. Adaptive sampling is a process of monitoring the overall incoming traffic rate on the network device and providing intelligent feedback to interfaces to dynamically adapt their sampling rate to the traffic conditions. Interfaces on which incoming traffic exceeds the system threshold are checked so that all violations can be regulated without affecting the traffic on other interfaces. Every 12 seconds the agent checks interfaces to get the number of samples, and interfaces are grouped based on the slot that they belong to. The top five interfaces that produce the highest number of samples are selected. Using the binary backoff algorithm, the sampling load on these interfaces is reduced by half and allotted to interfaces that have a lower sampling rate. Therefore, when the processor’s sampling limit is reached, the sampling rate is adapted such that it does not load the processor any further. If the switch is rebooted, the adaptive sampling rate is reset to the user-configured sampling rate. Also, if you modify the sampling rate, the adaptive sampling rate changes.

The advantage of adaptive sampling is that the switch continues to operate at its optimum level even when there is a change in the traffic patterns in the interfaces. You do not need to make any changes. Because the sampling rate adapts dynamically to changing network conditions, the resources are utilized optimally resulting in a high performance network.

Infrequent sampling flows are not reported in the sFlow information, but over time the majority of flows are reported. Based on a defined sampling rate, 1 out of \( N \) packets is captured and sent to the collector. This type of sampling does not provide a 100 percent accurate result in the analysis, but it does provide a result with quantifiable accuracy. A user-configured polling interval defines how often the sFlow data for a specific interface are sent to the collector, but an sFlow agent can also schedule polling.

**NOTE:** sFlow technology on EX Series switches does not support graceful restart. When a graceful restart occurs, the adaptive sampling rate is set to the user-configured sampling rate.
sFlow Agent Address Assignment

The sFlow collector uses the sFlow agent's IP address to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID of the sFlow agent remains constant. If you do not specify the IP address to be assigned to the agent, an IP address is automatically assigned to the agent based on the following order of priority of interfaces configured on the switch:

1. Virtual management Ethernet (VME) interface
2. Management Ethernet interface

If neither of the preceding interfaces has been configured, the IP address of any Layer 3 interface or the routed VLAN interface (RVI) is assigned to the agent. At least one interface must be configured on the switch for an IP address to be automatically assigned to the agent. When the agent's IP address is assigned automatically, the IP address is dynamic and changes when the switch reboots.

sFlow data can be used to provide network traffic visibility information. You can explicitly configure the IP address to be assigned to source data (sFlow datagrams). If you do not explicitly configure that address, the IP address of the configured Gigabit Ethernet interface, 10-Gigabit Ethernet interface, or the routed VLAN interface (RVI) is used as the source IP address.

Understanding Ethernet OAM Link Fault Management for an EX Series Switch

Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities even as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward-compatible with existing Ethernet technology.
Ethernet OAM provides the tools that network management software and network managers can use to determine how a network of Ethernet links is functioning. Ethernet OAM should:

- Rely only on the media access control (MAC) address or virtual LAN identifier for troubleshooting.
- Work independently of the actual Ethernet transport and function over physical Ethernet ports or a virtual service such as pseudowire.
- Isolate faults over a flat (or single operator) network architecture or nested or hierarchical (or multiprovider) networks.

The following OAM LFM features are supported on EX Series switches:

- **Discovery and Link Monitoring**
  The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. You can specify the discovery mode used for IEEE 802.3ah OAM support. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery. The switch performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.
  
  You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

- **Remote Fault Detection**
  Remote fault detection uses flags and events. Flags are used to convey the following: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition such as a power failure, and Critical Event means an unspecified vendor-specific critical event. You can specify the periodic OAM PDU sending interval for fault detection. The EX Series switch uses the Event Notification OAM PDU to notify the remote OAM device when a problem is detected. You can specify the action to be taken by the system when the configured link-fault event occurs.

- **Remote Loopback Mode**
  Remote loopback mode ensures link quality between the switch and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.
  
  Junos OS can place a remote DTE into loopback mode (if remote loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent and processed.
Understanding Ethernet OAM Connectivity Fault Management for an EX Series Switch

Ethernet interfaces on Juniper Networks EX Series Ethernet Switches and Juniper Networks Junos operating system (Junos OS) for EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM). CFM monitors Ethernet networks that might comprise one or more service instances for network-compromising connectivity faults.

The major features of CFM are:

- Fault monitoring using the continuity check protocol. This is a neighbor discovery and health check protocol that discovers and maintains adjacencies at the VLAN or link level.
- Path discovery and fault verification using the linktrace protocol.
- Fault isolation using the loopback protocol.

CFM partitions the service network into various administrative domains. For example, operators, providers, and customers might be part of different administrative domains. Each administrative domain is mapped into one maintenance domain providing enough information to perform its own management, thus avoiding security breaches and making end-to-end monitoring possible.

In a CFM maintenance domain, each service instance is called a maintenance association. A maintenance association can be thought of as a full mesh of maintenance association endpoints (MEPs) having similar characteristics. MEPs are active CFM entities generating and responding to CFM protocol messages. There is also a maintenance intermediate point (MIP), which is a CFM entity similar to the MEP, but more passive (MIPs only respond to CFM messages).

Each maintenance domain is associated with a maintenance domain level from 0 through 7. Level allocation is based on the network hierarchy, where outer domains are assigned a higher level than the inner domains. Configure customer end points to have the highest maintenance domain level. The maintenance domain level is a mandatory parameter that indicates the nesting relationships between various maintenance domains. The level is embedded in each CFM frame. CFM messages within a given level are processed by MEPs at that same level.

To enable CFM on an Ethernet interface, you must configure maintenance domains, maintenance associations, and maintenance association end points (MEPs). Figure 45 on page 3554 shows the relationships among maintenance domains, maintenance association end points (MEPs), and maintenance intermediate points (MIPs) configured on a switch.
Performance management depends on the accurate measurement of service-level agreement (SLA) objective parameters, which can include bandwidth and reliability. In many cases, a service provider could be subject to penalties imposed by regulation, statute, or contract if network performance is not within the bounds established for the service. One key performance objective is delay, along with its close relative, delay variation (often called jitter). Some applications (such as bulk file transfer) will function just as well with high delays across the network and high delay variations, while other applications (such as voice) can function only with low and stable delays. Many networks invoke protocols or features available at Layer 3 (the packet layer) or higher to measure network delays and jitter link by link. However, when the network consists of many Ethernet links, there are few protocols and features available at Layer 2 (the frame layer) that allow routers and switches to measure frame delay and jitter. This is where the ability to configure and monitor Ethernet frame delay is helpful.

This topic includes:

- **Ethernet Frame Delay Measurements on page 3554**
- **Types of Ethernet Frame Delay Measurements on page 3555**
- **Limitations on page 3556**

**Ethernet Frame Delay Measurements**

You can perform Ethernet frame delay measurements (referred to as ETH-DM in Ethernet specifications) on Juniper Networks EX Series Ethernet Switches. This feature allows you to configure on-demand Operation, Administration, and Maintenance (OAM) statements for the measurement of frame delay and frame delay variation (jitter). You
can configure Ethernet frame delay measurement in either one-way or two-way (round-trip) mode to gather frame delay statistics simultaneously from multiple sessions. Ethernet frame delay measurement provides fine control to operators for triggering delay measurement on a given service and can be used to monitor SLAs.

Ethernet frame delay measurement also collects other useful information, such as worst and best case delays, average delay, and average delay variation. It supports software-assisted timestamping in the receive direction for delay measurements. It also provides runtime display of delay statistics when two-way delay measurement is triggered. Ethernet frame delay measurement records the last 100 samples collected per remote maintenance association end point (MEP) or per connectivity fault management (CFM) session. You can retrieve the history at any time using simple commands. You can clear all Ethernet frame delay measurement statistics and PDU counters. Ethernet frame delay measurement is fully compliant with the ITU-T Y.1731 (OAM Functions and Mechanisms for Ethernet-based Networks) specification.

Ethernet frame delay measurement uses the IEEE 802.1ag CFM infrastructure.

Generally, Ethernet frame delay measurements are made in a peer fashion from one MEP or CFM session to another. However, these measurements are not made to maintenance association intermediate points (MIPs).

For a complete description of Ethernet frame delay measurement, see the ITU-T Y.1731 Ethernet Service OAM topics in the Junos OS Network Interfaces Library for Routing Devices.

Types of Ethernet Frame Delay Measurements

There are two types of Ethernet frame delay measurements:

- One-way
- Two-way (round-trip)

For one-way Ethernet frame delay measurement, either MEP can send a request to begin a one-way delay measurement to its peer MEP. However, the statistics are collected only at the receiver MEP. This feature requires the clocks at the transmitting and receiving MEPs to be synchronized. If these clocks fall out of synchronization, only one-way delay variation and average delay variation values are computed correctly (and will, therefore, be valid). Use the show commands at the receiver MEP to display one-way delay statistics.

For two-way (round-trip) Ethernet frame delay measurement, either MEP can send a request to begin a two-way delay measurement to its peer MEP, which responds with timestamp information. Run-time statistics are collected and displayed at the initiator MEP. The clocks do not need to be synchronized at the transmitting and receiving MEPs. Junos OS supports timestamps in delay measurement reply (DMR) frames to increase the accuracy of delay calculations.

Use the show commands at the initiator MEP to display two-way delay statistics, and at the receiver MEP to display one-way delay statistics.

You can create an iterator profile to periodically transmit SLA measurement packets in the form of ITU-Y.1731-compliant frames for delay measurement or loss measurement.
**Limitations**

The following are some limitations with regard to using Ethernet frame delay measurement:

- Ethernet frame delay measurements are available only when distributed periodic packet management (PPM) is enabled.
- The statistics collected are lost after a graceful Routing Engine switchover (GRES).
- You can monitor only one session to the same remote MEP or MAC address.
- Accuracy is compromised when the system configuration changes (such as from reconfiguration). We recommend performing Ethernet frame delay measurements on a stable system.

**Uplink Failure Detection**

- Understanding Uplink Failure Detection on page 3556

**Understanding Uplink Failure Detection**

Uplink failure detection allows Juniper Networks EX Series Ethernet Switches to detect link failure on uplink interfaces and to propagate the failure to the downlink interfaces so that servers connected to those downlink interfaces can switch over to secondary interfaces.

Uplink failure detection supports network adapter teaming and provides network redundancy. In network adapter teaming, all the network interface cards (NICs) on a server are configured in a primary or secondary relationship and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link. With uplink failure detection, the switch monitors uplink interfaces for link failures. When it detects a failure, it disables the downlink interfaces. When the server detects disabled downlink interfaces, it switches over to the secondary link to help ensure balanced traffic flow on switches.

This topic describes:

- Uplink Failure Detection Overview on page 3557
- Failure Detection Pair on page 3558
Uplink Failure Detection Overview

Uplink failure detection allows switches to monitor uplink interfaces to spot link failures. When a switch detects a link failure, it automatically disables the downlink interfaces in that group. The server that is connected to the disabled downlink interfaces triggers a network-adapter failover to a secondary link to avoid any information drop.

Figure 46 on page 3557 illustrates a typical setup for uplink failure detection.

Figure 46: Uplink Failure Detection Configuration on Switches

For uplink failure detection, you specify a group of uplink interfaces to be monitored and downlink interfaces to be brought down when an uplink fails. The downlink interfaces are bound to the uplink interfaces within the group. If all uplink interfaces in a group go down, then the switch brings down all downlink interfaces within that group. If any uplink interface returns to service, then the switch brings all downlink interfaces in that group back to service.

**NOTE:** Routed VLAN interfaces (RVIs) cannot be configured as uplink interfaces to be monitored.

The switch can monitor both physical-interface links and logical-interface links for uplink failures, but you must put the two types of interfaces in separate groups.

**NOTE:** To detect failure of logical interfaces, the server must run some high level protocol such as keepalives between the switch and the server.
failureDetectionPair

Uplink failure detection requires that you create groups that contain uplink interfaces and downlink interfaces. Each group includes one of each of the following:

- A link-to-monitor interface—The link-to-monitor interfaces specify the uplink interfaces the switch monitors. You can configure a maximum of 48 uplink interfaces as link-to-monitor in a group.

- A link-to-disable interface—The link-to-disable interfaces specify the downlink interfaces the switch disables when the switch detects an uplink failure. You can configure a maximum of 48 downlink interfaces as link-to-disable in a group.

The link-to-disable interfaces are bound to the link-to-monitor interfaces within the group. When a link-to-monitor interface returns to service, the switch automatically enables all link-to-disable interfaces in the group.

Example: Configuring sFlow Technology to Monitor Network Traffic on EX Series Switches

You can configure sFlow technology, designed for monitoring high-speed switched or routed networks, to continuously monitor traffic at wire speed on all interfaces simultaneously. You can specify sample rates for ingress and egress packets. sFlow data can be used to provide network traffic visibility information.
This example describes how to configure and use sFlow technology to monitor network traffic. Junos OS fully supports the sFlow standard described in RFC 3176, InMon Corporation’s sFlow: A Method for Monitoring Traffic in Switched and Routed Networks (see http://faqs.org/rfcs/rfc3176.html).

- Requirements on page 3560
- Overview and Topology on page 3560
- Configuration on page 3561
- Verification on page 3563

**Requirements**

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 9.3 or later for EX Series switches

**Overview and Topology**

sFlow technology is a statistical-sampling–based network monitoring technology for high-speed switched or routed networks. sFlow technology samples network packets and sends the samples to a monitoring station. You can specify sample rates for ingress and egress packets. The information gathered is used to create a network traffic visibility picture.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent runs on the switch. It combines interface counters and flow samples and sends them across the network to the sFlow collector. Figure 47 on page 3561 depicts the basic elements of the sFlow system.
To configure sFlow technology, perform the following tasks:

**CLI Quick Configuration**

To quickly configure sFlow technology, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set sflow collector 10.204.32.46 udp-port 5600
set sflow interfaces ge-0/0/0
set sflow polling-interval 20
set sflow sample-rate egress 1000
```

**Step-by-Step Procedure**

To configure sFlow technology:

1. Configure the IP address and UDP port of the collector:

   ```
   [edit protocols]
   user@switch# set sflow collector 10.204.32.46 udp-port 5600
   ```

   **NOTE:** You can configure a maximum of 4 collectors.

2. Enable sFlow technology on a specific interface:
[edit protocols sflow]
user@switch# set Interfaces (sFlow Monitoring Technology) ge-0/0/0

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a link aggregation group (LAG) interface—that is, an aggregated Ethernet interface with a name such as ae0. You can enable sFlow technology on the member interfaces that make up the LAG.

3. Specify how often the sFlow agent polls the interface:

[edit protocols sflow]
user@switch# set polling-interval 20

**NOTE:** The polling interval can be specified as a global parameter also. Specify 0 if you do not want to poll the interface.

4. Specify the rate at which egress packets must be sampled:

[edit protocols sflow]
user@switch# set sample-rate egress 1000

**NOTE:** If you set only the egress sample rate, the ingress sample rate will be disabled.

**Results**

Check the results of the configuration:

[edit protocols sflow]
user@switch# show
polling-interval 20;
sample-rate egress 1000;
collector 10.204.32.46 {
  udp-port 5600;
}
interfaces ge-0/0/0.0;
Verification

To confirm that the configuration is correct, perform these tasks:

- Verifying That sFlow Technology Has Been Configured Properly on page 3563
- Verifying That sFlow Technology Is Enabled on the Intended Interface on page 3563
- Verifying the sFlow Collector Configuration on page 3564

**Verifying That sFlow Technology Has Been Configured Properly**

**Purpose** Verify that sFlow technology has been configured properly.

**Action** Use the `show sflow` command:

```
user@switch> show sflow
sFlow: Enabled
Sample limit: 300 packets/second
Polling interval: 20 seconds
Sample rate egress: 1:1000: Enabled
Sample rate ingress: 1:2048: Disabled
Agent ID: 10.204.96.222
```

**NOTE:** The sample limit cannot be configured and is set to 300 packets/second.

**Meaning** The output shows that sFlow technology is enabled and specifies the values for the sample limit, polling interval, and sample rate.

**Verifying That sFlow Technology Is Enabled on the Intended Interface**

**Purpose** Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

**Action** Use the `show sflow interface` command:

```
user@switch> show sflow interface
Interface    Status     Sample rate   Adapted sample rate   Polling-interval
ge-0/0/0.0   Enabled    1000         2048                 20
```

**NOTE:** The sample limit cannot be configured and is set to 300 packets/second.

**Meaning** The output indicates that sFlow technology is enabled on the `ge-0/0/0.0` interface with an egress sample rate of 1000, a disabled ingress sample rate, a sampling limit of 300 packets per second and a polling interval of 20 seconds.
Verifying the sFlow Collector Configuration

Purpose
Verify the sFlow collector's configuration.

Action
Use the `show sflow collector` command:

```
user@switch> show sflow collector
```

<table>
<thead>
<tr>
<th>Collector address</th>
<th>Udp-port</th>
<th>No. of samples</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.204.32.46</td>
<td>5600</td>
<td>1000</td>
</tr>
<tr>
<td>10.204.32.76</td>
<td>3400</td>
<td>1000</td>
</tr>
</tbody>
</table>

Meaning
The output displays the IP address of the collectors and the UDP ports. It also displays the number of samples.

Related Documentation
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 3603
- Understanding How to Use sFlow Technology for Network Monitoring on an EX Series Switch on page 3549

Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on EX Series Switches. For ELS details, see Getting Started with Enhanced Layer 2 Software.

EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN

You can analyze the mirrored traffic by using a protocol analyzer application installed on a system connected to the local destination interface (or running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN).

This example describes how to configure local mirroring on an EX4300 switch. This example describes how to configure the switch to mirror traffic entering interfaces connected to employee computers to an analyzer output interface on the same switch.

- Requirements on page 3565
- Overview and Topology on page 3565
- Mirroring All Employee Traffic for Local Analysis on page 3566
• Mirroring Employee-to-Web Traffic for Local Analysis on page 3567
• Verification on page 3569

Requirements

This example uses the following hardware and software components:

• One EX4300 switch
• Junos OS Release 13.2X50-D10. or later for EX Series switches

Before you configure mirroring, be sure you have an understanding of mirroring concepts. For information about mirroring, see “Understanding Port Mirroring and Analyzers on EX4300 Switches” on page 3544.

Overview and Topology

This topic includes two examples that describe how to mirror traffic entering ports on the switch to a destination interface on the same switch (local mirroring). The first example shows how to mirror all traffic entering the ports connected to employee computers. The second example shows the same scenario, but includes a filter to mirror only the employee traffic going to the Web.

The interfaces ge-0/0/0 and ge-0/0/1 serve as connections for employee computers. The interface ge0/0/10 is reserved for analysis of mirrored traffic. Connect a PC running a protocol analyzer application to the analyzer output interface to analyze the mirrored traffic.

NOTE: Multiple ports mirrored to one interface can cause buffer overflow and dropped packets.

Both examples use the network topology shown in Figure 48 on page 3566.
To configure mirroring for all employee traffic for local analysis, perform these tasks:

**CLI Quick Configuration**

To quickly configure local mirroring for ingress traffic to the two ports connected to employee computers, copy the following commands and paste them into the switch terminal window:

```plaintext
[edit]
set interfaces ge-0/0/0 unit 0 family ethernet-switching
set interfaces ge-0/0/1 unit 0 family inet 192.1.1.1/24
set interfaces ge-0/0/10 unit 0 family ethernet-switching
set forwarding-options analyzer employee–monitor input ingress interface ge-0/0/0.0
set forwarding-options analyzer employee–monitor input ingress interface ge-0/0/1.0
set forwarding-options analyzer employee–monitor output interface ge-0/0/10.0
```

**Step-by-Step Procedure**

To configure an analyzer called `employee-monitor` and specify the input (source) interfaces and the analyzer output interface:

1. Configure each interface connected to employee computers as an input interface for the analyzer `employee-monitor`:
   ```plaintext
   [edit forwarding-options]
   user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
   user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
   ```

2. Configure the output analyzer interface for the analyzer `employee-monitor`. This will be the destination interface for the mirrored packets:
   ```plaintext
   [edit forwarding-options]
   user@switch# set analyzer employee-monitor output interface ge-0/0/10.0
   ```

**Results**

Check the results of the configuration:

```plaintext
[edit]
user@switch> show
```
forwarding-options {
    analyzer employee-monitor {
        input {
            ingress {
                interface ge-0/0/0.0;
                interface ge-0/0/1.0;
            }
        }
        output {
            interface {
                ge-0/0/10.0;
            }
        }
    }
}

Mirroring Employee-to-Web Traffic for Local Analysis

To configure mirroring for employee to Web traffic, perform these tasks:

**CLI Quick Configuration**

To quickly configure local mirroring of traffic from the two ports connected to employee computers, filtering so that only traffic to the external Web is mirrored, copy the following commands and paste them into the switch terminal window:

```
[edit]
set forwarding-options port-mirroring instance employee--web--monitor output interface ge-0/0/10.0
set firewall family ethernet-switching filter watch-employee term employee-to-corp from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web then port-mirroring instance employee-web-monitor
set firewall family ethernet-switching filter watch-employee term employee-to-web then port-mirroring instance employee-web-monitor
set interfaces ge-0/0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1/0 unit 0 family ethernet-switching filter input watch-employee
```

**Step-by-Step Procedure**

To configure local mirroring of employee to Web traffic from the two ports connected to employee computers:

1. Configure the local analyzer interface:
   ```
   [edit interfaces]
   user@switch# set ge-0/0/10 unit 0 family ethernet-switching
   ```
2. Configure the **employee-web-monitor** output instance (the input to the instance comes from the action of the filter):
   ```
   [edit forwarding-options port-mirroring]
   user@switch# set instance employee-web-monitor output interface ge-0/0/10.0
   ```
3. Configure a firewall filter called **watch-employee** to send mirrored copies of employee requests to the Web to the **employee-web-monitor** instance. Accept all traffic to and from the corporate subnet (destination or source address of 192.0.2.16/28). Send mirrored copies of all packets destined for the Internet (**destination port 80**) to the **employee-web-monitor** instance.
   ```
   [edit firewall family ethernet-switching]
   ```
4. Apply the **watch-employee** filter to the appropriate ports:

```junos
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

**Results**

Check the results of the configuration:

```junos
[edit]
user@switch> show
forwarding-options {
    port-mirroring {
        instance {
            employee-web-monitor {
                family ethernet-switching {
                    output {
                        interface ge-0/0/10.0;
                    }
                }
            }
        }
    }
}

firewall {
    family ethernet-switching {
        filter watch-employee {
            term employee-to-corp {
                from {
                    destination-address 192.0.2.16/28;
                    source-address 192.0.2.16/28;
                }
                then accept {
                }
            }
            term employee-to-web {
                from {
                    destination-port 80;
                }
                then port-mirroring-instance employee-web-monitor;
            }
        }
    }
}

interfaces {
    ge-0/0/0 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
                vlan members [employee-vlan, voice-vlan];
            }
        }
    }
```
input watch-employee;
}
}
}
}
ge-0/0/1 {
    family ethernet-switching {
        filter {
            input watch-employee;
        }
    }
}
}

Verification
To confirm that the configuration is correct, perform these tasks:

- Verifying That the Analyzer Has Been Correctly Created on page 3569
- Verifying That The Port-Mirroring Instance Is Configured Properly on page 3569

Verifying That the Analyzer Has Been Correctly Created

Purpose
Verify that the analyzer employee-monitor or employee-web-monitor has been created on the switch with the appropriate input interfaces, and appropriate output interface.

Action
You can use the `show analyzer` command to verify that the analyzer is configured properly.

```
user@switch> show forwarding-options analyzer
Analyzer name : employee-monitor
Mirror rate : 1
Maximum packet length : 0
State : up
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
Output interface : ge-0/0/10.0
```

Meaning
This output shows that the analyzer employee-monitor has a ratio of 1 (mirroring every packet, the default setting), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration (is up indicates that the analyzer is mirroring the traffic entering the ge-0/0/0, and ge-0/0/1 interfaces, and sending the mirrored traffic to the ge-0/0/10 interface). If the state of the output interface is down or if the output interface is not configured, the value of state will be down and the analyzer will not be programmed for mirroring.

Verifying That The Port-Mirroring Instance Is Configured Properly

Purpose
Verify that the port-mirroring instance employee-web-monitor has been configured properly on the switch with the appropriate input interfaces.
Action

You can verify that the port-mirroring instance is configured properly by using the `show forwarding-options port-mirroring` command.

```
user@switch> show forwarding-options port-mirroring
Instance Name: employee-web-monitor
    Instance Id: 3
    Input parameters:
        Rate              : 1
        Run-length        : 0
        Maximum-packet-length : 0
    Output parameters:
        Family    State     Destination          Next-hop
        ethernet-switching  up        ge-0/0/10.0
```

Meaning

This output shows that the `employee-web-monitor` instance has a ratio of 1 (mirroring every packet, the default), the maximum size of the original packet that was mirrored (0 indicates an entire packet), the state of the configuration is up and port mirroring is programmed, and that mirrored traffic from the firewall filter action is sent out on interface `ge-0/0/10.0`. If the state of the output interface is down or if the interface is not configured, the value for state will be down and port mirroring will not be programmed for mirroring.

- [Configuring Mirroring on EX4300 Switches to Analyze Traffic (CLI Procedure)](#)
- [Configuring Port Mirroring to Analyze Traffic (J-Web Procedure)](#)
- [Understanding Port Mirroring and Analyzers on EX4300 Switches](#)

Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see “Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches” on page 3570. For ELS details see: Getting Started with Enhanced Layer 2 Software.

EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on EX4300 switches

You can analyze the mirrored traffic by using a protocol analyzer application running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN.
This topic includes two related examples that describe how to mirror traffic entering ports on the switch to the remote-analyzer VLAN so that you can perform analysis from a remote monitoring station. The first example shows how to mirror all traffic entering the ports connected to employee computers. The second example shows the same scenario but includes a filter to mirror only the employee traffic going to the Web.

**BEST PRACTICE:** Mirror only necessary packets to reduce potential performance impact. We recommend that you:

- Disable your configured mirroring sessions when you are not using them.
- Specify individual interfaces as input to analyzers rather than specifying all interfaces as input.
- Limit the amount of mirrored traffic by using firewall filters.

This example describes how to configure remote mirroring:

- Requirements on page 3571
- Overview and Topology on page 3571
- Mirroring All Employee Traffic for Remote Analysis on page 3572
- Mirroring Employee-to-Web Traffic for Remote Analysis on page 3575
- Verification on page 3579

**Requirements**

This example uses the following hardware and software components:

- Junos OS Release 13.2X50-D10 or later for EX Series switches
- An EX4300 switch connected to another EX4300 switch

The diagram shows an EX4300 Virtual Chassis connected to an EX4300 destination switch.

Before you configure remote mirroring, be sure that:

- You have an understanding of mirroring concepts.
- The interfaces that the analyzer will use as input interfaces have been configured on the switch.

**Overview and Topology**

This topic includes two related examples that describe how to configure mirroring to the remote-analyzer VLAN so that analysis can be performed from a remote monitoring station. The first example shows how to configure a switch to mirror all traffic from employee computers. The second example shows the same scenario, but the setup includes a filter to mirror only the employee traffic going to the Web.

Figure 49 on page 3572 shows the network topology for both these example scenarios.
In this example:

a. Interface ge-0/0/0 is a Layer 2 interface, and interface ge-0/0/1 is a Layer 3 interface (both interfaces on the source switch) that serve as connections for employee computers.

b. Interface ge-0/0/10 is a Layer 2 interface that connects the source switch to the destination switch.

c. Interface ge-0/0/5 is a Layer 2 interface that connects the destination switch to the remote monitoring station.

d. VLAN remote-analyzer is configured on all switches in the topology to carry the mirrored traffic.

**Mirroring All Employee Traffic for Remote Analysis**

To configure an analyzer for remote traffic analysis for all incoming and outgoing employee traffic, perform these tasks:

- **CLI Quick Configuration**

  To quickly configure an analyzer for remote traffic analysis for incoming and outgoing employee traffic, copy the following commands and paste them into the switch terminal window:

  - Copy and paste the following commands in the source switch terminal window:

    ```
    [edit]
    set vlans remote-analyzer vlan-id 999
    set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
    set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
    set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0/0.0
    set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
    set forwarding-options analyzer employee-monitor input egress interface ge-0/0/0/0.0
    set forwarding-options analyzer employee-monitor input egress interface ge-0/0/1.0
    set forwarding-options analyzer employee-monitor output vlan remote-analyzer
    ```

  - Copy and paste the following commands in the destination switch terminal window:
Step-by-Step Procedure

1. On the source switch:
   - Configure the VLAN ID for the remote-analyzer VLAN:
     ```
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the interface on the network port connected to the destination switch for trunk mode and associate it with the remote-analyzer VLAN:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
     ```
   - Configure the employee-monitor analyzer:
     ```
     [edit forwarding-options]
     user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
     user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
     user@switch# set instance employee-monitor input egress interface ge-0/0/0.0
     user@switch# set instance employee-monitor input egress interface ge-0/0/1.0
     user@switch# set analyzer employee-monitor output vlan remote-analyzer
     ```
2. On the destination switch:
   - Configure the VLAN ID for the remote-analyzer VLAN:
     ```
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the interface on the destination switch for trunk mode and associate it with the remote-analyzer VLAN:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
     ```
   - Configure the interface connected to the destination switch for trunk mode:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk
     ```
   - Configure the employee-monitor analyzer:
     ```
     [edit forwarding-options]
     user@switch# set analyzer employee-monitor input ingress vlan remote-analyzer
     user@switch# set analyzer employee-monitor output interface ge-0/0/5.0
     ```

Results

Check the results of the configuration on the source switch:

```
[edit]
user@switch> show
forwarding-options {
 analyzer employee-monitor {
```
input {
    ingress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;
    }
    egress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;
    }
}
output {
    vlan {
        remote-analyzer;
    }
}
}

interfaces {
    ge-0/0/10 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
                vlan {
                    members 999;
                }
            }
        }
    }
}

vlans {
    remote-analyzer {
        vlan-id 999;
        interface {
            ge-0/0/10.0
        }
    }
}
}

Check the results of the configuration on the destination switch:

[edit]
user@switch> show
interfaces {
    ge0/0/5 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
            }
        }
    }
    ge-0/0/10 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
                vlan {
            }
        }
    }
}
Mirroring Employee-to-Web Traffic for Remote Analysis

To configure port mirroring for remote traffic analysis of employee-to-Web traffic, perform these tasks:

**CLI Quick Configuration**

To quickly configure port mirroring to mirror employee traffic to the external Web, copy the following commands and paste them into the switch terminal window:

- Copy and paste the following commands in the source switch terminal window:

```plaintext
[edit]
set forwarding-options port-mirroring instance employee-web-monitor output vlan 999
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set firewall family ethernet-switching filter watch-employee term employee-to-corp from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then port-mirror-instance employee-web-monitor
set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```
• Copy and paste the following commands in the destination switch terminal window:

```plaintext
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk
set forwarding-options analyzer employee-web-monitor input ingress vlan remote-analyzer
set forwarding-options analyzer employee-web-monitor output interface ge-0/0/5.0
```

**Step-by-Step Procedure**

To configure port mirroring of all traffic from the two ports connected to employee computers to the remote-analyzer VLAN for use from a remote monitoring station:

1. On the source switch:
   - Configure the **employee-web-monitor** port mirroring instance:
     ```plaintext
     [edit ]
     user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
     user@switch# set forwarding-options port-mirroring instance employee-web-monitor output vlan 999
     ```
   - Configure the VLAN ID for the remote-analyzer VLAN:
     ```plaintext
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the interface to associate it with the remote-analyzer VLAN:
     ```plaintext
     [edit interfaces]
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
     ```
   - Configure the firewall filter called **watch-employee**:
     ```plaintext
     [edit firewall family ethernet-switching]
     user@switch# set filter (Firewall Filters) watch-employee term employee-to-corp from destination-address 192.0.2.16/28
     user@switch# set filter watch-employee term employee-to-corp from source-address 192.0.2.16/28
     user@switch# set filter watch-employee term employee-to-corp then accept
     user@switch# set filter watch-employee term employee-to-web from destination-port 80
     user@switch# set filter watch-employee term employee-to-web then port-mirror-instance employee-web-monitor
     ```
   - Apply the firewall filter to the employee interfaces:
     ```plaintext
     [edit interfaces]
     user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
     user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
     ```
2. On the destination switch:
   - Configure the VLAN ID for the remote-analyzer VLAN:
     ```plaintext
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the interface on the destination switch for trunk mode and associate it with the remote-analyzer VLAN:
     ```plaintext
     [edit interfaces]
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
     user@switch# set ge-0/0/5 unit 0 family ethernet-switchingvlan members 999
     ```
   - Configure the interface connected to the destination switch for trunk mode:
[edit interfaces]
user@switch# set ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk

- Configure the employee-monitor analyzer:

[edit forwarding-options port-mirroring]
user@switch# set instance employee-web-monitor input ingress vlan remote-analyzer
user@switch# set instance employee-web-monitor output interface ge-0/0/5.0

Results Check the results of the configuration on the source switch:

[edit]
user@switch> show
interfaces {
  ge-0/0/10 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
        vlan {
          members remote-analyzer;
        }
      }
    }
  }
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
}
firewall {
  family ethernet-switching {
    filter watch-employee {
      term employee-to-corp {
        from {
          source-address {
            192.0.2.16/28;
          }
          destination-address {
            192.0.2.16/28;
          }
        }
        then accept;
      }
    }
  }
}
term employee-to-web {
  from {
    destination-port 80;
  }
  then port-mirror-instance employee-web-monitor;
}
}
}
forwarding-options {
  analyzer employee-web-monitor {
    output {
      vlan {
        999;
      }
    }
  }
  vlans {
    remote-analyzer {
      vlan-id 999;
    }
  }
}
vlans {
  remote-analyzer {
    vlan-id 999;
  }
}
}
Check the results of the configuration on the destination switch:

[edit]
user@switch> show
vlans {
  remote-analyzer {
    vlan-id 999;
  }
}
interfaces {
  ge-0/0/10 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
        vlan {
          members remote-analyzer;
        }
      }
    }
  }
  ge-0/0/5 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
}
forwarding-options {
  port-mirroring {
    instance employee-web-monitor {
      input {
      }
      ingress [
Verify that the analyzer named `employee-monitor` or `employee-web-monitor` has been created on the switch with the appropriate input interfaces and appropriate output interface.

You can verify the analyzer is configured as expected by using the `show forwarding-options analyzer` command. To view previously created analyzers that are disabled, go to the J-Web interface.

To verify that the analyzer is configured as expected while monitoring all employee traffic on the source switch, run the `show analyzer` command on the source switch. The following output is displayed for this configuration example:

```
user@switch> show forwarding-options analyzer
Analyzer name            : employee-monitor
Mirror rate              : 1
Maximum packet length    : 0
State                    : up
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
Egress monitored interfaces : ge-0/0/0.0
Egress monitored interfaces : ge-0/0/1.0
Output VLAN              : default-switch/remote-analyzer
```

This output shows that the `employee-monitor` instance has a ratio of 1 (mirroring every packet, the default), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration is up (which indicates the proper state and that the analyzer is programmed, and is mirroring the traffic entering `ge-0/0/0/0` and `ge-0/0/1.0` and is sending the mirrored traffic to the VLAN called `remote-analyzer`). If the state of the output interface is down or if the output interface is not configured, the value of state will be down and the analyzer will not be programmed for mirroring.

- **Related Documentation**
  - Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches on page 3564
EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on EX4300 switches

You can analyze the mirrored traffic by using a protocol analyzer application running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN.

This topic includes an example that describes how to mirror traffic entering ports on the switch to the remote-analyzer VLAN through a transit switch, so that you can perform analysis from a remote monitoring station.

**BEST PRACTICE:** Mirror only necessary packets to reduce potential performance impact. We recommend that you:

- Disable your configured mirroring sessions when you are not using them.
- Specify individual interfaces as input to analyzers rather than specifying all interfaces as input.
- Limit the amount of mirrored traffic by using firewall filters.

This example describes how to configure remote mirroring through a transit switch:
Requirements

This example uses the following hardware and software components:

• An EX4300 switch connected to another EX4300 switch through a third EX4300 switch
• Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you configure remote mirroring, be sure that:

• You have an understanding of mirroring concepts.
• The interfaces that the analyzer will use as input interfaces have been configured on the switch.

Overview and Topology

This example describes how to mirror traffic entering ports on the switch to the remote-analyzer VLAN through a transit switch so that you can perform analysis from a remote monitoring station. The example shows how to configure a switch to mirror all traffic from employee computers to a remote analyzer.

In this configuration, an analyzer session is required on the destination switch to mirror incoming traffic from the analyzer VLAN to the egress interface to which the remote monitoring station is connected. You must disable MAC learning on the transit switch for the remote-analyzer VLAN so that MAC learning is disabled for all member interfaces of the remote-analyzer VLAN on the transit switch.

Figure 50 on page 3581 shows the network topology for this example.

Figure 50: Remote Mirroring Through a Transit Switch Network—Sample Topology
In this example:

- Interface ge-0/0/0 is a Layer 2 interface, and interface ge-0/0/1 is a Layer 3 interface (both interfaces on the source switch) that serve as connections for employee computers.
- Interface ge-0/0/10 is a Layer 2 interface that connects to the transit switch.
- Interface ge-0/0/11 is a Layer 2 interface on the transit switch.
- Interface ge-0/0/12 is a Layer 2 interface on the transit switch and connects to the destination switch.
- Interface ge-0/0/13 is a Layer 2 interface on the destination switch.
- Interface ge-0/0/14 is a Layer 2 interface on the destination switch and connects to the remote monitoring station.
- VLAN remote-analyzer is configured on all switches in the topology to carry the mirrored traffic.

**Mirroring All Employee Traffic for Remote Analysis Through a Transit Switch**

To configure mirroring for remote traffic analysis through a transit switch, for all incoming and outgoing employee traffic, perform these tasks:

**CLI Quick Configuration**

To quickly configure mirroring for remote traffic analysis through a transit switch, for incoming and outgoing employee traffic, copy the following commands and paste them into the switch terminal window:

- Copy and paste the following commands in the source switch (monitored switch) terminal window:
  ```
  [edit]
  set vlans remote-analyzer vlan-id 999
  set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
  set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
  set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0.0
  set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
  set forwarding-options analyzer employee-monitor output vlan remote-analyzer
  ```
- Copy and paste the following commands in the transit switch window:
  ```
  [edit]
  set vlans remote-analyzer vlan-id 999
  set interfaces ge-0/0/11 unit 0 family ethernet-switching interface-mode trunk
  set vlans remote-analyzer interface ge-0/0/11
  set interfaces ge-0/0/12 unit 0 family ethernet-switching interface-mode trunk
  set vlans remote-analyzer interface ge-0/0/12
  set vlans remote-analyzer no-mac-learning
  ```
- Copy and paste the following commands in the destination switch window:
  ```
  [edit]
  set vlans remote-analyzer vlan-id 999
  set interfaces ge-0/0/13 unit 0 family ethernet-switching interface-mode trunk
  set vlans remote-analyzer interface ge-0/0/13 ingress
  set interfaces ge-0/0/14 unit 0 family ethernet-switching interface-mode trunk
  ```
To configure remote mirroring through a transit switch:

1. **On the source switch:**
   - Configure the VLAN ID for the `remote-analyzer` VLAN:
     ```
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the interfaces on the network port connected to transit switch for trunk mode and associate it with the `remote-analyzer` VLAN:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
     user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
     ```
   - Configure the `employee-monitor` analyzer:
     ```
     [edit forwarding-options]
     user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
     user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
     user@switch# set analyzer employee-monitor input egress interface ge-0/0/0.0
     user@switch# set analyzer employee-monitor input egress interface ge-0/0/1.0
     user@switch# set analyzer employee-monitor output vlan remote-analyzer
     ```

2. **On the transit switch:**
   - Configure the VLAN ID for the `remote-analyzer` VLAN:
     ```
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the `ge-0/0/11` interface for trunk mode, associate it with the `remote-analyzer` VLAN:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/11 unit 0 family ethernet-switching interface-mode trunk
     ```
   - Configure the `ge-0/0/12` interface for trunk mode, associate it with the `remote-analyzer` VLAN, and set the interface for egress traffic only:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/12 unit 0 family ethernet-switching interface-mode trunk
     user@switch# set vlans remote-analyzer interface ge-0/0/12
     ```
   - Configure the `no-mac-learning` option for the `remote-analyzer` VLAN to disable MAC learning on all interfaces that are members of the `remote-analyzer` VLAN:
     ```
     [edit interfaces]
     user@switch# set vlans remote-analyzer no-mac-learning
     ```

3. **On the destination switch:**
   - Configure the VLAN ID for the `remote-analyzer` VLAN:
     ```
     [edit vlans]
     user@switch# set remote-analyzer vlan-id 999
     ```
   - Configure the `ge-0/0/13` interface for trunk mode, associate it with the `remote-analyzer` VLAN, and set the interface for ingress traffic only:
     ```
     [edit interfaces]
     user@switch# set ge-0/0/13 unit 0 family ethernet-switching interface-mode trunk
     ```
user@switch# set vlans remote-analyzer interface ge-0/0/13 ingress
• Configure the interface connected to the remote monitoring station for trunk mode:
  [edit interfaces]
user@switch# set ge-0/0/14 unit 0 family ethernet-switching interface-mode trunk
• Configure the employee-monitor analyzer:
  [edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress vlan remote-analyzer
user@switch# set analyzer employee-monitor output interface ge-0/0/14.0

Results
Check the results of the configuration on the source switch:

[edit]
user@switch> show forwarding-options {
  analyzer employee-monitor {
    input {
      ingress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;
      }
      egress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;
      }
    }
    output {
      vlan {
        remote-analyzer;
      }
    }
  }
  vlans {
    remote-analyzer {
      vlan-id 999;
    }
  }
  interfaces {
    ge-0/0/10 {
      unit 0 {
        family ethernet-switching {
          interface-mode trunk;
          vlan {
            member 999;
          }
        }
      }
    }
  }
}
Check the results of the configuration on the transit switch:

[edit]
user@switch> show vlans {
  remote-analyzer {
    vlan-id 999;
    interface {
      ge-0/0/11.0 {
      }
      ge-0/0/12.0 {
      }
    }
    no-mac-learning;
  }
}

interfaces {
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
  ge-0/0/12 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
}

Check the results of the configuration on the destination switch:

[edit]
user@switch> show vlans {
  remote-analyzer {
    vlan-id 999;
    interface {
      ge-0/0/13.0 {
        ingress;
      }
    }
  }
}

interfaces {
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
  ge-0/0/14 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
}
forwarding-options {
  analyzer employee-monitor {
    input {
      ingress {
        vlan remote-analyzer;
      }
    }
    output {
      interface {
        ge-0/0/14.0;
      }
    }
  }
}

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Analyzer Has Been Correctly Created on page 3586

**Verifying That the Analyzer Has Been Correctly Created**

**Purpose**

Verify that the analyzer named `employee-monitor` has been created on the switch with the appropriate input interfaces and the appropriate output interface.

**Action**

You can verify whether the analyzer is configured as expected by using the `show analyzer` command. To view previously created analyzers that are disabled, go to the J-Web interface.

To verify that the analyzer is configured as expected while monitoring all employee traffic on the source switch, run the `show analyzer` command on the source switch. The following output is displayed for this example configuration:

```
user@switch> show forwarding-options analyzer
Analyzer name : employee-monitor
  Mirror rate : 1
  Maximum packet length : 0
  State : up
  Ingress monitored interfaces : ge-0/0/0.0
  Ingress monitored interfaces : ge-0/0/1.0
  Egress monitored interfaces : ge-0/0/0.0
  Egress monitored interfaces : ge-0/0/1.0
  Output vlan : default-switch/remote-analyzer
```

**Meaning**

This output shows that the `employee-monitor` analyzer has a ratio of 1 (mirroring every packet, the default), is mirroring the traffic entering ge-0/0/0 and ge-0/0/1, and sending the mirrored traffic to the analyzer `remote-analyzer`.
Example: Configuring Ethernet OAM Connectivity Fault Management on EX Series Switches

Ethernet interfaces on EX Series switches and Junos OS for EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM).

This example describes how to enable and configure OAM CFM on a Gigabit Ethernet interface:

- Requirements on page 3587
- Overview and Topology on page 3587
- Configuring Ethernet OAM Connectivity Fault Management on Switch 1 on page 3587
- Configuring Ethernet OAM Connectivity Fault Management on Switch 2 on page 3588
- Verification on page 3590

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for EX Series switches
- Two EX Series switches connected by a point-to-point Gigabit Ethernet link

Overview and Topology

CFM can be used to monitor the physical link between two switches. In the following example, two switches are connected by a point-to-point Gigabit Ethernet link. The link between these two switches is monitored using CFM.

Configuring Ethernet OAM Connectivity Fault Management on Switch 1

To quickly configure Ethernet OAM CFM, copy the following commands and paste them into the switch terminal window:

```cli
[edit protocols oam ethernet connectivity-fault-management maintenance-domain]
set name-format character-string
set maintenance-domain private level 0
set maintenance-association private-ma
set continuity-check hold-interval 1s
```
**Step-by-Step Procedure**

To enable and configure OAM CFM on switch 1:

1. Specify the maintenance domain name format:
   
   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain]
   user@switch1# set name-format character-string
   ```

2. Specify the maintenance domain name and the maintenance domain level:
   
   ```
   [edit protocols oam ethernet connectivity-fault-management]
   user@switch1# set maintenance-domain private level 0
   ```

3. Create a maintenance association:
   
   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain private]
   user@switch1# set maintenance-association private-ma
   ```

4. Enable the continuity check protocol and specify the continuity check hold interval:
   
   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain private maintenance-association private-ma]
   user@switch1# set continuity-check hold-interval 1s
   ```

5. Configure the maintenance association end point (MEP):
   
   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain private maintenance-association private-ma]
   user@switch1# set mep 100 interface ge-1/0/1 auto-discovery direction down
   ```

**Results**

Check the results of the configuration.

```
[edit]
user@switch1 > show
protocols {
  oam {
    ethernet {
      connectivity-fault-management {
        maintenance-domain private {
          level 0;
          maintenance-association private-ma {
            continuity-check {
              interval 1s;
            }
            mep 100 {
              interface ge-1/0/1;
              auto-discovery;
              direction down;
            }
          }
        }
      }
    }
  }
}
```

---

**CLI Quick Configuration**

To quickly configure Ethernet OAM CFM, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain]
set name-format character-string
```
Step-by-Step Procedure

The configuration on switch 2 mirrors that on switch 2.

1. Specify the maintenance domain name format:
   
   \[
   \text{set name-format character-string} \\
   \text{[edit protocols oam ethernet connectivity-fault-management]} \\
   \text{user@switch2# set name-format character-string} \\
   \]

2. Specify the maintenance domain name and the maintenance domain level:
   
   \[
   \text{set maintenance-domain private level 0} \\
   \text{[edit protocols oam ethernet connectivity-fault-management]} \\
   \text{user@switch2# set maintenance-domain private level 0} \\
   \]

3. Create a maintenance association:
   
   \[
   \text{set maintenance-association private-ma} \\
   \text{[edit protocols oam ethernet connectivity-fault-management maintenance-domain private]} \\
   \text{user@switch2# set maintenance-association private-ma} \\
   \]

4. Enable the continuity check protocol and specify the continuity check hold interval:
   
   \[
   \text{set continuity-check hold-interval 1s} \\
   \text{[edit protocols oam ethernet connectivity-fault-management maintenance-domain private maintenance-association private-ma]} \\
   \text{user@switch2# set continuity-check hold-interval 1s} \\
   \]

5. Configure the maintenance association end point (MEP)
   
   \[
   \text{set mep 200 interface ge-0/2/5 auto-discovery direction down} \\
   \text{[edit protocols oam ethernet connectivity-fault-management maintenance-domain private maintenance-association private-ma]} \\
   \text{user@switch2# set mep 200 interface ge-0/2/5 auto-discovery direction down} \\
   \]

Results

Check the results of the configuration.

\[
\text{[edit]} \\
\text{user@switch2 > show} \\
\text{protocols { 
  oam { 
    ethernet { 
      connectivity-fault-management { 
        maintenance-domain private { 
          level 0; 
        maintenance-association private-ma { 
          continuity-check { 
            interval 1s; 
          } 
          mep 200 { 
            interface ge-0/2/5; 
            auto-discovery; 
            direction down; 
          } 
        } 
      } 
    } 
  } 
} 
\]
Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That OAM CFM Has Been Configured Properly on page 3590

**Verifying That OAM CFM Has Been Configured Properly**

**Purpose**
 Verify that OAM CFM has been configured properly.

**Action**
 Use the `show oam ethernet connectivity-fault-management interfaces detail` command:

```
user@switch1# show oam ethernet connectivity-fault-management interfaces detail
```

**Sample Output**

```
Interface name: ge-1/0/1.0, Interface status: Active, Link status: Up
Maintenance domain name: private, Format: string, Level: 0
Maintenance association name: private-ma, Format: string
Continuity-check status: enabled, Interval: 1ms, Loss-threshold: 3 frames
MEP identifier: 100, Direction: down, MAC address: 00:90:69:0b:4b:94
MEP status: running
Defects:
  Remote MEP not receiving CCM : no
  Erroneous CCM received : yes
  Cross-connect CCM received : no
  RDI sent by some MEP : yes
Statistics:
  CCMs sent : 76
  CCMs received out of sequence : 0
  LBMs sent : 0
  Valid in-order LBRs received : 0
  Valid out-of-order LBRs received : 0
  L BRs received with corrupted data : 0
  L BRs sent : 0
  L TMs sent : 0
  L TMs received : 0
  L TRs sent : 0
  L TRs received : 0
Sequence number of next LTM request : 0
Remote MEP count: 2
Identifier MAC address State Interface
2001 00:90:69:0b:7f:71 ok ge-0/2/5.0
```

**Meaning**
 When the output displays that continuity-check status is **enabled** and displays details of the remote MEP, it means that connectivity fault management (CFM) has been configured properly.

**Related Documentation**
- Understanding Ethernet OAM Connectivity Fault Management for an EX Series Switch on page 3553
- Junos OS Network Interfaces Configuration Guide
Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches

Junos OS for EX Series switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example describes how to enable and configure OAM LFM on a Gigabit Ethernet interface:

- Requirements on page 3591
- Overview and Topology on page 3591
- Configuring Ethernet OAM Link Fault Management on Switch 1 on page 3591
- Configuring Ethernet OAM Link Fault Management on Switch 2 on page 3592
- Verification on page 3593

Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.4 or later for EX Series switches
- Two EX3200 or EX4200 switches connected directly

Overview and Topology

Junos OS for EX Series switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example uses two EX4200 switches connected directly. Before you begin configuring Ethernet OAM LFM on two switches, connect the two switches directly through a trunk interface.

Configuring Ethernet OAM Link Fault Management on Switch 1

CLI Quick Configuration

To quickly configure Ethernet OAM LFM, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet link-fault-management]
set interface ge-0/0/0
set interface ge-0/0/0 link-discovery active
set interface ge-0/0/0 pdu-interval 800
set interface ge-0/0/0 remote-loopback
```

Step-by-Step Procedure

To configure Ethernet OAM LFM on switch 1:

1. Enable IEEE 802.3ah OAM support on an interface:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface (OAM LFM) ge-0/0/0
```
2. Specify that the interface initiates the discovery process by configuring the link discovery mode to **active**:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface ge-0/0/0 link-discovery active
```

3. Set the periodic OAM PDU-sending interval (in milliseconds) to 800 on switch 1:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface pdu-interval 800
```

4. Set a remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes made to the frames. Ensure that the remote DTE supports remote loopback mode. To set the remote DTE in loopback mode:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface ge-0/0/0.0 remote-loopback
```

### Results

Check the results of the configuration:

```
[edit]
user@switch1# show
protocols {
oam {
ethernet {
link-fault-management {
interface ge-0/0/0 {
pdu-interval 800;
link-discovery active;
remote-loopback;
}
}
}
```

---

**Configuring Ethernet OAM Link Fault Management on Switch 2**

**CLI Quick Configuration**

To quickly configure Ethernet OAM LFM on switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet link-fault-management ]
set interface ge-0/0/1
set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

**Step-by-Step Procedure**

To configure Ethernet OAM LFM on switch 2:

1. Enable OAM on the peer interface on switch 2:

```
[edit protocols oam ethernet link-fault-management]
user@switch2# set interface ge-0/0/1
```

2. Enable remote loopback support for the local interface:

```
[edit protocols oam ethernet link-fault-management]
user@switch2# set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

### Results

Check the results of the configuration:

```
[edit]
```
Verification

Verifying That OAM LFM Has Been Configured Properly

Purpose

Verify that OAM LFM has been configured properly.

Action

Use the `show oam ethernet link-fault-management` command:

```
user@switch1# show oam ethernet link-fault-management
```

Sample Output

```
Interface: ge-0/0/0.0
Status: Running, Discovery state: Send Any
Peer address: 00:19:e2:50:3b:e1
Flags: Remote-Stable Remote-State-Valid Local-Stable 0x50
Remote entity information:
  Remote MUX action: forwarding, Remote parser action: forwarding
  Discovery mode: active, Unidirectional mode: unsupported
  Remote loopback mode: supported, Link events: supported
  Variable requests: unsupported
```

Meaning

When the output displays the MAC address and the discover state is **Send Any**, it means that OAM LFM has been configured properly.

Configuring SNMP (J-Web Procedure)

You can use the J-Web interface to define system identification information, create SNMP communities, create SNMP trap groups, and configure health monitor options for EX Series switches.

To configure SNMP features:

1. Select Configure > Services > SNMP.
2. Enter information into the configuration page for SNMP as described in Table 433 on page 3594.
3. To apply the configuration click Apply.

NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

### Configuring Mirroring on EX4300 Switches to Analyze Traffic (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Port Mirroring to Analyze Traffic (CLI Procedure). For ELS details, see Getting Started with Enhanced Layer 2 Software.

EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN

**BEST PRACTICE:** Mirror only necessary packets to reduce potential performance impact. We recommend that you:

- Disable your configured mirroring configurations when you are not using them.
- Specify individual interfaces as input to analyzers rather than specifying all interfaces as input.
- Limit the amount of mirrored traffic by using firewall filters.
NOTE: If you want to create additional analyzers without deleting the existing analyzers, then disable the existing analyzers by using the disable analyzer analyzer-name statement from the command-line interface or the J-Web configuration page for mirroring.

NOTE: Interfaces used as output for an analyzer must be configured under the ethernet-switching family.

- Configuring an Analyzer for Local Traffic Analysis on page 3598
- Configuring an Analyzer for Remote Traffic Analysis on page 3598
- Configuring Port Mirroring on page 3599

Configuring an Analyzer for Local Traffic Analysis

To mirror interface traffic or VLAN traffic on the switch to an interface on the switch (by using analyzers):

1. Choose a name for the analyzer and specify the input:

   ```
   [edit forwarding-options]
   user@switch# set analyzer analyzer-name input ingress interface interface-name
   ```
   
   For example, create an analyzer called employee-monitor for which the input traffic is packets entering interfaces ge-0/0/0.0 and ge-0/0/1.0:

   ```
   [edit forwarding-options]
   user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
   ```

2. Configure the destination interface for the mirrored packets:

   ```
   [edit forwarding-options]
   user@switch# set analyzer analyzer-name output interface interface-name
   ```
   
   For example, configure ge-0/0/10.0 as the destination interface for the employee-monitor analyzer:

   ```
   [edit forwarding-options]
   user@switch# set analyzer employee-monitor output interface ge-0/0/10.0
   ```

Configuring an Analyzer for Remote Traffic Analysis

To mirror traffic that is traversing interfaces or a VLAN on the switch to a VLAN for analysis from a remote location (by using analyzers):

1. Configure a VLAN to carry the mirrored traffic:

   ```
   [edit]
   user@switch# set vlans analyzer-name vlan-id vlan-ID
   ```
   
   For example, define an analyzer VLAN called remote-analyzer and assign it a VLAN ID of 999:

   ```
   [edit]
   user@switch# set vlans remote-analyzer vlan-id 999
   ```
2. Set the uplink module interface that is connected to the distribution switch to trunk mode and associate it with the analyzer VLAN:

```plaintext
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching interface-mode trunk vlan members vlan-ID
```

For example, set the interface ge-0/1/1 to trunk mode and associate it with the analyzer VLAN ID 999:

```plaintext
[edit]
user@switch# set interfaces ge-0/1/1 unit 0 family ethernet-switching interface-mode trunk vlan members 999
```

3. Configure the analyzer:

a. Define an analyzer and specify the traffic to be mirrored:

```plaintext
[edit forwarding-options]
user@switch# set analyzer analyzer-name input ingress interface interface-name
```

For example, define the `employee-monitor` analyzer for which traffic to be mirrored is packets entering interfaces ge-0/0/0.0 and ge-0/0/1.0:

```plaintext
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
```

b. Specify the analyzer VLAN as the output for the analyzer:

```plaintext
[edit forwarding-options]
user@switch# set analyzer analyzer-name output vlan vlan-ID
```

For example, specify the `remote-analyzer` VLAN as the output analyzer for the `employee-monitor` analyzer:

```plaintext
[edit forwarding-options]
user@switch# set analyzer employee-monitor output vlan 999
```

### Configuring Port Mirroring

To filter packets to be mirrored to a port-mirroring instance, create the instance and then use it as the action in the firewall filter. You can use firewall filters in both local and remote mirroring configurations.

If the same port-mirroring instance is used in multiple filters or terms, the packets are copied to the analyzer output port or analyzer VLAN only once.

To filter mirrored traffic, create a port-mirroring instance under the [edit forwarding-options] hierarchy level, and then create a firewall filter. The filter can use any of the available match conditions and must have `port-mirror-instance instance-name` as an action. This action in the firewall filter configuration provides the input to the port-mirroring instance.

To configure a port-mirroring instance with firewall filters:

1. Configure the port-mirroring instance name (here, `employee-monitor`) and the output:

   a. For local analysis, set the output to the local interface to which you will connect the computer running the protocol analyzer application:

      ```plaintext
      [edit forwarding-options]
      ```
user@switch# set port-mirroring instance employee-monitor output interface ge-0/0/10.0

b. For remote analysis, set the output to the remote-analyzer VLAN:
   [edit forwarding-options]
   user@switch# set port-mirroring instance employee-monitor output vlan 999

2. Create a firewall filter by using any of the available match conditions and assign employee-monitor to the port-mirror-instance action:

   This step shows a firewall filter example-filter, with two terms (no-analyzer and to-analyzer):

   a. Create the first term to define the traffic that should not pass through to the port-mirroring instance employee-monitor:
      [edit firewall family ethernet-switching]
      user@switch# set filter (Firewall Filters) example-filter term no-analyzer from source-address ip-address
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term no-analyzer from destination-address ip-address
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term no-analyzer then accept

   b. Create the second term to define the traffic that should pass through to the port-mirroring instance employee-monitor:
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term to-analyzer from destination-port 80
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term to-analyzer then port-mirror-instance employee-monitor
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term to-analyzer then accept

3. Apply the firewall filter to the interfaces or VLAN that provide input to the port-mirroring instance:
   [edit]
   user@switch# set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input example-filter
   [edit]
   user@switch# set vlan (802.1Q Tagging) remote-analyzer filter input example-filter

Configuring Port Mirroring to Analyze Traffic (J-Web Procedure)

EX Series switches allow you to configure port mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use port mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on EX2200, EX3200, EX3300, EX4200, EX4300, EX4500, EX6200 switches
- Packets exiting a VLAN on EX8200 switches

To configure port mirroring on an EX Series switch using the J-Web interface:

1. Select Configure > Security > Port Mirroring.

   The top of the screen displays analyzer details such as the name, status, analyzer port, ratio, and loss priority.

   The bottom of the screen lists ingress and egress ports of the selected analyzer.

   NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:

   - Add—Add an analyzer. Enter information as specified in Table 434 on page 3602.
   - Edit—Modify details of the selected analyzer. Enter information as specified in Table 434 on page 3602.
   - Delete—Delete the selected analyzer.
   - Enable/Disable—Enable or disable the selected analyzer (toggle).

   NOTE: On EX2200, EX3200, EX4200, and EX4500 switches, only one analyzer can be enabled at a time. On EX8200 switches, a maximum of seven analyzers can be enabled. On EX4300 switches a maximum of four Analyzers/Port Mirror instances can be enabled.

   NOTE: When an analyzer is deleted or disabled, any filter association is removed.

Configuring sFlow Technology for Network Monitoring (CLI Procedure)

You can configure sFlow technology, designed for monitoring high-speed switched or routed networks, to continuously monitor traffic at wire speed on all interfaces simultaneously. Junos OS fully supports the sFlow standard described in RFC 3176, InMon Corporation’s sFlow: A Method for Monitoring Traffic in Switched and Routed Networks (see http://faqs.org/rfcs/rfc3176.html).

To configure sFlow features:

1. Configure the IP address and the UDP port of the collector:

   ```
   [edit protocols]
   user@switch# set sflow collector ip-address udp-port port-number
   ```

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@switch# set interfaces interface-name
   ```

   \[NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.\]

   You cannot enable sFlow technology on a link aggregation group (LAG), but you can enable it on the member interfaces of a LAG.

3. Specify how often the sFlow agent polls the interface:

   ```
   [edit protocols sflow]
   user@switch# set polling-interval seconds
   ```

   \[NOTE: Specify 0 if you do not want to poll the interface.\]

4. Specify the rate at which packets must be sampled. You can specify either an egress or an ingress qualifier, or both.

   ```
   [edit protocols sflow]
   user@switch# set sample-rate number
   ```

   \[NOTE: The sample-rate number (the global sampling rate) statement has been deprecated and might be removed from future product releases. We strongly recommend that you phase out its use.\]
NOTE: We recommend that you configure the same sample rates for both ingress and egress. If the sample rates are different, the lower value is used.

To specify an egress sampling rate:

```
[edit protocols sflow]
user@switch# set sample-rate egress number
```

To specify an ingress sampling rate:

```
[edit protocols sflow]
user@switch# set sample-rate ingress number
```

5. To configure the polling interval and the egress and ingress sampling rates at the interface level:

```
[edit protocols sflow interfaces interface-name]
user@switch# set polling-interval seconds
[edit protocols sflow interfaces]
user@switch# set sample-rate egress number
[edit protocols sflow interfaces]
user@switch# set sample-rate ingress number
```

NOTE: The interface-level configuration overrides the global configuration.

6. To specify an IP address to be used as the agent ID for the sFlow agent:

```
[edit protocols sflow]
user@switch# set agent-id ip-address
```

7. To specify the source IP address to be used for sFlow datagrams:

```
[edit protocols sflow]
user@switch# set source-ip ip-address
```

Configuring Real-Time Performance Monitoring (J-Web Procedure)

Real-time performance monitoring (RPM) in EX Series switches enables you to configure and send probes to a specified target and monitor the analyzed results to determine packet loss, round-trip time, and jitter. Jitter is the difference in relative transit time between two consecutive probes. You can set up probe owners and configure one or more performance probe tests under each probe owner.

The ways in which you can use RPM include:

- Monitor time delays between devices.
- Monitor time delays at the protocol level.
• Set thresholds to trigger SNMP traps when threshold values are exceeded. You can configure thresholds for round-trip time, ingress or egress delay, standard deviation, jitter, successive lost probes, and total lost probes per test.
• Determine automatically whether a path exists between a host switch and its configured Border Gateway Protocol (BGP) neighbors. You can view the results of the discovery using an SNMP client.
• Use the history of the most recent 50 probes to analyze trends in your network and predict future needs.

Probes collect packets per destination and per application, including PING Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets.

EX Series switches support the following tests and probe types:

• Ping tests:
  • ICMP echo
  • ICMP timestamp

• HTTP tests:
  • HTTP get (not available for BGP RPM services)

• UDP and TCP tests with user-configured ports:
  • UDP echo
  • TCP connection
  • UDP timestamp

To account for latency in the communication of probe messages, you can enable timestamping of the probe packets. You should configure both the requester and the responder to timestamp the RPM packets. The RPM features provides an additional configuration option to set one-way hardware timestamps. Use one-way timestamps when you want information about one-way, rather than round-trip, times for packets to traverse the network between the requester and the responder.

**NOTE:**

• EX Series switches support hardware timestamps for UDP and ICMP probes. EX Series switches do not support hardware timestamps for HTTP or TCP probes.
• If the responder does not support hardware timestamps, RPM can only report the round-trip measurements, it cannot calculate round-trip jitter.
• In EX Series switches timestamps apply only to IPv4 traffic.
To configure RPM using the J-Web interface:

1. Select **Troubleshoot > RPM > Configure RPM**.

2. In the **Configure RPM** page, enter information as specified in Table 435 on page 3606.
   a. Click **Add** to set up the **Owner Name** and **Performance Probe Tests**.
   b. Select a probe owner from **Probe Owners** list and click **Delete** to remove the selected
      probe owner.
   c. Double-click one of the probe owners in **Probe Owners** list to display the list of
      performance probe tests.
   d. Double-click one of the performance probe tests to edit the test parameters.

3. Enter the **Maximum Number of Concurrent Probes** and specify the **Probe Servers**.

4. Click **Apply** to apply the RPM probe settings.

### Table 435: RPM Probe Owner, Concurrent Probes, and Probe Servers Configuration Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
</table>
| Probe Owners            | Identifies a owner for whom one or more RPM tests are configured. In most implementations, the owner name identifies a network on which a set of tests is being run. | 1. Click **Add** and type an owner name.  
2. In **Performance Probe Tests**, click **Add** to define the RPM test parameters. See Table 436 on page 3607 for information on configuring RPM test parameters.  
3. Click **OK** to save the settings or **Cancel** to exit from the window without saving the changes. |
| Maximum Number of Concurrent Probes | Specifies the maximum number of concurrent probes allowed. | Type a number from 1 through 500. |
| Probe Servers           | Specifies the servers that act as receivers and transmitters for the probes. | Set up the following servers:  
  - TCP Probe Server—Specifies the port on which the device is to receive and transmit TCP probes. Type the number 7 (a standard TCP port number) or a port number from 49160 through 65535.  
  - UDP Probe Server—Specifies the port on which the device is to receive and transmit UDP probes. Type the number 7 (a standard TCP port number) or a port number from 49160 through 65535. |

</tbody>
</table>
Use real-time performance monitoring (RPM) to configure active probes to track and monitor traffic across the network and to investigate network problems. To configure basic RPM probes on the EX Series switch, you must configure the probe owner, the test, and the specific parameters of the RPM probe.

You can also set a timestamp to improve the measurement of latency or jitter. The probe is timestamped by the device originating the probe (the RPM client). If you do not enable hardware timestamps, the timer values are set. You should configure both the RPM client (the requester) and the RPM server (the responder) to timestamp the RPM packets. However, if the RPM server does not support hardware timestamps, RPM can only report the round-trip measurements.

Timestamps apply only to IPv4 traffic.

You can enable hardware timestamps for the following RPM probe types:

- icmp-ping
- icmp-ping-timestamp
- udp-ping
- udp-ping-timestamp

To configure RPM probes and enable hardware timestamping:

1. Specify the probe owner:
   
   ```
   [edit services rpm]
   user@switch# set probe owner
   ```

2. Specify a test name. A test represents the range of probes over which the standard deviation, average, and jitter are calculated.
   
   ```
   [edit services rpm probe owner]
   user@switch# set test test-name
   ```

3. Specify the packet and protocol contents of the probe:
   
   ```
   [edit services rpm probe owner test test-name]
   user@switch# set probe-type type
   ```

4. Specify the destination IPv4 address to be used for the probes:
   
   ```
   [edit services rpm probe owner test test-name]
   user@switch# set target address
   ```

5. Specify the number of probes within a test:
   
   ```
   [edit services rpm probe owner test test-name]
   user@switch# set probe-count count
   ```

6. Specify the time, in seconds, to wait between sending packets:
   
   ```
   [edit services rpm probe owner test test-name]
   ```
user@switch# set probe-interval interval

7. Specify the time, in seconds, to wait between tests:

[edit services rpm probe owner test test-name]
user@switch# set test-interval interval

8. Specify the source IP address to be used for probes. If the source IP address is not one of the switch’s assigned addresses, the packet uses the outgoing interface’s address as its source.

[edit services rpm probe owner test test-name]
user@switch# set source-address address

9. Specify the value of the Differentiated Services (DiffServ) field within the IP header. The DiffServ code point (DSCP) bits value must be set to a valid 6-bit pattern.

[edit services rpm probe owner test test-name]
user@switch# set dscp-code-point dscp-bits

10. If you are using ICMP probes, specify the size of the data portion of ICMP probes:

[edit services rpm probe owner test test-name]
user@switch# set data-size size

11. Enable hardware timestamping of RPM probe messages:

[edit services rpm probe owner test test-name]
user@switch# set hardware-timestamp

Configuring Ethernet OAM Connectivity Fault Management (CLI Procedure)

Ethernet interfaces on Juniper Networks EX Series Ethernet Switches and Juniper Networks Junos OS for EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM).

This topic describes these tasks:

1. Creating the Maintenance Domain on page 3612
2. Configuring the Maintenance Domain MIP Half Function on page 3613
3. Creating a Maintenance Association on page 3613
4. Configuring the Continuity Check Protocol on page 3614
5. Configuring a Maintenance Association End Point on page 3614
6. Configuring a Connectivity Fault Management Action Profile on page 3615
7. Configuring the Linktrace Protocol on page 3615

Creating the Maintenance Domain

A maintenance domain comprises network entities such as operators, providers, and customers. To enable connectivity fault management (CFM) on an Ethernet interface, you must create a maintenance domains, maintenance associations, and MEPs.
To create a maintenance domain:

1. Specify a name for the maintenance domain:

   ```
   [edit protocols oam ethernet connectivity-fault-management]
   user@switch# set maintenance-domain domain-name
   ```

2. Specify a format for the maintenance domain name. If you specify none, no name is configured:

   - A plain ASCII character string
   - A domain name service (DNS) format
   - A media access control (MAC) address plus a two-octet identifier in the range 0 through 65,535
   - none

   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
   user@switch# set name-format format
   ```

   For example, to specify the name format as MAC address plus a two-octet identifier:

   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
   user@switch# set name-format mac+2oct
   ```

3. Configure the maintenance domain level, which is used to indicate the nesting relationship between this domain and other domains. Use a value from 0 through 7:

   ```
   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
   user@switch# set level level
   ```

**Configuring the Maintenance Domain MIP Half Function**

MIP Half Function (MHF) divides the maintenance association intermediate point (MIP) functionality into two unidirectional segments, improves visibility with minimal configuration, and improves network coverage by increasing the number of points that can be monitored. MHF extends monitoring capability by responding to loop-back and link-trace messages to help isolate faults. Whenever a MIP is configured, the MIP half function value for all maintenance domains and maintenance associations must be the same.

To configure the MIP half function:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
user@switch# set mip-half-function (none | default | explicit)
```
Configuring the Continuity Check Protocol

The continuity check protocol is used for fault detection by a maintenance association end point (MEP) within a maintenance association. The MEP periodically sends continuity check multicast messages. The receiving MEPs use the continuity check messages (CCMs) to build a MEP database of all MEPs in the maintenance association.

To configure the continuity check protocol:

1. Enable the continuity check protocol:

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name]
   user@switch# set continuity-check

2. Specify the continuity check hold interval. The hold interval is the number of minutes to wait before flushing the MEP database if no updates occur. The default value is 10 minutes.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]
   user@switch# set hold-interval number

3. Specify the CCM interval. The interval is the time between the transmission of CCMs. You can specify 10 minutes (10m), 1 minute (1m), 10 seconds (10s), 1 second (1s), 100 milliseconds (100ms), or 10 milliseconds (10ms).

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]
   user@switch# set interval number

4. Specify the number of CCMs (that is, protocol data units) that can be lost before the MEP is marked as down. The default number of protocol data units (PDUs) is 3.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]
   user@switch# set loss-threshold number

Configuring a Maintenance Association End Point

To configure a maintenance association end point:

1. Specify an ID for the MEP. The value can be from 1 through 8191.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name]
   user@switch# set mep mep-id

2. Enable maintenance endpoint automatic discovery if you want to have the MEP accept continuity check messages (CCMs) from all remote MEPS of the same maintenance association:

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]
   user@switch# set auto-discovery

3. You can specify that CFM packets (CCMs) be transmitted only in one direction for the MEP, that is, the direction be set as down so that CCMs are transmitted only out of (not into) the interface configured on this MEP.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]
   user@switch# set direction down
4. Specify the logical interface to which the MEP is attached. It can be either an access interface or a trunk interface. If you specify a trunk interface, the VLAN associated with that interface must have a VLAN ID.

   NOTE: You cannot associate an access interface that belongs to multiple VLANs with the MEP.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]  
   user@switch# set interface interface-name

5. You can configure a remote MEP from which CCMs are expected. If autodiscovery is not enabled, the remote MEP must be configured under the mep statement. If the remote MEP is not configured under the mep statement, the CCMs from the remote MEP are treated as errors.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]  
   user@switch# set remote-mep mep-id

**Configuring a Connectivity Fault Management Action Profile**

You can configure an action profile and specify the action to be taken when any of the configured events occur. Alternatively, you can configure an action profile and specify default actions when connectivity to a remote MEP fails.

To configure an action profile:

1. Specify a name for an action profile:

   [edit protocols oam ethernet connectivity-fault-management]  
   user@switch# set action-profile profile-name

2. Configure the action of the action profile:

   [edit protocols oam ethernet connectivity-fault-management action-profile profile-name]  
   user@switch# set action interface-down

3. Configure one or more events under the action profile, the occurrence of which will trigger the corresponding action to be taken:

   [edit protocols oam ethernet connectivity-fault-management action-profile profile-name]  
   user@switch# set event event
   See Junos OS Network Interfaces Configuration Guide

**Configuring the Linktrace Protocol**

The linktrace protocol is used for path discovery between a pair of maintenance points. Linktrace messages are triggered by an administrator using the traceroute command to verify the path between a pair of MEPs under the same maintenance association. Linktrace messages can also be used to verify the path between a MEP and a MIP under the same maintenance domain.

To configure the linktrace protocol:
1. Configure the linktrace path age timer. If no response to a linktrace request is received, the request and response entries are deleted after the age timer expires:

```
[edit protocols oam ethernet connectivity-fault-management]
user@switch# set linktrace age time
```

2. Configure the number of linktrace reply entries to be stored per linktrace request:

```
[edit protocols oam ethernet connectivity-fault-management]
user@switch# set linktrace path-database-size path-database-size
```

### Configuring Ethernet OAM Link Fault Management (CLI Procedure)

Ethernet OAM link fault management (LFM) can be used for physical link-level fault detection and management. The IEEE 802.3ah LFM works across point-to-point Ethernet links either directly or through repeaters.

To configure Ethernet OAM LFM using the CLI:

1. Enable IEEE 802.3ah OAM support on an interface:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name
```

**NOTE:** You can configure Ethernet OAM LFM on aggregated interfaces.

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name link-discovery active
```

**NOTE:** The remaining steps are optional. You can choose which of these features to configure for Ethernet OAM LFM on your switch.

2. Specify whether the interface or the peer initiates the discovery process by configuring the link discovery mode to **active** or **passive** (**active** = interface initiates; **passive** = peer initiates):

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name link-discovery active
```

3. Configure a periodic OAM PDU-sending interval (in milliseconds) for fault detection:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface pdu-interval interval
```

4. Specify the number of OAM PDUs that an interface can miss before the link between peers is considered down:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name pdu-threshold threshold-value
```

5. Configure event threshold values on an interface for the local errors that trigger the sending of link event TLVs:
Set the threshold value (in seconds) for sending frame-error events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds frame-error count
```

Set the threshold value (in seconds) for sending frame-period events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds frame-period count
```

Set the threshold value (in seconds) for sending frame-period-summary events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds frame-period-summary count
```

Set the threshold value (in seconds) for sending symbol-period events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds symbol-period count
```

**NOTE:** You can disable the sending of link event TLVs.

To disable the sending of link event TLVs:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name negotiation-options no-allow-link-events
```

6. Create an action profile to define event fault flags and thresholds to be taken when the link fault event occurs. Then apply the action profile to one or more interfaces. (You can also apply multiple action profiles to a single interface.)

a. Name the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name
```

b. Specify actions to be taken by the system when the link fault event occurs:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name action syslog
user@switch# set action-profile profile-name action link-down
```

c. Specify events for the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name event link-adjacency-loss
```

**NOTE:** For each action profile, you must specify at least one link event and one action. The actions are taken only when all of the events in the action profile are true. If more than one action is specified, all actions are executed. You can set a low threshold for a specific action such as logging the error and set a high threshold for another action such as system logging.

7. Set a remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes made to the frames. Set the remote DTE in loopback mode as follows:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name negotiation-options no-allow-link-events
```
mode (the remote DTE must support remote-loopback mode) and then enable remote loopback support for the local interface.

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name remote-loopback
user@switch# set interface interface-name negotiation-options allow-remote-loopback
```

Configuring Interfaces for Uplink Failure Detection (CLI Procedure)

You can configure uplink failure detection on EX Series switches to help ensure balanced traffic flow. Using this feature, switches can monitor and detect link failure on uplink interfaces and can propagate the failure to downlink interfaces so that servers connected to those downlink interfaces can switch over to secondary interfaces.

Follow these configuration guidelines:

- You can configure a maximum of 48 groups for each switch.
- You can configure a maximum of 48 uplink interfaces and 48 downlink interfaces in each group.
- You can configure physical links and logical links in separate groups.
- Ensure that all the interfaces in the group are up. If the interfaces are down, uplink failure detection does not work.

NOTE: Routed VLAN interfaces (RVIs) cannot be configured as uplink interfaces to be monitored.

To configure uplink failure detection on a switch:

1. Specify a name for the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name
```

2. Add an uplink interface to the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name link-to-monitor interface-name
```

3. Repeat Step 2 for adding each uplink interface to the group.

NOTE: An interface can be configured as link-to-monitor in multiple groups.

4. Add a downlink interface to the group:

```
[edit protocols]
```
5. Repeat Step 4 for adding each downlink interface to the group.

NOTE: After you have configured a group, use the show uplink-failure-detection group group-name command to verify that all interfaces in the group are up.

Configuring MEP Interfaces on Switches to Support Ethernet Frame Delay Measurements (CLI Procedure)

Ethernet frame delay measurement is a useful tool for providing performance statistics or supporting or challenging service-level agreements (SLAs). By default, Ethernet frame delay measurement uses software for timestamping and delay calculations. You can configure an EX Series switch to perform and display Ethernet frame delay measurements on Ethernet interfaces. The switches support software-assisted timestamping.

Before you can begin configuring MEP interfaces to support Ethernet frame delay measurements on switches, ensure that you have:

- Configured Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) correctly
- Enabled distributed periodic packet management (PPM) (distributed PPM is enabled by default)
To configure MEP interfaces on switches to support Ethernet frame delay measurements:

1. Enable the Ethernet frame delay measurement by issuing the `monitor ethernet delay-measurement` operational mode command. In this command, you must specify one measurement type (either one-way or two-way measurement), and you must specify either the unicast MAC address of the peer MEP or its numeric identifier.

Optionally, you can also specify the following parameters:

- Number of frames to send to the peer MEP (`count count`)
- Number of seconds to wait between sending frames (`wait time`)
- Priority value of the delay measurement request frame (`priority value`)
- Size of the data in the data TLV of the request packet (`size value`)
- Suppression of the insertion of the session ID TLV in the request packet (`no-session-id-tlv`)

```
user@switch> monitor ethernet delay-measurement maintenance-domain md-name maintenance-association ma-name one-way mep remote-mep-id count count wait time priority value size value no-session-id-tlv
```

## Configuring One-Way Ethernet Frame Delay Measurements on Switches (CLI Procedure)

Ethernet frame delay measurement is a useful tool for providing performance statistics or supporting or challenging service-level agreements (SLAs). You can configure the frame delay measurements in either a one-way mode or a two-way (round-trip) mode to gather frame delay statistics. For one-way Ethernet frame delay measurement, clocks at the local and remote MEPs need to be synchronized. However, clock synchronization is not required for two-way Ethernet frame delay measurement.

Before you begin configuring one-way Ethernet frame delay measurements on two EX Series switches, ensure that you have:

- Configured Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) correctly on both the switches
- Synchronized the system clocks of both the switches

To configure one-way Ethernet frame delay measurements:

1. Configure the maintenance domain, maintenance association, and MEP ID on both the switches.
2. From either switch, start a one-way Ethernet frame delay measurement:
Configuring an Iterator Profile on a Switch (CLI Procedure)

Ethernet frame delay measurement provides fine control to operators for triggering delay measurement on a given service and can be used to monitor service-level agreements (SLAs). You can create an iterator profile with its parameters to periodically transmit SLA measurement packets in the form of ITU-Y.1731-compliant frames for two-way delay measurement.

To create an iterator profile:

1. Specify a name for an SLA iterator profile—for example, il:

   [edit protocols oam ethernet connectivity-fault-management performance-monitoring]
   user@switch# edit sla-iterator-profiles il

2. (Optional) Configure the cycle time, which is the time (in milliseconds) between back-to-back transmissions of SLA frames.

   [edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles il]
   user@switch# set cycle-time cycle-time-value

3. (Optional) Configure the iteration period, which indicates the maximum number of cycles per iteration (the number of connections registered to an iterator cannot exceed this value).

   [edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles il]
   user@switch# set iteration-period iteration-period-value

4. Configure the measurement type as two-way delay measurement.

   [edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles il]
   user@switch# set measurement-type two-way-delay

5. (Optional) Configure the calculation weight for delay.
6. (Optional) Configure the calculation weight for delay variation.

   [edit protocols oam ethernet connectivity-fault-management performance-monitoring
   sla-iterator-profiles i1]
   user@switch# set calculation-weight delay delay-value

7. Configure a remote MEP with the iterator profile.

   [edit protocols oam ethernet connectivity-fault-management maintenance-domain
   md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id]
   user@switch# set sla-iterator-profiles i1

**Triggering an Ethernet Frame Delay Measurement Session on a Switch**

To trigger Ethernet frame delay measurement, use the `monitor ethernet delay-measurement` operational command and specify the following values:

- Either one-way (**one-way**) or two-way (**two-way**) measurement
- Either the MAC address (**remote-mac-address**) or the MEP ID (**mep**) of the remote host
- The maintenance domain (**maintenance-domain**)
- The maintenance association (**maintenance-association**)
- (Optional) Any or all of these options: `count`, `size`, `wait`, `no-session-id-tlv`, `priority`

For example:

```
user@switch> monitor ethernet delay-measurement one-way 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10 size 50 wait 5
no-session-id-tlv priority 1
```

Before you begin configuring two-way Ethernet frame delay measurements on two EX Series switches, ensure that you have:

- Configured Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) correctly on both the switches

To configure two-way Ethernet frame delay measurements:

1. Configure the maintenance domain, maintenance association, and MEP ID on both the switches.
2. From either switch, start a two-way Ethernet frame delay measurement:

   user@switch> monitor ethernet delay-measurement maintenance-domain md-name maintenance-association ma-name two-way mep remote-mep-id count count wait time

   You can view the result on the other switch:

   user@switch> show oam ethernet connectivity-fault-management delay-statistics maintenance-domain md-name maintenance-association ma-name local-mep mep-id remote-mep mep-id

Configuration Statements: SNMP

- [edit snmp] Configuration Statement Hierarchy on EX Series Switches on page 3623
• **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.

• **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

• Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27

This topic lists:

• Supported Statements in the [edit snmp] Hierarchy Level on page 3624

• Unsupported Statements in the [edit snmp] Hierarchy Level on page 3628

**Supported Statements in the [edit snmp] Hierarchy Level**

The following hierarchy shows the **[edit snmp]** configuration statements supported on EX Series switches:

```
snmp {
  client-list list-name {
    address {
      restrict;
    }
  }
  community community-name {
    authorization (read-only | read-write);

**address (SNMP)**

**Syntax**

address address;

**Hierarchy Level**

[edit snmp v3 target-address target-address-name]

**Release Information**

**Description**

Specify the SNMP target address.

**Options**

address—IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.

**Required Privilege Level**

- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Address
### address-mask

**Syntax**

```snmp
address-mask address-mask;
```

**Hierarchy Level**

```
[edit snmp v3 target-address target-address-name]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 on the QFX Series.

**Description**

Define and verify the source addresses for a group of target addresses for SNMP traps and informs.

**Options**

- `address-mask`—Define a range of addresses.

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- [Configuring the Address Mask](#)

### agent-address

**Syntax**

```snmp
agent-address outgoing-interface;
```

**Hierarchy Level**

```
[edit snmp trap-options]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is `outgoing-interface`, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

**Options**

- `outgoing-interface`—Value of the agent address of all SNMPv1 traps generated by this router or switch. The `outgoing-interface` option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

**Default:** disabled (the agent address is not specified in SNMPv1 traps).

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- [Configuring the Agent Address for SNMP Traps](#)
alarm (SNMP RMON)

Syntax

```plaintext
alarm index {
  description description;
  falling-event-index index;
  falling-threshold integer;
  falling-threshold-interval seconds;
  interval seconds;
  request-type (get-next-request | get-request | walk-request);
  rising-event-index index;
  rising-threshold integer;
  sample-type (absolute-value | delta-value);
  startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
  syslog-subtag syslog-subtag;
  variable oid-variable;
}
```

Hierarchy Level

[edit snmp rmon]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure RMON alarm entries.

Options

- `index`—Identifies this alarm entry as an integer.

The remaining statements are explained separately.

Required Privilege

- snmp—to view this statement in the configuration.
- snmp-control—to add this statement to the configuration.

Related Documentation

### authorization

**Syntax**
```
authorization authorization;
```

**Hierarchy Level**
```
[edit snmp community community-name]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Set the access authorization for SNMP Get, GetBulk, GetNext, and Set requests.

**Options**
```
authorization—Access authorization level:
```
- `read-only`—Enable Get, GetNext, and GetBulk requests.
- `read-write`—Enable all requests, including Set requests. You must configure a view to enable Set requests.

**Default**: `read-only`

**Required Privilege**
```
level
```

**Related Documentation**
- Configuring the SNMP Community String

### bucket-size

**Syntax**
```
bucket-size number;
```

**Hierarchy Level**
```
[edit snmp rmon history]
```

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the sampling of Ethernet statistics for network fault diagnosis, planning, and performance tuning.

**Default**
50

**Options**
```
number—Number of discrete samples of Ethernet statistics requested.
```

**Required Privilege**
```
level
```

### categories

| Syntax     | categories {  
|            |   
|            |     category;  
|            | }  
| Hierarchy Level | [edit snmp trap-group group-name]  
| Release Information | Statement introduced before Junos OS Release 7.4.  
| Description | Statement introduced in Junos OS Release 9.0 for EX Series switches.  
| Default | Define the types of traps that are sent to the targets of the named trap group.  
| Options | If you omit the `categories` statement, all trap types are included in trap notifications.  
| Options | `category`—Name of a trap type: authentication, chassis, configuration, link, remote-operations, rmon-alarm, routing, sonet-alarms, startup, or vrrp-events.  
| Required Privilege | snmp—To view this statement in the configuration.  
| Required Privilege | snmp-control—To add this statement to the configuration.  
| Related Documentation | • Configuring SNMP Trap Groups  

### client-list

| Syntax     | client-list client-list-name {  
|            |   
|            |   ip-addresses;  
|            | }  
| Hierarchy Level | [edit snmp]  
| Release Information | Statement introduced in Junos OS Release 8.5.  
| Options | Define a list of SNMP clients.  
| Options | `client-list-name`—Name of the client list.  
| Options | `ip-addresses`—IP addresses of the SNMP clients to be added to the client list,  
| Required Privilege | snmp—To view this statement in the configuration.  
| Required Privilege | snmp-control—To add this statement to the configuration.  
| Related Documentation | • Adding a Group of Clients to an SNMP Community  

Copyright © 2013, Juniper Networks, Inc.
### client-list-name

**Syntax**

```plaintext
client-list-name client-list-name;
```

**Hierarchy Level**

```plaintext
[edit snmp community community-name]
```

**Release Information**

**Description**

Add a client list or prefix list to an SNMP community.

**Options**

- `client-list-name`—Name of the client list or prefix list.

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- *Adding a Group of Clients to an SNMP Community*

### clients

**Syntax**

```plaintext
clients {
  address <restrict>;
}
```

**Hierarchy Level**

```plaintext
[edit snmp community community-name]
```

**Release Information**

**Description**

Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.

**Default**

If you omit the `clients` statement, all SNMP clients using this community string are authorized to access the router.

**Options**

- `address`—Address of an SNMP client that is authorized to access this router. You must specify an address, not a hostname. To specify more than one client, include multiple `address` options.
- `restrict`—(Optional) Do not allow the specified SNMP client to access the router.

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- *Configuring the SNMP Community String*
### commit-delay

**Syntax**
```
commit-delay seconds;
```

**Hierarchy Level**
```
[edit snmp nonvolatile]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure the timer for the SNMP Set reply and start of the commit.

**Options**
- `seconds`—Delay between an affirmative SNMP Set reply and start of the commit.
- **Default:** 5 seconds

**Required Privilege**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- [Configuring the Commit Delay Timer](#)
community (SNMP)

Syntax  

```
community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
        address restrict;
    }
    view view-name;
}
```

Hierarchy Level  [edit snmp]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

The SNMP client application specifies an SNMP community name in `Get`, `GetBulk`, `GetNext`, and `Set` SNMP requests.

Default  If you omit the `community` statement, all SNMP requests are denied.

Options  community-name—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege  

Level  snmp—To view this statement in the configuration.

Related Documentation  

- Configuring the SNMP Community String
community (SNMP RMON)

Syntax  
community community-name;

Hierarchy Level  
[edit snmp rmon event index]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
The trap group that is used when generating a trap (if eventType is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group with the rmon-alarm category set.

Options  
community-name—Identifies the trap group that is used when generating a trap if the event is configured to send traps.

Required Privilege  
Level  
snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

Related Documentation  
• Configuring an Event Entry and Its Attributes
community-name (SNMP)

Syntax  

community-name community-name;

Hierarchy Level  

[edit snmp v3 snmp-community community-index]

Release Information  

Statement introduced before Junos OS Release 7.4. 
Statement introduced in Junos OS Release 9.0 for EX Series switches. 
Statement introduced in Junos OS Release 11. for the QFX Series.

Description  

Define an SNMP community to authorize SNMPv1 or SNMPv2c clients in an SNMPv3 system. When you configure a community in SNMPv3, you can also specify a security name. The access privileges associated with the security name determine which MIB objects are available and which operations (read, write, or notify) are allowed on those objects.

Options  

community-name—Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose the name in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the [edit snmp community] and [edit snmp v3 snmp-community community-index] hierarchy levels.

The community name at the [edit snmp v3 snmp-community community-index] hierarchy level is encrypted and not displayed in the command-line interface (CLI).

Required Privilege Level  

snmp—To view this statement in the configuration. 
snmp-control—To add this statement to the configuration.

Related Documentation  

• Configuring the SNMPv3 Community
contact (SNMP)

**Syntax**  
```
contact contact;
```

**Hierarchy Level**  
```
[edit snmp]
```

**Release Information**  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Define the value of the MIB II `sysContact` object, which is the contact person for the managed system.

**Options**  
- `contact`—Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").

**Required Privilege**  
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**  
- Configuring the System Contact on a Device Running Junos OS

---

description (SNMP)

**Syntax**  
```
description description;
```

**Hierarchy Level**  
```
[edit snmp]
```

**Release Information**  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**  
Define the value of the MIB II `sysDescription` object, which is the description of the system being managed.

**Options**  
- `description`—System description. If the name includes spaces, enclose it in quotation marks (" ").

**Required Privilege**  
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**  
- Configuring the System Description on a Device Running Junos OS
### description (SNMP RMON)

**Syntax**
```
description description;
```

**Hierarchy Level**
- [edit snmp rmon alarm index]
- [edit snmp rmon event index]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Text description of alarm or event.

**Options**
- `description`—Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").

**Required Privilege**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring the Description
- Configuring an Event Entry and Its Attributes

### destination-port

**Syntax**
```
destination-port port-number;
```

**Hierarchy Level**
- [edit snmp trap-group]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Assign a trap port number other than the default.

**Default**
If you omit this statement, the default port is 162.

**Options**
- `port-number`—SNMP trap port number.

**Required Privilege**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring SNMP Trap Groups
engine-id (SNMP)

Syntax

```
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level
[edit snmp]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description
The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.

For the engine ID, we recommend using the MAC address of the management port.

Options
- **local engine-id-suffix**—Explicit setting for the engine ID suffix.
- **use-default-ip-address**—The engine ID suffix is generated from the default IP address.
- **use-mac-address**—The SNMP engine identifier is generated from the MAC address of the management interface on the router.

Default: **use-default-ip-address**

Required Privilege Level
- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Local Engine ID
### event (SNMP)

**Syntax**

```plaintext
event index {
    community community-name;
    description description;
    type type;
}
```

**Hierarchy Level**

```plaintext
[edit snmp rmon]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure RMON event entries.

**Options**

- `index`—Identifier for a specific event entry.

  The remaining statements are explained separately.

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring an Event Entry and Its Attributes
- alarm on page 3633

### falling-event-index

**Syntax**

```plaintext
falling-event-index index;
```

**Hierarchy Level**

```plaintext
[edit snmp rmon alarm index]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

The index of the event entry that is used when a falling threshold is crossed. If this value is zero, no event is triggered.

**Options**

- `index`—Index of the event entry that is used when a falling threshold is crossed.

  **Range:** 0 through 65,535
  **Default:** 0

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring the Falling Event Index or Rising Event Index
- rising-event-index on page 3665
## falling-threshold

**Syntax**  
falling-threshold *percentage*;

**Hierarchy Level**  
[edit snmp ]

**Release Information**  
Statement introduced in Junos OS Release 8.0.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
The lower threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the **rising-threshold**.

**Options**  

- **percentage**—The lower threshold for the alarm entry.  
  - **Range:** 1 through 100  
  - **Default:** 70 percent of the maximum possible value

**Required Privilege Level**  
- snmp—To view this statement in the configuration.  
- snmp-control—To add this statement to the configuration.

**Related Documentation**  
- [Configuring the Falling Threshold or Rising Threshold](#)  
- rising-threshold (SNMP Health Monitor) on page 3666
falling-threshold

Syntax  falling-threshold integer;

Hierarchy Level  [edit snmp rmon alarm index]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  The lower threshold for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup-alarm value is equal to falling-alarm value or rising-or-falling-alarm value. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising-threshold.

Options  integer—The lower threshold for the alarm entry.
Range:  -2,147,483,648 through 2,147,483,647
Default:  20 percent less than rising-threshold

Required Privilege  snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring the Falling Threshold or Rising Threshold
• rising-threshold (SNMP RMON) on page 3667
falling-threshold-interval

Syntax  
falling-threshold-interval seconds;

Hierarchy Level  
[edit snmp rmon alarm index]

Release Information  
Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Interval between samples when the rising threshold is crossed. Once the alarm crosses
the falling threshold, the regular sampling interval is used.

Options  
seconds—Time between samples, in seconds.

Range: 1 through 2,147,483,647 seconds
Default: 60 seconds

Required Privilege Level  
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  
- Configuring the Falling Threshold Interval
- interval (SNMP RMON) on page 3654

filter-duplicates

Syntax  
filter-duplicates;

Hierarchy Level  
[edit snmp]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Filter duplicate Get, GetNext, or GetBulk SNMP requests.

Required Privilege Level  
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  
- Filtering Duplicate SNMP Requests
filter-interfaces

Syntax

```
filter-interfaces {
    interfaces {
        all-internal-interfaces;
        interface 1;
        interface 2;
    }
}
```

Hierarchy Level
[edits snmp]

Release Information
Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 9.4 for EX Series Switches.

Description
Filter out information related to specific interfaces from the output of SNMP Get and GetNext requests performed on interface-related MIBs.

Options
- **all-internal-interfaces**—Filters out information from SNMP Get and GetNext requests for the specified interfaces.
- **interfaces**—Specifies the interfaces to filter out from the output of SNMP Get and GetNext requests.

NOTE: Starting with Release 12.1, Junos OS provides an except option (! operator) that enables you to filter out all interfaces except those interfaces that match the regular expressions prefixed with the ! mark.

Required Privilege
- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

Related Documentation

**group (Configuring Access Privileges)**

**Syntax**
```
group.group-name {
    (default-context-prefix | context-prefix context-prefix)
    security-model (any | usm | v1 | v2c) {
        security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
        }
    }
}
```

**Hierarchy Level**
[edit snmp v3 vacm access]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The `default-context-prefix` statement, when included, adds all the contexts configured on the device to the group, whereas the `context-prefix context-prefix` statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series.) When the context prefix is specified as default (for example, `context-prefix default`), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as `logical system/routing instance`. For example, to specify routing instance ri1 in logical system ls1, include `context-prefix ls1/ri1`.

The remaining statements under this hierarchy are explained separately.

**Options**
- `group-name`—SNMPv3 group name created for the SNMPv3 group.

**Required Privilege Level**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring the Group
**group (Associating a Security Name)**

**Syntax**

```
group group-name;
```

**Hierarchy Level**

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)
    security-name security-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Associate a security name with a group composed of users with the same access privileges. The security name is used during authentication of SNMP messages, and is mapped to a username.

**Options**

- `group-name`—Collection of SNMP security names that share the same SNMPv3 access privileges.

**Required Privilege**

- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**

- Configuring the Group

---

**health-monitor**

**Syntax**

```
health-monitor {
    falling-threshold percentage;
    interval seconds;
    rising-threshold percentage;
}
```

**Hierarchy Level**

```
[edit snmp]
```

**Release Information**

Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure health monitoring.

The remaining statements are explained separately.

**Required Privilege**

- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**

**history**

**Syntax**

```plaintext
history history-index {
    bucket-size number;
    interface (SNMP RMON History) interface-name;
    interval seconds;
    owner owner-name;
}
```

**Hierarchy Level**

[edit snmp rmon]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent in the switch to monitor all the traffic flowing among switches on all connected LAN segments. It collects statistics in accordance with user-configurable parameters.

The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. The `interface (SNMP RMON History) interface-name` statement is mandatory. Other statements in the history group are optional.

**Default**

Not configured.

**Options**

- `history-index`—identifies this history entry as an integer.
  
  **Range:** 1 through 655535

**Required Privilege Level**

- snmp—To view this statement in the configuration.
- snmp—control—To add this statement to the configuration.

**Related Documentation**

- Configuring SNMP (J-Web Procedure) on page 3594
- Junos OS Network Management Configuration Guide
interface (SNMP RMON History)

Syntax  
interface interface-name;

Hierarchy Level  
[edit snmp rmon history history-index]

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Specify the interface to be monitored in the specified RMON history entry. Only one interface can be specified for a particular RMON history index. There is a one-to-one relationship between the interface and the history index. The interface must be specified in order for the RMON history to be created.

Options  
interface-name—Specify the interface to be monitored within the specified entry of the RMON history of Ethernet statistics.

Required Privilege
Level  
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  
• Configuring SNMP (J-Web Procedure) on page 3594
• Junos OS Network Management Configuration Guide

interface (SNMP)

Syntax  
interface [ interface-names ];

Hierarchy Level  
[edit snmp]

Release Information  

Description  
Configure the interfaces on which SNMP requests can be accepted.

Default  
If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.

Options  
interface-names—Names of one or more logical interfaces.

Required Privilege
Level  
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  
• Configuring the Interfaces on Which SNMP Requests Can Be Accepted
interval

Syntax    interval seconds;

Hierarchy Level    [edit snmp rmon history]

Release Information    Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description    Configure the interval over which data is to be sampled for the specified interface.

Default    1800 sec

Options    seconds—Interval at which data is to be sampled for the specified interface.

Required Privilege Level    

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

interval (SNMP Health Monitor)

Syntax    interval seconds;

Hierarchy Level    [edit snmp health-monitor]

Release Information    Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description    Interval between samples.

Options    seconds—Time between samples, in seconds.
Range: 1 through 2147483647 seconds
Default: 300 seconds

Required Privilege Level    

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation    • Configuring the Interval
interval (SNMP RMON)

Syntax  interval seconds;

Hierarchy Level  [edit snmp rmon alarm index]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Interval between samples.

Options  seconds—Time between samples, in seconds.
Range: 1 through 2,147,483,647 seconds
Default: 60 seconds

Required Privilege Level  snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring the Interval

location (SNMP)

Syntax  location location;

Hierarchy Level  [edit snmp]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Define the value of the MIB II sysLocation object, which is the physical location of the managed system.

Options  location—Location of the local system. You must enclose the name within quotation marks (" ").

Required Privilege Level  snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring the System Location for a Device Running Junos OS
logical-system (SNMP)

Syntax
logical-system logical-system-name {
    routing-instance routing-instance-name;
}

Hierarchy Level
[edit snmp community community-name],
[edit snmp trap-options],
[edit snmp v3target-address target-address-name]

Release Information
Statement introduced in Junos OS Release 9.3
Statement introduced in Junos OS Release 9.0 for EX Series switches.

NOTE: The logical-system statement replaces the logical-router statement, and is backward-compatible with Junos OS Release 8.3 and later.

Description
Specify a logical system name for SNMP v1 and v2c clients.

Include at the [edit snmp trap-options] hierarchy level to specify a logical-system address as the source address of an SNMP trap.

Include at the [edit snmp v3 target-address] hierarchy level to specify a logical-system name as the destination address for an SNMPv3 trap or inform.

Options
logical-system-name—Name of the logical system.

routing-instance routing-instance-name—Statement to specify a routing instance associated with the logical system.

Required Privilege Level
snmp—to view this statement in the configuration.

snmp-control—to add this statement to the configuration.

Related Documentation

• Configuring the Trap Target Address
message-processing-model

Syntax  
message-processing-model (v1 | v2c | v3);

Hierarchy Level  
[edit snmp v3 target-parameters target-parameter-name parameters]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Configure the message processing model to be used when generating SNMP notifications.

Options  
v1—SNMPv1 message process model.

v2c—SNMPv2c message process model.

v3—SNMPv3 message process model.

Required Privilege Level  
snmp—to view this statement in the configuration.
snmp-control—to add this statement to the configuration.

Related Documentation  
• Configuring the Message Processing Model

name

Syntax  
name name;

Hierarchy Level  
[edit snmp]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Set the system name from the command-line interface.

Options  
name—System name override.

Required Privilege Level  
snmp—to view this statement in the configuration.
snmp-control—to add this statement to the configuration.

Related Documentation  
• Configuring the System Name
nonvolatile

Syntax:  
```
nonvolatile {
  commit-delay seconds;
}
```

Hierarchy Level: [edit snmp]

Release Information:  
Statement introduced before Junos OS Release 7.4. The `commit-delay` statement introduced in Junos OS Release 9.0 for EX Series switches.

Description:  
Conﬁgure options for SNMP Set requests.

The statement is explained separately.

Required Privilege Level:  
- snmp—To view this statement in the conﬁguration.
- snmp-control—To add this statement to the conﬁguration.

Related Documentation:  
- Configuring the Commit Delay Timer
- `commit-delay` on page 3637
**notify**

**Syntax**
```
notify name {
    tag tag-name;
    type (trap | inform);
}
```

**Hierarchy Level**
[edit snmp v3]

**Release Information**
Statement introduced before Junos OS Release 7.4.
*type inform* option added in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.

**Options**
- `name`—Name assigned to the notification.
- `tag-name`—Notifications are sent to all targets configured with this tag.
- `type`—Notification type is `trap` or `inform`. Traps are unconfirmed notifications. Informs are confirmed notifications.

**Required Privilege Level**
- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**

notify-filter (Applying to the Management Target)

Syntax

```
notify-filter profile-name;
```

Hierarchy Level

```
[edit snmpv3 target-parameters target-parameters-name]
```

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the notify filter applied to a specific set of SNMPv3 target parameters. Target parameters are the message processing and security parameters for notifications sent to a target SNMP manager.

Options

- **profile-name**—Name of the notify filter to apply to notifications.

Required Privilege Level

- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

Related Documentation

notify-filter (Configuring the Profile Name)

Syntax

```
notify-filter profile-name {
  oid oid (include | exclude);
}
```

Hierarchy Level

```
[edit snmp v3]
```

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.

Options

- **profile-name**—Name assigned to the notify filter.

The remaining statement is explained separately.

Required Privilege Level

- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

Related Documentation

**notify-view**

**Syntax**
```
notify-view view-name;
```

**Hierarchy Level**
```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

**Options**
- `view-name`—Name of the view to which the SNMP user group has access.

**Required Privilege**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring MIB Views
- Configuring the Notify View

**oid (SNMP)**

**Syntax**
```
oid oid (include | exclude):
```

**Hierarchy Level**
```
[edit snmp v3 notify-filter profile-name]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify an object identifier (OID) used to represent a subtree of MIB objects. This OID is a prefix that the represented MIB objects have in common.

**Options**
- `exclude`—Exclude the subtree of MIB objects represented by the specified OID.
- `include`—Include the subtree of MIB objects represented by the specified OID.
- `oid`—Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

**Required Privilege**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring the Trap Notification Filter
oid

Syntax  oid object-identifier (exclude | include);

Hierarchy Level  [edit snmp view view-name]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify an object identifier (OID) used to represent a subtree of MIB objects.

Options  exclude—Exclude the subtree of MIB objects represented by the specified OID.
include—Include the subtree of MIB objects represented by the specified OID.

object-identifier—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege  Level
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring MIB Views

owner

Syntax  owner owner-name;

Hierarchy Level  [edit snmp rmon history]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the user or group responsible for this configuration.

Options  owner-name—The user or group responsible for this configuration.

Range: 0 through 32 alphanumeric characters

Required Privilege  Level
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring SNMP (J-Web Procedure) on page 3594

**rising-threshold (SNMP Health Monitor)**

**Syntax**  
`rising-threshold percentage;`

**Hierarchy Level**  
[edit snmp ]

**Release Information**  
Statement introduced in Junos OS Release 8.0.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
The upper threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the **falling-threshold**.

**Options**  
`percentage`—The lower threshold for the alarm entry.  
**Range:** 1 through 100  
**Default:** 80 percent of the maximum possible value

**Required Privilege**  
- snmp—To view this statement in the configuration.  
- snmp-control—To add this statement to the configuration.

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure Remote Monitoring.

**Required Privilege**

```plaintext
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.
```

**Related Documentation**

- Configuring an Alarm Entry and Its Attributes
rmon

Syntax

rmon {  
  history history-index {  
    interface (SNMP RMON History) interface-name;  
    bucket-size number;  
    interval seconds;  
    owner owner-name;  
  }  
}

Hierarchy Level
[edit snmp]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
RMON is an existing feature of Junos OS.

The RMON specification provides network administrators with comprehensive network fault diagnosis, planning, and performance tuning information. It delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports RMON Statistics, History, Alarm, and Event groups. The EX Series documentation describes only the rmon history statement, which was added with this release.

The statements are explained separately.

Default
Disabled.

Required Privilege
snmp—to view this statement in the configuration.
snmp-control—to add this statement to the configuration.

routing-instance (SNMP)

Syntax

routeing-instance routing-instance-name;

Hierarchy Level

[edit snmp community community-name],
[edit snmp community community-name logical-system logical-system-name],
[edit snmp trap-group group]

Release Information

Statement introduced in Junos OS Release 8.3.
Added to the [edit snmp community community-name] hierarchy level in Junos OS Release 8.4.
Added to the [edit snmp community community-name logical-system logical-system-name] hierarchy level in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description

Specify a routing instance for SNMPv1 and SNMPv2 trap targets. All targets configured in the trap group use this routing instance.

If the routing instance is defined within a logical system, include the logical-system logical-system-name statement at the [edit snmp community community-name] hierarchy level and specify the routing-instance statement under the [edit snmp community community-name logical-system logical-system-name] hierarchy level.

Options

routeing-instance-name—Name of the routing instance.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

### routing-instance (SNMPv3)

**Syntax**
```
routing-instance routing-instance-name:
```

**Hierarchy Level**
```
[edit snmp v3 target-address target-address-name]
```

**Release Information**
Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify a routing instance for an SNMPv3 trap target.

**Options**
- **routing-instance-name**—Name of the routing instance.

To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash (/) to separate the two names (for example, test-ls/test-ri). To configure the default routing instance on a logical system, specify the logical system name followed by **default** (for example, test-ls/default).

**Required Privilege**
- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

**Related Documentation**
- Configuring the Trap Target Address

### sample-type

**Syntax**
```
sample-type (absolute-value | delta-value);
```

**Hierarchy Level**
```
[edit snmp rmon alarm index]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Method of sampling the selected variable.

**Options**
- **absolute-value**—Actual value of the selected variable is used when comparing against the thresholds.
- **delta-value**—Difference between samples of the selected variable is used when comparing against the thresholds.

**Required Privilege**
- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

**Related Documentation**
- Configuring the Sample Type
security-level (Defining Access Privileges)

Syntax

```plaintext
security-level (authentication | none | privacy) {
  notify-view view-name;
  read-view view-name;
  write-view view-name;
}
```

Hierarchy Level

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c)]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Define the security level used for access privileges.

Default

none

Options

- **authentication**—Provide authentication but no encryption.
- **none**—No authentication and no encryption.
- **privacy**—Provide authentication and encryption.

Required Privilege

- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

Related Documentation

- Configuring the Security Level
security-level (Generating SNMP Notifications)

**Syntax**
security-level (authentication | none | privacy);

**Hierarchy Level**
[edit snmp v3 target-parameters target-parameters-name parameters]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Configure the security level to use when generating SNMP notifications.

**Default**
none

**Options**
- **authentication**—Provide authentication but no encryption.
- **none**—No authentication and no encryption.
- **privacy**—Provide authentication and encryption.

**Required Privilege**
- snmp—to view this statement in the configuration.
- snmp-control—to add this statement to the configuration.

**Related Documentation**
- Configuring the Security Level
security-model (Access Privileges)

**Syntax**

security-model (usm | v1 | v2c);

**Hierarchy Level**

[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix)]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.

**Options**

- **usm**—SNMPv3 security model.
- **v1**—SNMPv1 security model.
- **v2c**—SNMPv2c security model.

**Required Privilege**

- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

**Related Documentation**

- Configuring the Security Model
security-model (Group)

Syntax

security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}

Hierarchy Level

[edit snmp v3 vacm security-to-group]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Define a security model for an SNMPv3 group and associate the security name of a user with the group. All users in the group have the same access privileges.

Options

usm—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Related Documentation

• Configuring the Security Model
security-model (SNMP Notifications)

Syntax

security-model (usm | v1 | v2c);

Hierarchy Level
[edit snmp v3 target-parameters target-parameters-name parameters]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.

Options
usm—SNMPv3 security model.
v1—SNMPv1 security model.
v2c—SNMPv2c security model.

Required Privilege
snmp—to view this statement in the configuration.
snmp-control—to add this statement to the configuration.

Related Documentation
• Configuring the Security Model
**security-name (Security Group)**

**Syntax**
```
security-name security-name {
  group group-name;
}
```

**Hierarchy Level**
```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
```

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Associate the security name of a user (for SNMPv3 clients) or a community string (for SNMPv1 and SNMPv2c clients) with a configured security group.

**Options**
- `security-name`—SNMPv3 secure username configured at the `[edit snmp v3 usm local-engine user username]` hierarchy level that is used for messaging security. For SNMPv1 and SNMPv2c, the security name is the community string configured at the `[edit snmp v3 snmp-community community-index]` hierarchy level.

**Required Privilege**
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**
- Assigning Security Names to Groups
- Assigning a Security Name to a Group
security-name (Community String)

**Syntax**
security-name security-name;

**Hierarchy Level**
[edit snmp v3 snmp-community community-index]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Associate a community string with the security name of a user. The community string, which is used for SNMPv1 and SNMPv2c clients in an SNMPv3 system, is configured at the [edit snmp v3 snmp-community community-index] hierarchy level.

**Options**
security-name—Name that is used for messaging security and user access control.

**NOTE:** The security name must match the configured security name at the [edit snmp v3 target-parameters target-parameters-name parameters] hierarchy level when you configure traps or informs.

**Required Privilege**
- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**
- Configuring the Security Names
security-name (SNMP Notifications)

Syntax

security-name security-name;

Hierarchy Level

[edit snmp v3 target-parameters target-parameters-name parameters]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the security name used when generating SNMP notifications.

Options

security-name—If the SNMPv3 USM security model is used, identify the user when generating the SNMP notification. If the v1 or v2c security models are used, identify the SNMP community used when generating the notification.

NOTE: The access privileges for the group associated with this security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the [edit snmp v3 vacm security-to-group] hierarchy level must match the security name at the [edit snmp v3 snmp-community community-index] hierarchy level.

Required Privilege

snmp—to view this statement in the configuration.

snmp-control—to add this statement to the configuration.

Related Documentation

source-address (SNMP)

**Syntax**
```
source-address address;
```

**Hierarchy Level**
```
[edit snmp trap-options]
```

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.

**Options**
- **address**—Source address of SNMP traps. You can configure the source address of trap packets two ways: *lo0* or a valid IPv4 address configured on one of the router interfaces. The value *lo0* indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface *lo0*.

  **Default:** Disabled. (The source address is the address of the outgoing interface.)

**Required Privilege**
- **snmp**—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

**Related Documentation**
- Configuring the Source Address for SNMP Traps
**startup-alarm**

**Syntax**
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);

**Hierarchy Level**
[edit snmp rmon alarm index]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
The alarm that can be sent upon entry startup.

**Options**
- **falling-alarm**—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.
- **rising-alarm**—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.
- **rising-or-falling-alarm**—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

**Default:** rising-or-falling-alarm

**Required Privilege**
- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**
- Configuring the Sample Type

**syslog-subtag**

**Syntax**
syslog-subtag syslog-subtag;

**Hierarchy Level**
[edit snmp rmon alarm index]

**Release Information**
Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Add a tag to the system log message.

**Options**
- **syslog-subtag syslog-subtag**—Tag of not more than 80 uppercase characters to be added to syslog messages.

**Default:** None

**Required Privilege**
- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**
- Configuring the System Log Tag
tag (SNMPv3)

Syntax:  tag tag-name;

Hierarchy Level: [edit snmp v3 notify name],
[edit snmp v3 snmp-community community-index]

Release Information: Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description: Configure a set of targets to receive traps or informs (for IPv4 packets only).

Options: tag-name—Identifies the address of managers that are allowed to use a community string.

Required Privilege Level: snmp—to view this statement in the configuration.
snmp-control—to add this statement to the configuration.

Related Documentation: • Configuring the Tag
• Configuring the SNMPv3 Trap Notification

tag-list

Syntax:  tag-list tag-list;

Hierarchy Level: [edit snmp v3 target-address target-address-name]

Release Information: Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description: Configure an SNMP tag list used to select target addresses.

Options: tag-list—Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.

Required Privilege Level: snmp—to view this statement in the configuration.
snmp-control—to add this statement to the configuration.

Related Documentation: • Configuring the Trap Target Address
target-address

Syntax  

```plaintext
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system (SNMP logical-system;
  port (SNMP) port-number;
  retry-count (SNMPv3) number;
  routing-instance (SNMPv3) instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
}
```

Hierarchy Level  [edit snmp v3]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure the address of an SNMP management application and the parameters to be used in sending notifications.

Options  target-address-name—String that identifies the target address.

The remaining statements are explained separately.

Required Privilege Level  

- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

Related Documentation

**target-parameters**

**Syntax**  At the [edit snmp v3] hierarchy level:

```plaintext
target-parameters target-parameters-name {
  profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

At the [edit snmp v3 target-address target-address-name] hierarchy level:

```plaintext
target-parameters target-parameters-name;
```

**Hierarchy Level**  [edit snmp v3]
[edit snmp v3 target-address target-address-name]

**Release Information**  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**  Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the [edit snmp v3] hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the [edit snmp v3 target-parameters target-parameters-name] hierarchy level to the target address configuration at the [edit snmp v3] hierarchy level.

**Required Privilege Level**  snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

**Related Documentation**  • Defining and Configuring the Trap Target Parameters
• Applying Target Parameters
targets

Syntax  targets {
       address;
    }

Hierarchy Level  [edit snmp trap-group group-name]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure one or more systems to receive SNMP traps.

Options  address—IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.

Required Privilege Level  snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring SNMP Trap Groups
traceoptions (SNMP)

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

[edit snmp]

Release Information

Statement introduced before Junos OS Release 7.4.
```
file filename
```
option added in Junos OS Release 8.1.
```
world-readable | no-world-readable
```
option added in Junos OS Release 8.1.
```
match regular-expression
```
option added in Junos OS Release 8.1.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

The output of the tracing operations is placed into log files in the /var/log directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the /var/log directory when the traceoptions statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options

```
file filename
```
—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.

```
files number
```
—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.

Range: 2 through 1000 files

Default: 10 files

```
flag flag
```
—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements:

- all—Log all SNMP events.
- configuration—Log reading of configuration at the [edit snmp] hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

**match regular-expression**—(Optional) Refine the output to include lines that contain the regular expression.

**size size**—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

- **Range:** 10 KB through 1 GB
- **Default:** 1000 KB

**world-readable | no-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

**Required Privilege**
- **Level:** snmp—To view this statement in the configuration.
- **snmp-control**—To add this statement to the configuration.

**Related Documentation**
- *Tracing SNMP Activity on a Device Running Junos OS*
**trap-group**

**Syntax**

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

**Hierarchy Level**  [edit snmp]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

**Options**

`group-name`—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

**Required Privilege**

- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

**Related Documentation**

- Configuring SNMP Trap Groups
trap-options

Syntax

```
trap-options {
    agent-address outgoing-interface;
    source-address address;
}
```

Hierarchy Level

```
[edit snmp]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

The remaining statements are explained separately.

Default

Disabled

Required Privilege

- snmp—to view this statement in the configuration.
- snmp-control—to add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Options
**type (SNMP RMON)**

**Syntax**

```plaintext
type type;
```

**Hierarchy Level**

```plaintext
[edit snmp rmon event index]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Type of notification generated when a threshold is crossed.

**Options**

- `type`—Type of notification:
  - `log`—Add an entry to `logTable`.
  - `log-and-trap`—Send an SNMP trap and make a log entry.
  - `none`—No notifications are sent.
  - `snmptrap`—Send an SNMP trap.

**Default:** `log-and-trap`

**Required Privilege**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

**Related Documentation**

- *Configuring an Event Entry and Its Attributes*
type (SNMPv3)

**Syntax**

```
type (inform | trap);
```

**Hierarchy Level**

```
[edit snmp v3 notify name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

- `inform` option added in Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Configure the type of SNMP notification.

**Options**

- `inform`—Defines the type of notification as an inform. SNMP informs are confirmed notifications.
- `trap`—Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.

**Required Privilege Level**

- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

    }
}
```

Hierarchy Level
```
[edit snmp v3]
```

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure view-based access control model (VACM) information, including access privileges such as security model and security level for a group of users.

The remaining statements are explained separately.

Required Privilege
snmp—to view this statement in the configuration.

snmp-control—to add this statement to the configuration.

Related Documentation
- Defining Access Privileges for an SNMP Group
variable

Syntax  variable oid-variable;

Hierarchy Level  [edit snmp rmon alarm index]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Object identifier (OID) of MIB variable to be monitored.

Options  oid-variable—OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.2.1.10.1). Alternatively, use the MIB object name (for example, ifInOctets.1).

Required Privilege Level  snmp—To view this statement in the configuration.
  snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring the Variable

version (SNMP)

Syntax  version (all | v1 | v2);

Hierarchy Level  [edit snmp trap-group group-name]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify the version number of SNMP traps.

Default  all—Send an SNMPv1 and SNMPv2 trap for every trap condition.

Options  all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
  v1—Send SNMPv1 traps only.
  v2—Send SNMPv2 traps only.

Required Privilege Level  snmp—To view this statement in the configuration.
  snmp-control—To add this statement to the configuration.

Related Documentation  • Configuring SNMP Trap Groups
view (Associating a MIB View with a Community)

Syntax  
```bash
view view-name;
```

Hierarchy Level  
```
[edit snmp community community-name]
```

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Associate a view with a community. A view represents a group of MIB objects.

Options  
- `view-name`—Name of the view. You must use a view name already configured in the `view` statement at the `[edit snmp]` hierarchy level.

Required Privilege  
- `snmp`—To view this statement in the configuration.
- `snmp-control`—To add this statement to the configuration.

Related Documentation  
- `Configuring the SNMP Community String`
view (Configuring a MIB View)

Syntax

```
view view-name {
    oid object-identifier (include | exclude);
}
```

Hierarchy Level

[edit snmp]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The `view` statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the `view` statement at the `[edit snmp community community-name]` hierarchy level.

NOTE: To remove an OID completely, use the `delete view all oid oid-number` command but omit the `include` parameter.

Options

`view-name`—Name of the view.

The remaining statement is explained separately.

Required Privilege Level

- snmp—To view this statement in the configuration.
- snmp-control—To add this statement to the configuration.

write-view

Syntax  write-view view-name;

Hierarchy Level  [edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series switches.

Description  Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options  view-name—Name of the view for which the SNMP user group has write permission.

Required Privilege
Level  snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

ingress (vlans)

Syntax

```plaintext
ingress;
```

Hierarchy Level

```plaintext
[edit vlans vlan-name vlan-id number interface interface-name]
```

Release Information

Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description

Specify that the member interface of the VLAN allows only ingress traffic.

Required Privilege

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

Related Documentation

- Example: Configuring Port Mirroring for Remote Monitoring of Employee Resource Use Through a Transit Switch on EX Series Switches

ingress (Analyzer)

Syntax

```plaintext
ingress {
  interface (all | interface-name);
  routing-instance routing-instance-name {
    vlan (vlan-name | vlan-id | vlan-list);
  }
  vlan (vlan-id | vlan-name);
}
```

Hierarchy Level

```plaintext
[edit forwarding-options analyzer on page 3701 name input]
```

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure ports, routing instances, or VLANs for which the entering traffic is mirrored as part of a mirroring configuration.

The remaining statements are explained separately.

Required Privilege

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

Related Documentation

input (Analyzer)

Syntax

```plaintext
input {
    ingress {
        interface (all | interface-name);
        routing-instance routing-instance-name {
            vlan (vlan-name | vlan-id | vlan-list);
        }
        vlan (vlan-id | vlan-name);
    }
    egress {
        interface (all | interface-name);
    }
}
```

Hierarchy Level
[edit forwarding-options analyzer on page 3701 name]

Release Information

Description
Define the traffic to be mirrored in a mirroring configuration—the definition can be a combination of:

- Packets entering or exiting a port
- Packets entering a VLAN

The remaining statements are explained separately.

Default
No default.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

## interface

**Syntax**  
interface (all | interface-name);

**Hierarchy Level**  
[edit forwarding-options analyzer on page 3701 name input egress],  
[edit forwarding-options analyzer on page 3701 name input ingress],  
[edit forwarding-options analyzer on page 3701 name output]

**Release Information**  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  

**Description**  
Configure the interfaces for which traffic is mirrored.

**Options**  
- all—Apply mirroring to all interfaces on the switch. Mirroring a high volume of traffic can be performance intensive for the switch. Therefore, you should generally select specific input interfaces in preference to using the all keyword, or use the all keyword in combination with setting a ratio for statistical sampling.
- interface-name—Apply mirroring to the specified interface only.

**Required Privilege Level**  
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**  
- Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches on page 3564

no-tag

Syntax  no-tag;

Hierarchy Level  [edit forwarding-options analyzer on page 3701 name output vlan (vlan-id | vlan-name)]

Release Information  Statement introduced in Junos OS Release 11.3 for EX Series switches.

Description  Specify that remote mirroring packets are not tagged.

Required Privilege  Level  system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation  • Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches on page 3564
• Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches on page 3570

output (Mirroring)

Syntax  output {
  interface interface-name;
  vlan (vlan-id | vlan-name) {
    no-tag;
  }
}

Hierarchy Level  [edit forwarding-options analyzer on page 3701 name]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure the destination for mirrored traffic, either an interface on the switch, for local monitoring, or a VLAN, for remote monitoring. You can optionally configure the no-tag statement so that remote port mirroring packets are not tagged.

The remaining statements are explained separately.

Required Privilege  Level  system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation  • Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches on page 3564
• Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches on page 3570
### vlan (Mirroring)

**Syntax**

```plaintext
vlan (vlan-id | vlan-name) {
  no-tag;
}
```

**Hierarchy Level**

[edit forwarding-options analyzer on page 3701 name output]

**Release Information**

**Description**

Configure mirrored traffic to be sent to a VLAN for remote monitoring. On a destination (output) VLAN, you can also configure the no-tag statement.

**Options**

- `vlan-id`—Numeric VLAN identifier.
- `vlan-name`—Name of the VLAN.

The remaining statement is explained separately.

**Required Privilege Level**

- system—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

EX Series Switch Software Features Overview

This topic lists supported and unsupported configuration statements in the [edit protocols sflow] hierarchy level on EX Series switches.

Supported statements are those that you can use to configure some aspect of a software feature on the switch.
• **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

• Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

• **Supported Statements in the [edit protocols sflow] Hierarchy Level**

• **Unsupported Statements in the [edit sflow] Hierarchy Level**

**Supported Statements in the [edit protocols sflow] Hierarchy Level**

The following hierarchy shows the [edit protocols sflow] configuration statements supported on EX Series switches:

```plaintext
sflow {
  agent-id;
  collector {
    ip-address;
    udp-port port-number;
  }
  interfaces interface-name {
    polling-interval seconds;
    sample-rate {
      egress number;
      ingress number;
    }
  }
  polling-interval seconds;
  sample-rate {
    egress number;
    ingress number;
  }
  source-ip;
}
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-readable >;
  flag (all | client-server | configuration | interface | rtsock);
}
```

**Unsupported Statements in the [edit sflow] Hierarchy Level**

All statements in the [edit protocols sflow] hierarchy level that are displayed in the command-line interface (CLI) on the EX Series switch are supported on the switch and operate as documented.

**Related Documentation**

• Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 3603

• [edit protocols] Configuration Statement Hierarchy on EX Series Switches on page 3327
agent-id

Syntax
agent-id ip-address;

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in JUNOS Release 10.2 for EX Series switches.

Description Configure the IP address to be assigned as the agent ID for the sFlow agent. By assigning an IP address, you ensure that the IP address is not dynamic.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 3603

collector

Syntax collector {
  ip-address;
  udp-port port-number;
}

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description Configure a remote collector for sFlow network traffic monitoring. The switch sends sFlow UDP datagrams to this collector for analysis. You can configure up to four collectors on the switch. You configure a collector by specifying its IP address and a UDP port.

The remaining statements are explained separately.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

interfaces (sFlow Monitoring Technology)

Syntax

```plaintext
interfaces interface-name {
  disable;
  polling-interval seconds;
  sample-rate {
    egress number;
    ingress number;
  }
}
```

Hierarchy Level

[edit protocols sflow]

Release Information

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description

Configure sFlow network traffic monitoring on the specified interface on the switch. You can configure sFlow parameters such as polling interval and sample rate with different values on different interfaces, and you can also disable sFlow monitoring on individual interfaces.

The remaining statements are explained separately.

Options

`interface-name`—Name of the interface on which to configure sFlow parameters.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

polling-interval

Syntax polling-interval seconds;

Hierarchy Level [edit protocols sflow],
              [edit protocols sflow interfaces interface-name]

Description Configure the interval (in seconds) that the switch waits between port statistics update messages. “Polling” refers to the switch's gathering various statistics for the network interfaces configured for sFlow monitoring and exporting the statistics to the configured sFlow collector.

Default If no polling interval is configured for a particular interface, the switch waits the number of seconds that is configured for the global sFlow configuration. If no global interval is configured, the switch waits 20 seconds between messages.

Options seconds—Number of seconds between port statistics update messages. A 0 (zero) value specifies that polling is disabled.

Range: 0–3600 seconds
Default: 20 seconds

Required Privilege Level routing—To view this statement in the configuration.
            routing-control—To add this statement to the configuration.

sample-rate

Syntax

```
sample-rate {
    egress number;
    ingress number;
}
```

Hierarchy Level

[edit protocols sflow],
[edit protocols sflow interfaces interface-name]

Release Information

Statement introduced in Junos OS Release 9.3 for EX Series switches.
Option number (directly following sample-rate) deprecated and options egress number
and ingress number added in Junos OS Release 10.4 for EX Series switches.

Description

Set the ratios of the number of packets to be sampled in sFlow network traffic monitoring.
For example, if you specify a rate of 1000, every thousandth packet (1 packet out of 1000)
is sampled.

Default

By default, both ingress and egress sample rates are disabled if no global sample rate is
configured.

NOTE: The sample-rate number (the global sample-rate) statement has been
deprecated and might be removed from future product releases. We strongly
recommend that you phase out its use.

Options

egress number—Egress qualifier for the sample rate.
Range: 100–1073741823
Default: 2048

ingress number—Ingress qualifier for the sample rate.
Range: 100–1073741823
Default: 2048

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

sflow

Syntax

```
sflow {
  agent-id ip-address;
  collector {
    ip-address;
    udp-port port-number;
  }
  disable;
  interfaces interface-name {
    disable;
    polling-interval seconds;
    sample-rate number;
  }
  polling-interval seconds;
  sample-rate number;
  source-ip ip-address;
}
```

Hierarchy Level

[edit protocols]

Release Information

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Options `agent-id` and `source-ip` added in Junos OS Release 10.2 for EX Series switches.

Description

Configure sFlow technology, designed for monitoring high-speed switched or routed networks, to continuously monitor traffic at wire speed on specified interfaces simultaneously. sFlow data can be used to provide network traffic visibility information.

The remaining statements are explained separately.

Default

The sFlow protocol is disabled by default.

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Related Documentation

source-ip

Syntax  
source-ip ip-address;

Hierarchy Level  
[edit protocols sflow]

Release Information  
Statement introduced in JUNOS Release 10.2 for EX Series switches.

Description  
Configure the IP address to be used for the sFlow datagrams. By configuring an IP address, you ensure that the IP address is not dynamic.

Required Privilege Level  
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation  
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 3603

udp-port

Syntax  
udp-port port-number;

Hierarchy Level  
[edit protocols sflow collector]

Release Information  
Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description  
Configure the UDP port for a remote collector for sFlow network traffic monitoring. The switch sends sFlow UDP datagrams to the collector for analysis.

Options  
- port-number—UDP port number for this collector.
  Default: 6343

Required Privilege Level  
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

Configuration Statements: Ethernet OAM Connectivity Fault Management

action-profile (Applying to OAM CFM, for EX Series Switch Only)

Syntax

```
action-profile profile-name {
  action {
    interface-down;
  }
  default-actions {
    interface-down;
  }
  event {
    adjacency-loss;
  }
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management]
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id remote-mep mep-id]
```

Release Information

Statement introduced in Junos OS Release 10.2 for EX Series switches.

Description

Configure a name and default action for an action profile.

Options

- **profile-name**—Name of the action profile.
- **action**—Defines the action to be taken when connectivity to the remote MEP is lost.
- **interface-down**—Brings the interface down when a remote MEP connectivity failure is detected.
- **default-actions**—Defines the default action to be taken when connectivity to the remote MEP is lost.
- **interface-down**—Brings the interface down when a remote MEP connectivity failure is detected.
- **event**—Defines the event to be monitored when a remote MEP connectivity failure is detected.
- **adjacency-loss**—Defines the connectivity loss to the remote MEP.

Required Privilege

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

calculation-weight

Syntax  
\[
\text{calculation-weight} \{ \\
\text{delay} \text{delay-value} ; \\
\text{delay-variation} \text{delay-variation-value} ; \\
\}\n\]

Hierarchy Level  
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]

Release Information  
Statement introduced in Junos OS Release 11.1.  
Statement introduced in Junos OS Release 11.4 for EX Series switches.

Description  
Configure the calculation weight for delay and delay variation.

NOTE: This option is applicable only for two-way delay measurement.

The remaining statements are explained separately.

Required Privilege

Level

Configure—To enter configuration mode.
Control—To modify any configuration.

direction (EX Series Switch Only)

Syntax
direction down;

Hierarchy Level
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]

Release Information
Statement introduced in Junos OS Release 10.2 for EX Series switches.

Description
Specify that connectivity fault management (CFM) packets (CCMs) be transmitted only in one direction for the MEP, that is, the direction be set as down so that CCMs are transmitted only out of (not into) the interface configured on this MEP.

Options
down—Down MEP CCMs are transmitted only out (not into) of the interface configured on this MEP.

Required Privilege
Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

mip-half-function (EX Series Switch Only)

Syntax
mip-half-function (none | default | explicit);

Hierarchy Level
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]

Release Information
Statement introduced in Junos OS Release 10.2 for EX Series switches.

Description
Specify the OAM Ethernet CFM maintenance domain MIP half functions.

NOTE: Whenever a MIP is configured, the MIP half function value for all maintenance domains and maintenance associations must be the same.

Options
- none—Specify to not use the mip-half-function.
- default—Specify to use the default mip-half-function.
- explicit—Specify an explicit mip-half-function.

Required Privilege
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

name-format (EX Series Switch Only)

Syntax

```plaintext
name-format (character-string | none | dns | mac+2oct);
```

Hierarchy Level

```plaintext
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
```

Release Information

Statement introduced in Junos OS Release 10.2 for EX Series switches.

Description

Specify the format of the maintenance domain name.

Options

- **character-string**—The name is an ASCII character string.
- **none**—Name format none means that maintenance domain name is not used.
- **dns**—Name is in domain name service (DNS) format. For example: www.juniper.net.
- **mac+2oct**—Name is the MAC address plus a two-octet maintenance association identifier. For example: 08:00:22:33:44:55.100.

Default: character-string

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

### action-profile

**Syntax**

```
action-profile profile-name;
action {
  syslog;
  link-down;
}
event {
  link-adjacency-loss;
  link-event-rate {
    frame-error count;
    frame-period count;
    frame-period-summary count;
    symbol-period count;
  }
}
```

**Hierarchy Level**

`[edit protocols oam ethernet link-fault-management]`

**Release Information**

Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**

Configure an Ethernet OAM link fault management (LFM) action profile by specifying a profile name.

The remaining statements are explained separately.

**Options**

- `profile-name`—Name of the action profile.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

### frame-error

**Syntax**

```
frame-error count;
```

**Hierarchy Level**

```
[edit protocols oam ethernet link-fault-management event link-event-rate],
[edit protocols oam ethernet link-fault-management interface interface-name event-thresholds]
```

**Release Information**

Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**

Configure the threshold value for sending frame error events or taking the action specified in the action profile.

Frame errors occur on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value.

**Options**

- `count`—Threshold count in seconds for frame error events.
  - **Range**: 1 through 100 seconds
  - **Default**: 1 second

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**Related Documentation**

### frame-period

**Syntax**

```
frame-period count;
```

**Hierarchy Level**

```
[edit protocols oam ethernet link-fault-management event link-event-rate],
[edit protocols oam ethernet link-fault-management interface interface-name event-thresholds]
```

**Release Information**

Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**

Configure the number of frame errors within the last N frames that has exceeded a threshold.

Frame errors occur on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value.

**Options**

- `count`—Threshold count in seconds for frame error events.
  - **Range**: 1 through 100 seconds

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 3616
frame-period-summary

Syntax

frame-period-summary count;

Hierarchy Level

[edit protocols oam ethernet link-fault-management event link-event-rate],
[edit protocols oam ethernet link-fault-management interface interface-name
event-thresholds]

Release Information

Statement introduced in Junos OS Release 9.4 for EX Series switches.

Description

Configure the threshold value for sending frame period summary error events or taking
the action specified in the action profile.

An errored frame second is any 1-second period that has at least one errored frame. This
event is generated if the number of errored frame seconds is equal to or greater than the
specified threshold for that period.

Options

count—Threshold count in seconds for frame period summary error events.

Range: 1 through 100 seconds

Required Privilege

Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Related Documentation

interface (OAM LFM)

Syntax

interface interface-name {  
  link-discovery (active | passive);  
  pdu-interval interval;  
  pdu-threshold threshold-value;  
  remote-loopback;  
  event-thresholds {  
    frame-error count;  
    frame-period count;  
    frame-period-summary count;  
    symbol-period count;  
  }  
  negotiation-options {  
    allow-remote-loopback;  
    no-allow-link-events;  
  }  
}

Hierarchy Level
[edit protocols oam ethernet link-fault-management]

Release Information
Statement introduced in Junos OS Release 9.4 for EX Series switches.

Description
Configure Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces.

The remaining statements are explained separately.

Options
interface-name—Name of the interface to be enabled for IEEE 802.3ah OAM link fault management (LFM) support.

Required Privilege Level
routing—To view this statement in the configuration.
route-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches on page 3591

link-adjacency-loss

**Syntax**  
link-adjacency-loss;

**Hierarchy Level**  
[edit protocols oam ethernet link-fault-management action-profile event]

**Release Information**  
Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**  
Configure loss of adjacency event with the IEEE 802.3ah link fault management (LFM) peer. When included, the loss of adjacency event triggers the action specified under the action statement.

**Required Privilege Level**  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**  
- Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches on page 3591

link-discovery

**Syntax**  
link-discovery (active | passive);

**Hierarchy Level**  
[edit protocols oam ethernet link-fault-management interface interface-name]

**Release Information**  
Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**  
Specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on an interface. Link monitoring is done when the interface sends periodic OAM PDUs.

**Options**  
- **active**—In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality.
- **passive**—In passive mode, the peer initiates the discovery process.

Once the discovery process is initiated, both sides participate in discovery.

**Required Privilege Level**  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

symbol-period

Syntax
symbol-period count;

Hierarchy Level
[edit protocols oam ethernet link-fault-management action-profile profile-name; event link-event-rate],
[edit protocols oam ethernet link-fault-management interface interface-name event-thresholds]

Release Information
Statement introduced in Junos OS Release 9.4 for EX Series switches.

Description
Configure the threshold for sending symbol period events or taking the action specified in the action profile.

Symbol code errors occur on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period. You cannot configure the default value to a different value.

Options
count—Threshold count in seconds for symbol period events.
Range: 1 through 100 seconds

Required Privilege
level routing—To view this statement in the configuration.
level routing-control—To add this statement to the configuration.

Related Documentation
• Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 3616

syslog (OAM LFM)

Syntax
syslog;

Hierarchy Level
[edit protocols oam ethernet link-fault-management action-profile profile-name; action]

Release Information
Statement introduced in Junos OS Release 9.4 for EX Series switches.

Description
Generate a system log message for the Ethernet Operation, Administration, and Maintenance (OAM) link fault management (LFM) event.

Required Privilege
level routing—To view this statement in the configuration.
level routing-control—To add this statement to the configuration.

Related Documentation

# Configuration Statements: RPM

## data-fill

<table>
<thead>
<tr>
<th>Syntax</th>
<th>data-fill data;</th>
</tr>
</thead>
</table>

### Hierarchy Level

[edit services rpm bgp],
[edit services rpm probe owner test test-name]

### Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.3 for EX Series switches.
- Statement introduced in Junos OS Release 93. for PTX Series Packet Transport Routers.

### Description

Specify the contents of the data portion of Internet Control Message Protocol (ICMP) probes. The `data-fill` statement is not valid with the `http-get` or `http-metadata-get` probe types.

### Options

- **data**—A hexadecimal value; for example, 0-9, A-F.

### Required Privilege Level

- system—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

### Related Documentation

- Configuring BGP Neighbor Discovery Through RPM
- Configuring RPM Probes
data-size

Syntax: data-size size;

Hierarchy Level: [edit services rpm bgp],
[edit services rpm probe owner test test-name]

Release Information: Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description: Specify the size of the data portion of ICMP probes. The data-size statement is not valid with the http-get or http-metadata-get probe type.

Options: data—The size can be from 0 through 65507
Default: 0

NOTE: If you configure the hardware timestamp feature (see Configuring RPM Timestamping), the data-size default value is 32 bytes and 32 is the minimum value for explicit configuration. The UDP timestamp probe type is an exception; it requires a minimum data size of 52 bytes.

Required Privilege Level: system—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation: • Configuring BGP Neighbor Discovery Through RPM
destination-port

Syntax
destination-port port;

Hierarchy Level
[edit services rpm bgp],
[edit services rpm probe owner test test-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description
Specify the User Datagram Protocol (UDP) or Transmission Control Protocol (TCP) port
to which a probe is sent. This statement is used only for TCP or UDP probe types.

The value for the destination-port can be only 7 when you configure along with hardware
timestamping. A constraint check prevents you for configuring any other value for the
destination port in this case.

This constraint does not apply when you are using one-way hardware timestamping
along with destination-port and either probe-type udp-ping or probe-type
udp-ping-timestamp.

Options
port—The port number can be 7 or from 49,160 to 65,535.

Required Privilege
Level
system—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

### dscp-code-point

**Syntax**
```
dscp-code-point dscp-bits;
```

**Hierarchy Level**
```
[edit services rpm probe owner test test-name]
```

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.3 for EX Series switches.
- Statement introduced in Junos OS Release for PTX Series Packet Transport Routers.

**Description**
Specify the value of the Differentiated Services (DiffServ) field within the IP header. The DiffServ code point (DSCP) bits value must be set to a valid 6-bit pattern.

**Options**
- **dscp-bits**—A valid 6-bit pattern; for example, **001111** or one of the following configured DSCP aliases:
  - **af1**—Default: 001010
  - **af2**—Default: 001100
  - **af3**—Default: 001110
  - **af21**—Default: 010010
  - **af22**—Default: 010100
  - **af23**—Default: 010110
  - **af31**—Default: 011010
  - **af32**—Default: 011100
  - **af33**—Default: 011110
  - **af41**—Default: 100010
  - **af42**—Default: 100100
  - **af43**—Default: 100110
  - **be**—Default: 000000
  - **cs1**—Default: 001000
  - **cs2**—Default: 010000
  - **cs3**—Default: 011000
  - **cs4**—Default: 100000
  - **cs5**—Default: 101000
  - **cs6**—Default: 110000
  - **cs7**—Default: 111000
  - **ef**—Default: 101110
  - **nc1**—Default: 110000
• nc2—Default: 111000

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
• Configuring RPM Probes

hardware-timestamp

Syntax
hardware-timestamp;

Hierarchy Level
[edit services rpm probe owner test test-name]

Release Information
Statement introduced in Junos OS Release 8.1.
Statement applied to MX Series routers in Junos OS Release 10.0.
Statement introduced in Junos OS Release 10.3 for EX Series switches.

Description
On MX Series routers and EX Series switches only, enable timestamping of RPM probe messages in the Packet Forwarding Engine host processor. This feature is supported only with icmp-ping, icmp-ping-timestamp, udp-ping, and udp-ping-timestamp probe types.

When you configure either probe-type udp-ping or probe-type udp-ping-timestamp along with the hardware-timestamp command, the value for the destination-port can be only 7. A constraint check prevents you for configuring any other value for the destination port in this case.

This constraint does not apply when you are configuring one-way-hardware-timestamp.

Required Privilege
Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

**history-size**

**Syntax**

```
history-size size;
```

**Hierarchy Level**

```
[edit services rpm bgp],
[edit services rpm probe owner test test-name]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.3 for EX Series switches.
- Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**

Specify the number of stored history entries.

**Options**

- **size**—A value from 0 to 255.
- **Default:** 50

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

---

**moving-average-size**

**Syntax**

```
moving-average-size number;
```

**Hierarchy Level**

```
[edit services rpm bgp],
[edit services rpm probe owner test test-name]
```

**Release Information**

- Statement introduced in Junos OS Release 8.5.
- Statement introduced in Junos OS Release 9.3 for EX Series switches.
- Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**

Enable statistical calculation operations to be performed across a configurable number of the most recent samples.

**Options**

- **number**—Number of samples to be used in calculations.
- **Range:** 0 through 255

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**

- Configuring RPM Probes
one-way-hardware-timestamp

Syntax
one-way-hardware-timestamp;

Hierarchy Level
[edit services rpm probe owner test test-name]

Release Information
Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description
Enable timestamping of RPM probe messages for one-way delay and jitter measurements.
You must configure this statement along with the destination-interface statement to invoke timestamping. This feature is supported only with icmp-ping, icmp-ping-timestamp, udp-ping, and udp-ping-timestamp probe types.

Required Privilege Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation
- Configuring RPM Timestamping
- destination-interface
- hardware-timestamp on page 3762

port (RPM)

Syntax
port number;

Hierarchy Level
[edit services rpm probe-server (tcp | udp)]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description
Specify the port number for the probe server.

Options
number—Port number for the probe server. The value can be 7 or 49,160 through 65,535.

Required Privilege Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation

probe

Syntax

```plaintext
probe owner {
    test test-name {
        data-fill data;
        data-size size;
        destination-interface interface-name;
        destination-port port;
        dscp-code-point dscp-bits;
        hardware-timestamp;
        history-size size;
        moving-average-size number;
        one-way-hardware-timestamp;
        probe-count count;
        probe-interval seconds;
        probe-type type;
        routing-instance instance-name;
        source-address address;
        target (url | address);
        test-interval interval;
        thresholds thresholds;
        traps traps;
    }
}
```

Hierarchy Level  [edit services rpm]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description  Specify an owner name. The owner name combined with the test name represent a single RPM configuration instance.

Options

- **owner**—Specify an owner name up to 32 characters in length.

The remaining statements are explained separately.

Required Privilege

- **Level**
  - system—To view this statement in the configuration.
  - interface-control—To add this statement to the configuration.

Related Documentation

# probe-limit

**Syntax**

```
probe-limit limit;
```

**Hierarchy Level**

```
[edit services rpm]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.3 for EX Series switches.
- Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**

Configure the maximum number of concurrent probes allowed.

**Options**

- `limit` — Maximum number of concurrent probes allowed.
  - **Range:** 1 through 500 (PTX Series Packet Transport Routers only) 1 through 200
  - **Default:** 100

**Required Privilege Level**

- `interface` — To view this statement in the configuration.
- `interface-control` — To add this statement to the configuration.

**Related Documentation**

- [Limiting the Number of Concurrent RPM Probes](#)
probe-server

Syntax

```
probe-server {
  tcp {
    destination-interface interface-name;
    port number;
  }
  udp {
    destination-interface interface-name;
    port number;
  }
}
```

Hierarchy Level
[edit services rpm]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description
Specify the server to act as a receiver for the probes.

The remaining statements are explained separately.

NOTE: The destination-interface statement is not supported on PTX Series routers.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
• Configuring RPM Receiver Servers
probe-type

Syntax  
proble-type type;

Hierarchy Level  
[edit services rpm bgp],  
[edit services rpm probe owner test test-name]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.3 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description  
Specify the packet and protocol contents of a probe.

Options  
type—Specify one of the following probe type values:

- http-get—(Not available at the [edit services rpm bgp] hierarchy level.) Sends a Hypertext Transfer Protocol (HTTP) get request to a target URL.
- http-metadata-get—(Not available at the [edit services rpm bgp] hierarchy level.) Sends an HTTP get request for metadata to a target URL.
- icmp-ping—Sends ICMP echo requests to a target address.
- icmp-ping-timestamp—Sends ICMP timestamp requests to a target address.
- tcp-ping—Sends TCP packets to a target.
- udp-ping—Sends UDP packets to a target.
- udp-ping-timestamp—Sends UDP timestamp requests to a target address.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation

**routing-instance**

**Syntax**
```
routing-instance instance-name;
```

**Hierarchy Level**
[edit services rpm probe owner test test-name]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**
Specify the routing instance used by the probes.

**Options**
- `instance-name`—A routing instance configured at the `[edit routing-instance]` hierarchy level.
  
  **Default:** Internet routing table inet.0.

**Required Privilege**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**
- Configuring RPM Probes

**routing-instances**

**Syntax**
```
routing-instances instance-name;
```

**Hierarchy Level**
[edit services rpm bgp],
[edit services rpm bgp logical-system logical-system-name]

**Release Information**
Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**
Specify the routing instance used by the probes.

**Options**
- `instance-name`—A routing instance configured at the `[edit routing-instances]` hierarchy level.
  
  **Default:** Internet routing table inet.0.

**Required Privilege**
- `interface`—To view this statement in the configuration.

- Configuring BGP Neighbor Discovery Through RPM
rpm

Syntax  rpm (client | server);

Hierarchy Level  [edit interfaces interface-name unit logical-unit-number]

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description  Associate an RPM client (router or switch that originates RPM probes) or RPM server
with a specified interface.

Options  
  client—Identifier for RPM client router or switch.
  server—Identifier for RPM server.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring RPM Timestamping

source-address

Syntax  source-address address;

Hierarchy Level  [edit services rpm probe owner test test-name]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description  Specify the source IP address used for probes. If the source IP address is not one of the
router’s or switch’s assigned addresses, the packet will use the outgoing interface’s
address as its source.

Options  address—Valid IP address.

Required Privilege Level  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring RPM Probes
**tcp**

**Syntax**
```
tcp {
    destination-interface interface-name;
    port port;
}
```

**Hierarchy Level**
[edit services rpm probe-server]

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.3 for EX Series switches.
- Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**
Specify the port information for the TCP server.

The remaining statements are explained separately.

**Required Privilege**
- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

    routing-instance instance-name;
    source-address address;
    target (url | address address);
    test-interval interval;
    thresholds thresholds;
    traps traps;
}

Hierarchy Level  [edit services rpm probe owner]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description  Specify the range of probes over which the standard deviation, average, and jitter are calculated. The test name combined with the owner name represent a single RPM configuration instance.

Options  test-name—Specify a test name. The name can be up to 32 characters in length.

The remaining statements are explained separately.

Required Privilege  interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation  • Configuring RPM Probes
**test-interval**

Syntax  

test-interval *frequency*;

Hierarchy Level  

[edit services rpm bgp],  
[edit services rpm probe owner test test-name]

Release Information  

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.3 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description  

Specify the time to wait between tests, in seconds.

Options  

*frequency*—Number of seconds, from 0 through 86400.

Required Privilege Level  

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation

thresholds

Syntax

thresholds thresholds;

Hierarchy Level

[edit services rpm probe owner test test-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Packet Series Transport Routers.

Description

Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.

Options

thresholds—Specify one or more threshold measurements. The following options are supported:

- **egress-time**—Measures maximum source-to-destination time per probe.
- **ingress-time**—Measures maximum destination-to-source time per probe.
- **jitter-egress**—Measures maximum source-to-destination jitter per test.
- **jitter-ingress**—Measures maximum destination-to-source jitter per test.
- **jitter-rtt**—Measures maximum jitter per test, from 0 through 60,000,000 microseconds.
- **rtt**—Measures maximum round-trip time per probe, in microseconds.
- **std-dev-egress**—Measures maximum source-to-destination standard deviation per test.
- **std-dev-ingress**—Measures maximum destination-to-source standard deviation per test.
- **std-dev-rtt**—Measures maximum standard deviation per test, in microseconds.
- **successive-loss**—Measures successive probe loss count, indicating probe failure.
- **total-loss**—Measures total probe loss count indicating test failure, from 0 through 15.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- Configuring RPM Probes
traps

Syntax 
traps traps;

Hierarchy Level 
[edit services rpm probe owner test test-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description
Set the trap bit to generate traps for probes. Traps are sent if the configured threshold is met or exceeded.

Options
traps—Specify one or more traps. The following options are supported:

- egress-jitter-exceeded—Generates traps when the jitter in egress time threshold is met or exceeded.
- egress-std-dev-exceeded—Generates traps when the egress time standard deviation threshold is met or exceeded.
- egress-time-exceeded—Generates traps when the maximum egress time threshold is met or exceeded.
- ingress-jitter-exceeded—Generates traps when the jitter in ingress time threshold is met or exceeded.
- ingress-std-dev-exceeded—Generates traps when the ingress time standard deviation threshold is met or exceeded.
- ingress-time-exceeded—Generates traps when the maximum ingress time threshold is met or exceeded.
- jitter-exceeded—Generates traps when the jitter in round-trip time threshold is met or exceeded.
- probe-failure—Generates traps for successive probe loss thresholds crossed.
- rtt-exceeded—Generates traps when the maximum round-trip time threshold is met or exceeded.
- std-dev-exceeded—Generates traps when the round-trip time standard deviation threshold is met or exceeded.
- test-completion—Generates traps when a test is completed.
- test-failure—Generates traps when the total probe loss threshold is met or exceeded.

NOTE: For RPM traps to be generated, you must configure the remote-operations SNMP trap category by including the categories statement at the [edit snmp trap-group trap-group-name hierarchy level.]
Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

group (Uplink Failure Detection)

Syntax

```
 group group-name {
    link-to-monitor interface-name;
    link-to-disable interface-name;
}
```

Hierarchy Level  [edit protocols uplink-failure-detection]

Release Information  Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description  Configure a group of uplink and downlink interfaces for uplink failure detection.

Options  group-name—Name of the uplink-failure-detection group.

The remaining statements are explained separately.

Required Privilege Level  admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Related Documentation  • Configuring Interfaces for Uplink Failure Detection (CLI Procedure) on page 3618
link-to-disable

Syntax  link-to-disable interface-name;

Hierarchy Level  [edit protocols uplink-failure-detection group group-name]

Release Information  Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description  Configure the downlink interfaces to be disabled when the switch detects an uplink failure. The switch can monitor a maximum of 48 downlink interfaces in a group.

Options  interface-name—Name of the downlink interface or interface range in the group. The interface can be a physical interface or a logical interface.

Required Privilege Level  admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Related Documentation  • Configuring Interfaces for Uplink Failure Detection (CLI Procedure) on page 3618

link-to-monitor

Syntax  link-to-monitor interface-name;

Hierarchy Level  [edit protocols uplink-failure-detection group group-name]

Release Information  Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description  Configure the uplink interfaces to be monitored for uplink failure detection. The switch can monitor a maximum of 48 uplink interfaces in a group.

An interface can be configured as link-to-monitor in multiple groups.

Options  interface-name—Name of the uplink interface or interface range in the group. The interface can be a physical interface or a logical interface.

Required Privilege Level  admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Related Documentation  • Configuring Interfaces for Uplink Failure Detection (CLI Procedure) on page 3618
traceoptions (Uplink Failure Detection)

Syntax

```
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-readable>;
  flag flag;
}
```

Hierarchy Level

[edit protocols uplink-failure-detection]

Release Information

Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description

Define tracing operations for uplink failure detection.

Default

The traceoptions feature is disabled by default.

Options

- **file filename** — Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks.
- **files number** — (Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached ( `xk` to specify KB, `xm` to specify MB, or `xg` to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.
  
  **Range:** 2 through 1000
  
  **Default:** 3 files

- **flag flag** — Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:
  
  - `all` — Trace everything.
  - `dcd` — Trace ufdd interaction with dcd.
  - `groups` — Trace uplink-failure-detection group handling.
  - `interface` — Trace interface notification handlers of ufdd.
  - `parse` — Trace configuration parsing.
  
  **no-stamp** — (Optional) Do not place a timestamp on any trace file.

  **no-world-readable** — (Optional) Restricted file access to the user who created the file.

  **size size** — (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option.

  **Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify gigabytes
Range: 10 KB through 1 GB
Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

**Required Privilege Level**
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Monitoring Hosts Using the J-Web Ping Host Tool

**Purpose**
Use the J-Web ping host tool to verify that the host can be reached over the network. The output is useful for diagnosing host and network connectivity problems. The switch sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

**Action**
To use the J-Web ping host tool:

1. Select **Troubleshoot>Ping Host**.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Ping Host page, as described in Table 438 on page 3784.
   The Remote Host field is the only required field.
4. Click **Start**.
The results of the ping operation are displayed in the main pane. If no options are specified, each ping response is in the following format:

```
bytes bytes from ip-address: icmp_seq=number ttl=number time=time
```

5. To stop the ping operation before it is complete, click **OK**.

**Meaning**

Table 438 on page 3784 lists the fields.

### Table 438: J-Web Ping Host Field Summary

<table>
<thead>
<tr>
<th>Field</th>
<th>Function</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Host</td>
<td>Identifies the host to ping.</td>
<td>Type the hostname or IP address of the host to ping.</td>
</tr>
<tr>
<td>Advanced Options</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Don't Resolve Addresses | Determines whether to display hostnames of the hops along the path. | • To suppress the display of the hop hostnames, select the check box.  
• To display the hop hostnames, clear the check box. |
| Interface            | Specifies the interface on which the ping requests are sent. | Select the interface on which ping requests are sent from the list. If you select any, the ping requests are sent on all interfaces. |
| Count                | Specifies the number of ping requests to send.     | Select the number of ping requests to send from the list. |
| Don't Fragment       | Specifies the Don't Fragment (DF) bit in the IP header of the ping request packet. | • To set the DF bit, select the check box.  
• To clear the DF bit, clear the check box. |
| Record Route         | Sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed in the main pane. | • To record and display the path of the packet, select the check box.  
• To suppress the recording and display of the path of the packet, clear the check box. |
| Type-of-Service      | Specifies the type-of-service (TOS) value in the IP header of the ping request packet. | Select the decimal value of the TOS field from the list. |
| Routing Instance     | Name of the routing instance for the ping attempt. | Select the routing instance name from the list. |
| Interval             | Specifies the interval, in seconds, between transmissions of individual ping requests. | Select the interval from the list. |
| Packet Size          | Specifies the size of the ping request packet. | Type the size, in bytes, of the packet. The size can be from 0 through 65468. The switch adds 8 bytes of ICMP header to the size. |
| Source Address       | Specifies the source address of the ping request packet. | Type the source IP address. |
| Time-to-Live         | Specifies the time-to-live (TTL) hop count for the ping request packet. | Select the TTL value from the list. |

Monitoring Network Traffic Using Traceroute

**Purpose**

Use the Traceroute page in the J-Web interface to trace a route between the switch and a remote host. You can use a traceroute task to display a list of waypoints between the switch and a specified destination host. The output is useful for diagnosing a point of failure in the path from the switch platform to the destination host and addressing network traffic latency and throughput problems.

**Action**

To use the traceroute tool:

1. Select Troubleshoot > Traceroute.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Traceroute page.
   - The Remote Host field is the only required field.
4. Click Start.
5. To stop the traceroute operation before it is complete, click OK while the results of the traceroute operation are being displayed.

**Meaning**

The switch generates the list of waypoints by sending a series of ICMP traceroute packets in which the time-to-live (TTL) value in the messages sent to each successive waypoint is incremented by 1. (The TTL value of the first traceroute packet is set to 1.) In this manner, each waypoint along the path to the destination host replies with a Time Exceeded packet from which the source IP address can be obtained.

The results of the traceroute operation are displayed in the main pane. If no options are specified, each line of the traceroute display is in the following format:

```
hop-number host (ip-address) [as-number] time1 time2 time3
```

The switch sends a total of three traceroute packets to each waypoint along the path and displays the round-trip time for each traceroute operation. If the switch times out before receiving a Time Exceeded message, an asterisk (*) is displayed for that round-trip time.
Table 439: Traceroute field summary

**Verifying Input and Output for Port Mirroring Analyzers on EX Series Switches**

**Purpose**
Verify that an analyzer has been created on the switch and has the appropriate output interfaces, and appropriate output interface.
Action

You can verify the port mirror analyzer is configured as expected using the `show analyzer` command.

```
[edit]
user@switch> show analyzer
Analyzer name                  : employee-monitor
Output VLAN                  : remote-analyzer
Mirror ratio                 : 1
Loss priority                : High
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
```

You can view all of the port mirror analyzers configured on the switch, including any that are disabled, using the `show ethernet-switching-options` command in configuration mode.

```
user@switch# show ethernet-switching-options
inactive: analyzer employee-web-monitor {
    loss-priority high;
    output {
        analyzer employee-monitor {
            loss-priority high;
            input {
                ingress {
                    interface ge-0/0/0.0;
                    interface ge-0/0/1.0;
                }
            }
            output {
                vlan {
                    remote-analyzer;
                }
            }
        }
    }
}
```

Meaning

This output shows that the employee-monitor analyzer has a ratio of 1 (mirroring every packet, the default), a loss priority of high (set this option to high whenever the analyzer output is to a VLAN), is mirroring the traffic entering `ge-0/0/0` and `ge-0/0/1`, and sending the mirrored traffic to the analyzer called remote-analyzer.

Viewing Real-Time Performance Monitoring Information

Real-time performance monitoring (RPM) on EX Series switches enables you to configure and send probes to a specified target and monitor the analyzed results to determine...
packet loss, round-trip time, and jitter. The J-Web interface provides a graphical view of RPM information for EX Series switches.

To view the RPM information using the J-Web interface:

1. Select Troubleshoot > RPM > View RPM.
2. Select the Round Trip Time check box to display the graph with round-trip time included. Clear the check-box to view the graph without the round-trip time.
3. From the Refresh Time list, select a refresh time interval for the graph.

Verifying That Uplink Failure Detection Is Working Correctly

Purpose Verify that the switch disables the downlink interface when it detects an uplink failure.

Action 1. View the current uplink-failure-detection status:

```
user@switch> show uplink-failure-detection
Group : group1
Uplink : ge-0/0/0*
Downlink : ge-0/0/1*
Failure Action : Inactive
```

**NOTE:** The asterisk (*) indicates that the link is up.

2. Disable the uplink interface:

```
[edit]
user@switch# set interface ge-0/0/0 disable
```
3. Save the configuration on the switch.
4. View the current uplink-failure-detection status:

```
user@switch> show uplink-failure-detection
Group : group1
Uplink : ge-0/0/0
Downlink : ge-0/0/1
Failure Action : Active
```

Meaning The output in Step 1 shows that the uplink interface is up, and hence that the downlink interface is also up, and that the status of Failure Action is Inactive.

The output in Step 4 shows that both the uplink and downlink interfaces are down and that the status of Failure Action is changed to Active. This output shows that uplink failure detection is working.

Operational Commands: General
# monitor traffic

## Syntax

```plaintext
monitor traffic
  <brief | detail | extensive>
  <absolute-sequence>
  <count count>
  <interface interface-name>
  <layer2-headers>
  <matching matching>
  <no-domain-names>
  <no-promiscuous>
  <no-resolve>
  <no-timestamp>
  <print-ascii>
  <print-hex>
  <resolve-timeout>
  <size size>
```

## Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

## Description

Display packet headers or packets received and sent from the Routing Engine.

### NOTE:

- Using the `monitor-traffic` command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the `no-resolve` option.

### NOTE: This command is not supported on the QFabric system.

## Options

- **none**—(Optional) Display packet headers transmitted through `fp0`. On a TX Matrix Plus router, display packet headers transmitted through `em0`.
- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **absolute-sequence**—(Optional) Display absolute TCP sequence numbers.
- **count count**—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.
interface interface-name—(Optional) Specify the interface on which the monitor traffic command displays packet data. If no interface is specified, the monitor traffic command displays packet data arriving on the lowest-numbered interface.

layer2-headers—(Optional) Display the link-level header on each line.

matching matching—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the monitor traffic command filters and displays packet data.

no-domain-names—(Optional) Suppress the display of the domain portion of hostnames. With the no-domain-names option enabled, the monitor traffic command displays only team for the hostname team.company.net.

no-promiscuous—(Optional) Do not put the interface into promiscuous mode.

no-resolve—(Optional) Suppress reverse lookup of the IP addresses.

no-timestamp—(Optional) Suppress timestamps on displayed packets.

print-ascii—(Optional) Display each packet in ASCII format.

print-hex—(Optional) Display each packet, except the link-level header, in hexadecimal format.

resolve-timeout timeout—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the print-ascii, print-hex, or extensive option.

size size—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to brief output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to detail and extensive output, the default packet size is 1514. The monitor traffic command truncates displayed packets if the matched data exceeds the configured size.

Additional Information

In the monitor traffic command, you can specify an expression to match by using the matching option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace expression with one or more of the match conditions listed in Table 440 on page 3792.
## Table 440: Match Conditions for the monitor traffic Command

<table>
<thead>
<tr>
<th>Match Type</th>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Entity**    | `host [address | hostname]` | Matches packets that contain the specified address or hostname.  
|               |                         | The protocol match conditions `arp`, `ip`, or `rarp`, or any of the directional match conditions can be prepended to the `host` match condition. |
|               | `net address`           | Matches packets with source or destination addresses containing the specified network address. |
|               | `net address mask mask` | Matches packets containing the specified network address and subnet mask. |
|               | `port (port-number | port-name)`           | Matches packets containing the specified source or destination TCP or UDP port number or port name.  
|               |                         | In place of the numeric port address, you can specify a text synonym, such as `bgp` (179), `dhcp` (67), or `domain` (53) (the port numbers are also listed). |
| **Directional** | `dst`                   | Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions. |
|               | `src`                   | Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions. |
|               | `src and dst`           | Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions. |
|               | `src or dst`            | Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions. |
| **Packet Length** | `less value`           | Matches packets shorter than or equal to the specified value, in bytes. |
|               | `greater value`         | Matches packets longer than or equal to the specified value, in bytes. |

</tr>
</tbody>
</table>

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0" "arithmetic_expression relational_operator arithmetic_expression"
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional size field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in Table 442 on page 3795.

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The monitor traffic command cannot apply match conditions to inbound traffic.
- The monitor traffic interface command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (|) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see Table 440 on page 3792.
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the monitor traffic interface ae[x] command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

  <size bytes>
  <source source-address>
  <strict>
  <strict-source value>
  <tos type-of-service>
  <ttl value>
  <verbose>
  <wait seconds>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**Description**
Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

**Options**

- **host**—IP address or hostname of the remote system to ping.

- **bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

- **count requests**—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

- **detail**—(Optional) Include in the output the interface on which the ping reply was received.

- **do-not-fragment**—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

**NOTE:** In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPv6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

- **inet**—(Optional) Ping Packet Forwarding Engine IPv4 routes.

- **inet6**—(Optional) Ping Packet Forwarding Engine IPv6 routes.

- **interface source-interface**—(Optional) Interface to use to send the ping requests.

- **interval seconds**—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

- **logical-system logical-system-name**—(Optional) Name of logical system from which to send the ping requests. Alternatively, enter the **set cli logical-system logical-system-name** command and then run the **ping** command. To return to the main router or switch, enter the **clear cli logical-system** command.

- **loose-source value**—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.
mac-address mac-address—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern string—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the count option.

record-route—(Optional) Record and report the packet’s path (IPv4).

routing-instance routing-instance-name—(Optional) Name of the routing instance for the ping attempt.

size bytes—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

strict—(Optional) Use the strict source route option (IPv4).

strict-source value—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos type-of-service—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255. If the device configuration includes the dscp-code-point value statement at the [edit class-of-service host-outbound-traffic] hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the dscp-code-point configuration statement instead of the value you specify in this command option.

ttl value—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

verbose—(Optional) Display detailed output.

vpls instance-name—(Optional) Ping the instance to which this VPLS belongs.

wait seconds—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.
**Required Privilege**

- network

**Related Documentation**

- Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

**List of Sample Output**

- ping hostname on page 3803
- ping hostname rapid on page 3803
- ping hostname size count on page 3803

**Output Fields**

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

**Sample Output**

**show pfe statistics bridge**

**Syntax**
```
show pfe statistics bridge
<fpc slot>
```

**Release Information**
Command introduced in Junos OS Release 12.1 for EX Series switches.

**Description**
Display information about the number of packets discarded in the ingress pipeline of the Packet Forwarding Engine, packets discarded because of egress filtering or congestion filtering, number of control packets, and general counters for dropped packets. You can use this information to inform troubleshooting investigations.

**Options**
- **none**—Display bridge counter statistics for all Flexible PIC Concentrator (FPC) slots.
- **fpc slot**—(Optional) Display bridge counter statistics for a specific FPC slot.

**Required Privilege Level**

traceroute

Syntax
traceroute host
<as-number-lookup>
<bypass-routing>
<clns>
<gateway address>
<inet | inet6>
<interface interface-name>
<logical system logical-system-name>
<monitor host>
<mpls (ldp FEC address | rsvp label-switched-path-name)>
<no-resolve>
<propagate-ttl>
<routing-instance routing-instance-name>
<source source-address>
<tos value>
<ttl value>
<wait seconds>

Syntax (QFX Series)
traceroute host
<as-number-lookup>
<bypass-routing>
<gateway address>
<inet>
<interface interface-name>
<monitor host>
<no-resolve>
<routing-instance routing-instance-name>
<source source-address>
<tos value>
<ttl value>
<wait seconds>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
mpls option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.1 for the QFX Series.
propagate-ttl option introduced in Junos OS Release 12.1.

Description
Display the route that packets take to a specified network host. Use traceroute as a debugging tool to locate points of failure in a network.

Options
host—IP address or name of remote host.

as-number-lookup—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

bypass-routing—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.
clns—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

gateway address—(Optional) Address of a router or switch through which the route transits.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interface interface-name—(Optional) Name of the interface over which to send packets.

logical-system logical-system-name—(Optional) Perform this operation on all logical systems or on a particular logical system.

monitor host—(Optional) Display real-time monitoring information for the specified host.

mpls (ldp FEC address | rsvp label-switched-path name)—(Optional) See traceroute mpls ldp and traceroute mpls rsvp.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

propagate-ttl—(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the no-propagate-ttl configuration statement.

NOTE: Using propagate-ttl with traceroute on the CE router does not show hop-by-hop information.

routing-instance routing-instance-name—(Optional) Name of the routing instance for the traceroute attempt.

source source-address—(Optional) Source address of the outgoing traceroute packets.

tos value—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

ttl value—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

wait seconds—(Optional) Maximum time to wait for a response to the traceroute request.
traceroute as-number-lookup host on page 3811
traceroute no-resolve on page 3811
traceroute propogate-ttl on page 3812
traceroute (Between CE Routers, Layer 3 VPN) on page 3812
traceroute (Through an MPLS LSP) on page 3812

Output Fields Table 444 on page 3811 describes the output fields for the traceroute command. Output fields are listed in the approximate order in which they appear.

Table 444: traceroute Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>traceroute to</td>
<td>IP address of the receiver.</td>
</tr>
<tr>
<td>hops max</td>
<td>Maximum number of hops allowed.</td>
</tr>
<tr>
<td>byte packets</td>
<td>Size of packets being sent.</td>
</tr>
<tr>
<td>number-of-hops</td>
<td>Number of hops from the source to the named router or switch.</td>
</tr>
<tr>
<td>router-name</td>
<td>Name of the router or switch for this hop.</td>
</tr>
<tr>
<td>address</td>
<td>Address of the router or switch for this hop.</td>
</tr>
<tr>
<td>Round trip time</td>
<td>Average round-trip time, in milliseconds (ms).</td>
</tr>
</tbody>
</table>

Sample Output

ttraceroute

user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets

traceroute (Through an MPLS LSP)

user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
1  mpls1-sr0.company.net (10.168.200.101)  0.555 ms  0.393 ms  0.367 ms
   MPLS Label=1024 CoS=0 TTL=1
2  mpls5-lo0.company.net (10.168.1.224)  0.420 ms  0.394 ms  0.401 ms

Operational Commands: RPM
show services rpm active-servers

Syntax
show services rpm active-servers

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description
Display the protocols and corresponding ports for which a router or switch is configured as a real-time performance monitoring (RPM) server.

Options
This command has no options.

Required Privilege Level
view

List of Sample Output
show services rpm active-servers on page 3813

Output Fields
Table 445 on page 3813 lists the output fields for the show services rpm active-servers command. Output fields are listed in the approximate order in which they appear.

Table 445: show services rpm active-servers Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>Protocol configured on the receiving probe server. The protocol can be the User Datagram Protocol (UDP) or the Transmission Control Protocol (TCP).</td>
</tr>
<tr>
<td>Port</td>
<td>Port configured on the receiving probe server.</td>
</tr>
<tr>
<td>Destination interface name</td>
<td>Output interface name for the probes.</td>
</tr>
</tbody>
</table>

Sample Output
show services rpm active-servers

user@host>  show services rpm active-servers
  Protocol: TCP, Port: 50000, Destination interface name: lt-0/0/0.0
  Protocol: UDP, Port: 50001, Destination interface name: lt-0/0/0.0
show services rpm history-results

Syntax

show services rpm history-results
  <brief | detail>
  <owner owner>
  <since time>
  <test name>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Description

Display standard information about the results of the last 50 probes for each real-time performance monitoring (RPM) instance.

Options

none—Display the results of the last 50 probes for all RPM instances.

brief | detail—(Optional) Display the specified level of output.

owner owner—(Optional) Display information for the specified probe owner.

since time—(Optional) Display information from the specified time. Specify time as yyyy-mm-dd.hh:mm:ss.

test name—(Optional) Display information for the specified test.

Required Privilege Level

view

Syntax

```
show services rpm probe-results
<owner owner>
<test name>
```

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the results of the most recent real-time performance monitoring (RPM) probes.

Options

- **none**—Display all results of the most recent RPM probes.
- **owner owner**—(Optional) Display information for the specified probe owner.
- **test name**—(Optional) Display information for the specified test.

Required Privilege Level

- **view**

List of Sample Output

- show services rpm probe-results on page 3820
- show services rpm probe-results (BGP Neighbor Discovery) on page 3821

Output Fields

Table 447 on page 3817 lists the output fields for the `show services rpm probe-results` command. Output fields are listed in the approximate order in which they appear.

Table 447: show services rpm probe-results Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Owner name. When you configure the probe owner statement at the [edit services rpm] hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is <code>Rpm-Bgp-Owner</code>.</td>
</tr>
<tr>
<td>Test</td>
<td>Name of a test representing a collection of probes. When you configure the test test-name statement at the [edit services rpm probe owner] hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is <code>Rpm-BGP-Test-n</code>, where <code>n</code> is a cumulative number.</td>
</tr>
<tr>
<td>Target address</td>
<td>Destination address used for the probes.</td>
</tr>
<tr>
<td>Source address</td>
<td>Source address used for the probes.</td>
</tr>
<tr>
<td>Test size</td>
<td>Number of probes within a test.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Field Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Routing Instance Name</strong></td>
<td>(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured:</td>
</tr>
<tr>
<td></td>
<td>• When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash (/) is used to separate the two entities. For example, if the routing instance called RI is configured within the logical system called LS, the name in the output field is LS/RI.</td>
</tr>
<tr>
<td></td>
<td>• When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance.</td>
</tr>
<tr>
<td></td>
<td>• When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by default. A slash (/) is used to separate the two entities. For example, LS/default.</td>
</tr>
<tr>
<td><strong>Probe results</strong></td>
<td>Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement:</td>
</tr>
<tr>
<td></td>
<td>• Response received—Timestamp when the probe result was determined.</td>
</tr>
<tr>
<td></td>
<td>• Client and server hardware timestamps—if timestamps are configured, an entry appears at this point.</td>
</tr>
<tr>
<td></td>
<td>• Rtt—Average ping round-trip time (RTT), in microseconds.</td>
</tr>
<tr>
<td></td>
<td>• Egress jitter—Egress jitter, in microseconds.</td>
</tr>
<tr>
<td></td>
<td>• Ingress jitter—Ingress jitter, in microseconds.</td>
</tr>
<tr>
<td></td>
<td>• Round trip jitter—Round-trip jitter, in microseconds.</td>
</tr>
<tr>
<td></td>
<td>• Egress interarrival jitter—Egress interarrival jitter, in microseconds.</td>
</tr>
<tr>
<td></td>
<td>• Ingress interarrival jitter—Ingress interarrival jitter, in microseconds.</td>
</tr>
<tr>
<td></td>
<td>• Round trip interarrival jitter—Round-trip interarrival jitter, in microseconds.</td>
</tr>
<tr>
<td><strong>Results over current test</strong></td>
<td>Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes.</td>
</tr>
<tr>
<td></td>
<td>• Probes sent—Number of probes sent within the current test.</td>
</tr>
<tr>
<td></td>
<td>• Probes received—Number of probe responses received within the current test.</td>
</tr>
<tr>
<td></td>
<td>• Loss percentage—Percentage of lost probes for the current test.</td>
</tr>
<tr>
<td></td>
<td>• Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay.</td>
</tr>
<tr>
<td></td>
<td>For each measurement type, the following individual calculated results are provided:</td>
</tr>
<tr>
<td></td>
<td>• Samples—Number of probes.</td>
</tr>
<tr>
<td></td>
<td>• Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test.</td>
</tr>
<tr>
<td></td>
<td>• Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test.</td>
</tr>
<tr>
<td></td>
<td>• Average—Average RTT, ingress delay, or egress delay measured over the course of the current test.</td>
</tr>
<tr>
<td></td>
<td>• Peak to peak—Peak-to-peak difference, in microseconds.</td>
</tr>

Operational Commands: SNMP
## clear snmp rmon history

**Syntax**
```
clear snmp rmon history <interface-name | all>
```

**Release Information**
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Delete the samples of Ethernet statistics collected, but do not delete the RMON history configuration.

The `clear snmp rmon history` command deletes all the samples collected for the interface configured for the history group, but not the configuration of that group. If you want to delete the RMON history group configuration, you must use the `delete snmp rmon history` configuration-mode command.

**Options**
- `interface-name`—Delete the samples of Ethernet statistics collected for this interface.
- `all`—Delete the samples of Ethernet statistics collected for all interfaces that have been configured for RMON monitoring.

**Required Privilege Level**
clear

**Related Documentation**
- show snmp rmon history on page 3848
### clear snmp statistics

**Syntax**
```
clear snmp statistics
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

**Options**
This command has no options.

**Required Privilege**
`clear`

**Related Documentation**
- show snmp statistics on page 3852

**List of Sample Output**
clear snmp statistics on page 3824

**Output Fields**
See show snmp statistics for an explanation of output fields.

#### Sample Output

**clear snmp statistics**

In the following example, SNMP statistics are displayed before and after the `clear snmp statistics` command is issued:

```bash
user@host> show snmp statistics
SNMP statistics:
Input:
  Packets: 8, Bad versions: 0, Bad community names: 0,
  Bad community uses: 0, ASN parse errors: 0,
  Too bigs: 0, No such names: 0, Bad values: 0,
  Read onlys: 0, General errors: 0,
  Total request varbinds: 8, Total set varbinds: 0,
  Get requests: 0, Get nexts: 8, Set requests: 0,
  Get responses: 0, Traps: 0,
  Silent drops: 0, Proxy drops 0
Output:
  Packets: 2298, Too bigs: 0, No such names: 0,
  Bad values: 0, General errors: 0,
  Get requests: 0, Get nexts: 0, Set requests: 0,
  Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:
Input:
  Packets: 0, Bad versions: 0, Bad community names: 0,
  Bad community uses: 0, ASN parse errors: 0,
  Too bigs: 0, No such names: 0, Bad values: 0,
  Read onlys: 0, General errors: 0,
```
Total request varbinds: 0, Total set varbinds: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,
Get responses: 0, Traps: 0,
Silent drops: 0, Proxy drops 0
Output:
Packets: 0, Too bigs: 0, No such names: 0,
Bad values: 0, General errors: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,
Get responses: 0, Traps: 0
**request snmp spoof-trap**

**Syntax**

```plaintext
request snmp spoof-trap<br>variable-bindings<br>object<br>instance<br>value
```

**Release Information**

Command introduced in Junos OS Release 8.2.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.

**Options**

- `<trap>`—Name of the trap to spoof.
- `variable-bindings object instance value`—(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, `ifIndex[14] = 14`). Enclose the list of variable bindings in quotation marks (" " ) and use a comma to separate each object name, instance, and value definition (for example, `variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"`). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.
- `<dummy name>`—A dummy trap name to display the list of available traps.
- `?`—Question mark (?) to display possible completions.

**Required Privilege Level**

`request`

**List of Sample Output**

`request snmp spoof-trap (with Variable Bindings)` on page 3826
`request snmp spoof-trap (Illegal Trap Name)` on page 3826
`request snmp spoof-trap (Question Mark ?)` on page 3830

**Sample Output**

**request snmp spoof-trap (with Variable Bindings)**

```plaintext
user@host> request snmp spoof-trap linkUp variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"
Spoof trap request result: trap sent successfully
```

**request snmp spoof-trap (Illegal Trap Name)**

```plaintext
user@host> request snmp spoof-trap xx
Spoof trap request result: trap not found
```

Allowed Traps:
- adslAtucInitFailureTrap
- adslAtucPerfESSThreshTrap
- adslAtucPerfLofsThreshTrap

show snmp health-monitor

Syntax
show snmp health-monitor
<alarms <detail>> | <logs>

Release Information
Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.

Options
none—Display information about all health monitor alarms and logs.
alarms <detail>—(Optional) Display detailed information about health monitor alarms.
logs—(Optional) Display information about health monitor logs.

Required Privilege Level
view

List of Sample Output
show snmp health-monitor on page 3834
show snmp health-monitor alarms detail on page 3836

Output Fields
Table 448 on page 3832 describes the output fields for the show snmp health-monitor command. Output fields are listed in the approximate order in which they appear.

Table 448: show snmp health-monitor Output Fields

**show snmp inform-statistics**

**Syntax**

```
show snmp inform-statistics
```

**Release Information**

- Command introduced in Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Display information about Simple Network Management Protocol (SNMP) inform requests.

**Options**

This command has no options.

**Required Privilege Level**

`view`

**List of Sample Output**

`show snmp inform-statistics` on page 3839

**Output Fields**

Table 449 on page 3839 describes the output fields for the `show snmp inform-statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 449: show snmp inform-statistics Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Name</td>
<td>Name of the device configured to receive and respond to SNMP informs.</td>
</tr>
<tr>
<td>Address</td>
<td>IP address of the target device.</td>
</tr>
<tr>
<td>Sent</td>
<td>Number of informs sent to the target device and acknowledged by the target device.</td>
</tr>
<tr>
<td>Pending</td>
<td>Number of informs held in memory pending a response from the target device.</td>
</tr>
<tr>
<td>Discarded</td>
<td>Number of informs discarded after the specified number of retransmissions to the target device were attempted.</td>
</tr>
<tr>
<td>Timeouts</td>
<td>Number of informs that did not receive an acknowledgement from the target device within the timeout specified.</td>
</tr>
<tr>
<td>Probe Failures</td>
<td>Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).</td>
</tr>
</tbody>
</table>

**Sample Output**

```
user@host> show snmp inform-statistics
Inform Request Statistics:
   Target Name: TA1_v3_md5_none Address: 172.17.20.184
   Sent: 176, Pending: 0
   Discarded: 0, Timeouts: 0, Probe Failures: 0

Discarded: 2, Timeouts: 10, Probe Failures: 0
show snmp mib

Syntax

show snmp mib (get | get-next | walk) (ascii | decimal) object-id

Release Information

Description

Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.

Options

get—Retrieve and display one or more SNMP object values.

get-next—Retrieve and display the next SNMP object values.

walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.

ascii—Display the SNMP object’s string indices as an ASCII-key representation.

decimal—Display the SNMP object values in the decimal (default) format. The decimal option is the default option for this command. Therefore, issuing the show snmp mib (get | get-next | walk) decimal object-id and the show snmp mib (get | get-next | walk) object-id commands display the same output.

object-id—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as interfaces). When entering multiple objects, enclose the objects in quotation marks.

Required Privilege Level

snmp—To view this statement in the configuration.

List of Sample Output

show snmp mib get on page 3842
show snmp mib get (Multiple Objects) on page 3842
show snmp mib get (Layer 2 Policer) on page 3842
show snmp mib get-next on page 3842
show snmp mib get-next (Specify an OID) on page 3842
show snmp mib walk on page 3842
show snmp mib walk (QFX Series) on page 3842
show snmp mib walk decimal on page 3843
show snmp mib walk (ASCII) on page 3843
show snmp mib walk (Multiple Indices) on page 3843
show snmp mib walk decimal (Multiple Indices) on page 3843

Output Fields

Table 450 on page 3842 describes the output fields for the show snmp mib command. Output fields are listed in the approximate order in which they appear.
Table 450: show snmp mib Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>name</strong></td>
<td>Object name and numeric instance value.</td>
</tr>
<tr>
<td><strong>object value</strong></td>
<td>Object value. The Junos OS translates OIDs into the corresponding object names.</td>
</tr>
</tbody>
</table>

Sample Output

**show snmp mib get**

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

**show snmp mib get (Multiple Objects)**

```
user@host> show snmp mib get ?sysObjectID.0 sysUpTime.0?

show snmp rmon

Syntax
show snmp rmon
<alarms <brief | detail> | events <brief | detail> | logs>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display information about Simple Network Management Protocol (SNMP) Remote
Monitoring (RMON) alarms and events.

Options
none—Display information about all RMON alarms and events.
alarms—(Optional) Display information about RMON alarms.
brief | detail—(Optional) Display brief or detailed information about RMON alarms or
events.
events—(Optional) Display information about RMON events.
logs—(Optional) Display information about RMON monitoring logs.

Required Privilege
view

List of Sample Output
show snmp rmon on page 3846
show snmp rmon alarms detail on page 3846
show snmp rmon events detail on page 3847

Output Fields
Table 451 on page 3844 describes the output fields for the show snmp rmon command.
Output fields are listed in the approximate order in which they appear.

Table 451: show snmp rmon Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm Index</td>
<td>Alarm identifier.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
Table 451: show snmp rmon Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>State</strong></td>
<td>State of the alarm or event entry:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td><strong>Alarms:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• active—Entry is fully configured and activated.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• falling threshold crossed—Value of the variable has crossed the lower threshold limit.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• rising threshold crossed—Value of the variable has crossed the upper threshold limit.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• under creation—Entry is being configured and is not yet activated.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• startup—Alarm is waiting for the first sample of the monitored variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• object not available—Monitored variable of that type is not available to the SNMP agent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• instance not available—Monitored variable’s instance is not available to the SNMP agent.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• object type invalid—Monitored variable is not a numeric value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• object processing errored—An error occurred when the monitored variable was processed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unknown—State is not one of the above.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Events:</strong></td>
<td></td>

```
show snmp rmon history
  <history-index>
  <sample-index>
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the contents of the RMON history group.

**Options**

- `none`—Display all the entries in the RMON history group.
- `history-index`—(Optional) Display the contents of the specified entry in the RMON history group.
- `sample-index`—(Optional) Display the statistics collected for the specified sample within the specified entry in the RMON history group.

**Required Privilege**

view

**Related Documentation**

- clear snmp rmon history on page 3823

**List of Sample Output**

- show snmp rmon history on page 3849
- show snmp rmon history 1 sample 15 on page 3850

**Output Fields**

Table 452 on page 3848 lists the output fields for the `show snmp rmon history` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>History Index</td>
<td>Identifies this RMON history entry within the RMON history group.</td>
</tr>
<tr>
<td>Owner</td>
<td>The entity that configured this entry. Range is 0 to 32 alphanumeric characters.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the RMON history entry.</td>
</tr>
<tr>
<td>Interface or Data Source</td>
<td>The ifindex object that identifies the interface that is being monitored.</td>
</tr>
<tr>
<td>Interval</td>
<td>The interval (in seconds) configured for this RMON history entry.</td>
</tr>
<tr>
<td>Buckets Requested</td>
<td>The requested number of buckets (intervals) configured for this RMON history entry.</td>
</tr>
<tr>
<td>Buckets Granted</td>
<td>The number of buckets granted for this RMON history entry.</td>
</tr>
</tbody>
</table>
### Table 452: show snmp rmon history Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Sample Index</strong></td>
<td>The sample statistics taken at the specified interval.</td>
</tr>
<tr>
<td><strong>Drop Events</strong></td>
<td>Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
</tr>
<tr>
<td><strong>Octets</strong></td>
<td>Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</td>
</tr>
<tr>
<td><strong>Packets</strong></td>
<td>Total number of packets.</td>
</tr>
<tr>
<td><strong>Broadcast Packets</strong></td>
<td>Number of broadcast packets.</td>
</tr>
<tr>
<td><strong>Multicast Packets</strong></td>
<td>Number of multicast packets.</td>
</tr>
<tr>
<td><strong>CRC errors</strong></td>
<td>Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).</td>
</tr>
<tr>
<td><strong>Undersize Pkts</strong></td>
<td>Number of packets received during this sampling interval that were less than 64 octets long (excluding framing bits but including FCS octets) and were otherwise well formed.</td>
</tr>
<tr>
<td><strong>Oversize Pkts</strong></td>
<td>Number of packets received during the sampling interval that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.</td>
</tr>
<tr>
<td><strong>Fragments</strong></td>
<td>Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
</tr>
<tr>
<td><strong>Jabbers</strong></td>
<td>Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
</tr>
<tr>
<td><strong>Collisions</strong></td>
<td>Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</td>
</tr>
<tr>
<td><strong>Utilization(%)</strong></td>
<td>The best estimate of the mean physical layer network utilization on this interface during this sampling interval, in hundredths of a percent.</td>
</tr>
</tbody>
</table>

**Output Fields**
Table 453 on page 3852 describes the output fields for the `show snmp statistics` command.  
Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Packets (snmpInPkts)</strong></td>
<td>Total number of messages delivered to the SNMP entity from the transport service.</td>
</tr>
<tr>
<td><strong>Bad versions</strong></td>
<td>(snmpInBadVersions) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version.</td>
</tr>
<tr>
<td><strong>Bad community names</strong></td>
<td>(snmpInBadCommunityNames) Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity.</td>
</tr>
<tr>
<td><strong>Bad community uses</strong></td>
<td>(snmpInBadCommunityUses) Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.</td>
</tr>
<tr>
<td><strong>ASN parse errors</strong></td>
<td>(snmpInASNParseErrs) Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.</td>
</tr>
<tr>
<td><strong>Too big</strong></td>
<td>(snmpInTooBigs) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of tooBig.</td>
</tr>
<tr>
<td><strong>No such names</strong></td>
<td>(snmpInNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName.</td>
</tr>
<tr>
<td><strong>Bad values</strong></td>
<td>(snmpInBadValues) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of badValue.</td>
</tr>
<tr>
<td><strong>Read only</strong></td>
<td>(snmpInReadOnlys) Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of readOnly. Only incorrect implementations of SNMP generate this error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input (continued)</strong></td>
<td></td>
</tr>
<tr>
<td>General errors—(snmpInGenErrs)</td>
<td>Total number of SNMP PDUs delivered to the SNMP entity with an error status field of genErr.</td>
</tr>
<tr>
<td>Total requests varbinds—(snmpInTotalReqVars)</td>
<td>Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP GetRequest and GetNext PDUs.</td>
</tr>
<tr>
<td>Total set varbinds—(snmpInSetVars)</td>
<td>Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP SetRequest PDUs.</td>
</tr>
<tr>
<td>Get requests—(snmpInGetRequests)</td>
<td>Total number of SNMP GetRequest PDUs that have been accepted and processed by the SNMP entity.</td>
</tr>
<tr>
<td>Get nexts—(snmpInGetNexts)</td>
<td>Total number of SNMP GetNext PDUs that have been accepted and processed by the SNMP entity.</td>
</tr>
<tr>
<td>Set requests—(snmpInSetRequests)</td>
<td>Total number of SNMP SetRequest PDUs that have been accepted and processed by the SNMP entity.</td>
</tr>
<tr>
<td>Get responses—(snmpInGetResponses)</td>
<td>Total number of SNMP GetResponse PDUs that have been accepted and processed by the SNMP entity.</td>
</tr>
<tr>
<td>Traps—(snmpInTraps)</td>
<td>Total number of SNMP traps generated by the SNMP entity.</td>
</tr>
<tr>
<td>Silent drops—(snmpSilentDrops)</td>
<td>Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests.</td>
</tr>
<tr>
<td>Proxy drops—(snmpProxyDrops)</td>
<td>Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned.</td>
</tr>
<tr>
<td>Commit pending drops</td>
<td>Number of SNMP packets for Set requests dropped because of a previous pending SNMP Set request on the committed configuration.</td>
</tr>
<tr>
<td>Throttle drops</td>
<td>Number of SNMP packets for any requests dropped reaching the throttle limit.</td>
</tr>
</tbody>
</table>

show snmp v3

Syntax

show snmp v3
  <access <brief | detail> | community | general | groups | notify <filter> | target <address | parameters> | users>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.

Options
none—Display all of the SNMPv3 operating configuration.

access—(Optional) Display SNMPv3 access information.

brief | detail—(Optional) Display brief or detailed information about SNMPv3 access information.

community—(Optional) Display SNMPv3 community information.

general—(Optional) Display SNMPv3 general information.

groups—(Optional) Display SNMPv3 security-to-group information.

notify <filter>—(Optional) Display SNMPv3 notify and, optionally, notify filter information.

target <address | parameters>—(Optional) Display SNMPv3 target and, optionally, either target address or target parameter information.

users—(Optional) Display SNMPv3 user information.

Additional Information
To edit the default display of the show snmp v3 command, specify options in the show statement at the [editsnmpv3] hierarchy level.

Required Privilege Level
view

List of Sample Output
show snmp v3 on page 3858

Output Fields
Table 454 on page 3857 describes the output fields for the show snmp v3 command. Output fields are listed in the approximate order in which they appear.
Table 454: show snmp v3 Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access control</td>
<td>Information about access control:</td>
</tr>
<tr>
<td>Group</td>
<td>Group name for which the configured access privileges apply. The group, together with the context prefix and the security model and security level, forms the index for this table.</td>
</tr>
<tr>
<td>Context prefix</td>
<td>SNMPv3 context for which the configured access privileges apply.</td>
</tr>
<tr>
<td>Security model/level</td>
<td>Security model and security level for which the configuration access privileges apply.</td>
</tr>
<tr>
<td>Read view</td>
<td>Identifies the MIB view applied to SNMPv3 read operations.</td>
</tr>
<tr>
<td>Write view</td>
<td>Identifies the MIB view applied to SNMPv3 write operations.</td>
</tr>
<tr>
<td>Notify view</td>
<td>Identifies the MIB view applied to outbound SNMP notifications.</td>
</tr>
<tr>
<td>Engine</td>
<td>Information about local engine configuration:</td>
</tr>
<tr>
<td>Local engine ID</td>
<td>Identifier that uniquely and unambiguously identifies the local SNMPv3 engine.</td>
</tr>
<tr>
<td>Engine boots</td>
<td>Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed.</td>
</tr>
<tr>
<td>Engine time</td>
<td>Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized.</td>
</tr>
<tr>
<td>Max msg size</td>
<td>Maximum message size the sender can accommodate.</td>
</tr>
<tr>
<td>Engine ID</td>
<td>Information about engine ID:</td>
</tr>
<tr>

### Operational Commands: Analyzers and Port Mirroring
### show forwarding-options port-mirroring

#### Syntax

```
show forwarding-options port-mirroring
<terse | detail>
<instance-name>
```

#### Release Information

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

#### Description

Display current state of port-mirroring instances.

#### Options

- `terse | detail`—(Optional) Display the specified level of output.
- `instance-name`—(Optional) Display a single port-mirroring instance.

#### Required Privilege

- Level: `view`

#### Related Documentation

- [edit forwarding-options port-mirroring] Hierarchy Level on page 3700

#### List of Sample Output

- show forwarding-options port-mirroring terse on page 3860
- show forwarding-options port-mirroring detail on page 3860

#### Output Fields

Table 455 on page 3859 lists the output fields for the `show forwarding-options port-mirroring` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Name</td>
<td>Name of port-mirroring instance.</td>
<td>All levels</td>
</tr>
<tr>
<td>Instance Id</td>
<td>Instance identification number.</td>

</tbody>
</table>

Sample Output

show forwarding-options port-mirroring terse

```bash
user@switch> show forwarding-options port-mirroring terse
Instance Name: &global_instance
Instance Id: 1      State: up
inst1         2      up
```

show forwarding-options port-mirroring detail

```bash
user@switch> show forwarding-options port-mirroring detail
Instance Name: &global_instance
Instance Id: 1      State: up
Input parameters:
  Rate:      1
  Run-length:     0
  Maximum-packet-length: 0
Output parameters:
  Family: ethernet-switching  State: up     Destination: ge-0/0/10.0

Instance Name: inst1
Instance Id: 2      State: up
Input parameters:
  Rate:      1
  Run-length:     0
  Maximum-packet-length: 0
Output parameters:
  Family: ethernet-switching  State: down   Destination: ge-0/0/10.0
```
**show forwarding-options analyzer**

**Syntax**

```
show forwarding-options analyzer analyzer-name
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.
Hierarchy level [edit forwarding-options] introduced in Junos OS Release T3.2X50-D10 (ELS).

**Description**

Display information about analyzers configured for mirroring.

**Options**

`analyzer-name`—(Optional) Displays the status of a specific analyzer on the switch.

**Required Privilege Level**

view

**Related Documentation**

<tr>
<td>Ingress monitored interfaces</td>
<td>Displays interfaces for which traffic entering the interfaces is mirrored.</td>
</tr>
<tr>
<td>Ingress monitored VLANs</td>
<td>Displays VLANs for which traffic entering the VLAN is mirrored.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
user@switch> show forwarding-options analyzer
Analyzer name : employee-monitor
    Mirror rate : 1
    Maximum packet length : 0
    State : up
```
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
Output VLAN : default-switch/remote-analyzer

**Operational Commands: sFlow**
show sflow

Syntax

```
show sflow
  <collector>
  <interface>
```

Release Information
Command introduced in Junos OS Release 9.3 for EX Series switches.

Description
Display default sFlow technology configuration information.

Options

- **none**—Display default sFlow technology configuration information.
- **collector**—(Optional) Display standard status information about the specified sFlow collector.
- **interface**—(Optional) Display standard status information about the specified sFlow interface.

clear sflow collectors statistics

**Syntax**

```
clear sflow collectors statistics
```

**Release Information**

Command introduced in JUNOS Release 9.5 for EX Series switches.

**Description**

Clear the sFlow collector's statistics.

**Required Privilege**

**Level**

clear

**Related Documentation**

- show sflow collector on page 3867
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 3603

**Sample Output**

```
clear sflow collectors statistics
```

**Operational Commands: Ethernet OAM Connectivity Fault Management**
clear oam ethernet connectivity-fault-management delay-statistics

Syntax

```
clear oam ethernet connectivity-fault-management delay-statistics
maintenance-association maintenance-association-name
maintenance-domain maintenance-domain-name
<logical-system logical-system-name>
<one-way>
<two-way>
```

Release Information

- Command introduced in Junos OS Release 11.4 for EX Series switches.

Description

On MX Series routers and EX Series switches, clear ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM) delay statistics and ETH-DM frame counts.

Options

- **maintenance-association maintenance-association-name**—Clear ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance association.
- **maintenance-domain maintenance-domain-name**—Clear ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance domain.
- **logical-system logical-system-name**—(MX Series routers only) (Optional) Clear ETH-DM delay statistics and ETH-DM frame counts for the specified logical system.
- **one-way**—(Optional) Clear one-way ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance association, maintenance domain, or (on the routers only) logical system.
- **two-way**—(Optional) Clear two-way ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance association, maintenance domain, or (on the routers only) logical system.

maintenance-association maintenance-association-name
maintenance-domain maintenance-domain-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
sla-iterator sla-iterator
```

Release Information

Command introduced in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 13.2 for MX Series routers.

Description

Clear Ethernet Operation, Administration, and Maintenance (OAM) service-level agreement (SLA) iterator statistics. For MX Series routers, clear the SLA iterator statistics and proactive Ethernet synthetic loss measurement (ETH-SLM) statistics.

Options

```
maintenance-association maintenance-association-name—Name of the maintenance association.
maintenance-domain maintenance-domain-name—Name of the maintenance domain.
local-mep local-mep-id—(Optional) Identifier of the local MEP.
remote-mep remote-mep-id—(Optional) Identifier of the remote MEP.
sla-iterator sla-iterator—Name of the SLA iterator profile.
```

Cleared statistics of all CFM sessions
```
monitor ethernet delay-measurement

Syntax

monitorethernetdelay-measurement maintenance-domain md-name
maintenance-association ma-name (one-way | two-way) (remote-mac-address | mep remote-mep-id) <count count> <no-session-id-tlv> <priority 802.1p value> <size size> <wait time>

Release Information

Command introduced in Junos OS Release 11.4 for EX Series switches.

Description

Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +C to explicitly quit the monitorethernetdelay-measurement command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the switch initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the monitorethernetdelay-measurement command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

- **Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

- **Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options

- **count count**—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.

- **maintenance-association ma-name**—Name of an existing CFM maintenance association.

- **maintenance-domain md-name**—Name of an existing CFM maintenance domain.

- **mep remote-mep-id**—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
no-session-id-tlv—(Optional) Prevent insertion of the session ID TLV in the request frame.

one-way—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (IDM) frame and the time at which the receiver MEP receives the frame.

priority 802.1p value—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in nn:nn:nn:nn:nn:nn format. Multicast MAC addresses are not supported.

size size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

two-way—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.

wait time—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

monitor ethernet delay-measurement two-way (Invalid DMR Frames Received) on page 3876

Output Fields

The monitor ethernet delay-measurement command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

• Table 460 on page 3875 lists the run-time output fields for the monitor ethernet delay-measurement one-way command.
• Table 461 on page 3875 lists the run-time output fields for the monitor ethernet delay-measurement two-way command.
Output fields are listed in the approximate order in which they appear.

### Table 460: monitor ethernet delay-measurement one-way Output Fields

<table>
<thead>
<tr>
<th>Output Field Name</th>
<th>Output Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-way ETH-DM request to</td>
<td>Unicast MAC address of the remote peer MEP.</td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.</td>
</tr>
<tr>
<td>1DM Frames sent</td>
<td>PDU frames sent to the remote MEP in this ETH-DM session.</td>
</tr>
<tr>
<td>Packets transmitted</td>
<td>Total number of 1DM PDU frames sent to the remote MEP during this measurement session.</td>
</tr>
<tr>
<td>Average delay</td>
<td>Average two-way frame delay measured in this session.</td>
</tr>
<tr>
<td>Average delay variation</td>
<td>Average frame jitter measured in this session.</td>
</tr>
<tr>
<td>Best case delay</td>
<td>Lowest two-way frame delay measured in this session.</td>
</tr>
<tr>
<td>Worst case delay</td>
<td>Highest two-way frame delay measured in this session.</td>
</tr>
</tbody>
</table>

**NOTE:** For one-way delay measurement, these CLI output fields display NA (“not applicable”) at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

show oam ethernet connectivity-fault-management delay-statistics
  <count entry-count>
  <local-mep local-mep-id>
  maintenance-association ma-name
  maintenance-domain md-name
  <remote-mep remote-mep-id>

**Release Information**
Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 11.4 for EX Series switches.

**Description**
On MX Series routers with Ethernet interfaces on Dense Port Concentrators (DPCs), display ETH-DM delay statistics.

On EX Series switches, display delay measurement results.

**Options**
- **count entry-count**—(Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.
- **local-mep local-mep-id**—(Optional) Numeric identifier of the local MEP. On MX Series routers, the range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.
- **maintenance-association ma-name**—Name of an existing CFM maintenance association.
- **maintenance-domain md-name**—Name of an existing connectivity fault management (CFM) maintenance domain.
- **remote-mep remote-mep-id**—(Optional) Numeric identifier of the remote MEP. On MX Series routers, the range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.

show oam ethernet connectivity-fault-management forwarding-state

Syntax
`show oam ethernet connectivity-fault-management forwarding-state`  
`interface interface-name`  
`<brief | detail | extensive>`

Release Information
Command introduced in Junos OS Release 10.2 for EX Series switches.

Description
Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

Options
-  `interface interface-name`—Display forwarding state information for the specified Ethernet interface only.
-  `brief | detail | extensive`—(Optional) Display the specified level of output.

Required Privilege
-  view

Related Documentation

Release Information

Command introduced in Junos OS Release 10.2 for EX Series switches.

Description

Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

Options

- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **ethernet-interface-name**—(Optional) Display CFM information only for CFM entities attached to the specified Ethernet interface.
- **level md-level**—(Optional) Display CFM information for CFM identities enclosed within a maintenance domain of the specified level.

Required Privilege

- **view**

**show oam ethernet connectivity-fault-management path-database**

**Syntax**  
```
show oam ethernet connectivity-fault-management path-database host
maintenance-association ma-name maintenance-domain md-name mac-address
```

**Release Information**  
Command introduced in Junos OS Release 10.2 for EX Series switches.

**Description**  
Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

**Options**  
- `mac-address`—Display connectivity fault management path database information for the specified MAC address of the remote host.
- `maintenance-association ma-name`—Display connectivity fault management path database information for the specified maintenance association.
- `maintenance-domain md-name`—Display connectivity fault management path database information for the specified maintenance domain.

**Required Privilege**  
`view`

**Related Documentation**

**Release Information**

Command introduced in Junos OS Release 10.2 for EX Series switches.

**Description**

Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**Options**

- `maintenance-association ma-name`—Display connectivity fault management information for the specified maintenance association.
- `maintenance-domain domain-name`—Display connectivity fault management information for the specified maintenance domain.
- `local-mep local-mep-id`—(Optional) Display connectivity fault management information for the specified local MEP only.
- `remote-mep remote-mep-id`—(Optional) Display connectivity fault management information for the specified remote MEP only.

**Required Privilege**

**show oam ethernet connectivity-fault-management mip**

**Syntax**

```
show oam ethernet connectivity-fault-management mip <qualifier>
```

**Release Information**
Command introduced in Junos OS Release 10.2 for EX Series switches.

**Description**
Display all the maintenance association intermediate points (MIPs) created in the system. Specify qualifiers to display specific MIPs.

**Options**
- `qualifier` - (Optional) Display the specified MIP.

**Required Privilege**
- View

**Related Documentation**

```
show oam ethernet connectivity-fault-management sla-iterator-statistics

Syntax

```
show oam ethernet connectivity-fault-management sla-iterator-statistics
maintenance-domain md-name
maintenance-association ma-name
sla-iterator sla-iterator
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Release Information

Command introduced in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 12.2 for ACX Series routers.
Command introduced in Junos OS Release 13.2 for MX Series routers (not on MPC3E Hyperion cards).

Description

Display the Ethernet Operation, Administration, and Maintenance (OAM) service-level agreement (SLA) iterator statistics.

Options

- `maintenance-domain md-name`—Name of an existing connectivity fault management (CFM) maintenance domain.
- `maintenance-association ma-name`—Name of an existing CFM maintenance association.
- `sla-iterator sla-iterator`—Name of the iterator profile.
- `local-mep local-mep-id`—(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8191.
- `remote-mep remote-mep-id`—(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192.

Operational Commands: Ethernet OAM Link Fault Management
**show oam ethernet link-fault-management**

**Syntax**

```
show oam ethernet link-fault-management
  <brief | detail>
  <interface-name>
```

**Release Information**

Command introduced in Junos OS Release 9.4 for EX Series switches.

**Description**

Displays Operation, Administration, and Maintenance (OAM) link fault management (LFM) information for Ethernet interfaces.

**Options**

- `brief | detail`—(Optional) Display the specified level of output.
- `interface-name`—(Optional) Display link fault management information for the specified Ethernet interface only.

**Required Privilege**

View

Operational Commands: Uplink Failure Detection
**show uplink-failure-detection**

**Syntax**

```
show uplink-failure-detection
<group group-name>
```

**Release Information**

Command introduced in Junos OS Release 11.1 for EX Series switches.

**Description**

Display information about the uplink-failure-detection group, the member interfaces, and their status.

**Options**

- `none`—Display information about all groups configured for uplink failure detection.
- `group group-name`—(Optional) Display information about the specified group only.

**Required Privilege**

```
view
```

**Related Documentation**

- Configuring Interfaces for Uplink Failure Detection (CLI Procedure) on page 3618

**List of Sample Output**

```
show uplink-failure-detection
```

```
Group             : group1
Uplink            :  ge-0/0/0*
Downlink          :  ge-0/0/1*
Failure Action    :  Inactive
```

**Output Fields**

Table 470 on page 3912 lists the output fields for the `show uplink-failure-detection` command. Output fields are listed in the approximate order in which they appear.

**Table 470: show uplink-failure-detection Output Fields**

```
Group : group2
Uplink : ge-0/0/3.0
Downlink : ge-0/0/4.0
Failure Action : Active
Troubleshooting Port Mirroring Configuration Error Messages

Problem
In an analyzer configuration, if the VLAN to which mirrored traffic is sent contains more than one member interface, the following error message is displayed in the CLI when you commit the analyzer configuration and the commit fails:

```
Multiple interfaces cannot be configured as a member of Analyzer output VLAN <vlan name>
```

Solution
You must direct the mirrored traffic to a VLAN that has a single member interface. You can do this by completing either of these tasks:

- Reconfigure the existing VLAN to contain a single member interface. You can choose this method if you want to use the existing VLAN.
- Create a new VLAN with a single member interface and associate the VLAN with the analyzer.

To reconfigure the existing VLAN to contain only one member interface:

1. Remove member interfaces from the VLAN repeatedly by using either the `delete vlan` command or the `delete interface` command until the VLAN contains a single member interface:
   ```
   [edit]
   user@switch# delete vlan vlan-id interface interface-name
   ```
• [edit]
  user@switch# delete interface interface-name unit 0 family family-name vlan member vlan-id

2. (Optional) Confirm that the VLAN contains only one interface:

[edit]
user@switch# show vlans vlan-name
The output for this command must display only one interface.

To create a new VLAN with a single member interface:

1. Configure a VLAN to carry the mirrored traffic:

[edit]
user@switch# set vlans vlan-name

2. Associate an interface with the VLAN:

[edit]
user@switch# set interfaces interface-name unit logical-unit-number family family-name vlan members vlan-name

3. Associate the VLAN with the analyzer:

[edit ethernet-switching-options]
user@switch# set analyzer analyzer-name output vlan vlan-name

Operational Commands
show pfe statistics bridge

Syntax

```
show pfe statistics bridge
<fpc slot>
```

Release Information
Command introduced in Junos OS Release 12.1 for EX Series switches.

Description
Display information about the number of packets discarded in the ingress pipeline of the Packet Forwarding Engine, packets discarded because of egress filtering or congestion filtering, number of control packets, and general counters for dropped packets. You can use this information to inform troubleshooting investigations.

Options
- **none**—Display bridge counter statistics for all Flexible PIC Concentrator (FPC) slots.
- **fpc slot**—(Optional) Display bridge counter statistics for a specific FPC slot.

Required Privilege
- **view**

</tr>
</tbody>
</table>
### Field Name | Field Description
--- | ---
**Egress Counters** | Information about egress counters:
- **Unicast**—Number of unicast packets transmitted.
- **Multicast**—Number of multicast packets transmitted.
- **Broadcast**—Number of broadcast packets transmitted.
- **Egress Filtered**—Number of egress-filtered packets (regardless of port, priority, or mode).
- **TailDrop**—Number of packets filtered because of egress queue congestion.
- **Forward Restrict**—Number of packets filtered because of egress forward restrictions.
- **Congestion Filtered**—Number of packets filtered because of transmit queue (TxQ) congestion.
- **Control Packets**—Number of control packets (sent to CPU, received from CPU, and sent to analyzer).

**Drop Counters** | Information about drop counters:
- **Drop Mode**—Count mode of the counter.
- **Drop Counter**—Counter value.

**General Counters** | Information about general counters:
- **Drop Mode**—Count mode of the counter.
- **Drop Counter**—Counter value.
- **Source Not Learnt**—Number of source addresses that were not learnt because of internal congestion.

**MUX PFE** | Information about multiplexer PFE for oversubscribed cards:
- **Drop Mode**—Count mode of the counter.
- **Drop Count**—Counter value.

CHAPTER 70

Overview

- Power over Ethernet Overview on page 3925

Power over Ethernet Overview

- Understanding PoE on EX Series Switches on page 3925

Understanding PoE on EX Series Switches

Power over Ethernet (PoE) permits electric power, along with data, to be passed over a copper Ethernet LAN cable. Powered devices—such as voice over IP (VoIP) telephones, wireless access points, video cameras, and point-of-sale devices—that support PoE can receive power safely from the same access ports that are used to connect personal computers to the network.

This topic describes PoE on Juniper Networks EX Series Ethernet Switches:

- PoE, PoE+, and Enhanced PoE on page 3925
- PoE Power Allocation on page 3927

PoE, PoE+, and Enhanced PoE

PoE was first defined in the IEEE 802.3af standard. In this standard, the amount of power that can be supplied to a powered device is limited to 15.4 W. A later standard, IEEE 802.3at, defined PoE+, which increases the amount of power to 30 W. The PoE+ standard provides support for legacy PoE devices—an IEEE 802.3af powered device can operate normally when connected to IEEE 802.3at (PoE+) power sourcing equipment.

Beginning in Juniper Networks Junos operating system (Junos OS) Release 11.1, Juniper Networks provides enhanced PoE on EX3200 and EX4200 switches. Enhanced PoE is a Juniper Networks extension to the IEEE 802.3af standard that allows power of up to 18.6 W per PoE port.

Table 472 on page 3926 lists EX Series switches and line cards and the version of PoE they support.
Table 472: PoE Version Support

<table>
<thead>
<tr>
<th>Switch or Line Card</th>
<th>PoE Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>EX2200 switch</td>
<td>PoE+ (IEEE 802.3at)</td>
</tr>
<tr>
<td>(EX2200-C-12P-2G, EX2200-24P-4G, EX2200-48P-4G models)</td>
<td></td>
</tr>
<tr>
<td>NOTE: Starting with Junos OS Release 12.2R1, PoE commands are enabled on all non-PoE-capable EX2200 switch models. The PoE commands do not provide any meaningful information on standalone non-PoE-capable switch models. However, in an EX2200 Virtual Chassis, you can execute PoE commands from a non-PoE-capable master switch to configure PoE on PoE-capable Virtual Chassis members.</td>
<td></td>
</tr>

</tr>
<tr>
<td>EX8200-2XS-40P (40-port PoE+ with 4-port SFP and 2-port SFP+) line card</td>
<td>PoE+ (IEEE 802.3at)—Ports 0 through 11, and PoE (IEEE 802.3af)—remaining PoE ports.</td>
</tr>
<tr>
<td>EX8200-48PL (2-port SFP+ and 48-port PoE+ 20 Gbps) line card</td>
<td></td>
</tr>
</tbody>
</table>

NOTE: This topic and its related topics use the term PoE as a generic term to refer to PoE, PoE+, and enhanced PoE.
PoE Power Allocation

A switch or line card that supports PoE has a PoE controller that keeps track of the PoE power consumption on the switch or line card, and allocates power to the PoE ports. The following factors determine how the PoE controller allocates power to the PoE ports:

- PoE Power Budget on page 3927
- PoE Interface Power Allocation on page 3931
- PoE Interface Power Priority on page 3933

PoE Power Budget

The PoE power budget is the total amount of power available for the PoE controller to allocate to the PoE ports. The PoE controller cannot exceed its PoE power budget and does not allocate power to a PoE port if the allocation would exceed the PoE power budget.

How the PoE power budget is determined depends on the switch model:

- PoE Power Budget on EX2200, EX3200, EX3300, EX4200, and EX4300 Switches on page 3927
- PoE Power Budget on EX6200 and EX8200 Switches on page 3930

PoE Power Budget on EX2200, EX3200, EX3300, EX4200, and EX4300 Switches

The PoE power budget on EX2200, EX3200, EX3300, EX4200, and EX4300 switches depends on the switch model and the capacities of the power supplies installed. To find the PoE power budget for each switch model, see Table 473 on page 3928 for EX2200 switch models, Table 474 on page 3928 for EX3200 switch models, Table 475 on page 3928 for EX3300 switch models, Table 476 on page 3929 for EX4200 switch models, and Table 477 on page 3929 for EX4300 switch models.

Use the `show poe controller` command to display a switch’s PoE power budget.

If your switch supports power supplies of different capacities, keep the following points in mind:

- If you change your existing power supply to a lower-capacity power supply, the PoE power budget might no longer be sufficient to power all the PoE ports on the switch.
- If your switch supports redundant power supplies and you have installed power supplies of different capacities, the PoE power budget is based on the wattage of the lower-capacity power supply.
- You cannot increase the number of PoE-capable ports on a switch by installing a power supply that has a higher capacity.

Table 473 on page 3928 lists the EX2200 switch models, number of PoE-enabled ports, power supply ratings, and PoE power budgets.
<table>

**PoE Power Budget on EX6200 and EX8200 Switches**

For EX6200 and EX8200 switches, each line card that supports PoE has its own PoE controller and PoE power budget. The PoE power budget is allocated to the line card by the switch's power management, while PoE power is allocated to the ports on the line card by the PoE controller. Because EX6200 and EX8200 switches can differ in the number and capacity of power supplies installed and in the number and types of line cards installed, the amount of power available for PoE power can vary for different switches of the same model.

Power management allocates PoE power to line cards that support PoE only after it has allocated base power to and powered on all line cards. It then allocates the remaining power to the PoE power budgets of PoE line cards in order of line card power priority. (In a default configuration, power priority is determined by the line card slot number, with slot 0 having the highest priority.) If the remaining power is insufficient to provide PoE power to all PoE line cards, a low-priority line card might receive no PoE power or partial PoE power.

By default, power management allocates enough PoE power to a line card to power all PoE ports at their maximum supported power. If the powered devices connected to that line card require less power than that, you can configure a smaller PoE power budget for the line card. For example, power management normally allocates 915 W of PoE power to a 48-port PoE+ 20 Gbps (EX8200-48PL) line card. If the powered devices connected to that line card consume no more than a total of 250 W, you can set the PoE power budget for the line card to 250 W. Doing so frees up 665 W, which then can be used to fulfill the PoE power needs of lower-priority line cards.

You can also configure the power priority of the PoE ports on a line card. If power management is unable to allocate enough power to a line card to meet its PoE power budget, the line card PoE controller will turn off power to PoE ports in reverse priority order as required to meet the reduced power allocation.

Power management adjusts PoE power allocations as power availability and demand in a switch changes. As a general rule, power management allocates power to power on line cards before it allocates PoE power. For example, if you add a line card and there is insufficient power available to power it on, power management reduces the PoE power it provides to line cards, starting with the lowest priority line card, until it frees up enough power to power on the new line card. When power management reduces the PoE power budget for a line card because of insufficient power, it logs a message in the system log.

Note that the actual power consumed by the powered devices does not affect power management's power allocation for a line card. If you have set the PoE budget for a line card to 500 W, power management allocates 500 W even if the powered devices are consuming less power than that. Similarly, the PoE power budget is not increased if you add additional powered devices: if the powered devices require more than the 500 W PoE budget that you have configured, lower-priority devices do not receive power.

You can display the switch's power budget maintained by power management, including its PoE power allocations, by using the `show chassis power-budget-statistics` command. You can also display the PoE power budget for each line card in a switch by using the `show poe controller` command.
For more information about how power management allocates power, including PoE power, see “Understanding Power Management on EX Series Switches” on page 2213.

**PoE Interface Power Allocation**

You can configure how the switch determines the maximum power for a PoE interface and how power is allocated to the PoE interfaces. If the power consumption of a powered device exceeds the maximum power allocated to the interface, the switch turns off power to the interface.

These PoE power allocation methods are available:

- LLDP Power Negotiation on page 3931
- Class PoE Management Mode on page 3931
- Static PoE Management Mode on page 3932

**LLDP Power Negotiation**

Link Layer Discovery Protocol (LLDP) power negotiation allows the PoE controller to dynamically allocate power to LLDP-enabled powered devices based on their power needs. The PoE controller allocates to an interface only the power currently required by the connected powered device, and it can allocate the power in small increments.

When the PoE management mode is set to **class** and LLDP is enabled (both are default settings), LLDP power negotiation is enabled by default. If you disable LLDP power negotiation or the powered device does not support it, the switch uses the class of the powered device to determine the maximum power for interfaces.

**NOTE:** LLDP power negotiation is not supported on EX3200 and EX4200 (except EX4200 PX models) switches.

**Class PoE Management Mode**

In **class** PoE management mode, the maximum power for an interface is determined by the class of the connected powered device. Table 478 on page 3931 lists the classes of powered devices and associated power levels.

<table>
<thead>
<tr>
<th>Standard</th>
<th>Class</th>
<th>Maximum Power Delivered by PoE Port</th>
<th>Power Range of Powered Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEEE 802.3af (PoE) and IEEE 802.3at (PoE+)</td>
<td>0</td>
<td>15.4 W</td>
<td>0.44 through 12.95 W</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>4.0 W</td>
<td>0.44 through 3.84 W</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>7.0 W</td>
<td>3.84 through 6.49 W</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>15.4 W</td>
<td>6.49 through 12.95 W</td>
</tr>
<tr>
<td>IEEE 802.3at (PoE+)</td>
<td>4</td>
<td>30.0 W</td>
<td>12.95 through 25.5 W</td>
</tr>
</tbody>
</table>
Because of line loss, the power range of the powered device is less than the maximum power delivered at the PoE port for each class. Line loss is influenced by cable length, quality, and other factors and is typically less than 16 percent of the maximum power.

The powered device communicates to the PoE controller which class it belongs to when it is connected. The PoE controller then allocates to the interface the maximum power required by the class (see Table 478 on page 3931). It does not allocate power to an interface until a powered device is connected. Class 0 is the default class for powered devices that do not provide class information. Class 4 powered devices are supported only by PoE ports that support IEEE 802.3at (PoE+).

By default, when class PoE management mode and LLDP are enabled, LLDP power negotiation is also enabled on supported switches. See “LLDP Power Negotiation” on page 3931 for more information.

**Static PoE Management Mode**

In the static PoE management mode, you specify the maximum power for each PoE interface. The PoE controller then allocates this amount of power to the interface from its total budget. For example, if you specify a maximum value of 8.0 W for ge-0/0/3, the PoE controller allocates 8.0 W out of its total power budget for this interface. This amount is allocated to the interface whether or not a powered device is connected to the interface or whether the connected powered device uses less power than 8.0 W.

Because of line loss, the power received by the powered device can be less than the power available at the PoE port. Table 479 on page 3932 shows the maximum power available at a PoE port and the resulting power guaranteed to the powered device.

**Table 479: Maximum Power Per Port in Static Mode**

<td>15.4 W (remaining PoE ports)</td>
<td>12.95 W</td>
</tr>
</tbody>
</table>
**PoE Interface Power Priority**

You can configure a PoE interface to have either a high or a low power priority. The power priority determines which interfaces receive power if PoE power demands are greater than the PoE power budget. If the total power allocated for all interfaces exceeds the switch budget, PoE power to lower-priority interfaces is turned off and the power allocated to those interfaces drops to 0. Thus you must set interfaces that connect to critical powered devices, such as security cameras and emergency phones, to high priority.

Among PoE interfaces that have the same assigned priority, power priority is determined by the port number, with lower-numbered ports having higher priority.

For EX6200 and EX8200 switches, interface power priority determines the relative priority of the interfaces on a line card, not on the switch as a whole. The relative priority of interfaces residing on different line cards is determined by line card priority. For example, if line card 1 has a higher power priority than line card 2 and a power shortage occurs, power is removed from the PoE interfaces in this order:

- Low-priority interfaces on line card 2
- High-priority interfaces on line card 2
- Low-priority interfaces on line card 1
- High-priority interfaces on line card 1

You can manually configure PoE interface power priority, or you can enable LLDP power priority, which assigns each interface the power priority provided by the connected LLDP-enabled powered device. Table 480 on page 3933 describes how the switch converts LLDP power priorities to switch power priorities.

### Table 480: LLDP Power Priority Conversion

<table>
<thead>
<tr>
<th>LLDP Power Priority</th>
<th>Switch Power Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical, High</td>
<td>High</td>
</tr>
<tr>
<td>Low</td>
<td>Low</td>
</tr>
</tbody>
</table>

**NOTE:** LLDP power priority requires LLDP power negotiation to be enabled, which is enabled by default when the PoE management option is set to class.

**NOTE:** LLDP power priority is not supported on EX3200 and EX4200 (except EX4200 PX model) switches.

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices and allow you to plug in devices that require both network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and some IP cameras.

You do not need to configure PoE unless you wish to modify the default values or disable PoE on a specific interface.

This example describes a default configuration of PoE interfaces on an EX Series switch:

- Requirements on page 3935
- Overview and Topology on page 3936
- Configuration on page 3936
- Verification on page 3937

Requirements

This example uses the following software and hardware components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch that supports PoE

Before you configure PoE, be sure you have:
• Performed the initial switch configuration. See Connecting and Configuring an EX Series Switch (CLI Procedure) or Connecting and Configuring an EX Series Switch (J-Web Procedure) for details.

Overview and Topology

The topology used in this example consists of a switch that has 24 ports. Eight of the ports support PoE (IEEE 802.3af), which means they provide both network connectivity and electric power for powered devices such as VoIP telephones, wireless access points, and IP security cameras that require 12.95 W or less. The remaining 16 ports provide only network connectivity. You use the standard ports to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers. Table 481 on page 3936 details the topology used in this configuration example.

Table 481: Components of the PoE Configuration Topology

Configuration

To enable the default PoE configuration on the switch:

CLI Quick Configuration

To quickly enable the default configuration on the switch:

Simply connect the powered devices to the PoE ports.

Step-by-Step Procedure

To use the PoE interfaces with default values:

1. Make sure the switch is powered on.
2. Connect the wireless access point to interface ge-0/0/0.
3. Connect the Avaya phones to interfaces ge-0/0/1 through ge-0/0/7.
### Verification

To verify that PoE interfaces have been created and are operational, perform this task:

- **Verifying That the PoE Interfaces Have Been Created on page 3937**

### Purpose

Verify that the PoE interfaces have been created on the switch.

### Action

List all the PoE interfaces configured on the switch:

```bash
user@switch> show poe interface
```

<table>

</tbody>
</table>

### Meaning

The `show poe interface` command lists PoE interfaces configured on the switch, with their status, priority, power consumption, and class. This output shows that eight interfaces have been created with default values and are consuming power at the expected rates.

### Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on an EX Series Switch on page 3937
- Configuring PoE (CLI Procedure) on page 3942
- Troubleshooting PoE Interfaces on page 3991

### Example: Configuring PoE Interfaces with Different Priorities on an EX Series Switch

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices. These ports allow you to plug in devices that need both network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and some IP cameras.

By default, PoE ports on EX Series switches are set to low power priority. You can configure a PoE port to have a high power priority setting. If a situation arises where there is not sufficient power for all the PoE ports, the available power is directed to the higher priority ports, while power to the lower priority ports is shut down as needed. Thus you should set ports that connect to security cameras, emergency phones, and other high priority powered devices to high priority.

This example describes how to configure a few high priority PoE interfaces.

- Requirements on page 3938
- Overview and Topology on page 3938
Requirements

This example uses the following software and hardware components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch that supports PoE

Before you configure PoE, be sure you have:

- Performed the initial switch configuration. See Connecting and Configuring an EX Series Switch (CLI Procedure) or Connecting and Configuring an EX Series Switch (J-Web Procedure) for details.

Overview and Topology

The topology used in this example consists of a switch that has 24 ports. Eight of the ports support PoE (IEEE 802.3af), which means they provide both network connectivity and electric power for powered devices such as VoIP telephones, wireless access points, and IP security cameras that require 12.95 W or less. The remaining 16 ports provide only network connectivity. You use the standard ports to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers.

Table 482 on page 3938 details the topology used in this configuration example.

Table 482: Components of the PoE Configuration Topology

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>Switch with 24 Gigabit Ethernet ports: 8 PoE interfaces (ge-0/0/0 through ge-0/0/7) and 16 non-PoE interfaces (ge-0/0/8 through ge-0/0/23)</td>
</tr>

<td>ge-0/0/21 through ge-0/0/23</td>
</tr>
</tbody>
</table>
Configuration

To configure PoE interfaces:

**CLI Quick Configuration**

By default, PoE interfaces are created for all PoE ports and PoE is enabled. The default priority for PoE interfaces is low.

To quickly set some interfaces to high priority and to include descriptions of the interfaces, copy the following commands and paste them into the switch terminal window:

```bash
[edit]
set poeinterface ge-0/0/1 priority high telemetries
set poeinterface ge-0/0/2 priority high telemetries
set poeinterface ge-0/0/3 priority high telemetries
set poeinterface ge-0/0/4 priority high telemetries
set interfaces ge-0/0/0 description "wireless access point"
set interfaces ge-0/0/1 description "security camera front door"
set interfaces ge-0/0/2 description "security camera back door"
set interfaces ge-0/0/3 description "emergency phone"
set interfaces ge-0/0/4 description "Executive Office VoIP phone"
set interfaces ge-0/0/5 description "staff VoIP phone"
set interfaces ge-0/0/6 description "staff VoIP phone"
set interfaces ge-0/0/7 description "staff VoIP phone"
```

**Step-by-Step Procedure**

To configure PoE interfaces with different priorities:

1. Set the interfaces connected to high priority powered devices to high priority. Include the telemetries statement for the high priority interfaces, thus enabling the logging of power consumption on those interfaces:

   ```bash
   [edit poe]
   user@switch# set interface ge-0/0/1 priority high telemetries
   user@switch# set interface ge-0/0/2 priority high telemetries
   user@switch# set interface ge-0/0/3 priority high telemetries
   user@switch# set interface ge-0/0/4 priority high telemetries
   ```

2. Provide descriptions for the PoE interfaces:

   ```bash
   [edit interfaces]
   user@switch# set ge-0/0/0 description "wireless access point"
   user@switch# set ge-0/0/1 description "security camera front door"
   user@switch# set ge-0/0/2 description "security camera back door"
   user@switch# set ge-0/0/3 description "emergency phone"
   user@switch# set ge-0/0/4 description "Executive Office VoIP phone"
   user@switch# set ge-0/0/5 description "staff VoIP phone"
   user@switch# set ge-0/0/6 description "staff VoIP phone"
   user@switch# set ge-0/0/7 description "staff VoIP phone"
   ```

3. Connect the wireless access point to interface ge-0/0/0. This interface uses the default PoE settings.

4. Connect the two security cameras to interfaces ge-0/0/1 and ge-0/0/2. These interfaces are set to high priority with telemetries enabled.

5. Connect the emergency VoIP phone to interface ge-0/0/3. This interface is set to high priority with telemetries enabled.
6. Connect the Executive Office VoIP phone to interface **ge-0/0/4**. This interface is set to high priority with telemetries enabled.

7. Connect the staff VoIP phones to **ge-0/0/5**, **ge-0/0/6**, and **ge-0/0/7**. These interfaces use the default PoE settings.

**Results**

Check the results of the configuration:

```
[edit]
user@switch# show interfaces { 
  ge-0/0/0 { 
    description "wireless access point"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
  ge-0/0/1 { 
    description "security camera front door"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
  ge-0/0/2 { 
    description "security camera back door"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
  ge-0/0/3 { 
    description "emergency phone"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
  ge-0/0/4 { 
    description "Executive Office VoIP phone"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
  ge-0/0/5 { 
    description "staff VoIP phone"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
  ge-0/0/6 { 
    description "staff VoIP phone"; 
    unit 0 { 
      family ethernet-switching; 
    } 
  } 
```
ge-0/0/7 {
    description "staff VoIP phone";
    unit 0 {
        family ethernet-switching;
    }
}
}
poe {
    interface all;
    interface ge-0/0/1 {
        priority high;
        telemetries;
    }
    interface ge-0/0/2 {
        priority high;
        telemetries;
    }
    interface ge-0/0/3 {
        priority high;
        telemetries;
    }
    interface ge-0/0/4 {
        priority high;
        telemetries;
    }
}

Verification

To verify that PoE interfaces have been created and are operational, perform the following tasks:

- Verifying That the PoE Interfaces Have Been Created with the Correct Priorities on page 3941

Verifying That the PoE Interfaces Have Been Created with the Correct Priorities

Purpose

Verify that the PoE interfaces on the switch are now set to the correct priority settings.

Action

List all the PoE interfaces configured on the switch:

```

Meaning

The `show poe interface` command lists PoE interfaces configured on the switch, with their status, priority, power consumption, and class. This output shows that eight PoE interfaces
are enabled. Interfaces ge-0/0/1 through ge-0/0/4 are configured as priority high. The remaining PoE interfaces are configured with the default priority value of low.

Configuration Tasks
- Configuring PoE (CLI Procedure) on page 3942
- Configuring PoE (J-Web Procedure) on page 3948

Configuring PoE (CLI Procedure)

Power over Ethernet (PoE) ports on EX Series switches supply electric power over the same ports that are used to connect network devices. These ports allow you to plug in devices that require both network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and some IP cameras.

This topic describes:
- PoE Configurable Options on page 3942
- Configuring the PoE Controller on EX2200, EX3200, EX3300, EX4200, and EX4300 Switches on page 3945
- Configuring the PoE Controllers on EX6200 and EX8200 Switches on page 3946
- Configuring PoE Interfaces on page 3947

PoE Configurable Options

For EX Series switches that support PoE ports, the factory default configuration enables PoE on the PoE-capable ports, with default settings in effect. You might not have to do any additional configuration if the default settings work for you. Table 483 on page 3942 shows the configurable PoE options and their default settings for the PoE controller and for the PoE interfaces.

NOTE: On EX8200 switches, the factory default configuration enables PoE on all interfaces starting at Junos OS Release 11.2. Switches that have been upgraded to Release 11.2 from a previous release might not have PoE enabled by default. To enable PoE on all PoE-capable ports on a switch, use the set poe interface all configuration command.

Table 483: Configurable PoE Options and Default Settings (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| guard-band      | 0 W                          | Reserves a specified amount of power from the PoE power budget to be used in the case of a spike in PoE power consumption:  
• Up to 15 W on EX6200 and EX8200 switches  
• Up to 19 W on all other switches |
| lldp-priority   | Not included in default configuration | When included in the configuration, assigns interfaces the power priority provided by the connected powered device by using Link Layer Discovery Protocol (LLDP) power negotiation rather than the power priority configured on the switch interface. Requires LLDP power negotiation to be enabled. |
| management      | **class**                    | Sets the PoE power management mode for the switch or line card. The power management mode determines how power to a PoE interface is allocated:  
• **class**—In this mode, the power allocated to a PoE interface is determined in one of two ways:  
  • If LLDP power negotiation is enabled, the PoE controller allocates PoE power by using LLDP power negotiation, which allows the PoE controller to dynamically allocate power to LLDP-enabled devices based on their power needs. LLDP power negotiation is enabled by default on supported switches when the `management` option is set to `class`. For information about configuring LLDP power negotiation, see “Configuring LLDP (CLI Procedure)” on page 1745.  
  • If LLDP power negotiation is disabled or not supported on the powered device or the switch, the maximum power delivered by an interface is determined by the class of the connected powered device. If there is no powered device connected, standard 15.4W power is allocated on the interface.  
• **static**—The maximum power delivered by an interface is statically configured and is independent of the class of the connected powered device. The maximum power is allocated to the interface even if a powered device is not connected. |
| maximum-power   | 792 W for the EX8200-2XS-40P (40-port PoE+ with 4-port SFP and 2-port SFP+) line card  
915 W for the EX8200-48PL (48-port PoE+ 20 Gbps) line card  
1440 W for the EX6200-48P (48-port PoE+) line card | (EX6200 and EX8200 switches only) Sets the PoE power budget for the line card:  
• 37 W through 792 W for the EX8200-2XS-40P line card  
• 37 W through 915 W for the EX8200-48PL line card  
• 37 W through 1440 W for the EX6200-48P line card |
| notification-control | Not included in default configuration | When included in the configuration, enables the PoE controller to send PoE SNMP traps. |

Interface Options
### Table 483: Configurable PoE Options and Default Settings (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>af-mode</strong></td>
<td>Not included in default</td>
<td>(EX6200 switches only) When included in the configuration, restricts a PoE interface to supporting IEEE 802.3af only. The maximum power that can be delivered by the PoE interface is 15.4 W.</td>
</tr>
<tr>
<td><strong>disable (Power over Ethernet)</strong></td>
<td>Not included in default</td>
<td>When included in the configuration, disables PoE on the interface. The interface maintains network connectivity but no longer supplies power to a connected powered device. Power is not allocated to the interface.</td>
</tr>
</tbody>
</table>
| **maximum-power (Interface)** | 30.0 W for interfaces that support PoE+ (IEEE 802.3at) and 15.4 W for interfaces that support PoE (IEEE 802.3af) | Sets the maximum power that can be delivered by a PoE interface when the power management mode is static:  
  • Up to 30 W for EX2200, EX3300, EX4200, EX4300, EX6200, and EX8200 switches  
  • Up to 18.6 W for EX3200 switches  
  This setting is ignored if the power management mode is class.  

**NOTE:** The maximum-power setting permitted by the CLI might be greater than the maximum power a given PoE port can deliver. For example, the CLI permits you to set any port on an EX8200 line card to 30 W; however, only ports 0 through 11 support 30 W. Similarly, the CLI permits you to set any port on an EX4200 switch to 30 W, but some EX4200 models support only 18.6 W per port. If you configure a maximum-power value that is greater than the maximum power supported by a port, the power allocated to the port will be the maximum supported. |
| **priority (Power over Ethernet)** | low                            | Sets an interface’s power priority to either low or high. If power is insufficient for all PoE interfaces, the PoE power to low priority interfaces is shut down before power to high priority interfaces is shut down. Among interfaces that have the same assigned priority, the power priority is determined by port number, with lower-numbered ports having higher priority.  
  If LLDP power priority is enabled, the switch assigns each interface the power priority provided by the connected LLDP-enabled powered device rather than the interface’s configured priority.  
  On EX6200 and EX8200 switches, priority determines the interface’s power priority relative to the other interfaces on the line card, not the interfaces on the switch as a whole. If power management cannot provide the line card with its full PoE power budget, PoE power to interfaces with low priority is shut down first. |
| **telemetries**            | Not included in default        | When included in the configuration, enables the logging of power consumption records on an interface. Logging occurs every 5 minutes for 1 hour unless you specify a different value for interval (Power over Ethernet) or duration. |
Configuring the PoE Controller on EX2200, EX3200, EX3300, EX4200, and EX4300 Switches

To configure the PoE controller on EX2200, EX3200, EX3300, EX4200, and EX4300 switches:

- To change the management mode or to configure a guard band setting for a standalone switch or for all members of an EX3300 Virtual Chassis, an EX4200 Virtual Chassis, an EX4300 Virtual Chassis, or a mixed EX4200 and EX4500 Virtual Chassis that supports PoE:

  [edit]
  user@switch# set poe management mode guard-band watts

  For example, to set the management mode to static and to configure a guard band of 15 W:

  [edit]
  user@switch# set poe management static guard-band 15

  **NOTE:** If the PoE power budget for the switch is insufficient to provide maximum power to all the PoE ports, we recommend that you do not change the management mode from class to static. If you change the power management mode to static and do not change the other default settings, the PoE controller allocates maximum power to the PoE ports in the order of port number, which means PoE will be disabled on higher-numbered ports when the PoE power budget runs out.

  In class mode, on the other hand, the PoE controller does not allocate power to a port until a powered device is connected. The class of the connected device determines the amount of power allocated. Thus in class mode, any PoE port can be used to power a device and all the PoE ports on the switch can be used as long as the combined power demand does not exceed the PoE power budget.

- To enable PoE SNMP traps on a standalone switch or on a specific member of a Virtual Chassis:

  [edit]
  user@switch# set poe notification-control fpc number

  For example, to enable PoE SNMP traps on a standalone switch or on member 0 of a Virtual Chassis:

  [edit]
  user@switch# set poe notification-control fpc 0

  **NOTE:** On EX3200 and EX4200 switches that support enhanced PoE, you must change the management mode from class mode to static mode to take advantage of the higher per-port power limits of enhanced PoE.
Configuring the PoE Controllers on EX6200 and EX8200 Switches

On EX6200 and EX8200 switches, each line card that supports PoE has its own PoE controller. This means that the PoE controller options are configured separately for each line card.

In addition, each line card has its own separate, configurable PoE power budget. The default power budget for a line card is the amount of power needed to supply all PoE ports on the line card with their maximum supported power. Because there might not be enough power available in a switch to supply each PoE line card with the default PoE power budget, you can configure smaller power budgets for one or more line cards, freeing up power for other line cards.

To configure the line card PoE controllers in an EX6200 or EX8200 switch:

- To configure a guard band setting, to change the management mode, or to configure the PoE power budget for a specific line card:

  ```
  [edit]
  user@switch# set poe fpc number guard-band watts management mode maximum-power watts
  ```

  For example, to configure a PoE budget of 350 W and a guard band of 15 W on line card 1:

  ```
  [edit]
  user@switch# set poe fpc 1 guard-band 15 maximum-power 350
  ```

  **NOTE:** If you configure a PoE power budget for a line card that is smaller than the default power budget, we recommend that you do not change the management mode from class to static. If you change the power management mode to static and do not change the interface default settings, the PoE controller allocates maximum power to the PoE ports in the order of port number. As a result, PoE will be disabled on higher-numbered ports when the PoE power budget runs out.

  In class mode, on the other hand, the PoE controller does not allocate power to a port until a powered device is connected. The class of the connected device determines the amount of power allocated. Thus in class mode, any PoE port can be used to power a device and all the PoE ports on the switch can be used as long as the combined power demand does not exceed the PoE power budget.

- To configure the same guard band value, management mode, or PoE power budget for all line cards in a switch:

  ```
  [edit]
  user@switch# set poe fpc all guard-band watts management mode maximum-power watts
  ```

  For example, to configure a PoE budget of 1000 W and static management mode for all line cards in a switch:
[edit]
user@switch# set poe fpc all management static maximum-power 1000

If you configure different settings for a specific line card, those settings override the settings configured with the `fpc all` statement.

- To enable PoE SNMP traps on a line card:
  
  [edit]
  user@switch# set poe notification-control fpc number

  For example, to enable PoE SNMP traps on line card 7:

  [edit]
  user@switch# set poe notification-control fpc 7

### Configuring PoE Interfaces

To configure the PoE interfaces on a switch that supports PoE:

- To configure all PoE interfaces with the same setting or settings:

  [edit]
  user@switch# set poe interface all options

  For example, to enable telemetry collection on all interfaces, using the default collection duration and interval:

  [edit]
  user@switch# set poe interface all telemetries

  **NOTE:** For PoE to be enabled on all PoE-capable interfaces, the configuration must include the `interface all` statement in the `[edit poe]` hierarchy. With the exception of EX8200 switches that were shipped from the factory with a Junos OS release earlier than Release 11.2, the factory default configurations of switches that support PoE include this statement.

  [edit]
  user@switch# set poe interface ge-0/0/0 priority high telemetries duration 24

  [edit]
  user@switch# set poe interface ge-0/0/1

  [edit]
  user@switch# set poe interface ge-0/0/5 maximum-power 18.6

  [edit]
  user@switch# set poe interface ge-5/0/7 disable
When you configure an individual interface, its configuration overrides any settings you configure with the `set poe interface all` command. For example, `ge-0/0/1` in the preceding example retains the default settings, regardless of any settings configured with the `set poe interface all` command.

**Related Documentation**

**Configuring PoE (J-Web Procedure)**

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices to EX Series switches. These ports allow you to plug in devices that require both network connectivity and electric power, such as VoIP phones, wireless access points, and some IP cameras. Using the Power over Ethernet (PoE) Configuration page in the J-Web interface, you can modify the settings of all interfaces that are PoE-enabled.

This topic includes:
- Configuring PoE on EX2200, EX2200-C, EX3200, EX3300, EX4200, and EX4300 Switches on page 3948
- Configuring PoE on EX6200 Switches on page 3949

**Configuring PoE on EX2200, EX2200-C, EX3200, EX3300, EX4200, and EX4300 Switches**

To configure PoE:

1. Select **Configure > Power over Ethernet**.

   The page displays a list of all PoE-capable interfaces except uplink ports. Specific operational details about an interface are displayed in the Details section of the page.

   The details include the PoE operational status and port class.

   **NOTE:** If you are configuring a Virtual Chassis, the PoE configuring option is displayed if any member of the Virtual Chassis supports PoE, even if the Virtual Chassis master does not support PoE.
NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Edit**—Changes PoE settings for the selected port as described in Table 484 on page 3949.
   - **System Settings**—Modifies general PoE settings as described in Table 485 on page 3949.

### Table 484: PoE Edit Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable PoE</td>
<td>Specifies that PoE is enabled on the interface.</td>
<td>Select this option to enable PoE or PoE+ on the interface.</td>
</tr>
<tr>
<td>Priority</td>
<td>Lists the power priority (low or high) configured on the interface enabled for PoE.</td>
<td>Set the priority as <strong>High</strong> or <strong>Low</strong>.</td>
</tr>
<tr>
<td>Maximum Power</td>
<td>Specifies the maximum PoE wattage available to provision the active PoE interface on the switch.</td>
<td>Select a value in watts. If no value is specified, the default is 15.4 for PoE interfaces and 30.0 for PoE+ interfaces.</td>
</tr>
</tbody>
</table>

### Table 485: System Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Your Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoE Management</td>
<td>Specifies the power management mode. The options are: <strong>static</strong> and <strong>class</strong>.</td>
<td>By default, the power management mode is <strong>class</strong>. Select <strong>static</strong> to change the power management mode.</td>
</tr>
</tbody>
</table>

**NOTE:** When the power management mode is set to **class**, the maximum power value is overridden by the maximum power value of the class of the powered device that is connected to the switch on the PoE port. When the power management mode is set to **static**, you can specify the maximum power for each PoE interface.

| Guard Band (watts) | Specifies the amount of power reserved for power spikes from the PoE power budget of the switch. | Enter a value to set the guard band value in watts. The default value is 0. |

---

### Configuring PoE on EX6200 Switches

To configure PoE:

1. Select **Configure > Power over Ethernet**.
The page displays a list of all PoE-capable interfaces for each FPC. Specific operational details about an interface are displayed in the Details section of the page. The details include the PoE operational status and port class.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Edit**—Changes PoE settings for the selected port as described in Table 486 on page 3950.
   - **FPC Settings**—Changes PoE settings of PoE-capable FPCs.

   To configure FPC settings, click one of the following options:
   - **Add**—Adds a PoE setting for an FPC as described in Table 487 on page 3950.
   - **Edit**—Modifies a PoE setting for an FPC as described in Table 487 on page 3950.
   - **Delete**—Deletes an existing PoE settings for an FPC.

### Table 486: Edit PoE Settings

**Configuration Statements**
- [edit poe] Configuration Statement Hierarchy on EX Series Switches on page 3951

**[edit poe] Configuration Statement Hierarchy on EX Series Switches**

This topic lists supported and unsupported configuration statements in the [edit poe] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.
- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.
This topic lists:

- Supported Statements in the [edit poe] Hierarchy Level on page 3952
- Unsupported Statements in the [edit poe] Hierarchy Level on page 3953

**Supported Statements in the [edit poe] Hierarchy Level**

The following hierarchy shows the [edit poe] configuration statements supported on EX Series switches except for EX6200 and EX8200 switches:

```plaintext
poe {
  guard-band watts;
  interface (all | interface-name) {
    disable;
    maximum-power watts;
    priority (high | low);
    telemetries {
      disable;
      duration hours;
      interval minutes;
    }
  }
  lldp-priority;
  management (class | static);
  notification-control {
    fpc slot-number {
      disable;
    }
  }
}
```

The following hierarchy shows the [edit poe] configuration statements supported on EX Series switches for EX6200 and EX8200 switches:

```plaintext
poe {
  fpc (all | slot-number) {
    guard-band watts;
    lldp-priority;
    management (class | static);
    maximum-power watts;
  }
  interface (all | interface-name) {
    af-mode;
    disable;
    maximum-power watts;
    priority (high | low);
    telemetries {
      disable;
      duration hours;
      interval minutes;
    }
  }
  notification-control {
    fpc slot-number {
      disable;
    }
  }
}
```
Unsupported Statements in the [edit poe] Hierarchy Level

All statements in the [edit poe] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

[edit poe notification-control fpc slot-number]
```

Release Information

Description

Disable a PoE interface, disable the collection of power consumption data for a PoE interface, or disable the generation of the PoE SNMP traps. The action of the `disable` statement depends on which statement it is used with:

- When used with `interface`—Disable the PoE capability of this interface. The interface operates as a standard network access interface, and power is no longer allocated to it from the PoE power budget. Although the PoE capability is disabled, the PoE configuration for the interface is retained. To re-enable the PoE capability of this interface, delete the `disable` statement from the `interface` entry in the configuration.

- When used with `telemetries`—Disable the collection of PoE power consumption records for this interface. Any previously collected records are deleted. However, the `telemetries` configuration is retained, including the values for `interval` and `duration`. To re-enable record collection, delete the `disable` statement from the `telemetries` entry in the configuration.

- When used with `notification-control`—Disable the generation of PoE SNMP traps. To re-enable PoE traps, delete the `disable` statement from the `notification-control` entry in the configuration.

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

[edit poe notification-control]
```

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Enable the specified PoE controller to generate PoE traps.

**Default**

PoE traps are disabled by default.

**Options**

`slot-number`—Indicates the PoE controller by FPC slot number, where `slot-number` is:

- 0—On an EX2200, EX3200, standalone EX3300, standalone EX4200, or standalone EX4300 switch
- Member ID—On an EX3300, EX4200, or EX4300 switch in a Virtual Chassis
- Line card slot number—On an EX6200 or EX8200 switch

The remaining statement is explained separately.

**Required Privilege**

```
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.
```

**Related Documentation**

guard-band

Syntax  guard-band watts;

Hierarchy Level  [edit poe],
                 [edit poe (all | fpc slot-number)]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Reserve a specified amount of power from the PoE power budget for the switch or the
              line card in case of a spike in PoE consumption.

Options  watts—Amount of power to be reserved in case of a spike in PoE consumption.
          Range: 0 through 15 for EX6200 and EX8200 switches and 0 through 19 for ACX2000
                  routers and all other switches.
          Default: 0

Required Privilege Level  system—To view this statement in the configuration.
                          system-control—To add this statement to the configuration.

Related Documentation  • Configuring PoE (CLI Procedure) on page 3942
interface (Power over Ethernet)

Syntax

```
interface (all | interface-name) {
  af-mode;
  disable;
  maximum-power watts;
  priority (high | low);
  telemetries {
    disable;
    duration hours;
    interval minutes;
  }
}
```

Hierarchy Level  [edit poe]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Specify a PoE interface to be configured.

Options  all—All PoE interfaces on the switch that have not been individually configured for PoE. If a PoE interface has been individually configured, that configuration overrides any settings specified with all.

```
interface-name—Name of the specific interface being configured.
```

If you use the interface statement without any substatements, PoE is enabled on all interfaces or the specified interface with default values for the remaining statements.

The remaining statements are explained separately.

Required Privilege Level  system—To view this statement in the configuration. system-control—To add this statement to the configuration.

Related Documentation  • Example: Configuring PoE Interfaces with Different Priorities on an EX Series Switch on page 3937
  • Configuring PoE (CLI Procedure) on page 3942
interval (Power over Ethernet)

Syntax  

```
interval minutes;
```

Hierarchy Level  

```
[edit poe interface (all | interface-name) telemetries]
```

Release Information  

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  

Modify the interval at which data is collected when you are monitoring the power consumption of a PoE interface.

Options  

- **minutes**—Frequency of data collection.
  
  **Range:** 1 through 30
  
  **Default:** 5

Required Privilege Level  

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

management

Syntax  management (class | static | high-power);

Hierarchy Level  [edit poe],
                [edit poe (all | fpc slot-number)]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Designate how the PoE controller allocates power to the PoE interfaces.

Default  class

Options  •  class—The amount of power allocated to the interface is determined by the class of the connected powered device. If no powered device is connected, standard 15.4 W power is allocated to the interface. See “Understanding PoE on EX Series Switches” on page 3925 for more information about classes of powered devices.

        •  static—The amount of power allocated to the interface is determined by the value of the maximum-power statement, not the class of the connected powered device. This amount is allocated even when a powered device is not connected to the interface, ensuring that power is available when needed.

        •  high-power—(ACX2000 routers only) ACX2000 PoE interfaces support power delivery of up to 65 W per port using all four pairs of Ethernet RJ45 cables. Traditional PoE ports use only two pairs of Ethernet cable for power delivery. According to the IEEE 802.3af standard, each port can deliver a maximum power of up to 32 W. With high-power mode of power delivery over all four pairs, the power sourcing equipment (PSE) has an option to deliver up to 65 W per port, provided the powered devices request this high power over all four pairs of the Ethernet cable. By default, high-power mode is not enabled and has to be explicitly enabled. When the PoE controller is configured for high-power mode, the PoE controller does not deliver power to normal powered devices that request power over two pairs.

Required Privilege Level  system—To view this statement in the configuration.
                        system-control—To add this statement to the configuration.

Related Documentation  •  Configuring PoE (CLI Procedure) on page 3942
                         •  [edit poe] Configuration Statement Hierarchy on ACX2000 Routers

                         •  Understanding PoE on EX Series Switches on page 3925
maximum-power (Interface)

Syntax  
maximum-power watts;

Hierarchy Level  
[edit poe interface (all | interface-name)]

Release Information  

Description  
Set the maximum amount of power that the switch can supply to the PoE port.

NOTE: Although you can set this value when PoE power management is in class mode, it does not establish the maximum power for the port. Instead, the IEEE 802.3af (PoE) or IEEE 802.3at (PoE+) class of the connected device determines the maximum power for the port.

Options  
watts—The maximum number of watts that can be supplied to the port.

For EX2200 switches, EX3300 switches, EX4200 switches, EX4300 switches, EX6200 switches, and EX8200 switches:
Range: 0.0 through 30.0
Default: 15.4 W for ports that support IEEE 802.3af and 30 W for ports that support IEEE 802.3at

For EX3200 switches:
Range: 0.0 through 18.6
Default: 15.4 W

For ACX2000 routers:
Range: 1 through 65 W
Default: 32 W

NOTE: The maximum-power setting permitted by the CLI might be greater than the maximum power a given PoE port can deliver. For example, the CLI permits you to set any PoE port on an EX8200 line card to 30 W; however, only ports 0 through 11 support 30 W. Similarly, the CLI permits you to set any PoE port on an EX4200 switch to 30 W, but some models of EX4200 switch support only 18.6 W per port. If you configure a maximum-power value that is greater than the maximum power supported by a port, the power allocated to the port will be the maximum supported.

If you use the all option to set maximum-power to a value greater than 15.4 W on all interfaces on an EX8200 line card, the maximum power allocated to all ports is 15.4 W.
NOTE: Support for a maximum of 18.6 W per port instead of 15.4 W per port on EX3200 switches and P and T models of EX4200 switch requires Junos OS Release 11.1 or later. In addition to requiring an upgrade of Junos OS to Release 11.1 or later, switches that are running a previous Junos OS release require the PoE controller software be upgraded as described in “Upgrading the PoE Controller Software” on page 3967. If the controller software is not upgraded and you set maximum-power to a value greater than 15.4 W, the configuration is accepted when you commit it, but the actual power allocated to the port will be 15.4 W.

NOTE: On ACX2000 routers, the power sourcing equipment (PSE) delivers up to 65 W per port, provided the management mode is set to high-power mode, by using the high-power option at the [edit poe management] hierarchy level. By default, the management mode is set to static. In the static mode, the PSE can deliver power up to 32 W.

poe

Syntax  For switches other than EX6200 and EX8200 switches:

    poe {
        guard-band watts;
        interface (all | interface-name) {
            disable;
            maximum-power watts;
            priority (high | low);
            telemetries {
                disable;
                duration hours;
                interval minutes;
            }
        }
        lldp-priority;
        management (class | static);
        notification-control {
            fpc slot-number {
                disable;
            }
        }
    }

For EX6200 and EX8200 switches:

    poe {
        fpc ( all | slot-number) {
            guard-band watts;
            lldp-priority;
            management (class | static);
            maximum-power watts;
        }
        interface (all | interface-name) {
            af-mode;
            disable;
            maximum-power watts;
            priority (high | low);
            telemetries {
                disable;
                duration hours;
                interval minutes;
            }
        }
        notification-control {
            fpc slot-number {
                disable;
            }
        }
    }

Hierarchy Level  [edit]
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Configure PoE options.

The remaining statements are explained separately.

```
priority (Power over Ethernet)
```

**Syntax**

```
priority (low | high);
```

**Hierarchy Level**

```
[edit poe interface (all | interface-name)]
```

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Set the power priority for individual interfaces when there is insufficient power for all PoE interfaces. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, low priority devices are shut down before high priority devices. Among interfaces that have the same assigned priority, priority is determined by port number, with lower-numbered ports having higher priority.

**Default**

```
low
```

**Options**

```
value—high or low:
```

- **high**—Specifies that this interface is to be treated as high priority in terms of power allocation. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, power is not shut down on this interface until it has been shut down on all the low priority interfaces.

- **low**—Specifies that this interface is to be treated as low priority in terms of power allocation. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, power is shut down on this interface before it is shut down on high priority interfaces.

**Required Privilege Level**

```
system—To view this statement in the configuration.
```

```
system-control—To add this statement to the configuration.
```

**Related Documentation**

telemetries

Syntax

telemetries {
  disable;
  duration hours;
  interval minutes;
}

Hierarchy Level
  [edit poe interface (all | interface-name)]

Release Information
  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
  Enable the logging of power consumption of a PoE interface over time.

  If you want to log the power consumption of a PoE interface, you must explicitly specify the telemetries statement. When you commit the configuration, logging begins, with data being collected at the specified intervals. Logging stops at the end of the specified duration. If you did not specify the duration and interval statements, data is collected at five minute intervals for one hour.

  The remaining statements are explained separately.

Default
  Logging of power consumption is disabled.

Required Privilege
  system—To view this statement in the configuration.

  system-control—To add this statement to the configuration.

CHAPTER 72

Administration

- Upgrading on page 3967
- Routine Monitoring on page 3970
- Operational Commands on page 3976

Upgrading

- Upgrading the PoE Controller Software on page 3967

Upgrading the PoE Controller Software

Each Junos OS image for an EX Series switch that supports PoE contains the most recent version of the PoE controller software at the time the Junos OS image was built. When you upgrade Junos OS on your switch, the new image might contain a more recent version of the PoE controller software than is currently running on the PoE controller. You can upgrade your PoE controller software by requesting that the more recent version of the software contained in the Junos OS image be downloaded to the controller.

**NOTE:** Powered devices are not guaranteed to receive power while the new software is being downloaded to the PoE controller, a process that can take up to 10 minutes. In addition, during the software download, some PoE operational commands, such as `show poe interface`, might not show correct output. We recommend that you upgrade your PoE controller software during a regularly scheduled maintenance window.

**NOTE:** On an EX8200 Virtual Chassis, you cannot execute PoE commands on the XRE200 External Routing Engine. You can execute PoE commands only on the member EX8200 switches. Use the `request session member member-id` command to open a CLI session on a member switch.
This topic covers:

- Determining Whether the PoE Controller Software Needs Upgrading on page 3968
- Upgrading the PoE Controller Software on page 3968
- Monitoring the Upgrade Progress on page 3969

### Determining Whether the PoE Controller Software Needs Upgrading

To determine if the version of the PoE controller software supplied with Junos OS is more recent than the version of the software currently running on the PoE controller, enter the following command:

```
user@switch> showpoecontroller
```

<table>
<thead>
<tr>
<th>Controller</th>
<th>Maximum Power</th>
<th>Consumption Power</th>
<th>Guard Band</th>
<th>Management Class</th>
<th>Status</th>
<th>Lldp Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>0**</td>
<td>130.00W</td>
<td>0.00W</td>
<td>0W</td>
<td>Class AF_MODE</td>
<td>Disabled</td>
<td></td>
</tr>
</tbody>
</table>

**New PoE software upgrade available.**

Use 'request system firmware upgrade poe fpc-slot <slot>'

This procedure will take around 10 minutes (recommended to be performed during maintenance)

The **New PoE software upgrade available** text in the output indicates that the PoE controller software is out-of-date and should be upgraded.

For Virtual Chassis or switches with PoE line cards, the output of the `showpoecontroller` command indicates which members of a Virtual Chassis or which PoE line cards have PoE controllers with out-of-date software:

```
user@switch> showpoecontroller
```

<table>
<thead>
<tr>
<th>Controller</th>
<th>Maximum Power</th>
<th>Consumption Power</th>
<th>Guard Band</th>
<th>Management Class</th>
<th>Status</th>
<th>Lldp Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>130.00W</td>
<td>120.34W</td>
<td>0W</td>
<td>Class AF_ENHANCE</td>
<td>Disabled</td>
<td></td>
</tr>
<tr>
<td>4**</td>
<td>410.00W</td>
<td>182.80W</td>
<td>0W</td>
<td>Class AF_MODE</td>
<td>Disabled</td>
<td></td>
</tr>
</tbody>
</table>

**New PoE software upgrade available.**

Use 'request system firmware upgrade poe fpc-slot slot'

This procedure will take around 10 minutes (recommended to be performed during maintenance)

In the preceding example, member 4 of the Virtual Chassis has out-of-date PoE controller software.

**NOTE:** We recommend that all member switches of a Virtual Chassis or all line cards in a switch run the same version of the PoE controller software.

### Upgrading the PoE Controller Software

To upgrade the PoE controller software for a standalone switch with built-in PoE interfaces, enter:

```
user@switch> request system firmware upgrade poe fpc-slot 0
```

Firmware upgrade initiated. Poe Upgrade takes about 10 minutes

Use 'show poe controller' to get the download status
To upgrade the PoE controller software on a specific Virtual Chassis member or line card on a switch, enter:

```
user@switch> request system firmware upgrade poe fpc-slot 8
Firmware upgrade initiated. Poe Upgrade takes about 10 minutes
Use 'show poe controller' to get the download status
```

To upgrade the PoE controller software on all members of a Virtual Chassis or all line cards on a switch, enter:

```
user@switch> request system firmware upgrade poe fpc-slot all-members
Firmware upgrade initiated. Poe Upgrade takes about 10 minutes
Use 'show poe controller' to get the download status
```

**Monitoring the Upgrade Progress**

Use the `show poe controller` command to monitor the progress of the controller software upgrade:

```
user@switch> show poe controller
Controller   Maximum   Power         Guard    Management  Status            Lldp
index       power     consumption   band                                   Priority
0***       130.00W   0.00W           0W                 SW_DOWNLOAD(14%)  Disabled
**New PoE software upgrade available.
Use 'request system firmware upgrade poe fpc-slot <slot>'
This procedure will take around 10 minutes (recommended to be performed during maintenance)
```

The **Status** field is updated during the download process to show the following stages of the download:

- **DOWNLOAD_INIT**
- **SW_DOWNLOAD (n%)**

When the software upgrade is complete, the **New PoE software upgrade available** text is no longer displayed for the particular FPC.

**NOTE:** If you are upgrading the PoE controller software to enable enhanced PoE, the **Status** field for the controller shows **AF_ENHANCE** after the upgrade completes, indicating that the controller now supports enhanced PoE. The default maximum power per port is not automatically increased as a result of the upgrade—it is still 15.4 W per port. You must explicitly set the maximum power for a port to 18.6 W. Enhanced PoE is supported in Junos OS Release 11.1 or later on EX3200 switches and on EX4200 P or T model switches.

**Related Documentation**

- Verifying PoE Configuration and Status (CLI Procedure) on page 3974
- Understanding PoE on EX Series Switches on page 3925
Routine Monitoring

- Monitoring PoE on page 3970
- Monitoring PoE Power Consumption (CLI Procedure) on page 3971
- Verifying PoE Configuration and Status (CLI Procedure) on page 3974

Monitoring PoE

**Purpose**
Use the monitoring functionality to view real-time data of the power consumed by each PoE interface, and to enable and configure telemetry values. When telemetry is enabled, the software measures the power consumed by each interface and stores the data for future reference.

**NOTE:** If you are configuring a Virtual Chassis, the PoE monitoring option is displayed if any member of the Virtual Chassis supports PoE, even if the Virtual Chassis master does not support PoE.

**Action**
To monitor PoE using the J-Web interface, select **Monitor > Power over Ethernet**.

To monitor PoE power consumption with CLI commands in the CLI Terminal in the J-Web interface:

1. Select **Troubleshoot > CLI Terminal**.
2. Type a CLI command:
   - `show poe controller`
   - `show poe interface`
   - `show poe telemetry`

For detailed information about using these CLI commands to monitor PoE power consumption, see Monitoring PoE Power Consumption (CLI Procedure) in the EX Series documentation at [http://www.juniper.net/techpubs](http://www.juniper.net/techpubs).

**Meaning**
In the J-Web interface the PoE Monitoring screen is divided into two parts. The top half of the screen displays real-time data of the power consumed by each PoE-capable interface and a list of ports that utilize maximum power.

Select a particular interface to view a graph of the power consumed by the selected interface.

The bottom half of the screen displays telemetry information for interfaces. The Telemetry Status field displays whether telemetry has been enabled on the interface. Click the **Show Graph** button to view a graph of the telemetries. The graph can be based on power or voltage. To modify telemetry values, click **Edit**. Specify Interval in minutes, Duration in hours, and select **Log Telemetries** to enable telemetry on the selected interface.
You can monitor Power over Ethernet (PoE) power consumption, both for the switch as a whole and for individual PoE interfaces.

This topic describes how to monitor:

- **PoE Power Consumption on a Switch** on page 3971
- **Current Power Consumption for PoE Interfaces** on page 3971
- **Power Consumption for PoE Interfaces over Time** on page 3973

### PoE Power Consumption on a Switch

**Purpose**

Determine the current PoE power consumption on a switch.

**Action**

Enter the following command:

```
user@switch> show poe controller
```

<table>
<thead>
<tr>
<th>Controller index</th>
<th>Maximum power consumption</th>
<th>Guard band power</th>
<th>Management Class</th>
<th>Status</th>
<th>Lldp Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>405.00W</td>
<td>130.00W</td>
<td>0W</td>
<td>AT_MODE</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**Meaning**

At the time the command was executed, the PoE interfaces on the switch were consuming 130 W out of the PoE power budget of 405 W.

### Current Power Consumption for PoE Interfaces

**Purpose**

Determine the current power consumption for individual PoE interfaces.

**Action**

To monitor the power consumption of all PoE interfaces on the switch, use the following command:

```
user@switch> show poe interface
```

<table>
<thead>
<tr>
<th>Interface status</th>
<th>Oper status</th>
<th>Max power</th>
<th>Priority</th>
<th>Power consumption</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/0</td>
<td>Enabled</td>
<td>15.4W</td>
<td>Low</td>
<td>7.4W</td>
<td>0</td>
</tr>
<tr>
<td>ge-0/0/1</td>
<td>Enabled</td>
<td>15.4W</td>
<td>High</td>
<td>12.0W</td>
<td>0</td>
</tr>
<tr>
<td>ge-0/0/2</td>
<td>Enabled</td>
<td>15.4W</td>
<td>Low</td>
<td>12.4W</td>
<td>0</td>
</tr>
<tr>
<td>ge-0/0/3</td>
<td>Enabled</td>

<td>4.0W</td>
<td>1</td>
</tr>
<tr>
<td>ge-0/0/5</td>
<td>Enabled</td>
<td>7.0W</td>
<td>Low</td>
<td>6.1W</td>
<td>2</td>
</tr>
<tr>
<td>ge-0/0/6</td>
<td>Enabled</td>
<td>15.4W</td>
<td>Low</td>
<td>12.3W</td>
<td>3</td>
</tr>
</tbody>
</table>
To monitor the power consumption of the PoE interfaces on a specific EX6200 or EX8200 line card, use the following command:

```
user@switch> showpoeinterface fpc-slot 3
```

<table>
<thead>
<tr>
<th>Interface status</th>

</tbody>
</table>

To monitor the power consumption of an individual PoE interface (for example, ge-0/0/3), use the following command:

```
user@switch> showpoeinterface ge-0/0/3
```

PoE interface status:
- PoE interface : ge-0/0/3
- Administrative status : Enabled
- Operational status : ON
- Power limit on the interface : 7.0W
- Priority : Low
- Power consumed : 5.3W
Class of power device : 2
PoE Mode : 802.3at

Meaning At the time the command was executed, the individual PoE ports were consuming the amount of power shown. For example, interface ge-0/0/3 was consuming 5.3 W at the time the command was executed.

Power Consumption for PoE Interfaces over Time

Purpose Monitor the power consumption of a PoE interface over a period of time. The records collected remain available for future viewing.

You can specify the intervals at which power consumption data is collected, from once every minute to once every 30 minutes. The default is once every 5 minutes. You can also specify the duration over which the records are collected, from 1 hour (default) to 24 hours.

Action To collect historical records of PoE interface power consumption and display those records:

1. Add the telemetries statement to the PoE interface configuration:

   [edit]
   user@switch# set poe interface ge-0/0/5 telemetries interval 10

   When you commit the configuration, record collection begins.

2. Display the collected records:

   user@switch> show poe telemetries interface ge-0/0/5 count all

   Sl No  Timestamp                Power    Voltage
   1     03-19-2010 13:00:07 UTC  3.9W     50.9V
   2     03-19-2010 12:50:07 UTC  3.9W     50.9V
   3     03-19-2010 12:40:07 UTC  3.9W     50.9V
   4     03-19-2010 12:30:07 UTC  3.9W     50.9V
   5     03-19-2010 12:20:07 UTC  3.9W     50.9V
   6     03-19-2010 12:10:07 UTC  3.9W     50.9V

   To start another session of record collection on the interface, you must delete the existing telemetries configuration on the interface and then reconfigure telemetries. Deleting the telemetries configuration also clears the power consumption history data.

   To clear the history of PoE power consumption without deleting the telemetries configuration, use the command clear poe telemetries interface.

Meaning Over the hour in which the PoE power consumption data on ge-0/0/5 was collected, the connected powered device consistently consumed 3.9 W.

- Configuring PoE (CLI Procedure) on page 3942
- Example: Configuring PoE Interfaces on an EX Series Switch on page 3935
- Example: Configuring PoE Interfaces with Different Priorities on an EX Series Switch on page 3937
You can verify the Power over Ethernet (PoE) configuration and status on an EX Series switch.

This topic describes how to verify:

- PoE Controller Configuration and Status on page 3974
- PoE Interface Configuration and Status on page 3975
- PoE SNMP Trap Generation Status on page 3976

### PoE Controller Configuration and Status

**Purpose**

Verify the PoE controller configuration and status, such as the PoE power budget, total PoE power consumption, power management mode, and the supported PoE standard.

**Action**

Enter the following command:

```
user@switch> show poe controller
```

Example output for an EX2200 switch:

<table>
<thead>
<tr>
<th>Controller index</th>
<th>Maximum power</th>
<th>Power consumption</th>
<th>Guard band</th>
<th>Management</th>
<th>Status</th>
<th>Lldp Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>405.00W</td>
<td>130.00W</td>
<td>19W</td>
<td>Class</td>
<td>AT_MODE</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

Example output for an EX8200 switch:

<table>
<thead>
<tr>
<th>Controller index</th>
<th>Maximum power</th>
<th>Power consumption</th>
<th>Guard band</th>
<th>Management</th>
<th>Status</th>
<th>Lldp Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>540.00W</td>
<td>435.25W</td>
<td>0W</td>
<td>Static</td>
<td>AT/AF COMBO</td>
<td>Disabled</td>
</tr>
<tr>
<td>4</td>
<td>915.00W</td>
<td>627.01W</td>
<td>15W</td>
<td>Class</td>
<td>AT/AF COMBO</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**Meaning**

- For the EX2200 switch—The switch has a PoE power budget of 405 W, of which 130 W were being used by the PoE ports at the time the command was executed. The **Guard band** field shows that 19 W is reserved out of the PoE power budget to protect against spikes in power demand. The power management mode is class. The PoE ports on the switch support PoE+ (IEEE 802.3at).

- For the EX8200 switch—Line card 3 has a PoE power budget of 540 W, of which 435.25 W were being used by the PoE ports on the line card at the time the command was executed. The management mode for line card 3 is static and the line card has a mix of PoE (IEEE 802.3af) and PoE+ (IEEE 802.3at) ports.

Line card 4 has a PoE power budget of 915 W, of which 627.01 W were being used by the PoE ports on the line card at the time the command was executed. The **Guard band** field shows that 15 W is reserved out of the PoE power budget to protect against spikes in power demand. The management mode for line card 4 is class and the line card has a mix of PoE (IEEE 802.3af) and PoE+ (IEEE 802.3at) ports.
PoE Interface Configuration and Status

Purpose
Verify that PoE interfaces are enabled and set to the correct maximum power and priority settings. Also verify current operational status and power consumption.

Action
To view configuration and status for all PoE interfaces, enter:

```
user@switch> show poe interface
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin status</th>
<th>Oper status</th>
<th>Max power</th>
<th>Priority</th>

</tbody>
</table>
To view configuration and status for a single PoE interface, enter:

```
user@switch> show poe interface ge-0/0/3
```

PoE interface status:
- **PoE interface**: ge-0/0/3
- **Administrative status**: Enabled
- **Operational status**: On
- **Power limit on the interface**: 7.0W
- **Priority**: High
- **Power consumed**: 3.3W
- **Class of power device**: 2
- **PoE Mode**: 802.3at

**Meaning**
The command output shows the status and configuration of interfaces. For example, the interface **ge-0/0/3** is administratively enabled. Its operational status is **On**; that is, the interface is currently delivering power to a connected powered device. The maximum power allocated to the interface is 7.0 W. The interface has a high power priority. At the time the command was executed, the powered device was consuming 3.3 W. The IEEE 802.3af class of the powered device is class 2. If the PoE power management mode is class, the class of the powered device determines the maximum power allocated to the interface, which is 7 W in the case of class 2 devices.

The PoE Mode field indicates that the interface supports IEEE 802.3at.

### PoE SNMP Trap Generation Status

**Purpose**: Verify the status of the `notification-control` option, which determines whether or not PoE SNMP traps are enabled.

**Action**: Enter the following command:

```
user@switch> show poe notification-control
```

**Meaning**: PoE SNMP traps are not enabled.

**Operational Commands**
request system firmware upgrade poe

Syntax  
request system firmware upgrade poe fpc-slot (number | all-members)

Release Information  
Command introduced in Junos OS Release 12.1 for EX Series switches.

Description  
Upgrade the PoE controller software on switches and line cards.

The Junos OS image running on the switch contains a copy of the PoE controller software. This command compares the Junos OS version with the version of the software running on the PoE controller. If the Junos OS version is a more recent version, the command downloads the more recent version to the controller.

For all Virtual Chassis except EX8200 Virtual Chassis, execute this command on the master. The master itself does not have to support PoE for this command to work—for example, you can execute this command on the master of a mixed EX4200 and EX4500 Virtual Chassis when the master is an EX4500 switch. On an EX8200 Virtual Chassis, you must execute this command on the member switch, not the master XRE200 External Routing Engine.

We recommend that all members of a Virtual Chassis run the same version of the PoE controller software.

Upgrading the controller software can take up to 10 minutes. Use the show poe controller command to monitor the progress of the software download.

You cannot downgrade the PoE controller software.

NOTE: When you enter the request system firmware upgrade poe command, a message advises you that the controller software upgrade has started and that it will take about 10 minutes to complete. This message appears even if the FPC you have specified does not have a PoE controller or if the PoE controller software is up-to-date. To determine whether or not the controller software upgrade has actually started, use the show poe controller command.

NOTE: While the upgrade is in progress, power to the powered devices is not guaranteed. We recommend that you upgrade the controller software during a regularly scheduled maintenance window.

Options  
fpc-slot (number | all-members)—Upgrade the PoE controller firmware for the Virtual Chassis member or line card specified by number, or for all Virtual Chassis members and line cards, specified by all-members.

Required Privilege Level  
maintenance
Related Documentation

- show poe controller on page 3979
- Upgrading the PoE Controller Software on page 3967

List of Sample Output
request system firmware upgrade poe fpc-slot 8 on page 3978

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system firmware upgrade poe fpc-slot 8

user@switch> request system firmware upgrade poe fpc-slot 8
Firmware upgrade initiated. Poe Upgrade takes about 10 minutes
Use 'show poe controller' to get the download status
show poe controller

Syntax
show poe controller

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.2 for ACX2000 routers.

Description
Display configuration and status of the PoE controllers.

Required Privilege
view

Related Documentation
- show poe interface on page 3982
- request system firmware upgrade poe on page 3977
- Verifying PoE Configuration and Status (CLI Procedure) on page 3974
- Monitoring PoE Power Consumption (CLI Procedure) on page 3971
- Upgrading the PoE Controller Software on page 3967

List of Sample Output
- show poe controller (EX3200 Switch) on page 3980
- show poe controller (EX8200 Switch) on page 3980
- show poe controller (Controller Software Upgrade in Progress) on page 3980
- show poe controller (ACX2000 Router) on page 3981

Output Fields
- **Controller index**: PoE controller number:
  - 0 for EX2200, EX3200, standalone EX3300, standalone EX4200 switches, standalone EX4300 switches, and ACX2000 routers.
  - Member ID for switches in an EX3300 Virtual Chassis, EX4200 Virtual Chassis, EX4300 Virtual Chassis, or a mixed EX4200 and EX4500 Virtual Chassis.
  - Slot number for line cards with a PoE controller in an EX6200 or EX8200 switch.
- **Maximum power**: The PoE power budget for the switch or line card. The PoE controller allocates power to the PoE ports from this budget.
- **Power consumption**: Total amount of power being used by the PoE ports at the time the command is executed.
- **Guard Band**: Amount of power that has been placed in reserve for power demand spikes and that cannot be allocated to a PoE interface.

Table 488 on page 3979 lists the output fields for the `show poe controller` command. Output fields are listed in the approximate order in which they appear.

<tbody>
<tr>
<td>• AF_ENHANCE—Controller supports enhanced PoE. The maximum power per PoE port is 18.6 W in static mode (15.4 W in class mode).</td>
<td></td>
</tr>
<tr>
<td>• DEVICE_FAIL—Software download to the controller has failed or the PoE controller is not initialized because of a hardware failure.</td>
<td></td>
</tr>
<tr>
<td>• DOWNLOAD_INIT—Software download to the controller is in the initial phase.</td>
<td></td>
</tr>
<tr>
<td>• AF_MODE—Controller supports standard IEEE 802.3af. The maximum power per PoE port is 15.4 W.</td>
<td></td>
</tr>
<tr>
<td>• AT/AF_COMBO—Controller supports a mix of standard IEEE 802.3af and IEEE 802.3at (PoE+) ports. The maximum power per port is 30 W for IEEE 802.3at (PoE+) ports and 15.4 W for the IEEE 802.3af ports.</td>
<td></td>
</tr>
<tr>
<td>• AT_MODE—Controller supports IEEE 802.3at (PoE+). The maximum power per PoE port is 30 W.</td>
<td></td>
</tr>
<tr>
<td>• SW_DOWNLOAD(n%)—Software download to the controller is in progress.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Lldp Priority</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link Layer Discovery Protocol (LLDP) priority operating state. The state can be Enabled or Disabled.</td>
<td></td>
</tr>
</tbody>
</table>

LLDP priority allows the PoE controller to assign interfaces the power priority provided by the connected powered device by using LLDP power negotiation rather than the power priority configured on the switch interface.

Sample Output

**show poe controller (EX3200 Switch)**

```
user@switch> show poe controller
Controller index | Maximum power | Power consumption | Guard band | Management | Status       | Lldp Priority
0                | 130.00W       | 81.20W            | 10W        | Static      | AF_ENHANCE   | Disabled
```

**show poe controller (EX8200 Switch)**

```
user@switch> show poe controller
Controller index | Maximum power | Power consumption | Guard band | Management | Status       | Lldp Priority
0                | 792.00W       | 603.50W           | 0W         | Class       | AT/AF_COMBO  | Disabled
4                | 915.00W       | 781.00W           | 0W         | Class       | AT/AF_COMBO  | Disabled
7                | 915.00W       | 0.00W             | 0W         | Class       | AT/AF_COMBO  | Disabled
```

**show poe controller (Controller Software Upgrade in Progress)**

```
user@switch> show poe controller
Controller index | Maximum power | Power consumption | Guard band | Management | Status       | Lldp Priority
0                | 130.00W       | 0.00W             | 0W         | Static      | AF_ENHANCE   | Disabled
```
**New PoE software upgrade available.**
Use 'request system firmware upgrade poe fpc-slot <slot>'
This procedure will take around 10 minutes (recommended to be performed during maintenance)

```
show poe controller (ACX2000 Router)
user@host> show poe controller

Controller index  Maximum power  Power consumption  Guard band  Management  Status  Lldp Priority

   0        130.0 W   14.2 W         0 W      high-power   UP
```
show poe interface

Syntax

```
show poe interface
  <fpc-slot number>
  <interface-name>
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.2 for ACX2000 routers.

Description

Display the status of PoE interfaces.

Options

- **none**—Display status of all PoE interfaces on the switch or router.
  - **fpc-slot number**—(Optional) (EX6200 or EX8200 switches only) Display the status of
    the PoE interfaces on the specified line card.
  - **interface-name**—(Optional) Display the status of a specific PoE interface on the switch.

Required Privilege

- **view**

Output Fields

Table 489 on page 3982 lists the output fields for the `show poe interface` command. Output fields are listed in the approximate order in which they appear.

Table 489: show poe interface Output Fields

<table>
<thead>
<tr>
<th>Field Name (All Interfaces Output)</th>
<th>Field Name (Single Interface Output)</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>PoE Interface</td>
<td>Interface name.</td>
</tr>
<tr>
<td>Admin status</td>
<td>Administrative status</td>
<td>Administrative state of the PoE interface: Enabled or Disabled. If the PoE interface is disabled, it can provide network connectivity, but it cannot provide power to connected devices.</td>
</tr>
</tbody>
</table>
### Table 489: show poe interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name (All Interfaces Output)</th>
<th>Field Name (Single Interface Output)</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oper status</td>
<td>Operational status</td>
<td>Operational state of the PoE interface:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>ON</strong>—The interface is currently supplying power to a powered device.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>OFF</strong>—PoE is enabled on the interface, but the interface is not currently supplying power to a powered device.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Disabled</strong>—PoE is disabled on the interface.</td>
</tr>
<tr>
<td>Max power</td>
<td>Power limit on the interface</td>
<td>Maximum power that can be provided by the interface.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An (L) next to the value indicates that the value on the port was negotiated by LLDP.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority</td>
<td>Interface power priority: either <strong>High</strong> or <strong>Low</strong>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An (L) next to the value indicates that the value on the port was negotiated by LLDP.</td>
</tr>
<tr>
<td>Power consumption</td>
<td>Power consumed</td>
<td>Amount of power being used by the interface at the time the command is executed.</td>
</tr>
<tr>
<td>Class</td>
<td>Class of power device</td>
<td>IEEE 802.3af (PoE) or IEEE 802.3at (PoE+) class of the powered device. Class 0 is the default class and is used when the class of the powered device is unknown. If no powered device is connected, this field contains <strong>not applicable</strong>.</td>
</tr>
<tr>
<td>PoE Mode</td>
<td>PoE Mode</td>
<td>IEEE PoE standard supported by the interface—either <strong>802.3af</strong> or <strong>802.3at</strong>.</td>
</tr>
</tbody>
</table>

### Sample Output

**show poe interface**

```
user@switch> show poe interface

Interface   Admin status  Oper status  Max power  Priority  Power consumption  Class

show poe notification-control

Syntax

```
show poe notification-control
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the state of the PoE notification-control option, which enables or disables PoE SNMP traps.

Required Privilege Level

view

show poe telemetries

**Syntax**

```plaintext
show poe telemetries
  <count (all | number)>
  <interface (all | interface-name)>
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display a history of power consumption on the specified interface or on all interfaces.

Telemetries must be enabled on the interface before you can display a history of power consumption.

**Options**

- **none**—Displays all records for all interfaces that have power consumption history data.
- **count (all | number)**—(Optional) Specify the number of power consumption records to display. The most recent records are displayed. If you do not specify the count, all available records are displayed.
- **interface (all | interface-name)**—(Optional) Display power consumption records for the specified PoE interface or for all PoE interfaces. If you do not specify interfaces, all interfaces are displayed.

**Required Privilege**

- **view**

Port Security Overview

Ethernet LANs are vulnerable to attacks such as address spoofing (forging) and Layer 2 denial of service (DoS) on network devices. Port security features help protect the access ports on your switch against the loss of information and productivity that can result from such attacks.

Juniper Networks Junos operating system (Junos OS) provides features to help secure ports on the switch. Ports can be categorized as either trusted or untrusted. You apply policies appropriate to each category to protect ports against various types of attacks.

Basic port security features are enabled in the switch's default configuration. You can configure additional features with minimal configuration steps.

Depending on the particular feature, you can configure the feature either on VLANs or interfaces.
Port security features supported on switches are:

- **DHCP option 82**—Also known as the DHCP relay agent information option. This feature helps protect the switch against attacks such as spoofing of IP addresses and media access control (MAC) addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

- **DHCP snooping**—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP address to MAC address binding (IP-MAC binding) database, which is called the DHCP snooping database. DHCP snooping is enabled on a VLAN. The details of enabling DHCP snooping depend on the particular switch.

  **NOTE:** Most port security features depend on DHCP snooping. However, DHCP snooping is not enabled in the default switch configurations.

- **Dynamic ARP inspection (DAI)**—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made on the basis of the results of those comparisons. You enable DAI on a VLAN.

- **IP source guard**—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. With IP source guard enabled, the source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is forwarded if the source IP-MAC binding is valid; if the binding is not valid, the packet is discarded. You enable IP source guard on a VLAN.

  **NOTE:** IP source guard is not supported on the QFX Series.

- **MAC limiting**—Protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You can enable MAC limiting on an interface.

- **MAC move limiting**—(Not supported on EX9200) Tracks MAC movement and detects MAC spoofing on access ports. You enable this feature on a VLAN.

- **Persistent MAC learning**—Also known as sticky MAC. Persistent MAC learning enables interfaces to retain dynamically learned MAC addresses across switch reboots. You enable this feature on an interface.

- **Trusted DHCP server**—Configuring the DHCP server on a trusted port protects against rogue DHCP servers sending leases. You enable this feature on an interface (port). By default, access ports are untrusted, and trunk ports are trusted. (Access ports are the switch ports that connect to Ethernet endpoints such as user PCs and laptops, servers, and printers. Trunk ports are the switch ports that connect to other Ethernet switches or to routers.)

Understanding DAI for Port Security

Dynamic ARP inspection (DAI) protects switches against ARP spoofing.

DAI inspects Address Resolution Protocol (ARP) packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP spoofing (also known as ARP poisoning or ARP cache poisoning). ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons. When an attacker tries to use a forged ARP packet to spoof an address, the switch compares the address with entries in the database. If the media access control (MAC) address or IP address in the ARP packet does not match a valid entry in the DHCP snooping database, the packet is dropped.

ARP packets are sent to the Routing Engine and are rate-limited to protect the switch from CPU overload.

Address Resolution Protocol

Sending IP packets on a multi-access network requires mapping an IP address to an Ethernet MAC address.

Ethernet LANs use ARP to map MAC addresses to IP addresses.

The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device’s address and stores the response in the cache.

ARP Spoofing

ARP spoofing is one way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the LAN. Instead of the switch sending traffic to the proper network device, the switch sends the traffic to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker’s machine, the attacker receives all the traffic from the switch that must have gone to another device. The result is that traffic from the switch is misdirected and cannot reach its proper destination.
One type of ARP spoofing is gratuitous ARP, which is when a network device sends an ARP request to resolve its own IP address. In normal LAN operation, gratuitous ARP messages indicate that two devices have the same MAC address. They are also broadcast when a network interface card (NIC) in a device is changed and the device is rebooted, so that other devices on the LAN update their ARP caches. In malicious situations, an attacker can poison the ARP cache of a network device by sending an ARP response to the device that directs all packets destined for a certain IP address to go to a different MAC address instead.

To prevent MAC spoofing through gratuitous ARP and through other types of spoofing, the switches examine ARP responses through DAI.

**Dynamic ARP Inspection**

DAI examines ARP requests and responses on the LAN and validates ARP packets. The switch intercepts ARP packets from an access port and validates them against the DHCP snooping database. If no IP-MAC entry in the database corresponds to the information in the ARP packet, DAI drops the ARP packet and the local ARP cache is not updated with the information in that packet. DAI also drops ARP packets when the IP address in the packet is invalid. ARP probe packets are not subjected to dynamic ARP inspection. The switch always forwards such packets.

Junos OS for EX Series switches and the QFX Series uses DAI for ARP packets received on access ports because these ports are untrusted by default. Trunk ports are trusted by default, and therefore ARP packets bypass DAI on them.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

If you set an interface to be a DHCP trusted port, it is also trusted for ARP packets.

---

**NOTE:**

- If your switch uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, see “Enabling a Trusted DHCP Server (CLI Procedure)” on page 4036 for information about configuring an access interface to be a DHCP trusted port.

- If your switch is not using Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, see Enabling a Trusted DHCP Server (CLI Procedure) for information about configuring an access interface to be a DHCP trusted port.

For packets directed to the switch to which a network device is connected, ARP queries are broadcast on the VLAN. The ARP responses to those queries are subjected to the DAI check.

For DAI, all ARP packets are trapped to the PFE. To prevent CPU overloading, ARP packets destined for the Routing Engine are rate-limited.
If the DHCP server goes down and the lease time for an IP-MAC entry for a previously valid ARP packet runs out, that packet is blocked.

**Prioritizing Inspected Packets**

**NOTE:** Prioritizing inspected packets is not supported on the QFX Series.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DAI packets for a specified VLAN. This type of configuration places inspected packets for that VLAN in the egress queue, that you specify, ensuring that the security procedure does not interfere with the transmission of high-priority traffic.

Understanding DHCP Option 82 for Port Security on EX Series Switches

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect Juniper Networks EX Series Ethernet Switches against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Hosts on untrusted access interfaces on Ethernet LAN switches send requests for IP addresses to access the Internet. The switch forwards or relays these requests to DHCP servers, and the servers send offers for IP address leases in response. Attackers can use these messages to perpetrate address spoofing and starvation.

Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client. The Juniper Networks Junos operating system (Junos OS) implementation of DHCP option 82 supports RFC 3046, DHCP Relay Agent Information Option, at http://tools.ietf.org/html/rfc3046.

This topic covers:

- DHCP Option 82 Processing on page 4000
- Suboption Components of Option 82 on page 4001
- Configurations of the EX Series Switch That Support Option 82 on page 4001

DHCP Option 82 Processing

If DHCP option 82 is enabled on a VLAN, then when a network device—a DHCP client—that is connected to the VLAN on an untrusted interface sends a DHCP request, the switch inserts information about the client’s network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or another parameter for the client. See “Suboption Components of Option 82” on page 4001 for details about option 82 information.

NOTE:

- If your switch uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, you can enable DHCP option 82 only for a specific VLAN. See “Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)” on page 4039.

- If your switch is not using Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, you can enable DHCP option 82 either for a specific VLAN or for all VLANs. See Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure).
When option 82 is enabled on a VLAN, the following sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards (or relays) the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

NOTE: To use the DHCP option 82 feature, you must ensure that the DHCP server is configured to accept option 82. If it is not configured to accept option 82, then when it receives requests containing option 82 information, it does not use the information in setting parameters and it does not echo the information in its response message.

Suboption Components of Option 82
Option 82 as implemented on an EX Series switch comprises the suboptions circuit ID, remote ID, and vendor ID. These suboptions are fields in the packet header:

- circuit ID—Identifies the circuit (interface and/or VLAN) on the switch on which the request was received. The circuit ID contains the interface name and/or VLAN name, with the two elements separated by a colon—for example, ge-0/0/10:vlan1, where ge-0/0/10 is the interface name and vlan1 is the VLAN name. If the request packet is received on a Layer 3 interface, the circuit ID is just the interface name—for example, ge-0/0/10.
- remote ID—Identifies the host. See remote-id for details.
- vendor ID—Identifies the vendor of the host. If you specify the vendor-id option but do not enter a value, the default value Juniper is used. To specify a value, you type a character string.

Configurations of the EX Series Switch That Support Option 82
Configurations of the EX Series switch that support option 82 are:

- Switch, Clients and DHCP Server Are on Same VLAN on page 4002
- Switch Acts as a Relay Agent on page 4002
Switch, Clients and DHCP Server Are on Same VLAN

If the switch, the DHCP clients, and the DHCP server are all on the same VLAN, the switch forwards the requests from the clients on untrusted access interfaces to the server on a trusted interface. See Figure 51 on page 4002.

Figure 51: DHCP Clients, Switch, and DHCP Server Are All on Same VLAN

Switch Acts as a Relay Agent

The switch functions as a relay agent (extended relay server) when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as RVIs. Figure 52 on page 4003 illustrates a scenario for the switch acting as an extended relay server; in this instance, the switch relays requests to the server.
Figure 52: Switch Acting as an Extended Relay Server

Understanding DHCP Snooping for Port Security

NOTE: This topic includes information about enabling DHCP snooping when using Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Understanding DHCP Snooping for Port Security. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

DHCP snooping enables the switch to monitor and control DHCP messages received from untrusted devices connected to the switch. When DHCP snooping is enabled on a VLAN, the system snoops the DHCP messages to view DHCP lease information and build and maintain a database of valid IP address to MAC address (IP-MAC) bindings called the DHCP snooping database. Only clients with valid bindings are allowed access to the network.

- DHCP Snooping Basics on page 4004
- DHCP Snooping Process on page 4005
- DHCP Server Access on page 4006
- DHCP Snooping Table on page 4009
- Static IP Address Additions to the DHCP Snooping Database on page 4009
- Snooping DHCP Packets That Have Invalid IP Addresses on page 4009

**DHCP Snooping Basics**

Dynamic Host Configuration Protocol (DHCP) allocates IP addresses dynamically, leasing addresses to devices so that the addresses can be reused when no longer needed. Hosts and end devices that require IP addresses obtained through DHCP must communicate with a DHCP server across the LAN.

DHCP snooping acts as a guardian of network security by keeping track of valid IP addresses assigned to downstream network devices by a trusted DHCP server (the server is connected to a trusted network port).

By default, all trunk ports on the switch are trusted and all access ports are untrusted for DHCP snooping.

DHCP snooping is enabled automatically by Junos OS software when you configure any port security features at the `edit vlans vlan-name forwarding-options dhcp-security` hierarchy level.

When DHCP snooping is enabled, the lease information from the switch is used to create the DHCP snooping database. See “Configuring Port Security (CLI Procedure)” on page 4023 for additional information.

NOTE: DHCP snooping is not enabled in the default switch configuration.
Entries in the DHCP database are updated in these events:

- When a DHCP client releases an IP address (sends a DHCPRELEASE message), the associated mapping entry is deleted from the database.
- If you move a network device from one VLAN to another, typically the device needs to acquire a new IP address. Therefore, its entry in the database, including the VLAN ID, is updated.
- When the lease time (timeout value) assigned by the DHCP server expires, the associated entry is deleted from the database.

**TIP:** By default, the IP-MAC bindings are lost when the switch is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the `dhcp-snooping-file` statement to store the database file either locally or remotely.

You can configure the switch to snoop DHCP server responses only from specific VLANs. Doing this prevents spoofing of DHCP server messages.

You configure DHCP snooping per VLAN, not per interface (port). DHCP snooping is disabled by default. The details of the enabling or configuring DHCP snooping depend on the particular switch.

**DHCP Snooping Process**

The basic process of DHCP snooping consists of the following steps:

**NOTE:** When DHCP snooping is enabled for a VLAN, all DHCP packets sent from that network devices in that VLAN are subjected to DHCP snooping. The final IP-MAC binding occurs when the DHCP server sends DHCPACK to the DHCP client.

1. The network device sends a DHCPDISCOVER packet to request an IP address.
2. The switch forwards the packet to the DHCP server.
3. The server sends a DHCPOFFER packet to offer an address. If the DHCPOFFER packet is from a trusted interface, the switch forwards the packet to the DHCP client.
4. The network device sends a DHCPREQUEST packet to accept the IP address. The switch adds an IP-MAC placeholder binding to the database. The entry is considered a placeholder until a DHCPACK packet is received from the server. Until then, the IP address could still be assigned to some other host.
5. The server sends a DHCPACK packet to assign the IP address or a DHCPNAK packet to deny the address request.
6. The switch updates the DHCP database in accordance with the type of packet received:
Upon receipt of a DHCPACK packet, the switch updates lease information for the IP-MAC binding in its database.

Upon receipt of a DHCPNACK packet, the switch deletes the placeholder.

**NOTE:** The DHCP database is updated only after the DHCPREQUEST packet has been sent.

For general information about the messages that the DHCP client and DHCP server exchange during the assignment of an IP address for the client, see the Junos OS System Basics Configuration Guide.

**DHCP Server Access**

A switch's access to the DHCP server can be configured in three ways:

- **Switch, DHCP Clients, and DHCP Server Are All on the Same VLAN on page 4006**
- **Switch Acts as DHCP Server on page 4007**
- **Switch Acts as Relay Agent on page 4008**

**Switch, DHCP Clients, and DHCP Server Are All on the Same VLAN**

When the switch, DHCP clients, and DHCP server are all members of the same VLAN, the DHCP server can be connected to the switch in one of two ways:

**NOTE:** To enable DHCP snooping on the VLAN, set [edit vlans vlan-name forwarding-options] dhcp-security.

- The server is directly connected to the same switch as the one connected to the DHCP clients (the hosts, or network devices, that are requesting IP addresses from the server). The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. See Figure 53 on page 4007.
- The server is connected to an intermediary switch (Switch 2) that is connected through a trunk port to the switch (Switch 1) that the DHCP clients are connected to. Switch 2 is being used as a transit switch. The VLAN is enabled for DHCP snooping to protect the untrusted access ports of Switch 1. The trunk port is configured by default as a trusted port. See Figure 54 on page 4007—in the figure, ge-0/0/11 is a trusted trunk port.
Figure 53: DHCP Server Connected Directly to Switch

Switch Acts as DHCP Server

The switch itself is configured as a DHCP server; this is known as a "local" configuration. See Figure 55 on page 4008.
Figure 55: Switch Is the DHCP Server

Switch Acts as Relay Agent

The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. The Layer 3 interfaces on the switch are configured as routed VLAN interfaces (RVIs,) or integrated routing and bridging (IRB) interfaces. The trunk interfaces are trusted by default.

These two scenarios illustrate the switch acting as a relay agent:

- The DHCP server and clients are in different VLANs.
- The switch is connected to a router that is in turn connected to the DHCP server. See Figure 56 on page 4009.
The software creates a DHCP snooping information table that displays the content of the DHCP snooping database. The table shows current IP-MAC bindings, as well as lease time, type of binding, names of associated VLANs, and associated interface.

To display the contents of the DHCP snooping database, issue the operational mode command `show dhcp-security binding`.

Static IP Address Additions to the DHCP Snooping Database

You can add specific static IP addresses to the database as well as have the addresses dynamically assigned through DHCP snooping. To add static IP addresses, you supply the IP address, the MAC address of the device, the interface on which the device is connected, and the VLAN with which the interface is associated. No lease time is assigned to the entry. The statically configured entry never expires.

Snooping DHCP Packets That Have Invalid IP Addresses

If you enable DHCP snooping on a VLAN and then devices on that VLAN send DHCP packets that request invalid IP addresses, these invalid IP addresses will be stored in the DHCP snooping database until they are deleted when their default timeout is reached. To eliminate this unnecessary consumption of space in the DHCP snooping database, the switch drops the DHCP packets that request invalid IP addresses. The invalid IP addresses are:

- 0.0.0.0
- 128.0.x.x
- 191.255.x.x

Understanding IP Source Guard for Port Security on EX Series Switches

Ethernet LAN switches are vulnerable to attacks that involve spoofing (forging) of source IP addresses or source MAC addresses. You can use the IP source guard access port security feature on Juniper Networks EX Series Ethernet Switches to mitigate the effects of these attacks.

- IP Address Spoofing on page 4010
- How IP Source Guard Works on page 4010
- The IP Source Guard Database on page 4011
- Typical Uses of Other Junos Operating System (Junos OS) Features with IP Source Guard on page 4011

IP Address Spoofing

Hosts on access interfaces can spoof source IP addresses and source MAC addresses by flooding the switch with packets containing invalid addresses. Such attacks combined with other techniques such as TCP SYN flood attacks can result in denial-of-service (DoS) attacks. With source IP address or source MAC address spoofing, the system administrator cannot identify the source of the attack. The attacker can spoof addresses on the same subnet or on a different subnet.

How IP Source Guard Works

IP source guard checks the IP source address and MAC source address in a packet sent from a host attached to an untrusted access interface on the switch against entries stored in the DHCP snooping database. If IP source guard determines that the packet header contains an invalid source IP address or source MAC address, it ensures that the switch does not forward the packet—that is, the packet is discarded.
NOTE:

- If your switch uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, DHCP snooping is enabled automatically when you enable IP source guard on a VLAN. See “Configuring IP Source Guard (CLI Procedure)” on page 4029.

- If your switch is not using Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style and you enable IP source guard on a VLAN, you must also explicitly enable DHCP snooping on that VLAN. Otherwise, the default value of no DHCP snooping applies to the VLAN.

IP source guard applies its checking rules to packets sent from untrusted access interfaces on those VLANs. By default, on EX Series switches, access interfaces are untrusted and trunk interfaces are trusted. IP source guard does not check packets that have been sent to the switch by devices connected to either trunk interfaces or to trusted access interfaces so that a DHCP server can be connected to that interface to provide dynamic IP addresses.

NOTE: IP source guard is not supported on trunk interfaces regardless of whether the trunk interface is trusted or untrusted.

IP source guard obtains information about IP address to MAC address binding (IP-MAC binding) from the DHCP snooping database. It causes the switch to validate incoming IP packets against the entries in that database.

After the DHCP snooping database has been populated either through dynamic DHCP snooping or through configuration of specific static IP address/MAC address bindings, the IP source guard feature builds its database. It then checks incoming packets from access interfaces on the VLANs on which it is enabled. If the source IP addresses and source MAC addresses match the IP source guard binding entries, the switch forwards the packets to their specified destination addresses. If there are no matches, the switch discards the packets.

The IP Source Guard Database

For information about how to display the IP source guard database, issue the operational mode command that appears in the command-line interface (CLI):

- `show ip-source-guard`
- `show dhcp-security binding ip-source-guard`

Typical Uses of Other Junos Operating System (Junos OS) Features with IP Source Guard

You can configure IP source guard with various other features on the EX Series switch to provide access port security, including:
- VLAN tagging (used for voice VLANs)
- GRES (Graceful Routing Engine switchover)
- Virtual Chassis configurations (See “EX Series Switch Software Features Overview” on page 27 for list of models that support IP Source Guard.)
- Link aggregation groups (LAGs)
- 802.1X user authentication in single supplicant, single-secure supplicant, or multiple supplicant mode.

**NOTE:** If you are implementing 802.1X user authentication in single-secure supplicant or multiple supplicant mode, use the following configuration guidelines:

- If the 802.1X interface is part of an untagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has untagged membership.
- If the 802.1X interface is part of a tagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has tagged membership.

Understanding MAC Limiting and MAC Move Limiting for Port Security on EX Series Switches

MAC limiting for port security protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on interfaces (ports).

MAC move limiting detects MAC movement and MAC spoofing on access interfaces. You enable this feature on VLANs.

This topic describes the various method of MAC limiting and MAC move limiting for port security:

- MAC Limiting for Port Security by Limiting the Number of MAC Addresses That Can be Learned on Interfaces on page 4013
- MAC Limiting for Port Security by Specifying MAC Addresses That Are Allowed to Access Interfaces on page 4013
- MAC Move Limiting for Port Security by Monitoring MAC Address Moves within VLANs on page 4014

MAC Limiting for Port Security by Limiting the Number of MAC Addresses That Can be Learned on Interfaces

One method to enhance port security is to set the maximum number of MAC addresses that can be learned (added to the Ethernet switching table) on any of the following:

- A specific access interface (port)
- All access interfaces
- A specific access interface on the basis of its membership within a specific virtual LAN (VLAN membership MAC limit)

![NOTE: Static MAC addresses do not count toward the limit you specify for dynamic MAC addresses.]

When you are configuring the maximum MAC limit for an interface, you can choose the action that occurs on incoming packets when the MAC limit is exceeded. For additional information about configuring MAC limit for an interface, see Configuring MAC Limiting (CLI Procedure) or “Configuring MAC Limiting (CLI Procedure)” on page 2132.

MAC Limiting for Port Security by Specifying MAC Addresses That Are Allowed to Access Interfaces

Another method to enhance port security is to configure specific MAC addresses as allowed MAC addresses for specific access interfaces. Any MAC address that is not in the list of the configured addresses is not learned and the switch logs a message.

Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.
MAC Move Limiting for Port Security by Monitoring MAC Address Moves within VLANs

MAC move limiting causes the switch to limit and track the frequency with which a MAC address can move to a new interface (port). It can help prevent MAC spoofing, and it can also detect and prevent loops.

NOTE: MAC move limiting is not supported on EX9200.

If a MAC address moves more than the configured number of times within one second, the switch performs the configured action. You can configure MAC move limiting to apply to all VLANs or to a specific VLAN.

Understanding Persistent MAC Learning (Sticky MAC)

Persistent MAC learning, also known as sticky MAC, is a port security feature that enables an interface to retain dynamically learned MAC addresses when the switch is restarted or if the interface goes down and is brought back online.

Persistent MAC address learning is disabled by default. You can enable persistent MAC address learning in conjunction with MAC limiting to restrict the number of persistent MAC addresses. You enable this feature on interfaces.

Configure persistent MAC learning on an interface to:

- Prevent traffic losses for trusted workstations and servers because the interface does not have to relearn the addresses from ingress traffic after a restart.
- Protect the switch against security attacks. Use persistent MAC learning in combination with MAC limiting to protect against attacks, such as Layer 2 denial-of-service (DoS) attacks, overflow attacks on the Ethernet switching table, and DHCP starvation attacks, by limiting the MAC addresses allowed while still allowing the interface to dynamically learn a specified number of MAC addresses. The interface is secured because after the limit has been reached, additional devices cannot connect to the port.
By configuring persistent MAC learning along with MAC limiting, you enable interfaces to learn MAC addresses of trusted workstations and servers from the time when you connect the interface to your network until the limit for MAC addresses is reached, and ensure that after this limit is reached, new devices will not be allowed to connect to the interface even if the switch restarts. As an alternative to using persistent MAC learning with MAC limiting, you can statically configure each MAC address on each port or allow the port to continuously learn new MAC addresses after restarts or interface-down events. Allowing the port to continuously learn MAC addresses represents a security risk.

**NOTE:** While a switch is restarting or an interface is coming back up, there might be a short delay before the interface can learn more MAC addresses. This delay occurs while the system re-enters previously learned persistent MAC addresses into the forwarding database for the interface.

**TIP:** If you move a device within your network that has a persistent MAC address entry on the switch, use the clear ethernet-switching table persistent-mac command to clear the persistent MAC address entry from the interface. If you move the device and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address of the device and the device will not be able to connect.

If the original port is down when you move the device, then the new port will learn the MAC address and the device can connect. However, if you do not clear the persistent MAC address on the original port, then when the port restarts, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the persistent MAC address is removed from the new port and the device loses connectivity.

Consider the following configuration guidelines when configuring persistent MAC learning:

- Interfaces must be configured in access mode (use the `port-mode` configuration statement or, for switches operating on the Enhanced Layer 2 Software (ELS) configuration style, the `interface-mode` configuration statement).
- You cannot enable persistent MAC learning on an interface on which 802.1x authentication is configured.
- You cannot enable persistent MAC learning on an interface that is part of a redundant trunk group.
- You cannot enable persistent MAC learning on an interface on which `no-mac-learning` is enabled.

Understanding Trusted DHCP Servers for Port Security

Any interface on the switch that connects to a DHCP server can be configured as a trusted port. Configuring a DHCP server on a trusted port protects against rogue DHCP servers sending leases.

Ensure that the DHCP server interface is physically secure—that is, that access to the server is monitored and controlled at the site—before you configure the port as trusted.

Configuration Examples

- Example: Configuring IP Source Guard and Dynamic ARP Inspection to Protect the Switch from IP Spoofing and ARP Spoofing on page 4017

Example: Configuring IP Source Guard and Dynamic ARP Inspection to Protect the Switch from IP Spoofing and ARP Spoofing

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

This example describes how to enable IP source guard and DAI on a specified VLAN to protect the switch against spoofed IP/MAC addresses and ARP spoofing attacks. When you enable either IP source guard or DAI, the configuration automatically enables DHCP snooping for the same VLAN.

- Requirements on page 4017
- Overview and Topology on page 4018
- Configuration on page 4019
- Verification on page 4020

Requirements

This example uses the following hardware and software components:

- One EX4300 switch
- Junos OS Release 13.2X50-D10 or later for EX Series switches
• A DHCP server to provide IP addresses to network devices on the switch

Before you configure IP source guard to prevent IP/MAC spoofing or DAI to mitigate ARP spoofing attacks, be sure you have:

• Connected the DHCP server to the switch.
• Configured the VLAN to which you are adding DHCP security features. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

Overview and Topology

Ethernet LAN switches are vulnerable to attacks on security that involve spoofing (forging) of source MAC addresses or source IP addresses. These spoofed packets are sent from hosts connected to untrusted access interfaces on the switch. These spoofed packets are sent from hosts connected to untrusted access interfaces on the switch. IP source guard checks the IP source address and MAC source address in a packet sent from a host attached to an untrusted access interface on the switch against entries stored in the DHCP snooping database. If IP source guard determines that the packet header contains an invalid source IP address or source MAC address, it ensures that the switch does not forward the packet—that is, the packet is discarded.

Another type of security attack is ARP spoofing (also known as ARP poisoning or ARP cache poisoning). ARP-spoofing is a way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the LAN. Instead of the switch sending traffic to the proper network device, it sends it to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker's machine, the attacker receives all the traffic from the switch that should have gone to another device. The result is that traffic from the switch is misdirected and cannot reach its proper destination.

NOTE: When dynamic ARP inspection (DAI) is enabled, the switch logs the number of invalid ARP packets that it receives on each interface, along with the sender’s IP and MAC addresses. You can use these log messages to discover ARP spoofing on the network.

This example shows how to configure these important port security features on a switch that is connected to a DHCP server. The setup for this example includes the VLAN employee-vlan on the switch. Figure 57 on page 4019 illustrates the topology for this example.

NOTE: The trunk interface connecting to the DHCP server interface is a trusted port by default.
Figure 57: Network Topology for Basic Port Security

The components of the topology for this example are shown in Table 493 on page 4019.

Table 493: Components of the Port Security Topology

<table>
<thead>
<tr>
<th>Properties</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch hardware</td>
<td>One EX4300 or EX9200 switch</td>
</tr>
<tr>
<td>VLAN name and ID</td>
<td>employee-vlan, tag 20</td>
</tr>
<tr>
<td>VLAN subnets</td>
<td>192.0.2.16/28</td>
</tr>
<tr>
<td></td>
<td>192.0.2.17 through 192.0.2.30</td>
</tr>
<tr>
<td></td>
<td>192.0.2.31 is the subnet’s broadcast address</td>
</tr>
<tr>
<td>Interfaces in employee-vlan</td>
<td>ge-0/0/1, ge-0/0/2, ge-0/0/3, ge-0/0/8</td>
</tr>
<tr>
<td>Interface connecting to DHCP server</td>
<td>ge-0/0/8</td>
</tr>
</tbody>
</table>

In this example, the switch has already been configured as follows:

- All access ports are untrusted, which is the default setting.
- The trunk port (ge-0/0/8) is trusted, which is the default setting.
- The VLAN (employee-vlan) has been configured to include the specified interfaces.

**Configuration**

To configure IP source guard and DAI (and thereby, also automatically configure DHCP snooping) to protect the switch against IP spoofing and ARP attacks:
To quickly configure IP source guard and DAI (and thereby, also automatically configure DHCP snooping), copy the following commands and paste them into the switch terminal window:

```plaintext
[edit]
set vlans employee-vlan forwarding-options dhcp-security ip-source-guard
set vlans employee-vlan forwarding-options dhcp-security arp-inspection
```

**Step-by-Step Procedure**

Configure IP source guard and DAI (and thereby, also automatically configure DHCP snooping) on the VLAN:

1. **Configure IP source guard on the VLAN:**
   ```plaintext
   [edit vlans employee-vlan forwarding-options dhcp-security]
   user@switch# set ip-source-guard
   ```

2. **Enable DAI on the VLAN:**
   ```plaintext
   [edit vlans employee-vlan forwarding-options dhcp-security]
   user@switch# set arp-inspection
   ```

**Results**

Check the results of the configuration:

```plaintext
user@switch> show vlans employee-vlan forwarding-options
employee-vlan {
    forwarding-options {
        dhcp-security {
            arp-inspection;
            ip-source-guard;
        }
    }
}
```

**Verification**

Confirm that the configuration is working properly.

- **Verifying That DHCP Snooping Is Working Correctly on the Switch** on page 4020
- **Verifying That IP Source Guard Is Working on the VLAN** on page 4021
- **Verifying That DAI Is Working Correctly on the Switch** on page 4021

**Purpose**

Verify that DHCP snooping is working on the switch.
**Action**  
Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the port on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp-security binding
```

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Vlan</th>
<th>Expires</th>
<th>State</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.0.2.17</td>
<td>00:05:85:3A:82:77</td>
<td>employee-vlan</td>
<td>86265</td>
<td>BOUND</td>
<td>ge-0/0/1.0</td>
</tr>
<tr>
<td>192.0.2.18</td>
<td>00:05:85:3A:82:79</td>
<td>employee-vlan</td>
<td>86265</td>
<td>BOUND</td>
<td>ge-0/0/1.0</td>
</tr>
<tr>
<td>192.0.2.19</td>
<td>00:05:85:3A:82:80</td>
<td>employee-vlan</td>
<td>86287</td>
<td>BOUND</td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td>192.0.2.20</td>
<td>00:05:85:3A:82:81</td>
<td>employee-vlan</td>
<td>86287</td>
<td>BOUND</td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td>192.0.2.21</td>
<td>00:05:85:3A:82:83</td>
<td>employee-vlan</td>
<td>86287</td>
<td>BOUND</td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td>192.0.2.22</td>

<td>employee-vlan</td>
<td>86254</td>
<td>BOUND</td>
<td>ge-0/0/3.0</td>
</tr>
</tbody>
</table>

**Meaning**  
When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for the assigned IP address, the device’s MAC address, the VLAN name, and the time, in seconds, remaining before the lease expires.

**Verifying That IP Source Guard is Working on the VLAN**

**Purpose**  
Verify that IP source guard is enabled and working on the VLAN.

**Action**  
Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch. View the IP source guard information for the data VLAN.

```
user@switch> show dhcp-security binding ip-source-guard
```

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Vlan</th>
<th>Expires</th>
<th>State</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>

<td>86265</td>
<td>BOUND</td>
<td>ge-0/0/1.0</td>
</tr>
<tr>
<td>192.0.2.18</td>
<td>00:05:85:3A:82:79</td>
<td>employee-vlan</td>
<td>86265</td>
<td>BOUND</td>
<td>ge-0/0/1.0</td>
</tr>
<tr>
<td>192.0.2.19</td>
<td>00:05:85:3A:82:80</td>
<td>employee-vlan</td>
<td>86287</td>
<td>BOUND</td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td>192.0.2.20</td>
<td>00:05:85:3A:82:81</td>
<td>employee-vlan</td>
<td>86287</td>
<td>BOUND</td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td>192.0.2.21</td>
<td>00:05:85:3A:82:83</td>
<td>employee-vlan</td>
<td>86287</td>
<td>BOUND</td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td>192.0.2.22</td>
<td>00:05:85:27:32:88</td>
<td>employee-vlan</td>
<td>86254</td>
<td>BOUND</td>
<td>ge-0/0/3.0</td>
</tr>
</tbody>
</table>

**Meaning**  
The IP source guard database table contains the VLANs enabled for IP source guard.

**Verifying That DAI Is Working Correctly on the Switch**

**Purpose**  
Verify that DAI is working on the switch.
Action

Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show dhcp-security arp inspection statistics
ARP inspection statistics:
Interface           Packets received  ARP inspection pass  ARP inspection failed
ge-0/0/1.0                  7                       5                     2
ge-0/0/2.0                 10                      10                     0
ge-0/0/3.0                 12                      12                     0
```

Meaning

The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

Configuring Port Security (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Port Security (CLI Procedure). For ELS details, see "Getting Started with Enhanced Layer 2 Software" on page 3.

Ethernet LANs are vulnerable to attacks such as address spoofing and Layer 2 denial of service (DoS) on network devices. DHCP port security features such as DHCP snooping, DAI (dynamic ARP inspection), IP source guard, and DHCP option 82 help protect the access ports on the switch against the losses of information and productivity that can result from such attacks.

DAI, IP source guard, and DHCP option 82 are configured per VLAN.

The DHCP port security features that you specify for the VLAN apply to all the interfaces included within that VLAN. However, you can create a specific group of access interfaces within the VLAN to have different attributes, such as:

- Specifying a specific interface to have a static IP-MAC address (**static-ip**).
- Specifying an access interface to act as a trusted interface to a DHCP server (**trusted**)
- Specifying a specific interface not to transmit DHCP (**no-option-82**)

**NOTE:**

- If you configure any of these DHCP port security features—including configuring a group of access interfaces—for a specific VLAN, the switch software enables automatically enables DHCP snooping for that VLAN.
- If you explicitly disable DHCP snooping by setting **no-dhcp-snooping** for a specific VLAN, the switch software automatically disables any other DHCP port security features for that VLAN.

**NOTE:** Trunk interfaces are trusted by default. However, on an EX9200 switch, you can override this default behavior and set a trunk interface as untrusted.

You must configure a VLAN prior to configuring these DHCP port security features. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.
DAI, IP source guard, and DHCP option 82 are configured per VLAN. Enabling any one of these features automatically enables DHCP snooping.

For additional details, see:

- Enabling Dynamic ARP Inspection (CLI Procedure) on page 4035
- Configuring IP Source Guard (CLI Procedure) on page 4029
- Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure) on page 4039

You can override the general port security settings for the VLAN by configuring a group of access interfaces within that VLAN. For details, see:

- Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) on page 4034
- Enabling a Trusted DHCP Server (CLI Procedure) on page 4036

### Configuring Port Security (J-Web Procedure)

To configure port security on an EX Series switch using the J-Web interface:

1. Select **Configure > Security > Port Security**.

   The VLAN List table lists all the VLAN names, VLAN identifiers, port members, and port security VLAN features.

   The Interface List table lists all the ports and indicates whether security features have been enabled on the ports.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:

   - **Edit**—Click this option to modify the security features for the selected port or VLAN.

     Enter information as specified in Table 494 on page 4025 to modify port security settings on VLANs.

     Enter information as specified in Table 495 on page 4027 to modify port security settings on interfaces.

   - **Activate/Deactivate**—Click this option to enable or disable security on the switch.
NOTE: This option is not supported on EX4300 switches.

- **Delete**—Click this option to delete the security features of the selected port or VLAN.

NOTE: This option is supported only on EX4300 switches.

Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

An Ethernet switching access interface on an EX Series switch might shut down or be disabled as a result of one of the following port-security or storm control configurations:

- MAC limiting—`mac-limit` statement is configured with the action `shutdown`.
- MAC move limiting—(Not supported on EX9200) `mac-move-limit` statement is configured with the action `shutdown`.
- Storm control—`storm-control` statement is configured with the action `shutdown`.

You can configure the switch to automatically restore the disabled interfaces to service after a specified period of time. The specified `recovery-timeout` applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: To enable autorecovery, specify the timeout value for the interfaces to recover automatically. There is no default recovery timeout. If you do not specify a timeout value, you need to use the `clear ethernet-switching recovery-timeout` command to clear the errors and restore the interfaces to service.

Specify the recovery timeout period for the interface:

```
[edit interfaces interface-name family ethernet-switching]
user@switch# set recovery-timeout seconds
```

Configuring IP Source Guard (CLI Procedure)

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring IP Source Guard (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can use the IP source guard access port security feature on EX Series switches to mitigate the effects of source IP address spoofing and source MAC address spoofing. If IP source guard determines that a host connected to an access interface has sent a packet with an invalid source IP address or source MAC address in the packet header, then IP source guard ensures that the switch does not forward the packet—that is, the packet is discarded.

You enable the IP source guard feature on a specific VLAN. When you enable IP source guard on a VLAN, the switch automatically enables DHCP snooping on that VLAN.

**NOTE:** IP source guard can be applied only to untrusted interfaces.

**NOTE:** You can use IP source guard together with 802.1X user authentication in single supplicant, single-secure supplicant, or multiple supplicant mode.

Before you can enable IP source guard on a VLAN, you must configure the VLAN. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

To enable IP source guard on a specific VLAN by using the CLI:

```
[edit vlans vlan-name forwarding-options]
user@switch# set ip-source-guard
```

**Related Documentation**

Configuring MAC Limiting (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring MAC Limiting (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.
This topic describes various ways of configuring a limitation on MAC addresses in packets that are received and forwarded by the switch.

The different ways of setting a MAC limit are described in the following sections:

- Limiting the Number of MAC Addresses Learned by an Interface on page 4030
- Limiting the Number of MAC Addresses Learned by a VLAN on page 4030

**Limiting the Number of MAC Addresses Learned by an Interface**

To secure a port, you can set the maximum number of MAC addresses that can be learned by an interface:

- Set the MAC limit on an interface, and specify an action that the switch takes after the specified limit is exceeded:

  ```
  [edit switch-options]
  user@switch# set interface interface-name interface-mac-limit limit packet-action action
  ```

  After you set a new MAC limit for the interface, the system clears existing entries in the MAC address forwarding table associated with the interface.

**Limiting the Number of MAC Addresses Learned by a VLAN**

To limit the number of MAC addresses learned by a VLAN:

1. Set the maximum number of MAC addresses that can be learned by a VLAN, and specify an action that the switch takes after the specified limit is exceeded:

   ```
   [edit vlans]
   user@switch# set vlan-name switch-options mac-table-size limit packet-action action
   ```

2. Set the maximum number of MAC addresses that can be learned by one or all interfaces in the VLAN, and specify an action that the switch takes after the specified limit is exceeded:

   ```
   [edit vlans]
   user@switch# set vlan-name switch-options interface interface-name interface-mac-limit limit packet-action action
   ```

   ```
   [edit vlans]
   user@switch# set vlan-name switch-options interface-mac-limit limit packet-action action
   ```

**NOTE:** If you specify a MAC limit and packet action for all interfaces in the VLAN and a specific interface in the VLAN, the MAC limit and packet action specified at the specific interface level takes precedence. Also, at the VLAN interface level, only the drop and drop-and-log options are supported.

After you set new MAC limits for a VLAN by using the `mac-table-size` statement or for interfaces associated with a VLAN by using the `interface-mac-limit` statement, the system clears the corresponding existing entries in the MAC address forwarding table.
Configuring MAC Limiting (J-Web Procedure)

MAC limiting protects against flooding of the Ethernet switching table on an EX Series switch. MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

Junos OS provides two MAC limiting methods:

- Maximum number of dynamic MAC addresses allowed per interface—if the limit is exceeded, incoming packets with new MAC addresses are dropped.
- Specific “allowed” MAC addresses for the access interface—Any MAC address that is not in the list of configured addresses is not learned.

You configure MAC limiting for each interface, not for each VLAN. You can specify the maximum number of dynamic MAC addresses that can be learned on a single Layer 2 access interface or on all Layer 2 access interfaces. The default action that the switch will take if that maximum number is exceeded is drop—drop the packet and generate an alarm, an SNMP trap, or a system log entry.

To enable MAC limiting on one or more interfaces using the J-Web interface:

2. Select one or more interfaces from the Interface List.
3. Click the Edit button. If a message appears asking whether you want to enable port security, click Yes.
4. To set a dynamic MAC limit:
   1. Type a limit value in the MAC Limit box.
   2. Select an action from the MAC Limit Action box (optional). The switch takes this action when the MAC limit is exceeded. If you do not select an action, the switch applies the default action, drop.
      - Log—Generate a system log entry.
      - Drop—Drop the packets and generate a system log entry. (Default)
      - Shutdown—Shut down the VLAN and generate a system log entry. You can mitigate the effect of this option by configuring the switch for autorecovery from the disabled state and specifying a disable timeout value. See Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure). If you have not configured autorecovery from the disabled state, you can bring up the interfaces by running the clear ethernet-switching port-error command.
      - None—No action to be taken.
4. To add allowed MAC addresses:
1. Click Add.

2. Type the allowed MAC address and click OK.

Repeat this step to add more allowed MAC addresses.

6. Click OK when you have finished setting MAC limits.

7. Click OK after the configuration has been successfully delivered.

NOTE: You can enable or disable port security on the switch at any time by clicking the Activate or Deactivate button on the Port Security Configuration page. If security status is shown as Disabled when you try to edit settings for any VLANs or interfaces (ports), a message asking whether you want to enable port security appears.

Configuring Persistent MAC Learning (CLI Procedure)

NOTE: This topic uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Persistent MAC Learning (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Persistent MAC address learning is disabled by default. You can enable it to:

- Help prevent traffic losses for trusted workstations and servers because the interface does not have to relearn the addresses from ingress traffic after a restart.

- Protect the switch against security attacks—Use persistent MAC learning in combination with MAC limiting to protect against attacks while still avoiding the need to statically configure MAC addresses. When the initial learning of MAC addresses up to the number specified by the MAC limit is done, new addresses will not be allowed even after a
To configure persistent MAC learning on an interface and limit the number of allowed MAC addresses:

1. Enable persistent MAC learning on an interface \texttt{ge-x/y/z} where \(x, y, \) and \(z\) are variables:

   \[
   \begin{align*}
   & \text{[edit "switch-options" on page 2027]} \\
   & \text{user@switch\# set interface ge-x/y/z persistent-learning}
   \end{align*}
   \]

2. To configure a MAC move limit for MAC addresses within a specific VLAN:

   - To limit the number of MAC address movements that can be made by an individual MAC address within the specified VLAN:
     \[
     \begin{align*}
     & \text{[edit vlans vlan-name switch-options]} \\
     & \text{user@switch\# set mac-move-limit limit}
     \end{align*}
     \]
     The action is not specified, so the switch performs the default action drop if it tracks that an individual MAC address within the specified VLAN has moved more than the specified number of times within one second.

   - To limit the number of MAC address movements that can be made by an individual MAC address and to specify the action to be taken when the limit is reached:
     \[
     \begin{align*}
     & \text{[edit vlans vlan-name switch-options]} \\
     & \text{user@switch\# set mac-move-limit limit packet-action action}
     \end{align*}
     \]
     Values for \texttt{action} are:

     - \texttt{drop}—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.

     - \texttt{drop-and-log}—(EX Series switches only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

     - \texttt{log}—(EX Series switches only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

     - \texttt{none}—(EX Series switches only) Forward packets with new source MAC addresses, and learn the new source MAC address.

     - \texttt{shutdown}—(EX Series switches only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

   \[\text{TIP: If you move a device within your network that has a persistent MAC address entry on the switch, use the clear ethernet-switching table persistent-mac command to clear the persistent MAC address entry from the interface. If you move the device and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address of the device and the device will not be able to connect.} \]

   If the original port is down when you move the device, then the new port will learn the MAC address and the device can connect. However, if you do not clear the persistent MAC address on the original port, then when the port
restarts, the system reinstall the persistent MAC address in the forwarding
table for that port. If this occurs, the persistent MAC address is removed from
the new port and the device loses connectivity.

Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure)

NOTE: This example uses Junos OS for EX Series switches with support for
the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs
software that does not support ELS, see Configuring Static IP Addresses for
DHCP Bindings on Access Ports (CLI Procedure). For ELS details, see “Getting
Started with Enhanced Layer 2 Software” on page 3.

You can add static (fixed) IP addresses and bind them to fixed MAC addresses in the
DHCP snooping database. These bindings are labeled as static in the database, while
those bindings that have been added through the process of DHCP snooping are labeled
dynamic.

Before you can perform this procedure, you must configure the VLAN. See “Configuring
VLANs for EX Series Switches (CLI Procedure)” on page 2119.

To configure a static IP address/MAC address binding in the DHCP snooping database,
you must first create a group of access interfaces under [edit vlans
vlan-name
forwarding-options dhcp-security]. Creating this group automatically enables DHCP
snooping, which is a prerequisite for creating the DHCP snooping database. You can then
configure a specific interface within the group to have a static IP address that is bound
to a fixed MAC address. If you want to have multiple static IP addresses, configure
additional interfaces within the same group.

To configure a static IP address and MAC address binding in the DHCP snooping database:

[edit vlans vlan-name forwarding-options dhcp-security]
user@switch# set group group-name interface interface-name static-ip
ip-address mac
mac-address

If you want to have multiple static IP addresses within the same VLAN, configure additional
interfaces within the same group.

Enabling Dynamic ARP Inspection (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Enabling Dynamic ARP Inspection (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Dynamic ARP inspection (DAI) protects switches against ARP spoofing. DAI inspects ARP packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP cache poisoning.

Before you can enable DAI on a VLAN, you must configure the VLAN. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

To enable DAI on a VLAN by using the CLI:

```
[edit vlans vlan-name forwarding-options dhcp-security]
user@switch# set arp-inspection
```

Enabling Dynamic ARP Inspection (J-Web Procedure)

Dynamic ARP inspection (DAI) protects EX Series switches against ARP spoofing. DAI inspects ARP packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP cache poisoning.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

To enable DAI on one or more VLANs by using the J-Web interface:

2. Select one or more VLANs from the VLAN list.
3. Click the Edit button. If a message appears asking if you want to enable port security, click Yes.
4. Select the Enable ARP Inspection on VLAN check box and then click OK.
5. Click OK after the command has been successfully delivered.
NOTE: You can enable or disable port security on the switch at any time by clicking the Activate or Deactivate button on the Port Security Configuration page. If security status is shown as Disabled when you try to edit settings for any VLANs or interfaces (ports), the message asking if you want to enable port security appears.

## Enabling a Trusted DHCP Server (CLI Procedure)

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Enabling a Trusted DHCP Server (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can configure any interface on a switch that connects to a DHCP server as a trusted interface (port). Configuring a DHCP server on a trusted interface protects against rogue DHCP servers sending leases.

By default, all access interfaces are untrusted, and all trunk interfaces are trusted. However, you can override the default setting for access interfaces by configuring a group of access interfaces within a VLAN, specifying an interface to belong to that group, and then configuring the group as trusted.

Before you can configure a trusted DHCP server, you must configure a VLAN. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

To configure an untrusted access interface as a trusted interface for a DHCP server by using the CLI:

1. Configure a group within a VLAN with a specific access interface:
   ```
   [edit vlans vlan-name forwarding-options]
   user@switch# set group group-name interface interface-name
   ```
2. Configure that group as **trusted** to make the specified interface contained within the
group a trusted interface:

   ```
   [edit vlans vlan-name forwarding-options dhcp-security group group-name]
   user@switch# set overrides trusted
   ```

**Related Documentation**

- Enabling a Trusted DHCP Server (J-Web Procedure) on page 4037
- Understanding Trusted DHCP Servers for Port Security on page 4016

### Enabling a Trusted DHCP Server (J-Web Procedure)

You can configure any interface on the EX Series switch that connects to a DHCP server
as a trusted interface (port). Configuring a DHCP server on a trusted interface protects
against rogue DHCP servers sending leases.

You configure a trusted DHCP server on an interface, not on a VLAN. By default, all access
interfaces are untrusted and all trunk interfaces are trusted.

To enable a trusted DHCP server on one or more interfaces by using the J-Web interface:

1. Select **Configure>Security>Port Security**.
2. Select one or more interfaces from the Port list.
3. Click the **Edit** button. If a message appears asking if you want to enable port security,
click **Yes**.
4. Select the **Trust DHCP** check box and then click **OK**.
5. Click **OK** after the command has been successfully delivered.

**NOTE:** You can enable or disable port security on the switch at any time by
clicking the **Activate** or **Deactivate** button on the Port Security Configuration
page. If security status is shown as **Disabled** when you try to edit settings for
any VLANs or interfaces (ports), the message asking if you want to enable
port security appears.

**Related Documentation**

- Enabling a Trusted DHCP Server (CLI Procedure)
- Example: Configuring Basic Port Security Features
- Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from
Rogue DHCP Server Attacks
- Verifying That a Trusted DHCP Server Is Working Correctly
- Monitoring Port Security
- Understanding Trusted DHCP Servers for Port Security on page 4016
Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

By default, IP-MAC bindings in the DHCP snooping database do not persist. You can configure the IP-MAC bindings in the DHCP database to persist through switch reboots by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.

The DHCP snooping database of IP-MAC bindings is created when you enable any of the port security features for a specific VLAN in [edit vlans vlan-name forwarding-options dhcp-security]. DHCP snooping is not enabled by default.

To make the IP-MAC bindings in the DHCP snooping database persist through switch reboots:

- For local storage, specify a local pathname as the location in which to store the DHCP snooping database:

  [edit system processes]
  user@switch# set dhcp-service dhcp-snooping-file local-pathname write-interval seconds

  For example:

  [edit system processes]
  user@switch# set dhcp-service dhcp-snooping-file /var/tmp/test.log write-interval 60

- For remote storage, use ftp://ip-address or ftp://hostname/path as the location in which to store the DHCP snooping database:

  [edit system processes]
  user@switch# set dhcp-service dhcp-snooping-file remote-url write-interval seconds

  For example:

  [edit system processes]
  user@switch# set dhcp-service dhcp-snooping-file location ftp://test:Test123@14.1.2.1 write-interval 60

NOTE: Specify any requisite user credentials for the FTP server before specifying the IP address or hostname. In this example, test is the username and Test123 is the password for FTP server 14.1.2.1.

Related Documentation

• Understanding DHCP Snooping for Port Security
You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

You can configure the DHCP option 82 feature in two topologies:

- The switch, DHCP clients, and DHCP server are all on the same VLAN. The switch forwards the clients’ requests to the server and forwards the server’s responses to the clients. This topic describes this configuration.

- The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as integrated routing and bridging (IRB) interfaces. The switch relays the clients’ requests to the server and then forwards the server’s responses to the clients. This configuration is described in Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure).

Before you configure DHCP option 82 on the switch, perform these tasks:

- Connect and configure the DHCP server.

  **NOTE:** Your DHCP server must be configured to accept DHCP option 82. If the server is not configured for DHCP option 82, the server does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configure a VLAN on the switch and associate the interfaces on which the clients and the server connect to the switch with that VLAN. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.
To configure DHCP option 82:

1. Specify DHCP option 82 for the VLAN that you configured.
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security]
   user@switch# option-82
   ```

   **NOTE:** If you want to enable DHCP option 82 on all VLANs, you must configure it separately for each specific VLAN.

   The remaining steps are optional.

2. Configure the prefix for the circuit ID suboption to include the switch’s hostname or the routing instance name for the VLAN:
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set circuit-id prefix (host-name | routing-instance-name)
   ```

3. Specify that the circuit ID suboption value contains the interface description rather than the interface name (the default):
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set circuit-id use-interface-description
   ```

4. Specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set circuit-id use-vlan-id
   ```

5. Specify that the remote ID suboption is included in the DHCP option 82 information:
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set remote-id
   ```

   **NOTE:** If you do not specify a keyword after `remote-id`, the default value for the remote-id suboption is the interface name.

6. Specify that the remote ID suboption is the hostname of the switch:
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set remote-id host-name
   ```

7. Specify that the remote ID suboption value contains the interface description:
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set remote-id use-interface-description
   ```

8. Specify that the remote ID suboption value contains a character string:
   
   ```
   [edit vlans vlan-name forwarding-options dhcp-security option-82]
   user@switch# set remote-id use-string mystring
   ```

9. Configure a vendor ID suboption:

   - To use the default value (the default value is Juniper), do not type a character string after the `vendor-id` option keyword:
     
     ```
     [edit vlans vlan-name forwarding-options dhcp-security option-82]
     user@switch# set vendor-id
     ```

   - To configure that the vendor ID suboption value contains a character string value that you specify rather than Juniper (the default):
[edit vlans vlan-name forwarding-options dhcp-security option-82]
user@switch# set vendor-id mystring

- Understanding DHCP Option 82 for Port Security on EX Series Switches on page 4000

Configuration Statements

- [edit vlans] Configuration Statement Hierarchy on EX Series Switches on page 4041

[edit vlans] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit vlans] hierarchy level on EX Series switches.

- Supported statements are those that you can use to configure some aspect of a software feature on the switch.

- Unsupported statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit vlans] Hierarchy Level on page 4041
- Unsupported Statements in the [edit vlans] Hierarchy Level on page 4043

Supported Statements in the [edit vlans] Hierarchy Level

The following hierarchy shows the [edit vlans] configuration statements supported on one or more of the EX Series switches:

vlans {
  vlan-name {
    description text-description;
    domain-type bridge;
    forwarding-options {
      dhcp-security {
        arp-inspection;
        group group-name {
          interface interface-name {
            static-ip ip-address {
              mac mac-address;
            }
          }
        }
        overrides {
          no-option82;
          trusted;
        }
      }
    }
  }
}

}
vlan-id number;
vlan-id-list [vlan-id | vlan-id–vlan-id];
}

Unsupported Statements in the [edit vlans] Hierarchy Level

All statements in the [edit vlans] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

Table 496: Unsupported [edit vlans] Configuration Statements on EX Series Switches

<table>
<thead>
<tr>
<th>Statement</th>
<th>Hierarchy Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>mcae-mac-synchronize</td>
<td>[edit vlans]</td>

arp-inspection

Syntax
arp-inspection {
    forwarding-class class-name;
}

Hierarchy Level
- For platforms with ELS:
  [edit vlans vlan-name forwarding-options dhcp-security],
  [edit forwarding-options dhcp-relay ]
- For platforms without ELS:
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name)],
  [edit forwarding-options dhcp-relay ]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Hierarchy level [edit vlans vlan-name forwarding-options dhcp-security] introduced in
Junos OS Release 13.2X50-D10. (See "Getting Started with Enhanced Layer 2 Software"
on page 3 for information about ELS.)

Description
Perform dynamic ARP inspection (DAI) on all VLANs or on the specified VLAN.

NOTE: If you enable DAI at the [edit vlans vlan-name forwarding-options dhcp-security] hierarchy level, you can configure DAI only for a specific VLAN. You cannot configure it for a list or a range of VLAN IDs.

When DAI is enabled, the switch logs invalid ARP packets that it receives on each interface, along with the sender’s IP and MAC addresses.

NOTE: The forwarding-class statement is not available at the [edit vlans vlan-name forwarding-options dhcp-security] hierarchy level.

The remaining statement is explained separately.

NOTE: If you enable arp-inspection at the [edit vlans vlan-name forwarding-options dhcp-security] hierarchy level, DHCP snooping is automatically enabled. Conversely, if you explicitly disable DHCP snooping by specifying no-dhcp-snooping, DAI is automatically disabled.

See “Enabling Dynamic ARP Inspection (CLI Procedure)” on page 4035 for more information about this configuration.

Default
Disabled.
Required Privilege
Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**circuit-id**

**Syntax**

```plaintext
circuit-id {  
  prefix hostname;  
  use-interface-description;  
  use-vlan-id;  
}
```

**Hierarchy Level**

- For platforms with ELS:

  ```plaintext
  [edit vlans vlan-name forwarding-options dhcp-security option-82 ]
  ```

- For platforms without ELS:

  ```plaintext
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82],  
  [edit forwarding-options helpers bootp dhcp-option82],  
  [edit forwarding-options helpers bootp interface interface-name dhcp-option82]
  ```

**Release Information**

**Description**

Configure the **circuit-id** suboption (suboption 1) of DHCP option 82 (the DHCP relay agent information option) in DHCP packets destined for a DHCP server. This suboption identifies the circuit (the interface, the VLAN, or both) on which the DHCP request arrived.

The remaining statements are explained separately.

**Default**

If DHCP option 82 is enabled on the switch, the circuit ID is supplied by default in the format **interface-name:vlan-name** or, on a Layer 3 interface, just **interface-name**.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

    option-82 {
        circuit-id {
            prefix {
                host-name;
                logical-system-name;
                routing-instance-name;
            }
            use-interface-description (device | logical);
            use-vlan-id;
        }
        remote-id {
            host-name hostname;
            use-interface-description (device | logical);
            use-string string;
        }
        vendor-id {
            use-string string;
        }
    }
}

Hierarchy Level  [edit vlans vlan-name forwarding-options]

Release Information  Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  Configure port security features on the switch. DHCP snooping is enabled automatically if you configure any of the following port security features within this hierarchy:

- Dynamic ARP inspection (DAI)
- IP source guard
- DHCP option 82
- Static IP

The remaining statements are explained separately.
**Required Privilege**

- Interface—To view this statement in the configuration.
- Interface-control—To add this statement to the configuration.

**Related Documentation**

- Enabling Dynamic ARP Inspection (CLI Procedure) on page 4035

- Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) on page 4034

### dhcp-service

**Syntax**

```
dhcp-service {
  dhcp-snooping-file (local_pathname | remote_URL);
  write-interval interval;
}
```

**Hierarchy Level**

[edit system processes]

**Release Information**

- Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
- Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description**

Enable DHCP services on the switch. DHCP services automate network-parameter assignment to network devices. The DHCP service process is enabled by default on your switch. However, by default, IP-MAC bindings in the DHCP snooping database do not persist. You can configure the IP-MAC bindings in the DHCP database to persist through switch reboots by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.

The remaining statements are explained separately.

**Required Privilege**

- Admin—To view this statement in the configuration.
- Admin-control—To add this statement to the configuration.

**Related Documentation**

- Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure) on page 4038
dhcp-snooping-file

Syntax

dhcp-snooping-file (local_pathname | remote_URL);

write-interval seconds;

}

Hierarchy Level

[edit system processes dhcp-service]

Release Information

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Ensure that IP-MAC bindings persist through switch reboots by specifying a local pathname or a remote URL for the storage location of the DHCP snooping database file.

The remaining statement is explained separately.

Default

The IP-MAC bindings in the DHCP snooping database file are not persistent. If the switch is rebooted, the bindings are lost.

Required Privilege

Level system—to view this statement in the configuration.

system-control—to add this statement to the configuration.

group (DHCP Security)

Syntax

```plaintext
group group-name {
  interface interface-name;
  static-ip
}
overrides {
  no-option-82;
  trusted;
  untrusted;
}
}
```

Hierarchy Level

```
[edit vlans vlan-name forwarding-options dhcp-security]
```

Release Information

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Specify the name of a group of access interfaces that you want to configure for DHCP security attributes that are different from the attributes set for other interfaces in the VLAN. A group must contain at least one interface.

The remaining statements are explained separately.

Required Privilege

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**host-name**

**Syntax**

host-name *host-name*

**Hierarchy Level**

[edit vlans vlan-name forwarding-options dhcp-security option-82 remote-id]

**Release Information**

Statement introduced in Junos OS Release 13.2X50-D10.

**Description**

Use the hostname of the switch as the remote-id suboption of DHCP option 82 (also known as the DHCP relay agent information option) in DHCP request packet headers before forwarding or relaying requests to a DHCP server. This suboption provides a trusted identifier for the host system that has forwarded or relayed requests to the server.

**Required Privilege Level**

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

**Related Documentation**

**interface (DHCP Security)**

**Syntax**

interface interface-name;
    static-ip;
}

**Hierarchy Level**

[edit vlans vlan-name forwarding-options dhcp-security group group-name]

**Release Information**

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description**

Configure an interface for a static IP address to MAC address binding (IP-MAC binding) or configure an interface to belong to a group within the VLAN that has DHCP security attributes that are different from the attributes of other interfaces in the VLAN.

The remaining statement is explained separately.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- [edit vlans on page 2136 vlan-name switch-options interface interface-name]

**Release Information**

Statement introduced in Junos OS Release 8.4.
Support for the `switch-options` statement added in Junos OS Release 9.2.
Support for top-level configuration for the `virtual-switch` type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.
Support for logical systems added in Junos OS Release 9.6.
Support at [edit switch-options], [edit switch-options interface interface-name], [edit vlans vlan-name switch-options], and [edit vlans vlan-name switch-options interface interface-name] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at hierarchy levels under [edit vlans vlan-name] introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.
Description: (MX Series routers and EX Series switches) Configure a limit to the number of MAC addresses that can be learned from a bridge domain or VLAN, virtual switch, or set of bridge domains or VLANs.

Default: All devices except the EX Series switches: 1024 MAC addresses for each logical interface; EX Series switches: 65,536 MAC addresses for each interface and VLAN.

Options:

- **limit**—Maximum number of MAC addresses learned from an interface.

  Range: 1 through 131,071 MAC addresses per interface, or 1 through 65,535 MAC addresses per interface

  The remaining statement is explained separately.

Required Privilege Level:

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

ip-source-guard

Syntax  ip-source-guard;

Hierarchy Level  • For platforms with ELS:
  [edit vlans vlan-name forwarding-options dhcp-security]
  • For platforms without ELS:
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name)]

  Hierarchy level [edit vlans vlan-name forwarding-options dhcp-security] introduced in
  Junos OS Release 13.2X50-D10. (See “Getting Started with Enhanced Layer 2 Software”
  on page 3 for information about ELS.)

Description  Perform IP source guard checking on packets sent from access interfaces. Validate source
  IP addresses and source MAC addresses on all VLANs or on the specified VLAN or VLAN
  range. Forward packets with valid addresses and drop those with invalid addresses.

**NOTE:** If you enable IP source guard at the [edit vlans vlan-name
  forwarding-options dhcp-security] hierarchy level, it can be configured only
  for a specific VLAN. You cannot configure it for a list or range of VLAN IDs.

  • ip-source-guard—Enable IP source guard checking.
  • no-ip-source-guard—(Not available in [edit vlans vlan-name forwarding-options
dhcp-security]) Disable IP source guard checking.

**NOTE:** If you enable ip-source-guard at the [edit ethernet-switching-options
secure-access-port vlan (all | vlan-name)] hierarchy level, use the following
guidelines:

Before you configure IP source guard, be sure that you have:

  • Explicitly enabled DHCP snooping on the specific VLAN or specific VLANs
    on which you will configure IP source guard. See Enabling DHCP Snooping
    (CLI Procedure).
  • If you configure IP source guard on specific VLANs rather than on all VLANs,
    you must also enable DHCP snooping explicitly on those VLANs. Otherwise,
    the default behavior of no DHCP snooping applies to that VLAN.

**NOTE:** If you enable ip-source-guard at the [edit vlans vlan-name
forwarding-options dhcp-security] hierarchy level, DHCP snooping is
automatically enabled. Conversely, if you explicitly disable DHCP snooping by specifying `no-dhcp-snooping`, it automatically disables IP source guard for the specified VLAN.

### Release Information

Statement introduced in Junos OS Release 8.4.

Support for the `switch-options` statement added in Junos OS Release 9.2.

Support for top-level configuration for the `virtual-switch` type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy...
supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.
Support for logical systems added in Junos OS Release 9.6.
Support for EVPNs introduced in Junos OS Release 13.2 on MX Series 3D Universal Edge Routers.

Description Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

Default Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

Options drop—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.

drop-and-log—(EX Series switches only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

log—(EX Series switches only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

none—(EX Series switches only) Forward packets with new source MAC addresses, and learn the new source MAC address.

shutdown—(EX Series switches only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

Required Privilege routing—To view this statement in the configuration.

Level routing-control—To add this statement to the configuration.
persistent-learning

**Syntax**

```
persistent-learning;
```

**Hierarchy Level**

```
[edit switch-options on page 2027 interface interface-name]
```

**Release Information**

Hierarchy level [edit switch-options interface interface-name] introduced in Junos OS Release 13.2X50-D10

**Description**

Specify that learned MAC addresses persist on the specified interfaces across restarts of the switch and link-down conditions. This feature is also known as sticky MAC.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system–control—To add this statement to the configuration.

recovery-timeout

Syntax

```plaintext
recovery-timeout seconds;
```

Hierarchy Level

```plaintext
[edit interfaces interface-name family ethernet-switching]
```

Release Information

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, or rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after the specified period of time:

- If you have enabled MAC limiting with the `shutdown` option and you enable `recovery-timeout`, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.
- If you have enabled MAC move limiting (Not supported on EX9200) with the `shutdown` option and you enable `recovery-timeout`, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.
- If you have enabled storm control with the `action-shutdown` option and you enable `recovery-timeout` the switch disables (rather than shuts down) the interface when applicable traffic exceeds the specified levels. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.

NOTE: The `recovery-timeout` configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after `recovery-timeout` has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the operational mode command `clear ethernet-switching recovery-timeout`.

Default

Not enabled.

Options

`seconds`— Number of seconds that the interface remains in a disabled state due to a port error prior to automatic recovery.

Range: 10 through 3600

Required Privilege Level

system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

remote-id

Syntax

remote-id {  
  host-name host-name;  
  prefix hostname | mac | none; host  
  use-interface-description;  
  use-string string;  
}

Hierarchy Level

- For platforms with ELS:
  [edit vlans vlan-name forwarding-options dhcp-security option-82 ]
- For platforms without ELS:
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82],
  [edit forwarding-options helpers bootp dhcp-option82],
  [edit forwarding-options helpers bootp interface interface-name dhcp-option82]

Release Information

Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Insert the remote-id suboption of DHCP option 82 (also known as the DHCP relay agent information option) in DHCP request packet headers before forwarding or relaying requests to a DHCP server. This suboption provides a trusted identifier for the host system that has forwarded or relayed requests to the server.

The remaining statements are explained separately, and their availability depends on the hierarchy level at which remote-id is specified, as follows:

- The statement prefix is not supported at the [edit vlans vlan-name forwarding-options dhcp-security option-82] hierarchy level.
- The statement host-name is supported only at the [edit vlans vlan-name forwarding-options dhcp-security option-82] hierarchy level.

Default

If remote-id is not explicitly set, no remote ID value is inserted in the DHCP request packet header.

If remote-id is explicitly set, but is not qualified by a keyword:

- At the [edit vlans vlan-name forwarding-options dhcp-security] hierarchy level, the default keyword value is interface-name.
- At all other hierarchy levels, the remote-id default keyword value of is the MAC address of the switch.

Required Privilege

Level system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

**routing-instance-name (circuit-id)**

**Syntax**

```
route-instance-name;  
```

**Hierarchy Level**

```
[edit vlans vlan-name forwarding-options dhcp-security option-82 circuit-id prefix]  
```

**Release Information**

Statement introduced in Junos OS Release 13.2 for EX Series switches.

**Description**

Specify that the routing instance name used by the VLAN is included with the circuit ID suboption in the DHCP option 82 information that is inserted by the switch into the packet header of a DHCP request before it forwards or relays the request to a DHCP server.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

### static-ip

**Syntax**

```plaintext
static-ip ip-address {
  vlan vlan-name;
  mac mac-address;
}
```

**Hierarchy Level**

- For platforms with ELS:
  ```plaintext
  [edit vlans vlan-name forwarding-options dhcp-security group group-name interface interface-name]
  ```
- For platforms without ELS:
  ```plaintext
  [edit ethernet-switching-options secure-access-port interface (all | interface-name)]
  ```

**Release Information**

**Description**

Configure a static IP address to MAC address (IP-MAC) binding to be added to the DHCP snooping database.

---

**NOTE:** The VLAN is specified at the higher hierarchy level when `static-ip` is configured at `[edit vlans vlan-name forwarding-options dhcp-security group group-name interface interface-name]`.

**Options**

- **ip-address**—Static IP address assigned to a device connected on the specified interface.
- **mac mac-address**—Static MAC address assigned to a device connected on the specified interface.

The remaining statements are explained separately.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

**Related Documentation**

trusted

Syntax trusted;

Hierarchy Level [edit vlans vlan-name forwarding-options dhcp-security group group-name overrides]

Release Information Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description Allow DHCP responses from the specified interface. The interface is not subject to DHCP snooping, even if the VLAN is enabled for DHCP snooping.

Required Privilege Level interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Related Documentation • Enabling a Trusted DHCP Server (CLI Procedure) on page 4036

use-interface-description

Syntax

```
use-interface-description;
```

Hierarchy Level

- For platforms with ELS:
  ```
  [edit vlans vlan-name forwarding-options dhcp-security option-82 circuit-id]
  ```

- For platforms without ELS:
  ```
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82 circuit-id],
  [edit forwarding-options helpers bootp dhcp-option82 circuit-id],
  [edit forwarding-options helpers bootp interface interface-name dhcp-option82 circuit-id],
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82 remote-id],
  [edit forwarding-options helpers bootp dhcp-option82 remote-id],
  [edit forwarding-options helpers bootp interface interface-name dhcp-option82 remote-id]
  ```

Release Information

Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Use the interface description rather than the interface name (which is the default value) in the circuit ID or remote ID value in the DHCP option 82 information.

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

Related Documentation

use-string

Syntax  
use-string string;

Hierarchy Level
- For platforms with ELS:
  [edit vlans vlan-name forwarding-options dhcp-security option-82 remote-id]
- For platforms without ELS:
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82 remote-id],
  [edit forwarding-options helpers bootp dhcp-option82 remote-id],
  [edit forwarding-options helpers bootp interface interface-name dhcp-option82 remote-id]

Release Information
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Hierarchy level [edit vlans vlan-name forwarding-options dhcp-security] introduced in
Junos OS Release 13.2X50-D10. (See “Getting Started with Enhanced Layer 2 Software”
on page 3 for information about ELS.)

Description
Use a string rather than the MAC address of the host system (the default) in the remote
ID value in the DHCP option 82 information.

Options
string—Character string used as the remote ID value.

Range: 1–255 characters

Required Privilege
Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

**use-vlan-id**

**Syntax**

```
use-vlan-id;
```

**Hierarchy Level**

- For platforms with ELS:
  
  `[edit vlans vlan-name forwarding-options dhcp-security option-82 circuit-id]`

- For platforms without ELS:

  `[edit forwarding-options helpers bootp dhcp-option82-circuit-id],`
  
  `[edit forwarding-options helpers bootp interface interface-name dhcp-option82-circuit-id]`

**Release Information**

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Use the VLAN ID rather than the VLAN name (the default) in the circuit ID value in the DHCP option 82 information.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

vendor-id

Syntax

vendor-id <string>;

Hierarchy Level

- For platforms with ELS:
  
  [edit vlans vlan-name forwarding-options dhcp-security option-82]
  
- For platforms without ELS:
  
  [edit ethernet-switching-options secure-access-port vlan (all | vlan-name) dhcp-option82],
  [edit forwarding-options helpers bootp dhcp-option82],
  [edit forwarding-options helpers bootp interface interface-name dhcp-option82]

Release Information

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Insert a vendor ID in the DHCP option 82 information in a DHCP request packet header before forwarding or relaying the request to a DHCP server.

Default

If vendor-id is not explicitly configured for DHCP option 82, then no vendor ID is set.

Options

string—(Optional) A single string that designates the vendor ID.

Range: 1–255 characters

Default: If you specify vendor-id with no string value, then the default vendor ID Juniper is configured.

Required Privilege Level

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

write-interval

Syntax

write-interval seconds;

Hierarchy Level

- For platforms with ELS:
  [edit system processes] dhcp-service dhcp-snooping-file
- For platforms without ELS:
  [edit ethernet-switching-options secure-access-port dhcp-snooping-file]

Release Information

Description

Specify how frequently the switch writes the database entries from memory into the specified DHCP snooping database file.

- If you are configuring write-interval at the [edit ethernet-switching-options secure-access-port dhcp-snooping-file] hierarchy level, see Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure).
- If you are configuring write-interval at the [edit system processes dhcp-service dhcp-snooping-file] hierarchy level, see “Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure)” on page 4038.

Default

None

Options

seconds—Value in seconds.

Range: 60–86,400 seconds

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Operational Commands
clear arp

**Syntax**
```
clear arp
<hostname hostname>
<interface interface-name>
<logical-system logical-system-name>
<vpn vpn>
```

**Release Information**
Command introduced before Junos OS Release 7.4.

**Description**
Remove entries from the Address Resolution Protocol (ARP) table for the current CLI view. To clear entries for a specific logical system, you must first enter the `set cli logical-system logical-system-name` command, and then issue the `clear arp` command.

**Options**
- `none`—Clear all entries from the ARP table.
- `hostname hostname`—(Optional) Clear only the specified host entry from the ARP table.
- `interface interface-name`—(Optional) Clear entries only for the specified interface from the ARP table.
- `logical-system logical-system-name`—(Optional) Clear entries for only the specified logical system from the ARP table (only available in main router context).
- `vpn vpn`—(Optional) Clear entries from the ARP table for the specified virtual private network (VPN).

**Required Privilege Level**
clear

**Related Documentation**
- `set cli logical-system`
- `show arp`
- `show dhcp-security arp inspection statistics on page 4076`

**List of Sample Output**
clear arp on page 4072
clear arp logical-system ls1 on page 4073

**Output Fields**
When you enter this command, you are provided feedback on the status of your request.

**Sample Output**
clear arp
```
user@host> clear arp
192.168.71.254 deleted
192.168.65.46 deleted
192.168.64.10 deleted
10.0.12.14 deleted
10.0.17.14 deleted
```
clear arp logical-system ls1

user@host> clear arp logical-system ls1
192.168.71.254  deleted
192.168.65.46   deleted
192.168.64.10   deleted
10.0.12.14       deleted
10.0.17.14       deleted
clear dhcp-security binding

Syntax

clear dhcp-security binding
  <interface interface-name>
  <ip-address ip-address>
  <statistics>
  <vlan vlan-name>

Release Information
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description
Clear the DHCP snooping database information.

Options
interface interface-name—(Optional) Clear DHCP snooping database information for the specified interface.

ip-address ip-address—(Optional) Clear DHCP snooping database information for the specified IP address.

statistics—(Optional) Clear all DHCP snooping database statistics.

vlan vlan-name—(Optional) Clear DHCP snooping database information for the specified VLAN.

Required Privilege Level
clear

Output Fields
This command produces no output.

Sample Output
clear dhcp-security binding

user@switch> clear dhcp-security binding
clear ethernet-switching recovery-timeout

**Syntax**
clear ethernet-switching recovery-timeout

**Release Information**
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**
Clear all MAC limiting, MAC move limiting, and storm control errors from all the Ethernet switching interfaces on the switch, and restore the interfaces to service.

**Options**
- **none**—Clear all MAC limiting, MAC move limiting, and storm control errors from all the Ethernet switching interfaces on the switch and restore these interfaces to service.

**Required Privilege Level**
clear

**Related Documentation**
- Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure) on page 2023

**Output Fields**
This command produces no output.
show dhcp-security arp inspection statistics

**Syntax**
show dhcp-security arp inspection statistics

**Release Information**
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**
Display ARP inspection statistics.

**Required Privilege Level**
view

**Related Documentation**
- show dhcp-security binding on page 4078
- clear dhcp-security binding
- clear interfaces statistics
- Example: Configuring IP Source Guard and Dynamic ARP Inspection to Protect the Switch from IP Spoofing and ARP Spoofing on page 4017

**List of Sample Output**
show dhcp-security arp inspection statistics on page 4076

**Output Fields**
Table 497 on page 4076 lists the output fields for the show dhcp-security arp inspection statistics command. Output fields are listed in the approximate order in which they appear.

The IP source guard database table shows the untrusted access interfaces in VLANs that have been enabled for IP source guard. The entries include the VLAN 802.1Q tag IDs if there are any, and the IP addresses and MAC addresses that are bound to one another.

PART 25

Routing Policy and Packet Filtering

• Overview on page 4085
• Configuration on page 4161
• Administration on page 4259
• Troubleshooting Procedures on page 4291
Juniper Networks Junos operating system (Junos OS) is a network operating system that has been hardened through the separation of control forwarding and services planes, with each function running in protected memory. The control-plane CPU is protected by rate limiting, routing policy, and firewall filters to ensure switch uptime even under severe attack. Access port security features such as dynamic Address Resolution Protocol (ARP) inspection, DHCP snooping, and MAC limiting are controlled through a single Junos OS CLI command.

Juniper Networks EX Series Ethernet Switches provide the following hardware and software security features:

**Console Port**—Allows use of the console port to connect to the Routing Engine through an RJ-45 cable. You then use the command-line interface (CLI) to configure the switch.

**Out-of-Band Management**—A dedicated management Ethernet port on the rear panel allows out-of-band management.

**Software Images**—All Junos OS images are signed by Juniper Networks certificate authority (CA) with public key infrastructure (PKI).

**User Authentication, Authorization, and Accounting (AAA)**—Features include:

- User and group accounts with password encryption and authentication.
- Access privilege levels configurable for login classes and user templates.
- RADIUS authentication, TACACS+ authentication, or both, for authenticating users who attempt to access the switch.
- Auditing of configuration changes through system logging or RADIUS/TACACS+.
802.1X Authentication—Provides network access control. Supplicants (hosts) are authenticated when they initially connect to a LAN. Authenticating supplicants before they receive an IP address from a DHCP server prevents unauthorized supplicants from gaining access to the LAN. EX Series switches support Extensible Authentication Protocol (EAP) methods, including EAP-MD5, EAP-TLS, EAP-TTLS, and EAP-PEAP.

Port Security—Access port security features include:

- DHCP snooping—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP-address/MAC-address binding database (called the DHCP snooping database).
- Dynamic ARP inspection (DAI)—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons.
- MAC limiting—Protects against flooding of the Ethernet switching table.
- MAC move limiting—Detects MAC movement and MAC spoofing on access ports.
- Trusted DHCP server—With a DHCP server on a trusted port, protects against rogue DHCP servers sending leases.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. The source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is allowed for further processing if the source IP address to source MAC address binding is valid; if the binding is not valid, the packet is discarded.
- DHCP option 82—Also known as the DHCP relay agent information option. Helps protect the EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- Unrestricted proxy ARP—The switch responds to all ARP messages with its own MAC address. Hosts that are connected to the switch's interfaces cannot communicate directly with other hosts. Instead, all communications between hosts go through the switch.
- Restricted proxy ARP—The switch does not respond to an ARP request if the physical networks of the source and target of the ARP request are the same. It does not matter whether the destination host has the same IP address as the incoming interface or a different (remote) IP address. An ARP request for a broadcast address elicits no reply.

Device Security—Storm control permits the switch to monitor unknown unicast and broadcast traffic and drop packets, or shut down, or temporarily disable the interface when a specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN. You can enable storm control on access interfaces or trunk interfaces.

Firewall Filters—Allow auditing of various types of security violations, including attempts to access the switch from unauthorized locations. Firewall filters can detect such attempts and create audit log entries when they occur. The filters can also restrict access by limiting
traffic to source and destination MAC addresses, specific protocols, or, in combination with policers, to specified data rates to prevent denial of service (DoS) attacks.

**Policers**—Provide rate-limiting capability to control the amount of traffic that enters an interface, which acts to counter DoS attacks.

**Encryption Standards**—Supported standards include:

- 128-, 192-, and 256-bit Advanced Encryption Standard (AES)
- 56-bit Data Encryption Standard (DES) and 168-bit 3DES

Firewall Filters for EX Series Switches Overview

Firewall filters provide rules that define whether to permit, deny, or forward packets that are transiting an interface on a Juniper Networks EX Series Ethernet Switch from a source address to a destination address. You configure firewall filters to determine whether to permit, deny, or forward traffic before it enters or exits a port, VLAN, or Layer 3 (routed) interface to which the firewall filter is applied. To apply a firewall filter, you must first configure the filter and then apply it to an port, VLAN, or Layer 3 interface.

You can apply firewall filters to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), loopback interfaces, management interfaces, virtual management Ethernet interfaces (VMEs), and routed VLAN interfaces (RVIs). For information on EX Series switches that support a firewall filter on these interfaces, see “EX Series Switch Software Features Overview” on page 27.

An ingress firewall filter is a filter that is applied to packets that are entering a network. An egress firewall filter is a filter that is applied to packets that are exiting a network. You can configure firewall filters to subject packets to filtering, class-of-service (CoS) marking (grouping similar types of traffic together, and treating each type of traffic as a class with its own level of service priority), and traffic policing (controlling the maximum rate of traffic sent or received on an interface).

This topic describes:

- Firewall Filter Types on page 4088
- Firewall Filter Components on page 4089
- Firewall Filter Processing on page 4090

Firewall Filter Types

The following firewall filter types are supported for EX Series switches:

- Port (Layer 2) firewall filter—Port firewall filters apply to Layer 2 switch ports. You can apply port firewall filters in both ingress and egress directions on a physical port.

- VLAN firewall filter—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN. You can apply VLAN firewall filters in both ingress and egress directions on a VLAN. VLAN firewall filters are applied to all packets that are forwarded to or forwarded from the VLAN.

- Router (Layer 3) firewall filter—You can apply a router firewall filter in both ingress and egress directions on Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs). You can apply a router firewall filter in the ingress direction on the loopback interface (lo0) also. Firewall filters configured on loopback interfaces are applied only to packets that are sent to the Routing Engine CPU for further processing.

You can apply port, VLAN, or router firewall filters to both IPv4 and IPv6 traffic on these switches:

- EX3200 switch
- EX4200 switch
• EX4300 switch
• EX8200 switch

You can apply port, VLAN, or router firewall filters to only IPv4 traffic on these switches:
• EX2200 switch
• EX3300 switch
• EX4500 switch
• EX6200 switch

For information on firewall filters supported on different switches, see “Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches” on page 4111.

Firewall Filter Components

In a firewall filter, you first define the family address type (ethernet-switching, inet, or inet6), and then you define one or more terms that specify the filtering criteria (specified as terms with match conditions) and the action (specified as actions or action modifiers) to take if a match occurs.

The maximum number of terms allowed per firewall filter for EX Series switches is:
• 512 for EX2200 switches
• 1436 for EX3300 switches
• 7,042 for EX3200 and EX4200 switches—as allocated by the dynamic allocation of ternary content addressable memory (TCAM) for firewall filters.

On EX4300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filers configured on a port, VLAN and Layer 3 interface:
• For ingress traffic:
  • 3500 terms for firewall filters configured on a port
  • 3500 terms for firewall filters configured on a VLAN
  • 7000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
  • 3500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
• For egress traffic:
• 512 terms for firewall filters configured on a port
• 256 terms for firewall filters configured on a VLAN
• 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
• 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

NOTE: You can configure the maximum number of terms only when you configure one type of firewall filter (port, VLAN, or router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on any interface in the switch.

• 1200 for EX4500 and EX4550 switches
• 1400 for EX6200 switches
• 32,768 for EX8200 switches

NOTE: The on-demand dynamic allocation of the shared space TCAM in EX8200 switches is achieved by assigning free space blocks to firewall filters. Firewall filters are categorized into two different pools. Port and VLAN filters are pooled together (the memory threshold for this pool is 22K) while router firewall filters are pooled separately (the threshold for this pool is 32K). The assignment happens based on the filter pool type. Free space blocks can be shared only among the firewall filters belonging to the same filter pool type. An error message is generated when you try to configure a firewall filter beyond the TCAM threshold.

Each term consists of the following components:

• Match conditions—Specify the values or fields that the packet must contain. You can define various match conditions, including the IP source address field, IP destination address field, Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) source port field, IP protocol field, Internet Control Message Protocol (ICMP) packet type, TCP flags, and interfaces.

• Action—Specifies what to do if a packet matches the match conditions. Possible actions are to accept or discard the packet or to send the packet to a specific virtual routing interface. In addition, packets can be counted to collect statistical information. If no action is specified for a term, the default action is to accept the packet.

• Action modifier—Specifies one or more actions for the switch if a packet matches the match conditions. You can specify action modifiers such as count, mirror, rate limit, and classify packets.

Firewall Filter Processing
The order of the terms within a firewall filter configuration is important. Packets are tested against each term in the order in which the terms are listed in the firewall filter
configuration. For information on how firewall filters process packets, see “Understanding How Firewall Filters Are Evaluated” on page 4149.

Understanding Planning of Firewall Filters

Before you create a firewall filter and apply it to an interface, determine what you want the firewall filter to accomplish and how to use its match conditions and actions to achieve your goals. You must understand how packets are matched to match conditions, the default and configured actions of the firewall filter, and proper placement of the firewall filter.

You can configure and apply no more than one firewall filter per port, VLAN, or router interface, per direction. The following limits apply for the number of firewall filter terms allowed per filter on various switch models:

- On EX2200 switches, the number of terms per filter cannot exceed 512.
- On EX3300 switches, the number of terms per filter cannot exceed 1436.
- On EX3200 and EX4200 switches, the number of terms per filter cannot exceed 7042.
- On EX4300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filers configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3500 terms for firewall filters configured on a port
    - 3500 terms for firewall filters configured on a VLAN
    - 7000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
- 512 terms for firewall filters configured on a port
- 256 terms for firewall filters configured on a VLAN
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure the maximum number of terms only when you configure one type of firewall filter (port, VLAN, or router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on any interface in the switch.

- On EX4500 and EX4550 switches, the number of terms per filter cannot exceed 1200.
- On EX6200 switches, the number of terms per filter cannot exceed 1400.
- On EX8200 switches, the number of terms per filter cannot exceed 32,768.

In addition, try to be conservative in the number of terms (rules) that you include in each firewall filter because a large number of terms requires longer processing time during a commit and also can make firewall filter testing and troubleshooting more difficult. Similarly, applying firewall filters across many switch and router interfaces can make testing and troubleshooting the rules of those filters difficult.

Before you configure and apply firewall filters, answer the following questions for each of those firewall filters:

1. What is the purpose of the firewall filter?
   For example, you can use a firewall filter to limit traffic to source and destination MAC addresses, specific protocols, or certain data rates or to prevent denial of service (DoS) attacks.

2. What are the appropriate match conditions?
   a. Determine the packet header fields that the packet must contain for a match. Possible fields include:
      - Layer 2 header fields—Source and destination MAC addresses, dot1q tag, Ethernet type, and VLAN
      - Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, TTL type)
      - TCP header fields—Source and destination ports and flags
      - ICMP header fields—Packet type and code
   b. Determine the port, VLAN, or router interface on which the packet was received.

3. What are the appropriate actions to take if a match occurs?
   Possible actions to take if a match occurs are accept, discard, and forward to a routing instance.
4. What additional action modifiers might be required?

Determine whether additional actions are required if a packet matches a match condition; for example, you can specify an action modifier to count, analyze, or police packets.

5. On what interface should the firewall filter be applied?

Start with the following basic guidelines:

- If all the packets entering a port need to be exposed to filtering, then use port firewall filters.
- If all the packets that are bridged need filtering, then use VLAN firewall filters.
- If all the packets that are routed need filtering, then use router firewall filters.

Before you choose the interface on which to apply a firewall filter, understand how that placement can impact traffic flow to other interfaces. In general, apply a firewall filter that filters on source and destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP and UDP port numbers—nearest to the source devices. However, typically apply a firewall filter that filters only on a source IP address nearest to the destination devices. When applied too close to the source device, a firewall filter that filters only on a source IP address could potentially prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

6. In which direction should the firewall filter be applied?

You can apply firewall filters to ports on the switch to filter packets that are entering a port. You can apply firewall filters to VLANs, and Layer 3 (routed) interfaces to filter packets that are entering or exiting a VLAN or routed interface. Typically, you configure different sets of actions for traffic entering an interface than you configure for traffic exiting an interface.

Understanding Firewall Filter Processing Points for Bridged and Routed Packets on EX Series Switches

Juniper Networks EX Series Ethernet Switches are multilayered switches that provide Layer 2 switching and Layer 3 routing. You apply firewall filters at multiple processing points in the packet forwarding path on EX Series switches. At each processing point, the action to be taken on a packet is determined based on the results of the lookup in the switch's forwarding table. A table lookup determines which exit port on the switch to use to forward the packet.

For both bridged unicast packets and routed unicast packets, firewall filters are evaluated and applied hierarchically. First, a packet is checked against the port firewall filter, if present. If the packet is permitted, it is then checked against the VLAN firewall filter, if present. If the packet is permitted, it is then checked against the router firewall filter, if present. The packet must be permitted by the router firewall filter before it is processed.

Figure 58 on page 4094 shows the various firewall filter processing points in the packet forwarding path in a multilayered switching platform.

Figure 58: Firewall Filter Processing Points in the Packet Forwarding Path

For a multicast packet that results in replications, an egress firewall filter is applied to each copy of the packet based on its corresponding egress VLAN.
For Layer 2 (bridged) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter
- Egress port firewall filter
- Egress VLAN firewall filter

For Layer 3 (routed and multilayer-switched) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter (Layer 2 CoS)
- Ingress router firewall filter (Layer 3 CoS)
- Egress router firewall filter
- Egress VLAN firewall filter

Understanding How Firewall Filters Control Packet Flows

Juniper Networks EX Series Ethernet Switches support firewall filters that allow you to control flows of data packets and local packets. **Data packets** are chunks of data that transit the switch as they are forwarded from a source to a destination. **Local packets** are chunks of data that are destined for or sent by the switch. Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP).

You create firewall filters to protect your switch from excessive traffic transiting the switch to a network destination or destined for the Routing Engine on the switch. Firewall filters that control local packets can also protect your switch from external incidents such as denial-of-service (DoS) attacks.

Firewall filters affect packet flows entering in to or exiting from the switch’s interfaces:

- Ingress firewall filters affect the flow of data packets that are received by the switch's interfaces. The Packet Forwarding Engine handles this flow. When a switch receives a data packet on an interface, the switch determines where to forward the packet by looking in the forwarding table for the best route (Layer 2 switching, Layer 3 routing) to a destination. Data packets are forwarded to their destination through an outgoing interface. Locally destined packets are forwarded to the Routing Engine.
Egress firewall filters affect the flow of data packets that are transmitted from the switch’s interfaces but do not affect the flow of locally generated control packets from the Routing Engine. The Packet Forwarding Engine handles the flow of data packets that are transmitted from the switch, and egress firewall filters are applied here. The Packet Forwarding Engine also handles the flow of control packets from the Routing Engine.

Figure 59 on page 4096 illustrates the application of ingress and egress firewall filters to control the flow of packets through the switch.

Figure 59: Application of Firewall Filters to Control Packet Flow

1. Ingress firewall filter applied to control locally destined packets that are received on the switch’s interfaces and are destined for the Routing Engine.
2. Ingress firewall filter applied to control incoming packets on the switch’s interfaces.
3. Egress firewall filter applied to control packets that are transiting the switch’s interfaces.

Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches

When you define a firewall filter for an EX Series switch, you define filtering criteria (terms, with match conditions) for the packets and an action (and, optionally, an action modifier) for the switch to take if the packets match the filtering criteria. You can define a firewall filter to monitor IPv4, IPv6, or non-IP traffic.

This topic describes in detail the various match conditions, actions, and action modifiers that you can define in a firewall filter. For information about support for match conditions
on various EX Series switches, see “Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches” on page 4111.

This topic describes:

- Firewall Filter Elements on page 4097
- Match Conditions Supported on Switches on page 4097
- Actions for Firewall Filters on page 4104
- Action Modifiers for Firewall Filters on page 4105

**Firewall Filter Elements**

A firewall filter configuration contains a term, a match condition, an action, and, optionally, an action modifier. Table 500 on page 4097 describes each element in a firewall filter configuration.

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Term</td>
<td>Defines the filtering criteria for the packets. Each term in the firewall filter consists of match conditions and an action. You can define a single term or multiple terms in the firewall filter. If you define multiple terms, each term must have a unique name.</td>
</tr>
<tr>
<td>Match condition</td>
<td>Consists of a string (called a <em>match statement</em>) that defines the match condition. Match conditions are the values or fields that a packet must contain. You can define a single match condition or multiple match conditions for a term. You can also opt not to define a match condition. If no match conditions are specified for a term, all packets are matched by default.</td>
</tr>
<tr>
<td>Action</td>
<td>Specifies the action that the switch takes if a packet matches all the criteria specified in the match conditions.</td>
</tr>
<tr>
<td>Action modifier</td>
<td>Specifies one or more actions that the switch takes if a packet matches the match conditions for the specific term.</td>
</tr>
</tbody>
</table>

**Match Conditions Supported on Switches**

Based on the type of traffic that you want to monitor, you can configure a firewall filter to monitor IPv4, IPv6, or non-IP traffic. When you configure a firewall filter to monitor a particular type of traffic, ensure that you specify match conditions that are supported for that type of traffic. For information about match conditions supported for a specific type of traffic and switches on which they are supported, see “Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches” on page 4111.

Table 501 on page 4097 describes all the match conditions that are supported for firewall filters on EX Series Switches.

<table>
<thead>
<tr>
<th>Match Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination-address ip-address</td>
<td>IP destination address field, which is the address of the final destination node.</td>
</tr>
<tr>
<td>Match Condition</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ip-destination-address ip-address</td>
<td>IP destination address field, which is the address of the final destination node.</td>
</tr>
<tr>
<td>ip6-destination-address ip-address</td>
<td>IP destination address field, which is the address of the final destination node.</td>
</tr>
<tr>
<td>destination-mac-address mac-address</td>
<td>Destination media access control (MAC) address of the packet.</td>
</tr>
<tr>
<td></td>
<td>You can define a destination MAC address with a prefix, such as device-mac-address 00:01:02:03:04:05/24. If no prefix is specified, the default value 48 is used.</td>
</tr>
<tr>
<td>destination-port number</td>
<td>TCP or UDP destination port field. Typically, you specify this match condition in conjunction with the protocol or ip-protocol match condition to determine which protocol is used on the port. For number, you can specify one of the following text synonyms (the port numbers are also listed):</td>
</tr>

<td>TCP packets of an established TCP connection. This condition matches packets other than the first packet of a connection. <em>tcp-established</em> is a synonym for the bit names &quot;(ack</td>
</tr>
<tr>
<td></td>
<td><em>tcp-established</em> does not implicitly check whether the protocol is TCP. To do so, specify the <em>next-header tcp</em> match condition.</td>
</tr>
</tbody>
</table>
### Table 501: Firewall Filter Match Conditions Supported on EX Series Switches (continued)

<table>
<thead>
<tr>
<th>Match Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tcp-flags (flags tcp-initial)</code></td>
<td>One or more TCP flags:</td>
</tr>
<tr>
<td></td>
<td>- bit-name—<code>fin</code>, <code>syn</code>, <code>rst</code>, <code>push</code>, <code>ack</code>, <code>urgent</code></td>
</tr>
<tr>
<td></td>
<td>- logical operators—<code>&amp;</code> (logical AND), `</td>
</tr>
<tr>
<td></td>
<td>- numerical value—0x01 through 0x20</td>
</tr>
<tr>
<td></td>
<td>- text synonym—<code>tcp-initial</code></td>
</tr>
<tr>
<td></td>
<td>To specify multiple flags, use logical operators.</td>
</tr>
</tbody>
</table>

- `tcp-initial` Matches the first TCP packet of a connection. `tcp-initial` is a synonym for the bit names `(syn&!ack)`.  
  `tcp-initial` does not implicitly check whether the protocol is TCP. To do so, specify the `protocol tcp` or `ip-protocol tcp` match condition.

- `traffic-class number` Specifies the DSCP code point for a packet.

- `ttl value` TTL type to match. The value ranges from 1 through 255.

- `vlan (vlan-name | vlan-id)` The VLAN that is associated with the packet. For `vlan-id`, you can specify either the VLAN ID or a VLAN range. The `vlan` match condition and the `dot1q-tag` match condition are mutually exclusive.

- `learn-vlan-id (vlan-name | vlan-id)` The VLAN that is associated with the packet. For `vlan-id`, you can specify either the VLAN ID or a VLAN range. The `vlan` match condition and the `user-vlan-id` match condition are mutually exclusive.

### Actions for Firewall Filters

You can define an action for the switch to take if a packet matches the filtering criteria defined in a match condition. Table 502 on page 4104 describes the actions supported in a firewall filter configuration.

### Table 502: Actions for Firewall Filters

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>accept</code></td>
<td>Accept a packet.</td>
</tr>
<tr>
<td><code>discard</code></td>
<td>Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.</td>
</tr>
</tbody>
</table>
**Table 502: Actions for Firewall Filters (continued)**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reject message-type</td>
<td>Discard a packet, and send the ICMPv4 message (type 3) destination unreachable. You can log the rejected packets if you configure the syslog action modifier. You can specify one of the following message codes: administratively-prohibited (default), bad-host-tos, bad-network-tos, host-prohibited, host-unreachable, network-prohibited, network-unreachable, port-unreachable, precedence-cutoff, precedence-violation, protocol-unreachable, source-host-isolated, source-route-failed, tcp-reset. If you specify tcp-reset, a TCP reset is returned if the packet is a TCP packet. Otherwise nothing is returned. If you do not specify a message type, the ICMP notification destination unreachable is sent with the default message communication administratively filtered.</td>
</tr>
<tr>
<td>routing-instance</td>
<td>Forward matched packets to a virtual routing instance.</td>
</tr>
<tr>
<td>routing-instance-name</td>
<td>NOTE: EX4200 switches do not support firewall-filter-based redirection to the default routing instance.</td>
</tr>
<tr>
<td>vlan</td>
<td>Forward matched packets to a specific VLAN. Ensure that you specify the VLAN name or VLAN ID and not a VLAN range, because the vlan action does not support the vlan-range option. NOTE: If you have defined a VLAN that is enabled for dot1q tunneling, then that particular VLAN is not supported as an action (using the vlan vlan-name action) for an ingress VLAN firewall filter.</td>
</tr>
</tbody>
</table>

**Action Modifiers for Firewall Filters**

In addition to the actions described in Table 502 on page 4104, you can define action modifiers in a firewall filter configuration for a switch if packets match the filtering criteria defined in the match condition. Table 503 on page 4105 describes the action modifiers supported in a firewall filter configuration.

**Table 503: Action Modifiers for Firewall Filters**

<table>
<thead>
<tr>
<th>Action Modifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analyzer analyzer-name</td>
<td>Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. Mirroring copies all packets seen on one switch port to a network monitoring connection on another switch port. The analyzer name must be configured under [edit ethernet-switching-options analyzer]. NOTE: analyzer is not a supported action modifier for a management interface. NOTE: On EX4500 switches, you can configure only one analyzer and include it in a firewall filter. If you configure multiple analyzers, you cannot include any one of those analyzers in a firewall filter.</td>
</tr>
<tr>
<td>Action Modifier</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>dscp number</td>
<td>Change the DSCP value for matched packets to the DSCP value specified with this action modifier. <code>number</code> specifies the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.</td>
</tr>
<tr>

Support for Match Conditions and Actions for Loopback Firewall Filters on Switches

On EX Series Ethernet switches, a loopback interface is a gateway for all the control traffic that enters the Routing Engine of the switch. If you want to monitor this control traffic, you must configure a firewall filter on the loopback interface (lo0). Loopback firewall filters are applied only to packets that are sent to the Routing Engine CPU for further processing. Therefore, you can apply a firewall filter only in the ingress direction on the loopback interface.

Each term in a firewall filter consists of match conditions and an action. Match conditions are the values or fields that a packet must contain. You can define multiple, single, or no match conditions. If no match conditions are specified for the term, all packets are matched by default. The string that defines a match condition is called a match statement. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Action modifiers are optional and specify one or more actions that the switch takes if a packet matches the match conditions for the specific term.

The following tables list match conditions, actions, and action modifiers that are supported for a firewall filter configured on a loopback interface on a switch:

- Table 504 on page 4108
- Table 505 on page 4109
For information on match conditions, actions, and action modifiers supported for a firewall filter configured on a network interface, see “Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches” on page 4111.

NOTE: On EX8200 switches, if an implicit or explicit discard action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the neighbor discovery IPv6 resolve packets to pass through the switch.

Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches

After you define a firewall filter on an EX Series switch, you must associate the filter to a bind point so that the filter can filter the packets that enter or exit the bind point. Port firewall filters, VLAN firewall filters, and Layer 3 (or router) firewall filters are the different types of firewall filters you can apply on a switch, depending on the bind points the filters are associated with. While a port firewall filter applies to Layer 2 interfaces, a VLAN firewall filter applies to packets that enter or leave a VLAN and also to packets that are bridged within a VLAN. A Layer 3 firewall filter applies to Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs).

NOTE: If you want to control the traffic that enters the Routing Engine of the switch, you must configure a firewall filter on the loopback interface (lo0) of the switch. For information about match conditions, actions, and action modifiers supported on the loopback interface of a switch, see “Support for Match Conditions and Actions for Loopback Firewall Filters on Switches” on page 4107.

This topic describes the supported switches and bind points for match conditions, actions, and action modifiers for firewall filters supported on EX Series switches. For descriptions of the match conditions, actions, and action modifiers, see “Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches” on page 4096.

This topic describes:

Firewall Filter Types and Their Bind Points

You can apply a firewall filter at specific bind points to filter IPv4, IPv6, or non-IP traffic. See the remaining sections in this topic for information about support on individual switches for different traffic types.

Table 507 on page 4112 lists the firewall filter types and their associated bind points that are supported on the switches.
Table 507: Bind Points Associated with Firewall Filter Types

<table>
<thead>
<tr>
<th>Bind Points</th>
<th>Firewall Filter Type</th>
</tr>
</thead>

</tr>
<tr>
<td>Layer 3 interfaces (Layer 3 (routed) interfaces or routed VLAN interfaces (RVIs))</td>
<td>Router firewall filter</td>
</tr>
</tbody>
</table>

Support for IPv4 and IPv6 Firewall Filters on Switches

You can apply a port, VLAN, or router firewall filter to filter IPv4 traffic on all EX Series switches. You can apply port, VLAN, and router firewall filters for IPv6 traffic on EX3200, EX4200, EX4300, and EX8200 switches and only router firewall filters for IPv6 traffic on EX2200, EX3300, and EX4500 switches.

Table 508 on page 4112 briefly summarizes the support for IPv4 and IPv6 firewall filters on different switches. The support for port, VLAN, and router firewall filters on different switches is further discussed in the subsequent sections in this topic.

Platform Support for Match Conditions for IPv4 Traffic

You can define port, VLAN, and router firewall filters for ingress and egress IPv4 traffic on all EX Series switches. Table 509 on page 4113 summarizes the support for match conditions on different bind points for ingress and egress IPv4 traffic on different switches.

Platform Support for Match Conditions for IPv6 Traffic

You can define port, VLAN, and router firewall filters for ingress and egress IPv6 traffic on EX3200, EX4200, and EX8200 switches, and router firewall filters for ingress and egress IPv6 traffic on EX2200, EX3300, and EX4500 switches. Table 510 on page 4126 summarizes support for match conditions on different bind points for ingress and egress IPv6 traffic on different switches.

Platform Support for Match Conditions for Non-IP Traffic

You can define port, VLAN, and router firewall filters for ingress and egress non-IP traffic on all EX Series switches. Table 511 on page 4133 summarizes support for match conditions on different bind points for ingress and egress non-IP traffic on different switches.

Table 511: Firewall Filter Match Condition Supported for Non-IP Traffic on Switches

Understanding How Firewall Filters Are Evaluated

A firewall filter consists of one or more terms, and the order of the terms within a firewall filter is important. Before you configure firewall filters, you should understand how Juniper Networks EX Series Ethernet Switches evaluate the terms within a firewall filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the `then` statement is taken.
- If the packet matches all the conditions, and no action is specified in the `then` statement, the default action `accept` is taken.

When a firewall filter consists of more than one term, the firewall filter is evaluated sequentially:

1. The packet is evaluated against the conditions in the `from` statement in the first term.
2. If the packet matches all the conditions in the term, the action in the `then` statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the `from` statement in the second term.
   - This process continues until either the packet matches the conditions in the `from` statement in one of the subsequent terms or there are no more terms in the filter.
4. If a packet passes through all the terms in the filter without a match, the packet is discarded.

Figure 60 on page 4150 shows how an EX Series switch evaluates the terms within a firewall filter.
If a term does not contain a `from` statement, the packet is considered to match and the action in the `then` statement of the term is taken.

If a term does not contain a `then` statement, or if an action has not been configured in the `then` statement, and the packet matches the conditions in the `from` statement of the term, the packet is accepted.

Every firewall filter contains an implicit `deny` statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {
    then discard;
}
```

Consequently, if a packet passes through all the terms in a filter without matching any conditions, the packet is discarded. If you configure a firewall filter that has no terms, all packets that pass through the filter are discarded.

**NOTE:** Firewall filtering is supported on packets that are at least 48 bytes long.

Understanding Firewall Filter Match Conditions

Before you define terms for firewall filters, you must understand how the match conditions that you specify in a term are handled and how to specify various types of match conditions to achieve the desired filtering results. A match condition consists of a string (called a match statement) that defines the match condition. Match conditions are the values or fields that a packet must contain.

This topic describes:

- Filter Match Conditions on page 4151
- Numeric Filter Match Conditions on page 4151
- Interface Filter Match Conditions on page 4152
- IP Address Filter Match Conditions on page 4152
- MAC Address Filter Match Conditions on page 4153
- Bit-Field Filter Match Conditions on page 4153

Filter Match Conditions

In the from statement of a firewall filter term, you specify the packet conditions that trigger the action in one of the then statements: then with various options, then interface or then vlan. All conditions in the from statement must match for the action to be taken. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify no match conditions in a term, that term matches all packets.

An individual condition in a from statement cannot contain a list of values. For example, you cannot specify numeric ranges or multiple source or destination addresses.

Individual conditions in a from statement cannot be negated. A negated condition is an explicit mismatch.

Numeric Filter Match Conditions

Numeric filter conditions match packet fields that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify a keyword that identifies the condition and a single value that a field in a packet must match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example:
  
  source-port 25;

- Text synonym for a single number— A match occurs if the value of the field matches the number that corresponds to the synonym. For example:
  
  source-port http;
To specify more than one value in a filter term, you enter each value in its own match statement, which is a string that defines a match condition. For example, a match occurs in the following term if the value of `vlan` is 10 or 30.

```
[edit firewall family family-name filter filter-name term term-name from]
  vlan 10;
  vlan 30;
```

The following restrictions apply to numeric filter match conditions:

- You cannot specify a range of values.
- You cannot specify a list of comma-separated values.
- You cannot exclude a specific value in a numeric filter match condition. For example, you cannot specify a condition that would match only if the match condition was not equal to a given value.

### Interface Filter Match Conditions

Interface filter match conditions can match interface name values in a packet. For interface filter match conditions, you specify the name of the interface, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/0/1
```

Port and VLAN interfaces do not use logical unit numbers. However, a firewall filter that is applied to a router interface can specify the logical unit number in the interface filter match condition, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/1/0.0
```

You can include the `*` wildcard as part of the interface name, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/*/1
user@switch# set interface ge-0/1/*
user@switch# set interface ge-*
```

### IP Address Filter Match Conditions

Address filter match conditions can match prefix values in a packet, such as IP source and destination prefixes. For address filter match conditions, you specify a keyword that identifies the field and one prefix of that type that a packet must match.

You specify the address as a single prefix. A match occurs if the value of the field matches the prefix. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10.2.1.0/28;
```

Each prefix contains an implicit 0/0 except statement, which means that any prefix that does not match the prefix that is specified is explicitly considered not to match.

To specify the address prefix, use the notation prefix/prefix-length. If you omit prefix-length, it defaults to /32. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10
To specify more than one IP address in a filter term, you enter each address in its own match statement. For example, a match occurs in the following term if the value of the source-address field matches either of the following source-address prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.0.0.0/8
user@switch# set source-address 10.1.0.0/16
```

### MAC Address Filter Match Conditions

MAC address filter match conditions can match source and destination MAC address values in a packet. For MAC address filter match conditions, you specify a keyword that identifies the field and one value of that type that a packet must match.

You can specify the MAC address as six hexadecimal bytes in the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 0011.2233.4455
user@switch# set destination-mac-address 00:11:22:33:44:55
user@switch# set destination-mac-address 001122334455
```

To specify more than one MAC address in a filter term, you enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the source-mac-address field matches either of the following addresses:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-mac-address 00:11:22:33:44:55
user@switch# set source-mac-address 00:11:22:33:20:15
```

### Bit-Field Filter Match Conditions

Bit-field filter conditions match packet fields if particular bits in those fields are or are not set. You can match the IP options, TCP flags, and IP fragmentation fields. For bit-field filter match conditions, you specify a keyword that identifies the field and tests to determine that the option is present in the field.

To specify the bit-field value to match, enclose the value in double quotation marks. For example, a match occurs if the RST bit in the TCP flags field is set:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "rst"
```

Typically, you specify the bits to be tested by using keywords. Bit-field match keywords always map to a single bit value. You also can specify bit fields as hexadecimal or decimal numbers.

To match multiple bit-field values, use the logical operators, which are described in Table 516 on page 4154. The operators are listed in order from highest precedence to lowest precedence. Operations are left-associative.
Table 516: Logical Operators for Matching Multiple Bit-Field Operators

<table>
<thead>
<tr>
<th>Logical Operators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Negation.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Logical AND.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To negate a match, precede the value with an exclamation point. For example, a match occurs only if the RST bit in the TCP flags field is not set:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "!rst"
```

In the following example of a logical AND operation, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&!ack"
```

In the following example of a logical OR operation, a match occurs if the packet is not the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn|ack"
```

For a logical OR operation, you can specify a maximum of two match conditions in a single term. If you need to match more than two bit-field values in a logical OR operation, configure the same match condition in consecutive terms with additional bit-field values. In the following example, the two terms configured match the SYN, ACK, FIN, or RST bit in the TCP flags field:

```
[edit firewall family family-name filter filter-name term term-name1 from]
user@switch# set tcp-flags "syn|ack"
[edit firewall family family-name filter filter-name term term-name2 from]
user@switch# set tcp-flags "fin|rst"
```

You can use text synonyms to specify some common bit-field matches. You specify these matches as a single keyword. In the following example of a text synonym, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags tcp-initial
```

Understanding How Firewall Filters Test a Packet's Protocol

When examining match conditions, Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches tests only the field that is specified. The software does not implicitly test the IP header to determine whether a packet is an IP packet. Therefore, in some cases, you must specify protocol field match conditions in conjunction with other match conditions to ensure that the filters are performing the expected matches.

If you specify a protocol match condition or a match of the ICMP type or TCP flags field, there is no implied protocol match. For the following match conditions, you must explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify the match `protocol tcp` or `protocol udp`.
- **source-port**—Specify the match `protocol tcp` or `protocol udp`.

If you do not specify the protocol when using the preceding fields, design your filters carefully to ensure that they perform the expected matches. For example, if you specify a match of `destination-port ssh`, the switch deterministically matches any packets that have a value of 22 in the two-byte field that is two bytes beyond the end of the IP header without ever checking the IP protocol field.

Understanding the Use of Policers in Firewall Filters

Policing, or rate limiting, is an important component of firewall filters that lets you control the amount of traffic that enters an interface on Juniper Networks EX Series Ethernet Switches. You can achieve policing by including policers in firewall filter configurations.

This topic describes:

- Policers Overview on page 4155
- Policer Types on page 4156
- Policer Actions on page 4157
- Policer Levels on page 4157
- Color Modes on page 4158
- Naming Conventions for Policers on page 4158

Policers Overview

You can use policers to specify rate limits on traffic. A firewall filter configured with a policer permits only traffic within a specified set of rate limits, thereby providing protection from denial-of-service (DoS) attacks. Traffic that exceeds the rate limits specified by
the policer is either discarded immediately or is marked as lower priority than traffic that is within the rate limits. The switch discards the lower-priority traffic when there is traffic congestion.

A policer applies two types of rate limits on traffic:

- **Bandwidth**—The number of bits per second permitted, on average.
- **Maximum burst size**—The maximum size permitted for bursts of data that exceed the given bandwidth limit.

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can define specific classes of traffic on an interface and apply a set of rate limits to each class. After you name and configure a policer, it is stored as a template. You can then use the policer in a firewall filter configuration.

On all EX Series switches except Juniper Networks EX8200 Ethernet Switches, each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limit specified for the policer. Each EX8200 switch contains three global management counters. You must assign ingress policers to these global management counters to obtain policer statistics. You can assign any number of ingress policers to each global management counter. The policer statistics for each global management counter are the aggregate of the policer statistics for all policers associated with that global management counter.

To get filter-specific packet counts, you must configure a different policer for each firewall filter. Policers give term-specific counts by default.

**Policer Types**

Switches support three types of policers:

- **Single-rate two-color**—A two-color policer (sometimes called simply “policer”) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit or simply discard them. A two-color policer is most useful for metering traffic at the port (physical interface) level.

- **Single-rate three-color**—This type of policer is defined in RFC 2697, A *Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured committed information rate (CIR), committed burst size (CBS), and the excess burst size (EBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets are arriving at rates that are below the CBS (green), exceed the CBS but not the EBS (yellow), or exceed the EBS (red). A single-rate three-color policer is most useful when a service is structured according to packet size and not according to peak arrival rate.

- **Two-rate three-color**—This type of policer is defined in RFC 2698, A *Two Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured CIR and the peak information rate
(PIR), along with their associated burst sizes; the CBS, and the peak burst size (PBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on packets are arriving at rates that are below the CIR (green), exceed the CIR but not the PIR (yellow), or exceed the PIR (red). A two-rate three-color policer is most useful when a service is structured according to arrival rates and not to packet size.

**Policer Actions**

Policer actions can be implicit or explicit and vary by policer type. The term implicit means that Junos OS assigns a loss-priority value automatically; explicit means that you configure the action. Table 517 on page 4157 lists policer actions.

<table>

<td></td>
<td>NOTE: Not supported on EX8200 switches</td>
<td></td>
</tr>
</tbody>
</table>

**Policer Levels**

You can configure policers at the queue level, logical interface level, or Layer 2 (MAC) level. Only a single policer is applied to a packet at the egress queue. The search for policers occurs in this order:

- Queue level
- Logical interface level
- Layer 2 (MAC) level
Color Modes

Tricolor marking (TCM) policers are not bound by a green-yellow-red coloring convention. Packets are marked with low or high PLP bit configurations based on color. Therefore, both three-color policer types (single-rate and two-rate) extend the functionality of class-of-service (CoS) traffic policing by providing three levels of drop precedence (loss priority) instead of the two normally available in policers. Both single-rate and two-rate three-color policer types can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer operates without reference to whether the examined packets have been previously marked or metered. In other words, the three-color policer is *blind* to any previous coloring a packet might have had.

- **Color-aware**—In color-aware mode, the three-color policer operates with reference to any previous marking or metering of the examined packets. In other words, the three-color policer is aware of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but can never decrease it. For example, if a color-aware three-color policer meters a packet with a low PLP marking, it can raise the PLP level to high. But it cannot reduce a high PLP level to low.

Naming Conventions for Policers

We recommend you use the naming convention `rate-TCMnumber-colortype` when configuring three-color policers. TCM stands for tricolor marking. Because policers can be numerous and must be applied correctly to work, observing a simple naming convention makes it easier to apply the policers properly.

For example, if you configure a single-rate, three-color, color-aware policer, name it `srTCM1-ca`. If you configure a two-rate, three-color, color-blind policer, name it `trTCM2-cb`. The **Related Documentation** section includes links to related resources.

Understanding Filter-Based Forwarding for EX Series Switches

Administrators of Juniper Networks EX Series Ethernet Switches can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature, which is called filter-based forwarding, you specify a filter and match criteria and then specify the virtual routing instance to send packets to.

You might want to use filter-based forwarding to route specific types of traffic through a firewall or security device before the traffic continues on its path. You can also use...
filter-based forwarding to give certain types of traffic preferential treatment or to improve load balancing of switch traffic.

**Understanding Tricolor Marking Architecture**

Tricolor marking (TCM) policers provide two functions: metering and marking. A policer meters each packet and passes the packet and the metering result to the marker.

The meter operates in two modes. In the color-blind mode, the meter treats the packet stream as uncolored. Any preset loss priorities are ignored. In the color-aware mode, the meter inspects the packet loss priority (PLP) field, which has been set by an upstream device as high or low; in other words, the PLP field has already been set by a behavior aggregate (BA) or multifield (MF) classifier. The marker changes the PLP of each incoming IP packet according to the results of the meter.

Single-rate TCM is so called because traffic is policed according to one rate—the committed burst rate (CBR)—and two burst sizes: the committed burst size (CBS) and the excess burst size (EBS). The configured information rate (CIR) specifies the average rate at which bits are admitted to the network. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes for packets that are admitted to the network. The EBS is greater than or equal to the CBS, and neither can be 0. As each packet enters the network, its bytes are counted. Packets that do not exceed the CBS are marked low PLP. Packets that exceed the peak information rate (PIR) are marked high PLP.

Two-rate TCM is so called because traffic is policed according to two rates: the CIR and the PIR. The PIR is greater than or equal to the CIR. The CIR specifies the average rate at which bits are admitted to the network, and the PIR specifies the maximum rate at which bits are admitted to the network. As each packet enters the network, its bits are counted. Bits in packets that do not exceed the CIR have their packets marked low PLP. Bits in packets that exceed the PIR have their packets marked high PLP.

Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches

This example shows how to configure and apply firewall filters to control traffic that is entering or exiting a port on the switch, a VLAN on the network, and a Layer 3 interface on the switch. Firewall filters define the rules that determine whether to forward or deny packets at specific processing points in the packet flow.

• Verification on page 4177

Requirements

This example uses the following software and hardware components:

• Junos OS Release 9.0 or later for EX Series switches.
• Two Juniper Networks EX3200-48T switches: one to be used as an access switch, the other to be used as a distribution switch
• One Juniper Networks EX-UM-4SFP uplink module
• One Juniper Networks J-series router

Before you configure and apply the firewall filters in this example, be sure you have:

• An understanding of firewall filter concepts, policers, and CoS
• Installed the uplink module in the distribution switch. See Installing an Uplink Module in an EX3200 Switch.

Overview

This configuration example show how to configure and apply firewall filters to provide rules to evaluate the contents of packets and determine when to discard, forward, classify, count, and analyze packets that are destined for or originating from the EX Series switches that handle all voice-vlan, employee-vlan, and guest-vlan traffic. Table 518 on page 4162 shows the firewall filters that are configured for the EX Series switches in this example.

Table 518: Configuration Components: Firewall Filters

<table>

</tr>
</tbody>
</table>

Figure 61 on page 4163 shows the application of port, VLAN, and Layer 3 routed firewall filters on the switch.

Figure 61: Application of Port, VLAN, and Layer 3 Routed Firewall Filters
Network Topology

The topology for this configuration example consists of one EX-3200-48T switch at the access layer, and one EX-3200-48T switch at the distribution layer. The distribution switch’s uplink module is configured to support a Layer 3 connection to a J-series router.

The EX Series switches are configured to support VLAN membership. Table 519 on page 4164 shows the VLAN configuration components for the VLANs.

Table 519: Configuration Components: VLANs

<table>
<thead>
<tr>
<th>VLAN Name</th>
<th>VLAN ID</th>
<th>VLAN Subnet and Available IP Addresses</th>
<th>VLAN Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>VLAN standalone PCs, PCs connected to the network through the hub in VoIP telephones, wireless access points, and printers. This VLAN completely includes the voice VLAN. Two VLANs (voice-vlan and employee-vlan) must be configured on the ports that connect to the telephones.</td>
</tr>
<tr>
<td>guest-vlan</td>
<td>30</td>
<td>192.0.2.32/28 192.0.2.33 through 192.0.2.46 192.0.2.47 is subnet’s broadcast address</td>
<td>VLAN for guests’ data devices (PCs). The scenario assumes that the corporation has an area open to visitors, either in the lobby or in a conference room, that has a hub to which visitors can plug in their PCs to connect to the Web and to their company’s VPN.</td>
</tr>
<tr>
<td>camera-vlan</td>
<td>40</td>
<td>192.0.2.48/28 192.0.2.49 through 192.0.2.62 192.0.2.63 is subnet’s broadcast address</td>
<td>VLAN for the corporate security cameras.</td>
</tr>
</tbody>
</table>

Ports on the EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. Table 520 on page 4165 shows the switch ports that are assigned to the VLANs and the IP and MAC addresses for devices connected to the switch ports.
Table 520: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

<td>Two security cameras</td>
</tr>
<tr>
<td>ge-0/0/9</td>
<td>voice-vlan</td>
<td>IP address: 192.0.2.14</td>
<td>Gatekeeper device. The gatekeeper manages call registration, admission, and call status for VoIP phones.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>MAC address: 00.05.85.00.00.0E</td>
<td></td>
</tr>
<tr>
<td>ge-0/1/0</td>
<td></td>
<td>IP address: 192.0.2.65</td>
<td>Layer 3 connection to a router; note that this is a port on the switch’s uplink module</td>
</tr>
</tbody>
</table>

Configuring an Ingress Port Firewall Filter to Prioritize Voice Traffic and Rate-Limit TCP and ICMP Traffic

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

**CLI Quick Configuration**

To quickly configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the employee-vlan subnet, copy the following commands and paste them into the switch terminal window:

```bash
[edit]
set firewall policer tcp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
set firewall policer tcp-connection-policer then discard
set firewall policer icmp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
set firewall policer icmp-connection-policer then discard
set firewall family ethernet-switching filter ingress-port-voip-class-limit tcp-icmp term voip-high from source-mac-address 00.05.85.00.00.01
set firewall family ethernet-switching filter ingress-port-voip-class-limit tcp-icmp term voip-high from source-mac-address 00.05.85.00.00.02
set firewall family ethernet-switching filter ingress-port-voip-class-limit tcp-icmp term voip-high from protocol udp
set firewall family ethernet-switching filter ingress-port-voip-class-limit tcp-icmp term voip-high then forwarding-class expedited-forwarding
set firewall family ethernet-switching filter ingress-port-voip-class-limit tcp-icmp term voip-high then loss-priority low
```

set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class best-effort scheduler best-effort
Step-by-Step Procedure

To configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the employee-vlan subnet:

1. Define the policers tcp-connection-policer and icmp-connection-policer:

   ```
   [edit]
   user@switch# set firewall policer tcp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
   user@switch# set firewall policer tcp-connection-policer then discard
   user@switch# set firewall policer icmp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
   user@switch# set firewall policer icmp-connection-policer then discard
   ```

2. Define the firewall filter ingress-port-voip-class-limit-tcp-icmp:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp
   ```

3. Define the term voip-high:

   ```
   [edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp ]
   user@switch# set term voip-high from source-mac-address 00.05.85.00.00.01
   user@switch# set term voip-high from source-mac-address 00.05.85.00.00.02
   user@switch# set term voip-high from protocol udp
   user@switch# set term voip-high then forwarding-class expedited-forwarding
   user@switch# set term voip-high then loss-priority low
   ```

4. Define the term network-control:

   ```
   [edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp ]
   user@switch# set term network-control from precedence net-control
   user@switch# set term network-control then forwarding-class network-control
   user@switch# set term network-control then loss-priority low
   ```

5. Define the term tcp-connection to configure rate limits for TCP traffic:

   ```
   [edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp ]
   user@switch# set term tcp-connection from destination-address 192.0.2.16/28
   user@switch# set term tcp-connection from protocol tcp
   user@switch# set term tcp-connection then policer tcp-connection-policer
   user@switch# set term tcp-connection then count tcp-counter
   user@switch# set term tcp-connection then forwarding-class best-effort
   user@switch# set term tcp-connection then loss-priority high
   ```

6. Define the term icmp-connection to configure rate limits for ICMP traffic:

   ```
   [edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp ]
   user@switch# set term icmp-connection from destination-address 192.0.2.16/28
   user@switch# set term icmp-connection from protocol icmp
   user@switch# set term icmp-connection then policer icmp-policer
   user@switch# set term icmp-connection then count icmp-counter
   user@switch# set term icmp-connection then forwarding-class best-effort
   user@switch# set term icmp-connection then loss-priority high
   ```

7. Define the term best-effort with no match conditions for an implicit match on all packets that did not match any other term in the firewall filter:

   ```
   [edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp ]
   user@switch# set term best-effort then forwarding-class best-effort
   user@switch# set term best-effort then loss-priority high
   ```
8. Apply the firewall filter `ingress-port-voip-class-limit-tcp-icmp` as an input filter to the port interfaces for `employee-vlan`:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0 description "voice priority and tcp and icmp traffic rate-limiting filter at ingress port"
   user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input ingress-port-voip-class-limit-tcp-icmp
   user@switch# set ge-0/0/1 description "voice priority and tcp and icmp traffic rate-limiting filter at ingress port"
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input ingress-port-voip-class-limit-tcp-icmp
   ```

9. Configure the parameters that are desired for the different schedulers.

   ```
   NOTE: When you configure parameters for the schedulers, define the numbers to match your network traffic patterns.
   ```

10. Assign the forwarding classes to schedulers with a scheduler map:

    ```
    [edit class-of-service]
    user@switch# set scheduler-maps ethernet-diffsrv-cos-map
    user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class expedited-forwarding scheduler voice-high
    user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class network-control scheduler network-control
    user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class best-effort scheduler best-effort
    ```

11. Associate the scheduler map with the outgoing interface:

    ```
    [edit class-of-service]
    user@switch# set interfaces ge–0/1/0 scheduler-map ethernet-diffsrv-cos-map
    ```

**Results** Display the results of the configuration:

```python
user@switch# show firewall {
  policer tcp-connection-policer {
    if-exceeding {
      bandwidth-limit 1m;
      burst-size-limit 30k;
    }
    then {
      discard;
    }
  }
  policer icmp-connection-policer {
    if-exceeding {
      bandwidth-limit 1m;
    }
  }
}
```
burst-size-limit 30K;
}
then {
discard;
}
}
family ethernet-switching {
filter ingress-port-voip-class-limit-tcp-icmp {
term voip-high {
  from {
    destination-mac-address 00.05.85.00.00.01;
    destination-mac-address 00.05.85.00.00.02;
    protocol udp;
  }
  then {
    forwarding-class expedited-forwarding;
    loss-priority low;
  }
}
term network-control {
  from {
    precedence net-control;
  }
  then {
    forwarding-class network-control;
    loss-priority low;
  }
}
term tcp-connection {
  from {
    destination-address 192.0.2.16/28;
    protocol tcp;
  }
  then {
    policer tcp-connection-policer;
    count tcp-counter;
    forwarding-class best-effort;
    loss-priority high;
  }
}
term icmp-connection {
  from {
    protocol icmp;
  }
  then {
    policer icmp-connection-policer;
    count icmp-counter;
    forwarding-class best-effort;
    loss-priority high;
  }
}
term best-effort {
  then {
    forwarding-class best-effort;
    loss-priority high;
  }
}
### CLI Quick Configuration

To quickly configure a VLAN firewall filter on voice-vlan to prevent rogue devices from using HTTP sessions to mimic the gatekeeper device that manages VoIP traffic, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper from
destination-address 192.0.2.14
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper from
destination-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper then
accept
```

---

**Configuring a VLAN Ingress Firewall Filter to Prevent Rogue Devices from Disrupting VoIP Traffic**

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:
**Step-by-Step Procedure**

To configure and apply a VLAN firewall filter on **voice-vlan** to prevent rogue devices from using HTTP to mimic the gatekeeper device that manages VoIP traffic:

1. Define the firewall filter **ingress-vlan-rogue-block** to specify filter matching on the traffic you want to permit and restrict:
   
   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter ingress-vlan-rogue-block
   ```

2. Define the term **to-gatekeeper** to accept packets that match the destination IP address of the gatekeeper:
   
   ```
   [edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
   user@switch# set term to-gatekeeper from destination-address 192.0.2.14
   user@switch# set term to-gatekeeper from destination-port 80
   user@switch# set term to-gatekeeper then accept
   ```

3. Define the term **from-gatekeeper** to accept packets that match the source IP address of the gatekeeper:
   
   ```
   [edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
   user@switch# set term from-gatekeeper from source-address 192.0.2.14
   user@switch# set term from-gatekeeper from source-port 80
   user@switch# set term from-gatekeeper then accept
   ```

4. Define the term **not-gatekeeper** to ensure all **voice-vlan** traffic on TCP ports is destined for the gatekeeper device:

   ```
   [edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
   user@switch# set term not-gatekeeper from destination-port 80
   user@switch# set term not-gatekeeper then count rogue-counter
   user@switch# set term not-gatekeeper then discard
   ```

5. Apply the firewall filter **ingress-vlan-rogue-block** as an input filter to the VLAN interface for the VoIP telephones:

   ```
   [edit]
   user@switch# set vlans voice-vlan description "block rogue devices on voice-vlan"
   user@switch# set vlans voice-vlan filter input ingress-vlan-rogue-block
   ```

**Results**

Display the results of the configuration:

```
user@switch# show
firewall {
    family ethernet-switching {
        filter ingress-vlan-rogue-block {
            term to-gatekeeper {
                from {
```
destination-address 192.0.2.14/32
destination-port 80;
}
then {
accept;
}
}
term from-gatekeeper {
from {
source-address 192.0.2.14/32
source-port 80;
}
then {
accept;
}
}
term not-gatekeeper {
from {
destination-port 80;
}
then {
count rogue-counter;
discard;
}
}
}
vlans {
voice-vlan {
description "block rogue devices on voice-vlan";
filter {
input ingress-vlan-rogue-block;
}
}
}

Configuring a VLAN Firewall Filter to Count, Monitor, and Analyze Egress Traffic on the Employee VLAN

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

A firewall filter is configured and applied to VLAN interfaces to filter employee-vlan egress traffic. Employee traffic destined for the corporate subnet is accepted but not monitored. Employee traffic destined for the Web is counted and analyzed.

To quickly configure and apply a VLAN firewall filter, copy the following commands and paste them into the switch terminal window:

[edit]
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-corp
from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-corp
then accept
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
from destination-port 80
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web then count employee-web-counter
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web then analyzer employee-monitor
set vlans employee-vlan description "filter at egress VLAN to count and analyze employee to Web traffic"
set vlans employee-vlan filter output egress-vlan-watch-employee

Step-by-Step Procedure

To configure and apply an egress port firewall filter to count and analyze employee-vlan traffic that is destined for the Web:

1. Define the firewall filter egress-vlan-watch-employee:

   [edit firewall]
   user@switch# set family ethernet-switching filter egress-vlan-watch-employee

2. Define the term employee-to-corp to accept but not monitor all employee-vlan traffic destined for the corporate subnet:

   [edit firewall family ethernet-switching filter egress-vlan-watch-employee]
   user@switch# set term employee-to-corp from destination-address 192.0.2.16/28
   user@switch# set term employee-to-corp then accept

3. Define the term employee-to-web to count and monitor all employee-vlan traffic destined for the Web:

   [edit firewall family ethernet-switching filter egress-vlan-watch-employee]
   user@switch# set term employee-to-web from destination-port 80
   user@switch# set term employee-to-web then count employee-web-counter
   user@switch# set term employee-to-web then analyzer employee-monitor

   NOTE: See Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on EX Series Switches for information about configuring the employee-monitor analyzer.

4. Apply the firewall filter egress-vlan-watch-employee as an output filter to the port interfaces for the VoIP telephones:

   [edit]
   user@switch# set vlans employee-vlan description "filter at egress VLAN to count and analyze employee to Web traffic"
   user@switch# set vlans employee-vlan filter output egress-vlan-watch-employee

Results

Display the results of the configuration:

user@switch# show
firewall {
  family ethernet-switching {
    filter egress-vlan-watch-employee {
      term employee-to-corp {
        from {
          destination-address 192.0.2.16/28
        }
        then {
          accept;
        }
      }
    }
  }
}
term employee-to-web {
    from {
        destination-port 80;
    }
    then {
        count employee-web-counter:
        analyzer employee-monitor;
    }
}

vls {
    employee-vlan {
        description "filter at egress VLAN to count and analyze employee to Web traffic";
        filter {
            output egress-vlan-watch-employee;
        }
    }
}

Configuring a VLAN Firewall Filter to Restrict Guest-to-Employee Traffic and Peer-to-Peer Applications on the Guest VLAN

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

CLI Quick Configuration

In the following example, the first filter term permits guests to talk with other guests but not employees on employee-vlan. The second filter term allows guests Web access but prevents them from using peer-to-peer applications on guest-vlan.

To quickly configure a VLAN firewall filter to restrict guest-to-employee traffic, blocking guests from talking with employees or employee hosts on employee-vlan or attempting to use peer-to-peer applications on guest-vlan, copy the following commands and paste them into the switch terminal window:

[edit]
set firewall family ethernet-switching filter ingress-vlan-limit-guest term guest-to-guest from destination-address 192.0.2.33/28
set firewall family ethernet-switching filter ingress-vlan-limit-guest term guest-to-guest then accept
set firewall family ethernet-switching filter ingress-vlan-limit-guest term no-guest-employee-no-peer-to-peer from destination-mac-address 00.05.85.00.00.DF
set firewall family ethernet-switching filter ingress-vlan-limit-guest term no-guest-employee-no-peer-to-peer then accept
set vlans guest-vlan description "restrict guest-to-employee traffic and peer-to-peer applications on guest VLAN"
set vlans guest-vlan filter input ingress-vlan-limit-guest
To configure and apply a VLAN firewall filter to restrict guest-to-employee traffic and peer-to-peer applications on guest-vlan:

1. Define the firewall filter ingress-vlan-limit-guest:
   ```
   [edit firewall]
   set firewall family ethernet-switching filter ingress-vlan-limit-guest
   ``

2. Define the term guest-to-guest to permit guests on the guest-vlan to talk with other guests but not employees on the employee-vlan:
   ```
   [edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
   user@switch# set term guest-to-guest from destination-address 192.0.2.33/28
   user@switch# set term guest-to-guest then accept
   ``

3. Define the term no-guest-employee-no-peer-to-peer to allow guests on guest-vlan Web access but prevent them from using peer-to-peer applications on the guest-vlan.
   ```
   [edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
   user@switch# set term no-guest-employee-no-peer-to-peer from destination-mac-address 00.05.85.00.00.DF
   user@switch# set term no-guest-employee-no-peer-to-peer then accept
   ``

4. Apply the firewall filter ingress-vlan-limit-guest as an input filter to the interface for guest-vlan:
   ```
   [edit]
   user@switch# set vlans guest-vlan description "restrict guest-to-employee traffic and peer-to-peer applications on guest VLAN"
   user@switch# set vlans guest-vlan filter input ingress-vlan-limit-guest
   ```

Results
Display the results of the configuration:

```bash
user@switch# show
firewall {
    family ethernet-switching {
        filter ingress-vlan-limit-guest {
            term guest-to-guest {
                from {
                    destination-address 192.0.2.33/28;
                }
                then {
                    accept;
                }
            }
            term no-guest-employee-no-peer-to-peer {
                from {
                    destination-mac-address 00.05.85.00.00.DF;
                }
                then {
                    accept;
                }
            }
        }
    }
}
```
Configuring a Router Firewall Filter to Give Priority to Egress Traffic Destined for the Corporate Subnet

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

**CLI Quick Configuration**

To quickly configure a firewall filter for a routed port (Layer 3 uplink module) to filter *employee-vlan* traffic, giving highest forwarding-class priority to traffic destined for the corporate subnet, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family inet filter egress-router-corp-class term corp-expedite from destination-address 192.0.2.16/28
set firewall family inet filter egress-router-corp-class term corp-expedite then forwarding-class expedited-forwarding
set firewall family inet filter egress-router-corp-class term corp-expedite then loss-priority low
set firewall family inet filter egress-router-corp-class term not-to-corp then accept
set interfaces ge-0/1/0 unit 0 family inet address 103.104.105.1
set interfaces ge-0/1/0 unit 0 family inet filter output egress-router-corp-class
```

**Step-by-Step Procedure**

To configure and apply a firewall filter to a routed port (Layer 3 uplink module) to give highest priority to *employee-vlan* traffic destined for the corporate subnet:

1. Define the firewall filter *egress-router-corp-class*:
   
   ```
   [edit]
   user@switch# set firewall family inet filter egress-router-corp-class
   ```

2. Define the term *corp-expedite*:
   
   ```
   [edit firewall]
   user@switch# set family inet filter egress-router-corp-class term corp-expedite from destination-address 192.0.2.16/28
   ```

3. Define the term *not-to-corp*:
   
   ```
   [edit firewall]
   user@switch# set family inet filter egress-router-corp-class term not-to-corp then accept
   ```

4. Apply the firewall filter *egress-router-corp-class* as an output filter for the port on the switch's uplink module, which provides a Layer 3 connection to a router:
[edit interfaces]
user@switch# set ge-0/1/0 description "filter at egress router to expedite employee traffic destined for corporate network"
user@switch# set ge-0/1/0 unit 0 family inet address 103.104.105.1
user@switch# set ge-0/1/0 unit 0 family inet filter output egress-router-corp-class

Results
Display the results of the configuration:

user@switch# show firewall {
  family inet {
    filter egress-router-corp-class {
      term corp-expedite {
        from {
          destination-address 192.0.2.16/28;
        }
        then {
          forwarding-class expedited-forwarding;
          loss-priority low;
        }
      }
      term not-to-corp {
        then {
          accept;
        }
      }
    }
  }
}

  interfaces {
    ge-0/1/0 {
      unit 0 {
        description "filter at egress router interface to expedite employee traffic destined for corporate network";
        family inet {
          source-address 103.104.105.1
          filter {
            output egress-router-corp-class;
          }
        }
      }
    }
  }
}

Verification
To confirm that the firewall filters are working properly, perform the following tasks:

- Verifying that Firewall Filters and Policers are Operational on page 4177
- Verifying that Schedulers and Scheduler-Maps are Operational on page 4178

Purpose
Verify the operational state of the firewall filters and policers that are configured on the switch.
**Action**  Use the operational mode command:

```bash
user@switch> show firewall
```

Filter: ingress-port-voip-class-limit-tcp-icmp

Counters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>icmp-counter</td>
<td>0</td>
</tr>
<tr>
<td>tcp-counter</td>
<td>0</td>
</tr>
</tbody>
</table>

Policers:

<table>
<thead>
<tr>
<th>Name</th>
<th>Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>icmp-connection-policer</td>
<td>0</td>
</tr>
<tr>
<td>tcp-connection-policer</td>
<td>0</td>
</tr>
</tbody>
</table>

Filter: ingress-vlan-rogue-block

Filter: egress-vlan-watch-employee

Counters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>employee-web-counter</td>
<td>0</td>
</tr>
</tbody>
</table>

**Meaning**  The `show firewall` command displays the names of the firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for all configured counters and the packet count for all policers.

**Verifying that Schedulers and Scheduler-Maps are Operational**

**Purpose**  Verify that schedulers and scheduler-maps are operational on the switch.

**Action**  Use the operational mode command:

```bash
user@switch> show class-of-service scheduler-map
```

Scheduler map: default, Index: 2

Scheduler: default-be, Forwarding class: best-effort, Index: 20
Transmit rate: 95 percent, Rate Limit: none, Buffer size: 95 percent,

Example: Configuring a Firewall Filter on a Management Interface on an EX Series Switch

You can configure a firewall filter on a management interface on an EX Series switch to filter ingress or egress traffic on the management interface on the switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch.

This example discusses how to configure a firewall filter on a management interface to filter SSH packets egressing from an EX Series switch:

- Requirements on page 4180
- Overview and Topology on page 4180
Requirements

This example uses the following hardware and software components:

- One EX Series switch and one management PC
- Junos OS Release 10.4 or later for EX Series switches

Overview and Topology

In this example, a management PC establishes an SSH connection with the management interface on a switch to remotely manage the switch. The IP address configured for the management interface is 10.204.33.103/20. A firewall filter is configured on the management interface to count the number of packets egressing from a source SSH port on the management interface. When the management PC establishes the SSH session with the management interface, the management interface returns SSH packets to the management PC to confirm that the session is established. These SSH packets are filtered based on the match condition specified in the firewall filter before they are forwarded to the management PC. As these packets are generated from the source SSH port on the management interface, they fulfill the match condition specified for the management interface. The number of matched SSH packets provides a count of the number of packets that have traversed the management interface. A system administrator can use this information to monitor the management traffic and take any action if required.

Figure 62 on page 4180 shows the topology for this example in which a management PC establishes an SSH connection with the switch.

Figure 62: SSH Connection From a Management PC to an EX Series Switch

CLI Quick Configuration

To quickly create and configure a firewall filter on the management interface to filter SSH packets egressing from the management interface, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family inet filter mgmt_filter term t1 from source-port ssh
set firewall family inet filter mgmt_filter term t1 then count c1
set firewall family inet filter mgmt_filter term t2 then accept
set interfaces me0 unit 0 family inet filter output mgmt_filter
```
Step-by-Step Procedure

To configure a firewall filter on the management interface to filter SSH packets:

1. Configure the firewall filter that matches SSH packets from the source port:

   [edit]
   user@switch# set firewall family inet filter (Firewall Filters) mgmt_filter term t1 from source-port ssh
   user@switch# set firewall family inet filter mgmt_filter term t1 then count c1
   user@switch# set firewall family inet filter mgmt_filter term t2 then accept

   These statements set a counter c1 to count the number of SSH packets that egress from the source SSH interface on the management interface.

2. Set the firewall filter for the management interface:

   [edit]
   user@switch# set interfaces me0 unit 0 family inet filter output mgmt_filter

   NOTE: You can also set the firewall filter for a VME interface.

Results

Check the results of the configuration:

[edit]
user@switch# show interfaces { me0 { unit 0 { family inet { filter { output mgmt_filter; } address 10.93.54.6/24; } } } }

firewall { family inet { filter mgmt_filter [ term t1 { from [ source-port ssh; then count c1; ] } term t2 { then accept; ] } ] } }
Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Firewall Filter Is Configured on a Management Interface on page 4182

**Verifying That the Firewall Filter Is Configured on a Management Interface**

**Purpose**
Verify that the firewall filter has been enabled on the management interface on the switch.

**Action**
1. Verify that the firewall filter is applied to the management interface:

   ```
   [edit]
   user@switch# show interfaces me0
   unit 0 {
     family inet {
       filter {
         output mgmt_fil1;
       }
       address 10.204.33.103/20;
     }
   }
   ``

2. Check the counter value that is associated with the firewall filter:

   ```
   user@switch> show firewall
   Filter: mgmt_fil1
   Counters:
   Name      Bytes    Packets
   c1        0         0
   ```

3. From the management PC, establish a secure shell session with the switch:

   ```
   [user@management-pc ~]$ ssh user@10.204.33.103
   ```

4. Check counter values after SSH packets are generated from the switch in response to the secure shell session request by the management PC:

   ```
   user@switch> show firewall
   Filter: mgmt_fil1
   Counters:
   Name      Bytes    Packets
   c1        3533      23
   ```

**Meaning**
The output indicates that the firewall filter has been applied to the management interface and the counter value indicates that 23 SSH packets were generated from the switch.

**Related Documentation**
- Configuring Firewall Filters (CLI Procedure) on page 4192
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4161
Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on EX Series Switches

Administrators can configure filter-based forwarding on an EX Series switch by using a firewall filter to forward matched traffic to a specific virtual routing instance. This example describes how to set up filter-based forwarding:

- Requirements on page 4183
- Overview and Topology on page 4183
- Configuration on page 4183
- Verification on page 4185

Requirements

This example uses the following software and hardware components:

- One EX Series switch
- Junos OS Release 9.4 or later for EX Series switches

Overview and Topology

In this example, traffic from one application server that is destined for a different application server is matched by a firewall filter based on the IP address. Any matching packets are routed to a particular virtual routing instance that first sends all traffic to a security device, then forwards it to the designated destination address.

Configuration

To configure filter-based forwarding:

1. Create interfaces to the application servers:

```
user@switch# set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24
user@switch# set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24
```

2. Create a firewall filter that matches the correct source address:

```
set firewall family inet filter fil term t1 from source-address 1.1.1.1/32
set firewall family inet filter fil term t1 from protocol tcp
```

3. Configure the virtual routing instance:

```
set routing-instances vrf01 instance-type virtual-router
set routing-instances vrf01 interface ge-0/0/1.0
set routing-instances vrf01 interface ge-0/0/3.0
set routing-instances vrf01 routing-options static route 12.34.56.0/24 next-hop 10.1.3.254
set firewall family inet filter fil term t1 then routing-instance vrf01
```
3. Associate the filter with the source application server’s interface:

```
[edit]
user@switch# set interfaces ge-0/0/0 unit 0 family inet filter input fil
```

4. Create a virtual router:

```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```

5. Associate the interfaces with the virtual router:

```
[edit]
user@switch# set routing-instances vrf01 interface ge-0/0/1.0
user@switch# set routing-instances vrf01 interface ge-0/0/3.0
```

6. Configure the routing information for the virtual routing instance:

```
[edit]
user@switch# set routing-instances vrf01 routing-options static route 12.34.56.0/24 next-hop 10.1.3.254
```

7. Set the filter to forward packets to the virtual router you created:

```
[edit]
user@switch# set firewall family inet filter fil term t1 then routing-instance vrf01
```

**Results**

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/0 {
    unit 0 {
      family inet {
        filter {
          input fil;
        }
        address 10.1.0.1/24;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      family inet {
        address 10.1.3.1/24;
      }
    }
  }
}
firewall {
  family inet {
    filter fil {
      term t1 {
        from {
          source-address {
            1.1.1.1/32;
          }
        protocol tcp;
```
then {
    routing-instance vrf01;
}
}

} routing-instances {
 vrf01 {
    instance-type virtual-router;
    interface ge-0/0/1.0;
    interface ge-0/0/3.0;
    routing-options {
        static {
            route 12.34.56.0/24 next-hop 10.1.3.254;
        }
    }
}
}

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That Filter-Based Forwarding Was Configured on page 4185

Verifying That Filter-Based Forwarding Was Configured

**Purpose**
Verify that filter-based forwarding was properly enabled on the switch.

**Action**
1. Use the `show interfaces filters` command:

```
user@switch> show interfaces filters ge-0/0/0.0
Interface        Admin Link Proto Input Filter         Output Filter
ge-0/0/0.0       up    down inet  fil
```

2. Use the `show route forwarding-table` command:

```
user@switch> show route forwarding-table
Routing table: default.inet
Internet:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            user     1 0:12:f2:21:cf:0    ucst   331     4 me0.0
default            perm     0                    rjct    36     3
0.0.0.0/32         perm     0                    dscd    34     1

### Meaning

The output indicates that the filter was created on the interface and that the virtual routing instance is forwarding matching traffic to the correct IP address.

### Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- Requirements on page 4187
- Overview and Topology on page 4187
Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.5 or later for EX Series switches
- One EX Series switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1675.
- Configured 802.1X authentication on the switch, with the authentication mode for interface ge-0/0/2 set to multiple. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1740 and “Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch” on page 1684.
- Configured users on the RADIUS authentication server.

Overview and Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in Figure 18 on page 1727, when User1 is authenticated by the EX Series switch, the system creates the firewall filter `dynamic-filter-example`. When User2 is authenticated, another term is added to the firewall filter, and so on.
This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface `ge-0/0/2` to the file server, which is located on subnet `192.0.2.16/28`, and set policer definitions to rate limit the traffic. Figure 19 on page 1728 shows the network topology for this example.
Figure 64: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server

Configuration

To configure firewall filters for multiple supplicants on 802.1X-enabled interfaces:

- Configuring Firewall Filters on Interfaces with Multiple Supplicants on page 4189

**Configuring Firewall Filters on Interfaces with Multiple Supplicants**

**CLI Quick Configuration**

To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/2 supplicant multiple
set firewall family ethernet-switching filter filter1 term term1 from destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

**Step-by-Step Procedure**

To configure firewall filters on an interface enabled for multiple supplicants:

1. Configure interface `ge-0/0/2` for multiple supplicant mode authentication:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/2 supplicant multiple
   ```

2. Set policer definition:
3. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

**Results**  
Check the results of the configuration:

```
user@switch> show configuration

firewall {
    family ethernet-switching {
        filter filter1 {
            term term1 {
                from {
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then count counter1;
            }
            term term2 {
                from {
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then policer p1;
            }
        }
    }
    policer p1 {
        if-exceeding {
            bandwidth-limit 1m;
            burst-size-limit 1k;
        }
        then discard;
    }
}
protocols {
    dot1x {
        authenticator
        interface ge-0/0/2 {
            supplicant multiple;
        }
    }
}
```
Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying Firewall Filters on Interfaces with Multiple Supplicants on page 4191

**Verifying Firewall Filters on Interfaces with Multiple Supplicants**

**Purpose**
Verify that firewall filters are functioning on the interface with multiple supplicants.

**Action**

1. Check the results with one user authenticated on the interface. In this case, the user is authenticated on **ge-0/0/2**:

```shell
user@switch> show dot1x firewall
Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```

2. When a second user, User2, is authenticated on the same interface, **ge-0/0/2**, you can verify that the filter includes the results for both of the users authenticated on the interface:

```shell
user@switch> show dot1x firewall
Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```

**Meaning**
The results displayed by the `show dot1x firewall` command output reflect the dynamic filter created with the authentication of each new user. User1 accessed the file server located at the specified destination address 100 times, while User2 accessed the same file server 400 times.

You configure firewall filters on EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

This topic describes:

- Configuring a Firewall Filter on page 4192
- Configuring a Term Specifically for IPv4 or IPv6 Traffic on page 4196
- Applying a Firewall Filter to a Port on a Switch on page 4197
- Applying a Firewall Filter to a Management Interface on a Switch on page 4198

- Applying a Firewall Filter to a Layer 3 (Routed) Interface on page 4200

**Configuring a Firewall Filter**

Before you can apply a firewall filter to a port, VLAN, or Layer 3 interface, you must configure a firewall filter with the required details, such as type of family for the firewall filter, firewall filter name, and match conditions. A match condition in the firewall filter configuration can contain multiple terms that define the criteria for the match condition. For each term, you must specify an action to be performed if a packet matches the conditions in the term. For information on different match conditions and actions, see “Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches” on page 4096.

To configure a firewall filter:
1. Configure the family address type for the firewall filter:

   - For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching** to filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets, for example:
     
     ```
     [edit firewall]
     user@switch# set family ethernet-switching
     ```

   - For a firewall filter that is applied to a Layer 3 (routed) interface:
     
     - To filter IPv4 packets, specify the family address type **inet**, for example:
       
       ```
       [edit firewall]
       user@switch# set family inet
       ```
     
     - To filter IPv6 packets, specify the family address type **inet6**, for example:
       
       ```
       [edit firewall]
       user@switch# set family inet6
       ```

     **NOTE:** You can configure firewall filters for both IPv4 and IPv6 traffic on the same Layer 3 interface.

2. Specify the filter name:

   ```
   [edit firewall family ethernet-switching]
   user@switch# set filter ingress-port-filter
   ```

   The filter name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters. Each filter name must be unique.

3. If you want to apply a firewall filter to multiple interfaces and name individual firewall counters specific to each interface, configure the **interface-specific** option:

   ```
   [edit firewall family ethernet-switching filter ingress-port-filter]
   user@switch# set interface-specific
   ```

4. Specify a term name:

   ```
   [edit firewall family ethernet-switching filter ingress-port-filter]
   user@switch# set term term-one
   ```

   The term name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters.

   A firewall filter can contain one or more terms. Each term name must be unique within a filter.
The maximum number of terms allowed per firewall filter for EX Series switches is:

- 512 for EX2200 switches
- 1,436 for EX3300 switches

On EX3300 switches, if you add and delete filters with a large number of terms (on the order of 1000 or more) in the same commit operation, not all the filters are installed. You must add filters in one commit operation, and delete filters in a separate commit operation.

- 7,168 for EX3200 and EX4200 switches
- On EX4300 switches, following are the number of terms supported for ingress and egress traffic, for firewall filers configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3,500 terms for firewall filters configured on a port
    - 3,500 terms for firewall filters configured on a VLAN
    - 7,000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3,500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port
    - 256 terms for firewall filters configured on a VLAN
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

You can configure these maximum number of terms only when you configure one type of firewall filter (Port, VLAN, or Router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on all interfaces in the switch.

- 1,200 for EX4500 and EX4550 switches
• 1,400 for EX6200 switches
• 32,768 for EX8200 switches

If you attempt to configure a firewall filter that exceeds these limits, the switch returns an error message when you commit the configuration.

5. In each firewall filter term, specify the match conditions to use to match components of a packet.

To specify match conditions to match on packets that contain a specific source address and source port—for example:

```plaintext
[edit firewall family ethernet-switching filter ingress-port-filter term term-one]
user@switch# set from source-address 192.0.2.14
user@switch# set from source-port 80
```

You can specify one or more match conditions in a single **from** statement. For a match to occur, the packet must match all the conditions in the term.

The **from** statement is optional, but if included in a term, the **from** statement cannot be empty. If you omit the **from** statement, all packets are considered to match.

6. In each firewall filter term, specify the action to take if the packet matches all the conditions in that term.

You can specify an action and/or action modifiers:

• To specify a filter action, for example, to discard packets that match the conditions of the filter term:

  ```plaintext
  [edit firewall family ethernet-switching filter ingress-port-filter term term-one]
  user@switch# set then discard
  ```

  You can specify no more than one action per filter term.

• To specify an action modifier, for example, to count and classify packets in a forwarding class:

  ```plaintext
  [edit firewall family ethernet-switching filter ingress-port-filter term term-one]
  user@switch# set then count counter-one
  user@switch# set then forwarding-class expedited-forwarding
  ```

  In a **then** statement, you can specify the following action modifiers:

  • **analyzer analyzer-name**—Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. An **analyzer** must be configured under the **ethernet-switching** family address type. See Configuring Port Mirroring to Analyze Traffic (CLI Procedure).

  • **count counter-name**—Count the number of packets that pass this filter term.
NOTE: We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

- **forwarding-class class**—Classify packets in a forwarding class.
- **loss-priority priority**—Set the priority for dropping a packet.
- **policer policer-name**—Apply rate limiting to the traffic.
- **interface interface-name**—Forward the traffic to the specified interface, bypassing the switching lookup.
- **log**—Log the packet's header information in the Routing Engine.

If you omit the *then* statement or do not specify an action, packets that match all the conditions in the *from* statement are accepted. However, you must always explicitly configure an action and/or action modifier in the *then* statement. You can include no more than one action, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the *from* statement must match.

NOTE: Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

On Juniper Networks EX8200 Ethernet Switches, if an implicit or explicit discard action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the next hop IPv6 resolve packets to pass through the switch.

### Configuring a Term Specifically for IPv4 or IPv6 Traffic

To configure a term in a firewall filter configuration specifically for IPv4 traffic:

1. Verify that neither `ether-type ipv6` nor `ip-version ipv6` is specified in the term in the configuration. By default, a configuration that does not contain either `ether-type ipv6` or `ip-version ipv6` in a term applies to IPv4 traffic.

2. (Optional) Perform one of these tasks:
   - Define `ether-type ipv4` in a term in the configuration.
   - Define `ip-version ipv4` in a term in the configuration.
   - Define both `ether-type ipv4` and `ip-version ipv4` in a term in the configuration.
   - Verify that neither `ether-type ipv6` nor `ip-version ipv6` is specified in a term in the configuration—by default, a configuration that does not contain either `ether-type ipv6` or `ip-version ipv6` in a term applies to IPv4 traffic if it does not contain `ether-type ipv6` or `ip-version ipv6`. 
3. Ensure that other match conditions in the term are valid for IPv4 traffic.

To configure a term in a firewall filter configuration specifically for IPv6 traffic:

1. Perform one of these tasks:
   - Define \texttt{ether-type ipv6} in a term in the configuration.
   - Define \texttt{ip-version ipv6} in a term in the configuration.
   - Define both \texttt{ether-type ipv6} and \texttt{ip-version ipv4} in a term in the configuration.

   \textbf{NOTE:} By default, a configuration that does not contain either \texttt{ether-type ipv6} or \texttt{ip-version ipv6} in a term applies to IPv4 traffic.

2. Ensure that other match conditions in the term are valid for IPv6 traffic.

   \textbf{NOTE:} If the term contains either of the match conditions \texttt{ether-type ipv6} or \texttt{ip-version ipv6}, with no other IPv6 match condition specified, all IPv6 traffic is matched.

   \textbf{NOTE:} To configure a firewall filter for both IPv4 and IPv6 traffic, you must include two separate terms, one for IPv4 traffic and the other for IPv6 traffic.

\section*{Applying a Firewall Filter to a Port on a Switch}

You can apply a firewall filter to a port on a switch to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in "Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 4096. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a port to filter ingress or egress traffic:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

   \begin{verbatim}
   [edit interfaces]
   user@switch# set ge-0/0/1 description "filter to limit tcp traffic filter at trunk port for employee-vlan and voice-vlan applied on the interface"
   \end{verbatim}

   \textbf{NOTE:} Providing the description is optional.
2. Specify the unit number and family address type for the interface:

   [edit interfaces]
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching
   
   For firewall filters that are applied to ports, the family address type must be "ethernet-switching".

3. To apply a firewall filter to filter packets that are entering a port:

   [edit interfaces]
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input ingress-port-filter
   
   To apply a firewall filter to filter packets that are exiting a port:

   [edit interfaces]
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter output egress-port-filter
   
   **NOTE:** You can apply no more than one firewall filter per port, per direction.

Applying a Firewall Filter to a Management Interface on a Switch

You can configure and apply a firewall filter to a management interface to control traffic that is entering or exiting the interface on a switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch. Similar to configuring a firewall filter on other types of interfaces, you can configure a firewall filter on a management interface using any match condition, action, and action modifier specified in "Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 4096 except for the following action modifiers:

- loss-priority
- forwarding-class

You can apply a firewall filter to the management Ethernet interface on any EX Series switch. You can also apply a firewall filter to the virtual management Ethernet (VME) interface on the EX4200 switch. For more information on the management Ethernet interface and the VME interface, see "EX Series Switches Interfaces Overview" on page 2267.

To apply a firewall filter on the management interface to filter ingress or egress traffic:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

   [edit interfaces]
   user@switch# set me0 description "filter to limit tcp traffic filter at management interface"

   **NOTE:** Providing the description is optional.

2. Specify the unit number and family address type for the management interface:

   [edit interfaces]
   user@switch# set me0 unit 0 family inet
NOTE: For firewall filters that are applied to management interfaces, the family address type can be either inet or inet6.

3. To apply a firewall filter to filter packets that are entering a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter output egress-port-filter
```

NOTE: You can apply no more than one firewall filter per management interface, per direction.

Applying a Firewall Filter to a VLAN on a Network

You can apply a firewall filter to a VLAN on a network to filter ingress or egress traffic on the network. To apply a firewall filter to a VLAN, specify the VLAN name and ID, and then apply the firewall filter to the VLAN. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in "Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 4096. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a VLAN:

1. Specify the VLAN name and VLAN ID and provide a meaningful description of the firewall filter and the VLAN to which the filter is applied:

```
[edit vlans]
user@switch# set employee-vlan vlan-id (802.1Q Tagging) 20 vlan-description "filter to rate limit traffic applied on employee-vlan"
```

NOTE: Providing the description is optional.

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:

- To apply a firewall filter to filter packets that are entering the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 filter input ingress-vlan-filter
```

(On EX4300 switches) To apply a firewall filter to filter packets that are entering the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 forwarding-options input ingress-vlan-filter
```

- To apply a firewall filter to filter packets that are exiting the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 filter output egress-vlan-filter
```
To apply a firewall filter to filter packets that are exiting the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 forwarding-options output egress-vlan-filter
```

**NOTE:** You can apply no more than one firewall filter per VLAN, per direction.

---

### Applying a Firewall Filter to a Layer 3 (Routed) Interface

You can apply a firewall filter to a Layer 3 (routed) interface to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in “Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches” on page 4096. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a Layer 3 interface on a switch:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set ge-0/1/0 description "filter to count and monitor employee-vlan traffic applied on layer 3 interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number, family address type, and address for the interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24
```

For firewall filters applied to Layer 3 interfaces, the family address type must be **inet** (for IPv4 traffic) or **inet6** (for IPv6 traffic).

3. You can apply firewall filters to filter packets that are entering or exiting a Layer 3 (routed) interface:
   - To apply a firewall filter to filter packets that are entering a Layer 3 interface:
     ```
     [edit interfaces]
     user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter input ingress-router-filter
     ```
   - To apply a firewall filter to filter packets that are exiting a Layer 3 interface:
     ```
     [edit interfaces]
     user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter output egress-router-filter
     ```
You can apply no more than one firewall filter per Layer 3 interface, per direction.

Configuring Firewall Filters (J-Web Procedure)

You configure firewall filters on EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter, you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

To configure firewall filter settings by using the J-Web interface:

1. Select Configure > Security > Filters.

   The Firewall Filter Configuration page displays a list of all configured ports or VLANs or router filters and the ports or VLANs associated with a particular filter.

   NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Select this option to create a new filter. Enter information as specified in Table 521 on page 4202.
   - **Edit**—Select this option to edit an existing filter. Enter information as specified in Table 521 on page 4202.
   - **Delete**—Select this option to delete a filter.
• **Term Up**—Select this option to move a term up in the filter term list.
• **Term Down**—Select this option to move a term down in the filter term list.

- Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4096

**Configuring Policers to Control Traffic Rates (CLI Procedure)**

You can configure policers to rate limit traffic on EX Series switches. After you configure a policer, you can include it in an ingress firewall filter configuration.

When you configure a firewall filter, you can specify a policer action for any term or terms within the filter. All traffic that matches a term that contains a policer action goes through the policer that the term references. Each policer that you configure includes an implicit counter. To get term-specific packet counts, you must configure a separate policer for each filter term that requires policing.

**NOTE:** On all EX Series switches except EX8200 switches, each policer that you configure includes an implicit counter. To ensure term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the `counter` option.

The following policer limits apply on a switch:

- A maximum of 512 policers can be configured for port firewall filters.
- A maximum of 512 policers can be configured for VLAN and Layer 3 firewall filters.

If the number of policers in the firewall filter configuration exceeds these limits, the switch returns the following message when you commit the configuration:

*Cannot assign policers: Max policer limit reached*
This topic includes these tasks:

1. **Configuring Policers on page 4207**
2. **Specifying Policers in a Firewall Filter Configuration on page 4208**
3. **Applying a Firewall Filter That Is Configured with a Policer on page 4208**

**Configuring Policers**

To configure a policer:

1. Specify the name of the policer:

   ```
   [edit firewall]
   user@switch# set policer policer-one
   ```
   The policer name can include letters, numbers, and hyphens (-) and can contain up to 64 characters.

2. Specify the *filter-specific* statement to configure a policer to act as a filter-specific policer; else proceed to step 3:

   ```
   [edit firewall]
   user@switch# set policer policer-one filter-specific
   ```
   If you do not specify the *filter-specific* statement, the policer acts as a term-specific policer by default.

3. Configure rate limiting for the policer:

   a. Specify the bandwidth limit in bits per second (bps) to control the traffic rate on an interface:

      ```
      [edit firewall policer policer-one]
      user@switch# set if-exceeding bandwidth-limit 300k
      ```
      The range for the bandwidth limit is 1k through 102.3g bps.

   b. Specify the burst-size limit (the maximum allowed burst size in bytes) to control the amount of traffic bursting:

      ```
      [edit firewall policer policer-one]
      user@switch# set if-exceeding burst-size-limit 500k
      ```
      To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur:

      \[
      \text{burst size} = (\text{bandwidth}) \times (\text{allowable time for burst traffic})
      \]
      The range for the burst-size limit is 1 through 2,147,450,880 bytes.

4. Specify the policer action **discard** to discard packets that exceed the rate limits:

   ```
   [edit firewall policer]
   user@switch# set policer-one then (Policer Action) discard
   ```
   Discard is the only supported policer action.

5. On EX8200 switches, you must assign a global management counter to the policer to obtain policer statistics:

   ```
   [edit firewall policer]
   user@switch# set policer-one counter counter-id 0
   ```
In this sample statement, the global management counter ID is 0. You can assign any number of policers to the global management counter. The policer statistics displayed for each counter are the collective statistics of all policers assigned to that counter.

**Specifying Policers in a Firewall Filter Configuration**

To reference a policer for a single firewall, configure a filter term that includes the policer action:

```
[edit firewall family ethernet-switching]
user@switch# set filter limit-hosts term term-one from source-address 192.0.2.16/28
user@witch# set filter limit-hosts term term-one then policer policer-one
```

**Applying a Firewall Filter That Is Configured with a Policer**

A firewall filter that is configured with one or more policer actions, like any other firewall filter, must be applied to a port, VLAN, or Layer 3 interface. For information about applying firewall filters, see the sections on applying firewall filters in “Configuring Firewall Filters (CLI Procedure)” on page 4192.

**Related Documentation**

- Verifying That Policers Are Operational on page 4260
- Understanding the Use of Policers in Firewall Filters on page 4155
Assigning Multifield Classifiers in Firewall Filters to Specify Packet-Forwarding Behavior (CLI Procedure)

You can configure firewall filters with multifield classifiers to classify packets transiting a port, VLAN, or Layer 3 interface on an EX Series switch.

You specify multifield classifiers in a firewall filter configuration to set the forwarding class and packet loss priority (PLP) for incoming or outgoing packets. By default, the data traffic that is not classified is assigned to the best-effort class associated with queue 0.

You can specify any of the following default forwarding classes:

<table>
<thead>
<tr>
<th>Forwarding class</th>
<th>Queue</th>
</tr>
</thead>
<tbody>
<tr>
<td>best-effort</td>
<td>0</td>
</tr>
<tr>
<td>assured-forwarding</td>
<td>1</td>
</tr>
<tr>
<td>expedited-forwarding</td>
<td>5</td>
</tr>
<tr>
<td>network-control</td>
<td>7</td>
</tr>
</tbody>
</table>

To assign multifield classifiers in firewall filters:

1. Configure the family name and filter name for the filter at the [edit firewall] hierarchy level, for example:

   [edit firewall]
   user@switch# set family ethernet-switching
   user@switch# set family ethernet-switching filter ingress-filter

2. Configure the terms of the filter, including the forwarding-class and loss-priority action modifiers as appropriate. When you specify a forwarding class you must also specify the packet loss priority. For example, each of the following terms examines different packet header fields and assigns an appropriate classifier and the packet loss priority:

   - The term voice-traffic matches packets on the voice-vlan and assigns the forwarding class expedited-forwarding and packet loss priority low:

     [edit firewall family ethernet-switching filter ingress-filter]
     user@switch# set term voice-traffic from vlan-id voice-vlan
     user@switch# set term voice-traffic then forwarding-class expedited-forwarding
     user@switch# set term voice-traffic then loss-priority low

   - The term data-traffic matches packets on employee-vlan and assigns the forwarding class assured-forwarding and packet loss priority low:

     [edit firewall family ethernet-switching filter ingress-filter]
     user@switch# set term data-traffic from vlan-id employee-vlan
     user@switch# set term data-traffic then forwarding-class assured-forwarding
     user@switch# set term data-traffic then loss-priority low

   - Because loss of network-generated packets can jeopardize proper network operation, delay is preferable to discard of packets. The following term,
network-traffic, assigns the forwarding class network-control and packet loss priority low:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch#  set term network-traffic from precedence net-control
user@switch#  set term network-traffic then forwarding-class network
user@switch#  set term network-traffic then loss-priority low
```

- The last term accept-traffic matches any packets that did not match on any of the preceding terms and assigns the forwarding class best-effort and packet loss priority low:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch#  set term accept-traffic from precedence net-control
user@switch#  set term accept-traffic then forwarding-class best-effort
user@switch#  set term accept-traffic then loss-priority low
```

3. Apply the filter ingress-filter to a port, VLAN or Layer 3 interface. For information about applying the filter, see “Configuring Firewall Filters (CLI Procedure)” on page 4192.

- Configuring Firewall Filters (J-Web Procedure) on page 4201

### Configuring Routing Policies (J-Web Procedure)

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes are advertised in the protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table on the routing device.

To configure routing policies for an EX Series switch using the J-Web interface:

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
• **Global Options**—Configures global options for policies. Enter information into the configuration page as described in Table 524 on page 4211.

• **Add**—Configures a new policy. Select New and specify a policy name. To add terms, enter information into the configuration page as described in Table 525 on page 4212. Select Clone to create a copy of an existing policy.

• **Edit**—Edits an existing policy. To modify an existing term, enter information into the configuration page as described in Table 525 on page 4212.

• **Term Up**—Moves a term up in the list.

• **Term Down**—Moves a term down in the list.

• **Delete**—Deletes the selected policy.

• **Test Policy**—Tests the policy. Use this option to check whether the policy produces the results that you expect.

## Configuring Tricolor Marking Policers

You can rate-limit traffic on EX Series switches by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

This topic describes how to configure single-rate and two-rate tricolor marking (TCM) policers, also known as single-rate and two-rate three-color policers. If you want to
configure a single-rate two-color policer (also known just as a "policer"), see "Configuring Policers to Control Traffic Rates (CLI Procedure)" on page 4206.

This topic includes:

- Configuring a Tricolor Marking Policer on page 4216
- Applying Tricolor Marking Policers to Firewall Filters on page 4216

Configuring a Tricolor Marking Policer

A tricolor marking policer polices traffic on the basis of metering rates, including the configured information rate (CIR), the peak information rate (PIR), their associated burst sizes, and any policing actions configured for the traffic. With tri-color marking, you can configure traffic policing according to two separate modes—color-blind and color-aware. In color-blind mode, the current packet loss priority (PLP) value is ignored. In color-aware mode, the current PLP values are considered by the policer, and the policer can increase those values but cannot decrease them.

To configure a tricolor marking (TCM) policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

   ```
   [edit firewall]
   user@switch# set three-color-policer policer-name
   user@switch# set three-color-policer policer-name action loss-priority high then discard
   ```

2. Specify the policer as either single-rate or two-rate and as color-aware or color-blind:

   ```
   [edit firewall three-color-policer policer-name]
   user@switch# set rate mode
   ```

   For example:

   ```
   [edit firewall three-color-policer srTCM-1a]
   user@switch# set single-rate color-aware
   [edit firewall three-color-policer trTCM2-cb]
   user@switch# set two-rate color-blind
   ```

3. For a single-rate TCM policer, configure the CIR, committed burst size (CBS), and excess burst size (EBS):

   ```
   [edit firewall three-color-policer policer-name single-rate]
   user@switch# set committed-information-rate bps
   user@switch# set committed-burst-size bytes
   user@switch# set excess-burst-size bytes
   ```

4. For a two-rate TCM policer, configure the CIR, CBS, PIR, and peak burst size (PBS):

   ```
   [edit firewall three-color-policer policer-name single-rate]
   user@switch# set committed-information-rate bps
   user@switch# set committed-burst-size bytes
   user@switch# set peak-information-rate bps
   user@switch# set peak-burst-size bytes
   ```

Applying Tricolor Marking Policers to Firewall Filters

To rate-limit traffic by applying a tricolor marking (TCM) policer to a firewall filter:

```
[edit firewall family family filter filter-name term term-name then]
user@switch# set three-color-policer rate srTCM1-ca
```
For example:

```
[edit firewall family inet filter test1 term term1 then]
user@switch# set three-color-policer single-rate policer
```

You must include either the single-rate statement or the two-rate statement in the reference to the policer in the firewall filter configuration, and this statement must match the configured TCM policer. Otherwise, an error message appears in the configuration listing.

For example, if you configure `srTCM1-ca` as a single-rate TCM policer and try to apply it as a two-rate policer, the following message appears:

```
[edit firewall]
user@switch# show three-color-policer srTCM1-ca
single-rate {
  color-aware;
  ...
}
user@switch# show filter TESTER
term A {
  then {
    three-color-policer {
      #
      # Warning: Referenced two-rate policer does not exist
      #
      two-rate srTCM;
    }
  }
}
```

**Configuration Statements**

- [edit firewall] Configuration Statement Hierarchy on EX Series Switches on page 4217
- Firewall Filter Configuration Statements Supported by Junos OS for EX Series Switches on page 4219

**[edit firewall] Configuration Statement Hierarchy on EX Series Switches**

This topic lists supported and unsupported configuration statements in the [edit firewall] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.
- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.
This topic lists:

- Supported Statements in the [edit firewall] Hierarchy Level on page 4218
- Unsupported Statements in the [edit firewall] Hierarchy Level on page 4219

**Supported Statements in the [edit firewall] Hierarchy Level**

The following hierarchy shows the [edit firewall] configuration statements supported on EX Series switches:

```plaintext
firewall {
    family family-name {
        filter filter-name {
            interface-specific;
            term term-name {
                from {
                    match-conditions;
                }
                then {
                    action;
                    action-modifiers;
                }
            }
        }
    }
    policer policer-name {
        filter-specific;
        if-exceeding {
            bandwidth-limit bps;
            burst-size-limit bytes;
        }
        then {
            policer-action;
        }
    }
    three-color-policer policer-name {
        action {
            loss-priority high then discard;
        }
        filter-specific;
        single-rate {
            (color-aware | color-blind);
            committed-burst-size bytes;
            committed-information-rate bps;
            excess-burst-size bytes;
        }
        two-rate {
            (color-aware | color-blind);
            committed-burst-size bytes;
            committed-information-rate bps;
            peak-information-rate bps;
            peak-burst-size bytes;
        }
    }
}
```
Unsupported Statements in the [edit firewall] Hierarchy Level

All statements in the [edit firewall] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

Firewall Filter Configuration Statements Supported by Junos OS for EX Series Switches

You configure firewall filters to filter packets based on their components and to perform an action on packets that match the filter.

Table 526 on page 4219 lists the options that are supported for the firewall statement in Junos OS for EX Series switches.

Table 526: Supported Options for Firewall Filter Statements

<table>
<thead>
<tr>
<th>Statement and Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>family family-name {</code></td>
<td>The <code>family-name</code> option specifies the version or type of addressing protocol:</td>
</tr>
<tr>
<td><code>}</code></td>
<td>• <code>any</code>—Filter packets based on protocol-independent match conditions.</td>
</tr>
<tr>
<td></td>
<td>• <code>ethernet-switching</code>—Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets</td>
</tr>
<tr>
<td></td>
<td>• <code>inet</code>—Filter IPv4 packets</td>
</tr>
<tr>
<td></td>
<td>• <code>inet6</code>—Filter IPv6 packets</td>
</tr>
<tr>
<td><code>filter filter-name {</code></td>
<td>The <code>filter-name</code> option identifies the filter. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the name in quotation marks (&quot; &quot;).</td>
</tr>
<tr>
<td><code>}</code></td>
<td></td>
</tr>
<tr>
<td><code>interface-specific</code></td>
<td>The <code>interface-specific</code> statement configures unique names for individual firewall counters specific to each interface.</td>
</tr>
<tr>
<td><code>term term-name {</code></td>
<td>The <code>term-name</code> option identifies the term. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (&quot; &quot;). Each term name must be unique within a filter.</td>
</tr>
<tr>
<td><code>}</code></td>
<td></td>
</tr>
</tbody>
</table>
### Table 526: Supported Options for Firewall Filter Statements (continued)

<table>
<thead>
<tr>
<th>Statement and Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>from {</code></td>
<td>The <code>from</code> statement is optional. If you omit it, all packets are considered to match.</td>
</tr>
<tr>
<td><code>match-conditions;</code></td>
<td><code>then {</code> For information about the <code>action</code> and <code>action-modifiers</code> options, see &quot;Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches&quot; on page 4096.</td>
</tr>
<tr>
<td><code>}</code></td>
<td><code>policer policer-name</code> {</td>
</tr>
<tr>
<td></td>
<td>The <code>policer-name</code> option identifies the policer. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the name in quotation marks (&quot; &quot;).</td>
</tr>
<tr>
<td><code>}</code></td>
<td><code>filter-specific</code> The <code>filter-specific</code> statement configures policers and counters for a specific filter name.</td>
</tr>
<tr>
<td><code>if-exceeding {</code></td>
<td>The <code>bandwidth-limit bps</code> option specifies the traffic rate in bits per second (bps).</td>
</tr>
<tr>
<td><code>burst-size-limit bytes</code></td>
<td>You can specify <code>bps</code> as a decimal value or as a decimal number followed by one of the following abbreviations:</td>
</tr>
<tr>
<td><code>}</code></td>
<td>• k (thousand)</td>
</tr>
<tr>
<td></td>
<td>• m (million)</td>
</tr>
<tr>
<td></td>
<td>• g (billion, which is also called a thousand million)</td>
</tr>
<tr>
<td></td>
<td><strong>Range</strong>: 1000 (1k) through 102,300,000,000 (102.3g) bps</td>
</tr>
<tr>
<td></td>
<td><code>burst-size-limit bytes</code> option specifies the maximum allowed burst size to control the amount of traffic bursting. To determine the value for the burst-size limit, you can multiply the bandwidth of the interface on which the filter is applied by the amount of time (in seconds) to allow a burst of traffic at that bandwidth to occur:</td>
</tr>
<tr>
<td></td>
<td>burst size = bandwidth * allowable time for burst traffic</td>
</tr>
<tr>
<td></td>
<td>You can specify a decimal value or a decimal number followed by k (thousand) or m (million).</td>
</tr>
<tr>
<td></td>
<td><strong>Range</strong>: 1 through 2,147,450,880 bytes</td>
</tr>
<tr>
<td><code>}</code></td>
<td><code>then {</code> Use the <code>policer-action</code> option to specify <code>discard</code> to discard traffic that exceeds the rate limits.</td>
</tr>
<tr>
<td><code>policer-action</code></td>
<td></td>
</tr>
</tbody>
</table>

Junos OS for EX Series switches does not support some of the firewall filter statements that are supported by other Junos OS packages. Table 527 on page 4221 shows the firewall filter statements that are not supported by Junos OS for EX Series switches.

**action (TCM Policers)**

Syntax

```plaintext
action [ 
  loss-priority high then discard;
]
```

Hierarchy Level

```
[edit firewall three-color-policer name]
```

Release Information

Statement introduced in Junos OS Release 11.2 for EX Series switches.

Description

Discard traffic on a logical interface using tricolor marking policing.

The remaining statement is explained separately.

Required Privilege Level

- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

Related Documentation

- Configuring Tricolor Marking Policers on page 4215

**apply-path**

Syntax

```plaintext
apply-path path;
```

Hierarchy Level

```
[edit logical-systems logical-system-name policy-options prefix-list name],
[edit policy-options prefix-list name]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Expand a prefix list to include all prefixes pointed to by a defined path.

Options

- `path`—String of elements composed of identifiers or configuration keywords that points to a set of prefixes. You can include wildcards (enclosed in angle brackets) to match more than one identifier. You cannot add a path element, including wildcards, after a leaf statement. Path elements, including wildcards, can only be used after a container statement.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

as-path-group

Syntax

```
as-path-group group-name {
  as-path name regular-expression;
}
```

Hierarchy Level

[edit dynamic policy-options],
[edit logical-systems logical-system-name policy-options],
[edit policy-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for dynamic database configuration introduced in Junos OS Release 9.5.
Support for dynamic database configuration introduced in Junos OS Release 9.5 for EX Series switches.

Description

Define a group containing multiple AS path regular expressions for use in a routing policy match condition.

Options

- `group-name`—Name that identifies the AS path group. One or more AS path regular expressions must be listed below the `as-path-group` hierarchy.

- `name`—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

- `regular-expression`—One or more regular expressions used to match the AS path.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

bandwidth-limit

**Syntax**

bandwidth-limit bps;

**Hierarchy Level**

[edit firewall policer policer-name if-exceeding]
[edit logical-systems logical-system-name firewall policer policer-name if-exceeding]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Logical systems support introduced in Junos OS Release 9.3.

**Description**

Specify the traffic rate in bits per second.

**Options**

**bps** — Traffic rate to be specified in bits per second. Specify **bps** as a decimal value or as a decimal number followed by one of the following abbreviations:

- k (thousand)
- m (million)
- g (billion, which is also called a thousand million)

**Range:**

- 1000 (1k) through 102,300,000,000 (102.3g) bps (EX Series switches)
- 8000 (8k) through 40,000,000,000 (40g) bps (routers)

**Required Privilege Level**

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

### burst-size-limit

**Syntax**

`burst-size-limit bytes;`

**Hierarchy Level**

- [edit firewall policer policer-name if-exceeding]
- [edit logical-systems logical-system-name firewall policer policer-name if-exceeding]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Logical systems support introduced in Junos OS Release 9.3.

**Description**

Specify the maximum allowed burst size to control the amount of traffic bursting.

**Options**

- `bytes` — Decimal value or a decimal number followed by k (thousand) or m (million).

**Range:**

- 1 through 2,147,450,880 bytes (EX Series switches)
- 1500 through 1,000,000,000,000 bytes (routers)

**Required Privilege Level**

- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

**Related Documentation**

- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4161

- *Basic Single-Rate Two-Color Policers*
color-aware

Syntax

Color-aware;

Hierarchy Level

[edit firewall three-color-policer policer-name single-rate]
[edit firewall three-color-policer policer-name two-rate]

Release Information

Statement introduced in Junos OS Release 11.2 for EX Series switches.

Description

Configure the way preclassified packets are metered. In color-aware mode, the local switch can assign a higher packet loss priority but cannot assign a lower packet loss priority.

Default

If you omit the color-aware statement, the default behavior is color-aware mode.

Required Privilege Level

firewall—to view this statement in the configuration.
firwall-control—to add this statement to the configuration.

Related Documentation

• Configuring Tricolor Marking Policers on page 4215

color-blind

Syntax

Color-blind;

Hierarchy Level

[edit firewall three-color-policer policer-name single-rate]
[edit firewall three-color-policer policer-name two-rate]

Release Information

Statement introduced in Junos OS Release 11.2 for EX Series switches.

Description

Configure the way preclassified packets are metered. In color-blind mode, the local switch ignores the preclassification of packets and can assign a higher or lower packet loss priority.

Default

If you omit the color-blind statement, the default behavior is color-aware mode.

Required Privilege Level

firewall—to view this statement in the configuration.
firwall-control—to add this statement to the configuration.

Related Documentation

• Configuring Tricolor Marking Policers on page 4215
committed-burst-size

Syntax
committed-burst-size bytes;

Hierarchy Level
[edit firewall three-color-policer policer-name single-rate],
[edit firewall three-color-policer policer-name two-rate]

Release Information
Statement introduced in Junos OS Release 11.2 for EX Series switches.

Description
Configure the maximum number of bytes allowed for incoming packets to burst above
the committed information rate (CIR) and still be marked with low packet loss priority
(green).

NOTE: When you include the committed-burst-size statement in the
configuration, you must also include the committed-information-rate
statement at the same hierarchy level.

Options
bytes—Number of bytes. You can specify a value in bytes either as a complete decimal
number or as a decimal number followed by the abbreviation k (1000),
m (1,000,000), or g (1,000,000,000).
Range: 1500 through 100,000,000,000 bytes

Required Privilege Level
firewall—to view this statement in the configuration.
firewall-control—to add this statement to the configuration.

Related Documentation

community (Policy Options)

Syntax

```
community name {
  invert-match;
  members [community-ids];
}
```

Hierarchy Level

[edit dynamic policy-options],
[edit logical-systems logical-system-name policy-options],
[edit policy-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.

Description

Define a community or extended community for use in a routing policy match condition.

Options

- **name**—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (" ").
- **invert-match**—Invert the results of the community expression matching. The community match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The invert-match statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result.
- **members community-ids**—One or more community members. If you specify more than one member, you must enclose all members in brackets.

The format for **community-ids** is:

```
as-number:community-value
```

- **as-number** is the AS number and can be a value in the range from 0 through 65,535.
- **community-value** is the community identifier and can be a number in the range from 0 through 65,535.

You also can specify **community-ids** for communities as one of the following well-known community names, which are defined in RFC 1997, BGP Communities Attribute:

- **no-export**—Routes containing this community name are not advertised outside a BGP confederation boundary.
- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.
You can explicitly exclude BGP community information with a static route using the `none` option. Include `none` when configuring an individual route in the `route` portion of the `static` statement to override a `community` option specified in the `defaults` portion of the statement.

The format for extended `community-ids` is the following:

```
type:administrator:assigned-number
```

`type` is the type of extended community and can be either a `bandwidth`, `target`, `origin`, `domain-id`, `src-as`, or `rt-import` community or a 16-bit number that identifies a specific BGP extended community. The `target` community identifies the destination to which the route is going. The `origin` community identifies where the route originated. The `domain-id` community identifies the OSPF domain from which the route originated. The `src-as` community identifies the autonomous system from which the route originated. The `rt-import` community identifies the route to install in the routing table.

**NOTE:** For `src-as`, you can specify only an AS number and not an IP address. For `rt-import`, you can specify only an IP address and not an AS number.

`administrator` is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

`assigned-number` identifies the local provider.

The format for linking a bandwidth with an AS number is:

```
bandwidth:as-number:bandwidth
```

`as-number` specifies the AS number and `bandwidth` specifies the bandwidth in bytes per second.

**NOTE:** In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a target or origin extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as `target:334324L:132`.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the target and origin extended communities. Specify two integers joined by a period: `16-bit high-order value in decimal.16-bit low-order value in decimal`. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as `1.10`.

damping (Policy Options)

Syntax

damping name {
    disable;
    half-life minutes;
    max-suppress minutes;
    reuse number;
    suppress number;
}

Hierarchy Level
[edit logical-systems logical-system-name policy-options],
[edit policy-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Define route flap damping properties to set on BGP routes.

Options

disable—Disable damping on a per-prefix basis. Any damping state that is present in the
routing table for a prefix is deleted if damping is disabled.

half-life minutes—Decay half-life. minutes is the interval after which the accumulated
figure-of-merit value is reduced by half if the route remains stable.
Range: 1 through 45
Default: 15 minutes

NOTE: For the half-life, configure a value that is less than the max-suppress. If you do not, the configuration is rejected.

max-suppress minutes—Maximum hold-down time. minutes is the maximum time that
a route can be suppressed no matter how unstable it has been.
Range: 1 through 720
Default: 60 minutes

NOTE: For the max-suppress, configure a value that is greater than the
half-life. If you do not, the configuration is rejected.

name—Name that identifies the set of damping parameters. The name can contain letters,
numbers, and hyphens (-) and can be up to 255 characters long. To include spaces
in the name, enclose it in quotation marks (" ").

reuse number—Reuse threshold. number is the figure-of-merit value below which a
suppressed route can be used again.
Range: 1 through 20,000
Default: 750 (unitless)
**suppress number**—Cutoff (suppression) threshold. `number` is the figure-of-merit value above which a route is suppressed for use or inclusion in advertisements.

**Range:** 1 through 20,000  
**Default:** 3000 (unitless)

**Required Privilege**  
`routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

family (Firewall Filter)

Syntax

family family-name {
  filter filter-name {
    interface-specific;
    term term-name {
      from {
        match-conditions;
      }
      then {
        action;
        action-modifiers;
      }
    }
  }
}

Hierarchy Level
[edit firewall]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Option interface-specific introduced in Junos OS Release 9.5 for EX Series switches.

Description
Configure a firewall filter for IP version 4 or IP version 6.

Options

family-name—Version or type of addressing protocol:
  • any—Filter packets based on protocol-independent match conditions.
  • ethernet-switching—Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets.
  • inet—Filter IPv4 packets.
  • inet6—Filter IPv6 packets.

The remaining statements are explained separately.

Required Privilege
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**filter (Firewall Filters)**

**Syntax**

```plaintext
filter filter-name {
    interface-specific;
    term term-name {
        from {
            match-conditions;
        }
        then {
            action;
            action-modifiers;
        }
    }
}
```

**Hierarchy Level**

```
[edit firewall family family-name]
```

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Option `interface-specific` introduced in Junos OS Release 9.5 for EX Series switches.

**Description**

Configure firewall filters.

**Options**

`filter-name`—Name that identifies the filter. The name can contain letters, numbers, and hyphens (`-`), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks.

The remaining statements are explained separately.

**Required Privilege**

filter (VLANs)

Syntax
filter (input | output) filter-name;

Hierarchy Level [edit vlans vlan-name]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Apply a firewall filter to traffic coming into or exiting from the VLAN.

Default All incoming traffic is accepted unmodified to the VLAN, and all outgoing traffic is sent unmodified from the VLAN.

Options
- filter-name —Name of a firewall filter defined in a filter statement.
  - input—Apply a firewall filter to VLAN ingress traffic.
  - output—Apply a firewall filter to VLAN egress traffic.

Required Privilege
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

firewall

Syntax

```
firewall {  
  family family-name {  
    filter filter-name {  
      interface-specific;  
      term term-name {  
        from {  
          match-conditions;  
        }  
        then {  
          action;  
          action-modifiers;  
        }  
      }  
    }  
  }  
  policer policer-name {  
    filter-specific;  
    if-exceeding {  
      bandwidth-limit bps;  
      burst-size-limit bytes;  
    }  
    then {  
      policer-action;  
    }  
  }  
}  
```

three-color-policer policer-name {  
  action {  
    loss-priority high then discard;  
  }  
  single-rate {  
    (color-aware | color-blind);  
    committed-information-rate bps;  
    committed-burst-size bytes;  
    excess-burst-size bytes;  
  }  
  two-rate {  
    (color-aware | color-blind);  
    committed-information-rate bps;  
    committed-burst-size bytes;  
    peak-information-rate bps;  
    peak-burst-size bytes;  
  }  
}

Hierarchy Level [edit]

Configure firewall filters and policers.

The remaining statements are explained separately.

**Required Privilege**
- firewall—to view this statement in the configuration.
- firewall-control—to add this statement to the configuration.

**Related Documentation**
- Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4096
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4161
- Configuring Firewall Filters (CLI Procedure) on page 4192
- Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4206
- Firewall Filters for EX Series Switches Overview on page 4088

**Syntax**
```plaintext
from {
    match-conditions;
}
```

**Hierarchy Level**
```
[edit firewall family family-name filter filter-name term term-name]
```

**Description**
Match packet fields to values specified in a match condition. If the `from` statement is not included in a firewall filter configuration, all packets are considered to match and the actions and action modifiers in the `then` statement are taken.

**Options**
- `match-conditions`—Conditions that define the values or fields that the incoming or outgoing packets must contain for a match. You can specify one or more match conditions. If you specify more than one, they all must match for a match to occur and for the action in the `then` statement to be taken.

**Required Privilege**
- firewall—to view this statement in the configuration.
- firewall-control—to add this statement to the configuration.

**Related Documentation**
- Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4096

- Understanding Firewall Filter Match Conditions on page 4151
if-exceeding

Syntax

if-exceeding {
bandwidth-limit bps;
bandwidth-percent percent
burst-size-limit bytes;
}

Hierarchy Level
[edit firewall policer policer-name]
[edit logical-systems logical-system-name firewall policer policer-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Logical systems support introduced in Junos OS Release 9.3.

Description
Configure policer rate limits.

The bandwidth-percent statement is supported on routers only.

The remaining statements are explained separately.

Required Privilege Level
- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4161

- Basic Single-Rate Two-Color Policers
### interface-specific

**Syntax**  
interface-specific;

**Hierarchy Level**  
[edit firewall family *family-name* filter *filter-name*]

**Release Information**  
Statement introduced in Junos OS Release 9.5 for EX Series switches.

**Description**  
Configure firewall counters that are interface-specific. You can configure an interface-specific firewall filter only on a port or a Layer 3 interface as an interface-specific firewall filter is not supported for a VLAN.

**Required Privilege Level**  
- *interface*—To view this statement in the configuration.
- *interface-control*—To add this statement to the configuration.

**Related Documentation**  
- Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4096

### loss-priority high then discard (Three-Color Policier)

**Syntax**  
loss-priority high then discard;

**Hierarchy Level**  
[edit firewall three-color-policer *policer-name* action]

**Release Information**  
Statement introduced in Junos OS Release 11.2 for EX Series switches.

**Description**  
For packets with high loss priority, discard the packets. The loss priority setting is implicit and cannot be configured. Include this statement if you do not want the local switch to forward packets that have high packet loss priority.

For single-rate three-color policers, Junos OS assigns high loss priority to packets that exceed the committed information rate and the excess burst size.

For two-rate three-color policers, Junos OS assigns high loss priority to packets that exceed the peak information rate and the peak burst size.

**Required Privilege Level**  
- *firewall*—To view this statement in the configuration.
- *firewall-control*—To add this statement to the configuration.

**Related Documentation**  
- Configuring Tricolor Marking Policers on page 4215
peak-burst-size

Syntax  peak-burst-size bytes;

Hierarchy Level  [edit firewall three-color-policer policer-name two-rate]

Release Information  Statement introduced in Junos OS Release 11.2 for EX Series switches.

Description  Configure the maximum number of bytes allowed for incoming packets to burst above the peak information rate (PIR) and still be marked with medium-high packet loss priority (yellow). Packets that exceed the peak burst size (PBS) are marked with high packet loss priority (red).

NOTE: When you include the peak-burst-size statement in the configuration, you must also include the committed-burst-size and peak-information-rate statements at the same hierarchy level.

Options  bytes—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).
Range: 1500 through 100,000,000,000 bytes

Required Privilege Level  firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation  • Configuring Tricolor Marking Policers on page 4215
The `policer` command in Junos OS is used to configure policer rate limits and actions. To activate a policer, you must include the `policer` action modifier in the `then` statement in a firewall filter term. For EX8200 switches, configure a policer and associate it with a global management counter using the `counter` option.

### Syntax
```
policer policer-name {
  counter {
    counter-id counter-index;
  }
  filter-specific;
  if-exceeding {
    bandwidth-limit bps;
    bandwidth-percent percent
    burst-size-limit bytes;
  }
  then {
    policer-action;
  }
}
```

### Hierarchy Level
```
[edit firewall],
[edit logical-systems logical-system-name firewall]
```

### Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Logical systems support introduced in Junos OS Release 9.3.

### Description
Configure policer rate limits and actions. To activate a policer, you must include the `policer` action modifier in the `then` statement in a firewall filter term. Except for EX8200 switches, each policer that you configure includes an implicit counter. To obtain term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the `counter` option.

### Options
- `policer-name`: Name that identifies the policer. The name can include letters, numbers, hyphens (-), and can contain up to 64 characters.

The remaining statements are explained separately.

### Required Privilege Level
- `firewall`: To view this statement in the configuration.
- `firewall-control`: To add this statement to the configuration.

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.
inet-mdt option introduced in Junos OS Release 10.0R2.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
route-target option introduced in Junos OS Release 12.2.

Description

Define a routing policy, including subroutine policies.

A term is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of
accept or reject is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either accept or reject) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the [edit policy-options] hierarchy level by policy-statement policy-name in alphabetical order, enter the show policy-options configuration command.
Options  

**actions**—(Optional) One or more actions to take if the conditions match. The actions are described in Configuring Flow Control Actions.

**family family-name**—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**.

---

**NOTE:** When family is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the family statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

**from**—(Optional) Match a route based on its source address.

**match-conditions**—(Optional in from statement; required in to statement) One or more conditions to use to make a match. The qualifiers are described in Routing Policy Match Conditions.

**policy subroutine-policy-name**—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form __.*-internal__, as this form is reserved. For information about how to configure subroutines, see Understanding Policy Subroutines in Routing Policy Match Conditions.

**policy-name**—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

**prefix-list prefix-list-name** —Name of a list of IPv4 or IPv6 prefixes.

**prefix-list-filter prefix-list-name**—Name of a prefix list to evaluate using qualifiers; **match-type** is the type of match (see Configuring Prefix List Filters), and **actions** is the action to take if the prefixes match.

**route-filter destination-prefix match-type <actions>**—(Optional) List of routes on which to perform an immediate match; **destination-prefix** is the IPv4 or IPv6 route prefix to match, **match-type** is the type of match (see Configuring Route Lists), and **actions** is the action to take if the destination-prefix matches.

**source-address-filter source-prefix match-type <actions>**—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. **source-prefix** is
the IPv4 or IPv6 route prefix to match, **match-type** is the type of match (see Configuring Route Lists), and **actions** is the action to take if the **source-prefix** matches.

**term term-name**—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens ( - ) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

to—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

then—(Optional) Actions to take on matching routes. The actions are described in Configuring Flow Control Actions and Configuring Actions That Manipulate Route Characteristics.

**Required Privilege**  
**Level**  
*routing*—To view this statement in the configuration.  
*routing-control*—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5.
Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.
Support for the vpls protocol family introduced in Junos OS Release 10.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description
Define a list of IPv4 or IPv6 address prefixes for use in a routing policy statement or firewall filter statement.

You can configure up to 85,325 prefixes in each prefix list. To configure more than 85,325 prefixes, configure multiple prefix lists and apply them to multiple firewall filter terms.

Options
name—Name that identifies the list of IPv4 or IPv6 address prefixes.

ip-addresses—List of IPv4 or IPv6 address prefixes, one IP address per line in the configuration.

The remaining statement is explained separately.

Required Privilege Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

## single-rate

**Syntax**

```
single-rate {
  (color-aware | color-blind);
  committed-burst-size bytes;
  committed-information-rate bps;
  excess-burst-size bytes;
}
```

**Hierarchy Level**

[edit firewall three-color-policer policer-name]

**Release Information**

Statement introduced in Junos OS Release 11.2 for EX Series switches.

**Description**

Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).

Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but do not exceed the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).

Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.

The remaining statements are explained separately.

**Required Privilege Level**

CHAPTER 79
Administration

- Routine Monitoring on page 4259
- Operational Commands on page 4262

Routine Monitoring

- Verifying That Firewall Filters Are Operational on page 4259
- Verifying That Policers Are Operational on page 4260
- Monitoring Firewall Filter Traffic on page 4261

Verifying That Firewall Filters Are Operational

**Purpose**
After you configure and apply firewall filters to ports, VLANs, or Layer 3 interfaces, you can perform the following task to verify that the firewall filters configured on EX Series switches are working properly.

**Action**
Use the operational mode command to verify that the firewall filters on the switch are working properly:

```
user@switch> show firewall
```

<table>
<thead>
<tr>
<th>Filter: egress-vlan-watch-employee</th>
</tr>
</thead>
<tbody>
<tr>
<td>Counters:</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>counter-employee-web</td>
</tr>
</tbody>
</table>

```
Filter: ingress-port-voip-class-limit-tcp-icmp
```

| Counters:                         |
| Name                              | Bytes | Packets |
| icmp-counter                      | 0     | 0        |

**Policers:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>icmp-connection-policer</td>
<td>0</td>
</tr>
<tr>
<td>tcp-connection-policer</td>
<td>0</td>
</tr>
</tbody>
</table>

```
Filter: ingress-vlan-rogue-block
```

**Meaning**
The `show firewall` command displays the names of all firewall filters, policers, and counters that are configured on the switch. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits.
Verifying That Policers Are Operational

Purpose: After you configure policers and include them in firewall filter configurations, you can perform the following tasks to verify that the policers configured on EX Series switches are working properly.

Action: Use the operational mode command to verify that the policers on the switch are working properly:

```
user@switch> show policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
Name                                              Packets
icmp-connection-policer                                 0
tcp-connection-policer                                  0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

Meaning: The `show policer` command displays the names of all firewall filters and policers that are configured on the switch. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

Related Documentation:

Monitoring Firewall Filter Traffic

You can monitor firewall filter traffic on EX Series switches.

- Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch on page 4261
- Monitoring Traffic for a Specific Firewall Filter on page 4261
- Monitoring Traffic for a Specific Policer on page 4262

**Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch**

**Purpose**
Perform the following task to monitor the number of packets and bytes that matched the firewall filters and monitor the number of packets that exceeded policer rate limits:

**Action**
Use the operational mode command:

```
user@switch> show firewall
```

```
Filter: egress-vlan-watch-employee
Counters:
  Name                                                  Bytes              Packets
  counter-employee-web                                 3348                   27
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
  Name                                                  Bytes              Packets
  icmp-counter                                         4100                   49
Policers:
  Name                                              Packets
  icmp-connection-policer                                 0
  tcp-connection-policer                                  0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning**
The `show firewall` command displays the names of all firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for counters and packet count for policers.

**Monitoring Traffic for a Specific Firewall Filter**

**Purpose**
Perform the following task to monitor the number of packets and bytes that matched a firewall filter and monitor the number of packets that exceeded the policer rate limits:

**Action**
Use the operational mode command:

```
user@switch> show firewallfilter ingress-vlan-rogue-block
```

```
Filter: ingress-vlan-rogue-block
Counters:
  Name                                                  Bytes              Packets
  rogue-counter                                        2308                   20
```

**Meaning**
The `show firewall filter filter-name` command displays the name of the firewall filter, the packet and byte count for all counters configured with the filter, and the packet count for all policers configured with the filter.
Monitoring Traffic for a Specific Policer

**Purpose**
Perform the following task to monitor the number of packets that exceeded policer rate limits:

**Action**
Use the operational mode command:

```
user@switch> show policer tcp-connection-policer
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
  Name                          Packets
  tcp-connection-policer        0
```

**Meaning**
The `show policer policer-name` command displays the name of the firewall filter that specifies the policer-action and displays the number of packets that exceeded rate limits for the specified filter.

**Operational Commands**
clear firewall

Syntax

```
clear firewall
<all>
<counter counter-name>
<filter filter-name>
<policer counter <all | counter-id counter-index>>
```

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Clear statistics about configured firewall filters.

When you clear the counters of a filter, this not only impacts the counters shown by the CLI, but also the ones tracked by SNMP 2.

Options

- **none**—Clear the packet and byte counts for all firewall filter counters and clear the packet counts for all policer counters.
- **all**—(Optional) Clear the packet and byte counts for all firewall filter counters and clear the packet counts for all policer counters.
- **counter counter-name** —(Optional) Clear the packet and byte counts for the specified firewall filter counter.
- **filter filter-name** —(Optional) Clear the packet and byte counts for the specified firewall filter.
- **policer counter <all | counter-id counter-index>**—(EX8200 switches only) (Optional) Clear policers associated with a specific counter ID. You can also use **policer counter all** to clear all counters. The value of **counter-index** can be 0, 1, or 2.

Required Privilege
Level
```
clear
```

Related Documentation

- Verifying That Policers Are Operational on page 4260
- Firewall Filters for EX Series Switches Overview on page 4088
- Understanding the Use of Policers in Firewall Filters on page 4155

Sample Output
```
clear firewall (all)

user@switch> clear firewall all

clear firewall (counter counter-name)

user@switch> clear firewall counter port-filter-counter
```
clear firewall (filter filter-name)
    user@switch> clear firewall filter ingress-port-filter

clear firewall (policer counter all)
    user@switch# clear firewall policer counter all

clear firewall (policer counter counter-id counter-index)
    user@switch# clear firewall policer counter counter-id 0
clear firewall

Syntax

clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | logical-system logical-system-name)

Syntax (EX Series Switches)
clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | policer counter (all | counter-id counter-index))

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
logical-system option introduced in Junos OS Release 9.3.
log option introduced before Junos OS Release 11.4.

Description

Clear statistics about configured firewall filters.

When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.

NOTE: The clear firewall command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).

If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the prefix-action action on matched packets, wait at least 5 seconds before you enter the show firewall prefix-action-stats command. A 5-second pause between issuing the clear firewall and show firewall prefix-action-stats commands avoids a possible timeout of the show firewall prefix-action-stats command.

Options

clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | logical-system logical-system-name) | logical-system logical-system-name | policer counter (all | counter-id counter-index))

all—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.

counter counter-name—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.

filter filter-name—Clear the packet and byte counts for the specified firewall filter.

log (all | logical-system-name)—Clear log entries for IPv4 firewall filters that have then log as an action. Use log_all to clear all log entries or log logical-system-name to clear log entries for the specified logical system.

logical-system logical-system-name—Clear the packet and byte counts for the specified logical system.

policer counter (all | counter-id counter-index)—(EX8200 switches only) Clear all policer counters using the policer counter all command, or clear a specific policer counter using the policer counter counter-id counter-index command. The value of counter-index can be 0, 1, or 2.

  clear firewall (policer counter all) (EX8200 Switch) on page 4266
  clear firewall (policer counter counter-id counter-index) (EX8200 Switch) on page 4266

Sample Output
  clear firewall all
    user@host> clear firewall all

  clear firewall (counter counter-name)
    user@host> clear firewall counter port-filter-counter

  clear firewall (filter filter-name)
    user@host> clear firewall filter ingress-port-filter

  clear firewall (policer counter all) (EX8200 Switch)
    user@switch> clear firewall policer counter all

  clear firewall (policer counter counter-id counter-index) (EX8200 Switch)
    user@switch> clear firewall policer counter counter-id 0
show firewall

Syntax

show firewall
<counter counter-name>
<filter filter-name>
<log (detail | interface interface-name)>
<policer counters (<(detail) | counter-id counter-index <detail>)>>
terse

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
Option policer counters introduced in Junos OS Release 12.2 for EX Series switches.

Description

Display statistics about configured firewall filters.

Options

none—Display statistics about all configured firewall filters, counters, and policers.

counter counter-name—(Optional) Display statistics about a particular firewall filter counter.

filter filter-name—(Optional) Display statistics about a particular firewall filter.

log (detail | interface interface-name)—(Optional) Display detailed log entries of firewall activity or log information about a specific interface.

policer counters (<detail) | counter-id counter-index <detail>)—(EX8200 switches only)
(Original) Display policer counter statistics in brief or in detail.

terse—(Optional) Display firewall filter names only.

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- logical-system option introduced in Junos OS Release 9.3.
- terse option introduced in Junos OS Release 9.4.
- policer counters option introduced in Junos OS Release 12.2 for EX Series switches.
- detail option introduced in Junos OS Release 12.3.

**Description**
Display statistics about configured firewall filters.

**Options**
- **none**—(Optional) Display statistics about all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.

- **counter counter-name**—(Optional) Name of a filter counter.

- **detail**—(EX Series switches only) (Optional) Display firewall filter statistics with enhanced policer.

- **filter filter-name**—(Optional) Name of a configured filter.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

- **log**—(Optional) Display log entries for firewall filters.

- **log <(detail | interface interface-name)>**—(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.

- **policer counters <(detail | counter-id counter-index <detail>)>**—(EX8200 switches only) (Optional) Display policer counter statistics in brief or in detail.

- **terse**—(Optional) Display firewall filter names only.

Output Fields

Table 529: show firewall Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Name of a filter that has been configured with the <code>filter</code> statement at the <code>[edit firewall]</code> hierarchy level.</td>
</tr>
<tr>
<td></td>
<td>Except on EX Series switches:</td>
</tr>
<tr>
<td></td>
<td>• When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <code>-i</code> for an input filter or <code>-o</code> for an output filter.</td>
</tr>
<tr>
<td></td>
<td>• When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <code>-in</code> for an input filter or <code>-out</code> for an output filter. When a logical system–specific filter is displayed, the name of the filter is prefixed with two underscore (<code>_</code>) characters and the name of the logical system (for example, <code>__ls1/filter1</code>).</td>
</tr>
<tr>
<td></td>
<td>• When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (<code>;</code>).</td>
</tr>
<tr>
<td>Counters</td>
<td>Display filter counter information:</td>
</tr>
<tr>
<td></td>
<td>• Name—Name of a filter counter that has been configured with the <code>counter</code> firewall filter action.</td>
</tr>
<tr>
<td></td>
<td>• Bytes—Number of bytes that match the filter term under which the <code>counter</code> action is specified.</td>
</tr>
<tr>
<td></td>
<td>• Packets—Number of packets that matched the filter term under which the <code>counter</code> action is specified.</td>
</tr>
</tbody>
</table>

NOTE: On M and T Series routers, firewall filters cannot count IP-Options packets on a per option type and per interface basis. A limited work around is to use the `show pfe statistics ip options` command to see IP-Options statistics on a per Packet Forwarding Engine (PFE) basis. See `show pfe statistics ip` for sample output.
Display policer information:

- **Name**—Name of policer.
- **Bytes**—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer.
  
  For other combinations of policer type, device, and line card type, this field is blank.
- **Packets**—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

**show firewall log**

**Syntax**

```
show firewall log
<detail>
<interface interface-name>
<logical-system (logical-system-name | all)>
```

**Syntax (EX Series Switches)**

```
show firewall log
<detail>
<interface interface-name>
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
logical-system option introduced in Junos OS Release 9.3.

**Description**

Display log information about firewall filters.

**Options**

- `none`—Display log information about firewall filters.
- `detail`—(Optional) Display detailed information.
- `interface interface-name`—(Optional) Display log information about a specific interface.
- `logical-system (logical-system-name | all)`—(Optional) Perform this operation on all logical systems or on a particular system.

**Required Privilege**

view

**List of Sample Output**

- show firewall log on page 4280
- show firewall log detail on page 4280

**Output Fields**

Table 530 on page 4279 lists the output fields for the `show firewall log` command. Output fields are listed in the approximate order in which they appear.

**Table 530: show firewall log Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time of Log</td>
<td>Time that the event occurred.</td>
</tr>
<tr>
<td>Filter</td>
<td>• Displays the name of a configured firewall filter or service filter only if the packet hit the filter’s log action in a kernel filter (in the control plane). For any traffic that reaches the Routing Engine, the packets hit the log action in the kernel.</td>
</tr>
<tr>
<td></td>
<td>• For all other logged packets (packet hit the filter’s log action in the Packet Forwarding Engine), this field displays pfe instead of a configured filter name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter Action</td>
<td>Filter action:</td>
</tr>
<tr>
<td></td>
<td>• A—Accept</td>
</tr>
<tr>
<td></td>
<td>• D—Discard</td>
</tr>
<tr>
<td></td>
<td>• R—Reject</td>
</tr>
<tr>
<td>Name of Interface</td>
<td>• Displays a physical interface name if the packet arrived at a port on a line card.</td>
</tr>
<tr>
<td></td>
<td>• Displays local if the packet was generated by the device's internal Ethernet interface, em1 or fpx1, which connects the Routing Engine with the router’s packet-forwarding components.</td>
</tr>
<tr>
<td>Name of protocol</td>
<td>Packet’s protocol name: egp, gre, icmp, ipip, ospf, pim, rsvp, tcp, or udp.</td>
</tr>
<tr>
<td>Packet length</td>
<td>Length of the packet.</td>
</tr>
<tr>
<td>Source address</td>
<td>Packet’s source address.</td>
</tr>
<tr>
<td>Destination address</td>
<td>Packet’s destination address and port.</td>
</tr>
</tbody>
</table>

show policy conditions

Syntax

show policy conditions
<condition-name>
<detail>
<dynamic>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show policy conditions
<condition-name>
<detail>
<dynamic>

Release Information

Command introduced in Junos OS Release 9.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display all the configured conditions as well as the routing tables with which the configuration manager is interacting. If the detail keyword is included, the output also displays dependent routes for each condition.

Options

none—Display all configured conditions and associated routing tables.

condition-name—(Optional) Display information about the specified condition only.

detail—(Optional) Display the specified level of output.

dynamic—(Optional) Display information about the conditions in the dynamic database.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Table l3vpn.inet.0, generation 633, dependencies 2
```
test policy

Syntax

```
test policy policy-name prefix
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Test a policy configuration to determine which prefixes match routes in the routing table.

NOTE: If you are using the test policy command on a logical system, you must first set the CLI to the logical system context. For example, if you want to test a routing policy that is configured on logical system R2, first run the set cli logical-system R2 command.

Options

- `policy-name`—Name of a policy.
- `prefix`—Destination prefix to match.

Additional Information

All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the `from` clause in the specified policy. All prefixes accepted by the policy are displayed. The `test policy` command evaluates a policy differently from the BGP import process. When testing a policy that contains an `interface` match condition in the `from` clause, the `test policy` command uses the match condition. In contrast, BGP does not use the `interface` match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.

Troubleshooting Procedures

- Troubleshooting Firewall Filters on page 4291

Troubleshooting Firewall Filters

Troubleshooting issues with firewall filters on EX Series switches:

1. A Firewall Filter Configuration Returns a “No Space Available in TCAM” Message on page 4291

A Firewall Filter Configuration Returns a “No Space Available in TCAM” Message

**Problem** When a firewall filter configuration exceeds the amount of available ternary content addressable memory (TCAM) space, the switch returns the following system log (syslogd) message:

No space available in tcam.
Rules for filter filter-name will not be installed.

The switch returns this error message during the commit operation in the following instances:

- If the firewall filter that you have applied to a port, VLAN, or Layer 3 interface requires more than the amount of available TCAM space.

- If you delete and add large firewall filters in the same commit operation. In this case, the large firewall filter might not be deleted from the TCAM space, because of which there will be no TCAM space freed up for the new firewall filter to be added to it. In addition to the syslogd message, the following error message is displayed in the CLI:

  fpc<device-id> dfw_grph_merge_dfw_bind: rules for filter filter-name will not be installed

However, in both these instances, the commit operation for the firewall filter configuration is completed in the CLI.

**Solution** When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms or, if you had deleted and created a firewall filter with a large number of terms (on the order of 1000 or more), you must delete and add the large firewall filters in separate commit operations.
The first procedure (set of steps) in this Solution section tells you how to delete a firewall filter and its bind point and associate a new firewall filter with that existing bind point.

The second procedure in this Solution section tells you how to create a new firewall filter with fewer terms (without deleting the bind point) and bind the new firewall filter with the existing bind point, when you want to create a firewall filter with fewer terms. Do not use the second procedure if you need to replace one large firewall filter with another large firewall filter—you must delete the original large firewall filter and commit that delete operation, and then add the new large firewall filter.

To delete the firewall filter and its bind point and apply a new firewall filter to the same bind point:

1. Delete the firewall filter configuration and its bind points to ports, VLANs, or Layer 3 interfaces—for example:
   ```
   [edit]
   user@switch# delete firewall family ethernet-switching filter mini-filter-ingress-vlan
   user@switch# delete vlans voice-vlan description "filter to block rogue devices on voice-vlan"
   user@switch# delete vlans voice-vlan filter input mini-filter-ingress-vlan
   ```

2. Commit the operation:
   ```
   [edit]
   user@switch# commit
   ```

   **NOTE:** Use separate commit operations for deleting and adding large firewall filters.

3. Configure a firewall filter with fewer terms (if the error message appeared when you tried to create a new filter) or configure a large filter (if the error message appeared when you tried to delete and add large firewall filters)—for example:
   ```
   [edit]
   user@switch# set firewall family ethernet-switching filter new-filter-ingress-vlan ...
   ```

   **NOTE:** See “Firewall Filters for EX Series Switches Overview” on page 4088 to ascertain the maximum number of terms allowed for various firewall filters on EX Series switches.

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface—for example:
   ```
   [edit]
   user@switch# set vlans voice-vlan description "filter to block rogue devices on voice-vlan"
   user@switch# set vlans voice-vlan filter input new-filter-ingress-vlan
   ```

5. Commit the operation:
   ```
   [edit]
   user@switch# commit
   ```

To create a new firewall filter and attach it to the existing bind point:

1. Configure a firewall filter with fewer terms than the original filter:
[edit]
user@switch# set firewall family ethernet-switching filter new-filter-ingress-vlan

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the bind points of the original filter—for example:

[edit]
user@switch# set vlans voice-vlan description "smaller filter to block rogue devices on voice-vlan"
user@switch# set vlans voice-vlan filter input new-filter-ingress-vlan

As a bind point can be attached to only one firewall filter, this configuration detaches the bind point from the previous firewall filter that contained many terms and attaches the bind point to the new firewall filter.

3. Commit the operation:

[edit]
user@switch# commit

Understanding MSTP for EX Series Switches

Ethernet networks are susceptible to broadcast storms if loops are introduced. However, an Ethernet network should always include loops because they provide redundant paths in case of a link failure. Spanning-tree protocols address both of these issues because they provide link redundancy while simultaneously preventing undesirable loops.

Spanning-tree protocols intelligently avoid loops in a network by creating a tree topology (spanning-tree) of the entire bridged network with only one available path between the tree root and a leaf. All other paths are forced into a standby state. The tree root is a switch within the network elected by the STA (spanning-tree algorithm) to use when computing the best path between bridges throughout the network and the root bridge. Frames travel through the network to their destination—a leaf such as an end-user PC—along branches. A tree branch is a network segment, or link, between bridges. Switches that forward frames through an STP spanning-tree are called designated bridges.

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning-Tree Protocol (STP), Rapid Spanning-Tree Protocol (RSTP), Multiple Spanning-Tree Protocol (MSTP), and VLAN Spanning-Tree Protocol (VSTP). This topic explains MSTP.

This topic describes:

- MSTP Maps Multiple VLANs on page 4298
- Configuring MSTP Regions on page 4299
- Selecting a Spanning-Tree Protocol on page 4299

MSTP Maps Multiple VLANs

MSTP is an extension of RSTP that maps multiple independent spanning-tree instances onto one physical topology. Each spanning-tree instance (STI) includes one or more VLANs. Unlike in STP and RSTP configurations, a port may belong to multiple VLANs and be dynamically blocked in one spanning-tree instance but forwarding in another. This behavior significantly improves network resource utilization by load-balancing across the network and maintaining switch CPU loads at moderate levels. MSTP also leverages the fast re-convergence time of RSTP when a network, switch, or port failure occurs within a spanning-tree instance.

MSTP creates a Common and Internal Spanning-Tree (CIST) to interconnect and manage all MSTP regions and even individual devices that run RSTP or STP, which are recognized as distinct spanning-tree regions by MSTP. The CIST views each MSTP region as a virtual bridge, regardless of the actual number of devices participating in the MSTP region, and enables MSTIs to link to other regions. The CIST is a single topology that connects all switches (STP, RSTP, and MSTP devices) through an active topology, ensuring connectivity between LANs and devices within a bridged network. This functionality provided by MSTP enables you to better utilize network resources while remaining backward-compatible with older network devices.
Configuring MSTP Regions

When enabling MSTP, you define one or more MSTP regions. An MSTP region defines a logical domain where MSTIs can be administered independently of MSTIs in other regions, setting the boundary for Bridge Protocol Data Units (BPDUs) sent by one MSTI. An MSTP region is a group of switches that is defined by three parameters:

- Region name—User-defined alphanumeric name for the region.
- Revision level—User-defined value that identifies the region.

An MSTP region can support up to 64 MST instances, and each MSTI can support from 1 to 4094 VLANs. When you define a region, MSTP automatically creates an internal spanning-tree instance (IST instance 0) that provides the root switch for the region and includes all currently configured VLANs that are not specifically assigned to a user-defined Multiple Spanning-Tree Instance (MSTI). An MSTI includes all static VLANs that you specifically add to it. The switch places any dynamically created VLANs in the IST instance by default, unless you explicitly map them to another MSTI. Once you assign a VLAN to a user-defined MSTI, the switch removes the VLAN from the IST instance.

Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of STP. To determine which spanning-tree protocol is best for your situation, see Table 534 on page 4299 below.

Understanding RSTP for EX Series Switches

Ethernet networks are susceptible to broadcast storms if loops are introduced. However, an Ethernet network should always include loops because they provide redundant paths in case of a link failure. Spanning tree protocols address both of these issues because they provide link redundancy while simultaneously preventing undesirable loops. Rapid Spanning-Tree Protocol (RSTP) is the default spanning-tree protocol for preventing loops on Ethernet networks.

This topic describes:

Spanning-Tree Protocols Help Prevent Broadcast Storms

Spanning tree protocols intelligently avoid loops in a network by creating a tree topology (spanning-tree) of the entire bridged network with only one available path between the
tree root and a leaf. All other paths are forced into a standby state. The tree root is a switch within the network elected by the STA (spanning-tree algorithm) to use when computing the best path between bridges throughout the network and the root bridge. Frames travel through the network to their destination—a leaf such as an end-user PC—along branches. A tree branch is a network segment, or link, between bridges. Switches that forward frames through an STP spanning-tree are called designated bridges.

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning-Tree Protocol (STP), Rapid Spanning-Tree Protocol (RSTP), Multiple Spanning-Tree Protocol (MSTP), and VLAN Spanning-Tree Protocol (VSTP). This topic explains the spanning-tree default RSTP.

**RSTP is an Enhancement of the Original STP**

RSTP evolved from the original STP IEEE 802.1D protocol to provide faster spanning-tree re-convergence after a switch port, switch, or LAN failure. Where STP took up to 50 seconds to respond to topology changes, RSTP responds to changes within the timeframe of three hello BPDUs (bridge protocol data units), or 6 seconds. This is the primary reason that RSTP is the default configuration on EX Series switches. In addition, note that EX Series switches configured to use STP actually run RSTP force version 0, which is compatible with STP.

**Port Roles Determine Participation in The Spanning-Tree**

Each port has both a state and a role. A port’s role determines how it participates in the spanning-tree. The five port roles used in RSTP are:

- **Root port**—The port closest to the root bridge (has the lowest path cost from a bridge). This is the only port that receives frames from and forwards frames to the root bridge.

- **Designated port**—The port that forwards traffic away from the root bridge toward a leaf. A designated bridge has one designated port for every link connection it serves. A root bridge forwards frames from all of its ports, which serve as designated ports.

- **Alternate port**—A port that provides an alternate path toward the root bridge if the root port fails and is placed in the discarding state. This port is not part of the active spanning-tree, but if the root port fails, the alternate port immediately takes over.

- **Backup port**—A port that provides a backup path toward the leaves of the spanning-tree if a designated port fails and is placed in the discarding state. A backup port can only exist where two or more bridge ports connect to the same LAN for which the bridge serves as the designated bridge. A backup port for a designated port immediately takes over if the port fails.

- **Disabled port**—The port is not part of the active spanning-tree.

**Port States Determine How a Port Processes a Frame**

Each port has both a state and a role. A port’s state determines how it processes a frame. RSTP places each port of a designated bridge in one of three states:

- **Discarding**—The port discards all BPDUs. A port in this state discards all frames it receives and does not learn MAC addresses.
- **Learning**—The port prepares to forward traffic by examining received frames for location information in order to build its MAC address table.

- **Forwarding**—The port filters and forwards frames. A port in the forwarding state is part of the active spanning-tree.

### Edge Ports Connect to Devices That Cannot Be Part of a Spanning-Tree

RSTP also defines the concept of an *edge port*, which is a designated port that connects to non-STP-capable devices, such as PCs, servers, routers, or hubs that are not connected to other switches. Because edge ports connect directly to end stations, they cannot create network loops and can transition to the forwarding state immediately. You can manually configure edge ports, and a switch can also detect edge ports by noting the absence of communication from the end stations.

The edge ports themselves do send BPDUs to the spanning-tree. If you have a good understanding of the implications on your network and want to modify RSTP on the edge port interface, see *Configuring RSTP (CLI Procedure)*.

### BPDUs Maintain the Spanning-Tree

Spanning-tree protocols use frames called bridge protocol data units (BPDUs) to create and maintain the spanning-tree. A BPDU frame is a message sent from one switch to another to communicate information about itself, such as its bridge ID, root path costs, and port MAC addresses. The initial exchange of BPDUs between switches determines the root bridge. Simultaneously, BPDUs are used to communicate the cost of each link between branch devices, which is based upon port speed or user configuration. RSTP uses this path cost to determine the ideal route for data frames to travel from one leaf to another leaf and then blocks all other routes. If an edge port receives a BPDU, it automatically transitions to a regular RSTP port.

When the network is in a steady state, the spanning-tree converges when the spanning-tree algorithm (STA) identifies both the root and designated bridges and all ports are in either a forwarding or blocking state. To maintain the tree, the root bridge continues to send BPDUs at a “hello time” interval (default 2 seconds). These BPDUs continue to communicate the current tree topology. When a port receives a hello BPDU, it compares the information to that already stored for the receiving port. One of three actions takes place when a switch receives a BPDU:

- If the BPDU data matches the existing entry in the MAC address table, the port resets a timer called “max age” to zero and then forwards a new BPDU with the current active topology information to the next port in the spanning-tree.

- If the topology in the BPDU has been changed, the information is updated in the MAC address table, “max age” is again set to zero, and a new BPDU is forwarded with the current active topology information to the next port in the spanning-tree.

- When an RSTP port does not receive a BPDU for three hello times, it reacts one of two ways. If the port is the root port, a complete rework of the spanning-tree occurs—see *When an RSTP Root Bridge Fails*. If the bridge is any non-root bridge, RSTP detects that the connected device cannot send BPDUs and converts that port to an edge port.
When an RSTP Root Bridge Fails

When a link to the root port goes down, a flag called a topology change notification (TCN) is added to the BPDU. When this BPDU reaches the next port in the VLAN, the MAC address table is flushed and the BPDU is sent to the next bridge. Eventually, all ports in the VLAN have flushed their MAC address tables. Then, RSTP configures a new root port.

After a root port or a designated port fails, the alternate or backup port takes over after an exchange of BPDU's called the proposal-agreement handshake. RSTP propagates this handshake over point-to-point links, which are dedicated links between two network nodes, or switches, that connect one port to another. If a local port becomes a new root or designated port, it negotiates a rapid transition with the receiving port on the nearest neighboring switch by using the proposal-agreement handshake to ensure a loop-free topology.

Switches Must Relearn MAC Addresses After a Link Failure

Because a link failure causes all associated ports to flush their MAC address table, the network may be slower as it floods to relearn the MAC addresses. There is a way to speed up this relearning process. During TCN propagation, the Layer 2 forwarding table of switches is flushed, resulting in a flood of data packets. The ARP feature causes the switch to proactively send ARP requests for IP addresses in the ARP cache (present because of Layer 3 VLAN interface). With ARP on STP enabled, as the reply comes through, the switches builds up the Layer 2 forwarding table, thus limiting the flooding later. Enabling ARP on STP is most useful to prevent excessive flooding in large Layer 2 networks using RVIs.

Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of the original STP. To determine which spanning-tree protocol is best for your situation, see Table 535 on page 4303 below.

Understanding STP for EX Series Switches

Ethernet networks are susceptible to broadcast storms if loops are introduced. However, an Ethernet network should always include loops because they provide redundant paths in case of a link failure. Spanning-tree protocols address both of these issues because they provide link redundancy while simultaneously preventing undesirable loops.

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning–Tree Protocol (STP), Rapid Spanning–Tree Protocol (RSTP), Multiple Spanning–Tree Protocol (MSTP), and VLAN Spanning–Tree Protocol (VSTP). Configure STP when you need to support older 802.1D 1998 bridges. However, note that EX Series switches configured to use STP actually run RSTP force version 0, which is compatible with STP. For an explanation of RSTP, see “Understanding RSTP for EX Series Switches” on page 4300

RSTP or VSTP Forced to Run as IEEE 802.1D STP

On MX Series routers and EX Series switches in a Layer 2 environment, you can force the configured Rapid Spanning Tree Protocol (RSTP) or VLAN Spanning Tree Protocol (VSTP) to run as the original IEEE 802.1D Spanning Tree Protocol (STP) version. Configure original IEEE.802.1D STP for compatibility with older bridges that do not support RSTP or VSTP.

Keep the following limitations in mind when RSTP or VSTP are forced to run as the original STP version:

- If you configure an instance interface as an edge port, the configuration statement is ignored.
- If you configure point-to-point link mode for an instance interface, the configuration statement is ignored.

Understanding VSTP for EX Series Switches

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default factory configuration for EX Series switches uses RSTP. If you use VLANs, however, we recommend that you enable MSTP unless your network requires the device compatibility provided by VSTP. Switches configured to run VSTP automatically assign each VLAN to one spanning-tree instance that runs RSTP. While this approach is useful to optimize network usage in small networks with a limited number of VLANs, a VSTP configuration in a network with several hundred VLANs can overload switch CPUs. MSTP ensures that your network is not slowed down by the increased network traffic caused by hundreds of VLANs, each with its own spanning-tree instance.

When using VSTP, you can selectively configure up to 253 VLANs per switch—additional VLANs use RSTP. (VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on a switch.)

NOTE: When you configure VSTP, we recommend that you enable VSTP on all VLANs that can receive VSTP bridge protocol data units (BPDUs).
NOTE: When you configure VSTP with the set protocol vstp vlan all command, VLAN ID 1 is not set; it is excluded so that the configuration is compatible with Cisco PVST+. If you want VLAN ID 1 to be included in the VSTP configuration on your switch, you must set it separately with the set protocol vstp vlan 1 command.

NOTE: Option vlan all is not supported in Junos OS Release 13.2X50.

Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of STP. To determine which spanning-tree protocol is best for your situation, see Table 537 on page 4307.

Table 537: Selecting a Spanning-Tree Protocol

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
</table>
| RSTP     | • Rapid Spanning Tree Protocol is the default switch configuration and is recommended for most network configurations because it converges more quickly than STP after a failure.  
• Voice and video work better with RSTP than they do with STP.  
• RSTP is backward compatible with STP so switches do not all have to run RSTP.  
• RSTP supports more ports than MSTP or VSTP. | • RSTP does not work with 802.1D 1998 bridges.  
• RSTP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning tree. This limits the number of forwarding paths for data traffic. |
| STP      | • Spanning Tree Protocol works with 802.1D 1998 bridges.  
• RSTP is backward compatible with STP so switches do not all have to run STP. | • STP is slower than RSTP.  
• STP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. This limits the number of forwarding paths for data traffic. |
| MSTP     | • Multiple Spanning Tree Protocol works with most VLANs.

• VSTP uses more CPU than RSTP and does not converge as fast as RSTP. |
Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches

Networks frequently use multiple protocols simultaneously to achieve different goals and in some cases those protocols might conflict with each other. One such case is when spanning-tree protocols are active on the network, where a special type of switching frame called a bridge protocol data unit (BPDU) can conflict with BPDUs generated on other devices such as PCs. The different kinds of BPDUs are not compatible but they can still be recognized by other devices that use BPDUs and cause network outages. You need to protect any device that recognizes BPDUs from picking up incompatible BPDUs.

Different Kinds of BPDUs

Spanning-tree protocols such as Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP) generate their own BPDUs. These peer STP applications use their BPDUs to communicate, and ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

User bridge applications running on a PC can also generate BPDUs. If these BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations, and those miscalculations can lead to network outages. Similarly, BPDUs generated by STP protocols can cause problems if they are picked up by devices like PCs that are not using STP. Some mechanism for BPDU protection must be implemented in these cases.

Protecting Switches From Incompatible BPDUs

To protect the state of spanning-tree protocols on switches from outside BPDUs, enable BPDU protection on the interfaces of a switch on which spanning-tree protocols are configured and are connected to user devices (such as PCs)—for example, on edge ports connected to PCs. Use the same strategy when a device on which STP is not configured is connected to a switch through a trunk interface that could be forwarding BPDUs generated by spanning-tree protocols. In this case, you would protect the device from BPDUs generated by the STP on the switch.

To configure BPDU protection on a switch on which spanning-tree protocols are configured, include the `bpdu-block-on-edge` statement at the `[edit protocols (stp | mstp | rstp)]` hierarchy level. To prevent such a switch from forwarding BPDUs generated by spanning-tree protocols to devices, include the `bpdu-block` statement at the `[edit ethernet-switching-options]` hierarchy level.
NOTE: You can configure the drop option under the `bpdu-block` statement only on interfaces on which no spanning-tree protocol is configured.

When an interface configured with BPDU protection encounters an incompatible BPDU, it drops that BPDU and then, either shuts down or continues to receive packets other than spanning-tree protocol BPDUs (for STP, MSTP, and RSTP) depending on the configuration defined in the `bpdu-block` statement. If the interface continues to be open after dropping all incompatible BPDUs, all traffic except incompatible BPDUs continues to ingress and egress through the interface.

If the interface shuts down after dropping all BPDUs, there are two ways to re-enable the interface:

- Include the `disable-timeout` statement in the BPDU configuration so that the interface automatically returns to service after the timer expires.
- Issue the operational mode command `clear ethernet-switching bpdu-error` on the switch. This command will only re-enable an interface but the BPDU configuration for the interface will continue to exist unless you remove the BPDU configuration explicitly.

NOTE: You can also configure BPDU drop protection on a switch without spanning trees—typically, you do this when such a switch is connected to a switch with spanning trees through a trunk interface.

Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from moving into a forwarding state that would result in a loop opening up in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and makes sure both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It doesn't transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and then it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (log, block, or both).

Note that an interface can be configured for either loop protection or root protection, but not for both.

Understanding Root Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDDUs to communicate. Ultimately, the exchange of BPDDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDDUs, too, and interfere with root port election. Root protection allows network administrators to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive superior BPDDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives superior STP BPDDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving superior STP BPDDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives superior BPDDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches

EX Series switches use Rapid Spanning Tree Protocol (RSTP) by default to provide a loop-free topology.

When switches that support redundant Routing Engines use RSTP, it is important to keep RSTP synchronized on both Routing Engines so that no loss of service occurs after a Routing Engine switchover. Nonstop bridging protocol keeps Routing Engines synchronized.

This example describes how to configure RSTP and NSB on four EX Series switches:

- Requirements on page 4314
- Overview and Topology on page 4314
- Configuring RSTP and Nonstop Bridging on Switch 1 on page 4316
- Configuring RSTP and Nonstop Bridging on Switch 2 on page 4319
• Configuring RSTP and Nonstop Bridging on Switch 3 on page 4322
• Configuring RSTP and Nonstop Bridging on Switch 4 on page 4325
• Verification on page 4328

Requirements

This example uses the following hardware and software components:

• Junos OS Release 11.3 or later for EX Series switches
• Four EX Series switches

Before you configure the switches for RSTP, be sure you have:

• Installed the four switches. See Connecting and Configuring an EX Series Switch (J-Web Procedure).
• Performed the initial software configuration on all switches. See Installing and Connecting an EX3200 Switch.

Overview and Topology

RSTP works by identifying certain links as point to point links and blocking other possible paths. When one of the point-to-point links fails, a designated alternate link transitions to the forwarding state and take over. Configuring nonstop bridging (NSB) on a switch with redundant Routing Engines keeps RSTP synchronized on both Routing Engines. This way, RSTP remains active immediately after a switchover because it is already synchronized to the backup Routing Engine. RSTP does not have to reconverge after a Routing Engine switchover when NSB is enabled because the neighbor devices do not detect an RSTP change on the switch. In this example, four EX Series switches are connected in the topology displayed in Figure 65 on page 4315 to create a loop-free topology with NSB applied to switches with dual Routing Engines.
Table 538 on page 4315 shows the components of the topology for this example.

NOTE: You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

This configuration example creates a loop-free topology between four EX Series switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.
- The backup port is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

**NOTE:** You also can create a loop-free topology between the aggregation layer and the distribution layer using redundant trunk links. For more information about configuring redundant trunk links, see *Example: Configuring Redundant Trunk Links for Faster Recovery.*

### Configuring RSTP and Nonstop Bridging on Switch 1

**CLI Quick Configuration**

To quickly configure RSTP and nonstop bridging on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/13.0 cost 1000
set protocols rstp interface ge-0/0/13.0 mode point-to-point
set protocols rstp interface ge-0/0/9.0 cost 1000
set protocols rstp interface ge-0/0/9.0 mode point-to-point
set protocols rstp interface ge-0/0/11.0 cost 1000
set protocols rstp interface ge-0/0/11.0 mode point-to-point

If Switch 1 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 1, copy the following commands and paste them into the switch terminal window:

set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging

Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 1:

1. Configure the VLANs voice-vlan, employee-vlan, guest-vlan, and camera-vlan:

   [edit vlans]
   user@switch1# set voice-vlan description “Voice VLAN”
   user@switch1# set voice-vlan vlan-id 10
   user@switch1# set employee-vlan description “Employee VLAN”
   user@switch1# set employee-vlan vlan-id 20
   user@switch1# set guest-vlan description “Guest VLAN”
   user@switch1# set guest-vlan vlan-id 30
   user@switch1# set camera-vlan description “Camera VLAN”
   user@switch1# set camera-vlan vlan-id 40

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

   [edit interfaces]
   user@switch1# set ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]

3. Configure the port mode for the interfaces:

   [edit interfaces]
   user@switch1# set ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
   user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk

4. Configure RSTP on the switch:

   [edit protocols]
   user@switch1# rstp bridge-priority 16k
   user@switch1# rstp interface ge-0/0/13.0 cost 1000
   user@switch1# rstp interface ge-0/0/13.0 mode point-to-point
   user@switch1# rstp interface ge-0/0/9.0 cost 1000
   user@switch1# rstp interface ge-0/0/9.0 mode point-to-point
   user@switch1# rstp interface ge-0/0/11.0 cost 1000
   user@switch1# rstp interface ge-0/0/11.0 mode point-to-point

Step-by-Step Procedure

If Switch 1 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 1:

1. Enable graceful Routing Engine switchover (GRES):
2. Configure the switch to always synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch1# set commit synchronize
```

If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.

3. Enable nonstop bridging:

```
[edit ethernet-switching-options]
user@switch1# set nonstop-bridging
```

**NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

**Results** Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
    ge-0/0/13 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/9 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/11 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
}
```
Configuring RSTP and Nonstop Bridging on Switch 2

CLI Quick Configuration

To quickly configure RSTP and nonstop bridging on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
```
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface ge-0/0/14.0 cost 1000
set protocols rstp interface ge-0/0/14.0 mode point-to-point
set protocols rstp interface ge-0/0/18.0 cost 1000
set protocols rstp interface ge-0/0/18.0 mode point-to-point

If Switch 2 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 2, copy the following commands and paste them into the switch terminal window:

set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging

Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 2:

1. Configure the VLANs voice-vlan, employee-vlan, guest-vlan, and camera-vlan:

   [edit vlans]
   user@switch2# set voice-vlan description "Voice VLAN"
   user@switch2# set voice-vlan vlan-id 10
   user@switch2# set employee-vlan description "Employee VLAN"
   user@switch2# set employee-vlan vlan-id 20
   user@switch2# set guest-vlan description "Guest VLAN"
   user@switch2# set guest-vlan vlan-id 30
   user@switch2# set camera-vlan vlan-description "Camera VLAN"
   user@switch2# set camera-vlan vlan-id 40

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]

3. Configure the port mode for the interfaces:

   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk

4. Configure RSTP on the switch:

   [edit protocols]
   user@switch2# rstp bridge-priority 32k
   user@switch2# rstp interface ge-0/0/14.0 cost 1000
   user@switch2# rstp interface ge-0/0/14.0 mode point-to-point
   user@switch2# rstp interface ge-0/0/18.0 cost 1000
   user@switch2# rstp interface ge-0/0/18.0 mode point-to-point

Step-by-Step Procedure

If Switch 2 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 2:

1. Enable graceful Routing Engine switchover (GRES):

   [edit chassis redundancy]
user@switch2# set graceful-switchover

2. Configure the switch to always synchronize configuration changes between the Routing Engines:

[edit system]
user@switch2# set commit synchronize

If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.

3. Enable nonstop bridging:

[edit ethernet-switching-options]
user@switch2# set nonstop-bridging

NOTE: This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

Results

Check the results of the configuration:

user@switch2> show configuration

interfaces {
    ge-0/0/14 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/18 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
}
protocols {
    rstp {
        bridge-priority 32k;
        interface ge-0/0/14.0 {
            cost 1000;
            mode point-to-point;
        }
        interface ge-0/0/18.0 {
            cost 1000;
            mode point-to-point;
        }
    }
}
To quickly configure RSTP and nonstop bridging on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface ge-0/0/26.0 cost 1000
set protocols rstp interface ge-0/0/26.0 mode point-to-point
set protocols rstp interface ge-0/0/28.0 cost 1000
set protocols rstp interface ge-0/0/28.0 mode point-to-point
set protocols rstp interface ge-0/0/24.0 cost 1000
set protocols rstp interface ge-0/0/24.0 mode point-to-point
```
If Switch 3 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 3, copy the following commands and paste them into the switch terminal window:

```plaintext
set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging
```

### Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 3:

1. Configure the VLANs `voice-vlan`, `employee-vlan`, `guest-vlan`, and `camera-vlan`:
   ```plaintext
   [edit vlans]
   user@switch3# set voice-vlan description "Voice VLAN"
   user@switch3# set voice-vlan vlan-id 10
   user@switch3# set employee-vlan description "Employee VLAN"
   user@switch3# set employee-vlan vlan-id 20
   user@switch3# set guest-vlan description "Guest VLAN"
   user@switch3# set guest-vlan vlan-id 30
   user@switch3# set camera-vlan description "Camera VLAN"
   user@switch3# set camera-vlan vlan-id 40
   ``

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:
   ```plaintext
   [edit interfaces]
   user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
   ``

3. Configure the port mode for the interfaces:
   ```plaintext
   [edit interfaces]
   user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
   user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
   user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
   ``

4. Configure RSTP on the switch:
   ```plaintext
   [edit protocols]
   user@switch3# rstp bridge-priority 8k
   user@switch3# rstp interface ge-0/0/26 cost 1000
   user@switch3# rstp interface ge-0/0/26 mode point-to-point
   user@switch3# rstp interface ge-0/0/28 cost 1000
   user@switch3# rstp interface ge-0/0/28 mode point-to-point
   user@switch3# rstp interface ge-0/0/24 cost 1000
   user@switch3# rstp interface ge-0/0/24 mode point-to-point
   ```

### Step-by-Step Procedure

If Switch 3 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 3:

1. Enable graceful Routing Engine switchover (GRES):
   ```plaintext
   [edit chassis redundancy]
   user@switch3# set graceful-switchover
   ``

2. Configure the switch to always synchronize configuration changes between the Routing Engines:
   ```plaintext
   [edit system]
   user@switch3# set commit synchronize
   ```
If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.

3. Enable nonstop bridging:

   ```plaintext
   [edit ethernet-switching-options]
   user@switch3# set nonstop-bridging
   ```

   **NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

Results  Check the results of the configuration:

   ```plaintext
   user@switch3> show configuration
   interfaces {
     ge-0/0/26 {
       unit 0 {
         family ethernet-switching {
           port-mode trunk;
           vlan { members [10 20 30 40]; }
         }
       }
     }
     ge-0/0/28 {
       unit 0 {
         family ethernet-switching {
           port-mode trunk;
           vlan { members [10 20 30 40]; }
         }
       }
     }
     ge-0/0/24 {
       unit 0 {
         family ethernet-switching {
           port-mode trunk;
           vlan { members [10 20 30 40]; }
         }
       }
     }
   }
   }
   protocols {
     rstp {
       bridge-priority 8k;
       interface ge-0/0/26.0 {
         cost 1000;
     ```
mode point-to-point;
}
interface ge-0/0/28.0 {
  cost 1000;
  mode point-to-point;
}
interface ge-0/0/24.0 {
  cost 1000;
  mode point-to-point;
}
}
bridge-priority 8k;
}

vlans {
  voice-vlan {
    vlan-id 10;
  }
  employee-vlan {
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
    vlan-id 40;
  }
}

system {
  commit synchronize;
}

chassis {

  }
  ethernet-switching-options {
    nonstop-bridging;
  }
}

**Configuring RSTP and Nonstop Bridging on Switch 4**

**CLI Quick Configuration**

To quickly configure RSTP and nonstop bridging on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
```
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/23.0 cost 1000
set protocols rstp interface ge-0/0/23.0 mode point-to-point
set protocols rstp interface ge-0/0/19.0 cost 1000
set protocols rstp interface ge-0/0/19.0 mode point-to-point

If Switch 4 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 4, copy the following commands and paste them into the switch terminal window:

set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging

Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 4:

1. Configure the VLANs voice-vlan, employee-vlan, guest-vlan, and camera-vlan:

   [edit vlans]
   user@switch4# set voice-vlan description "Voice VLAN"
   user@switch4# set voice-vlan vlan-id 10
   user@switch4# set employee-vlan description "Employee VLAN"
   user@switch4# set employee-vlan vlan-id 20
   user@switch4# set guest-vlan description "Guest VLAN"
   user@switch4# set guest-vlan vlan-id 30
   user@switch4# set camera-vlan description "Camera VLAN"
   user@switch4# set camera-vlan vlan-id 40

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

   [edit interfaces]
   user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]

3. Configure the port mode for the interfaces:

   [edit interfaces]
   user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
   user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk

4. Configure RSTP on the switch:

   [edit protocols]
   user@switch4# rstp bridge-priority 16k
   user@switch4# rstp interface all cost 1000
   user@switch4# rstp interface ge-0/0/23.0 cost 1000
   user@switch4# rstp interface ge-0/0/23.0 mode point-to-point
   user@switch4# rstp interface ge-0/0/19.0 cost 1000
   user@switch4# rstp interface ge-0/0/19.0 mode point-to-point

Step-by-Step Procedure

If Switch 4 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 4:

1. Enable graceful Routing Engine switchover (GRES):

   [edit chassis redundancy]
   user@switch4# set graceful-switchover
2. Configure the switch to always synchronize configuration changes between the Routing Engines:

   [edit system]
   user@switch4# set commit synchronize

   If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.

3. Enable nonstop bridging:

   [edit ethernet-switching-options]
   user@switch4# set nonstop-bridging

   **NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

Results  Check the results of the configuration:

   user@switch4> show configuration
   interfaces {
     ge-0/0/23 {
       unit 0 {
         family ethernet-switching {
           port-mode trunk;
           vlan {
             members [10 20 30 40];
           }
         }
       }
     }
     ge-0/0/19 {
       unit 0 {
         family ethernet-switching {
           port-mode trunk;
           vlan {
             members [10 20 30 40];
           }
         }
       }
     }
   }
   protocols {
     rstp {
       bridge-priority 16k;
       interface ge-0/0/23.0 {
         cost 1000;
         mode point-to-point;
       }
       interface ge-0/0/19.0 {
         cost 1000;
         mode point-to-point;
       }
     }
   }
Verifying RSTP Configuration on Switch 1

Purpose

Verify the RSTP configuration on Switch 1.

Verification

To confirm that the configuration is working properly, perform these tasks on both Routing Engines:

- Verifying RSTP Configuration on Switch 1 on page 4328
- Verifying RSTP Configuration on Switch 2 on page 4329
- Verifying RSTP Configuration on Switch 3 on page 4329
- Verifying RSTP Configuration on Switch 4 on page 4330
**Action**  Use the operational mode command:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Port ID</th>
<th>Designated port ID</th>
<th>Designated bridge ID</th>
<th>Port Cost</th>
<th>State</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/13.0</td>
<td>128:526</td>
<td>128:526</td>
<td>16384.0019e25040e0</td>
<td>1000</td>
<td>BLK</td>
<td>ALT</td>
</tr>
<tr>
<td>ge-0/0/9.0</td>
<td>128:522</td>
<td>128:522</td>
<td>32768.0019e2503d20</td>
<td>1000</td>
<td>BLK</td>
<td>ALT</td>
</tr>
<tr>
<td>ge-0/0/11.0</td>
<td>128:524</td>
<td>128:524</td>
<td>8192.0019e25051e0</td>
<td>1000</td>
<td>FWD</td>
<td>ROOT</td>
</tr>
</tbody>
</table>

**Meaning**  Refer to the topology in Figure 65 on page 4315. The operational mode command `show spanning-tree interface` shows that `ge-0/0/13.0` is in a forwarding state. The other interfaces on Switch 1 are blocking.

**Verifying RSTP Configuration on Switch 2**

**Purpose**  Use this procedure to verify the RSTP configuration on both Switch 2 Routing Engines.

**Action**  Use the operational mode command:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Port ID</th>
<th>Designated port ID</th>
<th>Designated bridge ID</th>
<th>Port Cost</th>
<th>State</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/14.0</td>
<td>128:527</td>
<td>128:527</td>
<td>32768.0019e2503d20</td>
<td>1000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/18.0</td>
<td>128:529</td>
<td>128:529</td>
<td>8192.0019e25051e0</td>
<td>1000</td>
<td>FWD</td>
<td>ROOT</td>
</tr>
</tbody>
</table>

**Meaning**  Refer to the topology in Figure 65 on page 4315. The operational mode command `show spanning-tree interface` shows that `ge-0/0/18.0` is in a forwarding state and is the root port.

**Verifying RSTP Configuration on Switch 3**

**Purpose**  Use this procedure to verify the RSTP configuration on both Switch 3 Routing Engines.
Action

Use the operational mode commands:

```
user@switch3> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Port ID</th>
<th>Designated bridge ID</th>
<th>Designated Cost</th>
<th>Port Cost</th>
<th>State</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/26.0</td>
<td>128:539</td>
<td>128:539</td>
<td>8192.0019e25051e0</td>
<td>1000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/28.0</td>
<td>128:541</td>
<td>128:541</td>
<td>8192.0019e25051e0</td>
<td>1000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/24.0</td>
<td>128:537</td>
<td>128:537</td>
<td>8192.0019e25051e0</td>
<td>1000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
</tbody>
</table>

Meaning

Refer to the topology in Figure 65 on page 4315. The operational mode command `show spanning-tree interface` shows that no interface is the root interface.

**Verifying RSTP Configuration on Switch 4**

Purpose

Use this procedure to verify the RSTP configuration on both Switch 4 Routing Engines.

Action

Use the operational mode commands:

```
user@switch4> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Port ID</th>
<th>Designated bridge ID</th>
<th>Designated Cost</th>
<th>Port Cost</th>
<th>State</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/23.0</td>
<td>128:536</td>
<td>128:536</td>
<td>8192.0019e25051e0</td>
<td>1000</td>
<td>FWD</td>
<td>ROOT</td>
</tr>
<tr>
<td>ge-0/0/19.0</td>
<td>128:532</td>
<td>128:532</td>
<td>16384.0019e25040e0</td>
<td>1000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
</tbody>
</table>

Meaning

Refer to the topology in Figure 65 on page 4315. The operational mode command `show spanning-tree interface` shows that interface `ge-0/0/23.0` is the root interface and forwarding.

**Related Documentation**

- Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches on page 4330
- Understanding RSTP for EX Series Switches on page 4300

**Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches**

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates better load sharing across redundant links.

Up to 64 MSTI instances can be created for an EX Series switch, and each MSTI can support up to 4094 VLANs.
This example describes how to configure MSTP on four EX Series switches:

- Requirements on page 4331
- Overview and Topology on page 4331
- Configuring MSTP on Switch 1 on page 4334
- Configuring MSTP on Switch 2 on page 4336
- Configuring MSTP on Switch 3 on page 4339
- Configuring MSTP on Switch 4 on page 4342
- Verification on page 4344

Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- Four EX Series switches

Before you configure the switches for MSTP, be sure you have:

- Installed the four switches. See Connecting and Configuring an EX Series Switch (J-Web Procedure).
- Performed the initial software configuration on all switches. See Installing and Connecting an EX3200 Switch.

Overview and Topology

When the number of VLANs grows in a network, MSTP provides a more efficient way of creating a loop-free topology using MSTIs. Each MSTI in the spanning tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.
Figure 66: Network Topology for MSTP

NOTE: You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

The topology in Figure 66 on page 4332 shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.
- The backup port is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The voice-vlan supports voice traffic and has a VLAN tag identifier of 10.
- The employee-vlan supports data traffic and has a VLAN tag identifier of 20.
- The guest-vlan supports guest VLAN traffic (for supplicants that fail 802-1X authentication) and has a VLAN tag identifier of 30.
- The camera-vlan supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, 1 and 2, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.
### Configuring MSTP on Switch 1

**CLI Quick Configuration**

To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```plaintext
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge-0/0/13.0 cost 1000
set protocols mstp interface ge-0/0/13.0 mode point-to-point
set protocols mstp interface ge-0/0/9.0 cost 1000
set protocols mstp interface ge-0/0/9.0 mode point-to-point
set protocols mstp interface ge-0/0/11.0 cost 1000
set protocols mstp interface ge-0/0/11.0 mode point-to-point
set protocols msti 1 bridge-priority 16k
set protocols msti 1 vlan [10 20]
set protocols mstp msti 1 link 0/0/11 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

**Step-by-Step Procedure**

To configure interfaces and MSTP on Switch 1:

1. **Configure the VLANs** `voice-vlan`, `employee-vlan`, `guest-vlan`, and `camera-vlan`:
   ```plaintext
   [edit vlans]
   user@switch1# set voice-vlan description "Voice VLAN"
   user@switch1# set voice-vlan vlan-id 10
   user@switch1# set employee-vlan description "Employee VLAN"
   user@switch1# set employee-vlan vlan-id 20
   user@switch1# set guest-vlan description "Guest VLAN"
   user@switch1# set guest-vlan vlan-id 30
   user@switch1# set camera-vlan description "Camera VLAN"
   user@switch1# set guest-vlan vlan-id 40
   ```

2. **Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol**:
   ```plaintext
   [edit interfaces]
   user@switch1# set ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
   ```

3. **Configure the port mode for the interfaces**:
   ```plaintext
   [edit interfaces]
   ```
4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface ge-0/0/13.0 cost 1000
user@switch1# mstp interface ge-0/0/13.0 mode point-to-point
user@switch1# mstp interface ge-0/0/9.0 cost 1000
user@switch1# mstp interface ge-0/0/9.0 mode point-to-point
user@switch1# mstp interface ge-0/0/11.0 cost 4000
user@switch1# mstp interface ge-0/0/11.0 mode point-to-point
user@switch1# mstp msti1 bridge-priority 16k
user@switch1# mstp msti1 vlan [10 20]
user@switch1# mstp msti1 interface ge-0/0/11.0 cost 4000
user@switch1# mstp msti2 bridge-priority 8k
user@switch1# mstp msti2 vlan [30 40]
```

**Results**  
Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
```
members 30;
members 40;
}
}
}
}
}
}
}
}
}
protocols {
mstp {
   configuration-name region1;
   bridge-priority 16k;
   interface ge-0/0/13.0 {
      cost 1000;
      mode point-to-point;
   }
   interface ge-0/0/9.0 {
      cost 1000;
      mode point-to-point;
   }
   interface ge-0/0/11.0 {
      cost 4000;
      mode point-to-point;
   }
   msti1 {
      bridge-priority 16k;
      vlan [ 10 20 ];
      interface ge-0/0/11.0 {
         cost 4000;
      }
   }
   msti2 {
      bridge-priority 8k;
      vlan [ 30 40 ];
   }
}
vlans {
   voice-vlan {
      vlan-id 10;
   }
   employee-vlan {
      vlan-id 20;
   }
   guest-vlan {
      vlan-id 30;
   }
   camera-vlan {
      vlan-id 40;
   }
}

Configuring MSTP on Switch 2

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:
[edit]
To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs `voice-vlan`, `employee-vlan`, `guest-vlan`, and `camera-vlan`:

   ```
   [edit vlans]
   user@switch2# set voice-vlan description "Voice VLAN"
   user@switch2# set voice-vlan vlan-id 10
   user@switch2# set employee-vlan description "Employee VLAN"
   user@switch2# set employee-vlan vlan-id 20
   user@switch2# set guest-vlan description "Guest VLAN"
   user@switch2# set guest-vlan vlan-id 30
   user@switch2# set camera-vlan description "Camera VLAN"
   user@switch2# set camera-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
   ```

3. Configure the port mode for the interfaces:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
   ```

4. Configure MSTP on the switch, including the two MSTIs:

   ```
   [edit protocols]
   user@switch2# mstp configuration-name region1
   user@switch2# mstp bridge-priority 32k
   user@switch2# mstp interface ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
   user@switch2# mstp interface ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
   ```
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]

Results
Check the results of the configuration:

user@switch2> show configuration
interfaces {
    ge-0/0/14 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members 10;
                    members 20;
                    members 30;
                    members 40;
                }
            }
        }
    }
    ge-0/0/18 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members 10;
                    members 20;
                    members 30;
                    members 40;
                }
            }
        }
    }
}
protocols {
    mstp {
        configuration-name region1;
        bridge-priority 32k;
        interface ge-0/0/14.0 {
            cost 1000;
            mode point-to-point;
        }
        interface ge-0/0/18.0 {
            cost 1000;
            mode point-to-point;
        }
        msti 1 {
            bridge-priority 32k;
            vlan [10 20];
        }
        msti 2 {
            bridge-priority 4k;
            vlan [30 40];
        }
    }
}
vlans {
    voice-vlan {
        vlan-id 10;
    }
    employee-vlan {
        vlan-id 20;
    }
    guest-vlan {
        vlan-id 30;
    }
    camera-vlan {
        vlan-id 40;
    }
}

Configuring MSTP on Switch 3

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface ge-0/0/26.0 cost 1000
set protocols mstp interface ge-0/0/26.0 mode point-to-point
set protocols mstp interface ge-0/0/28.0 cost 1000
set protocols mstp interface ge-0/0/28.0 mode point-to-point
set protocols mstp interface ge-0/0/24.0 cost 1000
set protocols mstp interface ge-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]
```
To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs voice-vlan, employee-vlan, guest-vlan, and camera-vlan:

```plaintext
[edit vlans]
user@switch3# set voice-vlan description "Voice VLAN"
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description "Employee VLAN"
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description "Guest VLAN"
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description "Camera VLAN"
user@switch3# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```plaintext
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```plaintext
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```plaintext
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface ge-0/0/26.0 cost 1000
user@switch3# mstp interface ge-0/0/26.0 mode point-to-point
user@switch3# mstp interface ge-0/0/28.0 cost 1000
user@switch3# mstp interface ge-0/0/28.0 mode point-to-point
user@switch3# mstp interface ge-0/0/24.0 cost 1000
user@switch3# mstp interface ge-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti1 bridge-priority 4k
user@switch3# mstp msti1 vlan [10 20]
user@switch3# mstp msti2 bridge-priority 16k
user@switch3# mstp msti2 vlan [30 40]
```

Results

Check the results of the configuration:

```plaintext
user@switch3> show configuration
interfaces {
  ge-0/0/26 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
```

```plaintext
ge-0/0/28 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members 10;
        members 20;
        members 30;
        members 40;
      }
    }
  }
}

ge-0/0/24 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members 10;
        members 20;
        members 30;
        members 40;
      }
    }
  }
}

protocols {
    mstp {
      configuration-name region1;
      bridge-priority 8k;
      interface ge-0/0/26.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/28.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/24.0 {
        cost 1000;
        mode point-to-point;
      }
      msti 1 {
        bridge-priority 4k;
        vlan [ 10 20 ];
      }
      msti 2 {
        bridge-priority 16k;
        vlan [ 30 40 ];
      }
    }
  }
```
Configuring MSTP on Switch 4

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge-0/0/23.0 cost 1000
set protocols mstp interface ge-0/0/23.0 mode point-to-point
set protocols mstp interface ge-0/0/19.0 cost 1000
set protocols mstp interface ge-0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs voice-vlan, employee-vlan, guest-vlan, and camera-vlan:

```
[edit vlans]
user@switch4# set voice-vlan description "Voice VLAN"
user@switch4# set voice-vlan vlan-id 10
user@switch4# set employee-vlan description "Employee VLAN"
user@switch4# set employee-vlan vlan-id 20
user@switch4# set guest-vlan description "Guest VLAN"
user@switch4# set guest-vlan vlan-id 30
user@switch4# set camera-vlan description "Camera VLAN"
user@switch4# set guest-vlan vlan-id 40
```
2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface ge-0/0/23.0 cost 1000
user@switch4# mstp interface ge-0/0/23.0 mode point-to-point
user@switch4# mstp interface ge-0/0/19.0 cost 1000
user@switch4# mstp interface ge-0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

**Results**

Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
    ge-0/0/23 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members 10;
                    members 20;
                    members 30;
                    members 40;
                }
            }
        }
    }
    ge-0/0/19 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members 10;
                    members 20;
                    members 30;
                    members 40;
                }
            }
        }
    }
}
```

*/
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 16k;
    interface ge-0/0/23.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/19.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
      bridge-priority 16k;
      vlan [ 10 20 ];
    }
    msti 2 {
      bridge-priority 32k;
      vlan [ 30 40 ];
    }
  }
}
vlans {
  voice-vlan {
    vlan-id 10;
  }
  employee-vlan {
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
    vlan-id 40;
  }
}

Verification
To confirm that the configuration is working properly, perform these tasks:

- Verifying MSTP Configuration on Switch 1 on page 4344
- Verifying MSTP Configuration on Switch 2 on page 4346
- Verifying MSTP Configuration on Switch 3 on page 4348
- Verifying MSTP Configuration on Switch 4 on page 4350

Verifying MSTP Configuration on Switch 1

Purpose Verify the MSTP configuration on Switch 1.
Action

Use the operational mode commands:

```
user@switch1> show spanning-tree interface

### Meaning

The operational mode command `show spanning-tree interface` displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command `show spanning-tree bridge` displays the spanning-tree domain information at either the bridge level or interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

### Related Documentation

- Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches on page 4313
- Understanding MSTP for EX Series Switches on page 4298

### Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). All spanning-tree protocols use a special type of frame called a bridge protocol data unit (BPDU) to communicate. Other devices—PC bridging applications, for example, also use BPDUs and generate their own BPDUs. These different BPDUs are not compatible. When BPDUs generated by spanning-tree protocols are transmitted to a device that uses another type of BPDU, they can cause problems on the device. Similarly, if switches within a spanning-tree topology receive BPDUs from other devices, network outages can occur because of STP miscalculations.

This example configures BPDU protection on an EX Series switch that uses RSTP. The upstream configuration is done on the edge interfaces, where outside BPDUs are often received from other devices:

- Requirements on page 4353
- Overview and Topology on page 4353
- Configuration on page 4354
- Verification on page 4355
Requirements

This example uses the following hardware and software components:

- Two EX Series switches in an RSTP topology
- Junos OS Release 9.1 or later for EX Series switches

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- RSTP enabled on the switches.

NOTE: By default, RSTP is enabled on all EX Series switches.

Overview and Topology

The switches, being in an RSTP topology, support a loop-free network through the exchange of BPDUs. Receipt of outside BPDUs in an STP, RSTP, or MSTP topology, however, can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on STP interfaces that could receive outside BPDUs. If an outside BPDU is received on a BPDU-protected interface, the interface shuts down to prevent the outside BPDU from accessing the STP interface.

Figure 67 on page 4354 shows the topology for this example. In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are edge access ports—edge access ports frequently receive outside BPDUs generated by PC applications.

This example configures interface ge-0/0/5.0 and interface ge-0/0/6.0 as edge ports on Switch 2, and then configures BPDU protection on those ports. With BPDU protection enabled, these interfaces shut down when they encounter an outside BPDU sent by the PCs connected to Switch 2.
Figure 67: BPDU Protection Topology

Table 540 on page 4354 shows the components that will be configured for BPDU protection.

Table 540: Components of the Topology for Configuring BPDU Protection on EX Series Switches

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch 1 (Distribution Layer)</td>
<td>Switch 1 is connected to Switch 2 on a trunk interface.</td>
</tr>
<tr>
<td>Switch 2 (Access Layer)</td>
<td>Switch 2 has these access ports that require BPDU protection:</td>
</tr>
<tr>
<td></td>
<td>• ge-0/0/5.0</td>
</tr>
<tr>
<td></td>
<td>• ge-0/0/6.0</td>
</tr>
</tbody>
</table>

This configuration example uses RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the [edit protocols (mstp | stp)] hierarchy level.

Configuration

To configure BPDU protection on two access interfaces:

**CLI Quick Configuration**

Quickly configure RSTP on the two Switch 2 interfaces, and then configure BPDU protection on all edge ports on Switch 2 by copying the following commands and pasting them into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/5.0 edge
set protocols rstp interface ge-0/0/6.0 edge
set protocols rstp bpdublock-on-edge
```
To configure RSTP on the two Switch 2 interfaces, and then configure BPDU protection:

1. Configure RSTP on interface `ge-0/0/5.0` and interface `ge-0/0/6.0`, and configure them as edge ports:

   ```
   [edit protocols rstp]
   user@switch# set interface ge-0/0/5.0 edge
   user@switch# set interface ge-0/0/6.0 edge
   ```

2. Configure BPDU protection on all edge ports on this switch:

   ```
   [edit protocols rstp]
   user@switch# set bpdu-block-on-edge
   ```

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/5.0 [ 
  edge; 
  ]
interface ge-0/0/6.0 [ 
  edge; 
  ]
bpdu-block-on-edge;
```

To confirm that the configuration is working properly:

- Displaying the Interface State Before BPDU Protection Is Triggered on page 4355
- Verifying That BPDU Protection Is Working Correctly on page 4356

### Displaying the Interface State Before BPDU Protection Is Triggered

Before BPDUs can be received from PCs connected to interface `ge-0/0/5.0` and interface `ge-0/0/6.0`, confirm the interface state.

**Action**

Use the operational mode command:

```
user@switch> show spanning-tree interface
```

**Meaning**

The output from the operational mode command `show spanning-tree interface` shows that `ge-0/0/5.0` and interface `ge-0/0/6.0` are ports in a forwarding state.
Verifying That BPDU Protection Is Working Correctly

Purpose
In this example, the PCs connected to Switch 2 start sending BPDUs to interface ge-0/0/5.0 and interface ge-0/0/6.0. Verify that BPDU protection is working on the interfaces.

Action
Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Meaning
When BPDUs are sent from the PCs to interface ge-0/0/5.0 and interface ge-0/0/6.0 on Switch 2, the output from the operational mode command `show spanning-tree interface` shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state causes the interfaces to shut down.

Disabling the BPDU protection configuration on an interface does not automatically re-enable the interface. However, if the `disable-timeout (Spanning Trees)` statement has been included in the BPDU configuration, the interface does return to service after the timer expires. Otherwise, you must use the operational mode command `clear ethernet-switching bpdu-error` to unblock and re-enable the interface.

If the PCs connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state, causing them to shut down. In such cases, you need to find and repair the misconfiguration on the PCs that is sending BPDUs to Switch 2.

Related Documentation
- Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches on page 4313
- Example: Configuring BPDU Protection on Interfaces to Prevent STP Miscalculations on EX Series Switches on page 4357
- Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on EX Series Switches on page 4363
Spanning-tree protocols support loop-free network communication through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, when BPDUs generated by spanning-tree protocols are communicated to devices on which spanning-tree protocols are not configured, these devices recognize the BPDUs, which can lead to network outages. You can, however, enable BPDU protection on switch interfaces to prevent BPDUs generated by spanning-tree protocols from passing through those interfaces. When BPDU protection is enabled, an interface shuts down or drops BPDU packets when any incompatible BPDU is encountered, thereby preventing the BPDUs generated by spanning-tree protocols from reaching the switch. When an interface is configured to drop BPDU packets, all traffic except the incompatible BPDUs can pass through the interface.

NOTE: The BPDU drop feature can be specified only on interfaces on which no spanning-tree protocol is configured.

This example configures BPDU protection on STP switch downstream interfaces that connect to two PCs:

- Requirements on page 4357
- Overview and Topology on page 4358
- Configuration on page 4359
- Verification on page 4361

Requirements

This example uses the following hardware and software components:

- One EX Series switch in an RSTP topology
- One EX Series switch that is not in any spanning-tree topology
- Junos OS Release 9.1 or later for EX Series switches

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- Ensured that RSTP is operating on Switch 1.
- Disabled or enabled RSTP on Switch 2 (depending on the configuration that you plan to implement.)
If you want to enable the BPDU shutdown feature, then it is optional to disable spanning-tree protocols on the interface.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

**Overview and Topology**

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). All spanning-tree protocols use a special type of frame called a BPDU to communicate. Other devices also use BPDUs—PC bridging applications, for example, generate their own BPDUs. These different BPDUs are not compatible. When BPDUs generated by spanning-tree protocols are transmitted to a device that uses another type of BPDU, they can cause problems on the device. Similarly, if switches within a spanning-tree topology receive BPDUs from other devices, network outages can occur because of the miscalculations caused by the outside BPDUs. Therefore, you must configure BPDU protection on interfaces in a spanning-tree topology to avoid network outages.

This example explains how to block outside BPDUs from reaching a switch interface connected to devices that are not part of the STP topology. This example addresses two scenarios. In the first scenario, an interface is shutdown when it encounters an outside BPDU. In the second scenario, an interface drops only BPDU packets while retaining the status of the interface as up and allowing all other traffic to pass through the interface.

Figure 67 on page 4354 shows the topology for this example. Switch 1 and Switch 2 are connected through a trunk interface. Switch 1 is configured for RSTP while Switch 2 has a spanning-tree protocol configured on it for the first scenario, and does not have a spanning-tree protocol configured on it for the second scenario.

In the first scenario, this example configures downstream BPDU protection on Switch 2 interfaces `ge-0/0/5.0` and `ge-0/0/6.0` when the default spanning-tree protocol (RSTP) is not disabled on these interfaces. When BPDU protection is enabled with the `shutdown` statement, the switch interfaces will shut down if BPDUs generated by the laptops attempt to access Switch 2.

In the second scenario, this example configures downstream BPDU protection on Switch 2 interfaces `ge-0/0/5.0` and `ge-0/0/6.0` when the default spanning-tree protocol (RSTP) is disabled on these interfaces. When BPDU protection is enabled with the `drop` statement, the switch interfaces drop only the BPDUs while allowing remaining traffic to pass through and retaining their status as up if BPDUs generated by the laptops attempt to access Switch 2.

**CAUTION:** When configuring BPDU protection on an interface without spanning trees connected to a switch with spanning trees, be careful that you do not configure BPDU protection on all interfaces. Doing so could prevent
BPDUs being received on switch interfaces (such as a trunk interface) that you intended to have receive BPDUs from a switch with spanning trees.

**Figure 68: BPDU Protection Topology**

Table 541 on page 4359 shows the components that will be configured for BPDU protection.

Table 541: Components of the Topology for Configuring BPDU Protection on EX Series Switches

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch 1 (Distribution Layer)</td>
<td>Switch 1 is connected to Switch 2 through a trunk interface. Switch 1 is configured for RSTP.</td>
</tr>
<tr>
<td>Switch 2 (Access Layer)</td>
<td>Switch 2 has two downstream access ports connected to laptops:</td>
</tr>
<tr>
<td></td>
<td>• ge-0/0/5.0</td>
</tr>
<tr>
<td></td>
<td>• ge-0/0/6.0</td>
</tr>
</tbody>
</table>

**Configuration**

To configure BPDU protection on the interfaces:

**CLI Quick Configuration**

This is the first scenario that explains configuration for the `shutdown` statement. To quickly configure BPDU protection on Switch 2 for the `shutdown` statement, copy the following commands and paste them into the switch terminal window:

```
[edit]
```
To configure BPDU protection for the `shutdown` statement:

1. Configure the BPDU `shutdown` statement on the downstream interface `ge-0/0/5.0` on Switch 2:
   ```
   [edit ethernet-switching-options]
   user@switch# set bpdu-block interface ge-0/0/5.0 shutdown
   ```
2. Configure the BPDU `shutdown` statement on the downstream interface `ge-0/0/6.0` on Switch 2:
   ```
   [edit ethernet-switching-options]
   user@switch# set bpdu-block interface ge-0/0/6.0 shutdown
   ```

Check the results of the configuration:

```
user@switch> show ethernet-switching-options
bpdu-block {
  interface ge-0/0/5.0 {
    shutdown;
  }
  interface ge-0/0/6.0 {
    shutdown;
  }
}
```

This is the second scenario that explains configuration for the `drop` statement. To quickly configure BPDU protection on Switch 2 for the `drop` statement, copy the following commands and paste them into the switch terminal window:

```
[edit]
user@switch# set protocols rstp interface ge-0/0/5.0 disable
user@switch# set protocols rstp interface ge-0/0/6.0 disable
user@switch# set ethernet-switching-options bpdu-block interface ge-0/0/5.0 drop
user@switch# set ethernet-switching-options bpdu-block interface ge-0/0/6.0 drop
```

**NOTE:** You can also disable RSTP globally using the `delete protocols rstp`, the `set protocols rstp disable`, or the `set protocols rstp interface all disable` command.

To configure BPDU protection for the `drop` statement:

1. Disable RSTP on both the interfaces `ge-0/0/5.0` and `ge-0/0/6.0` interfaces:
   ```
   [edit]
   user@switch# set protocols rstp interface ge-0/0/5.0 disable
   user@switch# set protocols rstp interface ge-0/0/6.0 disable
   ```
2. Configure the BPDU `drop` statement on the downstream interface `ge-0/0/5.0` on Switch 2:
   ```
   [edit ethernet-switching-options]
   user@switch# set bpdu-block interface ge-0/0/5.0 drop
   ```
3. Configure the BPDU drop statement on the downstream interface ge-0/0/6.0 on Switch 2:

```
[edit ethernet-switching-options]
user@switch# set bpdu-block interface ge-0/0/6.0 drop
```

### Results
Check the results of the configuration:

```
user@switch> show protocols rstp
interface ge-0/0/5.0 {
   disable;
}
interface ge-0/0/6.0 {
   disable;
}
user@switch> show ethernet-switching-options
bpdu-block {
   interface ge-0/0/5.0 {
      drop;
   }
   interface ge-0/0/6.0 {
      drop;
   }
}
```

### Verification
To confirm that the configuration is working properly, perform these tasks:

- Displaying the Interface State Before BPDU Protection Is Triggered on page 4361
- Verifying That BPDU Shutdown Protection Is Working Correctly on page 4361
- Verifying That BPDU Drop Protection Is Working Correctly on page 4362

#### Displaying the Interface State Before BPDU Protection Is Triggered

**Purpose**
Before any BPDUs can be received on Switch 2 on either interface ge-0/0/5.0 or interface ge-0/0/6.0, confirm the state of those interfaces.

**Action**
Use the operational mode command `show ethernet-switching interfaces`:

```
user@switch> show ethernet-switching interfaces
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>State</th>
<th>VLAN members</th>
<th>Tag</th>
<th>Tagging</th>
<th>Blocking</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/5.0</td>
<td>up</td>
<td>default</td>
<td>untagged</td>
<td>untagged</td>
<td>unblocked</td>
</tr>
<tr>
<td>ge-0/0/6.0</td>
<td>up</td>
<td>default</td>
<td>untagged</td>
<td>untagged</td>
<td>unblocked</td>
</tr>
</tbody>
</table>

**Meaning**
The output from the operational mode command `show ethernet-switching interfaces` shows that ge-0/0/5.0 and interface ge-0/0/6.0 are up and unblocked.

#### Verifying That BPDU Shutdown Protection Is Working Correctly

**Purpose**
Verify that BPDU protection is working correctly in the network by checking to see whether BPDUs have been blocked appropriately.
Action  Issue `show ethernet-switching interfaces` to see what happened when the BPDUs reached the two interfaces configured for BPDU protection on Switch 2:

```
user@switch> show ethernet-switching interfaces
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>State</th>
<th>VLAN members</th>
<th>Tag</th>
<th>Tagging</th>
<th>Blocking</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/5.0</td>
<td>down</td>
<td>default</td>
<td>untagged</td>
<td>Disabled by bpdu-control</td>
<td></td>
</tr>
<tr>
<td>ge-0/0/6.0</td>
<td>down</td>
<td>default</td>
<td>untagged</td>
<td>Disabled by bpdu-control</td>
<td></td>
</tr>
</tbody>
</table>

Meaning  When the BPDUs sent from laptops reached interfaces `ge-0/0/5.0` and `ge-0/0/6.0` on Switch 2, the interfaces transitioned to a BPDU inconsistent state, shutting down the two interfaces to prevent BPDUs from reaching the laptops.

You need to re-enable the blocked interfaces. There are two ways to do this. If you included the statement `disable-timeout (Spanning Trees)` in the BPDU configuration, the interface returns to service after the timer expires. Otherwise, use the operational mode command `clear ethernet-switching bpdu-error` to unblock and re-enable `ge-0/0/5.0` and `ge-0/0/6.0`. This command will only re-enable an interface but the BPDU configuration for the interface will continue to exist unless you remove the BPDU configuration explicitly.

If BPDUs reach the downstream interfaces on Switch 2 again, BPDU protection is triggered again and the interfaces shut down. In such cases, you must find and repair the misconfiguration that is sending BPDUs to interfaces `ge-0/0/5.0` and `ge-0/0/6.0`.

**Verifying That BPDU Drop Protection Is Working Correctly**

Purpose  Verify that BPDU drop protection is working correctly in the network by checking to see whether BPDUs have been blocked appropriately.

Action  Issue `show ethernet-switching interfaces` to see what happened when the BPDUs reached the two interfaces configured for BPDU protection on Switch 2:

```
user@switch> show ethernet-switching interfaces
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>State</th>
<th>VLAN members</th>
<th>Tag</th>
<th>Tagging</th>
<th>Blocking</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/5.0</td>
<td>up</td>
<td>default</td>
<td>untagged</td>
<td>unblocked-xSTP bpdu</td>
<td>filter enabled</td>
</tr>
<tr>
<td>ge-0/0/6.0</td>
<td>up</td>
<td>default</td>
<td>untagged</td>
<td>unblocked-xSTP bpdu</td>
<td>filter enabled</td>
</tr>
</tbody>
</table>

Meaning  When the BPDUs sent from laptops reached interfaces `ge-0/0/5.0` and `ge-0/0/6.0` on Switch 2, the interfaces dropped those BPDUs to prevent them from reaching Switch 2, and the state of both the interfaces is `up`.

Related Documentation

- Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches on page 4313
- Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches on page 4352
- Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on EX Series Switches on page 4363
EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would result in a loop opening up in the network.

This example describes how to configure loop protection for an interface on an EX Series switch in an RSTP topology:

**Requirements**

This example uses the following hardware and software components:

- Junos OS Release 9.1 or later for EX Series switches
- Three EX Series switches in an RSTP topology

Before you configure the interface for loop protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

**Overview and Topology**

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPWDUs to communicate. Ultimately, the exchange of BPWDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPWDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop opens up in the spanning tree.
Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted and the ultimate result is a network outage.

**CAUTION:** An interface can be configured for either loop protection or root protection, but not for both.

Three EX Series switches are displayed in Figure 69 on page 4364. In this example, they are configured for RSTP and create a loop-free topology. Interface `ge-0/0/6` is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface `ge-0/0/7` on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface `ge-0/0/6` to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

**Figure 69: Network Topology for Loop Protection**

Table 542 on page 4364 shows the components that will be configured for loop protection.

**Table 542: Components of the Topology for Configuring Loop Protection on EX Series Switches**

<table>
<thead>
<tr>
<th>Property</th>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch 1</td>
<td>Switch 1 is the root bridge.</td>
</tr>
<tr>
<td>Switch 2</td>
<td>Switch 2 has the root port <code>ge-0/0/7</code>.</td>
</tr>
<tr>
<td>Switch 3</td>
<td>Switch 3 is connected to Switch 1 through interface <code>ge-0/0/6</code>.</td>
</tr>
</tbody>
</table>
A spanning-tree topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure loop protection for STP or MSTP topologies at the [edit protocols (mstp | stp)] hierarchy level.

**Configuration**

To configure loop protection on an interface:

**CLI Quick Configuration**

To quickly configure loop protection on interface ge-0/0/6:

```plaintext
[edit]
set protocols rstp interface ge-0/0/6 bpdu-timeout-action block
```

**Step-by-Step Procedure**

To configure loop protection:

1. Configure interface ge-0/0/6 on Switch 3:

```plaintext
[edit protocols rstp]
user@switch# set interface ge-0/0/6 bpdu-timeout-action (Spanning Trees) block
```

**Results**

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/6.0 {
    bpdu-timeout-action {
        block;
    }
}
```

**Verification**

To confirm that the configuration is working properly, perform these tasks:

- Displaying the Interface State Before Loop Protection Is Triggered on page 4365
- Verifying That Loop Protection Is Working on an Interface on page 4366

**Displaying the Interface State Before Loop Protection Is Triggered**

Before loop protection is triggered on interface ge-0/0/6, confirm that the interface is blocking.
Action  Use the operational mode command:

user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Port ID</th>
<th>Designated port ID</th>
<th>Designated bridge ID</th>
<th>Port Cost</th>
<th>State</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/0.0</td>
<td>128:513</td>
<td>128:513</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/1.0</td>
<td>128:514</td>
<td>128:514</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/2.0</td>
<td>128:515</td>
<td>128:515</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/3.0</td>
<td>128:516</td>
<td>128:516</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/4.0</td>
<td>128:517</td>
<td>128:517</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/5.0</td>
<td>128:518</td>
<td>128:518</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/6.0</td>
<td>128:519</td>
<td>128:2</td>
<td>16384.00abbbcc0348</td>
<td>20000</td>
<td>BLK</td>
<td>ALT</td>
</tr>
</tbody>
</table>

Meaning  The output from the operational mode command `show spanning-tree interface` shows that `ge-0/0/6.0` is the alternate port and in a blocking state.

Verifying That Loop Protection Is Working on an Interface

Purpose  Verify the loop protection configuration on interface `ge-0/0/6`. RSTP has been disabled on interface `ge-0/0/4` on Switch 1. This will stop BPDUs from being sent to interface `ge-0/0/6` and trigger loop protection on the interface.

Action  Use the operational mode command:

user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Port ID</th>
<th>Designated port ID</th>
<th>Designated bridge ID</th>
<th>Port Cost</th>
<th>State</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/0.0</td>
<td>128:513</td>
<td>128:513</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/1.0</td>
<td>128:514</td>
<td>128:514</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/2.0</td>
<td>128:515</td>
<td>128:515</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/3.0</td>
<td>128:516</td>
<td>128:516</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>BLK</td>
<td>DIS</td>
</tr>
<tr>
<td>ge-0/0/4.0</td>
<td>128:517</td>
<td>128:517</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/5.0</td>
<td>128:518</td>
<td>128:518</td>
<td>32768.0019e2503f00</td>
<td>20000</td>
<td>FWD</td>
<td>DESG</td>
</tr>
<tr>
<td>ge-0/0/6.0</td>
<td>128:519</td>
<td>128:2</td>
<td>16384.00abbbcc0348</td>
<td>20000</td>
<td>BLK</td>
<td>ALT</td>
</tr>
</tbody>
</table>

Meaning  The operational mode command `show spanning-tree interface` shows that interface `ge-0/0/6.0` has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

Related Documentation  •  Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches on page 4313
Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on EX Series Switches

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to manually enforce the root bridge placement in the network.

This example describes how to configure root protection on an interface on an EX Series switch:

- Requirements on page 4367
- Overview and Topology on page 4367
- Configuration on page 4370
- Verification on page 4370

Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.1 or later for EX Series switches
- Four EX Series switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDU's to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.
However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election.

To prevent this from happening, enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

![CAUTION: An interface can be configured for either root protection or loop protection, but not for both.]

Four EX Series switches are displayed in Figure 70 on page 4369. In this example, they are configured for RSTP and create a loop-free topology. Interface ge-0/0/7 on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface ge-0/0/6 on Switch 1 is the root port.

This example shows how to configure root protection on interface ge-0/0/7 to prevent it from transitioning to become the root port.
Figure 70: Network Topology for Root Protection

Table 543 on page 4369 shows the components that will be configured for root protection.

A spanning tree topology contains ports that have specific roles:

- The **root port** is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure root protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

To configure root protection on an interface:

**CLI Quick Configuration**

To quickly configure root protection on interface `ge-0/0/7`, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/7 no-root-port
```

**Step-by-Step Procedure**

To configure root protection:

1. Configure interface `ge-0/0/7`:
   ```
   [edit protocols rstp]
   user@switch#
   set interface ge-0/0/7 no-root-port (Spanning Trees)
   ```

**Results**

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/7.0 {
    no-root-port;
}
```

**Verification**

To confirm that the configuration is working properly:

- **Displaying the Interface State Before Root Protection Is Triggered on page 4370**
- **Verifying That Root Protection Is Working on the Interface on page 4371**

### Displaying the Interface State Before Root Protection Is Triggered

**Purpose**

Before root protection is triggered on interface `ge-0/0/7`, confirm the interface state.
Action Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

<table>
<thead>
<tr>

Meaning The output from the operational mode command `show spanning-tree interface` shows that `ge-0/0/7.0` is a designated port in a forwarding state.

Verifying That Root Protection Is Working on the Interface

Purpose A configuration change takes place on Switch 4. A smaller bridge priority on the Switch 4 causes it to send superior BPDUs to interface `ge-0/0/7`. Receipt of superior BPDUs on interface `ge-0/0/7` will trigger root protection. Verify that root protection is operating on interface `ge-0/0/7`.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

</tbody>
</table>

Meaning The operational mode command `show spanning-tree interface` shows that interface `ge-0/0/7.0` has transitioned to a loop inconsistent state. The loop inconsistent state makes the interface block and prevents the interface from becoming a candidate for the root port. When the root bridge no longer receives superior STP BPDUs from the interface, the interface will recover and transition back to a forwarding state. Recovery is automatic.

- Configuring Spanning-Tree Protocols (J-Web Procedure) on page 4373
- Configuring VSTP (CLI Procedure) on page 4378
- Unblocking an Interface That Receives BPDUs in Error (CLI Procedure) on page 4380

**Forcing RSTP or VSTP to Run as IEEE 802.1D STP (CLI Procedure)**

NOTE: This procedure uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

On EX Series switches running Rapid Spanning Tree Protocol (RSTP) (the default) or VLAN Spanning Tree Protocol (VSTP), you can force the original IEEE 802.1D Spanning Tree Protocol (STP) version to run in place of RSTP or VSTP. Configure the `force-version stp` statement for compatibility with older bridges that do not support RSTP or VSTP.

To force the spanning-tree protocol version to be the original IEEE 802.1D STP:

1. Enable IEEE 802.1D STP:

   ```
   [edit protocols]
   user@switch# set (rstp | vstp) force-version stp
   ```

   NOTE: After using the `force-version` statement to enable xSTP globally, apply the `force-version` statement for specific Layer 2 ports.

**Related Documentation**

- RSTP or VSTP Forced to Run as IEEE 802.1D STP on page 4306

Configuring Spanning-Tree Protocols (J-Web Procedure)

For EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). You can configure STP, RSTP, and MSTP by using the J-Web interface. You can configure bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

NOTE: In EX4300 switches, you can configure STP only by enabling RSTP and forcing it to act as STP. You need to select the Force STP check box from the RSTP configuration page.

To configure STP, MSTP, or RSTP for an EX Series switch by using the J-Web interface:

1. Select **Configure > Switching > Spanning Tree**.
   The Spanning Tree Configuration page displays the spanning-tree protocol configuration parameters and a list of interfaces configured for each spanning-tree protocol configuration.

   NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Creates a spanning-tree protocol configuration.
     a. Select a protocol name.
     b. Enter information as described in Table 544 on page 4374.
     c. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
   - **Edit**—Modifies a selected spanning-tree protocol configuration.
     a. Enter information as described in Table 544 on page 4374.
     b. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
   - **Delete**—Deletes a selected spanning-tree protocol configuration.

  - Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches on page 4313
Configuring VSTP (CLI Procedure)

The default spanning-tree protocol for EX Series switches is Rapid Spanning Tree Protocol (RSTP). VLAN Spanning Tree Protocol (VSTP) is an alternate protocol that allows EX Series switches to run one or more Spanning Tree Protocol (STP) or RSTP instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

NOTE: EX Series switches can have a maximum of 253 VLANs on VSTP. Therefore, to have as many spanning-tree protocol VLANs as possible, use both VSTP and RSTP. RSTP will then be applied to VLANs that exceed the limit for VSTP. Because RSTP is enabled by default, you just need to additionally enable VSTP.

You can configure VSTP for an interface at the global level (for all configured VLANs) or for a specific VLAN.

NOTE:

- If you configure VSTP on an interface at both the global and the specific VLAN level, the interface configuration that is defined at the specific VLAN level overrides the interface configuration that is defined at the global level.
- If you specify VSTP to be configured on an interface that is not configured to belong to the VLAN (or VLANs), an error message is displayed.
- Option `vlan all` is not supported in Junos OS Release 13.2X50.

To configure VSTP:

1. Configure VSTP on a group of VLANs, on all VLANs, or on a specific VLAN, or a specific interface within a VLAN, or on a specific interface that belongs to all VLANs:
   - To enable VSTP on multiple VLANs using a VLAN group:
     ```
     [edit protocols]
     user@switch# set vlan vlan-group group-name vlan vlan-id-range
     ```

     NOTE: EX Series switches can have a maximum of 253 VLANs on VSTP.

   - To enable VSTP on all VLANs:
NOTE: When you configure VSTP with the set protocol vstp vlan all command, VLAN ID 1 is not set; it is excluded so that the configuration is compatible with Cisco PVST+. If you want VLAN ID 1 to be included in the VSTP configuration on your switch, you must set it separately with the set protocol vstp vlan 1 command.

[edit protocols]
user@switch# set vlan vlan all

NOTE: EX Series switches can have a maximum of 253 VLANs on VSTP. RSTP will then be applied to VLANs that exceed the limit for VSTP. Be sure that RSTP is also enabled (the default setting) when you use the command set vstp vlan all. In addition to this being a recommended practice, your configuration will not commit if VSTP is enabled on a switch with more than 253 VLANs.

• To enable VSTP on a VLAN using a single VLAN ID:
  [edit protocols]
  user@switch# set vlan vlan vlan-id

• To enable VSTP on a VLAN using a single VLAN name:
  [edit protocols]
  user@switch# set vlan vlan vlan-name

• To enable VSTP on an interface at the global level:
  [edit protocols]
  user@switch# set vlan vlan all interface interface-name

CAUTION: Ensure that the interface is a member of all VLANs before you add the interface to the VSTP configuration. If the interface is not a member of all VLANs, this VSTP configuration will fail when you try to commit it.

• To enable VSTP on an interface for a specific VLAN:
  [edit protocols]
  user@switch# set vlan vlan vlan-id-or-vlan-name interface interface-name

CAUTION: Ensure that the interface is a member of the specified VLAN before you add the interface to the VSTP configuration. If the interface is not a member of the specified VLAN, this VSTP configuration will fail when you try to commit it.

2. (Optional) Enable the Address Resolution Protocol (ARP) for faster MAC address recovery only if a routed VLAN interface (RVI) is configured:

• To enable ARP on VSTP for all VLANs:
To enable ARP on VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vlan vlan all arp-on-stp
```

To enable ARP on VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vlan vlan-name arp-on-stp
```

**Unblocking an Interface That Receives BPDUs in Error (CLI Procedure)**

EX Series switches use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface either shuts down or transitions to a blocking state and stops forwarding frames. In the latter scenario, after the misconfiguration that triggered the BPDUs being sent to an interface is fixed in the topology, the interface can be unblocked and returned to service.

To unblock an interface and return it to service using the CLI:

- Automatically unblock an interface by configuring a timer that expires:

  ```
  [edit ethernet-switching-options]
  user@switch# set bpdu-block disable-timeout 30
  ```
  All interfaces on the switch will be re-enabled (unblocked) after the timer expires. However, once an interface on the switch receives a new spanning-tree protocol BPDU, the interface returns to the blocked state.

- Manually unblock an interface using the operational mode command:

  ```
  user@switch# clear ethernet-switching bpdu-error interface ge-0/0/6.0
  ```
  This command will only re-enable an interface but the BPDU configuration for the interface will continue to exist unless you remove the BPDU configuration explicitly.
Reverting to RSTP or VSTP from Forced IEEE 802.1D STP

On MX Series routers and EX Series switches on which Rapid Spanning Tree Protocol (RSTP) or VLAN Spanning Tree Protocol (VSTP) has been forced to run as the original IEEE 802.1D Spanning Tree Protocol (STP) version, you can revert back to RSTP or VSTP.

To revert from the forced instance of the original IEEE 802.1D STP version to the originally configured RSTP or VSTP version:

1. Remove the force-version statement from the following RSTP or VSTP configuration:

   ```
   user@host# delete protocols rstp force-version stp
   user@host# delete protocols vstp force-version stp
   ```

   Include this statement at the following hierarchy levels:

   - `[edit logical-systems routing-instance-name protocols rstp]`
   - `[edit protocols rstp]`
   - `[edit protocols vstp]`
   - `[edit routing-instances routing-instance-name protocols rstp]`
   - `[edit routing-instances routing-instance-name protocols vstp]`

2. Revert the forced IEEE 802.1D STP to run as the configured RSTP or VSTP:

   ```
   user@host# clear spanning-tree protocol-migration <interface interface-name> <routing-instance routing-instance-name>
   ```

   To revert the STP protocol globally, issue the statement without options (`clear spanning-tree protocol-migration`).

   To revert the STP protocol for the specified interface only, specify the `interface interface-name` option.

   To revert the STP protocol for a particular routing instance only, specify the `routing-instance routing-instance-name` option.

bpdu-block

Syntax
bpdu-block {
  interface (all | [interface-name]);
  disable-timeout seconds;
}

Hierarchy Level
[edit ethernet-switching-options]

Release Information
Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description
Configure BPDU protection on all interfaces or on a specified interface. If the interface receives incompatible BPDUs, it is disabled, or it is disabled for a specified timeout period (during which the BPDU packets are dropped).

The remaining statements are explained separately.

Required Privilege
Level
system—to view this statement in the configuration.
system-control—to add this statement to the configuration.

Related Documentation

### bpdu-block-on-edge

**Syntax**
bpdu-block-on-edge;

**Hierarchy Level**
[edit protocols mstp],
[edit protocols rstp],
[edit protocols vstp]

**Release Information**
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.
Statement updated in Junos OS Release 11.1 for EX Series switches to change blocking behavior to port shutdown.

**Description**
Configure bridge protocol data unit (BPDU) protection on all edge ports of a switch.

**Required Privilege Level**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**Related Documentation**
- show spanning-tree bridge on page 4428
- show spanning-tree interface on page 4438

- Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches on page 4352
- Understanding VSTP for EX Series Switches on page 4306
bpdu-timeout-action (Spanning Trees)

**Syntax**

```
bpdu-timeout-action {
  block;
  log;
}
```

**Hierarchy Level**

- `edit protocols mstp interface (all | interface-name)`
- `edit protocols mstp interface (all | interface-name) arp-on-stp`
- `edit protocols rstp interface (all | interface-name)`
- `edit protocols rstp interface (all | interface-name) arp-on-stp`
- `edit protocols stp interface (all | interface-name)`
- `edit protocols stp interface (all | interface-name) arp-on-stp`
- `edit protocols vstp vlan vlan-id interface (all | interface-name)`
- `edit protocols vstp vlan vlan-id interface (all | interface-name) arp-on-stp`

**Release Information**

Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

**Description**

Configure the BPDU timeout action on a specific interface. You must configure at least one action (`log`, `block`, or both).

The remaining statements are explained separately.

**Required Privilege**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- `show spanning-tree bridge` on page 4428
- `show spanning-tree interface` on page 4438

**bridge-priority (Spanning Trees)**

**Syntax**

`bridge-priority priority;`

**Hierarchy Level**

[edit protocols mstp],
[edit protocols mstp msti msti-id],
[edit protocols rstp],
[edit protocols stp],
[edit protocols vstp vlan vlan-id]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

**Description**

Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.

**Default**

32,768

**Options**

`priority`—Bridge priority. It can be set only in increments of 4096.

- **Range:** 0 through 61,440
- **Default:** 32,768

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- `show spanning-tree bridge` on page 4428
- `show spanning-tree interface` on page 4438
  - Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches on page 4330

  - Understanding VSTP for EX Series Switches on page 4306
configuration-name (Spanning Trees)

Syntax  
configuration-name configuration-name;

Hierarchy Level  
[edit protocols mstp]

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Specify the configuration name. The configuration name is the MSTP region name carried in the MSTP BPDUs.

Required Privilege Level  
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation  
- show spanning-tree bridge on page 4428

[edit protocols stp interface (all | interface-name)],
[edit protocols stp interface (all | interface-name) arp-on-stp],
[edit protocols vstp vlan vlan-id interface (all | interface-name)],
[edit protocols vstp vlan vlan-id interface (all | interface-name) arp-on-stp]
```

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

**Description**
For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link cost to control which bridge is the designated bridge and which interface is the designated interface.

**Default**
The link cost is determined by the link speed.

**Options**
- **cost**—Link cost associated with the port.

**Range**: 1 through 200,000,000

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

disable-timeout (Spanning Trees)

Syntax  disable-timeout timeout;

Hierarchy Level  [edit ethernet-switching-options bpdu-block]

Release Information  Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description  For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled.

Default  The disable timeout is not enabled.

Options  timeout —Amount of time, in seconds, the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service.

Range: 10 through 3600 seconds

Required Privilege Level  system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

```

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

Description

For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge interfaces. Edge interfaces immediately transition to a forwarding state.

Default

Edge interfaces are not enabled.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

max-hops (Spanning Trees)

Syntax
max-hops hops;

Hierarchy Level
[edit protocols mstp]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
For Multiple Spanning Tree Protocol (MSTP), configure the maximum number of hops a BPDU can be forwarded in the MSTP region.

Default
20 hops

Options
hops — Number of hops the BPDU can be forwarded.

Range: 1 through 255 hops
Default: 20 hops

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

## mode (Spanning Trees)

### Syntax

```
mode mode;
```

### Hierarchy Level

```
[edit protocols mstp interface (all | interface-name)],
[edit protocols mstp interface (all | interface-name) arp-on-stp],
[edit protocols mstp msti msti-id interface interface-name],
[edit protocols mstp msti msti-id interface interface-name) arp-on-stp],
[edit protocols rstp interface (all | interface-name)],
[edit protocols rstp interface (all | interface-name) arp-on-stp],
[edit protocols stp interface (all | (all | interface-name)],
[edit protocols stp interface (all | interface-name) arp-on-stp],
[edit protocols vstp vlan vlan-id interface (all | interface-name)],
[edit protocols vstp vlan vlan-id interface (all | interface-name) arp-on-stp]
```

### Release Information

- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

### Description

For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link mode to identify point-to-point links.

### Default

For a full-duplex link, the default link mode is **point-to-point**. For a half-duplex link, the default link mode is **shared**.

### Options

```
mode—Link mode:
  - point-to-point—Link is point to point.
  - shared—Link is shared media.
```

### Required Privilege Level

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

```

**Hierarchy Level**
[edit protocols]

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning tree regions.

The statements are explained separately.

**Default**
MSTP is disabled.
Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit protocols stp interface (all | interface-name) arp-on-stp],
[edit protocols vstp vlan vlan-id interface (all | interface-name)],
[edit protocols vstp vlan vlan-id interface (all | interface-name) arp-on-stp]

Release Information
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

Description
Configure an interface to be a spanning-tree designated port. If the bridge receives superior STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

Description

For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the interface priority to control which interface is elected as the root port.

Default

The default value is 128.

Options

```
priority—Interface priority. The interface priority must be set in increments of 16.
```

Range: 0 through 240

Required Privilege Level

```
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.
```

    flag flag;
  }
}

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, which results in shorter convergence times than those provided by basic Spanning Tree Protocol (STP).

VSTP and RSTP can be configured concurrently. You can selectively configure up to 253 VLANs using VSTP; the remaining VLANs will be configured using RSTP. VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on the switch. See "Configuring VSTP (CLI Procedure)" on page 4378 for more information on configuring VSTP and RSTP concurrently.

BEST PRACTICE: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than 253 VLANs.

The remaining statements are explained separately.
Default  RSTP is enabled on all Ethernet switching interfaces.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

    flag flag;
  }
}
```

**Hierarchy Level**
[edit protocols]

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure Spanning Tree Protocol (STP). When you explicitly configure STP, the switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).

The remaining statements are explained separately.

**Default**
STP is disabled. By default, RSTP is enabled on all Ethernet switching ports.

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**
- show spanning-tree bridge on page 4428

[edit protocols mstp],
[edit protocols mvrp],
[edit protocols rstp],
[edit protocols stp],
[edit protocols vstp vlan vlan-id]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

Description

Set protocol-level tracing options for MPLS, MVRP, STP, RSTP, MSTP, and VSTP.

Default

Traceoptions is disabled.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a
single operation when you have defined a broad group of tracing operations, such
as all.

file name—Name of the file to receive the output of the tracing operation. Enclose the
name in quotation marks. We recommend that you place STP tracing output in the
file /var/log/stp-log.

files number—(Optional) Maximum number of trace files. When a trace file named
trace-file reaches its maximum size, it is renamed trace-file .0, then trace-file .1, and
so on, until the maximum number of trace files is reached. Then, the oldest trace file
is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with
the size option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include
multiple flag statements:

  • all—Trace all operations.
  • all-failures—Trace all failure conditions.
  • bpdu—Trace BPDU reception and transmission. Note that you must also use
    port-transmit-state-machine in order to log transmit operations.
  • bridge-detection-state-machine—Trace the bridge detection state machine.
• **error**—Trace all failure conditions.

• **events**—Trace events of the protocol state machine.

• **pdu**—Trace PDUs that were received and sent.

• **port-information-state-machine**—Trace the port information state machine.

• **port-migration-state-machine**—Trace the port migration state machine.

• **port-receive-state-machine**—Trace the port receive state machine.

• **port-role-select-state-machine**—Trace the port role selection state machine.

• **port-role-transit-state-machine**—Trace the port role transit state machine.

• **port-state-transit-state-machine**—Trace the port state transit state machine.

• **port-transmit-state-machine**—Trace the port transmit state machine.

• **ppmd**—Trace the state and events for the ppmd process.

• **socket**—Trace socket activity.

• **state-machine**—Trace state machine information.

• **state-machine-variables**—Trace when the state machine variables change.

• **timers**—Trace protocol timers.

• **topology-change-state-machine**—Trace the topology change state machine.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file .0`. When the `trace-file` again reaches its maximum size, `trace-file .0` is renamed `trace-file .1` and `trace-file` is renamed `trace-file .0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

**Syntax:** \( xk \) to specify KB, \( xm \) to specify MB, or \( xg \) to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit protocols vstp]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement updated with enhanced (? (CLI completion feature) functionality in Junos OS
Release 9.5 for EX Series switches.

Description
Configure the VLANs for a Multiple Spanning Tree Instance (MSTI) or VSTP instance.

NOTE: When you configure VSTP with the set protocol vstp vlan all
command, vlan-id 1 is excluded to be compatible with Cisco PVST+. If you
want vlan-id 1 to be included in VSTP, you must set it separately with the set
protocol vstp vlan1 command.

TIP: To display a list of all configured VLANs on the system, including VLANs
that are configured but not committed, type ? after vlan or vlans in your
configuration mode command line. Note that only one VLAN is displayed for
a VLAN range.

Default  Not enabled.
Options

- `vlan-id`—Numeric VLAN identifier.
- `vlan-name`—Name of the VLAN.

The remaining statements are explained separately.

**Required Privilege**

- **Level** routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

}

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 9.4 for EX Series switches.

Description Configure VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

You can have a maximum of 253 VSTP VLANs per switch.

If the number of VLANs on your switch exceeds the VSTP VLAN limit, you must use the vlan (Spanning Trees) statement to specify which VLANs or VLAN groups use VSTP. You also cannot use the vlan all option to configure VSTP when your switch has more than the maximum allowed VSTP VLANs. To ensure all VLANs are running a spanning-tree protocol, run RSTP for networks with large numbers of VLANs.

NOTE: When you configure VSTP with the set protocol vstp vlan all command, VLAN ID 1 is not set; it is excluded so that the configuration is compatible with Cisco PVST+. If you want VLAN ID 1 to be included in the VSTP configuration
on your switch, you must set it separately with the set protocol vstp vlan 1 command.

NOTE: Option vlan all is not supported in Junos OS Release 13.2X50.

BEST PRACTICE: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that some spanning tree protocol is running on all VLANs on your switch, even when your switch has more than the maximum number of allowed VSTP VLANs.

The remaining statements are explained separately.

Default VSTP is not enabled by default.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

CHAPTER 83

Administration

- Routine Monitoring on page 4421
- Operational Commands on page 4423

Routine Monitoring

Monitoring Spanning-Tree Protocols on page 4421

Purpose
Use the monitoring feature to view status and information about the spanning-tree protocol parameters on your EX Series switch.

Action
To display spanning-tree protocol parameter details in the J-Web interface, select Monitor > Switching > STP.

To display spanning-tree protocol parameter details in the CLI, enter the following commands:

- `show spanning-tree interface`
- `show spanning-tree bridge`

Meaning
Table 545 on page 4421 summarizes the spanning-tree protocol parameters.

Table 545: Summary of Spanning-Tree Protocols Output Fields

#### Operational Commands
clear ethernet-switching bpdu-error

Syntax  
clear ethernet-switching bpdu-error interface interface-name

Release Information  
Command introduced in Junos OS Release 9.1 for EX Series switches. Command updated in Junos OS Release 11.1 for EX Series switches—a BPDU error shuts down the interface and this command brings the interface back up. Command introduced in Junos OS Release 11.1 for the QFX Series.

Description  
Clear bridge protocol data unit (BPDU) errors from an interface and bring up the interface.

Options  
interface-name—Clear BPDU errors on the specified interface.

Required Privilege Level  
clear

Sample Output  
clear ethernet-switching bpdu-error interface
user@switch> clear ethernet-switching bpdu-error interface xe-0/0/1.0
clear spanning-tree protocol-migration

**Syntax**

```
clear spanning-tree protocol-migration
<interface interface-name>
<routing-instance routing-instance-name>
```

**Release Information**

Command introduced in Junos OS Release 9.0.

**Description**

Revert from the original IEEE 802.1D Spanning Tree Protocol (STP) back to the Rapid Spanning Tree Protocol after the `force-version` statement has been removed from the configuration.

**Options**

- `none`—Reset the STP protocol for all interfaces and all routing instances.
- `interface interface-name`—(Optional) Reset the STP protocol for the specified interface only.
- `routing-instance routing-instance-name`—(Optional) Reset the STP protocol for a particular routing instance.

**Additional Information**

For information about the `force-version` statement, see the *Junos Routing Protocols Configuration Guide*, and “Forcing RSTP or VSTP to Run as IEEE 802.1D STP (CLI Procedure)” on page 4372.

**Required Privilege Level**

`clear`

**Sample Output**

```
clear spanning-tree protocol-migration

user@host> clear spanning-tree protocol-migration
```
clear spanning-tree statistics

Syntax

```
clear spanning-tree statistics
  <interface interface-name unit logical-unit-number>;
```

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Reset STP statistics for the all interfaces or a specified interface.

Options
- **none**—Reset STP counters for all interfaces.
- **interface-name**—(Optional) The name of the interface for which statistics should be reset.
- **logical-unit-number**—(Optional) The logical unit number of the interface.

Required Privilege
- **clear**

List of Sample Output
- clear spanning-tree statistics on page 4426

Output Fields
This command produces no output.

Sample Output
```
clear spanning-tree statistics
```
```
user@switch> clear spanning-tree statistics
```
clear spanning-tree statistics

**Syntax**
```
clear spanning-tree statistics
  <interface interface-name>
  <logical-system logical-system-name>
```

**Syntax (EX Series Switches and the QFX Series)**
```
clear spanning-tree statistics
  <interface interface-name>
```

**Release Information**
Command introduced in Junos OS Release 8.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**
Clear Spanning Tree Protocol statistics.

**Options**
- **none**—Reset STP counters for all interfaces for all routing instances.
- `interface interface-name`—(Optional) Clear STP statistics for the specified interface only.
- `logical-system logical-system-name`—(Optional) Clear STP statistics on a particular logical system.

**NOTE:** The logical-system option is not available on QFabric systems.

**Required Privilege Level**
clear

**Related Documentation**
- show spanning-tree statistics on page 4454

**List of Sample Output**
clear stp statistics on page 4427

**Sample Output**
clear stp statistics

```
user@host> clear stp statistics
```
**show spanning-tree bridge**

**Syntax**
```
show spanning-tree bridge
  <brief | detail>
  <msti msti-id>
  <vlan vlan-id>
```

**Release Information**
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display the configured or calculated spanning-tree protocol (can be either STP, RSTP, MSTP, or VSTP) parameters.

**Options**
- `none`—(Optional) Display brief spanning-tree protocol bridge information for all Multiple Spanning Tree Instances (MSTIs).
  
  - `brief | detail`—(Optional) Display the specified level of output.
  
  - `msti msti-id`—(Optional) Display spanning-tree protocol bridge information for the specified MSTI or Common and Internal Spanning Tree (CIST). Specify 0 for CIST. Specify a value from 1 through 4094 for an MSTI.
  
  - `vlan vlan-id`—(Optional) Display spanning-tree protocol bridge information for the specified VLAN. Specify a VLAN tag identifier from 1 through 4094.

**Required Privilege Level**
`view`

**show spanning-tree bridge**

**Syntax**
```
show spanning-tree bridge
  <brief | detail>
  <msti msti-id>
  <routing-instance routing-instance-name>
  <vlan-id vlan-id>
```

**Syntax (QFX Series)**
```
show spanning-tree bridge
  <brief | detail>
  <msti msti-id>
  <vlan-id vlan-id>
```

**Release Information**

**Description**
Display the configured or calculated Spanning Tree Protocol (STP) parameters.

**Options**
- `none`—(Optional) Display brief STP bridge information for all multiple spanning-tree instances (MSTIs).
- `brief | detail`—(Optional) Display the specified level of output.
- `msti msti-id`—(Optional) Display STP bridge information for the specified MSTI.
- `routing-instance routing-instance-name`—(Optional) Display STP bridge information for the specified routing instance.
- `vlan-id vlan-id`—(Optional) Display STP bridge information for the specified VLAN.

**Required Privilege**
view

**List of Sample Output**
- `show spanning-tree bridge routing-instance on page 4434`
- `show spanning-tree bridge msti on page 4435`
- `show spanning-tree bridge vlan-id (MSTP) on page 4436`
- `show spanning-tree bridge (RSTP) on page 4436`
- `show spanning-tree bridge vlan-id (RSTP) on page 4437`

show spanning-tree interface

Syntax

show spanning-tree interface
  <brief | detail>
  <interface-name interface-name>
  <msti msti-id>
  <vlan-id vlan-id>

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the configured or calculated interface-level spanning-tree protocol (can be either STP, RSTP, or MSTP) parameters. In brief mode, will not display interfaces that are administratively disabled or do not have a physical link.

Options

none—(Optional) Display brief STP interface information.

brief | detail—(Optional) Display the specified level of output.

interface-name interface-name—(Optional) Name of an interface.

msti msti-id—(Optional) Display STP bridge information for the specified MSTP instance ID or Common and Internal Spanning Tree (CIST). Specify 0 for CIST. Specify a value from 1 through 4094 for an MSTI.

vlan-id vlan-id—(Optional) For MSTP interfaces, display interface information for the specified VLAN. Specify a value from 0 through 4094.

Required Privilege Level

view

show spanning-tree interface

Syntax

```
show spanning-tree interface
  <brief | detail>
  <msti msti-id>
  <routing-instance routing-instance-name>
  <vlan-id vlan-id>
```

Syntax (EX Series Switches and the QFX Series)

```
show spanning-tree interface
  <brief | detail>
  <msti msti-id>
  <vlan-id vlan-id>
```

Release Information

- Command introduced in Junos OS Release 8.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the configured or calculated interface-level STP parameters.

Options

- none—Display brief STP interface information.
- brief | detail—(Optional) Display the specified level of output.
- msti msti-id—(Optional) Display STP interface information for the specified MST instance.
- routing-instance routing-instance-name—(Optional) Display STP interface information for the specified routing instance.
- vlan-id vlan-id—(Optional) Display STP interface information for the specified VLAN.

Required Privilege Level

view

List of Sample Output

- show spanning-tree interface on page 4443
- show spanning-tree interface (QFX Series) on page 4444
- show spanning-tree interface detail on page 4444
- show spanning-tree interface msti on page 4446
- show spanning-tree interface vlan-id on page 4446
- show spanning-tree interface (VSTP) on page 4447
- show spanning-tree interface vlan-id (VSTP) on page 4447

Output Fields

Table 549 on page 4442 lists the output fields for the `show spanning-tree interface` command. Output fields are listed in the approximate order in which they appear.

Table 549: show spanning-tree Interface Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance.</td>
</tr>
</tbody>
</table>
Table 549: show spanning-tree Interface Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port ID</td>
<td>Logical interface identifier configured to participate in the MSTP or VSTP instance.</td>
</tr>
<tr>
<td>Designated port ID</td>
<td>Port ID of the designated port for the LAN segment to which this interface is attached.</td>
</tr>
<tr>
<td>Designated bridge ID</td>
<td>Bridge ID of the designated bridge for the LAN segment to which this interface is attached.</td>
</tr>
<tr>
<td>Port Cost</td>
<td>Configured cost for the interface.</td>
</tr>
<tr>
<td>Port State</td>
<td>STP port state: forwarding (FWD), blocking (BLK), listening, learning, or disabled.</td>
</tr>
<tr>
<td>Port Role</td>
<td>MSTP, VSTP, or RSTP port role: designated (DESG), backup (BKUP), alternate (ALT), (ROOT), or Root Prevented (Root-Prev).</td>
</tr>
<tr>
<td>Link type</td>
<td>MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge.</td>
</tr>
<tr>
<td>Alternate</td>
<td>Identifies the interface as an MSTP, VSTP, or RSTP alternate root port (Yes) or nonalternate root port (No).</td>
</tr>
<tr>
<td>Boundary Port</td>
<td>Identifies the interface as an MSTP regional boundary port (Yes) or nonboundary port (No).</td>
</tr>
</tbody>
</table>

  interface interface-name
  vlan vlan-id
  <brief | detail>
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
Option `vlan vlan-id` introduced in Junos OS Release 10.1 for EX Series switches.

Description

Display STP statistics on an interface, or for a VLAN when VSTP is enabled.

Options

- `none`—Display brief STP statistics.
- `brief | detail`—(Optional) Display the specified level of output.
- `interface interface-name`—(Optional) The name of the interface.
- `vlan vlan-id`—(Optional) The name of a VLAN.

Understanding EX4300 Virtual Chassis

EX4300 Virtual Chassis brings the Virtual Chassis flexible, scaling switch solution to the Juniper Networks EX4300 Ethernet Switch. You can connect up to ten EX4300 switches together to form one EX4300 Virtual Chassis and manage the unit as a single chassis. The advantages of connecting multiple switches into a Virtual Chassis include better-managed bandwidth at a network layer, simplified configuration and maintenance because multiple switches can be managed as a single switch, increased fault tolerance and high availability (HA) because a Virtual Chassis can remain active and network traffic can be redirected to other member switches when a single member switch fails, and a simplified Layer 2 network topology that minimizes or eliminates the need for loop prevention protocols such as Spanning Tree Protocol (STP).

The Virtual Chassis also provides a flexible model for expanding your network. If you are using an EX4300 switch or EX4300 Virtual Chassis at the access layer, for instance, and need additional access ports to support more servers, computers, phones, or other
devices, you can add an EX4300 switch as a Virtual Chassis member to increase the number of access ports on your network with minimal complications to the existing network topology and switch configuration. You can add this new switch to a Virtual Chassis if the switch is installed in the same building or at a different site because the long-distance optical ports can be used to interconnect EX4300 switches into the a Virtual Chassis.

You configure an EX4300 Virtual Chassis by configuring optical interfaces connecting EX4300 switches into Virtual Chassis ports (VCPs). VCPs connect switches together to form a Virtual Chassis, and are responsible for passing all data and control traffic between member switches in the Virtual Chassis. All 40-Gigabit QSFP+ optical ports on an EX4300 switch are configured as VCPs by default. All 10-Gigabit optical ports on an EX4300 switch can be configured into VCPs. You can increase the VCP bandwidth between any two member switches by connecting multiple VCP links between the switches. When multiple VCP links are interconnecting the same two member switches, a Link Aggregation Group (LAG) bundle is formed when the links are identical speeds. For instance, if you have four 40-Gigabit links configured as VCPs between member switches, a LAG with four member links at 160Gbps of bandwidth is formed. 10-Gigabit and 40-Gigabit links configured as VCPs cannot be members of the same LAG, however.

All models of EX4300 switches can be interconnected into the same EX4300 Virtual Chassis. EX4300 switches cannot be interconnected into a Virtual Chassis with any other Juniper Networks product, including other EX Series Ethernet Switches.

An EX4300 Virtual Chassis is configured, monitored, and maintained like other EX Series Virtual Chassis. See “Understanding EX Series Virtual Chassis Components” on page 4460.

Understanding EX Series Virtual Chassis Components

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Understanding EX8200 Virtual Chassis Components for information about EX8200 Virtual Chassis.

This topic describes the components of EX Series Virtual Chassis—including the components of any mixed Virtual Chassis that contains EX4200, EX4500, or EX4550 member switches—except EX8200 Virtual Chassis.
Maximum Number of Switches per Virtual Chassis

The maximum number of switches that a Virtual Chassis supports varies by Virtual Chassis and can depend on the Junos OS release running on the Virtual Chassis. Table 554 on page 4461 lists the maximum member switch support by Virtual Chassis and Junos OS release.

Table 554: Maximum Member Switch Support for Virtual Chassis by Junos OS Release

| Mixed EX4500 and EX4550 Virtual Chassis | 12.2R1—Initial release. Support for up to ten total EX4500 and EX4550 switches |

### Virtual Chassis Ports (VCPs)

You use Virtual Chassis ports (VCPs) to interconnect the member switches in a Virtual Chassis.

Some switches have dedicated VCPs. Dedicated VCPs allow you to interconnect switches without requiring any additional interface configuration. These switches have dedicated VCPs:

- EX4200 switches, on the rear panel
- EX4500 switches, on the Virtual Chassis module
- EX4550 switches, on the Virtual Chassis module

To interconnect switches that do not have dedicated VCPs or to interconnect switches across greater distances than allowed by a dedicated-VCP connection, you configure an optical port as a VCP. You can configure those VCPs on these switches:

- EX2200 switches, through an uplink port
- EX3300 switches, through an uplink port

**NOTE:** Uplink ports 2 and 3 on EX3300 switches are configured as VCPs by default.

- EX4200 switches, through uplink module ports (SFP, SFP+, or XFP) or through an SFP+ port on the EX4200-24F switch
- EX4300 switches, through uplink ports
NOTE: All QSFP+ ports on an EX4300 switch are configured as VCPs by default.

- EX4500 switches, through any SFP+ port
- EX4550 switches, through any SFP+ port

All supported SFP, SFP+, and XFP uplink connections between EX4200, EX4500, and EX4550 switches can be configured as VCPs.

You can increase the Virtual Chassis bandwidth between member switches by configuring multiple optical ports connecting the switches as VCPs. The optical ports configured as VCPs automatically form a Link Aggregation Group (LAG) bundle. See “Understanding EX Series Virtual Chassis Port Link Aggregation” on page 4472.

Master Role

The member that functions in the master role in the Virtual Chassis:

- Manages the member switches.
- Runs Junos OS for EX Series switches in a master role.
- Runs the chassis management processes and control protocols.
- Represents all the member switches interconnected within the Virtual Chassis configuration. (The hostname and other properties that you assign to this switch during setup apply to all members of the Virtual Chassis configuration.)

When an EX Series switch that supports Virtual Chassis is powered on as a standalone switch, it is considered the master member. In a Virtual Chassis, one member functions as the master and a second member functions as the backup:

- In a preprovisioned configuration, one of the two members assigned as routing-engine functions as the master member. The selection of which member assigned as routing-engine functions as master and which as backup is determined by the software based on the master election algorithm. See “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467.
- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

In any mixed Virtual Chassis configuration that includes EX4200 switches, EX4500 switches, or EX4550 switches, any switch can be configured in any role in any configuration.

Backup Role

The member that functions in the backup role in the Virtual Chassis:

- Maintains a state of readiness to take over the master role if the master fails.
- Runs Junos OS for EX Series switches in a backup role.
• Synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

You must have at least two member switches in the Virtual Chassis configuration in order to have a backup member.

• In a preprovisioned configuration, one of the two members assigned as routing-engine functions in the backup role. The selection of which member assigned as routing-engine functions as master and which as backup is determined by the software based on the master election algorithm. See “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467.

• In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

In any mixed Virtual Chassis configuration that includes EX4200 switches, EX4500 switches, or EX4550 switches, any switch can be configured in any role in any configuration.

Linecard Role

A member that functions in the linecard role in the Virtual Chassis:

• Runs only a subset of Junos OS for EX Series switches.

• Does not run the chassis control protocols.

• Can detect certain error conditions (such as an unplugged cable) on any interfaces that have been configured on it through the master.

The Virtual Chassis configuration must have at least three members in order to include a linecard member.

• In a preprovisioned configuration, you can explicitly configure a member with the linecard role, which makes it ineligible for functioning as a master or backup.

• In a configuration that is not preprovisioned, the members that are not selected as master or backup function as linecard members of the Virtual Chassis configuration. The selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm. A switch with a mastership priority of 0 is always in the linecard role.

Member Switch and Member ID

Each standalone EX Series switch that supports Virtual Chassis is a potential member of a Virtual Chassis configuration. When one of those switches is powered on, it receives a member ID that can be seen by viewing the front-panel LCD or by entering the show virtual-chassis command. If the switch is powered on as a standalone switch, that member’s member ID is always 0. When the switch is interconnected with other switches in a Virtual Chassis configuration, its member ID is assigned by the master based on various factors, such as the order in which the switch was added to the Virtual Chassis.
configuration or the member ID assigned by a preprovisioned configuration. See “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467.

If the Virtual Chassis configuration previously included a member switch and that member was physically disconnected or removed from the Virtual Chassis configuration, its member ID is not available for assignment as part of the standard sequential assignment by the master. For example, you might have a Virtual Chassis configuration composed of member 0, member 2, and member 3, because member 1 was removed. When you add another member switch and power it on, the master assigns it as member 4.

The member ID distinguishes the member switches from one another. You use the member ID:

- To assign a mastership priority value to a member switch
- To configure interfaces for a member switch (The function is similar to that of a slot number on Juniper Networks routers.)
- To apply some operational commands to a member switch
- To display status or characteristics of a member switch

Mastership Priority

In a configuration that is not preprovisioned, you can designate the role (master, backup, or linecard) that a member switch assumes by configuring its mastership priority (from 0 through 255). The mastership priority value is the factor in the master election algorithm with the highest precedence for selecting the master of the Virtual Chassis configuration. A switch with a mastership priority of 0 never assumes the backup or master role.

The default value for mastership priority is 128 for EX2200, EX3300, EX4200, EX4500, and EX4550 switches. When a standalone switch is powered on, it receives the default mastership priority value. Because it is the only member of the Virtual Chassis configuration, it is also the master. When you interconnect a standalone switch to an existing Virtual Chassis configuration (which implicitly includes its own master), we recommend that you explicitly configure the mastership priority of the members that you want to function as the master and backup.

NOTE: Configuring the same mastership priority value for both the master and backup helps to ensure a smooth transition from master to backup when the master becomes unavailable. It prevents the original master from preempting control from the backup when the backup has taken control of the Virtual Chassis configuration because the original master became unavailable.

In a preprovisioned configuration, you assign the role of each member switch.

Mixed Virtual Chassis

EX4200 switches, EX4500 switches, and EX4550 switches can be interconnected into the same Virtual Chassis to form a mixed EX4200 and EX4500 Virtual Chassis, mixed
EX4200 and EX4550 Virtual Chassis, mixed EX4500 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, and EX4550 Virtual Chassis.

The other EX Series switches that support Virtual Chassis—EX2200, EX3300, and EX4300 switches—cannot be a part of any mixed Virtual Chassis.

A mixed Virtual Chassis supports up to 10 member switches regardless of whether the switches are EX4200 switches, EX4500 switches, or EX4550 switches. Any model of EX4200, EX4500, or EX4550 switch can be interconnected into the same mixed Virtual Chassis. The master election process that decides member switch roles in a mixed Virtual Chassis is identical to the master election process in a non-mixed Virtual Chassis, so any member switch in a mixed Virtual Chassis can assume the master, backup, or linecard role.

**Virtual Chassis Identifier (VCID)**

All members of a Virtual Chassis configuration share one Virtual Chassis identifier (VCID). This identifier is derived from internal parameters. When you are monitoring a Virtual Chassis configuration, the VCID is displayed in certain interface views and is also part of the `show virtual-chassis` output.

Understanding How the Master in an EX Series Virtual Chassis Is Elected

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See EX8200 Virtual Chassis Overview for information about EX8200 Virtual Chassis.

All switches that are interconnected in a Virtual Chassis configuration are member switches of that Virtual Chassis. Each Virtual Chassis configuration has one member that functions as the master and controls the Virtual Chassis configuration.

When a Virtual Chassis configuration boots, the Juniper Networks Junos operating system (Junos OS) on the switches automatically runs a master election algorithm to determine which member switch assumes the role of master.

The algorithm proceeds from the top condition downward until the stated condition is satisfied:

1. Choose the member with the highest user-configured mastership priority (255 is the highest possible value). A switch with a mastership priority of 0 will always stay in the linecard role.
2. Choose the member that was master the last time the Virtual Chassis configuration booted.
3. Choose the member that has been included in the Virtual Chassis configuration for the longest period of time. (For this to be a deciding factor, there has to be a minimum time lapse of 1 minute between the power-ons of the individual interconnected member switches.)
4. Choose the member with the lowest MAC address.

The variations among switches and switch models do not impact the master election algorithm.

To ensure that a specific member is elected as the master:

1. Power on only the switch that you want to configure as master of the Virtual Chassis configuration.
2. Configure the mastership priority of that member to have the highest possible value (255).
3. Continue to configure other members through the master member.
4. Power on the other members.

You can also specify the switch roles by preprovisioning your Virtual Chassis. Preprovisioning a Virtual Chassis allows you to manually assign the member ID and role for each switch in the Virtual Chassis. See Configuring an EX3300 Virtual Chassis (CLI Procedure) and Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure).
Understanding Software Upgrade in an EX Series Virtual Chassis

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Understanding Software Upgrades in an EX8200 Virtual Chassis for information about EX8200 Virtual Chassis.

In a Virtual Chassis, each member switch must be running the same version of Juniper Networks Junos operating system (Junos OS).

You can install a new Junos OS release on the entire Virtual Chassis or on a particular member in the Virtual Chassis by using the same CLI command that you use to install Junos OS on standalone switches—the `request system software add` command.

You can use the automatic software update feature to automatically update the Junos OS version on member switches as you add them to a Virtual Chassis. See “Understanding Automatic Software Update on EX Series Virtual Chassis Member Switches” on page 4479. If you are not configuring the automatic software update feature, we recommend that you update the new member switch to the version of Junos OS running on the Virtual Chassis before adding the member switch to the Virtual Chassis.

In any mixed Virtual Chassis, the member switches must be running the same version of Junos OS. You can upgrade all member switches simultaneously by specifying a path to multiple Junos OS images in the same `request system software add` command. Multiple Junos OS images are needed to upgrade a mixed Virtual Chassis because an EX4200 switch runs a different version of Junos OS than an EX4500 or EX4550 switch. See Installing Software on a Mixed Virtual Chassis with EX4200, EX4500, and EX4550 Switches (CLI Procedure).

NOTE: EX4500 and EX4550 switches run the same Junos OS image. You do not need to use multiple Junos OS images when updating a mixed EX4500 and EX4550 Virtual Chassis.

You can also use nonstop software upgrade (NSSU) to upgrade Junos OS on all members. NSSU provides an orderly upgrade of each member of the Virtual Chassis and takes advantage of graceful Routing Engine switchover, nonstop active routing, and link aggregation to minimize traffic disruption during the upgrade. For more information about NSSU, see Understanding Nonstop Software Upgrade on EX Series Switches.
Understanding Global Management of an EX Series Virtual Chassis

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Understanding Global Management of an EX8200 Virtual Chassis for information about EX8200 Virtual Chassis.

A Virtual Chassis is composed of multiple switches, and it, therefore, has multiple console ports and multiple out-of-band management Ethernet ports located on the switches.

You can connect a PC or laptop directly to a console port of any member switch to set up and configure the Virtual Chassis. When you connect to the console port of any member switch, the console session is redirected to the master switch, as shown in Figure 71 on page 4470.
Figure 71: Console Session Redirection (EX4200 Virtual Chassis Pictured)

If the master becomes unavailable, the console session is disconnected from the old master and a new session is established with the newly elected master.

An out-of-band management Ethernet port is often referred to simply as a management Ethernet port. It uses a dedicated management channel for device maintenance and allows a system administrator to monitor and manage the switch by remote control.

The Virtual Chassis configuration can be managed remotely through SSH or Telnet using a global management interface called the virtual management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member switches. When you connect to the Virtual Chassis configuration using the VME interface’s IP address, the connection is redirected to the master member as shown in Figure 72 on page 4471.
If the master management Ethernet link is unavailable, the session is redirected through the backup management Ethernet link. If there is no active management Ethernet link on the backup, the VME interface chooses a management Ethernet link on one of the linecard members, selecting the linecard member with the lowest member ID as its first choice.

You can configure an IP address for the VME global management interface at any time.

You can perform remote configuration and administration of all members of the Virtual Chassis configuration through the VME interface.

Understanding Nonvolatile Storage in an EX Series Virtual Chassis

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Understanding File Storage in an EX8200 Virtual Chassis for information about EX8200 Virtual Chassis.

The EX2200, EX3300, EX4200, EX4300, EX4500, and EX4550 switches store the Juniper Networks Junos operating system (Junos OS) system files in internal flash memory. In the Virtual Chassis configurations, both the master and the backup switch store the configuration information for all the member switches.

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Understanding Virtual Chassis Port Link Aggregation in an EX8200 Virtual Chassis for information about EX8200 Virtual Chassis.

You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a logical point-to-point link, known as a link aggregation group (LAG) or bundle. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by load-balancing traffic across all available links. If one of the links fails, the system automatically load-balances traffic across all remaining links.

Nonvolatile Memory Features

Junos OS optimizes the way the Virtual Chassis stores its configuration if a member switch or the Virtual Chassis configuration is shut down improperly:

- If the master is not available, the backup switch takes on the role of the master and its internal flash memory takes over as the alternate location for maintaining nonvolatile configuration memory.
- If a member switch is taken offline for repair, the master stores the configuration of the member switch.

Understanding EX Series Virtual Chassis Port Link Aggregation
Similarly, if a Virtual Chassis member switch that has LAG member interfaces on multiple member switches fails for any reason, the traffic traversing the LAG can be redirected through the active member switch. This setup has benefits for failover purposes and can be especially beneficial in cases when a member switch needs to be inactive for some time, such as during a software upgrade using NSSU.

You can configure any optical uplink port that can be used to connect EX2200, EX3300, EX4200, EX4300, EX4500, or EX4550 switches together into a Virtual Chassis port (VCP). You can configure multiple optical uplink interfaces between two member switches in the same Virtual Chassis as VCPs. If you have configured two or more optical ports as VCPs connecting the same member switches, the optical uplink ports configured as VCPs automatically form a LAG provided the optical uplink ports are configured to operate at the same link speeds. Each LAG is assigned a positive-integer identifier called a trunk ID.

On EX2200 and EX2200-C switches only, you can also configure the RJ-45 interfaces, including built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors and 1000BASE-T RJ-45 transceivers, into VCPs. On EX2200 and EX2200-C switches, a LAG that includes up to 8 interfaces configured as VCPs automatically forms. The LAG bundles includes all interfaces configured as VCPs, regardless of whether the interfaces are optical transceiver interfaces, RJ-45 transceiver interfaces, or built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors.

You can create an optical VCP LAG connecting any two member switches in any Virtual Chassis, including VCP LAG connections interconnecting different switch models in a mixed Virtual Chassis.

On an EX2200 switch only, you can also configure all RJ-45 interfaces, including built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors and 1000BASE-T RJ-45 transceivers, on EX2200 and EX2200-C switches, into VCPs. The RJ-45 interfaces also automatically form a LAG when configured into VCPs.

Table 555 on page 4473 provides the maximum member link limit for each optical VCP LAG.

A LAG over uplink VCPs provides higher overall bandwidth for forwarding traffic between the member switches connected by the optical VCPs, faster management communications, and greater redundancy of operations among the members than would be available without the LAG. A LAG over uplink VCPs provides an additional Virtual Chassis link throughput for the switches.

See “Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)” on page 4497 for information about configuring uplink ports as VCPs.

NOTE: The interfaces that are included within a bundle or LAG are sometimes referred to as member interfaces. Do not confuse this term with member switches, which refers to switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

Understanding EX Series Virtual Chassis Configuration

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Understanding EX8200 Virtual Chassis Components for information about EX8200 Virtual Chassis.

You configure and manage almost all aspects of an EX Series Virtual Chassis configuration through the master switch of the Virtual Chassis. However, you can also configure Virtual Chassis parameters when a switch is a standalone switch not interconnected with other members.

EX Series switches that support Virtual Chassis have some innate characteristics of a Virtual Chassis by default. A standalone switch is assigned member ID 0 and is the master of itself. Therefore, you can edit its Virtual Chassis configuration. When the standalone switch is interconnected with an existing Virtual Chassis configuration, the Virtual Chassis configuration statements and any uplink Virtual Chassis port (VCP) settings that you previously specified on the standalone switch remain part of its configuration.

A switch is not recognized by the Virtual Chassis as a member switch until it is interconnected with the master or interconnected with an existing member of the Virtual Chassis.

EX2200, EX3300, and EX4300 switches do not have dedicated VCPs. These switches form a Virtual Chassis by configuring optical ports connecting the member switches into VCPs. You can expand the uplink connections on these switches over long distances to connect switches at different locations into the same Virtual Chassis.

NOTE: Uplink ports 2 and 3 on any EX3300 switch are configured, by default, as VCPs. You can change this default configuration or configure another uplink port as a VCP on an EX3300 switch.

QSFP+ ports on an EX4300 switch are also configured, by default, as VCPs.

On all other EX Series switches, the optical ports are not configured as VCPs by default.

When an EX4200, EX4500, or EX4550 switch is located too far away to be interconnected through dedicated VCPs, you can configure an optical port as a VCP.

A link aggregation group (LAG) will be formed automatically when the new switch is added to the configuration if more than one such link with the same speed is detected between optical VCPs on the new member and an existing member. See “Understanding EX Series Virtual Chassis Port Link Aggregation” on page 4472.

When an optical port is set as a VCP, it cannot be used for any other purpose. If you want to use the optical port for another purpose, you must delete the VCP setting. You can
execute this command directly on the member whose uplink VCP setting you want to delete or through the master of the Virtual Chassis configuration.

**CAUTION:** Deleting a VCP in a Virtual Chassis configuration can cause the Virtual Chassis configuration to split. For more information, see “Understanding Split and Merge in an EX Series Virtual Chassis” on page 4476.

You can create a preprovisioned configuration. This type of configuration allows you to deterministically control the member ID and role assigned to a member switch by associating the switch with its serial number. For an example of a preprovisioned configuration, see *Example: Configuring an EX4200 Virtual Chassis Using a Preprovisioned Configuration File*.

**NOTE:** If a switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID as the slot element of the interface name.

The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. To include the FPC in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

**Understanding Split and Merge in an EX Series Virtual Chassis**

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis.

In a Virtual Chassis, two or more switches are connected together to form a unit that is managed as a single chassis. If there is a disruption to the Virtual Chassis configuration due to member switches failing or being removed from the configuration, the Virtual Chassis configuration splits into two separate Virtual Chassis. This situation could cause disruptions in the network if the two separate configurations share common resources, such as global IP addresses. The split and merge feature provides a method to prevent
the separate Virtual Chassis configurations from adversely affecting the network and also allows the two parts to merge back into a single Virtual Chassis configuration.

**NOTE:** If a Virtual Chassis configuration splits into separate parts, we recommend that you resolve the problem that caused the Virtual Chassis configuration to split as soon as possible.

You can also use this feature to merge two active but separate Virtual Chassis that have not previously been part of the same configuration into one Virtual Chassis configuration.

**NOTE:** The split and merge feature is enabled by default on EX Series switches. You can disable the split and merge feature by using the `set virtual-chassis no-split-detection` command.

This topic describes:

- **What Happens When a Virtual Chassis Configuration Splits** on page 4477
- **Merging Virtual Chassis Configurations** on page 4478

**What Happens When a Virtual Chassis Configuration Splits**

When a Virtual Chassis configuration splits into two separate Virtual Chassis configurations, the individual member switches detect this topology change and run the master election algorithm to select a new master for each of the two Virtual Chassis configurations. The new masters then determine whether their Virtual Chassis configuration remains active. One of the configurations remains active based on the following:

- It contains both the stable master and the stable backup (that is, the master and backup from the original Virtual Chassis configuration before the split).
- It contains the stable master and the configuration is greater than half the Virtual Chassis size.
- It contains the stable backup and is at least half the Virtual Chassis size.

In accordance with the rules given in the second and third list items, if the Virtual Chassis configuration splits into two equal parts and the stable master and stable backup are in different parts, then the part that contains the stable backup becomes active.

**NOTE:** The number of members in the Virtual Chassis configuration includes all member switches connected to date minus the number whose Virtual Chassis member IDs have been recycled (that is, made available for reassignment). Therefore, the size of the Virtual Chassis configuration increases when a new member switch is detected and decreases when a member switch’s ID is recycled.
These rules ensure that only one of the two separate Virtual Chassis configurations created by the split remains active. The member switches in the inactive Virtual Chassis configuration remain in a linecard role. For the inactive members to become active again, one of the following things must happen:

- The problem that caused the original Virtual Chassis configuration to split is resolved, allowing the two Virtual Chassis configurations to merge.
- You load the factory default configuration on the inactive members, which causes the inactive members to function as standalone switches or become part of a different Virtual Chassis configuration.

**NOTE:** When you remove a member switch from a Virtual Chassis configuration, we recommend that you recycle the member ID using the request virtual-chassis recycle command.

### Merging Virtual Chassis Configurations

There are two scenarios in which separate Virtual Chassis merge:

- A Virtual Chassis configuration that had split into two is now merging back into a single configuration because the problem that had caused it to split has been resolved.
- You want to merge two Virtual Chassis that had not previously been configured together.

Every Virtual Chassis configuration has a unique ID (VCID) that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a VCID using the set virtual-chassis id command. A VCID that you assign takes precedence over automatically assigned VCIDs.

When you reconnect the separate Virtual Chassis configurations or connect them for the first time, the members determine whether or not the separate Virtual Chassis configurations can merge. The members use the following rules to determine whether a merge is possible:

- If the Virtual Chassis configurations have the same VCID, then the configurations can merge. If the two Virtual Chassis were formed as the result of a split, they have the same VCID.
- If the VCIDs are different, then the two configurations can merge only if both are active (inactive configurations cannot merge, ensuring that members removed from one Virtual Chassis configuration do not become members of another Virtual Chassis configuration). If the configurations to merge are both active and one of them has a user-configured VCID, this ID becomes the ID of the merged Virtual Chassis. If neither Virtual Chassis has a user-configured VCID, then the VCID of the configuration with the highest mastership priority becomes the ID of the merged Virtual Chassis. The resulting merged Virtual Chassis configuration is active.

When you connect two Virtual Chassis configurations, the following events occur:
1. Connecting the two split Virtual Chassis configurations triggers the shortest-path-first (SPF) algorithm. The SPF algorithm computes the network topology and then triggers the master election algorithm. The master election algorithm waits for the members to synchronize the topology information before running.

2. The master election algorithm merges the VCIDs of all the members.

3. Each member runs the master election algorithm to select a master and a backup from among all members with the same VCIDs. For more information, see “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467.

4. The master determines whether the Virtual Chassis configuration is active or inactive. (See “What Happens When a Virtual Chassis Configuration Splits” on page 4477.)

5. If the Virtual Chassis configuration is active, the master assigns roles to all members. If the Virtual Chassis configuration is inactive, the master assigns all members the role of linecard.

6. When the other members receive their role from the master, they change their role to backup or linecard. They also use the active or inactive state information sent by the master to set their own state to active or inactive and to construct the Virtual Chassis member list from the information sent by the master.

7. If the Virtual Chassis state is active, the master waits for messages from the members indicating that they have changed their roles to the assigned roles, and then the master changes its own role to master.

**NOTE:** When you merge two Virtual Chassis that had not previously been part of the same Virtual Chassis configuration, any configuration settings (such as the settings for Telnet and FTP services, graceful Routing Engine switchover (GRES), fast failover, VLANs, and so on) that exist on the new master become the configuration settings for all members of the new Virtual Chassis, overwriting any other configuration settings.

**Understanding Automatic Software Update on EX Series Virtual Chassis Member Switches**

You can use the automatic software update feature to automatically update the Juniper Networks Junos operating system (Junos OS) version on prospective member switches as you add them to an EX Series Virtual Chassis.
This topic includes:

- Automatic Software Update Basics on page 4480
- Automatic Software Update Restrictions on page 4480

**Automatic Software Update Basics**

When you have configured automatic software update on a Virtual Chassis, the Junos OS version is updated on the new member switch when you add it to the Virtual Chassis. The new member switch immediately joins the Virtual Chassis configuration and is put in the active state.

For a standalone switch to join an existing Virtual Chassis, it must be running the same version of Junos OS that is running on the Virtual Chassis master. When the master in a Virtual Chassis detects that a new switch has been added to the configuration, it checks the software version on the new switch. If the software version on the new switch is not the same as the version running on the master, the master keeps the new switch in the inactive state. If you have not enabled the automatic software update feature, you have to manually install the correct software version on each prospective member switch as it is added to the Virtual Chassis.

**Automatic Software Update Restrictions**

You cannot use automatic software update in certain scenarios, and you must ensure that the software release version on the Virtual Chassis is supported by the release on the prospective member switch.

You cannot use the automatic software update feature to update software for a prospective member switch in the following scenarios:

- The Virtual Chassis was preprovisioned and is running Junos OS Release 10.4R2 or earlier.
- You configured the `mastership-priority` command to manually configure the mastership priority of at least one Virtual Chassis member switch and the Virtual Chassis was running Junos OS Release 10.4R2 or earlier when you committed this configuration.
- The Junos OS versions on the Virtual Chassis and the prospective member switch are different versions of the same major Junos OS release. For instance, if a Virtual Chassis is running Junos OS Release 10.4R1, the prospective member switch cannot be updated using automatic software update if it is running Junos OS Release 10.4R2, 10.4R3, or any other Junos OS Release 10.4 release version.

The automatic software update feature also has a Junos OS release dependency between the release that is already running on the Virtual Chassis and the release that is running on the prospective member switch.

Table 556 on page 4481 summarizes automatic software update support for each Junos OS release combination.

Understanding MAC Address Assignment on a Virtual Chassis

In a Virtual Chassis, multiple Juniper Networks EX Series Ethernet Switches—each with its own set of interfaces with unique MAC addresses—are connected together to form one chassis that can be managed as a single switch. The MAC address assigned to each network-facing interface on the switch changes when the switch joins a Virtual Chassis. Because all Layer 2 traffic decisions are based on an interface's MAC address, understanding MAC address assignment is important to understanding how network traffic is forwarded and received by the Virtual Chassis. For additional information about how a network uses MAC addresses to forward and receive traffic, see “Understanding Bridging and VLANs on EX Series Switches” on page 2049.

When a Virtual Chassis is formed, the MAC address of the switch in the master role becomes the system MAC base address. The Virtual Chassis assigns the system MAC base address as the MAC address for all Layer 3 interfaces within the Virtual Chassis. The Virtual Chassis also assigns the system MAC base address to the virtual management Ethernet (VME) interface and to all of the virtual LANs (VLANs) in the Virtual Chassis.

The system MAC base address does not change in the event of a switchover if the switch that was originally configured in the master role remains a member of the Virtual Chassis. If the switch that was originally configured in the master role is removed from the Virtual Chassis, the MAC address of the current member switch in the master role is assigned as the system MAC base address after the MAC persistence timer interval has expired. You can configure the MAC persistence timer interval.

For Layer 2 and aggregated Ethernet interfaces, the Virtual Chassis assigns a unique MAC address that is derived from the member switch MAC address to each interface. The assignment of a unique MAC address to each network interface helps ensure that functions that require MAC address differentiation—such as redundant trunk groups (RTGs), Link Aggregation Control Protocol (LACP), and general monitoring functions—can function properly.
NOTE: Unique MAC address assignment for Layer 2 and aggregated Ethernet interfaces in a Virtual Chassis was introduced in Junos OS Release 11.3. The same MAC address could be assigned to interfaces on different member switches in the same Virtual Chassis prior to this release.

If you reconfigure a Layer 2 interface into a Layer 3 interface, or the reverse, within a Virtual Chassis, the MAC address of that interface changes accordingly.

MAC addresses are assigned to interfaces in a Virtual Chassis automatically—no user configuration is possible or required. You can view the MAC addresses that are assigned to the interfaces by using the `show interfaces` command.

### Understanding High Availability on an EX Series Virtual Chassis

You increase your network's high availability (HA) when you interconnect a Juniper Networks EX Series Ethernet switch into a Virtual Chassis. A Virtual Chassis is more fault tolerant than a standalone EX series switch because it remains up when a single member switch fails.

You can further improve HA by configuring the HA features available for your EX Series Virtual Chassis. You can, for instance, configure Link Aggregation Groups (LAG) bundles to include member links on multiple member switches in the same Virtual Chassis. This configuration increases fault tolerance because traffic traversing the LAG can be redirected to an active member switch when a single member switch fails.

A Virtual Chassis has dual Routing Engines—the switch in the master role and the switch in the backup role—and therefore supports many HA features not supported on standalone EX Series switches. For a complete list of High Availability features available for your EX Series Virtual Chassis, see “EX Series Virtual Chassis Software Features Overview” on page 75.

Many HA features for the EX Series Virtual Chassis are designed to improve network resiliency after a Routing Engine switchover. Table 557 on page 4484 describes the effects of a Routing Engine switchover when no high availability features are enabled and when some High Availability features are enabled.
Table 557: Effects of a Routing Engine Switchover

<table>
<thead>
<tr>
<th>High Availability Feature</th>
<th>Effect of Routing Engine Switchover</th>
</tr>

Configuring an EX4300 Virtual Chassis (CLI Procedure)

In an EX4300 Virtual Chassis, you interconnect the EX4300 switches by using uplink ports configured as Virtual Chassis ports (VCPs). The QSFP+ uplink ports, which support 40Gbps speeds and can connect switches that are up to 492 feet (150 m) apart, are configured as VCPs by default. The SFP+ uplink ports, which support 10Gbps speeds and can connect switches that are up to 6.2 miles (10 km) apart, can be configured into VCPs.

The simplest way to interconnect EX4300 switches into a Virtual Chassis is to install the switches within 492 feet of one another and interconnect them into a Virtual Chassis by using the QSFP+ ports.
If the member switches must be installed in locations that are more than 492 feet apart—such as at a different site or at a distant location within the same site—or if you are using the QSFP+ ports for another purpose, you must configure the SFP+ uplink module ports into VCPs. If you need additional VCP bandwidth between two member switches, you can configure additional ports as VCPs between the member switches. The ports that have identical speeds become links in a link aggregation group (LAG) to provide resiliency to the Virtual Chassis; for instance, if you had two QSFP+ ports and two SFP+ ports configured as VCPs connecting to the same switch, you would have two LAGs—one LAG with two 40Gbps QSFP+ port member links and another with two 10Gbps SFP+ port member links—between the member switches.

NOTE: A Virtual Chassis configuration has two Routing Engines—the master switch and the backup switch. Therefore, we recommend that you always use commit synchronize rather than simply commit to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved on both Routing Engines.

An EX4300 Virtual Chassis can be configured with either:

- A nonprovisioned configuration—The master sequentially assigns a member ID to other member switches. The role is determined by the mastership priority value and other factors in the master election algorithm.
- A preprovisioned configuration—You can deterministically control the member ID and role assigned to a member switch by tying the member switch to its serial number.

NOTE: You must configure a VLAN on all interfaces in an EX4300 Virtual Chassis, with the exception of the interfaces on member switch 0, before the interfaces can send or receive traffic. The interfaces on member switch 0 are initially placed into the default VLAN; the interfaces on all other member switches are not placed into any VLAN. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

NOTE: On an EX4300 Virtual Chassis, STP is disabled on all interfaces except the interfaces on member switch 0 until a type of STP is enabled. See Configuring STP (CLI Procedure) to enable STP on the interfaces in your EX4300 Virtual Chassis.

This topic includes:

- Configuring an EX4300 Virtual Chassis with a Nonprovisioned Configuration File on page 4487
- Configuring an EX4300 Virtual Chassis with a Preprovisioned Configuration File on page 4488
Configuring an EX4300 Virtual Chassis with a Nonprovisioned Configuration File

You can use a nonprovisioned configuration to configure an EX4300 Virtual Chassis.

To configure the Virtual Chassis using a nonprovisioned configuration:

NOTE: We recommend that you physically cable the optical ports as the final step of this procedure.

You can, however, configure an EX4300 Virtual Chassis while the cables are physically connected.

1. Power on only the switch that you will use as the master switch.

2. Run the EZSetup program on the master switch, specifying the identification parameters. See Connecting and Configuring an EX Series Switch (CLI Procedure) for details.

NOTE: The properties that you specify for the master switch apply to the entire Virtual Chassis configuration.

3. (Optional) Configure the master switch with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis:

   [edit]
   user@switch# set interfaces vme unit 0 family inet address /ip-address/mask/

4. (Optional) Configure mastership priority for the other member switches.

   [edit virtual-chassis]
   user@switch# set member 0 mastership-priority 255
   user@switch# set member 1 mastership-priority 255
   user@switch# set member 2 mastership-priority 10
   user@switch# set member 3 mastership-priority 9
   user@switch# set member 4 mastership-priority 8
   user@switch# set member 5 mastership-priority 7
   user@switch# set member 6 mastership-priority 6
   user@switch# set member 7 mastership-priority 5
   user@switch# set member 8 mastership-priority 4
   user@switch# set member 9 mastership-priority 3

The mastership priority value determines the roles in a non-provisioned Virtual Chassis configuration. The switches with the highest mastership priority values assume the master and backup roles. All other switches assume the linecard role.

If you do not configure the mastership priority for any switch in your Virtual Chassis, including when you do not configure the Virtual Chassis, all switches assume the default mastership priority of 128. The master election algorithm selects the roles for the member switches. In most cases, the switches that have been powered on the longest assume the master and backup roles when all Virtual Chassis member switches are configured with the same mastership priority. See "Understanding How the Master in an EX Series Virtual Chassis Is Elected" on page 4467 for additional information on the master election algorithm.
A switch with a mastership priority of 0 never assumes the master or backup role.

**NOTE:** We recommend that you specify the same mastership priority value for the intended master and backup members.

5. (Optional. Recommended for a two-member Virtual Chassis) On the master switch, disable the split and merge feature:

```
[edit virtual-chassis]
user@switch# set no-split-detection
```

6. Power on the other member switches.

7. On each individual member switch, configure the SFP+ optical ports that will be used to interconnect the EX4300 member switches into VCPs.

**NOTE:** Because QSFP+ ports are configured into VCPs by default, you do not usually have to perform this step when you are using a QSFP+ port as a VCP.

You only need to configure a QSFP+ port as a VCP if you previously configured the QSFP+ port into a network port. If you previously configured the QSFP+ port into a network port, perform this step to configure the QSFP+ port into a VCP.

```
user@switch-0> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-0> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-1> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-1> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-2> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-2> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-3> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-3> request virtual-chassis vc-port set pic-slot 1 port 1
```

**NOTE:** If you want to change the member ID that the master has assigned to a member switch, use the `request virtual-chassis renumber` command.

### Configuring an EX4300 Virtual Chassis with a Preprovisioned Configuration File

Preprovisioning a Virtual Chassis configuration allows you to assign the member ID and role for each switch in the Virtual Chassis.

To configure a Virtual Chassis using a preprovisioned configuration:

**NOTE:** We recommend that you physically cable the optical ports as the final step of this procedure.

You can, however, configure an EX4300 Virtual Chassis while the cables are physically connected.
1. Make a list of the serial numbers of all the switches to be connected in a Virtual Chassis configuration.

2. Note the intended role (routing-engine or line-card) of each switch. If you configure the member with a routing-engine role, it is eligible to function in the master or backup role. If you configure the member with a line-card role, it is not eligible to function in the master or backup role.

3. Power on only the switch that you plan to use as the master switch.

4. Run the EZSetup program on the master switch, specifying the identification parameters. See Connecting and Configuring an EX Series Switch (CLI Procedure) for details.

   **NOTE:** The properties that you specify for the master switch apply to the entire Virtual Chassis configuration.

5. (Optional) Configure the master switch with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis:

   ```
   [edit]
   user@switch# set interfaces vme unit 0 family inet address /ip-address/mask/
   ```

6. Specify the preprovisioned configuration mode:

   ```
   [edit virtual-chassis]
   user@switch# set preprovisioned
   ```

7. Specify all the members that you want included in the Virtual Chassis, listing each switch’s serial number with the desired member ID and role.

   **NOTE:** You can retrieve the switch’s serial number using the show chassis hardware command output or by viewing the serial number ID label on the switch. See Locating the Serial Number on an EX4300 Switch or Component.

   ```
   [edit virtual-chassis]
   user@switch# set member 0 serial-number abc123 role routing-engine
   user@switch# set member 1 serial-number def456 role routing-engine
   user@switch# set member 2 serial-number ghi789 role line-card
   user@switch# set member 3 serial-number jkl012 role line-card
   user@switch# set member 4 serial-number mn013 role line-card
   user@switch# set member 5 serial-number pqr014 role line-card
   user@switch# set member 6 serial-number stu015 role line-card
   user@switch# set member 7 serial-number vwx016 role line-card
   user@switch# set member 8 serial-number yzz017 role line-card
   user@switch# set member 9 serial-number aaa018 role line-card
   ```

8. (Optional. Recommended for a two-member Virtual Chassis) Disable the split and merge feature:

   ```
   [edit virtual-chassis]
   user@switch# set no-split-detection
   ```
9. Power on the other member switches. The member IDs and roles have been determined by the configuration, so you can power on the member switches in any order.

10. On each individual member switch, configure the SFP+ optical ports that will be used to interconnect the EX4300 member switches into VCPs.

   **NOTE:** You can also use the `request virtual-chassis vc-port` command to configure a QSFP+ port into a VCP.

   Because QSFP+ ports are configured into VCPs by default, you do not usually have to perform this step when you are using a QSFP+ port as a VCP.

   You only need to configure a QSFP+ port as a VCP if you previously configured the QSFP+ port into a network port. If you previously configured the QSFP+ port into a network port, perform this step to configure the QSFP+ port into a VCP.

   ```
   user@switch-0> request virtual-chassis vc-port set pic-slot1port0
   user@switch-0> request virtual-chassis vc-port set pic-slot1port1
   user@switch-1> request virtual-chassis vc-port set pic-slot1port0
   user@switch-1> request virtual-chassis vc-port set pic-slot1port1
   user@switch-2> request virtual-chassis vc-port set pic-slot1port0
   user@switch-2> request virtual-chassis vc-port set pic-slot1port1
   user@switch-3> request virtual-chassis vc-port set pic-slot1port0
   user@switch-3> request virtual-chassis vc-port set pic-slot1port1
   ```

   **NOTE:** You cannot modify the mastership priority when you are using a pre provisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two Routing Engines are assigned the same mastership priority value. However, the member that was powered on first has higher prioritization according to the master election algorithm. See “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467.

   Related Documentation

   - Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis on page 4537

Adding a New Switch to an Existing EX4300 Virtual Chassis (CLI Procedure)

You can use this procedure to add an EX4300 switch to an EX4300 Virtual Chassis.

Before you begin, be sure you have:

- Mounted the new switch in a rack.
- Confirmed that the new switch is powered off.
• If you are expanding a preprovisioned configuration, made a note of the serial number (the number is on the back of the switch). You will need to edit the Virtual Chassis configuration to include the serial number of the new member switch.

• If you are expanding a preprovisioned configuration, edit the existing Virtual Chassis configuration to include the serial number of the new member switch. The parameters specified in the master Virtual Chassis configuration file are applied to the new switch after it has been interconnected to an existing member switch.

NOTE: If you are expanding a preprovisioned Virtual Chassis configuration, you can use the autoprovisioning feature to add member switches to that configuration.

• (Optional) Configured Ethernet interfaces on different member switches into the same LAG. See Example: Configuring Aggregated Ethernet High-Speed Uplinks Between an EX4200 Virtual Chassis Access Switch and an EX4200 Virtual Chassis Distribution Switch.

An active member switch might temporarily go down before coming back up as part of this procedure. Having traffic load-balanced across member switches using a LAG helps alleviate traffic loss during this procedure.

To add a new member switch to an existing Virtual Chassis configuration:

1. If the new member switch has been previously configured, revert that switch's configuration to the factory defaults before interconnecting it into the Virtual Chassis. See “Reverting to the Default Factory Configuration for the EX Series Switch” on page 504.

2. Interconnect the unpowered new switch to one member of the existing Virtual Chassis configuration using a QSFP+ or SFP+ port.

   Connect only one VCP on the unpowered new switch to a VCP on a member switch in the existing Virtual Chassis at this point of the procedure.

3. Power on the new switch.

4. (SFP+ interface only) Set the SFP+ interface as a Virtual Chassis Port (VCP):

   ```
   user@switch> request virtual-chassis vc-port set pic-slot1 port port-number
   ```

   NOTE: QSFP+ ports are configured as VCPs, by default. You do not, therefore, typically need to perform this step on QSFP+ ports.

   You can use the `request virtual-chassis vc-port` to set a QSFP+ port as a VCP if the QSFP+ port had previously been configured as a network port.

5. Confirm that the new member switch is now included within the Virtual Chassis configuration by entering the `show virtual-chassis` command. The new member switch should be listed in the output and the Status is Prsnt.

6. Cable the next port into the Virtual Chassis, using Steps 2 through 5.
CAUTION: If you immediately cable both VCPs on the new switch into the existing Virtual Chassis at the same time, a member switch that was already part of the Virtual Chassis might become nonoperational for several seconds. Network traffic to this switch is dropped during the downtime.

The member switch will return to the normal operational state with no user intervention, and normal operation of the Virtual Chassis will resume after this downtime.

Related Documentation
- Configuring an EX4300 Virtual Chassis (CLI Procedure) on page 4485

Replacing a Member Switch of an EX Series Virtual Chassis Configuration (CLI Procedure)

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Adding or Replacing a Member Switch or an External Routing Engine in an EX8200 Virtual Chassis (CLI Procedure) for information about EX8200 Virtual Chassis.

You can replace a member EX2200, EX3300, EX4200, EX4300, EX4500, or EX4550 switch in a Virtual Chassis without disrupting network service on the other members. You can retain the existing configuration of the member switch and apply it to a new member switch, or you can free up the member ID and make it available for assignment to a new member switch.

If you want to replace a member switch of a mixed Virtual Chassis that contains EX4200, EX4500, or EX4550 switches, see Removing an EX4200, EX4500, or EX4550 Switch From a Mixed Virtual Chassis (CLI Procedure).

To replace a member switch, use the procedure that matches what you need to accomplish:

- Remove, Repair, and Reinstall the Same Switch on page 4493
- Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration on page 4493
- Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch on page 4494
Remove, Repair, and Reinstall the Same Switch

If you need to repair a member switch, you can remove it from the Virtual Chassis configuration without disrupting network service for the other members. The master stores the configuration for the member ID so that it can be reapplied when the member switch (with the same base MAC address) is reconnected.

To remove, repair, and reinstall the member switch:

1. Power off and disconnect the member switch to be repaired.
2. Repair, as necessary.
3. Reconnect the switch and power it on.

Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration

If you are unable to repair a member switch, you can replace it with a different member switch while retaining the previous configuration. The master stores the configuration of the member that was removed. When you connect a different member switch, the master assigns a new member ID. But the old configuration is still stored under the previous member ID of the previous member switch.

NOTE: If you have used a preprovisioned configuration, you can use the replace command to change the serial number in the Virtual Chassis configuration file. Substitute the serial number of the replacement member switch (on the back of the switch) for the serial number of the member switch that was removed.

To remove and replace a switch and reapply the old configuration:

1. Power off and disconnect the member switch to be replaced.
2. If the replacement member switch has been previously configured, revert that switch’s configuration to the factory defaults. See “Reverting to the Default Factory Configuration for the EX Series Switch” on page 504.
3. If you are interconnecting a switch using a dedicated VCP, connect one VCP on the replacement member switch to a VCP of another Virtual Chassis member switch.

   If you are interconnecting a switch using an optical port configured as a VCP, cable the optical ports together then configure the port on the Virtual Chassis as a VCP:

   ```
   user@switch> request virtual-chassis vc-port set pic-slot1 port port-number
   ```

4. Power on the new member switch.
5. Confirm that the new member switch is now included in the Virtual Chassis configuration by checking the front-panel LCD or the for the member ID. It should display a member ID in the range from 0 through 9.
If you are using a switch that does not have an LCD interface, confirm the switch is part of the Virtual Chassis configuration by entering the `show virtual-chassis` and reviewing the output.

6. Cable the other VCP on the new member switch into the Virtual Chassis. Use the instruction in step 3 to complete this step.

   CAUTION: If you immediately cable both VCPs on the new switch into the existing Virtual Chassis at the same time, a member switch that was already part of the Virtual Chassis might become nonoperational for several seconds. Network traffic to this switch is dropped during the downtime.

   The member switch will return to the normal operational state with no user intervention, and normal operation of the Virtual Chassis will resume after this downtime.

7. On the master switch, issue the `request virtual-chassis renumber` command from the Virtual Chassis master to change the member switch’s current member ID to the member ID of the member switch that was removed from the Virtual Chassis configuration.

Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch

When you remove a member switch from the Virtual Chassis configuration, the master keeps that member switch’s member ID in reserve. To make that member switch’s member ID available for reassignment, issue the `request virtual-chassis recycle` command from the Virtual Chassis master.

   NOTE: When you add or delete members in a Virtual Chassis configuration, internal routing changes might cause temporary traffic loss for a few seconds.

Configuring Mastership of an EX Series Virtual Chassis (CLI Procedure)

NOTE: This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See Configuring an EX8200 Virtual Chassis (CLI Procedure) for information about EX8200 Virtual Chassis.

You can designate the role (master, backup, or linecard) that a member switch performs within any Virtual Chassis, whether or not you are using a preprovisioned configuration.

NOTE: A Virtual Chassis configuration has two Routing Engines—one is the switch in the master role and the other is the switch in the backup role. Therefore, we recommend that you always use commit synchronize rather than commit to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

This topic describes:

- Configuring Mastership Using a Preprovisioned Configuration File on page 4495
- Configuring Mastership Using a Configuration File That Is Not Preprovisioned on page 4496

Configuring Mastership Using a Preprovisioned Configuration File

To configure mastership using a preprovisioned configuration:

1. Note the serial numbers of the switches that you want to function in the master role and backup role.

2. Power on only the switch that you want to function in the master role.

3. Edit the configuration to specify the preprovisioned configuration mode:

   ```
   [edit virtual-chassis]
   user@switch# set preprovisioned
   ```

4. Specify the serial numbers of the member switches that you want to function as master and backup, specifying their role as routing-engine:

   ```
   [edit]
   user@switch# set virtual-chassis member 0 serial-number abc123 role routing-engine
   user@switch# set virtual-chassis member 1 serial-number def456 role routing-engine
   ```
You cannot directly modify the mastership priority value when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two members assigned the routing-engine role are assigned the same mastership priority value (128). However, the member that was powered on first has higher priority for the master role election according to the master election algorithm. See “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467. Only two members can be configured with the routing-engine role.

5. Specify the serial numbers of any other member switches that you are including in the Virtual Chassis configuration. You can also explicitly configure their role as line-card.

Configuring Mastership Using a Configuration File That Is Not Preprovisioned

To configure mastership of the Virtual Chassis through a configuration that is not preprovisioned:

1. Power on only the switch that you want to function in the master role.

2. Configure the highest possible mastership priority value (255) for the member that you want to function in the master role:

   [edit virtual-chassis]
   user@switch# set member 0 mastership-priority 255

3. Configure the same mastership priority value (continue to edit the Virtual Chassis configuration on the master) for the member that you want to be in the backup role:

   [edit virtual-chassis]
   user@switch# set member 1 mastership-priority 255

   NOTE: We recommend that the master and backup have the same mastership priority value to prevent the master and backup status from switching back and forth between master and backup members in failover conditions.

4. Use the default mastership priority value (128) for the remaining member switches or configure the mastership priority to a value that is lower than the value specified for members functioning in the master and backup roles.

Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)

The procedure described in this topic can be used to connect two EX series switches together within the same Virtual Chassis.

You typically configure an uplink port as a Virtual Chassis Port (VCP) for one of the following reasons:

• You want to interconnect two EX series switches into a Virtual Chassis that are located in different wiring closets or sites, and the switches are farther apart then the maximum length of the dedicated VCP cable.
• You are configuring an EX Series Virtual Chassis composed of switches that support Virtual Chassis but do not have dedicated VCPs. EX2200, EX3300, and EX4300 switches support Virtual Chassis but do not have dedicated VCPs.

You must manually configure VCPs to connect EX2200 switches together to form an EX2200 Virtual Chassis. See Setting a Port on an EX2200 Switch as a Virtual Chassis Port (CLI Procedure).

This procedure is usually not needed to configure an EX3300 Virtual Chassis. Uplink ports 2 and 3 on an EX3300 switch are configured as VCPs by default and, therefore, do not require user configuration to be set as VCPs. We recommend that you use this procedure to configure an uplink port on an EX3300 switch as a VCP only if you configured ports 2 and 3 as network uplink ports and the ports need to be reconfigured as VCPs, or when ports 2 and 3 cannot be used as VCPs for an unexpected reason. You can use this procedure to configure any uplink port on an EX3300 switch as a VCP.

QSFP+ ports on EX4300 switches are configured as VCPs, by default. You must use this procedure if you want to configure an SFP+ port on an EX4300 switch as a VCP, or if you want to configure a QSFP+ port that had been configured into a network port back into a VCP.

You can interconnect EX4200, EX4500, and EX4550 switches that are beyond the reach of the dedicated Virtual Chassis cables as members of a Virtual Chassis by using the uplink ports—including the ports on the SFP uplink module, SFP+ uplink module, or XFP uplink module—and connecting the uplink ports. To use the uplink ports or SFP network ports for interconnecting member switches, you must explicitly set the uplink ports as VCPs.

NOTE: You cannot set a 1000BASE-T copper SFP transceiver (EX-SFP-1GE-T) connection as a VCP on EX4200, EX4500, and EX4550 switches.
NOTE: When an uplink port is set as a VCP, it cannot be used for any other purpose. You can set one port as a VCP and configure the other port in trunk mode as an uplink to another switch.

Before you set an uplink port as a VCP:

1. Install the uplink module in the member switches that you want to interconnect, if you are configuring an uplink module port as a VCP.

2. Power on and connect to the switch that you plan to designate as the master of the Virtual Chassis.

NOTE: Do not power on the other switches at this point.

3. Run EZSetup on the switch that you are configuring to be the master. Follow the prompts to specify the hostname and other identification, time zone, and network properties. See Connecting and Configuring an EX Series Switch (CLI Procedure) for details. The properties that you specify for the master apply to the entire Virtual Chassis, including all the member switches that you later interconnect with the master.

4. If you want to configure and manage the Virtual Chassis remotely, specify the VME global management interface. You can configure the VME global management interface when you are setting up the master or you can do it after completing the other configuration steps for the Virtual Chassis. See Configuring the Virtual Management Ethernet Interface for Global Management of an EX Series Virtual Chassis (CLI Procedure).

5. Configure mastership of the Virtual Chassis by using either the nonprovisioned or preprovisioned configuration. See "Configuring Mastership of an EX Series Virtual Chassis (CLI Procedure)" on page 4495 for details.

NOTE: A Virtual Chassis has two Routing Engines, one in the master and the other in the backup. Therefore, we recommend that you always use commit synchronize rather than simply commit to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

Before you begin to interconnect a Virtual Chassis across long distances, such as between wiring closets:

- Prepare the existing Virtual Chassis for interconnecting with a potential member switch that is beyond the reach of a dedicated Virtual Chassis cable by setting at least one uplink VCP on an existing member of the Virtual Chassis.

- Prepare the potential member switch for interconnecting with the existing Virtual Chassis by setting at least one uplink VCP on the standalone switch.
NOTE: We recommend that you set two uplink VCPs within each wiring closet for redundancy.

This topic describes:
1. Setting an Uplink VCP Between the Member Switches on page 4499
2. Setting an Uplink VCP on a Standalone Switch on page 4499

Setting an Uplink VCP Between the Member Switches

You can set an uplink port as a VCP.

NOTE: If you use the SFP+ uplink module, you must configure all member switches to support either 1-gigabit SFP transceivers or 10-gigabit SFP+ transceivers on EX4200 switches. See Setting the Mode on an SFP+ or SFP+ MACsec Uplink Module (CLI Procedure).

To set the uplink ports for the local member switch (for example, member 0) and for a different member switch (for example, member 1) to function as VCPs:

1. Set one uplink port of member 0 as a VCP. You do not need to specify the member-member-id option, because the command applies by default on the member where it is executed.
   
   ```
   user@switch> request virtual-chassis vc-port set pic-slot 1 port 0
   ```

2. Set one uplink port of member 1 as a VCP.
   
   ```
   user@switch> request virtual-chassis vc-port set pic-slot 1 port 0 member 1
   ```
   
   This step includes the member-member-id option, because it is executed on a different member switch than the local member switch.

Setting an Uplink VCP on a Standalone Switch

You can set an uplink VCP on a standalone switch. You must set an uplink port on the standalone switch as a VCP prior to physically interconnecting the switch with the existing Virtual Chassis. Otherwise, the master cannot detect that the switch is a member of the Virtual Chassis.

To set one uplink VCP on the potential member, which is currently operating as a standalone switch:

1. Power on the standalone switch.

2. Set one uplink port as a VCP. You do not need to specify the member-member-id option, because the command applies by default on the member where it is executed.
   
   ```
   user@switch> request virtual-chassis vc-port set pic-slot 1 port 0
   ```
NOTE: If you do specify the member member-id option, use member ID 0. Because the switch is not yet interconnected with the other members of the Virtual Chassis, its current member ID is 0. Its member ID will change when it is interconnected with the Virtual Chassis. It does not impact the functioning of the uplink VCP that its VCP is set with 0 as the member ID. The VCP has significance only on the local switch.

3. After you have set the uplink VCP on the standalone switch, physically interconnect its uplink port with the VCP uplink ports of the members in the existing Virtual Chassis. The new member switch reboots and joins the now expanded Virtual Chassis with a different member ID.

NOTE: The setting for the new member switch's uplink VCP remains intact and is not affected by the change of member ID.

4. If you have additional members in the second wiring closet, set a redundant VCP uplink on another member switch by issuing the request virtual-chassis vc-port command.

Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of an EX Series Virtual Chassis (CLI Procedure)

When a backup member takes control of a Virtual Chassis because of a reset or other temporary failure, the backup member uses the MAC address of the old master switch as the system MAC base address. This process helps ensure a smooth transition of mastership with no disruption to network connectivity.

The MAC persistence timer is used in situations in which the master switch is no longer a member of the Virtual Chassis because it has been physically disconnected or removed. If the old master switch does not rejoin the Virtual Chassis before the timer elapses, the new master switch starts using its own MAC address as the system’s MAC base address. For information regarding how the system MAC base address is used to assign MAC addresses to ports in a Virtual Chassis, see “Understanding MAC Address Assignment on a Virtual Chassis” on page 4482.

The default timer value is 10 minutes. The maximum timer value is 60 minutes.

You can disable the MAC persistence timer starting in Junos OS Release 12.2. When the MAC persistence timer is disabled, the MAC address of the old master switch is used as the system MAC base address; no MAC address changes occur within the Virtual Chassis even when the old master switch is no longer a member of the Virtual Chassis because it has been physically disconnected or removed.

To configure or modify the MAC persistence timer:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer minutes
```

To disable the MAC persistence timer:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer disable
```

Disabling Split and Merge in an EX Series Virtual Chassis (CLI Procedure)

The split and merge feature is enabled by default on all EX Series switches in a Virtual Chassis. You can disable the split and merge feature. If you disable the split and merge feature and the Virtual Chassis splits, both parts of the split Virtual Chassis configuration remain active.

In a preprovisioned Virtual Chassis, if both of the Routing Engines end up in the same Virtual Chassis configuration after a split, the other part of the split Virtual Chassis configuration remains inactive. If the Routing Engines end up in different parts of the split Virtual Chassis configuration and the rest of the member switches are configured as having linecard roles, then a backup Routing Engine might not be selected for either part.

We recommend disabling split and merge on an EX Series Virtual Chassis with two member switches. A two-member switch Virtual Chassis that has disabled split and merge can reform more quickly and with less complications as a result of the feature being disabled.

To disable the split and merge feature in a Virtual Chassis:

```
[edit]
user@switch# set virtual-chassis no-split-detection
```

Configuring Automatic Software Update on EX Series Virtual Chassis Member Switches (CLI Procedure)

**NOTE:** Automatic software update is not supported on an EX8200 Virtual Chassis.

The automatic software update feature allows you to automatically update the software version on prospective member switches as they are added so that they can join the Virtual Chassis.

**NOTE:** The version of Junos OS running on the Virtual Chassis must be compatible with the software running on the prospective member switch for an automatic software update to occur. For information on Junos OS compatibility and other automatic software update restrictions, see “Understanding Automatic Software Update on EX Series Virtual Chassis Member Switches” on page 4479.

Before you begin, ensure that you know the name or the URL of the software package to be used by the automatic software update feature.
To configure the automatic software update feature:

```
[edit]
user@switch# set virtual-chassis auto-sw-update package-name package-name
```

If the software package is located on a local directory on the switch, use the following format for `package-name`:

```
/pathname/package-name
```

If the software package is to be downloaded and installed from a remote location, use one of the following formats:

```
ftp://hostname/pathname/package-name
ftp://username:prompt@ftp.hostname.net/pathname/package-name
http://hostname/pathname/package-name
```

---

**Assigning the Virtual Chassis ID to Determine Precedence During an EX Series Virtual Chassis Merge (CLI Procedure)**

Every Virtual Chassis has a unique ID that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a Virtual Chassis ID using the `set virtual-chassis id` command. When two Virtual Chassis configurations attempt to merge, the Virtual Chassis ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID for the newly merged Virtual Chassis configuration.

To configure the Virtual Chassis ID:

```
[edit]
user@switch# set virtual-chassis id id
```

- Understanding Split and Merge in an EX Series Virtual Chassis on page 4476
Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis, one member switch is assigned the master role and has the master Routing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up the Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two switches in a Virtual Chassis configuration with mastership priority of 255:

   ```
   [edit]
   user@switch# set virtual-chassis member 0 mastership-priority 255
   [edit]
   user@switch# set virtual-chassis member 1 mastership-priority 255
   ```

2. Set up graceful Routing Engine switchover:

   ```
   [edit]
   user@switch# set chassis redundancy graceful-switchover
   ```

Commit the configuration.

**NOTE:** We recommend that you use the `commit synchronize` command to save any configuration changes that you make to a multimember Virtual Chassis.

### Configuration Statements

- [edit virtual-chassis] Configuration Statement Hierarchy on EX Series Switches on page 4504

[edit virtual-chassis] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit virtual-chassis] hierarchy level on EX Series switches.

- Supported statements are those that you can use to configure some aspect of a software feature on the switch.
• **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

• Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

• Supported Statements in the [edit virtual-chassis] Hierarchy Level on page 4505
• Unsupported Statements in the [edit virtual-chassis] Hierarchy Level on page 4505

**Supported Statements in the [edit virtual-chassis] Hierarchy Level**

The following hierarchy shows the *[edit virtual-chassis]* configuration statements supported on EX Series switches:

```plaintext
virtual-chassis {
   auto-sw-update {
      (ex4200 | ex4500)
      package-name package-name;
   }
   fast-failover (ge | vcp disable | xe);
   graceful-restart {
      disable;
   }
   id id;
   mac-persistence-timer [minutes | disable];
   member member-id {
      location location;
      mastership-priority number;
      no-management-vlan;
      role (line-card | routing-engine);
      serial-number;
   }
   no-split-detection;
   preprovisioned;
   traceoptions {
      file filename <files number> <size size> <world-readable | no-world-readable> <match regex>;
      flag flag;
   }
   vc-port {
      lag-hash (packet-based | source-port-based);
   }
   vcp-no-hold-time;
}
```

**Unsupported Statements in the [edit virtual-chassis] Hierarchy Level**

All statements in the *[edit virtual-chassis]* hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

auto-sw-update

Syntax

auto-sw-update {
    (ex4200 | ex4500)
    package-name package-name;
}

Hierarchy Level
[edit virtual-chassis]

Release Information
Statement introduced in Junos OS Release 10.0 for EX Series switches. The ex4200 and ex4500 options introduced in Junos OS Release 12.2 for EX Series switches.

Description
Enable the automatic software update feature for Virtual Chassis configurations.

You should only use the ex4200 and ex4500 keywords when configuring a mixed Virtual Chassis.

You must enter the auto-sw-update statement twice—once to specify the path to a Junos OS package for an EX4200 switch and again to specify the path to Junos OS package for an EX4500 or EX4550 switch—when enabling the automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. You do not, therefore, need to specify the ex4500 keyword when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis. You also only have to enter the ex4500 keyword once to configure automatic software update for all EX4500 and EX4550 member switches in the same mixed Virtual Chassis.

The remaining statement is explained separately.

Default
The automatic software update feature is disabled.

Options

package-name package-name—Specify a path to a Junos OS software image.

ex4200—Specify a path to a Junos OS image for an EX4200 switch when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

ex4500—Specify a path to a Junos OS image for an EX4500 switch, an EX4550 switch, or both types of switches when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. Therefore, you only have to enter this command once to upgrade the EX4500 and EX4550 member switches in the same mixed Virtual Chassis.
The `ex-4500` keyword also does not need to be specified when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis.

**Required Privilege Level**
- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

**Related Documentation**
- *Example: Configuring Automatic Software Update on EX4200 Virtual Chassis Member Switches*
- *Configuring Automatic Software Update on EX Series Virtual Chassis Member Switches (CLI Procedure) on page 4502*
graceful-restart (Enabling Globally)

Syntax

graceful-restart {
  disable;
  helper-disable;
  maximum-helper-recovery-time seconds;
  maximum-helper-restart-time seconds;
  notify-duration seconds;
  recovery-time seconds;
  restart-duration seconds;
  stale-routes-time seconds;
}

Hierarchy Level
[edit logical-systems logical-system-name routing-options],
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit routing-options],
[edit routing-instances routing-instance-name routing-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Configure graceful restart globally to enable the feature. You cannot enable graceful
restart for specific protocols unless graceful restart is also enabled globally.

For VPNs, the graceful-restart statement allows a router whose VPN control plane is
undergoing a restart to continue to forward traffic while recovering its state from
neighboring routers.

For BGP, if you configure graceful restart after a BGP session has been established, the
BGP session restarts and the peers negotiate graceful restart capabilities.

Default
Graceful restart is disabled by default.

Options
The remaining statements are explained separately.

Required Privilege
Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

mac-persistence-timer

Syntax  
mac-persistence-timer [minutes | disable];

Hierarchy Level  
[edit virtual-chassis]

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches. 
Option disable introduced in Junos OS Release 12.2 for EX Series switches. 
The maximum timer limit changed from no maximum timer limit to 60 minutes in Junos 
OS Release 12.2 for EX Series switches.

Description  
Specify how long the Virtual Chassis continues to use the MAC address of the switch 
that was originally configured in the master role as the system MAC base address after 
the original master switch is removed from the Virtual Chassis. The system MAC base 
address does not change in the event of a switchover provided the switch originally 
configured in the master role remains a member of the Virtual Chassis.

The maximum timer limit is 60 minutes starting in Junos OS Release 12.2. There are no 
minimum or maximum timer limits in prior Junos OS releases.

Default  
The MAC persistence timer is set to 10 minutes by default.

Options  
minutes—Time in minutes that the member switch in the backup role continues to use 
the system MAC base address of the old master before using its own system MAC 
base address after the switch in the master role is physically disconnected or removed 
from the Virtual Chassis.

disable—Disable the MAC persistence timer. The system MAC base address never changes 
when the MAC persistence timer is disabled, even when the switch in the master 
role is physically disconnected or removed from the Virtual Chassis.

Required Privilege  
Level  
system—to view this statement in the configuration. 
system-control—to add this statement to the configuration.

Related Documentation  
• Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as 
  Master of an EX Series Virtual Chassis (CLI Procedure) on page 4501
mastership-priority

Syntax
mastership-priority number;

Hierarchy Level
[edit virtual-chassis member member-id]

Release Information
Statement introduced in Junos OS Release 9.0 for EX Series switches. Mastership priority option 0 introduced in Junos OS Release 11.1 for EX Series switches.

Description
The mastership priority value is the most important factor in determining the role of the member switch within the Virtual Chassis configuration. Other factors (see “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467) also affect the election of the master.

The mastership priority value takes the highest precedence in the master election algorithm. The member switch with highest mastership priority becomes the master of the Virtual Chassis configuration. Toggling back and forth between master and backup status in failover conditions is undesirable, so we recommend that you assign the same mastership priority value to both the master and the backup. Secondary factors in the master election algorithm determine which of these two members (that is, the two members that are assigned the highest mastership priority value) functions as the master of the Virtual Chassis configuration.

This statement is not used for the EX8200 Virtual Chassis, which determines mastership by external Routing Engine uptime. See Understanding Virtual Chassis Roles in an EX8200 Virtual Chassis.

A switch with a mastership priority of 0 never takes the master or backup role.

Default
128

Options
number—Mastership priority value.
Range: 0 through 255

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

}
```

Hierarchy Level

[edit virtual-chassis]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure a switch or an XRE200 External Routing Engine as a member of a Virtual Chassis.

NOTE: The mastership-priority and no-management-vlan statements are not used in an EX8200 Virtual Chassis.

Default

When an EX3300, EX4200, EX4500, or EX4550 switch is powered on as a standalone switch (not interconnected through its Virtual Chassis ports (VCPs) with other switches), its default member ID is 0.

There is no default member ID in an EX8200 Virtual Chassis. An EX8200 Virtual Chassis must be preprovisioned, and that process configures the member IDs.

Options

- `member-id`—Identifies a specific member switch of a Virtual Chassis configuration.
  
  **Range:** 0 through 9

  The exact range for a specific Virtual Chassis depends on the number of switches allowed in the Virtual Chassis.

  In an EX8200 Virtual Chassis, member IDs 0 through 7 are reserved for EX8200 member switches and member IDs 8 and 9 are reserved for the master and backup external Routing Engines.

  The remaining statements are explained separately.

Required Privilege Level

- `system`—To view this statement in the configuration.
- `system-control`—To add this statement to the configuration.

Related Documentation

### no-management-vlan

**Syntax**
no-management-vlan;

**Hierarchy Level**
[edit virtual-chassis member member-id]

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Remove the specified member's out-of-band management port from the virtual management Ethernet (VME) global management VLAN of the Virtual Chassis configuration.

For a member that is functioning in a linecard role, you can use this configuration to reserve the member's management Ethernet port for local troubleshooting:

```config
virtual-chassis {
    member 2 {
        no-management-vlan;
    }
}
```

You cannot configure the IP address for a local management Ethernet port using the CLI or the J-Web interface. To do this, you need to use the shell `ifconfig` command.

**Required Privilege Level**
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

**Related Documentation**
- Example: Setting Up a Multimember EX4200 Virtual Chassis Access Switch with a Default Configuration
- Configuring the Virtual Management Ethernet Interface for Global Management of an EX Series Virtual Chassis (CLI Procedure)
- Understanding Global Management of an EX Series Virtual Chassis on page 4469
**no-split-detection**

**Syntax**  
no-split-detection;

**Hierarchy Level**  
[edit virtual-chassis]

**Release Information**  
Statement introduced in Junos OS Release 9.3 for EX Series switches.

**Description**  
Disable the split and merge feature in a Virtual Chassis configuration.

We recommend using this statement to disable the split and merge feature when configuring a two-member EX Series Virtual Chassis. Enabling this statement on a two-member Virtual Chassis ensures that both switches remain in the correct Virtual Chassis roles in the event of a Virtual Chassis split.

**Default**  
The split and merge feature is enabled.

**Required Privilege Level**  
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

package-name

Syntax  package-name package-name;

Hierarchy Level  [edit virtual-chassis auto-sw-update]

Release Information  Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description  Specify the software package name or location of the software package to be used by the automatic software update feature for Virtual Chassis configurations.

Default  No package name is specified.

Options  package-name—Name of the software package or the URL to the software package to be used.

• If the software package is located on a local directory on the switch, use the following format for package-name:
  /pathname/package-name

• If the software package is to be downloaded and installed from a remote location, use one of the following formats:
  ftp://hostname/pathname/package-name
  ftp://username:prompt@ftp.hostname.net/pathname/package-name
  http://hostname/pathname/package-name

Required Privilege  Level  system—To view this statement in the configuration.
  system-control—To add this statement to the configuration.

## preprovisioned

<table>
<thead>
<tr>
<th>Syntax</th>
<th>preprovisioned:</th>
</tr>
</thead>
</table>

### Hierarchy Level

```
[edit virtual-chassis]
```

### Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

### Description

Enable the preprovisioned configuration mode for a Virtual Chassis configuration.

When the preprovisioned configuration mode is enabled, you cannot use the CLI or the J-Web interface to change the mastership priority or member ID of member switches.

You must use this statement to configure an EX8200 Virtual Chassis. Nonprovisioned configuration of an EX8200 Virtual Chassis is not supported.

### Required Privilege

- **Level**
  - system—To view this statement in the configuration.
  - system-control—To add this statement to the configuration.

### Related Documentation

**Syntax**

```
redundancy {
  failover {
    on-disk-failure;
    on-loss-of-keepalives;
  }
  graceful-switchover;
}
```

**Hierarchy Level**

[edit chassis]

**Release Information**

Statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Enable redundant Routing Engines on a Virtual Chassis with two or more member switches or on a standalone EX6200 or EX8200 switch with more than one Routing Engine.

The remaining statements are explained separately.

**Default**

Redundancy is enabled for the Routing Engines.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

## role

| Syntax                  | role (line-card | routing-engine); |
|-------------------------|-----------------|
| Hierarchy Level         | [edit virtual-chassis preprovisioned member member-id] |

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify the roles of the members of the Virtual Chassis in a preprovisioned Virtual Chassis.

### EX Series Virtual Chassis (except EX8200 Virtual Chassis)

Specify the role to be performed by each member switch. Associate the role with the member’s serial number.

When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces. The mastership priority value is generated by the software, based on the assigned role:

- A member configured as `routing-engine` is assigned the mastership priority 129.
- A member configured as `line-card` is assigned the mastership priority 0.
- A member listed in the preprovisioned configuration without an explicitly specified role is assigned the mastership priority 128.

The configured role specifications are permanent. If both `routing-engine` members fail, a `line-card` member cannot take over as master of the Virtual Chassis configuration. You must delete the preprovisioned configuration to change the specified roles in a Virtual Chassis.

Explicitly configure two members as `routing-engine` and configure additional switches as members of the preprovisioned Virtual Chassis by specifying only their serial numbers. If you do not explicitly configure the role of the additional members, they function in a linecard role by default. In that case, a member that is functioning in a linecard role can take over mastership if the members functioning as master and backup (`routing-engine` role) both fail.

### EX8200 Virtual Chassis

Specify the role to be performed by each XRE200 External Routing Engine and each EX8200 member switch. Associate the role with the member’s serial number. An EX8200 Virtual Chassis cannot function when both external Routing Engines, which must be configured in the `routing-engine` role, have failed.

**Options**
- `line-card`—Enables the member to be eligible to function only in the linecard role. Any member of the Virtual Chassis configuration other than the master or backup functions in the linecard role and runs only a subset of Junos OS for EX Series switches. A member functioning in the linecard role does not run the control protocols or the chassis management processes.
A Virtual Chassis must have at least three members for one member to function in the linecard role.

In an EX8200 Virtual Chassis configuration, all member switches must be in the linecard role.

- **routing-engine**—Enables the member to function as a master or backup of the Virtual Chassis configuration. The master manages all members of the Virtual Chassis configuration and runs the chassis management processes and control protocols. The backup synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

(All Virtual Chassis composed of EX2200, EX3300, EX4200, EX4500, or EX4550 switches) Specify two and only two members as **routing-engine**. The software determines which of the two members assigned the **routing-engine** role functions as master, based on the master election algorithm. See “Understanding How the Master in an EX Series Virtual Chassis Is Elected” on page 4467. In these Virtual Chassis, the **routing-engine** role is associated with a switch.

(Ex8200 Virtual Chassis) All XRE200 External Routing Engines must be in the **routing-engine** role.

### Required Privilege

- **system**—To view this statement in the configuration.
- **system-control**—To add this statement to the configuration.

serial-number

Syntax

serial-number serial-number;

Hierarchy Level

[edit virtual-chassis preprovisioned member member-id]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

In a preprovisioned Virtual Chassis composed of EX2200, EX3300, EX4200, EX4300, EX4500, or EX4550 switches, specify the serial number of each member switch to be included in the Virtual Chassis configuration. If you do not include the serial number within the Virtual Chassis configuration, the switch cannot be recognized as a member of a preprovisioned configuration.

In an EX8200 Virtual Chassis configuration, specify the serial number of each XRE200 External Routing Engine and each EX8200 member switch to be included in the Virtual Chassis configuration. If you do not include the serial number within the Virtual Chassis configuration, the external Routing Engine or switch cannot be recognized as a member of the configuration.

Options

serial-number—Permanent serial number for the external Routing Engine or for the member switch.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

traceoptions (Virtual Chassis)

Syntax

```
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-readable>;
  flag flag <detail> <disable> <receive> <send>;
}
```

Hierarchy Level
[edit virtual-chassis]

Release Information

Description
Define tracing operations for the Virtual Chassis configuration.

Default
Tracing operations are disabled.

Options
detail—(Optional) Generate detailed trace information for a flag.
disable—(Optional) Disable a flag.

file filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the size option.

Range: 2 through 1000
Default: 3 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- all—All tracing operations.
- auto-configuration—Trace Virtual Chassis ports (VCPs) that have been automatically configured.
- csn—Trace Virtual Chassis complete sequence number (CSN) packets.
- error—Trace Virtual Chassis errored packets.
- hello—Trace Virtual Chassis hello packets.
- krt—Trace Virtual Chassis KRT events.

TIP: The all flag displays a subset of logs that are useful in debugging most issues. For more detailed information, use all detail.
- **lsp**—Trace Virtual Chassis link-state packets.
- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis ME events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis SPF events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

**no-stamp**—(Optional) Do not place a timestamp on any trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**receive**—(Optional) Trace received packets.

**replace**—(Optional) Replace a trace file rather than appending information to it.

**send**—(Optional) Trace transmitted packets.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

### vcp-no-hold-time

**Syntax**  
`vcp-no-hold-time;`

**Hierarchy Level**  
`[edit virtual-chassis]`

**Release Information**  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**  
Disable the Virtual Chassis port (VCP) holddown timer for all VCPs in the Virtual Chassis.

The VCP holddown timer is an internal mechanism that delays a Virtual Chassis reconvergence for several seconds when a VCP becomes inactive. The purpose of this delay is to provide the VCP time to return online without having to reconverge the Virtual Chassis to adjust to the inactive VCP. All traffic to the VCP is dropped while the VCP is inactive. If the VCP remains down for a time that exceeds the VCP holddown timer, a Virtual Chassis reconvergence occurs.

When this statement is enabled, the VCP holddown timer is disabled and the Virtual Chassis reconvergence occurs when a VCP becomes inactive. The period of time where traffic is dropped waiting for the VCP to return online is avoided.

We recommend enabling this statement after a Virtual Chassis is operational. We recommend disabling this statement when you are adding or removing member switches from your Virtual Chassis.

The VCP holddown timer cannot be viewed and is not user-configurable. You can only control whether the VCP holddown timer is enabled or disabled by configuring this statement.

**Default**  
The VCP holddown timer is enabled by default on all EX series switches that support this statement. The VCP holddown timer is not configurable on all EX series switches that do not support this statement.

**Required Privilege Level**  
- system—to view this statement in the configuration.
- system-control—to add this statement to the configuration.

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure Virtual Chassis information.

The remaining statements are explained separately.

Default A standalone EX2200, EX3300, EX4200, EX4500, or EX4550 switch is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A standalone XRE200 External Routing Engine or EX8200 switch is not part of an EX8200 Virtual Chassis until a Virtual Chassis configuration is set up.

Required Privilege Level system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Command Forwarding Usage with an EX Series Virtual Chassis

Some CLI commands can be run either on all members or on a specific member of a Virtual Chassis configuration. This functionality is referred to as command forwarding.

You can always specify that these commands be applied to all member switches in the Virtual Chassis by using the all-members option, or to a specific member switch by using the member-member-id option. If neither option is specified, the default command forwarding behavior, which varies by command, is used. See the Default row in Table 558 on page 4530 to learn the command forwarding behavior for a specific command.

For example, to collect information about a particular member switch prior to contacting Juniper Networks Technical Assistance Center (JTAC), use the request support information member member-id command to gather data for the specified member switch. If you want to gather this data for all member switches in the Virtual Chassis, you can enter the request support information command, which by default uses the all-members option, or the request support information all-members command.

Table 558 on page 4530 provides a list of commands that can be run either on all members of the Virtual Chassis configuration or on a specific member switch.
### Table 558: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration

<table>
<thead>
<tr>
<th>Commands Available for Command Forwarding</th>
<th>Purpose</th>
<th>all-members</th>
<th>member-member-id</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>request support information</td>
<td>Displays information for the specified member switch.</td>
<td>Displays information for all members of the Virtual Chassis configuration.</td>
<td></td>
<td>all-members</td>
</tr>
</tbody>
</table>

- **forwarding-available** commands:
  - **request support information**:
    - **Purpose**: Use this command when you contact JTAC about your component problem. This command is the equivalent of using the following CLI commands:
      - `show version`
      - `show chassis firmware`
      - `show chassis hardware`
      - `show chassis environment`
      - `show interfaces extensive` (for each configured interface)
      - `show configuration` (excluding any SECRET-DATA)
      - `show system virtual-memory`
  - **request system partition hard-disk**:
    - **Purpose**: Set up the hard disk for partitioning. After this command is issued, the hard disk is partitioned the next time the system is rebooted. When the hard disk is partitioned, the contents of /altroot and /altconfig are saved and restored. All other data on the hard disk is at risk of being lost.
  - **request system reboot**:
    - **Purpose**: Reboots Junos OS for EX Series switches after a software upgrade and occasionally to recover from an error condition.
      - Reboots all members of the Virtual Chassis configuration.
      - Reboots the specified member switch.
      - all-members

Verifying the Member ID, Role, and Neighbor Member Connections of an EX Series Virtual Chassis Member

**Purpose**
You can designate the role that a member performs within a Virtual Chassis or you can allow the role to be assigned by default. You can designate the member ID that is assigned to a specific switch by creating a permanent association between the switch's serial number and a member ID, using a preprovisioned configuration. Or you can let the member ID be assigned by the master, based on the sequence in which the member switch is powered on and on which member IDs are currently available.

The role and member ID of the member switch are displayed on the front-panel LCD.

Each member switch can be cabled to one or two other member switches, using either the dedicated Virtual Chassis ports (VCPs) on the rear panel, an uplink port that has been configured as a VCP, or an optical port that has been configured as a VCP. The members that are cabled together are considered neighbor members.

**Action**
To display the role and member ID assignments using the CLI:

```
user@switch> show virtual-chassis
```

Virtual Chassis ID: 0000.e255.00e0

<table>
<thead>
<tr>
<th>Member ID</th>
<th>Status</th>
<th>Serial No</th>
<th>Model</th>
<th>Mastership Priority</th>
<th>Role</th>
<th>Neighbor List ID, Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (FPC 0)</td>
<td>Prsnt</td>
<td>abc123</td>
<td>ex4200-48p</td>
<td>255 Master*</td>
<td></td>
<td>1 vcp-0 2 vcp-1</td>
</tr>
<tr>
<td>1 (FPC 1)</td>
<td>Prsnt</td>
<td>def456</td>
<td>ex4200-24t</td>
<td>255 Backup</td>
<td></td>
<td>2 vcp-0</td>
</tr>
</tbody>
</table>
### Meaning
This output verifies that three EX4200 switches have been interconnected as a Virtual Chassis configuration through their dedicated VCPs to create an EX4200 Virtual Chassis. The display shows which of the VCPs is connected to which neighbor. The first port (vcp-0) of member 0 is connected to member 1 and the second port of member 0 (vcp-1) is connected to member 2. The FPC slots for the switches are the same as the member IDs.

The Mastership Priority values indicate that the master and backup members have been explicitly configured, because they are not using the default value (128).

### Verifying That Virtual Chassis Ports on an EX Series Switch Are Operational

**Purpose**
Display the status of Virtual Chassis ports (VCPs) in a Virtual Chassis.

**Action**
Display the VCPs:

```
user@switch> show virtual-chassis vc-port all-members
```

```plaintext
fpc0:
--- Interface or PIC / Port Type  Trunk Status  Speed (mbps)  Neighbor ID Interface
  vcp-0  Dedicated  1  Up  32000  1  vcp-0
```
<table>

</tbody>
</table>

Meaning

The dedicated VCPs are displayed as vcp-0 and vcp-1. The uplink interfaces that have been set as uplink VCPs are displayed as 1/0, 1/1, 1/2, and 1/3. The network interfaces that have been set as VCPs are displayed as 0/20 and 0/21. The neighbor interface names of uplink and network VCPs are of the form vcp-255/pic/port—for example, vcp-255/1/0. In that name, vcp-255 indicates that the interface is a VCP, 1 is the uplink PIC number, and 0 is the port number. The fpc number is the same as the member ID. The trunk ID is a positive number ID assigned to the link aggregation group (LAG) formed by the Virtual Chassis. If no LAG is formed, the value is –1.
NOTE: This example uses output from an EX4200 Virtual Chassis. The output would be identical on all other types of Virtual Chassis.

Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis

Purpose

Use the monitoring functionality to view the following information about the switches and the ports on EX2200, EX3300, EX4200, EX4300, EX4500, EX4550, and EX8200 switches that are members of a Virtual Chassis:

- Member details and how members are connected with each other
- Traffic statistics for Virtual Chassis ports (VCPs) of the selected members
- Details of the VCP packet counters

Action

To view Virtual Chassis monitoring details in the J-Web interface for a Virtual Chassis, select Monitor > Virtual Chassis.

NOTE: Virtual Chassis monitoring is supported on J-Web, on all Virtual Chassis platforms except EX3200 and EX6210.

To view member details for all members in the CLI, enter the following command:

```
user@switch> show virtual-chassis
```

To view VCP traffic statistics for a specific member in the CLI, enter the following command:

```
user@switch> show virtual-chassis vc-port statistics member member-id
```

To view the path a packet takes when going from a source interface to a destination interface in a Virtual Chassis configuration using the CLI, enter the following command:

```
user@switch> show virtual-chassis vc-path
```

Meaning

In the J-Web interface, the top half of the screen displays details of the Virtual Chassis configuration, such as:
Click the **Stop** button to stop fetching values from the switch, and click the **Start** button to start plotting data again from the point where it was stopped.

To view a graph of the statistics for the selected VCP of the member, click **Show Graph**.

**Refresh Interval (sec)**—Displays the time interval you have set for page refresh.

Click **Clear Statistics** to clear the monitoring statistics for the selected member switch.

You can specify the interval at which the member details and statistics must be refreshed.

The bottom half of the screen displays a chart of the Virtual Chassis statistics and the port packet counters.

For details about the output from CLI commands, see the `show virtual-chassis` and `show virtual-chassis vc-port statistics` command summaries.

### Verifying That Graceful Routing Engine Switchover Is Working in the Virtual Chassis

**Purpose**

Verify that a Graceful Routing Engine switchover (GRES) between two member switches acting as the master and backup routing engines in a Virtual Chassis has occurred.

**Action**

On the master switch, verify the member ID of the backup Routing Engine:

```shell
{master:0}
user@switch> show virtual-chassis
Virtual Chassis ID: 5efa.4b7a.aae6
Mastership Neighbor List
Member ID Status Serial No Model priority Role ID  Interface
0 (FPC 0) Prsnt BM0208105281 ex4200-24t 255 Master* 1 vcp-0
```
1 (FPC 1) Prsnt BP0208192350 ex4200-48t 255 Backup 0 vcp-0

Member ID for next new member: 2 (FPC 2)

1. Connect to the backup Routing Engine:

   {master:0}
   user@switch> request session member 1

   {backup:1}
   user@switch>

2. Verify that the backup Routing Engine is ready for switchover on member ID 1:

   {backup:1}
   user@switch> show system switchover

   Graceful switchover: On
   Configuration database: Ready
   Kernel database: Ready
   Peer state: Steady State

3. Switch the current backup Routing Engine to master Routing Engine:

   NOTE: You must wait a minimum of two minutes between Routing Engine failovers for the Routing Engines to synchronize.

   {backup:1}
   user@switch> request chassis routing-engine master acquire

4. Verify that the master and backup Routing Engines have switched roles:

   NOTE: Member ID 1 is now the master and member ID 0 is now the backup.

   {master:1}
   user@switch> show virtual-chassis

   Virtual Chassis ID: 5efa.4b7a.aee6
   Mastership         Neighbor List
   Member ID  Status  Serial No Model  priority  Role  ID  Interface
   0 (FPC 0)  Prsnt  BM0208105281 ex4200-24t 255  Backup 1  vcp-0
   1 (FPC 1)  Prsnt  BP0208192350 ex4200-48t 255  Master* 0  vcp-0

Member ID for next new member: 2 (FPC 2)

Meaning: With graceful Routing Engine switchover enabled, when you initiated a switchover from the backup Routing Engine, the backup Routing Engine became the master and the master Routing Engine became the backup.

Operational Commands
**clear virtual-chassis vc-port statistics**

**Syntax**
clear virtual-chassis vc-port statistics
<all-members>
</interface-name>
<local>
<member member-id>

**Release Information**
Command introduced in Junos OS Release 9.0 for EX Series switches. The options all-members and local were added in Junos OS Release 9.3 for EX Series switches.

**Description**
Clear—reset to zero (0)—the traffic statistics counters on Virtual Chassis ports (VCPs).

**Options**
none—Clear traffic statistics for VCPs of all members of a Virtual Chassis configuration.

all-members—(Optional) Clear traffic statistics for VCPs of all members of a Virtual Chassis configuration.

interface-name—(Optional) Clear traffic statistics for the specified VCP.

local—(Optional) Clear traffic statistics for VCPs from the switch or external Routing Engine on which this command is entered.

member member-id—(Optional) Clear traffic statistics for VCPs from the specified member of a Virtual Chassis configuration.

**Required Privilege**
clear

**request virtual-chassis recycle**

**Syntax**

request virtual-chassis recycle member-id member-id

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Make a previously used member ID available for reassignment.

When you remove a member switch from the Virtual Chassis configuration, the master reserves that member ID. To make the member ID available for reassignment, you must use this command.

**NOTE:** You must run this command from the Virtual Chassis member in the master role.

**Options**

- **member-id member-id**—Specify the member ID that you want to make available for reassignment to a different member.

**Required Privilege Level**

system-control

user@switch> request virtual-chassis recycle member-id 3

Sample Output

request virtual-chassis recycle member-id 1

user@external-routing-engine> request virtual-chassis recycle member-id 1
**request virtual-chassis renumber**

**Syntax**

```
request virtual-chassis renumber member-id old-member-id new-member-id new-member-id
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Renumber a member of a Virtual Chassis configuration.

**NOTE:** You must run this command from the Virtual Chassis member in the master role.

**Options**

- `member-id old-member-id`—Specify the ID of the member that you wish to renumber.
- `new-member-id new-member-id`—Specify an unassigned member ID.

**Required Privilege Level**

system-control

request virtual-chassis renumber member-id 1 new-member-id 0 on page 4545

**Sample Output**

request virtual-chassis renumber member-id 5 new-member-id 4

```
user@switch> request virtual-chassis renumber member-id 5 new-member-id 4
```

request virtual-chassis renumber member-id 1 new-member-id 0

```
user@external-routing-engine> request virtual-chassis renumber member-id 1 new-member-id 0
```
request virtual-chassis vc-port

Syntax

request virtual-chassis vc-port set | delete <fpc-slot fpc-slot> pic-slot pic-slot port port-number <member member-id>

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches. 
Option fpc-slot introduced in Junos OS Release 10.4 for EX Series switches.

Description

Enable or disable an uplink port (on an SFP, SFP+, or XFP uplink interface) or an SFP network port as a Virtual Chassis port (VCP).

If you omit member member-id, this command defaults to enabling or disabling the uplink VCP or SFP network port configured as a VCP on the switch where the command is issued.

On an EX3300 switch, uplink ports 2 and 3 are configured as VCPs by default. No other uplink ports on any other EX Series switches are configured as VCPs by default.

You might experience a temporary traffic disruption immediately after creating or deleting a user-configured VCP in an EX8200 Virtual Chassis.

Options

pic-slot pic-slot—Number of the PIC slot for the uplink port or SFP network port on the switch.

port port-number—Number of the uplink port or SFP network port that is to be enabled or disabled as a VCP.

member member-id—(Optional) Enable or disable the specified VCP on the specified member of the Virtual Chassis configuration.

Required Privilege

Level system-control

Sample Output

request virtual-chassis vc-port set pic-slot 1 port 0

user@switch> request virtual-chassis vc-port set pic-slot 1 port 0
To check the results of this command, use the `show virtual-chassis vc-port` command.

```plaintext
request virtual-chassis vc-port set pic-slot 1 port 1 member 3
  user@switch> request virtual-chassis vc-port set pic-slot 1 port 1 member 3
To check the results of this command, use the `show virtual-chassis vc-port` command.

request virtual-chassis vc-port delete pic-slot 1 port 1 member 3
  user@switch> request virtual-chassis vc-port delete pic-slot 1 port 1 member 3
To check the results of this command, use the `show virtual-chassis vc-port` command.
```
**request virtual-chassis vc-port diagnostics optics**

**Syntax**

`request virtual-chassis vc-port diagnostics optics`

**Release Information**

Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Run a digital optical monitoring (DOM) scan on the optical ports configured as Virtual Chassis ports (VCPs).

Enter the `show virtual-chassis vc-port diagnostics optics` command to view the results of the diagnostic scan.

On certain EX Series switches, the `request virtual-chassis vc-port diagnostics optics` command must be entered to run a diagnostic scan before you can gather the `show virtual-chassis vc-port diagnostics optics` output.

**Required Privilege Level**

`system-control`

show virtual-chassis device-topology

Syntax

show virtual-chassis device-topology
<all-members>
<local>
<member member-id>

Release Information
Command introduced in Junos OS Release 10.4 for EX Series switches.

Description
Display the device topology—the member and system IDs, the VCP numbers, and device status—for all hardware devices in the Virtual Chassis.

Options
none—Display the Virtual Chassis device topology for all members of the Virtual Chassis.

all-members—(Optional) Display the Virtual Chassis device topology for all members of the Virtual Chassis.

local—(Optional) Display the Virtual Chassis device topology for the switch or external Routing Engine on which this command is entered.

member member-id—(Optional) Display the Virtual Chassis device topology for the specified member of the Virtual Chassis.

Required Privilege
Level
clear

Output Fields
Table 561 on page 4554 lists the output fields for the show virtual-chassis device-topology command. Output fields are listed in the approximate order in which they appear.

Table 561: show virtual-chassis device-topology Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Member</td>
<td>Assigned member ID.</td>
</tr>
<tr>
<td>Device</td>
<td>Assigned device ID.</td>
</tr>
<tr>
<td></td>
<td>For an EX8200 Virtual Chassis, the member ID and the device ID are always identical.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the device within the Virtual Chassis. Outputs include:</td>
</tr>
<tr>
<td></td>
<td>* Prsnt—Device is currently connected to and participating in the Virtual Chassis configuration.</td>
</tr>
<tr>
<td></td>
<td>* NotPrsnt—Device is assigned but is not currently connected.</td>
</tr>
<tr>
<td>System ID</td>
<td>System ID of the device.</td>
</tr>
<tr>
<td></td>
<td>The system ID of the device is the device's MAC address.</td>
</tr>
</tbody>
</table>

### show virtual-chassis login

<table>
<thead>
<tr>
<th>Syntax</th>
<th>show virtual-chassis login</th>
</tr>
</thead>
</table>

**Release Information**  
Command introduced in Junos OS Release 9.3 for EX Series switches.

**Description**  
Supply the address of the host that logged into the Virtual Chassis, or identify the location of the member switch that redirected the current session to a different Virtual Chassis member switch.

You might need this information for tracing or troubleshooting purposes.

**Required Privilege Level**  
view

**Related Documentation**
- request session member on page 4543
- Understanding Global Management of an EX Series Virtual Chassis on page 4469

**List of Sample Output**
- show virtual-chassis login (Direct Login to the Master Console Port) on page 4557
- show virtual-chassis login (Backup Console Session Redirected to the Master Console Port) on page 4557

**Sample Output**

**show virtual-chassis login (Direct Login to the Master Console Port)**

```
user@switch> show virtual-chassis login
Current login session initiated from host 248.1.2.3
```

**show virtual-chassis login (Backup Console Session Redirected to the Master Console Port)**

```
user@switch> show virtual-chassis login
Current login session initiated from host backup
```
show virtual-chassis protocol adjacency

Syntax

```
show virtual-chassis protocol adjacency
  <brief | detail | extensive>
  <all-members>
  <local>
  <member member-id>
  <system-id>
```

Release Information

Command introduced in Junos OS Release 10.4 for EX Series switches.

Description

Display the Virtual Chassis Control Protocol (VCCP) adjacency statistics in the Virtual Chassis for all hardware devices.

Options

- **none**—Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis.
- **brief | detail | extensive**—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** and **extensive** options provide identical displays.
- **all-members**—(Optional) Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis.
- **local**—(Optional) Display VCCP adjacency statistics for the switch or external Routing Engine on which this command is entered.
- **member member-id**—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis.
- **system-id**—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis.

Required Privilege

- **clear**

**show virtual-chassis protocol database**

**Syntax**
```
show virtual-chassis protocol database
  <brief | detail | extensive>
  <all-members>
  <local>
  <member member-id>
```

**Release Information**
Command introduced in Junos OS Release 10.4 for EX Series switches.

**Description**
Display the Virtual Chassis Control Protocol (VCCP) database statistics for all hardware devices within the Virtual Chassis.

**Options**
- **none**—Display VCCP database statistics in brief form for all members of the Virtual Chassis.
- **brief | detail | extensive**—(Optional) Display the specified level of output. Using the `brief` option is equivalent to entering the command with no options (the default). The `detail` option provides more output than the `brief` option. The `extensive` option provides all output and is most useful for customer support personnel.
- **all-members**—(Optional) Display VCCP database statistics in brief form for all members of the Virtual Chassis.
- **local**—(Optional) Display VCCP database statistics for the switch or external Routing Engine on which this command is entered.
- **member member-id**—(Optional) Display VCCP database statistics for the specified member of the Virtual Chassis.

**Required Privilege**
- clear

**Related Documentation**

**List of Sample Output**
- `show virtual-chassis protocol database` on page 4563
- `show virtual-chassis protocol database detail` on page 4564

**Output Fields**
Table 563 on page 4562 lists the output fields for the `show virtual-chassis protocol database` command. Output fields are listed in the approximate order in which they appear.

**Table 563: show virtual-chassis protocol database Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSP ID</td>
<td>Link-state protocol (LSP) data unit identifier.</td>
<td>All levels</td>
</tr>
<tr>
<td>Sequence</td>
<td>Sequence number of the LSP.</td>
<td>All levels</td>
</tr>
<tr>
<td>Checksum</td>
<td>Checksum value of the LSP.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 563: show virtual-chassis protocol database Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lifetime</td>
<td>Remaining lifetime of the LSP, in seconds.</td>
<td>All levels</td>
</tr>
<tr>
<td>Neighbor</td>
<td>MAC address of the neighbor on the advertising system.</td>
<td>detail</td>
</tr>
<tr>
<td>Interface</td>
<td>Virtual Chassis port (VCP) interface name.</td>
<td>detail</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric of the prefix or neighbor.</td>
<td>detail</td>
</tr>
</tbody>
</table>

The **extensive** output was omitted from this list. The **extensive** output is useful for customer support personnel only.

show virtual-chassis protocol interface

Syntax

```
show virtual-chassis protocol interface
  <brief | detail>
  <all-members>
  <interface-name>
  <local>
  <member member-id>
```

Release Information

Command introduced in Junos OS Release 10.4 for EX Series switches.

Description

Display information about Virtual Chassis Control Protocol (VCCP) statistics for VCCP-enabled interfaces within the Virtual Chassis.

Options

- **none**—Display the VCCP interface statistics in brief form for all members of the Virtual Chassis.
- **brief | detail**—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option provides more output than the **brief** option.
- **all-members**—(Optional) Display VCCP interface statistics for all members of the Virtual Chassis.
- **interface-name**—(Optional) Display VCCP interface statistics for the specified interface.
- **local**—(Optional) Display VCCP interface statistics for the switch or external Routing Engine on which this command is entered.
- **member member-id**—(Optional) Display VCCP interface statistics for the specified member of the Virtual Chassis.

Required Privilege

```
clear
```

show virtual-chassis protocol route

**Syntax**

```
show virtual-chassis protocol route
<all-members>
<destination-id>
<local>
<member member-id>
```

**Release Information**

Command introduced in Junos OS Release 10.4 for EX Series switches.

**Description**

Display the unicast and multicast Virtual Chassis Control Protocol (VCCP) routing tables within the Virtual Chassis.

**Options**

- **none**—Display the unicast and multicast routing tables for all members of the Virtual Chassis.

- **all-members**—(Optional) Display the unicast and multicast routing tables for all members of the Virtual Chassis.

- **destination-id**—(Optional) Display the unicast and multicast routing tables to the specified destination member ID for each member of the Virtual Chassis.

- **local**—(Optional) Display the unicast and multicast routing tables on the device where this command is entered.

- **member member-id**—(Optional) Display the unicast and multicast routing tables for the specified member of the Virtual Chassis.

**Required Privilege**

- **clear**

show virtual-chassis protocol statistics

Syntax

```
show virtual-chassis protocol statistics
<all-members>
<interface-name>
<local>
<member member-id>
```

Release Information

Command introduced in Junos OS Release 10.4 for EX Series switches.

Description

Display the Virtual Chassis Control Protocol (VCCP) statistics for all hardware devices within the Virtual Chassis.

Options

- **none**—Display VCCP statistics for all members of the Virtual Chassis.
- **all-members**—(Optional) Display VCCP statistics for all members of the Virtual Chassis.
- **interface-name**—(Optional) Display VCCP statistics for the specified interface.
- **local**—(Optional) Display VCCP statistics for the switch or external Routing Engine on which this command is entered.
- **member member-id**—(Optional) Display VCCP statistics for the specified member of the Virtual Chassis.

Required Privilege Level

clear

List of Sample Output

```text
show virtual-chassis protocol statistics on page 4572
```

Output Fields

Table 566 on page 4571 lists the output fields for the `show virtual-chassis protocol interface` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDU type</td>
<td>Protocol data unit type.</td>
</tr>
<tr>
<td>Received</td>
<td>Number of PDUs received since VCCP started or since the statistics were set to zero.</td>
</tr>
<tr>
<td>Processed</td>
<td>Number of PDUs received minus the number of PDUs dropped.</td>
</tr>
<tr>
<td>Drops</td>
<td>Number of PDUs dropped.</td>
</tr>
<tr>
<td>Sent</td>
<td>Number of PDUs transmitted since VCCP started or since the statistics were set to zero.</td>
</tr>
<tr>
<td>Rexmit</td>
<td>Number of PDUs retransmitted since VCCP started or since the statistics were set to zero.</td>
</tr>
</tbody>
</table>
Table 566: show virtual-chassis protocol statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Packets Received</td>
<td>Number of PDUs received since VCCP started or since the statistics were set to zero.</td>
</tr>
<tr>
<td>Total Packets Sent</td>
<td>Number of PDUs sent since VCCP started or since the statistics were set to zero.</td>
</tr>
<tr>
<td>LSP queue length</td>
<td>Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.</td>
</tr>
<tr>
<td>SPF runs</td>
<td>Number of shortest-path-first (SPF) calculations that have been performed.</td>
</tr>
<tr>
<td>Fragments Rebuilt</td>
<td>Number of link-state PDU fragments that the local system has computed.</td>
</tr>
<tr>
<td>LSP Regenerations</td>
<td>Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.</td>
</tr>
<tr>
<td>Purges initiated</td>
<td>Number of purges that the system initiated. A purge is initiated if the software determines that a link-state PDU must be removed from the network.</td>
</tr>
</tbody>
</table>

**show virtual-chassis**

**Syntax**

```plaintext
show virtual-chassis
<status>
```

**Release Information**

Command introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Display information about all members of the Virtual Chassis configuration.

**Options**

- `none`—Display information about all Virtual Chassis members.
- `status`—Same output as for `show virtual-chassis`.

**Required Privilege Level**

view

**Related Documentation**

- show virtual-chassis active-topology on page 4551
- show virtual-chassis protocol adjacency on page 4558
- show virtual-chassis vc-path on page 4577

**List of Sample Output**

show virtual-chassis (EX4200 Virtual Chassis) on page 4575
show virtual-chassis (EX8200 Virtual Chassis) on page 4576

**Output Fields**

Table 567 on page 4574 lists the output fields for the `show virtual-chassis` command. Output fields are listed in the approximate order in which they appear.

**Table 567: show virtual-chassis Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Chassis ID</td>
<td>Assigned ID that applies to the entire Virtual Chassis configuration.</td>
</tr>
<tr>
<td>Virtual Chassis Mode</td>
<td>Mode of the Virtual Chassis: Enabled, Disabled, or Mixed.</td>
</tr>
<tr>
<td>Member ID</td>
<td>Assigned member ID and FPC:</td>
</tr>
<tr>
<td></td>
<td>• On EX2200 Virtual Chassis and EX3300, EX4200, and EX4500 Virtual Chassis, member IDs are numbered 0 through 9. The FPC number refers to the member ID assigned to the switch.</td>
</tr>
<tr>
<td></td>
<td>• On EX8200 Virtual Chassis, member IDs are numbered 0 through 9. The FPC number indicates the slot number of the line card within the Virtual Chassis. The FPC number on member 0 is always 0 through 15. The FPC number on member 1 is always 16 through 31. The FPC number on member 2 is always 32 through 47, and so on for the members.</td>
</tr>
</tbody>
</table>
Table 567: show virtual-chassis Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| **Status** | For a nonprovisioned configuration:  
  • **Prsnt** for a member that is currently connected to the Virtual Chassis configuration  
  • **NotPrsnt** for a member ID that has been assigned but is not currently connected  
  For a preprovisioned configuration:  
  • **Prsnt** for a member that is specified in the preprovisioned configuration file and is currently connected to the Virtual Chassis configuration  
  • **Unprvsn** for a member that is interconnected with the Virtual Chassis configuration but is not specified in the preprovisioned configuration file |
| **Serial No** | Serial number of the member switch or external Routing Engine. |
| **Model** | Model number of the member switch. |
| **Mastership Priority** | Mastership priority value of the member switch. |
| **Role** | Role of the member switch: Master, Backup, or Linecard. |
| **Mixed Mode** | (EX4200, EX4500, and EX4550 switches) Mixed mode configuration status:  
  • **Y** for a member switch configured in mixed mode.  
  • **N** for a member switch not configured in mixed mode.  
  • **NA** for a member switch that cannot be configured in mixed mode. |
| **Location** | Location of the member device.  
  If this field is empty, the location field was not set for the device. |
| **Neighbor List** | Member ID of the neighbor member to which this member’s Virtual Chassis port (VCP) is connected. |

Sample Output

show virtual-chassis (EX4200 Virtual Chassis)

```
user@switch> show virtual-chassis
Virtual Chassis ID: 0019.e250.47a0
Virtual Chassis Mode: Enabled

Member ID  Status  Serial No    Model      Mastership Priority  Role  Mode  ID  Interface

Member ID for next new member: 9 (FPC 9)
show virtual-chassis vc-path

Syntax

show virtual-chassis vc-path source-interface interface-name destination-interface interface-name

Release Information

Command introduced in Junos OS Release 9.6 for EX Series switches.

Description

Show the path a packet takes when going from a source interface to a destination interface in a Virtual Chassis configuration.

Options

source-interface interface-name — Name of the interface from which the packet originates

destination-interface interface-name — Name of the interface to which the packet is delivered

Required Privilege

List of Sample Output

show virtual-chassis vc-path source-interface destination-interface on page 4578

Output Fields

Table 568 on page 4577 lists the output fields for the show virtual-chassis vc-path command. Output fields are listed in the approximate order in which they appear.

Table 568: show virtual-chassis vc-path Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hop</td>
<td>The number of hops between the source and destination interfaces.</td>
</tr>
<tr>
<td>Member</td>
<td>The Virtual Chassis ID of the member switch that contains the Packet Forwarding Engine for each intermediate hop.</td>
</tr>
<tr>
<td>PFE-Device</td>
<td>The number of the Packet Forwarding Engine in each Virtual Chassis member through which a packet passes. Each Packet Forwarding Engine is the next hop of the preceding Packet Forwarding Engine.</td>
</tr>
<tr>
<td>Interface</td>
<td>The name of the interface through which the Packet Forwarding Engines are connected. The interface for the first hop is always the source interface and the interface for the last hop is always the destination interface. For intermediate hops, the <strong>Interface</strong> field denotes the Packet Forwarding Engines through which the packet passes on its way to the next hop.</td>
</tr>
</tbody>
</table>
Sample Output

show virtual-chassis vc-path source-interface destination-interface

```
show virtual-chassis vc-path source-interface ge-0/0/0 destination-interface ge-1/0/1
```

<table>

show virtual-chassis vc-port

Syntax
show virtual-chassis vc-port
<all-members>
<local>
<member member-id>

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Display the status of the Virtual Chassis ports (VCPs), including both the dedicated VCPs and the uplink ports configured as VCPs.

Options
none—Display the operational status of all VCPs of the member switch where the command is issued.

all-members—(Optional) Display the operational status of all VCPs on all members of the Virtual Chassis configuration.

local—(Optional) Display the operational status of the switch or external Routing Engine on which this command is entered.

member member-id—(Optional) Display the operational status of all VCPs for the specified member of the Virtual Chassis configuration.

Required Privilege

Output Fields
Table 569 on page 4579 lists the output fields for the show virtual-chassis vc-port command. Output fields are listed in the approximate order in which they appear.

Table 569: show virtual-chassis vc-port Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fpcnumber</td>
<td>The FPC number is the same as the member ID.</td>
</tr>
</tbody>
</table>
### Table 569: show virtual-chassis vc-port Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface or PIC/Port</td>
<td>VCP name.</td>
</tr>
<tr>
<td></td>
<td>• The dedicated VCPs in an EX4200, EX4500, or EX4550 Virtual Chassis are vcp-0 and vcp-1.</td>
</tr>
<tr>
<td></td>
<td>• The uplink module ports set as VCPs in an EX2200 Virtual Chassis or in an EX3300 or EX4200 Virtual Chassis are named 1/0 and 1/1, representing the PIC number and the port number.</td>
</tr>
<tr>
<td></td>
<td>• The native VCP (port 0) on an XRE200 External Routing Engine in an EX8200 Virtual Chassis is named vcp-0.</td>
</tr>
<tr>
<td></td>
<td>• The VCPs on each Virtual Chassis Control Interface (VCCI) module in an XRE200 External Routing Engine are named using the vcp-slot-number/port-number convention; for instance, vcp-1/0.</td>
</tr>
<tr>
<td></td>
<td>• The VCPs on EX8200 member switches are named using the vcp-slot-number/pic-number/interface-number convention; for instance, vcp-3/0/2.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of VCP:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dedicated</strong>—The rear panel VCP on an EX4200, EX4500, or EX4550 switch, or any VCP link connected to an XRE200 External Routing Engine in an EX8200 Virtual Chassis.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Configured</strong>—Optical port configured as a VCP.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Auto-Configured</strong>—Optical port autoconfigured as a VCP.</td>
</tr>
<tr>
<td></td>
<td>See “Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)” on page 4497 or Setting a 10-Gigabit Ethernet Port as a Virtual Chassis Port in an EX8200 Virtual Chassis (CLI Procedure) for information about configuring VCPs.</td>
</tr>
<tr>
<td>Trunk ID</td>
<td>A positive-number ID assigned to a link aggregation group (LAG) formed by the Virtual Chassis. The trunk ID value is −1 if no trunk is formed. A LAG between uplink VCPs requires that the link speed be the same on connected interfaces and that at least two VCPs on one member be connected to at least two VCPs on the other member in an EX4200 or EX4500 Virtual Chassis.</td>
</tr>
<tr>
<td></td>
<td>Dedicated VCP LAGs are assigned trunk IDs 1 and 2. Trunk IDs for LAGs formed with uplink VCPs therefore have values of 3 or greater.</td>
</tr>
<tr>
<td></td>
<td>The trunk ID value changes if the link-adjacency state between LAG members changes; trunk membership is then allocated or deallocated.</td>
</tr>
<tr>
<td>Status</td>
<td>Interface status:</td>
</tr>
<tr>
<td></td>
<td>• <strong>absent</strong>—Interface is not a VCP link.</td>
</tr>
<tr>
<td></td>
<td>• <strong>down</strong>—VCP link is down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>up</strong>—VCP link is up.</td>
</tr>
<tr>
<td>Speed (mbps)</td>
<td>Speed of the interface in megabits per second.</td>
</tr>
<tr>
<td>NeighborID/Interface</td>
<td>The Virtual Chassis member ID and interface of a VCP on a member that is connected to the interface or PIC/Port field in the same row as this interface.</td>
</tr>
</tbody>
</table>

### Sample Output

**show virtual-chassis vc-port (EX4200 Virtual Chassis)**

```bash
user@switch> show virtual-chassis vc-port
fpc0:
```
### show virtual-chassis vc-port (EX8200 Virtual Chassis)

**user@external-routing-engine> show virtual-chassis vc-port**

show virtual-chassis vc-port diagnostics optics

Syntax

show virtual-chassis vc-port diagnostics optics
<all-members>
<interface-name>
<local>
<member member-id>

Release Information

Command introduced in Junos OS Release 12.2 for EX Series switches.

Description

Display diagnostics data and alarms for Ethernet optical transceivers installed in ports configured as Virtual Chassis Ports (VCPs) in an EX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that a transceiver is not operating properly. DOM information can be used to diagnose why a transceiver is not working.

On some EX Series switches, the request virtual-chassis vc-port diagnostics optics command must be entered to run a diagnostic scan before you can gather the show virtual-chassis vc-port diagnostics optics output.

Options

none—Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis configuration.

all-members—(Optional) Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis configuration.

interface-name—(Optional) Display diagnostics information for the transceiver installed in a specified VCP.

local—(Optional) Display diagnostics information for transceivers installed in VCPs on the switch or external Routing Engine on which this command is entered.

member member-id—(Optional) Display diagnostics information for transceivers installed in VCPs on a specified member of a Virtual Chassis configuration.

Required Privilege Level

show virtual-chassis vc-port statistics

Syntax

```
show virtual-chassis vc-port statistics
<all-members>
<brief | detail | extensive >
<interface-name>
<local>
<member member-id>
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
The options `all-members`, `brief`, `detail`, `extensive`, and `local` were added in Junos OS Release 9.3 for EX Series switches.

Description

Display the traffic statistics collected on Virtual Chassis ports (VCPs).

Options

- `none`—Display traffic statistics for VCPs of all members of a Virtual Chassis configuration.
- `brief | detail | extensive`—(Optional) Display the specified level of output. Using the `brief` option is equivalent to entering the command with no options (the default). The `detail` and `extensive` options provide identical displays.
- `all-members`—(Optional) Display traffic statistics for VCPs of all members of a Virtual Chassis configuration.
- `interface-name`—(Optional) Display traffic statistics for the specified VCP.
- `local`—(Optional) Display traffic statistics for VCPs on the switch or external Routing Engine on which this command is entered.
- `member member-id`—(Optional) Display traffic statistics for VCPs on the specified member of a Virtual Chassis configuration.

Required Privilege Level

`view`

<td>detail, extensive</td>
</tr>
<tr>
<td><strong>CRC alignment errors</strong></td>
<td>Number of packets received on the VCP that had a length—excluding framing bits, but including frame check sequence (FCS) octets—of between 64 and 1518 octets, inclusive, and had one of the following errors:</td>
<td>detail, extensive</td>
</tr>
<tr>
<td></td>
<td>• Invalid FCS with an integral number of octets (FCS error)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Invalid FCS with a nonintegral number of octets (alignment error)</td>
<td></td>
</tr>
</tbody>
</table>
Table 571: show virtual-chassis vc-port statistics Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oversize packets</td>
<td>Number of packets received on the VCP that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Undersize packets</td>
<td>Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits but including FCS octets) and were otherwise well formed.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Jabber packets</td>
<td>Number of packets received on the VCP that were longer than 1518 octets—excluding framing bits, but including FCS octets—and that had either an FCS error or an alignment error.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> This definition of <em>jabber</em> is different from the definition in IEEE-802.3 section 8.2.1.5 (10Base5) and section 10.3.1.4 (10Base2). These documents define <em>jabber</em> as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</td>
<td></td>
</tr>
<tr>
<td>Fragments received</td>
<td>Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td></td>
<td>Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td>Ifout errors</td>
<td>Number of outbound packets received on the VCP that could not be transmitted because of errors.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Packet drop events</td>
<td>Number of outbound packets received on the VCP that were dropped, rather than being encapsulated and sent out of the switch as fragments. The packet drop counter is incremented if a temporary shortage of packet memory causes packet fragmentation to fail.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>64 octets frames</td>
<td>Number of packets received on the VCP (including invalid packets) that were 64 octets in length (excluding framing bits, but including FCS octets).</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>65–127 octets frames</td>
<td>Number of packets received on the VCP (including invalid packets) that were between 65 and 127 octets in length, inclusive (excluding framing bits, but including FCS octets).</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>128–255 octets frames</td>
<td>Number of packets received on the VCP (including invalid packets) that were between 128 and 255 octets in length, inclusive (excluding framing bits, but including FCS octets).</td>
<td>detail, extensive</td>
</tr>

- Troubleshooting an EX Series Virtual Chassis on page 4605

Troubleshooting an EX Series Virtual Chassis

This topic describes the following troubleshooting issues for a Virtual Chassis:

- A Disconnected Member Switch’s ID Is Not Available for Reassignment on page 4605
- Load Factory Default Does Not Commit on a Multimember Virtual Chassis on page 4605
- The Member ID Persists When a Member Switch Is Disconnected From a Virtual Chassis on page 4606
- A Member Switch Is Not Participating in a Mixed Virtual Chassis on page 4606

A Disconnected Member Switch’s ID Is Not Available for Reassignment

**Problem**
You disconnected a switch from the Virtual Chassis, but the disconnected switch’s member ID is still displayed in the status output. You cannot reassign that member ID to another switch.

**Solution**
When you disconnect a member of a Virtual Chassis configuration, the master retains the member ID and member configuration in its configuration database. Output from the `show virtual-chassis` command continues to display the member ID of the disconnected member with a status of `NotPrsnt`.

If want to permanently disconnect the member switch, you can free up the member ID by using the `request virtual-chassis recycle` command. This will also clear the status of that member.

Load Factory Default Does Not Commit on a Multimember Virtual Chassis

**Problem**
The `load factory-default` command fails on a multimember Virtual Chassis.

**Solution**
The `load factory-default` command is not supported on a multimember Virtual Chassis configuration. For information on how to revert the switches in the Virtual Chassis to
factory default settings, see “Reverting to the Default Factory Configuration for the EX Series Switch” on page 504.

The Member ID Persists When a Member Switch Is Disconnected From a Virtual Chassis

Problem
Gigabit Ethernet interfaces retain their previous slot numbers when a member switch is disconnected from the Virtual Chassis.

Solution
If a switch had been previously connected as a member of a Virtual Chassis configuration, it retains the member ID that it was assigned as a member of that configuration even after it is disconnected and operating as a standalone switch. The interfaces that were configured while the switch was a member of the Virtual Chassis configuration retain the old member ID as the first digit of the interface name.

For example, if the switch was previously member 1, its interfaces are named ge-1/0/0 and so on.

To change the switch's member ID, so that its member ID is 0, and to rename the switch's interfaces accordingly:

1. To change the member ID to 0:
   user@switch> request virtual-chassis renumber member-id 1 new-member-id 0

2. To rename the interfaces to match the new member ID:
   [edit virtual-chassis]
   user@switch# replace pattern ge-1/ with ge-0/

A Member Switch Is Not Participating in a Mixed Virtual Chassis

Problem
A member switch in a mixed Virtual Chassis is not participating in the Virtual Chassis. The show virtual-chassis output indicates the member switch status is Inactive or NotPrsnt.

This issue is most likely to occur immediately after you have cabled a mixed Virtual Chassis.

Solution
The Virtual Chassis mode on the switch might not be set to mixed mode. If the member switch is an EX4500 switch and is cabled into the Virtual Chassis through the dedicated Virtual Chassis port (VCP), the PIC mode might also be set to intraconnect instead of virtual-chassis.

To verify the Virtual Chassis mode:

user@switch> show virtual-chassis mode
fpc0:
  Mixed Mode: Enabled
fpc1:
  Mixed Mode: Enabled
fpc2:
  Mixed Mode: Enabled
fpc3:
Mixed Mode: Enabled
fpc4:

Mixed Mode: Disabled
fpc5:

Mixed Mode: Enabled

To change the Virtual Chassis mode on a member switch (in this case, member ID 4) to mixed mode:

user@switch> request virtual-chassis mode mixed member 4

(EX4500 switch only) To verify the PIC mode:

user@switch> show chassis pic-mode

fpc0:
   Pic Mode: Not-Applicable

fpc1:
   Pic Mode: Not-Applicable

fpc2:
   Pic Mode: Not-Applicable

fpc3:
   Pic Mode: Not-Applicable

fpc4:
   Pic Mode: PIC 3: Intraconnect

fpc5:
   Pic Mode: PIC 3: virtual-chassis

To change the PIC mode on an EX4500 switch to virtual-chassis mode (in this case, member ID 4):

user@switch> request chassis pic-mode virtual-chassis member 4

The member switch must be rebooted for the Virtual Chassis mode or PIC mode setting change to take effect. To reboot the member switch (in this case, member ID 4):

user@switch> request system reboot member 4
