In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on an EX Series switch that supports ELS, see Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure). To configure a static MAC-based VLAN on an EX Series switch that does not support ELS, see Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure).

For information about using 802.1X authentication to authenticate end devices and allow access to dynamic VLANs configured on a RADIUS server, see “Understanding Dynamic VLANs for 802.1X on EX Series Switches” on page 1670. You can optionally implement this feature to offload the manual assignment of VLAN traffic to automated RADIUS server databases.

Forwarding VLAN Traffic

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols and Multiple VLAN Registration Protocol (MVRP).

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. On EX Series switches, the same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under “Trunk Mode” on page 2052.

VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

EX Series switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named irb, while EX Series switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named vlan. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

Understanding Integrated Routing and Bridging Interfaces and Routed VLAN Interfaces on EX Series Switches

Virtual LANs (VLANs), by definition, divide a LAN's broadcast environment into isolated virtual broadcast domains, thereby limiting the amount of traffic flowing across the entire LAN and reducing the possible number of collisions and packet retransmissions within the LAN. For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs, you traditionally needed a router that connected the VLANs. However, you can also accomplish this forwarding with a switch by configuring one of the following features:

- On Juniper Networks EX Series Ethernet Switches that run Juniper Networks Junos operating system (Junos OS) that supports the Enhanced Layer 2 Software (ELS) configuration style, configure an integrated routing and bridging (IRB) interface.
- On EX Series switches that run Junos OS that does not support ELS, configure a routed VLAN interface (RVI).

**NOTE:** IRB interfaces and RVIs provide the same functionality. Where the functionality for both features is the same, this topic uses the term these *interfaces* to refer collectively to both IRB interfaces and RVIs. Where differences exist between the two features, this topic calls out the IRB interfaces and RVIs separately.

Configuring a switch to route traffic between VLANs reduces complexity and eliminates the costs associated with purchasing, installing, managing, powering, and cooling a router.

These interfaces route only VLAN traffic and work by logically dividing a switch into multiple virtual routing instances, thereby isolating VLAN traffic traveling across the network into virtual segments. These interfaces allow switches to recognize which packets are being sent to another VLAN's MAC addresses—then, packets are bridged (switched) whenever the destination is within the same VLAN and are routed through these interfaces only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. The switches rely on their Layer 3 capabilities to provide this basic routing between VLANs:

- Two VLANs on the same switch
- Two VLANs on different switches (routing is provided by an intermediary third switch.)
Figure 27 on page 2059 illustrates a switch routing VLAN traffic between two access layer switches using one of these interfaces.

Figure 27: An IRB Interface or RVI on a Switch Providing Routing Between Two Access Switches

This topic describes:

- When Should I Use an IRB Interface or RVI? on page 2059
- How Does an IRB Interface or RVI Work? on page 2059
- Creating an IRB Interface or RVI on page 2060
- Viewing IRB Interface and RVI Statistics on page 2061
- IRB Interfaces and RVI Functions and Other Technologies on page 2061

**When Should I Use an IRB Interface or RVI?**

Configure an IRB interface or an RVI for a VLAN if you need to:

- Allow traffic to be routed between VLANs.
- Provide Layer 3 IP connectivity to the switch.
- Monitor individual VLANs for billing purposes. Service providers often need to monitor traffic for this purpose, but this capability can be useful for enterprises where various groups share the cost of the network.

**How Does an IRB Interface or RVI Work?**

For an IRB interface, the switch provides the name irb, and for an RVI, the switch provides the name vlan. Like all Layer 3 interfaces, these interfaces require a logical unit number with an IP address assigned to it. In fact, to be useful, the implementation of these interfaces in an enterprise with multiple VLANs requires at least two logical units and two IP addresses—you must create units with addresses in each of the subnets associated with the VLANs between which you want traffic to be routed. That is, if you have two
VLANs (for example, VLAN red and VLAN blue) with corresponding subnets, your interfaces must have a logical unit with an address in the subnet for red and a logical unit with an address in the subnet for blue. The switch automatically creates direct routes to these subnets and uses these routes to forward traffic between VLANs.

The interface on the switch detects both MAC addresses and IP addresses, then routes data to other Layer 3 interfaces on routers or other switches. These interfaces detect both IPv4 and IPv6 unicast and multicast virtual routing and forwarding (VRF) traffic. Each logical interface can belong to only one routing instance and is further subdivided into logical interfaces, each with a logical interface number appended as a suffix to the names irb and vlan—for example, irb.10 and vlan.10.

Creating an IRB Interface or RVI

There are four basic steps in creating an IRB interface or RVI as shown in Figure 28 on page 2060.

Figure 28: Creating an IRB Interface or RVI

- Configure VLANs—Virtual LANs are groups of hosts that communicate as if they were attached to the same broadcast stream. VLANs are created with software and do not require a physical router to forward traffic. VLANs are Layer 2 constructs.

- Create IRB interfaces or RVIs for the VLANs—The switch’s IRB interfaces and RVIs use Layer 3 logical interfaces (unlike routers, which can use either physical or logical interfaces).
Assign an IP address to each VLAN—An IRB interface or RVI cannot be activated unless it is associated with a physical interface.

Bind the VLANs to the logical interfaces—There is a one-to-one mapping between a VLAN and an IRB interface or RVI, which means that only one of these interfaces can be mapped to a VLAN.

For specific instructions for creating an IRB interface, see “Configuring Integrated Routing and Bridging Interfaces (CLI Procedure)” on page 2122, and for an RVI, see Configuring Routed VLAN Interfaces (CLI Procedure).

Viewing IRB Interface and RVI Statistics

Some switches automatically track IRB interface and RVI traffic statistics. Other switches allow you to configure tracking. Table 260 on page 2061 illustrates the IRB interface– and RVI-tracking capability on various switches.

<table>
<thead>
<tr>
<th>Switch</th>
<th>Input (ingress)</th>
<th>Output (Egress)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EX4300</td>
<td>Automatic</td>
<td>Automatic</td>

<td>Configurable</td>
<td>Automatic</td>
</tr>
<tr>
<td>EX2200, EX3300, EX4500, EX6200</td>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

You can view input (ingress) and output (egress) totals with the following commands:

- For IRB interfaces, use the `show interfaces irb extensive` command. Look at the input and output values in the Transit Statistics field for IRB interface activity values.
- For RVI, use the `show interfaces vlan extensive` command. Look at the input and output values in the Logical Interface Transit Statistics field for RVI activity values.

IRB Interfaces and RVI Functions and Other Technologies

IRB interfaces and RVIs are similar to switch virtual interfaces (SVIs) and bridge-group virtual interfaces (BVIs), which are supported on other vendors’ devices. They can also be combined with other functions:

- VRF is often used in conjunction with Layer 3 subinterfaces, allowing traffic on a single physical interface to be differentiated and associated with multiple virtual routers. For more information about VRF, see “Understanding Virtual Routing Instances on EX Series Switches” on page 2062.
- For redundancy, you can combine an IRB interface or RVI with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments. For more information about VRRP, see “Understanding VRRP on EX Series Switches” on page 2220.
Understanding Virtual Routing Instances on EX Series Switches

Virtual routing instances allow administrators to divide a Juniper Networks EX Series Ethernet Switch into multiple independent virtual routers, each with its own routing table. Splitting a device into many virtual routing instances isolates traffic traveling across the network without requiring multiple devices to segment the network.

You can use virtual routing instances to isolate customer traffic on your network and to bind customer-specific instances to customer-owned interfaces.

Virtual routing and forwarding (VRF) is often used in conjunction with Layer 3 subinterfaces, allowing traffic on a single physical interface to be differentiated and associated with multiple virtual routers. Each logical Layer 3 subinterface can belong to only one routing instance.

EX Series switches support IPv4 and IPv6 unicast and multicast VRF traffic. Table 261 on page 2062 provides the number of IPv4 and IPv6 VRFs supported by each EX Series switch.

Table 261: Number of IPv4 and IPv6 VRFs Supported By EX Series Switches

Understanding Multiple VLAN Registration Protocol (MVRP) on EX Series Switches

Multiple VLAN Registration Protocol (MVRP) is a Layer 2 messaging protocol that manages the addition, deletion, and renaming of active virtual LANs, thereby reducing network administrators’ time spent on these tasks. Use MVRP on Juniper Networks EX Series Ethernet Switches to dynamically register and unregister active VLANs on trunk interfaces. Using MVRP means that you do not have to manually register VLANs on all connections—that is, you do not need to explicitly bind a VLAN to each trunk interface. With MVRP, you configure a VLAN on one switch interface and the VLAN configuration is distributed through all active switches in the domain.

MVRP is an application protocol of the Multiple Registration Protocol (MRP) and is defined in the IEEE 802.1ak standard. MRP and MVRP replace Generic Attribute Registration Protocol (GARP) and GARP VLAN Registration Protocol (GVRP) and overcome GARP and GVRP limitations.

This topic describes:

- How MVRP Updates, Creates, and Deletes VLANs on the Switches on page 2063
- MVRP Is Disabled by Default on the Switches on page 2063
- MRP Timers Control MVRP Updates on page 2064
- MVRP Uses MRP Messages to Transmit Switch and VLAN States on page 2064
- Compatibility Issues with Junos OS Releases of MVRP on page 2065

How MVRP Updates, Creates, and Deletes VLANs on the Switches

When any MVRP-member VLAN is changed, that VLAN sends a protocol data unit (PDU) to all other MVRP-member active VLANs. The PDU informs the other VLANs which switches and interfaces currently belong to the sending VLAN. This way, all MVRP-member VLANs are always updated with the current VLAN state of all other MVRP-member VLANs. Timers dictate when PDUs can be sent and when switches receiving MVRP PDUs can update their MVRP VLAN information.

In addition to sending PDU updates, MVRP dynamically creates VLANs on member interfaces when a new VLAN is added to any one interface. This way, VLANs created on one member switch are propagated to other member switches as part of the MVRP message exchange process.

To keep VLAN membership information current, MVRP removes switches and interfaces when they become unavailable. Pruning VLAN information has these benefits:

- Limits the network VLAN configuration to active participants, thereby reducing network overhead.
- Limits broadcast, unknown unicast, and multicast (BUM) traffic to interested devices.

MVRP Is Disabled by Default on the Switches

MVRP is disabled by default on the switches and, when enabled, affects only trunk interfaces. Once you enable MVRP, all VLAN interfaces on the switch belong to MVRP.
(the default normal registration mode) and those interfaces accept PDU messages and send their own PDU messages. To prevent one or more interfaces from participating in MVRP, you can specifically configure an interface to forbidden registration mode instead of the default normal mode.

VLAN updating, dynamic VLAN configuration through MVRP, and VLAN pruning are all active on trunk interfaces when MVRP is enabled.

**MRP Timers Control MVRP Updates**

MVRP registration and updates are controlled by timers that are part of the MRP. The timers define when MVRP PDUs can be sent and when MVRP information can be updated on a switch.

The timers are set on a per-interface basis, and on EX Series switches that use Juniper Networks Junos operating system (Junos OS) with support for the Enhanced Layer 2 Software (ELS) configuration style, the timers are also set on a per-switch basis.

On an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, the value on the interface level takes precedence.

The following MRP timers are used to control the operation of MVRP:

- **Join timer**—Controls the interval for the next MVRP PDU transmit opportunity.
- **Leave timer**—Controls the period of time that an interface on the switch waits in the leave state before changing to the unregistered state.
- **LeaveAll timer**—Controls the frequency with which the interface generates LeaveAll messages.

---

**BEST PRACTICE:** Unless there is a compelling reason to change the timer settings, leave the default settings in place. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.

---

**MVRP Uses MRP Messages to Transmit Switch and VLAN States**

MVRP uses MRP messages to register and declare MVRP states for a switch or VLAN and to inform the switching network that a switch or VLAN is leaving MVRP. These messages are communicated as part of the PDU sent by any switch interface to the other switches in the network.

The following MRP messages are communicated for MVRP:

- **Empty**—MVRP information is not declared and no VLAN is registered.
- **In**—MVRP information is not declared but a VLAN is registered.
- **JoinEmpty**—MVRP information is declared but no VLAN is registered.
- **JoinIn**—MVRP information is declared and a VLAN is registered.
- Leave—MVRP information that was previously declared is withdrawn.
- LeaveAll—Unregister all VLANs on the switch. VLANs must re-register to participate in MVRP.
- New—The MVRP information is new and a VLAN might not be registered yet.

**Compatibility Issues with Junos OS Releases of MVRP**

Except in Junos OS Releases 11.2 and earlier, MVRP has conformed with IEEE standard 802.1ak and IEEE Draft 802.1Q regarding the inclusion of an extra byte in the protocol data units (PDUs) sent and received by MVRP. Table 262 on page 2065 outlines the MVRP versions and whether or not each version includes the extra byte in the PDU. Table 262 on page 2065 also labels each MVRP version with a scenario number, which is used throughout the remainder of this discussion for brevity.

**Table 262: Junos OS MVRP Versions and Inclusion of Extra Byte in PDU**

<table>
<thead>
<tr>
<th>Scenario 1</th>
<th>Scenario 2</th>
<th>Scenario 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVRP in Junos OS Releases 11.2 and Earlier For EX Series Switches That Do Not Support Enhanced Layer 2 Software (ELS) Configuration Style</td>
<td>MVRP in Junos OS Releases 11.3 and Later For EX Series Switches That Do Not Support ELS</td>
<td>MVRP in Junos OS Releases 13.2 and Later For EX Series Switches With Support For ELS</td>
</tr>
<tr>
<td>Includes extra byte in the PDU</td>
<td>By default, does not include extra byte in the PDU</td>
<td>By default, includes extra byte in the PDU</td>
</tr>
</tbody>
</table>

As a result of the non-conformance of Releases 11.2 and earlier and changes in the standards with regard to the extra byte, a compatibility issue exists between some of the Junos OS versions of MVRP. This issue can result in some versions of MVRP not recognizing PDUs without the extra byte.

To address this compatibility issue, the MVRP versions described in scenarios 2 and 3 include the ability to control whether or not the PDU includes the extra byte. Before using these controls, however, you must understand each scenario that applies to your environment and plan carefully so that you do not inadvertently create an additional compatibility issue between the MVRP versions in scenarios 2 and 3.

Table 263 on page 2065 provides a summary of environments that include the various MVRP scenarios and whether or not a particular environment requires you to take action.

**Table 263: MVRP Environments and Description of Required Actions**

### Understanding MAC Address Aging

Juniper Networks EX Series Ethernet Switches store MAC addresses in the Ethernet switching table, also called the MAC table. When the aging time for a MAC address in the table expires, the address is removed.

If your switch runs Juniper Networks Junos operating system (Junos OS) for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, you can configure the MAC table aging time on all VLANs on the switch. If your switch runs Junos OS that does not support ELS, you can configure the MAC table aging time on all VLANs on the switch or on specified VLANs, as well as configure aging time to be unlimited, either on all VLANs or on specified VLANs, so that MAC addresses never age out of the table.

To learn MAC addresses, the switch reads all packets that it detects on the LAN or on the local VLAN, looking for MAC addresses of sending nodes. It places these addresses
into its Ethernet switching table, along with two other pieces of information—the interface on which the traffic was received and the time when the address was learned.

When the switch receives traffic on an interface, it searches the Ethernet switching table for the MAC address of the destination. If the MAC address is not found, the traffic is flooded out all of the other interfaces associated with the VLAN. For example, if traffic is received on an interface that is associated with VLAN v-10 and there is no entry in the Ethernet switching table for VLAN v-10 (the Ethernet switching table is organized by VLAN), then the traffic is flooded to all access and trunk interfaces that are members of VLAN v-10.

Flooding allows the switch to learn about destinations that are not yet in its Ethernet switching table. If a particular destination MAC address is not in the Ethernet switching table, the switch floods the traffic to all interfaces except the interface on which it was received. When the destination node receives the flooded traffic, it sends an acknowledgment packet back to the switch, allowing the switch to learn the MAC address of the node and to add the address to its Ethernet switching table.

The switch uses a mechanism called aging to keep the Ethernet switching table current. For each MAC address in the Ethernet switching table, the switch records a timestamp of when the information about the network node was learned. Each time the switch detects traffic from a MAC address that is in its Ethernet switching table, it updates the timestamp of that MAC address. A timer on the switch periodically checks the timestamp, and if the MAC address of a node is older than the value set, the switch removes that MAC address from the Ethernet switching table. This aging process ensures that the switch tracks only active MAC addresses on the network and that it is able to flush out from the Ethernet switching table MAC addresses that are no longer available.

You configure how long MAC addresses remain in the Ethernet switching table by:

- (On switches that run Junos OS with support for the ELS configuration style) Using the `global-mac-table-aging-time` statement in the `[edit protocols l2-learning]` hierarchy.
- (On switches that run Junos OS that does not support ELS) Using the `mac-table-aging-time` statement in either the `[edit ethernet-switching-options]` or the `[edit vlans]` hierarchy, depending on whether you want to configure it for the entire switch or only for specific VLANs.

For example, in a topology with EX switches that run Junos OS that does not support ELS, if you have a printer VLAN, you might choose to configure the aging time for that VLAN to be considerably longer than for other VLANs so that MAC addresses of printers on this VLAN age out less frequently. Because the MAC addresses remain in the table, even if a printer has been idle for some time before traffic arrives for it, the switch still finds the MAC address and does not need to flood the traffic to all other interfaces.

Similarly, in a data center environment where the list of servers connected to the switch is fairly stable, you might choose to increase MAC address aging time, or even set it to unlimited, to increase the efficiency of the utilization of network bandwidth by reducing flooding.
Redundant Trunk Groups

Understanding Redundant Trunk Links on EX Series Switches

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk port on a Juniper Networks EX Series Ethernet Switch goes down. In that case, traffic is routed to another trunk port, keeping network convergence time to a minimum.

To configure a redundant trunk link, create a redundant trunk group. The redundant trunk group is configured on the access switch and contains two links: a primary or active link, and a secondary link. If the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal spanning-tree protocol convergence.

NOTE: You can configure a maximum of 16 redundant trunk groups on most standalone switches or on Virtual Chassis. The EX8200 switch and EX8200 Virtual Chassis, however, support up to 254 redundant trunk groups.

Data traffic is forwarded only on the active link. Data traffic on the secondary link is dropped and shown as dropped packets when you issue the operational mode command `show interfaces interface-name extensive`.

While data traffic is blocked on the secondary link, Layer 2 control traffic is still permitted. For example, an LLDP session can be run between two switches on the secondary link.

Rapid Spanning Tree Protocol (RSTP) is enabled by default on EX Series switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You must disable RSTP on an interface if a redundant trunk group is configured on that interface. For example, in Figure 29 on page 2069, in addition to disabling RSTP on the Switch 3 interfaces, you must also disable RSTP on the Switch 1 and Switch 2 interfaces connected to Switch 3. Spanning-tree protocols can, however, continue operating on other interfaces on those switches—for example on the link between Switch 1 and Switch 2.

Figure 29 on page 2069 shows three switches in a basic topology for redundant trunk links. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2). Link 1 and Link 2 are in a redundant trunk group called group1. Link 1 is designated as the primary link. Traffic flows between Switch 3 in the access layer and Switch 1 in the distribution layer through Link 1. While Link 1 is active, Link 2 blocks traffic.
Figure 29: Redundant Trunk Group, Link 1 Active

Figure 30 on page 2069 illustrates how the redundant trunk link topology works when the primary link goes down.

Figure 30: Redundant Trunk Group, Link 2 Active
When Link 1 between Switch 1 and Switch 3 goes down, Link 2 takes over as the active link. Traffic between the access layer and the distribution layer is then automatically switched to Link 2 between Switch 1 and Switch 2.

### Proxy ARP

**Understanding Proxy ARP on EX Series Switches**

You can configure proxy Address Resolution Protocol (ARP) on your Juniper Networks EX Series Ethernet Switch to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

- *What Is ARP? on page 2070*
- *Proxy ARP Overview on page 2070*
- *Best Practices for Proxy ARP on EX Series Switches on page 2071*

#### What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

**Proxy ARP Overview**

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

**NOTE:** For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.
You can configure proxy ARP for each interface. You can also configure proxy ARP for an integrated routing and bridging (IRB) interface named irb or a routed VLAN interface (RVI) named vlan. (On EX Series switches that use Juniper Networks Junos operating system (Junos OS) with support for the Enhanced Layer 2 Software (ELS) configuration style, the feature is known as an IRB interface. On EX Series switches that use Junos OS that does not support ELS, the feature is known as an RVI.)

EX Series switches support two modes of proxy ARP, restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- **Restricted**—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.

- **Unrestricted**—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Juniper Networks Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

### Best Practices for Proxy ARP on EX Series Switches

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP on the interfaces that you want, including IRB interfaces or RVIs, to restricted mode.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

- Example: Configuring Proxy ARP on an EX Series Switch on page 2113
- Configuring Proxy ARP (CLI Procedure) on page 2130
EX Series switches use bridging and virtual LANs (VLANs) to connect network devices in a LAN—desktop computers or laptops, IP telephones, printers, file servers, wireless access points, and others—and to segment the LAN into smaller broadcast domains.

This example describes how to configure basic bridging and a VLAN on an EX Series switch:

- Requirements on page 2074
- Overview and Topology on page 2074

Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs Junos OS that does not support ELS, see Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.
Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you set up bridging and a VLAN, be sure you have:

- Installed your EX Series switch. See the installation instructions for your switch.
- Performed the initial switch configuration. See Connecting and Configuring an EX Series Switch (CLI Procedure).

Overview and Topology

EX Series switches connect network devices in an office LAN or a data center LAN to provide sharing of common resources such as printers and file servers and to enable wireless devices to connect to the LAN through wireless access points. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN.

To use an EX Series switch to connect network devices on a LAN, you must, at a minimum, explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist, as is the case with this example. You must also assign all needed interfaces to the VLAN, after which the interfaces function in access mode. After the VLAN is configured, you can plug access devices—such as desktop or laptop computers, IP telephones, file servers, printers, and wireless access points—into the switch, and they are joined immediately into the VLAN, and the LAN is up and running.

The topology used in this example consists of one EX4300-24P switch, which has a total of 24 ports. All ports support Power over Ethernet (PoE), which means they provide both network connectivity and electric power for the device connecting to the port. To these ports, you can plug in devices requiring PoE, such as Avaya VoIP telephones, wireless access points, and some IP cameras. (Avaya phones have a built-in hub that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one port on the switch.) Table 264 on page 2075 details the topology used in this configuration example.
### Table 264: Components of the Basic Bridging Configuration Topology

<table>

### Configuration

**To set up basic bridging and a VLAN:**

**CLI Quick Configuration**

To quickly configure a VLAN, copy the following commands and paste them into the switch terminal window:

```plaintext
[edit]
set vlans employee-vlan vlan-id 10
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
```
You must then plug the wireless access point into PoE-enabled port `ge-0/0/0` and the Avaya IP phones into the PoE-enabled ports `ge-0/0/1` through `ge-0/0/7`. Also, plug the PCs, file servers, and printers into ports `ge-0/0/8` through `ge-0/0/12` and `ge-0/0/17` through `ge-0/0/20`.

### Step-by-Step Procedure

To set up basic bridging and a VLAN:

1. Create a VLAN named `employee-vlan` and specify the VLAN ID of 10 for it:
   ```
   [edit vlans]
   user@switch# set employee-vlan vlan-id 10
   ```

2. Assign interfaces `ge-0/0/0` through `ge-0/0/12`, and `ge-0/0/17` through `ge-0/0/20` to the `employee-vlan` VLAN:
   ```
   [edit interface]
   user@switch# set ge-0/0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
   user@switch# set ge-0/0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
   ```

3. Connect the wireless access point to switch port `ge-0/0/0`.

4. Connect the seven Avaya phones to switch ports `ge-0/0/1` through `ge-0/0/7`.

5. Connect the five PCs to ports `ge-0/0/8` through `ge-0/0/12`.

6. Connect the two file servers to ports `ge-0/0/17` and `ge-0/0/18`.

7. Connect the two printers to ports `ge-0/0/19` and `ge-0/0/20`. 
Results

Check the results of the configuration:

```plaintext
user@switch> show configuration
ge-0/0/0 {
    unit 0 {
        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
ge-0/0/1 {
    unit 0 {
        family ethernet-switching {

        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
ge-0/0/12 {
    unit 0 {
        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
Verification

To verify that switching is operational and that employee-vlan has been created, perform these tasks:

- Verifying That the VLAN Has Been Created on page 2079
- Verifying That Interfaces Are Associated with the Proper VLANs on page 2080

Verifying That the VLAN Has Been Created

Purpose

Verify that the VLAN named employee-vlan has been created on the switch.
**Action**  
List all VLANs configured on the switch:

<table>
<thead>
<tr>
<th>Routing instance</th>
<th>VLAN name</th>
<th>Tag</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-switch</td>
<td>employee-vlan</td>
<td>10</td>
<td>ge-0/0/0.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/1.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/2.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/3.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/4.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/5.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/6.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/7.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/8.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/9.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/10.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/11.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/12.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/17.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/18.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/19.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ge-0/0/20.0</td>
</tr>
</tbody>
</table>

...  

**Meaning**  
The `show vlans` command lists the VLANs configured on the switch. This output shows that the VLAN `employee-vlan` has been created.

**Verifying That Interfaces Are Associated with the Proper VLANs**

**Purpose**  
Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.
Action

List all interfaces on which switching is enabled:

```
user@switch> show ethernet-switching interfaces
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, 
                        LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
ge-0/0/0.0                    65535                                 untagged

</tbody>
</table>
Meaning

The `show ethernet-switching interfaces` command lists all interfaces on which switching is enabled (in the Logical interface column), along with the VLANs that are active on the interfaces (in the VLAN members column). The output in this example shows all the connected interfaces, ge-0/0/0 through ge-0/0/12 and ge-0/0/17 through ge-0/0/20 and that they are all part of VLAN `employee-vlan`. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows ge-0/0/0.0 instead of ge-0/0/0. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

- Example: Connecting Access Switches to a Distribution Switch on page 2083
- Understanding Bridging and VLANs on EX Series Switches on page 2049

Example: Connecting Access Switches to a Distribution Switch

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Connecting an Access Switch to a Distribution Switch. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect access switches to a distribution switch:

- Requirements on page 2084
- Overview and Topology on page 2084
- Configuring the Access Switch on page 2086
• Configuring the Distribution Switch on page 2090
• Verification on page 2092

Requirements

This example uses the following hardware and software components:

• Three EX Series access switches.
• One EX Series distribution switch.

NOTE: In an access switch-distribution switch topology, you can connect EX Series switches that run a version of Junos OS that supports ELS with EX Series switches that do not run a version of Junos OS that supports ELS. However, this example uses switches running ELS only to show how to configure this topology using the ELS CLI.

• Junos OS Release 12.3R2 or later that supports ELS for EX Series switches.

Before you connect an access switch to a distribution switch, be sure you have:

• Installed the switches. See the installation instructions for your switch.

• Performed the initial software configuration on both switches. For information about the initial software configuration for all EX Series switches except the EX9200 Series switches, see Connecting and Configuring an EX Series Switch (CLI Procedure). For information about the initial software configuration for the EX9200 Series switches, see Connecting and Configuring an EX9200 Switch (CLI Procedure).

Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect three access switches to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on one of the access switch’s uplink modules connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

Figure 31 on page 2085 shows an EX9200 distribution switch that is connected to three EX4300 access switches.
Table 265 on page 2085 describes the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

Table 265: Components of the Topology for Connecting an Access Switch to a Distribution Switch

<table>

**Configuring the Access Switch**

To configure the access switch:

**CLI Quick Configuration**

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description "Sales wireless access point port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/0 unit 0 family network-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description "Sales phone port"
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description "Sales printer port"
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description "Sales file server port"
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/26 unit 0 description "Support wireless access point port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/24 unit 0 description "Support phone port"
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/26 unit 0 description "Support printer port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/44 unit 0 description "Support file server port"
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/46 unit 0 description "Support file server port"
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/2/0 unit 0 description "Uplink module port connection to distribution switch"
set interfaces ge-0/2/0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/2/0/0 native-vlan-id 1
set interfaces ge-0/2/0 unit 0 family ethernet-switching vlan members [sales support]
set interfaces ge-0/2/0 unit 0 family ethernet-switching vlan members sales
set interfaces irb unit 0 family inet address 192.0.2.1/25
set interfaces irb unit 1 family inet address 192.0.2.129/25
set vlans sales description "Sales VLAN"
set vlans sales i3-interface irb.0
set vlans sales vlan-id 100
set vlans support description "Support VLAN"
set vlans support vlan-id 200
set vlans support i3-interface irb.1
```

**Step-by-Step Procedure**

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:

   ```
   [edit interfaces]
   user@access-switch# set ge-0/2/0 unit 0 description "Uplink module port connection to distribution switch"
   user@access-switch# set ge-0/2/0 unit 0 family ethernet-switching interface-mode trunk
   ```

2. Specify the VLANs to be aggregated on the trunk port:
3. To handle untagged packets that are received on the trunk port, create a native VLAN by configuring a VLAN ID and specifying that the trunk port is a member of the native VLAN:

```
[edit interfaces]
user@access-switch# set ge-0/2/0 unit 0 family ethernet-switching vlan members
```

4. Configure the sales VLAN:

```
[edit vlans]
user@access-switch# set sales description "Sales VLAN"
user@access-switch# set sales vlan-id 100
user@access-switch# set sales l3-interface irb.0
```

5. Configure the support VLAN:

```
[edit vlans]
user@access-switch# set support description "Support VLAN"
user@access-switch# set support vlan-id 200
user@access-switch# set support l3-interface irb.1
```

6. Create the subnet for the sales VLAN:

```
[edit interfaces]
user@access-switch# set irb unit 0 family inet address 192.0.2.1/25
```

7. Create the subnet for the support VLAN:

```
[edit interfaces]
user@access-switch# set irb unit 1 family inet address 192.0.2.129/25
```

8. Configure the interfaces in the sales VLAN:

```
[edit interfaces]
user@access-switch# set ge-0/0/0 unit 0 description "Sales wireless access point port"
user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/3 unit 0 description "Sales phone port"
user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/20 unit 0 description "Sales file server port"
user@access-switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/22 unit 0 description "Sales printer port"
user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/24 unit 0 description "Support wireless access point port"
user@access-switch# set ge-0/0/24 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/26 unit 0 description "Support phone port"
user@access-switch# set ge-0/0/26 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/44 unit 0 description "Support printer port"
user@access-switch# set ge-0/0/44 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/46 unit 0 description "Support file server port"
user@access-switch# set ge-0/0/46 unit 0 family ethernet-switching vlan members support
```
Results  Display the results of the configuration:

    user@access-switch> show configuration

            family inet { 
                address 192.0.2.1/25;
            } 
        } 
        unit 1 { 
            family inet { 
                address 192.0.2.129/25;
            } 
        } 
    } 
} 

vlans { 
    sales { 
        description "Sales VLAN";
        vlan-id 100;
        l3-interface irb.0;
    } 
    support { 
        description "Support VLAN";
        vlan-id 200;
        l3-interface irb.1;
    } 
}
TIP: To quickly configure the access switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

Configuring the Distribution Switch

To configure the distribution switch:

**CLI Quick Configuration**

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

- `set interfaces ge-0/0/0 unit 0 description "Connection to access switch"`
- `set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk`
- `set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members [sales support]`
- `set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members 1`
- `set interfaces irb unit 0 family inet address 192.0.2.2/25`
- `set interfaces irb unit 1 family inet address 192.0.2.130/25`
- `set vlans sales description "Sales VLAN"`
- `set vlans sales vlan-id 100`
- `set vlans sales l3-interface irb.0`
- `set vlans support description "Support VLAN"`
- `set vlans support vlan-id 200`
- `set vlans support l3-interface irb.1`

**Step-by-Step Procedure**

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:

   ```
   [edit interfaces]
   user@distribution-switch# set ge-0/0/0 unit 0 description "Connection to access switch"
   user@distribution-switch# set ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk
   ```

2. Specify the VLANs to be aggregated on the trunk port:

   ```
   [edit interfaces]
   user@distribution-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members [sales support]
   ```

3. To handle untagged packets that are received on the trunk port, create a native VLAN by configuring a VLAN ID and specifying that the trunk port is a member of the native VLAN:

   ```
   [edit interfaces]
   user@distribution-switch# set ge-0/0/0 native-vlan-id 1
   user@distribution-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members 1
   ```

4. Configure the sales VLAN:

   ```
   [edit vlans]
   user@distribution-switch# set sales description "Sales VLAN"
   user@distribution-switch# set sales vlan-id 100
   user@distribution-switch# set sales l3-interface irb.0
   ```
The VLAN configuration for the distribution switch includes the `set l3-interface irb.0` command to route traffic between the sales and support VLANs. The VLAN configuration for the access switch does not include this statement because the access switch is not monitoring IP addresses. Instead, the access switch is passing the IP addresses to the distribution switch for interpretation.

5. Configure the support VLAN:

```
[edit vlans]
user@distribution-switch# set support description "Support VLAN"
user@distribution-switch# set support vlan-id 200
user@distribution-switch# set support l3-interface irb.1
```

The VLAN configuration for the distribution switch includes the `set l3-interface irb.1` command to route traffic between the sales and support VLANs. The VLAN configuration for the access switch does not include this statement because the access switch is not monitoring IP addresses. Instead, the access switch is passing the IP addresses to the distribution switch for interpretation.

6. Create the subnet for the sales VLAN:

```
[edit interfaces]
user@distribution-switch# set irb unit 0 family inet address 192.0.2.2/25
```

7. Create the subnet for the support VLAN:

```
[edit interfaces]
user@distribution-switch# set irb unit 1 family inet address 192.0.2.130/25
```
Results Display the results of the configuration:

user@distribution-switch> show configuration
interfaces {
  ge-0/0/0 {
    native-vlan-id 1;
    unit 0 {
      description "Connection to access switch";
      family ethernet-switching {
        interface-mode trunk;
        vlan {
          members [ 1 sales support ];
        }
      }
    }
  }
  irb {
    unit 0 {
      family inet {
        address 192.0.2.2/25;
      }
    }
    unit 1 {
      family inet {
        address 192.0.2.130/25;
      }
    }
  }
}
vlans {
  sales {
    description "Sales VLAN";
    vlan-id 100;
    l3-interface irb.0;
  }
  support {
    description "Support VLAN";
    vlan-id 200;
    l3-interface irb.1;
  }
}

TIP: To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the VLAN Members and Interfaces on the Access Switch on page 2093
- Verifying the VLAN Members and Interfaces on the Distribution Switch on page 2093
Verifying the VLAN Members and Interfaces on the Access Switch

**Purpose**
Verify that the sales and support VLANs have been created on the switch.

**Action**
List all VLANs configured on the switch:

```
user@access-switch> show vlans
Routing instance  VLAN name  Tag  Interfaces
default-switch  sales       100  ge-0/0/20.0
                ge-0/0/22.0
                ge-0/0/3.0*
                ge-0/0/0.0*
                ge-0/2/0.0*

default-switch  support     200  ge-0/0/24.0
                ge-0/0/26.0
                ge-0/0/44.0*
                ge-0/0/46.0*
                ge-0/2/0.0*
```

**Meaning**
The output shows the sales and support VLANs and the interfaces that are configured as members of the respective VLANs.

Verifying the VLAN Members and Interfaces on the Distribution Switch

**Purpose**
Verify that the sales and support VLANs have been created on the switch.

**Action**
List all VLANs configured on the switch:

```
user@distribution-switch> show vlans
Routing instance  VLAN name  Tag  Interfaces
default-switch  sales       100  ge-0/0/0.0*

default-switch  support     200  ge-0/0/0.0*
```

**Meaning**
The output shows the sales and support VLANs and the interface (ge-0/0/0.0) that is configured as a member of both VLANs. Interface ge-0/0/0.0 is also the trunk interface connected to the access switch.

**Related Documentation**
- Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch on page 2073
- Configuring VLANs for EX Series Switches (CLI Procedure) on page 2119
- Understanding Bridging and VLANs on EX Series Switches on page 2049
- Example: Using Virtual Routing Instances to Route Among VLANs on EX Series Switches

Virtual routing instances allow each EX Series switch to have multiple routing tables on a device. With virtual routing instances, you can segment your network to isolate traffic without setting up additional devices.
This example describes how to create virtual routing instances:

- Requirements on page 2094
- Overview and Topology on page 2094
- Configuration on page 2094
- Verification on page 2096

Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 9.2 or later for EX Series switches

Before you create the virtual routing instances, make sure you have:

- Configured the necessary VLANs. See Configuring VLANs for EX Series Switches (CLI Procedure), “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119, or “Configuring VLANs for EX Series Switches (J-Web Procedure)” on page 2117.

Overview and Topology

In a large office, you may need multiple VLANs to properly manage your traffic. This configuration example shows a simple topology to illustrate how to connect a single EX Series switch with a virtual routing instance for each of two VLANs, enabling traffic to pass between those VLANs.

In the example topology, the LAN is segmented into two VLANs, each associated with an interface and a routing instance on the EX Series switch.

Configuration

CLI Quick Configuration

To quickly create and configure virtual routing instances, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 vlan-tagging
set interfaces ge-0/0/3 unit 0 vlan-id 1030 family inet address 103.1.1.1/24
set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 103.1.1.1/24
set routing-instances r1 instance-type virtual-router
set routing-instances r1 interface ge-0/0/1.0
set routing-instances r1 interface ge-0/0/3.0
set routing-instances r2 instance-type virtual-router
set routing-instances r2 interface ge-0/0/2.0
set routing-instances r2 interface ge-0/0/3.1
```

Step-by-Step Procedure

To configure virtual routing instances:

1. Create a VLAN-tagged interface:
   ```
   [edit]user@switch# set interfaces ge-0/0/3 vlan-tagging
   ```

2. Create two subinterfaces, on the interface, one for each routing instance:
   ```
   [edit]user@switch# set interfaces ge-0/0/3 unit 0 vlan-id 1030 family inet address 103.1.1.1/24
   ```
user@switch# set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 103.1.1.1/24

3. Create two virtual routers:
   [edit]user@switch# set routing-instances r1 instance-type virtual-router
   user@switch# set routing-instances r2 instance-type virtual-router

4. Set the interfaces for the virtual routers:
   [edit]user@switch# set routing-instances r1 interface ge-0/0/1.0
   user@switch# set routing-instances r1 interface ge-0/0/3.0
   user@switch# set routing-instances r2 interface ge-0/0/2.0
   user@switch# set routing-instances r2 interface ge-0/0/3.1

Results Check the results of the configuration:

user@switch> show configuration
interfaces {
    ge-0/0/1 {
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/2 {
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/3 {
        vlan-tagging;
        unit 0 {
            vlan-id 1030;
            family inet {
                address 103.1.1.1/24;
            }
        }
        unit 1 {
            vlan-id 1031;
            family inet {
                address 103.1.1.1/24;
            }
        }
    }
}

routing-instances {
    r1 {
        instance-type virtual-router;
        interface ge-0/0/1.0;
        interface ge-0/0/3.0;
    }
    r2 {
        instance-type virtual-router;
        interface ge-0/0/2.0;
        interface ge-0/0/3.1;
    }
}
Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Routing Instances Were Created on page 2096

**Verifying That the Routing Instances Were Created**

**Purpose**  
Verify that the virtual routing instances were properly created on the switch.

**Action**  
Use the `show route instance` command:

```
user@switch> show route instance

Instance       Type
master         Primary RIB forwarding Active/holddown/hidden
               inet.0            3/0/0
r1             virtual-router
               r1.inet.0        1/0/0
r2             virtual-router
               r2.inet.0        1/0/0
```

**Meaning**  
Each routing instance created is displayed, along with its type, information about whether it is active or not, and its primary routing table.

- Configuring Virtual Routing Instances (CLI Procedure) on page 2125

---

**Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches**

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex and the task of efficiently configuring VLANs on multiple EX Series switches becomes increasingly difficult. However, you can automate VLAN administration by enabling Multiple VLAN Registration Protocol (MVRP) on the network. MVRP also dynamically creates VLANs, further simplifying the network overhead required to statically configure VLANs.

**NOTE:** Only trunk interfaces can be enabled for MVRP.
This example describes how to use MVRP to automate administration of VLAN membership changes within your network and how to use MVRP to dynamically create VLANs:

- Requirements on page 2097
- Overview and Topology on page 2097
- Configuring VLANs and MVRP on Access Switch A on page 2099
- Configuring VLANs and MVRP on Access Switch B on page 2101
- Configuring VLANs and MVRP on Distribution Switch C on page 2103
- Verification on page 2104

Requirements

This example uses the following hardware and software components:

- Two EX Series access switches
- One EX Series distribution switch
- Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you configure MVRP on an interface, you must enable one of the following spanning tree protocols on that interface:

- Rapid Spanning-Tree Protocol (RSTP). For more information about RSTP, see “Understanding RSTP for EX Series Switches” on page 4300.
- Multiple Spanning-Tree Protocol (MSTP). For more information about MSTP, see “Understanding MSTP for EX Series Switches” on page 4298.

Overview and Topology

MVRP is used to manage dynamic VLAN registration in a LAN. It can also be used to dynamically create VLANs.

This example uses MVRP to dynamically create VLANs on the switching network. Alternatively, you can disable dynamic VLAN creation and create VLANs statically. Enabling MVRP on the trunk interface of each switch in your switching network ensures that the active VLAN information for the switches in the network is propagated to each switch through the trunk interfaces, assuming dynamic VLAN creation is enabled for MVRP.

MVRP ensures that the VLAN membership information on the trunk interface is updated as the switch’s access interfaces become active or inactive in the configured VLANs in a static or dynamic VLAN creation setup.

You do not need to explicitly bind a VLAN to the trunk interface. When MVRP is enabled, the trunk interface advertises all the VLANs that are active (bound to access interfaces) on that switch. An MVRP-enabled trunk interface does not advertise VLANs that are configured on the switch but are not currently bound to an access interface. Thus, MVRP provides the benefit of reducing network overhead—by limiting the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.
When VLAN access interfaces become active or inactive, MVRP ensures that the updated information is advertised on the trunk interface. Thus, in this example, distribution Switch C does not forward traffic to inactive VLANs.

**NOTE:** This example shows a network with three VLANs: finance, sales, and lab. All three VLANs are running the same version of Junos OS. If switches in this network were running a mix of Junos OS releases that included Release 11.3, additional configuration would be necessary—see Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) for details.

Figure 32 on page 2098 shows MVRP configured on two access switches and one distribution switch.

Figure 32: MVRP Configured on Two Access Switches and One Distribution Switch for Automatic VLAN Administration

Table 266 on page 2098 explains the components of the example topology.

Interfaces

Access Switch A interfaces:

- **ge-0/0/1**—Connects PC1 to access Switch A.
- **ge-0/0/2**—Connects PC2 to access Switch A.
- **ge-0/0/3**—Connects PC3 to access Switch A.
- **xe-0/1/1**—Connects access Switch A to distribution Switch C (trunk).

Access Switch B interfaces:

- **ge-0/0/0**—Connects PC4 to access Switch B.
- **ge-0/0/1**—Connects PC5 to access Switch B.
- **ge-0/0/2**—Reserved for future use,
- **xe-0/1/0**—Connects access Switch B to distribution Switch C. (trunk)

Distribution Switch C interfaces:

- **xe-0/1/1**—Connects distribution Switch C to access Switch A. (trunk)
- **xe-0/1/0**—Connects distribution Switch C to access Switch B. (trunk)

**Configuring VLANs and MVRP on Access Switch A**

To configure VLANs on the switch, bind access interfaces to the VLANs, and enable MVRP on the trunk interface of access Switch A, perform these tasks:

**CLI Quick Configuration**

To quickly configure access Switch A for MVRP, copy the following commands and paste them into the switch terminal window of Switch A:

```
[edit]
sedit vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members lab
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/1/1 unit 0 family ethernet-switching interface-mode trunk
set protocols mvrp interface xe-0/1/1
```
NOTE: This example uses default MVRP timers. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms (10 seconds) for the leaveall timer. We recommend retaining the use of default timer values as modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default settings, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

Step-by-Step Procedure

To configure access Switch A for MVRP:

1. Configure the finance VLAN:
   ```
   [edit]
   user@Access-Switch-A# set vlans finance vlan-id 100
   ```

2. Configure the lab VLAN:
   ```
   [edit]
   user@Access-Switch-A# set vlans lab vlan-id 200
   ```

3. Configure the sales VLAN:
   ```
   [edit]
   user@Access-Switch-A# set vlans sales vlan-id 300
   ```

4. Configure an Ethernet interface as a member of the finance VLAN:
   ```
   [edit]
   user@Access-Switch-A# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members finance
   ```

5. Configure an Ethernet interface as a member of the lab VLAN:
   ```
   [edit]
   user@Access-Switch-A# set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members lab
   ```

6. Configure an Ethernet interface as a member of the sales VLAN:
   ```
   [edit]
   user@Access-Switch-A# set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
   ```

7. Configure a trunk interface:
   ```
   [edit]
   user@Access-Switch-A# set interfaces xe-0/1/1 unit 0 family ethernet-switching interface-mode trunk
   ```

8. Enable MVRP on the trunk interface:
   ```
   [edit]
   user@Access-Switch-A# set protocols mvrp interface xe-0/1/1
   ```

Results

Check the results of the configuration on Switch A:

```
[edit]
user@Access-Switch-A# show interfaces {
  ge-0/0/1 {
```
unit 0 [

Configuring VLANs and MVRP on Access Switch B

To configure three VLANs on the switch, bind access interfaces for PC4 and PC5 to the VLANs, and enable MVRP on the trunk interface of access Switch B, perform these tasks:
CLI Quick Configuration

To quickly configure Access Switch B for MVRP, copy the following commands and paste them into the switch terminal window of Switch B:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members lab
set interfaces xe-0/1/0 unit 0 family ethernet-switching interface-mode trunk
set protocols mvrp interface xe-0/1/0
```

Step-by-Step Procedure

To configure Access Switch B for MVRP:

1. Configure the finance VLAN:
   
   ```
   [edit]
   user@Access-Switch-B# set vlans finance vlan-id 100
   ```

2. Configure the lab VLAN:
   
   ```
   [edit]
   user@Access-Switch-B# set vlans lab vlan-id 200
   ```

3. Configure the sales VLAN:
   
   ```
   [edit]
   user@Access-Switch-B# set vlans sales vlan-id 300
   ```

4. Configure an Ethernet interface as a member of the finance VLAN:
   
   ```
   [edit]
   user@Access-Switch-B# set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members finance
   ```

5. Configure an Ethernet interface as a member of the lab VLAN:
   
   ```
   [edit]
   user@Access-Switch-B# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members lab
   ```

6. Configure a trunk interface:
   
   ```
   user@Access-Switch-B# set interfaces xe-0/1/0 unit 0 family ethernet-switching interface-mode trunk
   ```

7. Enable MVRP on the trunk interface:
   
   ```
   [edit]
   user@Access-Switch-B# set protocols mvrp xe-0/1/0
   ```

**NOTE:** This example uses default MVRP timers. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms (10 seconds) for the leaveall timer. We recommend retaining the use of default timer values as modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.
Results  Check the results of the configuration for Switch B:

```
[edit]
user@Access-Switch-B# show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members finance;
        }
      }
    }
  }
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members lab;
        }
      }
    }
  }
  xe-0/1/0 {
    unit 0 {
      family ethernet-switching {
        interface-modetrunk;
      }
    }
  }
}
protocols {
  mvrp {
    interface xe-0/1/0;
  }
}
vlans {
  finance {
    vlan-id 100;
  }
  lab {
    vlan-id 200;
  }
  sales {
    vlan-id 300;
  }
}
```

Configuring VLANS and MVRP on Distribution Switch C

CLI Quick Configuration  To quickly configure distribution Switch C for MVRP, copy the following commands and paste them into the switch terminal window of distribution Switch C:

```
[edit]
set interfaces xe-0/1/1 unit 0 family ethernet-switching interface-mode trunk
```
To configure distribution Switch C for MVRP:

1. Configure the trunk interface to access Switch A:
   ```
   [edit]
   user@Distribution-Switch-C# set interfaces xe-0/1/1 unit 0 family ethernet-switching interface-mode trunk
   ```

2. Configure the trunk interface to access Switch B:
   ```
   [edit]
   user@Distribution-Switch-C# set interfaces xe-0/1/0 unit 0 family ethernet-switching interface-mode trunk
   ```

3. Enable MVRP on the trunk interface for xe-0/1/1:
   ```
   [edit]
   user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/1
   ```

4. Enable MVRP on the trunk interface for xe-0/1/0:
   ```
   [edit]
   user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/0
   ```

Check the results of the configuration for Switch C:

```
[edit]
user@Distribution Switch-C# show interfaces {
  xe-0/1/0 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
  xe-0/1/1 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
}
protocols {
  mvrp {
    interface xe-0/1/0;
    interface xe-0/1/1;
  }
}
```
Verifying That MVRP Is Enabled on Access Switch A

**Purpose**
Verify that MVRP is enabled on the switch.

**Action**
Show the MVRP configuration:

```
user@Access-Switch-A> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface       Join   Leave  LeaveAll
  xe-0/1/1         200    1000     10000
```

**Meaning**
The results show that MVRP is enabled on the trunk interface of Switch A and that the default timers are used.

Verifying That MVRP Is Updating VLAN Membership on Access Switch A

**Purpose**
Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch A.

**Action**
List Ethernet switching interfaces on the switch:

```
user@Access-Switch-A> show ethernet-switching interface
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                       LH - MAC limit hit, DN - interface down )
Logical Vlan members TAG   MAC      STP       Logical Tagging
interface    members      limit    state     interface flags
ge-0/0/1.0   finance     65535                  Forwarding  tagged
ge-0/0/2.0   lab          65535                  Forwarding  tagged
ge-0/0/3.0   sales        65535                  Forwarding  tagged
```

Copyright © 2013, Juniper Networks, Inc.
Meaning

MVRP has automatically added `finance` and `lab` as VLAN members on the trunk interface because they are being advertised by access Switch B.

Verifying That MVRP Is Enabled on Access Switch B

Purpose

Verify that MVRP is enabled on the switch.

Action

Show the MVRP configuration:

```
user@Access-Switch-B> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)            
                           Interface       Join   Leave  LeaveAll
                           xe-0/1/0         200    1000     10000

Meaning

The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

Verifying That MVRP Is Updating VLAN Membership on Access Switch B

Purpose

Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch B.

Action

List Ethernet switching interfaces on the switch:

```
user@Access-Switch-B> show ethernet-switching interface
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, 
                           LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
ge-0/0/0.0                    65535                                 tagged
finance 100 65535    Forwarding
lab 200 65535    Forwarding
```

Meaning

The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

```
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, 
                           LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
ge-0/0/0.0                    65535                                 tagged
```

Meaning

The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

```
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, 
                           LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
ge-0/1/0.0                    65535                                   tagged
```

Meaning

The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

```

ge-0/1/0.0                    65535                                   tagged
```

Meaning

The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

```
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, 
                           LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
ge-0/1/0.0                    65535                                   tagged
```

Meaning

The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.
### Meaning
MVRP has automatically added finance, lab, and sales as VLAN members on the trunk interface because they are being advertised by access Switch A.

### Verifying That MVRP Is Enabled on Distribution Switch C

#### Purpose
Verify that MVRP is enabled on the switch.

#### Action
Show the MVRP configuration:

```bash
user@Distribution-Switch-C> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)          
Interface       Join   Leave  LeaveAll
xe-0/1/1         200    1000     10000
xe-0/1/0         200    1000     10000
```

#### Meaning
The results show that MVRP is enabled on the trunk interfaces of Switch C and that the default timers are used.

### Verifying That MVRP Is Updating VLAN Membership on Distribution Switch C

#### Purpose
Verify that MVRP is updating VLAN membership on distribution Switch C by displaying the Ethernet switching interfaces and associated VLANs on distribution Switch C.

#### Action
List the Ethernet switching interfaces on the switch:

```bash
user@Distribution-Switch-C> show ethernet-switching interface
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
xe-0/1/1.0                    65535                                 tagged
       mvrp_100               65535 Forwarding
       mvrp_200               65535 Forwarding
       mvrp_300               65535 Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop, LH - MAC limit hit, DN - interface down )
Logical      Vlan       TAG   MAC      STP          Logical         Tagging
interface    members          limit    state        interface flags
xe-0/1/0.0                    65535                                   tagged
       mvrp_100               65535 Forwarding
```

### Meaning
The results show that MVRP is enabled on the trunk interfaces of Switch C and that the default timers are used.
List the VLANs that were created dynamically using MVRP on the switch:

```
user@Distribution-Switch-C> show mvrp dynamic-vlan-memberships
```

MVRP dynamic vlans for routing instance 'default-switch'
(s) static vlan, (f) fixed registration

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>xe-0/1/1.0</td>
</tr>
<tr>
<td></td>
<td>xe-0/1/0.0</td>
</tr>
<tr>
<td>200</td>
<td>xe-0/1/1.0</td>
</tr>
<tr>
<td></td>
<td>xe-0/1/0.0</td>
</tr>
<tr>
<td>300</td>
<td>xe-0/1/1.0</td>
</tr>
</tbody>
</table>

Note that this scenario does not have any fixed registration, which is typical when MVRP is enabled.

**Meaning**

Distribution Switch C has two trunk interfaces. Interface `xe-0/1/1.0` connects Distribution Switch C to Access Switch A and is, therefore, updated to show that it is a member of all the VLANs that are active on Switch A. Any traffic for those VLANs will be passed on from Switch C to Switch A, through interface `xe-0/1/1.0`. Interface `xe-0/1/0.0` connects Switch C to Switch B and is updated to show that it is a member of the two VLANs that are active on Switch B. Thus, Switch C sends traffic for `finance` and `lab` to both Switch A and Switch B. But Switch C sends traffic for `sales` only to Switch A.

Switch C also has three dynamic VLANs created using MVRP: `mvrp_100`, `mvrp_200`, and `mvrp_300`. The dynamically created VLANs `mvrp_100` and `mvrp_200` are active on interfaces `xe-0/1/1.0` and `xe-0/1/0.0`, and dynamically created VLAN `mvrp_300` is active on interface `xe-0/1/1.0`.

**Example: Configuring Redundant Trunk Links for Faster Recovery**

NOTE: This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Example: Configuring Redundant Trunk Links for Faster Recovery. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can manage network convergence by configuring both a primary link and a secondary link on a switch; this is called a redundant trunk group (RTG). If the primary link in a redundant trunk group fails, it passes its known MAC address locations to the secondary link, which automatically takes over after one minute.
This example describes how to create a redundant trunk group with a primary and a secondary link:

- Requirements on page 2109
- Overview and Topology on page 2109
- Disabling RSTP on Switches 1 and 2 on page 2111
- Configuring Redundant Trunk Links on Switch 3 on page 2112
- Verification on page 2113

Requirements

This example uses the following hardware and software components:

- Two EX Series distribution switches
- One EX Series access switch
- Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you configure the redundant trunk links network on the access and distribution switches, be sure you have:

- Configured interfaces ge-0/0/9 and ge-0/0/10 on the access switch, Switch 3, as trunk interfaces. See “Configuring Gigabit Ethernet Interfaces (CLI Procedure)” on page 2286.
- Configured one trunk interface on each distribution switch, Switch 1 and Switch 2.
- Connected the three switches as shown in the topology for this example (see Figure 33 on page 2111).

Overview and Topology

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for trunk interface network recovery. When a trunk interface fails, data traffic is routed to another trunk interface after one minute, thereby keeping network convergence time to a minimum.

This example shows the configuration of a redundant trunk group that includes one primary link (and its interface) and one unspecified link (and its interface) that serves as the secondary link.

A second type of redundant trunk group, not illustrated in the example, consists of two unspecified links (and their interfaces); in this case, neither of the links is primary. The software selects an active link by comparing the port numbers of the two links and activating the link with the higher port number. For example, if the two link interfaces use interfaces ge-0/1/0 and ge-0/1/1, the software activates ge-0/1/1. (In the interface names, the final number is the port number.)

The two links in a redundant trunk group generally operate the same way, whether they are configured as primary/unspecified or unspecified/unspecified. Data traffic initially passes through the active link but is blocked on the inactive link. While data traffic is blocked on the secondary link, note that Layer 2 control traffic is still permitted if the link...
is active. For example, an LLDP session can be run between two switches on the secondary link. If the active link either goes down or is disabled administratively, it broadcasts a list of its known MAC addresses for data traffic; the other link immediately picks up and adds the MAC addresses to its address table, becomes active, and begins forwarding traffic.

The one difference in operation between the two types of redundant trunk groups occurs when a primary link is active, goes down, is replaced by the secondary link, and then reactivates. When a primary link is re-enabled like this while the secondary link is active, the primary link waits 2 minutes (you can change the time interval by using the preempt cutover timer to accommodate your network) and then takes over as the active link. In other words, the primary link has priority and is always activated if it is available. This differs from the behavior of two unspecified links, both of which act as equals. Because the unspecified links are equal, the active link remains active until it either goes down or is disabled administratively; this is the only time that the other unspecified link learns the MAC addresses and immediately becomes active.

The example given here illustrates a primary/unspecified configuration for a redundant trunk group because that configuration gives you more control and is more commonly used.

---

**NOTE:** Rapid Spanning Tree Protocol (RSTP) is enabled by default on EX Series switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You will need to disable RSTP on the two distribution switches in the example, Switch 1 and Switch 2. Spanning-tree protocols can, however, continue operating in other parts of the network—for example, between the distribution switches and also in links between distribution switches and the enterprise core.

Figure 33 on page 2111 displays an example topology containing three switches. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk interfaces ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2).

Table 267 on page 2111 lists the components used in this redundant trunk group.

Because RSTP and RTGs cannot operate simultaneously on a switch, you disable RSTP on Switch 1 and Switch 2 in the first configuration task, and you disable RSTP on Switch 3 in the second task.

The second configuration task creates a redundant trunk group called example 1 on Switch 3. The trunk interfaces ge-0/0/9.0 and ge-0/0/10.0 are the two links configured in the second configuration task. You configure the trunk interface ge-0/0/9.0 as the primary link. You configure the trunk interface ge-0/0/10.0 as an unspecified link, which becomes the secondary link by default.
Figure 33: Topology for Configuring the Redundant Trunk Links

Disabling RSTP on Switches 1 and 2

To disable RSTP on Switch 1 and Switch 2, perform this task on each switch:

CLI Quick Configuration

To quickly disable RSTP on Switch 1 and Switch 2, copy the following command and paste it into each switch terminal window:

```
[edit]
set protocols rstp disable
```

Step-by-Step Procedure

To disable RSTP on Switch 1 and Switch 2:

1. Disable RSTP on Switch 1 and Switch 2:

```
[edit]
user@switch# set protocols rstp disable
```

Results

Check the results of the configuration:
Configuring Redundant Trunk Links on Switch 3

To configure redundant trunk links on Switch 3, perform this task:

**CLI Quick Configuration**

To quickly configure the redundant trunk group example1 on Switch 3, copy the following commands and paste them into the switch terminal window:

```plaintext
[edit]
set protocols rstp disable
set switch-options redundant-trunk-group group example1 interface ge-0/0/9.0 primary
set switch-options redundant-trunk-group group example1 interface ge-0/0/10.0
set redundant-trunk-group group example1 preempt-cutover-timer 60
```

**Step-by-Step Procedure**

Configure the redundant trunk group example1 on Switch 3.

1. Turn off RSTP:
   ```plaintext
   [edit]
   user@switch# set protocols rstp disable
   ```

2. Name the redundant trunk group example1 while configuring trunk interface ge-0/0/9.0 as the primary link and ge-0/0/10 as an unspecified link to serve as the secondary link:
   ```plaintext
   [edit switch-options]
   user@switch# set redundant-trunk-group group example1 interface ge-0/0/9.0 primary
   user@switch# set redundant-trunk-group group example1 interface ge-0/0/10.0
   ```

3. (Optional) Change the time interval (from the default 120 seconds) that a re-enabled primary link waits to take over for an active secondary link:
   ```plaintext
   [edit switch-options]
   user@switch# set redundant-trunk-group group example1 preempt-cutover-timer 60
   ```

**Results**

Check the results of the configuration:

```plaintext
[edit]
user@switch# show
switch-options
redundant-trunk-group {
    group example1 {
        preempt-cutover-timer 60;
        interface ge-0/0/9.0 {
            primary;
        }
        interface ge-0/0/10.0;
    }
}
protocols {
    rstp {
        disable;
    }
}
```
Verification

To confirm that the configuration is set up correctly, perform this task:

- Verifying That a Redundant Trunk Group Was Created on page 2113

**Verifying That a Redundant Trunk Group Was Created**

**Purpose**
Verify that the redundant trunk group example1 has been created on Switch 1 and that trunk interfaces are members of the redundant trunk group.

**Action**
List all redundant trunk groups configured on the switch:

```bash
user@switch> show redundant-trunk-group
```

<table>
<thead>
<tr>
<th>Group name</th>
<th>Interface</th>
<th>State</th>
<th>Time of last flap</th>
<th>Flap count</th>
</tr>
</thead>
<tbody>
<tr>
<td>example1</td>
<td>ge-0/0/9.0</td>
<td>Up/Pri</td>
<td>Never</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>ge-0/0/10.0</td>
<td>Up</td>
<td>Never</td>
<td>0</td>
</tr>
</tbody>
</table>

**Meaning**
The `show redundant-trunk-group` command lists all redundant trunk groups configured on the switch as well as the interface names and their current states (up or down for an unspecified link, and up or down and primary for a primary link). For this configuration example, the output shows that the redundant trunk group example1 is configured on the switch. The Up beside the interfaces indicates that both link cables are physically connected. The Pri beside trunk interface ge-0/0/9.0 indicates that it is configured as the primary link.

**Example: Configuring Proxy ARP on an EX Series Switch**

You can configure proxy Address Resolution Protocol (ARP) on your EX Series switch to enable the switch to respond to ARP queries for network addresses by offering its own MAC address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

This example shows how to configure proxy ARP on an access switch:

- Requirements on page 2114
- Overview and Topology on page 2114
- Configuration on page 2114
- Verification on page 2115
Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 10.0 or later for EX Series switches

Overview and Topology

This example shows the configuration of proxy ARP on an interface of an EX Series switch using restricted mode. In restricted mode, the switch does not act as a proxy for hosts on the same subnet.

The topology for this example consists of one EX Series switch. When a host wants to communicate with a host that is not already in its ARP table, it broadcasts an ARP request for the MAC address of the destination host:

- When proxy ARP is not enabled, a host that shares the same IP address replies directly to the ARP request, providing its MAC address, and future transmissions are sent directly to the destination host MAC address.
- When proxy ARP is enabled, the switch responds to ARP requests, providing the switch’s MAC address—even when the destination IP address is the same as the source IP address. Thus, communications must be sent through the switch and then routed through the switch to the appropriate destination.

Configuration

To configure proxy ARP, perform the following tasks:

**CLI Quick Configuration**

To quickly configure proxy ARP on an interface, copy the following command and paste it into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 unit 0 proxy-arp restricted
```
Step-by-Step Procedure

You configure proxy ARP on individual interfaces.

1. To configure proxy ARP on an interface:

   [edit interfaces]
   user@switch# set ge-0/0/3 unit 0 proxy-arp restricted

   **BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid a situation wherein the switch's response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

   [edit interfaces]
   user@switch# set ge-0/0/3 no-gratuitous-arp-request

Results

Display the results of the configuration:

   user@switch> show configuration
   interfaces {
      ge-0/0/3 {
         unit 0 {
            proxy-arp restricted;
            family ethernet-switching;
         }
      }
   }

Verification

To verify that the switch is sending proxy ARP messages, perform these tasks:

- Verifying That the Switch Is Sending Proxy ARP Messages on page 2115

Verifying That the Switch Is Sending Proxy ARP Messages

Purpose

Verify that the switch is sending proxy ARP messages.

Action

List the system statistics for ARP messages:

   user@switch> show system statistics arp
   arp:
      90060 datagrams received
      34 ARP requests received
      610 ARP replies received
      2 resolution request received
      0 unrestricted proxy requests
      0 restricted proxy requests
      0 received proxy requests
      0 unrestricted proxy requests not proxied
      0 restricted proxy requests not proxied
      0 datagrams with bogus interface
      0 datagrams with incorrect length
      0 datagrams for non-IP protocol
      0 datagrams with unsupported op code
Meaning

The statistics show that two proxy ARP requests were received. The *unrestricted proxy requests not proxied* and *restricted proxy requests not proxied* fields indicate that all the unproxied ARP requests received have been proxied by the switch.

Configuring VLANs for EX Series Switches (J-Web Procedure)

You can use the VLAN Configuration page to add a new VLAN or to edit or delete an existing VLAN on an EX Series switch.

To access the VLAN Configuration page:

1. Select Configure > Switching > VLAN.

   The VLAN Configuration page displays a list of existing VLANs. If you select a specific VLAN, the specific VLAN details are displayed in the Details section.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Creates a VLAN.
   - **Edit**—Edits an existing VLAN configuration.
   - **Delete**—Deletes an existing VLAN.

   **NOTE:** If you delete a VLAN, the VLAN configuration for all the associated interfaces is also deleted.

When you are adding or editing a VLAN, enter information as described in Table 268 on page 2117.

### Configuring VLANs for EX Series Switches (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring VLANs for EX Series Switches (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

EX Series switches use VLANs to make logical groupings of network nodes with their own broadcast domains. VLANs limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

- Why Create a VLAN? on page 2119
- Creating a VLAN Using the Minimum Procedure on page 2120
- Creating a VLAN Using All of the Options on page 2120
- Configuration Guidelines for VLANs on page 2121

**Why Create a VLAN?**

For switching to begin, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist.

Some reasons to create more than one VLAN are:
• A LAN has more than 200 devices.
• A LAN has a large amount of broadcast traffic.
• A group of clients requires that a higher-than-average level of security be applied to traffic entering or exiting the group's devices.
• A group of clients requires that the group's devices receive less broadcast traffic than they are currently receiving, so that data speed across the group is increased.

Creating a VLAN Using the Minimum Procedure

These steps are required to create a VLAN:

• Uniquely identify the VLAN. You do this by assigning a name and an ID to the VLAN.
• Assign at least one switch port interface to the VLAN for communication. After assigning one or more interfaces to the VLAN, the interfaces function in access mode. All interfaces in a single VLAN are in a single broadcast domain, even if the interfaces are on different switches. You can assign traffic on any switch to a particular VLAN by referencing either the interface sending traffic or the MAC addresses of devices sending traffic.

The following example creates a VLAN using only a few required steps. The VLAN is created with the name `employee-vlan` and the VLAN ID of `100`. Then, three interfaces are assigned to that VLAN, and these interfaces, which function in access mode, transmit traffic among themselves.

```
[edit] set vlans employee-vlan
edit] set vlans employee-vlan vlan-id 100
[edit] set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
[edit] set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
[edit] set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
```

In the example, all users connected to the interfaces ge-0/0/1, ge-0/0/2, and ge-0/0/3 can communicate with each other, but not with users on other interfaces in this network. To configure communication between VLANs, you must configure an integrated routing and bridging (IRB) interface. See "Configuring Integrated Routing and Bridging Interfaces (CLI Procedure)" on page 2122.

Creating a VLAN Using All of the Options

To configure a VLAN, follow these steps:

1. Create the VLAN by setting the unique VLAN name:

   ```
   [edit vlans]
   user@switch# set vlan-name
   ```

2. Configure the VLAN ID or a VLAN ID list for the VLAN. Using the VLAN ID list option, you can optionally specify a range of VLAN IDs.

   ```
   [edit vlans]
   user@switch# set vlan-name vlan-id vlan-id-number
   ```
or

[edit vlans]
user@switch# set vlan-name vlan-id-list [vlan-ids | vlan-id--vlan-id-]

3. Assign at least one interface to the VLAN:

[edit interfaces]
user@switch# set interface-name unit logical-unit-number family ethernet-switching vlan members [all | vlan-names | vlan-ids]

NOTE: You can also specify that a trunk interface is a member of all VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

4. (Optional) Create a subnet for the VLAN because all computers that belong to a subnet are addressed with a common, identical, most-significant-bit group in their IP address. This makes it easy to identify VLAN members by their IP addresses. To create the subnet for the VLAN:

[edit interfaces]
user@switch# set vlan unit logical-unit-number family inet address ip-address/destination-prefix

5. (Optional) Specify the description of the VLAN:

[edit vlans]
user@switch# set vlan-name description text-description

6. (Optional) For security purposes, specify a VLAN firewall filter to be applied to incoming or outgoing packets:

[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name

Configuration Guidelines for VLANs

To create a VLAN, you must uniquely identify the VLAN and assign at least one switch port interface to the VLAN for communication. After you assign one or more interfaces to the VLAN, the interfaces function in access mode.

After creating a VLAN, all users connected to interfaces that are assigned to the VLAN can communicate with each other but not with users on other interfaces in the network. To configure communication between VLANs, you must configure an IRB interface. For information about creating an IRB interface, see “Configuring Integrated Routing and Bridging Interfaces (CLI Procedure)” on page 2122.

The number of VLANs supported per switch varies. Use the command set vlans vlan-name vlan-id ? to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created.
Configuring Integrated Routing and Bridging Interfaces (CLI Procedure)

Integrated routing and bridging (IRB) interfaces allow an EX Series switch to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated.

An interface named irb functions as a logical router on which you can configure a Layer 3 logical interface for each virtual LAN (VLAN). For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

Jumbo frames of up to 9216 bytes are supported on an IRB interface. To route jumbo data packets on the IRB interface, you must configure the jumbo MTU size on the member physical interfaces of the IRB interface and also on the IRB interface itself (the interface named irb). However, for jumbo control packets—for example, to ping the IRB interface with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named irb (the IRB interface).

CAUTION: Setting or deleting the jumbo MTU size on the IRB interface (the interface named irb) while the switch is transmitting packets might result in dropped packets.

To configure the IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

   [edit]
   user@switch# set vlans vlan-name vlan-id

2. Assign an interface to the VLAN by naming the VLAN as a trunk member on the logical interface, thereby making the interface part of the VLAN’s broadcast domain:

   [edit]
   user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching vlan members vlan-name

3. Create a logical Layer 3 IRB interface (its name will be irb.logical-interface-number, where the value for logical-interface-number is the value you supplied for vlan-id in Step 1; in the following command, it is the logical-unit-number) on a subnet for the VLAN’s broadcast domain:

   [edit]
   user@switch# set interfaces vlan unit logical-unit-number family inet address inet-address

4. Link the Layer 2 VLAN to the logical Layer 3 IRB interface:

   [edit]
   user@switch# set vlans vlan-name l3-interface irb.logical-interface-number

NOTE: Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple Layer 2 VLANs. Within a VLAN, traffic is switched, while across VLANs, traffic is routed.
Configuring MAC Table Aging (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring MAC Table Aging (CLI Procedure).

The Ethernet switching table (or MAC table) aging process ensures that the EX Series switch tracks only active MAC addresses on the network and is able to flush out MAC addresses that are no longer used.

You can configure the MAC table aging time, the maximum time that an entry can remain in the Ethernet Switching table before it ages out, on all VLANs on the switch. This setting can influence efficiency of network resource use by affecting the amount of traffic that is flooded to all interfaces because when traffic is received for MAC addresses no longer in the Ethernet switching table, the switch floods the traffic to all interfaces.

To configure the MAC table aging time on all VLANs on the switch:

```
[edit]
user@switch# set protocols l2-learning global-mac-table-aging-time seconds
```

### Configuring the Native VLAN Identifier (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring the Native VLAN Identifier (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

EX Series switches can receive and forward routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received. The logical interface on which untagged packets are to be received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface.

To configure the native VLAN ID by using the command-line interface (CLI):

1. On the interface on which you want untagged data packets to be received, set the **interface mode** to **trunk**, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs:

   ```
   [edit interfaces]
   user@switch# set interface-name unit logical-unit-number family ethernet-switching interface-mode trunk
   ```

2. Configure the native VLAN ID:

   ```
   [edit interfaces]
   user@switch# set interface-name native-vlan-id vlan-id
   ```

3. Specify that the logical interface that will receive the untagged data packets is a member of the native VLAN:

   ```
   [edit interfaces]
   user@switch# set interface-name unit logical-unit-number family ethernet-switching vlan members vlan-id
   ```

**Related Documentation**

Configuring Virtual Routing Instances (CLI Procedure)

Use virtual routing and forwarding (VRF) to divide an EX Series switch into multiple virtual routing instances. VRF allows you to isolate traffic traversing the network without using multiple devices to segment your network. VRF is supported on all Layer 3 interfaces.

Before you begin, make sure to set up your VLANs. See Configuring VLANs for EX Series Switches (CLI Procedure), “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119, or “Configuring VLANs for EX Series Switches (J-Web Procedure)” on page 2117.

To configure virtual routing instances:

1. Create a routing instance:

   [edit routing-instances]user@switch# set routing-instance-name instance-type virtual-router

   **NOTE:** EX Series switches only support the virtual-router instance type.

2. Bind each routing instance to the corresponding physical interfaces:

   [edit routing-instances]user@switch# set routing-instance-name interface interface-name.logical-unit-number

3. Create the logical interfaces that are bound to the routing instance.

   • To create a logical interface with an IPv4 address:

     [edit interfaces]user@switch# set interface-name unit logical-unit-number family inet address ip-address

   • To create a logical interface with an IPv6 address:

     [edit interfaces]user@switch# set interface-name unit logical-unit-number family inet6 address ipv6-address

   **NOTE:** Do not create a logical interface using the family ethernet-switching option in this step. Binding an interface using the family ethernet-switching option to a routing instance can cause the interface to shutdown.

4. Enable VLAN tagging on each physical interface that was bound to the routing instance:

   [edit interfaces]user@switch# set interface-name vlan-tagging

**Related Documentation**

Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs Junos OS that does not support ELS, see Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Multiple VLAN Registration Protocol (MVRP) is used to manage dynamic VLAN registration in a LAN. You can use MVRP on EX Series switches.

MVRP is disabled by default on EX Series switches.

To enable MVRP or set MVRP options, follow these instructions:

- Enabling MVRP on page 2126
- Disabling MVRP on page 2126
- Disabling Dynamic VLANs on page 2126
- Configuring Timer Values on page 2127
- Configuring MVRP Registration Mode on page 2128
- Using MVRP in a Mixed-Release Network on page 2128

Enabling MVRP

MVRP can only be enabled on trunk interfaces.

To enable MVRP on a trunk interface:

````
[edit protocols mvrp]
user@switch# set interface interface-name
```

Disabling MVRP

MVRP is disabled by default. You only need to perform this procedure if you have previously enabled MVRP.

You can disable MVRP globally only. To disable MVRP on all trunk interfaces on a switch, use one of the following commands:

````
user@switch# deactivate protocols mvrp
user@switch# delete protocols mvrp
```

Disabling Dynamic VLANs

By default, dynamic VLANs can be created on interfaces participating in MVRP. Dynamic VLANs are VLANs created on one switch that are propagated to other switches dynamically; in this case, using MVRP.
Dynamic VLAN creation through MVRP cannot be disabled per switch interface. To disable dynamic VLAN creation for interfaces participating in MVRP, you must disable it for all interfaces on the switch.

To disable dynamic VLAN creation:

[edit protocols mvrp]
user@switch# set no-dynamic-vlan

Configuring Timer Values

The timers in MVRP define the amount of time all interfaces on a switch or a specific interface wait to join or leave MVRP, or to send or process the MVRP information for the switch after receiving an MVRP PDU. The join timer controls the amount of time the switch waits to accept a registration request, the leave timer controls the period of time that the switch waits in the Leave state before changing to the unregistered state, and the leaveall timer controls the frequency with which the LeaveAll messages are communicated.

The default MVRP timer values are 200 ms for the join timer, 1000 ms for the leave timer, and 10 seconds for the leaveall timer.

BEST PRACTICE: Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

On an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

To set the join timer for all interfaces on the switch:

[edit protocols mvrp]
user@switch# set join-timer milliseconds

To set the join timer for a specific interface:

[edit protocols mvrp]
user@switch# set interface interface-name join-timer milliseconds

To set the leave timer for all interfaces on the switch:

[edit protocols mvrp]
user@switch# set leave-timer milliseconds

To set the leave timer for a specific interface:

[edit protocols mvrp]
user@switch# set interface interface-name leave-timer milliseconds

To set the leaveall timer for all interfaces on the switch:

[edit protocols mvrp]
user@switch# set leave-all-timer seconds
To set the leaveall timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface interface-name leaveall-timer seconds
```

### Configuring MVRP Registration Mode

The default MVRP registration mode for any interface participating in MVRP is normal. An interface in normal registration mode participates in MVRP when MVRP is enabled on the switch.

You can change the registration mode of a specific interface to **forbidden**. An interface in forbidden registration mode does not participate in MVRP even if MVRP is enabled on the switch.

To set an interface to forbidden registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration forbidden
```

To set an interface to normal registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration normal
```

### Using MVRP in a Mixed-Release Network

Except in Junos OS Releases 11.2 and earlier, MVRP has conformed with IEEE standard 802.1ak and IEEE Draft 802.1Q regarding the inclusion of an extra byte in the protocol data units (PDUs) sent and received by MVRP. As a result of changes in the standards with regard to the extra byte, MVRP in Junos OS Releases 13.2 and later for EX Series switches with support for the Enhanced Layer 2 Software (ELS) includes the extra byte, while MVRP in Junos OS Releases 11.3 and later for EX Series switches that do not support ELS does not include the extra byte. A compatibility issue arises, wherein the ELS version of MVRP does not recognize PDUs without the extra byte sent by the non-ELS version of MVRP.

For more information about this issue, see “Understanding Multiple VLAN Registration Protocol (MVRP) on EX Series Switches” on page 2063.

You can recognize an MVRP version compatibility issue by observing the switch running the ELS version of MVRP. Because a switch running the ELS version of MVRP cannot interpret an unmodified PDU from a switch running the non-ELS version of MVRP, the switch will not add VLANs from the non-ELS version of MVRP. When you use the `show mvrp statistics` command in the ELS version of MVRP, the values for `Received Join Empty` and `Received Join In` will incorrectly display zero, even though the value for the `Received MVRP PDUs without error` has been increased. Another indication that MVRP is having a version compatibility issue is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the ELS version of MVRP.

If your network includes a mix of EX Series switches running ELS and non-ELS versions of MVRP, you can eliminate the compatibility issue by entering the following command on the switches running the ELS version of MVRP:
The `no-attribute-length-in-pdu` statement prevents the ELS version of MVRP from sending PDUs with the extra byte, thereby eliminating the compatibility issue with the non-ELS version of MVRP.

**Configuring Redundant Trunk Groups (J-Web Procedure)**

A redundant trunk link provides a simple solution for network recovery when a trunk interface goes down. Traffic is routed to another trunk interface, keeping network convergence time to a minimum. You can configure redundant trunk groups (RTGs) with a primary link and a secondary link on trunk interfaces, or configure dynamic selection of the active interface. If the primary link fails, the secondary link automatically takes over without waiting for normal Spanning Tree Protocol (STP) convergence. An RTG can be created only if the following conditions are satisfied:

- A minimum of two trunk interfaces that are not part of any RTG are available.
- All the selected trunk interfaces to be added to the RTG have the same VLAN configuration.
- The selected trunk interfaces are not part of a spanning-tree configuration.

To configure an RTG by using the J-Web interface:

1. Select **Configure > Switching > RTG**.

   The RTG Configuration page displays a list of existing RTGs. If you select a specific RTG, the details of the selected RTG are displayed in the Details of group section.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - **Add**—Creates an RTG.
   - **Edit**—Modifies an RTG.
   - **Delete**—Deletes an RTG.
When you are adding or editing an RTG, enter information as described in Table 269 on page 2130.

3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

Table 269: RTG Configuration Fields

<table>
<thead>

**Configuring Proxy ARP (CLI Procedure)**

**NOTE:** This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Proxy ARP (CLI Procedure) or Configuring Proxy ARP. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can configure proxy Address Resolution Protocol (ARP) on your switch to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:
```
[edit interfaces]
```
user@switch# set interface-name unit logical-unit-number proxy-arp (restricted | unrestricted)

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you decide to use unrestricted mode, disable gratuitous ARP requests on the interface to avoid a situation wherein the switch’s response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

To configure proxy ARP on an integrated routing and bridging (IRB) interface:

```
[edit interfaces]
user@switch# set irb.logical-unit-number proxy-arp restricted
```

**Related Documentation**

---

The Ethernet switching table, also known as the forwarding table, specifies the known locations of VLAN nodes and the addresses of devices within those nodes. There are two ways to populate the Ethernet switching table on a switch. The easiest method is to let the switch update the table with MAC addresses.

The second way to populate the Ethernet switching table is to manually insert addresses into the table. You can do this to reduce flooding and speed up the switch’s automatic learning process.

Before configuring a static MAC address, be sure that you have:

- Set up the VLAN. See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2119.

To configure an interface to have a static MAC address:

```
[edit vlans vlan-name switch-options]
user@switch# set static-mac mac-address
```

**Related Documentation**

Configuring MAC Limiting (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring MAC Limiting (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

This topic describes various ways of configuring a limitation on MAC addresses in packets that are received and forwarded by the switch.

The different ways of setting a MAC limit are described in the following sections:

- Limiting the Number of MAC Addresses Learned by an Interface on page 2132
- Limiting the Number of MAC Addresses Learned by a VLAN on page 2132

Limiting the Number of MAC Addresses Learned by an Interface

To secure a port, you can set the maximum number of MAC addresses that can be learned by an interface:

- Set the MAC limit on an interface, and specify an action that the switch takes after the specified limit is exceeded:

  ```
  [edit switch-options]
  user@switch# set interface interface-name interface-mac-limit limit packet-action action
  
  After you set a new MAC limit for the interface, the system clears existing entries in the MAC address forwarding table associated with the interface.
  ```

Limiting the Number of MAC Addresses Learned by a VLAN

To limit the number of MAC addresses learned by a VLAN:

1. Set the maximum number of MAC addresses that can be learned by a VLAN, and specify an action that the switch takes after the specified limit is exceeded:

   ```
   [edit vlans]
   user@switch# set vlan-name switch-options mac-table-size limit packet-action action
   
   After you set a new VLAN MAC limit, the system clears existing entries in the VLAN MAC address forwarding table.
   ```

2. Set the maximum number of MAC addresses that can be learned by one or all interfaces in a VLAN, and specify an action that the switch takes after the specified limit is exceeded:

   ```
   [edit vlans]
   user@switch# set vlan-name switch-options interface interface-name interface-mac-limit limit packet-action action
   
   After you set a new VLAN interface MAC limit, the system clears existing entries in the VLAN interface MAC address forwarding table.
   ```
NOTE: If you specify a MAC limit and packet action for all interfaces in the VLAN and a specific interface in the VLAN, the MAC limit and packet action specified at the specific interface level takes precedence. Also, at the VLAN interface level, only the drop and drop-and-log options are supported.

After you set new MAC limits for a VLAN by using the `mac-table-size` statement or for interfaces associated with a VLAN by using the `interface-mac-limit` statement, the system clears the corresponding existing entries in the MAC address forwarding table.

This topic lists supported and unsupported configuration statements in the [edit switch-options] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.

- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit switch-options] Hierarchy Level on page 2134
- Unsupported Statements in the [edit switch-options] Hierarchy Level on page 2135

### Supported Statements in the [edit switch-options] Hierarchy Level

The following hierarchy shows the [edit switch-options] configuration statements supported on EX Series switches:

```json
switch-options {
    authentication-whitelist mac-address {
        interface interface-name;
        vlan-assignment (vlan-id | vlan-name);
    }
    interface interface-name {
        interface-mac-limit number {
            packet-action action;
        }
        no-mac-learning;
        persistent-learning
    }
}
```
no-mac-learning;
redundant-trunk-group {
  group name {
    description text;
    interface interface-name {
      primary;
      }
    preempt-cutover-timer seconds
    }
  }
unknown-unicast-forwarding {
  vlan (all | vlan-name | vlan-tag) {
    interface interface-name;
  }
}
voip {
  interface (all | [interface-name | access-ports]) {
    forwarding-class (assured-forwarding | best-effort | expedited-forwarding | mcast-af | mcast-be | mcast-ef | mcast-nc | network-control);
    vlan vlan-name;
  }
}

Unsupported Statements in the [edit switch-options] Hierarchy Level

All statements in the [edit switch-options] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

</table>

**NOTE:** Variables, such as filename, are not shown in the statements or hierarchies.

- Example: Connecting Access Switches to a Distribution Switch on page 2083
address

Syntax

`address (ip-address | ipv6-address);`

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family family],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family],
[edit dynamic-profiles profile-name interfaces pp0 unit "$junos-interface-unit" family family],
[edit interfaces interface-name unit logical-unit-number family family inet],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]
```

Release Information

Statement introduced in Junos OS Release 9.2.
Support at the `[edit dynamic-profiles profile-name interfaces pp0 unit “$junos-interface-unit” family family]` hierarchy level introduced in Junos OS Release 10.1.
Support at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

Configure the interface address.

Options

`ip-address`—IPv4 address of the interface.

`ipv6-address`—IPv6 address of the interface. When configuring an IPv6 address on a dynamically created interface, use the `$junos-ipv6-address` dynamic variable.

Required Privilege

Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

filter (VLANs)

Syntax  
filter (input | output) filter-name;

Hierarchy Level  
[edit vlans vlan-name]

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Apply a firewall filter to traffic coming into or exiting from the VLAN.

Default  
All incoming traffic is accepted unmodified to the VLAN, and all outgoing traffic is sent unmodified from the VLAN.

Options  
filter-name — Name of a firewall filter defined in a filter statement.

  • input — Apply a firewall filter to VLAN ingress traffic.
  • output — Apply a firewall filter to VLAN egress traffic.

Required Privilege Level  
system—To view this statement in the configuration.

  system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.
Support for the switch-options statement added in Junos OS Release 9.2.
Support for top-level configuration for the virtual-switch type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.
Support for logical systems added in Junos OS Release 9.6.
Support at [edit switch-options], [edit switch-options interface interface-name], [edit vlans vlan-name switch-options], and [edit vlans vlan-name switch-options interface interface-name] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.
Support at hierarchy levels under [edit vlans vlan-name] introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.
Description: 
(MX Series routers and EX Series switches) Configure a limit to the number of MAC addresses that can be learned from a bridge domain or VLAN, virtual switch, or set of bridge domains or VLANs.

Default: 
All devices except the EX Series switches: 1024 MAC addresses for each logical interface; EX Series switches: 65,536 MAC addresses for each interface and VLAN.

Options: 
- limit—Maximum number of MAC addresses learned from an interface.
  - Range: 1 through 131,071 MAC addresses per interface, or 1 through 65,535 MAC addresses per interface

The remaining statement is explained separately.

Required Privilege: 
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation:

interface-mode

Syntax

interface-mode (access | trunk);

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family bridge],
[edit interfaces interface-name unit logical-unit-number family ethernet-switching],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family bridge]

Release Information

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the trunk option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the vlan-id or vlan-id-list statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the access option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the vlan-id statement.

NOTE: On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure interface-mode and irb for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see Configuring a Trunk Interface on a Bridge Network.

Options

access—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the vlan-id statement.

trunk—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the vlan-id or vlan-id-list statement.

Required Privilege Level

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

**join-timer (MVRP)**

**Syntax**
```
join-timer milliseconds;
```

**Hierarchy Level**
- For platforms with ELS:
  ```
  [edit protocols mvrp],
  [edit protocols mvrp interface interface-name]
  ```
- For platforms without ELS:
  ```
  [edit protocols mvrp interface (all interface-name)]
  ```

**Release Information**
Statement introduced in Junos OS Release 10.0 for EX Series switches.
Hierarchy level [edit protocols mvrp] introduced in Junos OS Release 13.2X50-D10 (ELS).
(See “Getting Started with Enhanced Layer 2 Software” on page 3 for information about ELS.)

**Description**
Configure the maximum number of milliseconds interfaces must wait before sending Multiple VLAN Registration Protocol (MVRP) protocol data units (PDUs).

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

**Options**
- `milliseconds`—Number of milliseconds that an interface must wait before sending MVRP PDUs.
- **Default:** 200 milliseconds

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

I3-interface (VLANs)

Syntax  
```
I3-interface I3-interface-name.logical-interface-number {  
  I3-interface-ingress-counting;  
}
```

Hierarchy Level  
```
[edit vlans vlan-name]
```

Release Information  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

Default  
No Layer 3 (routing) interface is associated with the VLAN.

Options  
```
I3-interface-name.logical-interface-number—For an integrated routing and bridging (IRB) interface, the Layer 3 interface name is irb; for a routed VLAN interface (RVI), the Layer 3 interface name is vlan. Number of the logical interface defined with a `set interfaces vlan unit` command. For the logical interface number, use the same number you configure in the `unit` statement.
```

The remaining statement is explained separately.

Required Privilege Level  
```
system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.
```

```
leaveall-timer (MVRP)

Syntax

```
leaveall-timer interval;
```

Hierarchy Level

- For platforms with ELS:
  
  ```
  [edit protocols mvrp],
  [edit protocols mvrp interface interface-name]
  ```

- For platforms without ELS:
  
  ```
  [edit protocols mvrp interface (all | interface-name)]
  ```

Release Information

Statement introduced in Junos OS Release 10.0 for EX Series switches.
Hierarchy level [edit protocols mvrp] introduced in Junos OS Release 13.2X50-D10 (ELS).
(See “Getting Started with Enhanced Layer 2 Software” on page 3 for information about ELS.)

Description

For Multiple VLAN Registration Protocol (MVRP), configure the interval at which the LeaveAll state operates on the interface.

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

Options

- `interval`—Number of seconds or milliseconds between the sending of Leave All messages.
  
  Default: 10 seconds, or 10,000 milliseconds

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

leave-timer (MVRP)

Syntax
leave-timer milliseconds;

Hierarchy Level
- For platforms with ELS:
  [edit protocols mvrp],
  [edit protocols mvrp interface interface-name]
- For platforms without ELS:
  [edit protocols mvrp interface (all | interface-name)]

Release Information

Description
For Multiple VLAN Registration Protocol (MVRP), configure the number of milliseconds the switch retains a VLAN in the Leave state before the VLAN is unregistered. If the interface receives a join message before this timer expires, the VLAN remains registered.

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

Options
milliseconds—Number of milliseconds that the switch retains a VLAN in the Leave state before the VLAN is unregistered. At a minimum, set the leave-timer interval at twice the join-timer interval.

Default: 1000 milliseconds

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

- [edit routing-instances routing-instance-name switch-options],
- [edit switch-options]

**Release Information**

- Statement introduced in Junos OS Release 8.4.
- Support for the `switch-options` statement added in Junos OS Release 9.2.
- Support for top-level configuration for the `virtual-switch` type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.
- Support for logical systems added in Junos OS Release 9.6.
- Support at the `[edit vlans vlan-name switch-options]` hierarchy level introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Modify the size of the MAC address table for the bridge domain or VLAN, a set of bridge domains or VLANs associated with a trunk port, or a virtual switch.

**Options**

- `limit`—Specify the maximum number of addresses in the MAC address table.
  - **Range:** (EX Series switches only) 16 through 65,535 MAC addresses; (other devices) 16 through 1,048,575 MAC addresses
  - **Default:** (EX Series switches only) 65,536 MAC addresses; (other devices) 5120 MAC addresses

The remaining statement is explained separately.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

Description

For trunk interfaces, configure the VLANs that can carry traffic.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

NOTE: The number of VLANs supported per switch varies for each model. Use the configuration-mode command set vlans id vlan-id ? to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum.

On an EX Series switch that runs Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style, the maximum number of VLAN members allowed on the switch is 8 times the maximum number of VLANs the switch supports (vmember limit = vlan max * 8). If the switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (eswd) due to memory allocation failure.

On an EX Series switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs the switch supports (vmember limit = vlan max * 24). If the configuration of one of these switches exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

Options

all—Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.
NOTE: Since VLAN members are limited, specifying all could cause the number of VLAN members to exceed the limit at some point.

*names*—Name of one or more VLANs. VLAN IDs are applied automatically in this case.

NOTE: all cannot be a VLAN name.

*vlan-ids*—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, 10–20 or 10–20 23–30.

NOTE: Each configured VLAN must have a specified VLAN ID to successfully commit the configuration; otherwise, the configuration commit fails.

**Required Privilege Level**

- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

mvrp { interface interface-name { join-timer milliseconds; leave-timer milliseconds; leaveall-timer seconds; registration (forbidden | normal); } join-timer milliseconds; leave-timer milliseconds; leaveall-timer seconds; no-attribute-length-in-pdu no-dynamic-vlan; traceoptions (Spanning Trees) { file filename <files number > <size size > <world-readable | no-world-readable>; flag <flag > <disable >; } } }
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description

NOTE: If your switch command-line interface (CLI) displays different options for the mvrp statement from the options shown in this document, see mvrp.

Configure Multiple VLAN Registration Protocol (MVRP) on a trunk interface to ensure that the VLAN membership information on the trunk interface is updated as the switch’s access interfaces become active or inactive in the configured VLANs.

NOTE: In Junos OS Release 11.3, MVRP was updated to conform to the IEEE standard 802.1ak. This update might result in compatibility issues in mixed release networks. For details, see “Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)” on page 2126.

The remaining statements are explained separately.

Default MVRP is disabled by default.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Release Information  Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description  For 1-, 4-, and 8-port Gigabit Ethernet IQ2 and IQ2-E PICs, for 1-port 10-Gigabit Ethernet
IQ2 and IQ2-E PICs configured for 802.1Q flexible VLAN tagging, for all Ethernet interfaces
on MX Series routers, and for aggregated Ethernet interfaces on IQ2 and IQ2-E PICs or
MX Series DPCs, and for 100-Gigabit Ethernet Type 5 PIC with CFP, configure mixed
tagging support for untagged packets on a port. When the native-vlan-id statement is
included with the flexible-vlan-tagging statement, untagged packets are accepted on
the same mixed VLAN-tagged port.

NOTE: Mixed VLAN tagging is not supported on EX Series switches.

The logical interface on which untagged packets are received must be configured with
the same VLAN ID as the native VLAN ID configured on the physical interface. To configure
the logical interface, include the vlan-id statement (matching the native-vlan-id statement
on the physical interface) at the [edit interfaces interface-name unit logical-unit-number]
hierarchy level.

When the native-vlan-id statement is included with the interface-mode statement,
untagged packets are accepted and forwarded within the bridge domain or VLAN that
is configured with the matching VLAN ID.

Options  number—VLAN ID number.
Range: (ACX Series routers and EX Series switches) 0 through 4094.

Required Privilege  interface—To view this statement in the configuration.
Level  interface-control—To add this statement to the configuration.

no-attribute-length-in-pdu

**Syntax**

no-attribute-length-in-pdu;

**Hierarchy Level**

[edit protocols mvrp]

**Release Information**

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Include an extra byte in protocol data units (PDUs) sent by the Multiple VLAN Registration Protocol (MVRP). You can disable the extra byte to address a compatibility issue between MVRP in Junos OS Releases 13.2 and later for EX Series switches with support for the Enhanced Layer 2 Software (ELS), which includes the extra byte, and MVRP in Junos OS Releases 11.3 and later for EX Series switches that do not support ELS, which does not include the extra byte. If this compatibility issue arises, the ELS version of MVRP does not recognize PDUs without the extra byte sent by the non-ELS version of MVRP.

You can recognize an MVRP version compatibility issue by observing the switch running the ELS version of MVRP. Because a switch running the ELS version of MVRP cannot interpret an unmodified PDU from a switch running the non-ELS version of MVRP, the switch will not add VLANs from the non-ELS version of MVRP. When you execute the command `show mvrp statistics` in the ELS version of MVRP, the values for `Received Join Empty` and `Received Join In` will incorrectly display zero, even though the value for the `Received MVRP PDUs without error` has been increased. Another indication that MVRP is having a version compatibility issue is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the ELS version of MVRP.

**Required Privilege Level**

routing—To view this statement in the configuration.

routing control—To add this statement to the configuration.

no-dynamic-vlan

Syntax
no-dynamic-vlan;

Hierarchy Level
[edit protocols mvrp]
[edit protocols mvrp]

Release Information
Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description
Disable the dynamic creation of VLANs using Multiple VLAN Registration Protocol (MVRP) for interfaces participating in MVRP.

Dynamic VLAN configuration can be enabled on an interface independent of MVRP. The MVRP dynamic VLAN configuration setting does not override the interface configuration dynamic VLAN configuration setting. If dynamic VLAN creation is disabled on the interface in the interface configuration, no dynamic VLANs are created on the interface, including dynamic VLANs created using MVRP.

This option can be applied globally; it cannot be applied per interface.

Default
If MVRP is enabled, the dynamic creation of VLANs as a result of MVRP protocol exchange messages is enabled.

Required Privilege
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

no-gratuitous-arp-request

**Syntax**

no-gratuitous-arp-request;

**Hierarchy Level**

[edit interfaces interface-name]

**Release Information**

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure the switch not to respond to gratuitous ARP requests. You can disable responses to gratuitous ARP requests on Layer 2 Ethernet switching interfaces, and integrated routing and bridging (IRB) interfaces or routed VLAN interfaces (RVIs). (On EX Series switches that use Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, the feature is known as an IRB interface. On EX Series switches that use Junos OS that does not support ELS, the feature is known as an RVI.)

**Default**

Gratuitous ARP responses are enabled on all Ethernet switching interfaces, and IRB interfaces or RVIs.

**Required Privilege Level**

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information  Statement introduced in Junos OS Release 8.4.
Support for the switch-options statement added in Junos OS Release 9.2.
Support for top-level configuration for the virtual-switch type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or bridge domain configured within a virtual switch.
Support for logical systems added in Junos OS Release 9.6.
[edit switch-options], [edit switch-options interface interface-name], [edit vlans vlan-name switch-options], and [edit vlans vlan-name switch-options interface interface-name] hierarchy levels introduced in Junos OS Release 12.3 R2 for EX Series switches.
Support for EVPNPs added in Junos OS Release 13.2 for MX 3D Series routers.
Hierarchy levels [edit switch-options interface interface-name] and [edit vlans vlan-name switch-options] introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Description  For MX Series routers and EX Series switches, disable MAC learning for a virtual switch, for a bridge domain or VLAN, for a specific logical interface in a bridge domain or VLAN, or for a set of bridge domains or VLANs associated with a Layer 2 trunk port. On platforms that support EVPNPs, you can disable MAC learning on an EVPN.
NOTE: When MAC learning is disabled for a VPLS routing instance, traffic is not load balanced and only one of the equal-cost next hops is used.

Release Information  Statement introduced in Junos OS Release 8.4.
Support for the switch-options statement added in Junos OS Release 9.2.
Support for top-level configuration for the virtual-switch type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy

Description Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

Default Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

Options drop—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.

drop-and-log—(EX Series switches only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

log—(EX Series switches only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

none—(EX Series switches only) Forward packets with new source MAC addresses, and learn the new source MAC address.

shutdown—(EX Series switches only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

Required Privilege Level routing—to view this statement in the configuration.

routing-control—to add this statement to the configuration.

**proxy-arp**

**Syntax**
```
proxy-arp (restricted | unrestricted);
```

**Hierarchy Level**
```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.6 for EX Series switches.
**restricted** added in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description**
For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request’s target address.

**NOTE:** You must configure the IP address and the inet family for the interface when you enable proxy ARP.

**Default**
Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.

**Options**
- **none**—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.
- **restricted**—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address.
- **unrestricted**—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.

**Default:** unrestricted

redundant-trunk-group {
  group name {
    interface interface-name <primary>;
    interface interface-name;
    preempt-cutover-timer seconds;
  }
}
```

**Hierarchy Level**
- For platforms with ELS:
  [edit switch-options]
- For platforms without ELS:
  [edit ethernet-switching-options]

**Release Information**
Statement introduced in Junos OS Release 9.0 for EX Series switches.
(See “Getting Started with Enhanced Layer 2 Software” on page 3 for information about ELS.)

**Description**
Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over without waiting for normal spanning-tree protocol convergence. You can configure a maximum of 16 redundant trunk groups on most standalone switches or on Virtual Chassis. The EX8200 switch and EX8200 Virtual Chassis, however, support up to 254 redundant trunk groups.

The remaining statements are explained separately.

**Required Privilege Level**
- **system**—To view this statement in the configuration.
- **system–control**—To add this statement to the configuration.

**vlan-id (802.1Q Tagging)**

**Syntax**  
`vlan-id number;`

**Hierarchy Level**  
`[edit vlans vlan-name]`

**Release Information**  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**  
Configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

The number zero is reserved for priority tagging and the number 4095 is also reserved.

**Default**  
If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1.

**Options**  
`number` — VLAN tag identifier

**Range:**

- 1 through 4094 (all switches except EX8200 Virtual Chassis)
- 1 through 4092 (EX8200 Virtual Chassis only)

**Default:** 1

**Required Privilege Level**  
`system`—To view this statement in the configuration.

`system-control`—To add this statement to the configuration.

- `edit vlans vlan-name`

**Release Information**

Statement introduced in Junos OS Release 9.4.
Support for logical systems added in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

Specify a VLAN identifier list to use for a bridge domain or VLAN in trunk mode.

Specify the `trunk` option in the `interface-mode` statement to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the `vlan-id-list` statement to forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the `access` option to accept packets with no VLAN ID to forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the `vlan-id` statement.

**Options**

- `vlan-id-numbers`—Valid VLAN identifiers. You can combine individual numbers with range lists including a hyphen.
  
  **Range:** 0 through 4095

  **NOTE:** On EX Series switches, the range is 0 through 4094.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

    vlan-range vlan-id-low~vlan-id-high;
  }
}

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure VLAN properties on EX Series switches. The following configuration guidelines apply:

- Only private VLAN (PVLAN) firewall filters can be used when the VLAN is enabled for Q-in-Q tunneling.
- An S-VLAN tag is added to the packet if the VLAN is Q-in-Q-tunneled and the packet is arriving from an access interface.
- You cannot use a firewall filter to assign an integrated routing and bridging (IRB) interface or a routed VLAN interface (RVI) to a VLAN.
- VLAN assignments performed using a firewall filter override all other VLAN assignments.

Options vlan-name—Name of the VLAN. The name can include letters, numbers, hyphens (-), and periods (.) and can contain up to 255 characters long.
The remaining statements are explained separately.

**Required Privilege Level**
- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

CHAPTER 40

Administration

- Routine Monitoring on page 2177
- Operational Commands on page 2182

Routine Monitoring

- Verifying That Virtual Routing Instances Are Working on page 2177
- Verifying Integrated Routing and Bridging Interface Status and Statistics on page 2178
- Verifying That MVRP Is Working Correctly on page 2180
- Verifying That Proxy ARP Is Working Correctly on page 2181

Verifying That Virtual Routing Instances Are Working

**Purpose**
After creating a virtual routing instance, make sure it is set up properly.

**Action**

1. Use the `show route instance` command to list all of the routing instances and their properties:

   ```
   user@switch> show route instance
   Instance          Type                  Primary RIB             Active/holddown/hidden
   master            forwarding           inet.0                  3/0/0
   __juniper_private1__ forwarding
   __juniper_private1__.inet.0                  1/0/3
   __juniper_private2__ forwarding
   instance1         forwarding
   r1                virtual-router       r1.inet.0               1/0/0
   r2                virtual-router       r2.inet.0               1/0/0
   ```

2. Use the `show route forwarding-table` command to view the forwarding table information for each routing instance:

   ```
   user@switch> show route forwarding-table
   Routing table: r1.inet
   Internet:
   ```

</tr>
</tbody>
</table>

**Meaning**
The output confirms that the virtual routing instances are created and the links are up and displays the routing table information.

**Related Documentation**
- Configuring Virtual Routing Instances (CLI Procedure) on page 2125
- Example: Using Virtual Routing Instances to Route Among VLANs on EX Series Switches on page 2093

### Verifying Integrated Routing and Bridging Interface Status and Statistics

**Purpose**
Determine status information and traffic statistics for integrated routing and bridging (IRB) interfaces.

**Action**
Display IRB interfaces and their current states:
```bash
user@switch> show interfaces irb terse
Interface  Admin  Link  Proto    Local                 Remote
irb        up    up      inet     111.111.111.1/24
irb.111    up    up      inet     111.111.111.1/24
...
```

Display Layer 2 VLANs, including any tags assigned to the VLANs and the interfaces associated with the VLANs:
```bash
user@switch> show vlans
Routing instance  VLAN name  Tag  Interfaces
default-switch    irb        101  ge-0/0/18.0
default-switch    support    111  ge-0/0/18.0
...
```

Display Ethernet switching table entries for the VLAN that is attached to the IRB interface:
```bash
user@switch> show ethernet-switching table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)
Routing instance : default-switch
Vlan Name          MAC address          MAC flags          Age Logical interface
```
Display the ingress-counting statistics of an IRB interface with either the `show interfaces irb detail` command or the `show interfaces irb extensive` command. Ingress counting is displayed as **Input bytes** and **Input packets** and egress counting is displayed as **Output bytes** and **Output packets** under **Transit Statistics**.

```
user@switch> show interfaces irb.111 detail
```

Logical interface irb.111 (Index 65) (SNMP ifIndex 503) (HW Token 100) (Generation 131)
Flags: SNMP-Traps 0x4000  Encapsulation: ENET2
Bandwidth: 1000mbps
Routing Instance: default-switch Bridging Domain: irb+111
Traffic statistics:
  Input bytes: 17516756
  Output bytes: 411764
  Input packets: 271745
  Output packets: 8256
Local statistics:
  Input bytes: 3240
  Output bytes: 411764
  Input packets: 54
  Output packets: 8256
Transit statistics:
  Input bytes: 17513516 0 bps
  Output bytes: 0 0 bps
  Input packets: 271745 0 pps
  Output packets: 0 0 pps
Protocol inet, MTU: 1514, Generation: 148, Route table: 0
Flags: None
Addresses, Flags: iS-Preferred  Is-Primary
  Destination: 50.1.1/24, Local: 50.1.1.1, Broadcast: 50.1.1.255, Generation: 136

**Meaning**
- `show interfaces irb terse` displays a list of interfaces, including IRB interfaces, and their current states (up, down).
- `show vlans` displays a list of VLANs, including any tags assigned to the VLANs and the interfaces associated with the VLANs.
- `show ethernet-switching table` displays the Ethernet switching table entries, including VLANs attached to the IRB interface.
- `show interfaces irb detail` displays IRB interface ingress counting as **Input Bytes** and **Input Packets** under **Transit Statistics**.

Verifying That MVRP Is Working Correctly

### Purpose

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Verifying That MVRP Is Working Correctly*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

After configuring your EX Series switch to participate in MVRP, verify that the configuration is properly set and that MVRP messages are being sent and received on your switch.

### Action

1. Confirm that MVRP is enabled on your switch.

    ```
    user@switch> show mvrp
    MVRP configuration for routing instance 'default-switch'
    MVRP dynamic VLAN creation : Enabled
    MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
    MVRP timers (ms)
        Interface       Join   Leave  LeaveAll
        xe-0/1/1         200    1000     10000
    ```

2. Confirm that MVRP messages are being sent and received on your switch.

    ```
    user@switch> show mvrp statistics
    MVRP statistics for routing instance 'default-switch'

    Interface name                  : xe-0/1/1
    VLAN IDs registered             : 117
    Sent MVRP PDUs                  : 118824
    Received MVRP PDUs without error: 118848
    Received MVRP PDUs with error   : 0
    Transmitted Join Empty          : 5229
    Transmitted Leave All           : 2
    Received Join In                : 11884924
    Transmitted Leave               : 888
    Transmitted Join In             : 1835
    Transmitted Empty               : 93606408
    Transmitted Leave In            : 13780024
    Transmitted New                 : 2692
    Received Leave All              : 118761
    Received Leave                  : 97
    Received In                     : 3869
    Received Empty                  : 828
    Received Join Empty             : 2020152
    Received New                    : 224
    ...                             
    ```

### Meaning

The output of `show mvrp` shows that interface xe-0/1/1 is enabled for MVRP participation.

The output for `show mvrp statistics` confirms that MVRP messages are being transmitted and received on interface xe-0/1/1.
NOTE: You can identify an MVRP compatibility issue by observing the output from this command. If Received Join Empty and Received Join In incorrectly display zero, even though the value for Received MVRP PDUs without error has been increased, you are probably running different versions of Junos OS on the switches in this network. Another indication that MVRP is having a version problem is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the earlier release version. To remedy these problems, see “Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)” on page 2126.

Verifying That Proxy ARP Is Working Correctly

Purpose Verify that the switch is sending proxy ARP messages.

Action List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
90060 datagrams received
34 ARP requests received
610 ARP replies received
2 resolution request received
0 unrestricted proxy requests
0 restricted proxy requests
0 received proxy requests
0 unrestricted proxy requests not proxied
0 restricted proxy requests not proxied
0 datagrams with bogus interface
0 datagrams with incorrect length
0 datagrams for non-IP protocol
0 datagrams with unsupported op code
0 datagrams with bad protocol address length
0 datagrams with bad hardware address length
0 datagrams with multicast source address
0 datagrams with multicast target address
0 datagrams with my own hardware address
0 datagrams for an address not on the interface
0 datagrams with a broadcast source address
294 datagrams with source address duplicate to mine
89113 datagrams which were not for me
0 packets discarded waiting for resolution
0 packets sent after waiting for resolution
309 ARP requests sent
35 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
```
Meaning

The statistics show that two proxy ARP requests were received. The unrestricted proxy requests not proxied and restricted proxy requests not proxied fields indicate that all the unproxied ARP requests received have been proxied by the switch.

### show ethernet-switching table

**Syntax**

```plaintext
show ethernet-switching table
  <brief | count | detail | extensive | summary>
  <address>
  <instance instance-name>
  <interface interface-name>
  isid isid
  <logical-system logical-system-name>
  <persistent-learning (interface interface-name | mac mac-address)>
  <address>
  <vlan-id (all-vlan | vlan-id)>
  <vlan-name (all | vlan-name)>
```

**Release Information**

Command introduced in Junos OS Release 12.3R2.
Command introduced in Junos OS Release 12.3R2 for EX Series switches.
Options *logical-system*, *persistent-learning*, and *summary* introduced in Junos OS Release 13.2X50-D10 (ELS).

**Description**

NOTE: If your EX Series switch CLI displays different options for the `show ethernet-switching table` command from the options shown in this document, then see `show ethernet-switching table`.

(MX Series routers and EX Series switches only) Display Layer 2 MAC address information.

**Options**

- **none**—Display all learned Layer 2 MAC address information.
- **brief | count | detail | extensive | summary**—(Optional) Display the specified level of output.
- **address**—(Optional) Display the specified learned Layer 2 MAC address information.
- **instance instance-name**—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.
- **interface interface-name**—(Optional) Display learned Layer 2 MAC addresses for the specified interface.
- **isid isid**—(Optional) Display learned Layer 2 MAC addresses for the specified ISID.
- **logical-system logical-system-name**—(Optional) Display Ethernet-switching statistics information for the specified logical system.
- **persistent-learning (interface interface-name | mac mac-address)**—(Optional) Display dynamically learned MAC addresses that are retained despite device restarts and interface failures for a specified interface, or information about a specified MAC address.
- **vlan-id (all-vlan | vlan-id)**—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.
**vlan-name** *(all | vlan-name)*—*(Optional)* Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

**Additional Information**
When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.

show interfaces irb

Syntax

```
show interfaces irb
<brief | detail | extensive | terse>
<descriptions>
<media>
<routing-instance instance-name>
<snmp-index snmp-index>
<statistics>
```

Release Information

Command introduced in Junos OS Release 12.3R2.
Command introduced in Junos OS Release 12.3R2 for EX Series switches.
Command introduced in Junos OS Release 13.2 for the QFX Series

Description

Display integrated routing and bridging interfaces information.

Options

- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `routing-instance instance-name`—(Optional) Display information for the interface with the specified SNMP index.
- `snmp-index snmp-index`—(Optional) Display information for the interface with the specified SNMP index.

Additional Information

Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another VLAN that has a Layer 3 protocol configured.

Required Privilege

Level

`view`

### show mvrp

**Syntax**

```
show mvrp
```

**Release Information**

Command introduced in Junos OS Release 10.1.
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Display Multiple VLAN Registration Protocol (MVRP) configuration information.

**Required Privilege**

`view`

**Related Documentation**

- `show mvrp applicant-state`
- `show mvrp dynamic-vlan-memberships on page 2200`
- `show mvrp interface`
- `show mvrp registration-state`
- `show mvrp statistics`

**List of Sample Output**

`show mvrp on page 2198`

**Output Fields**

Table 275 on page 2198 lists the output fields for the `show mvrp` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVRPdynamic VLAN creation</td>
<td>Displays whether global MVRP dynamic Virtual LAN (VLAN) creation is <strong>Enabled</strong> or <strong>Disabled</strong>.</td>
</tr>
<tr>
<td>MVRP BPDU MAC address</td>
<td>Displays the multicast media access control (MAC) address for MVRP. If configured, the provider MVRP multicast MAC address is used; otherwise, the customer MVRP multicast MAC address is used.</td>
</tr>
<tr>
<td>MVRP timers (ms)</td>
<td>Displays MVRP timer information:</td>
</tr>
<tr>
<td></td>
<td>- <strong>interface</strong>—The interface on which MVRP is configured.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Join</strong>—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Leave</strong>—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message.</td>
</tr>
<tr>
<td></td>
<td>- <strong>LeaveAll</strong>—The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
show mvrp
```

```
user@host> show mvrp
```
MVRP configuration for routing instance 'default-switch'

MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)

MVRP timers (ms)

**Release Information**
Command introduced in Junos OS Release 10.1.
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**
Display all Virtual LANs (VLANs) that have been created dynamically using Multiple VLAN Registration Protocol (MVRP) on the router or switch.

**Required Privilege Level**
clear

**Related Documentation**
- show mvrp on page 2198
- show mvrp applicant-state
- show mvrp interface
- show mvrp registration-state
- show mvrp statistics

**List of Sample Output**
show mvrp dynamic-vlan-memberships on page 2200

**Output Fields**
Table 276 on page 2200 lists the output fields for the show mvrp dynamic-vlan-memberships command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Id</td>
<td>The VLAN ID of the dynamically created VLAN.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The interface or interfaces that are bound to the dynamically created VLAN.</td>
</tr>
</tbody>
</table>

**Sample Output**
show mvrp dynamic-vlan-memberships

```
user@host> show mvrp dynamic-vlan-memberships
MVRP dynamic vlans for routing instance 'default-switch'
(s) static vlan, (f) fixed registration

<table>
<thead>
<tr>
<th>VLAN Id</th>

High Availability Features for EX4300 Switches Overview

*High availability refers to the hardware and software components that provide redundancy and reliability for network communications. This topic covers the following high availability features of Juniper Networks EX4300 Ethernet Switches:*

- Redundant Routing Engines on page 2211
- Virtual Chassis on page 2212
- VRRP on page 2212
- Graceful Routing Engine Switchover on page 2212
- Link Aggregation on page 2213

Redundant Routing Engines

Redundant Routing Engines are two Routing Engines that are installed in a switch or a Virtual Chassis. When a switch has two Routing Engines, one functions as the master, while the other stands by as a backup in case the master Routing Engine fails. When a Virtual Chassis has two Routing Engines, the switch in the master role functions as the master Routing Engine and the switch in the backup role functions as the backup Routing Engine. Redundant Routing Engines are supported on Juniper Networks EX4300 Ethernet Switches configuring into a Virtual Chassis.

The master Routing Engine receives and transmits routing information, builds and maintains routing tables, communicates with interfaces and Packet Forwarding Engine components of the switch, and has full control over the control plane of the switch.

The backup Routing Engine stays in sync with the master Routing Engine in terms of protocol states, forwarding tables, and so forth. If the master becomes unavailable, the backup Routing Engine takes over the functions that the master Routing Engine performs.
Network reconvergence takes place more quickly on switches and on Virtual Chassis with redundant Routing Engines than on switches and on Virtual Chassis with a single Routing Engine.

Virtual Chassis

A Virtual Chassis is multiple switches connected together that operate as a single network entity. The advantages of connecting multiple switches into a Virtual Chassis include better-managed bandwidth at a network layer, simplified configuration and maintenance because multiple devices can be managed as a single device, a simplified Layer 2 network topology that minimizes or eliminates the need for loop prevention protocols such as Spanning Tree Protocol (STP), and improved fault tolerance and high availability. A Virtual Chassis improves high availability for the following reasons:

- Dual Routing Engine support. A Virtual Chassis automatically has two Routing Engines—the switches in the master and backup routing-engine roles—and, therefore, provides more high availability options than standalone switches. Many high availability features are available for an EX Series Virtual Chassis that are not available on standalone EX Series switches.

- Increased fault tolerance. You increase your fault tolerance options when you configure your EX Series switches into a Virtual Chassis. You can, for instance, configure interfaces into a link aggregation group (LAG) with member interfaces on different member switches in the same Virtual Chassis to ensure network traffic is received by a Virtual Chassis even when a switch or physical interface in the Virtual Chassis fails.

You can configure up to ten EX4300 switches into an EX4300 Virtual Chassis. See “Understanding EX4300 Virtual Chassis” on page 4459.

VRRP

You can configure Virtual Router Redundancy Protocol (VRRP) for IP and IPv6 on most switch interfaces, including Gigabit Ethernet interfaces, high-speed uplink interfaces, and logical interfaces. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts.

Graceful Routing Engine Switchover

You can configure graceful Routing Engine switchover (GRES) on a switch with redundant Routing Engines or on a Virtual Chassis, allowing control to switch from the master Routing Engine to the backup Routing Engine with minimal interruption to network communications. When you configure GRES, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and
forwarding state. Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur. If the kernel on the master Routing Engine stops operating, the master Routing Engine experiences a hardware failure, or the administrator initiates a manual switchover, mastership switches to the backup Routing Engine.

When the backup Routing Engine assumes mastership in a redundant failover configuration (that is, when GRES is not enabled), the Packet Forwarding Engines initialize their state to the boot state before they connect to the new master Routing Engine. In contrast, in a GRES configuration, the Packet Forwarding Engines do not reinitialize their state, but resynchronize their state to that of the new master Routing Engine. The interruption to traffic is minimal.

**Link Aggregation**

You can combine multiple physical Ethernet ports to form a logical point-to-point link, known as a link aggregation group (LAG) or bundle. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by load-balancing traffic across all available links. If one of the links should fail, the system automatically load-balances traffic across all remaining links. In a Virtual Chassis, LAGs can be used to load-balance network traffic between member switches, which increases high availability by ensuring that network traffic is received by the Virtual Chassis even if a single interface fails for any reason.

The number of Ethernet interfaces you can include in a LAG and the number of LAGs you can configure on a switch depend on the switch model. For information about LAGs, see “Understanding Aggregated Ethernet Interfaces and LACP” on page 2272.

**Power Management Overview**

* Understanding Power Management on EX Series Switches on page 2213

**Understanding Power Management on EX Series Switches**

The power management feature for Juniper Networks Ethernet Switches helps ensure that normal operation of the system is not disrupted because of insufficient power to the switch. For example:

- Power management ensures that operating line cards continue to receive power if a user installs a new line card in an operating switch when power is insufficient for both the new and existing line cards.
• Power management reserves a certain amount of power to power supply redundancy, so that if a power supply fails, the switch can continue to operate normally. If power management must use some of this reserved power to provide power to switch components, it raises an alarm to indicate that power supply redundancy no longer exists and that normal operations might be disrupted if a power supply fails.

• If power supply failure requires power management to power down some components, it does so gracefully by powering down line cards and PoE ports in the order specified by the user.

Power management manages power to switch components by employing a power budget policy. In its power budget policy, power management:

• Budgets power for each installed switch component that requires power. With the exception of PoE power for line cards that support PoE, the amount that power management budgets for each component is the maximum power that component might consume under worst case operating conditions. For example, for the fan tray, power management budgets the amount of power required to run the fans at their maximum speed setting, even if the current fan speed is much lower.

• Reserves a set amount of power for power supply redundancy. In its default configuration, power management manages the switch for \( N+1 \) power redundancy, which ensures uninterrupted system operation if one power supply fails. For example, if a switch has four online 3000 W power supplies, power management reserves 3000 W in its power budget policy for redundancy. It allocates the remaining 9000 W to normal operating power.

• Specifies the rules under which components receive power. These rules are designed to ensure the least disruption to switch operation under conditions of insufficient power. For example, power management provides power to core system components, such as the Routing Engines, before it provides power to line cards.

You can configure certain aspects of power management’s budget policy, specifically:

• The power priority of individual line cards. By assigning different power priorities to the line cards, you can determine which line cards are more likely to receive power in the event of insufficient power.

• The power redundancy configuration. The default power redundancy configuration is \( N+1 \); you can optionally configure \( N+N \). For example, if you have deployed two independent AC power feeds to the switch, configure \( N+N \) redundancy. When you configure power management for \( N+N \) redundancy, it reserves the appropriate amount of power in its power budget and reports insufficient power conditions accordingly.

These configurable items are discussed further in:

• Power Priority of Line Cards on page 2215
• Power Supply Redundancy on page 2218
Power Priority of Line Cards

The power priority of line cards determines:

• The order in which line cards are allocated power
• The order in which line cards that support PoE are allocated power for PoE
• How power is reallocated in cases of changes in power availability or demand in an operating switch

NOTE: On EX6200 switches, the four 10-Gigabit Ethernet SFP+ uplink ports on a Switch Fabric and Routing Engine (SRE) module are treated like a line card in the power budget.

This section covers:

• How a Line Card’s Power Priority Is Determined on page 2215
• Line Card Priority and Line Card Power on page 2215
• Line Card Priority and PoE Power on page 2216
• Line Card Priority and Changes in the Power Budget on page 2216

How a Line Card’s Power Priority Is Determined

Using the CLI, you can assign a explicit power priority to a line-card slot. If more than one slot has the same assigned priority, the power priority is determined by slot number, with the lowest-numbered slots receiving power first.

By default, all slots in an EX8200 switch are assigned the lowest priority. Thus if you do not explicitly assign priorities to slots, power priority is determined by slot number, with slot 0 having the highest priority.

In an EX6200 switch, all slots are assigned the lowest priority, except for the slots containing an SRE module. Slots containing an SRE module are automatically assigned the highest priority. This means that the line cards that represent the 10-Gigabit Ethernet SFP+ ports on SRE modules have the highest priority among the line cards.

Line Card Priority and Line Card Power

When an EX6200 or EX8200 switch is powered on, power management allocates power to components according to its power budget policy. After power management has allocated power to the base chassis components, it allocates the remaining available power to the line cards. It powers on the line cards in priority order until all line cards are powered on or the available power (including reserved power, if necessary) is exhausted. Thus if available power is exhausted before all line cards receive power, higher-priority cards are powered on while lower-priority cards remain powered off.

A lower-priority card might receive power while a higher-priority card does not if the remaining available power is sufficient to power on the lower-priority card but not the higher-priority card. For example, if a line card requiring 450 W is in a higher-priority slot
than line card requiring 330 W, the line card requiring 330 W receives the power if there is less than 450 W but more than 330 W remaining in the power budget.

Line cards that have been administratively taken offline are not allocated power.

**NOTE:** Because power management does not allocate power to a line card that has been administratively taken offline, a line card that has been taken offline in an EX6200 or EX8200 switch is not automatically brought online when you commit a configuration. You must explicitly use the `request chassis fpc slot slot-number online` command to bring a line card online that was taken offline previously. This behavior differs from other platforms running Juniper Networks Junos operating system (Junos OS), which automatically bring an offline FPC online when you commit a configuration.

If power management cannot power on a line card because of insufficient power, it raises a major (red) alarm.

**Line Card Priority and PoE Power**

After all line cards have been powered on, power management allocates any remaining available power, including reserved power, to the PoE power budgets of line cards that have PoE ports. Power management allocates PoE power to line cards in the order of power priority. If enough power is available, a line card receives its full PoE power budget before power management allocates PoE power to the next highest-priority line card. If not enough power is available, a line card receives partial PoE power and lower-priority line cards receive no PoE power.

If power management is unable to allocate enough power to meet the PoE power budget for a line card, it logs a message to the system log.

The default PoE power budget for a line card is the amount of power needed to supply the maximum supported power to all PoE ports. In cases where powered devices do not require the maximum power or in which some PoE ports are not used for powered devices, you can configure a smaller PoE power budget for a line card. By configuring a smaller PoE power budget, you make more power available for the PoE power budgets of lower-priority line cards.

You can also configure the power priority of the PoE ports on a line card. If power management is unable to allocate enough power to a line card to meet its PoE power budget, the line card PoE controller will turn off power to PoE ports in reverse priority order as required to meet the reduced power allocation.

See “Configuring PoE (CLI Procedure)” on page 3942 for more information on how to configure the PoE power budget for a line card and how to configure PoE port priorities.

**Line Card Priority and Changes in the Power Budget**

In an operating switch, power management dynamically reallocates power in response to changes in power availability or demand or changes in line card priority. Power management uses line card priority to determine how to reallocate power in response to the following events:
• A power supply fails, is removed, or is taken offline:
  • If power is insufficient to meet the PoE power allocations of all PoE line cards, power
    management deallocates PoE power from the line cards in reverse priority order
    until power is sufficient to meet the remaining PoE power allocations.
  • If power is insufficient to meet the base (non-PoE) power requirements of all the
    line cards, all PoE power is deallocated. If, after the deallocation of PoE power, power
    is still not sufficient, power management turns off line cards in reverse priority order
    until power is sufficient for the remaining line cards.

• A new line card is inserted or a line card is brought online:
  • If the line card supports PoE and there is insufficient power to meet its PoE power
    budget, PoE power is reallocated from lower-priority line cards. If not enough PoE
    power can be reallocated from lower-priority line cards, the new line card receives
    a partial PoE power allocation.
  • If there is insufficient power to power on the new line card, PoE power is removed
    from PoE line cards in reverse priority order until the new line card can be powered
    on.
  • If the removal of all PoE power is insufficient to free up enough power to power on
    the line card, the line card remains powered off and the PoE line cards continue to
    receive their PoE power allocations. To minimize disruption on an operating switch,
    lower-priority line cards are not turned off to provide power to the new line card.
    However, if you restart the switch, power management reruns the current power
    budget policy and powers line cards on or off based on their priority. As a result, line
    cards receive power strictly by priority order and previously operating line cards might
    no longer receive power.

• A new power supply is brought online:
  • Any line cards that were powered off because of insufficient power are powered on
    in priority order.
  • After all line cards are powered on, remaining power is allocated to the PoE power
    budgets of line cards in priority order.

• A line card is removed or taken offline, freeing up power:
  • Any line cards that were powered down because of insufficient power are powered
    on in priority order.
  • After all line cards are powered on, any remaining power is allocated to the PoE
    power budgets of line cards in priority order.

• A user changes the assigned power priority of one or more line cards when power is
  insufficient to meet the power budget:
  • PoE power to the line cards is reallocated based on the new power priorities.
  • Base power allocation to the line cards is not changed—in other words, power
    management does not power down line cards that had been receiving power because
    they are now a lower priority. However, if you restart the switch, power management
    reruns the current power budget policy and powers line cards on or off based on their
priority. As a result, line cards receive power strictly by priority order and previously operating line cards might no longer receive power.

If, because of insufficient power, power management reduces or eliminates the PoE power budget for a line card, it logs a message to the system log. If power management must power down a line card because of insufficient power, it raises a major (red) alarm.

**Power Supply Redundancy**

By default, power management in EX Series switches is configured to manage the power supplies for $N+1$ redundancy, in which one power supply is held in reserve for backup if one of the other power supplies is removed or fails.

You can configure power management to manage the power supplies for $N+N$ redundancy. In $N+N$ redundancy, power management holds $N$ power supplies in reserve for backup. For example, if your switch has six power supplies and you configure $N+N$ redundancy, power management makes three power supplies available for normal operating power and reserves three power supplies for redundancy ($3+3$). If you have an odd number of power supplies, power management allocates one more power supply to normal operating power than to redundant power. For example, if you have five power supplies, the $N+N$ configuration is $3+2$.

Given the same number of power supplies, an $N+N$ configuration usually provides less normal operating power than an $N+1$ configuration because the $N+N$ configuration holds more power in reserve for backup. Table 279 on page 2218 shows the effect on normal operating power in $N+1$ and $N+N$ configurations.

**Table 279: Available Operating Power in N+1 and N+N Redundancy Configurations**

<table>
<thead>
<tr>
<th>Number of Power Supplies at $n$ W Each</th>
<th>Normal Operating Power in $N+1$ Configuration</th>
<th>Normal Operating Power in $N+N$ Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>$1 \times (n \ W)$</td>
<td>$1 \times (n \ W)$</td>
</tr>
<tr>
<td>3</td>
<td>$2 \times (n \ W)$</td>
<td>$2 \times (n \ W)$</td>
</tr>
<tr>
<td>4</td>
<td>$3 \times (n \ W)$</td>
<td>$2 \times (n \ W)$</td>
</tr>
<tr>
<td>5 (EX8200 switches only)</td>
<td>$4 \times (n \ W)$</td>
<td>$3 \times (n \ W)$</td>
</tr>
<tr>
<td>6 (EX8200 switches only)</td>
<td>$5 \times (n \ W)$</td>
<td>$3 \times (n \ W)$</td>
</tr>
</tbody>
</table>

To compensate for the reduced normal operating power, power management on EX8200 switches allocates less power to the chassis in an $N+N$ configuration than in an $N+1$ configuration. This reduction in allocated chassis power allows a switch in an $N+N$ configuration to power more line cards than it could without the reduction. For the EX8208 switch, the power allocated for the chassis is reduced to 1200 W from 1600 W; for the EX8216 switch, it is reduced to 1800 W from 2400 W.
NOTE: To achieve the reduction in allocated chassis power in an EX8200 switch, power management reduces the maximum fan speed to 60 percent in an N+N configuration from 80 percent in an N+1 configuration. Because the maximum fan speed is reduced, it is possible that a line card that overheats would be shut down sooner in an N+N configuration than in an N+1 configuration.

On EX6200 switches, the same amount of power is allocated for the chassis in N+N configurations as in N+1 configurations.

Power management automatically recalculates the reserved power and normal operating power as power supplies go online or offline. For example, if you have an N+N configuration with three online 2000 W power supplies, power management allocates 2000 W to reserved power. If you bring a fourth 2000 W power supply online, power management then allocates 4000 W to reserved power. If a power supply goes offline again, power management once again allocates 2000 W to reserved power.

When power is insufficient to meet the budgeted power requirements, power management raises alarms as follows:

- A minor (yellow) alarm is raised when insufficient power exists to maintain the configured N+1 or N+N power reserves, but all line cards are still receiving their base and PoE power allocations. If this condition persists for 5 minutes, the alarm becomes a major (red) alarm. Even though operation of the switch is unaffected in this condition, you should remedy it as quickly as possible because a power supply failure might cause a disruption in switch operation.

- A major (red) alarm is raised when insufficient power exists to provide all the line cards with their base and PoE power allocations. One or more PoE ports might be down or one or more line cards might be down.

Power management clears all alarms when sufficient power is available to meet normal operating and reserved power requirements.

Understanding VRRP on EX Series Switches

Juniper Networks EX Series Ethernet Switches support the Virtual Router Redundancy Protocol (VRRP) and VRRP for IPv6. This topic covers:

- Overview of VRRP on EX Series Switches on page 2220
- Examples of VRRP Topologies on page 2221

Overview of VRRP on EX Series Switches

You can configure the Virtual Router Redundancy Protocol (VRRP) or VRRP for IPv6 on Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and logical interfaces on EX Series switches. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup EX Series switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts. Virtual Router Redundancy Protocol is not supported on management interfaces.

VRRP for IPv6 provides a much faster switchover to an alternate default routing platform than IPv6 Neighbor Discovery (ND) procedures. VRRP for IPv6 does not support the `authentication-type` or `authentication-key` statements.

**NOTE:** Do not confuse the VRRP master and backup routing platforms with the master and backup member switches of a Virtual Chassis configuration. The master and backup members of a Virtual Chassis configuration compose a single host. In a VRRP topology, one host operates as the master routing platform and another operates as the backup routing platform, as shown in Figure 35 on page 2221.

Switches running VRRP dynamically elect master and backup routing platforms. You can also force assignment of master and backup routing platforms using priorities from 1 through 255, with 255 being the highest priority. In VRRP operation, the default master routing platform sends advertisements to backup routing platforms at regular intervals. The default interval is 1 second. If the backup routing platforms do not receive an advertisement for a set period, the backup routing platform with the highest priority takes over as master and begins forwarding packets.

**NOTE:** Priority 255 cannot be set for routed VLAN interfaces (RVIs).

VRRP is defined in RFC 3768, *Virtual Router Redundancy Protocol*. 
**Examples of VRRP Topologies**

Figure 34 on page 2221 illustrates a basic VRRP topology with EX Series switches. In this example, Switches A, B, and C are running VRRP and together they make up a virtual routing platform. The IP address of this virtual routing platform is **10.10.0.1** (the same address as the physical interface of Switch A).

**Figure 34: Basic VRRP on EX Series Switches**

Figure 35 on page 2221 illustrates a basic VRRP topology using Virtual Chassis configurations. Switch A, Switch B, and Switch C are each composed of multiple interconnected Juniper Networks EX4200 Ethernet Switches. Each Virtual Chassis configuration operates as a single switch, which is running VRRP, and together they make up a virtual routing platform. The IP address of this virtual routing platform is **10.10.0.1** (the same address as the physical interface of Switch A).

**Figure 35: VRRP on Virtual Chassis Switches**
Because the virtual routing platform uses the IP address of the physical interface of Switch A, Switch A is the master VRRP routing platform, while Switch B and Switch C function as backup VRRP routing platforms. Clients 1 through 3 are configured with the default gateway IP address of 10.10.0.1 as the master router, Switch A, forwards packets sent to its IP address. If the master routing platform fails, the switch configured with the higher priority becomes the master virtual routing platform and provides uninterrupted service for the LAN hosts. When Switch A recovers, it becomes the master virtual routing platform again.

- Configuring VRRP for IPv6 (CLI Procedure) on page 2224

Configuring Power Supply Redundancy (CLI Procedure)

By default, the power management feature in EX Series switches is configured to manage the power supplies for N+1 redundancy, in which one power supply is held in reserve for backup if any one of the other power supplies is removed or fails.

You can configure power management to manage the power supplies for N+N redundancy. For example, to set up your AC power supplies for dual power feed, N+N redundancy is required. In N+N redundancy, power management allocates half of the online power supplies to normal operating power and half to redundant power. If you have an odd number of online power supplies, power management allocates one more power supply to normal operating power than to redundant power.

This topic describes how to configure power management for N+N redundancy and how to revert back to N+1 redundancy if your deployment needs change.

Before you configure power management for N+N redundancy, ensure that you have sufficient power supplies to meet the power requirements of an N+N configuration. Use the `show chassis power-budget-statistics` command to display your current power budget.
NOTE: To allow more power to be available to line cards in an EX8200 switch, power management compensates for the reduced normal operating power in an N+N configuration by allocating less power to the chassis than it does in an N+1 configuration. For the EX8208 switch, the power allocated to the chassis is reduced to 1200 W from 1600 W. For the EX8216 switch, it is reduced to 1800 W from 2400 W. In determining whether you have enough power for an N+N configuration, take this reduction of allocated chassis power into account.

The reduction in allocated chassis power is achieved by reducing the maximum fan speed to 60 percent in an N+N configuration from 80 percent in an N+1 configuration. Because the maximum fan speed is reduced, it is possible that a line card that overheats would be shut down sooner in an N+N configuration than in an N+1 configuration.

On EX6200 switches, the same amount of power is allocated for the chassis in N+N configurations as in N+1 configurations.

To configure N+N redundancy:

```
[edit chassis]
user@switch# set PSU redundancy n-plus-n
```

To revert back to N+1 redundancy:

```
[edit chassis]
user@switch# delete chassis PSU redundancy n-plus-n
```

Configuring VRRP for IPv6 (CLI Procedure)

By configuring the Virtual Router Redundancy Protocol (VRRP) on EX Series switches, you can enable hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. You can configure VRRP for IPv6 on Gigabit Ethernet, 10-Gigabit Ethernet, and logical interfaces.

To configure VRRP for IPv6:
1. Configure VRRP group support on interfaces:

   
   ```
   [edit interfaces interface-name unit logical-unit-number family inet6 address address]
   user@switch# set vrrp-inet6-group group-id priority number virtual-inet6-address address virtual-link-local-address ipv6-address
   ```

   You must explicitly define a virtual link local address for each VRRP for IPv6 group.
   Otherwise, when you attempt to commit the configuration, the commit request fails.
   The virtual link local address must be on the same subnet as the physical interface address.

2. If you want to configure the priority order in which this switch functioning as a backup router becomes the master router if the master router becomes nonoperational, configure a priority for this switch:

   ```
   [edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
   user@switch# set priority number
   ```

3. Specify the interval in milliseconds in which the master router sends advertisement packets to the members of the VRRP group:

   ```
   [edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
   user@switch# set inet6-advertise-interval milliseconds
   ```

4. By default, a higher-priority backup router preempts a lower-priority master router.

   - To explicitly enable the master router to be preempted:
     ```
     [edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
     user@switch# set preempt
     ```
   - To prohibit a higher-priority backup router from preempting a lower priority master router:
     ```
     [edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
     user@switch# set no-preempt
     ```

**synchronize**

**Syntax**

synchronize;

**Hierarchy Level**

[edit system commit]

**Release Information**

Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 10.4 for EX Series switches.

**Description**

For devices with multiple Routing Engines only. Configure the `commit` command to automatically perform a **commit synchronize** action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the `commit` command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engine. Each Routing Engine then performs a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

**NOTE:** When you configure nonstop active routing (NSR), you must configure the **commit synchronize** statement. Otherwise, the commit operation fails.

On the TX Matrix router, synchronization only occurs between the Routing Engines within the same chassis. When synchronization is complete, the new configuration is then distributed to the Routing Engines on the T640 routers. That is, the master Routing Engine on the TX Matrix router distributes the configuration to the master Routing Engine on each T640 router. Likewise, the backup Routing Engine on the TX Matrix router distributes the configuration to the backup Routing Engine on each T640 router.

On the TX Matrix Plus router and TX Matrix Plus router with 3D SIBs, synchronization only occurs between the Routing Engines within the switch-fabric chassis and when synchronization is complete, the new configuration is then distributed to the Routing Engines on the line-card chassis (LCC). That is, the master Routing Engine on the TX Matrix Plus router distributes the configuration to the master Routing Engine on each LCC. Likewise, the backup Routing Engine on the TX Matrix Plus router distributes the configuration to the backup Routing Engine on each LCC.

In EX Series Virtual Chassis configurations:

- On EX4200 switches in Virtual Chassis, synchronization occurs between the switch in the master role and the switch in the backup role.
- On EX8200 switches in a Virtual Chassis, synchronization occurs only between the master and backup XRE200 External Routing Engines.

**Options**

- **and-quit**—(Optional) Quit configuration mode if the commit synchronization succeeds.
- **at**—(Optional) Time at which to activate configuration changes.
- **comment**—(Optional) Write a message to the commit log.
force—(Optional) Force a commit synchronization on the other Routing Engine (ignore warnings).

scripts—(Optional) Push scripts to the other Routing Engine.

    }
    power (off | on);
    power-budget-priority priority;
}
```

**Hierarchy Level**

```
[edit chassis]
```

**Release Information**

Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**

On an EX3200 or an EX4200 switch, specify the port of the SFP+ uplink module for which you want to configure the operating mode.

On an EX6200 or an EX8200 switch, specify the line card slot for which you want to assign a power priority.

---

**NOTE:** On an EX6200 switch, you cannot change the power priority of a slot containing a Switch Fabric and Routing Engine (SRE) module. Although the CLI allows you to set a different power priority for the slot, your change does not go into effect, and the power priority remains 0. A message is sent to the system log to inform you that changing the power priority of the slot is unsupported.

---

For generic routing encapsulation (GRE) tunneling, use the `fpc` statement with the `tunnel-port` statement to specify the port on the switch that you want to convert to a GRE tunnel port.

**Options**

- `slot`—Number of the slot:
  - 0—EX3200 and standalone EX4200 switches. The FPC value refers to the switch itself.
  - 0–9—EX4200 switch in a Virtual Chassis configuration. The value corresponds to the switch’s member ID.
  - 0–3 and 6–9—EX6210 switch. The slot is a line card slot.
  - 4–5—The slot is a line card slot or an SRE module slot.
  - 0–7—EX8208 switch. The slot is a line card slot.
  - 0–15—EX8216 switch. The slot is a line card slot.

The remaining statements are explained separately.
graceful-switchover

Syntax  graceful-switchover;

Hierarchy Level  [edit chassis redundancy]

Description  For switches with more than one Routing Engine, including those in a Virtual Chassis, configure the master Routing Engine to switch over gracefully to a backup Routing Engine without interruption to packet forwarding.

Default  Graceful Routing Engine switchover (GRES) is disabled.

Required Privilege Level  interface—To view this statement in the configuration.

**Release Information**

Statement introduced in Junos OS Release 10.0 for EX Series switches.

**Description**

Configure the time in seconds after which a backup router with the highest priority preempts the master router.

**Options**

`seconds`—Hold-time period.

**Required Privilege**

interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring VRRP for IPv6 (CLI Procedure) on page 2224

---

**inet6-advertise-interval**

**Syntax**

```
inet6-advertise-interval milliseconds;
```

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]

**Release Information**

Statement introduced in Junos OS Release 10.0 for EX Series switches.

**Description**

Configure the interval between Virtual Router Redundancy Protocol (VRRP) IPv6 advertisement packets.

**Options**

`milliseconds`—Interval, in milliseconds, between advertisement packets.

**Range:** 100 to 40,000 ms

**Default:** 1 second

**Required Privilege**

interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring VRRP for IPv6 (CLI Procedure) on page 2224
**keepalive-time**

**Syntax**  
keepalive-time seconds;

**Hierarchy Level**  
[edit chassis redundancy]

**Release Information**  
Statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**  
Configure the time period that must elapse before the backup router takes mastership when it detects loss of the keepalive signal.

**Default**  
The on-loss-of-keepalives statement at the [edit chassis redundancy failover] hierarchy level must be included for failover to occur.

When the on-loss-of-keepalives statement is included and graceful Routing Engine switchover is not configured, failover occurs after 300 seconds (5 minutes).

When the on-loss-of-keepalives statement is included and graceful Routing Engine switchover is configured, the keepalive signal is automatically enabled and the failover time is set to 2 seconds.

**Options**  
seconds—Time before the backup router takes mastership when it detects loss of the keepalive signal. The range of values is 2 through 10,000.

**Required Privilege Level**  
interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**  
- failover on page 2232
- graceful-switchover on page 2234

**n-plus-n (Power Management)**

**Syntax**

```
n-plus-n;
```

**Hierarchy Level**

```
[edit chassis psu redundancy]
```

**Release Information**

Statement introduced in Junos OS Release 10.2 for EX Series switches.

**Description**

Configure $N+N$ power supply redundancy for power management on an EX6200 or EX8200 switch.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Power Supply Redundancy (CLI Procedure) on page 2223

**preempt**

**Syntax**

```
(preempt | no-preempt) {
  hold-time seconds;
}
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number family inet6 address address
  vrrp-inet6-group group-id]
```

**Release Information**

Statement introduced in Junos OS Release 10.0 for EX Series switches.

**Description**

Configure whether a backup router can preempt a master router:

- **preempt**—Allow the master router to be preempted.
- **no-preempt**—Prohibit the preemption of the master router.

The remaining statement is explained separately.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

priority

Syntax  

priority number;

Hierarchy Level  

[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id],  
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]

Release Information  

Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description  

Configure a switch’s priority for becoming the master default routing platform. The routing platform with the highest priority within the group becomes the master.

Options  

number—Routing platform’s priority for being elected to be the master router in the VRRP group. A larger value indicates a higher priority for being elected.

Range: 1 through 255
Default: 100 (for backup routers)

NOTE: Priority 255 cannot be assigned to routed VLAN interfaces (RVIs).

Required Privilege  

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

redundancy (Graceful Switchover)

Syntax

redundancy {
  failover {
    on-disk-failure;
    on-loss-of-keepalives;
  }
  graceful-switchover;
}

Hierarchy Level
[edit chassis]

Release Information
Statement introduced in Junos OS Release 9.2 for EX Series switches.

Description
Enable redundant Routing Engines on a Virtual Chassis with two or more member switches or on a standalone EX6200 or EX8200 switch with more than one Routing Engine.

The remaining statements are explained separately.

Default
Redundancy is enabled for the Routing Engines.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
nsr-synchronization flag for BGP, IS-IS, LDP, and OSPF added in Junos OS Release 8.4.
nsr-synchronization and nsr-packet flags for BFD sessions added in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
nsr-synchronization flag for RIP and RIPng added in Junos OS Release 9.0.
nsr-synchronization flag for Layer 2 VPNs and VPLS added in Junos OS Release 9.1.
nsr-synchronization flag for PIM added in Junos OS Release 9.3.
nsr-synchronization flag for MPLS added in Junos OS Release 10.1.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
nsr-synchronization flag for MSDP added in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Define tracing operations that track all routing protocol functionality in the routing device.

To specify more than one tracing operation, include multiple flag statements.

Default

If you do not include this statement, no global tracing operations are performed.

Options

Values:

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.

file filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place global routing protocol tracing output in the file routing-log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and
so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the size option.

**Range:** 2 through 1000 files  
**Default:** 10 files

flag **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. These are the global routing protocol tracing options:

- **all**—All tracing operations  
- **condition-manager**—Condition-manager events  
- **config-internal**—Configuration internals  
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)  
- **graceful-restart**—Graceful restart operations  
- **normal**—All normal operations  
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only  
- **nsr-synchronization**—Tracing operations for nonstop active routing  
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail  
- **parse**—Configuration parsing  
- **policy**—Routing policy operations and actions  
- **regex-parse**—Regular-expression parsing  
- **route**—Routing table changes  
- **state**—State transitions  
- **task**—Interface transactions and processing  
- **timer**—Timer usage

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

**Syntax:** xk to specify KB, xm to specify MB, or xg to specify GB  
**Range:** 10 KB through the maximum file size supported on your system  
**Default:** 128 KB
world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

• Tracing Nonstop Active Routing Synchronization Events

virtual-inet6-address

Syntax
virtual-inet6-address [addresses];

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family inet6 address address
vrrp-inet6-group group-id]

Release Information
Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description
Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv6 group. You can configure up to eight addresses.

NOTE: The address of an aggregated Ethernet interface (a LAG) or a routed VLAN interface (RVI) cannot be assigned as the virtual router address in a VRRP IPv6 group.

Options
addresses—Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface’s physical address, the interface becomes the master virtual router for the group.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
• Configuring VRRP for IPv6 (CLI Procedure) on page 2224
virtual-link-local-address

**Syntax**

virtual-link-local-address *ipv6-address*;

**Hierarchy Level**

[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-inet6-group group-id]
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]

**Release Information**

Statement introduced in Junos OS Release 10.0 for EX Series switches.

**Description**

Configure a virtual link local address for a Virtual Router Redundancy Protocol (VRRP) IPv6 group. You must explicitly define a virtual link local address for each VRRP IPv6 group. The virtual link local address must be in the same subnet as the physical interface address.

**Options**

*ipv6-address*—Virtual link local IPv6 address for VRRP for an IPv6 group.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- Configuring VRRP for IPv6 (CLI Procedure) on page 2224
vrrp-inet6-group

Syntax
vrrp-inet6-group group-id {
    inet6-advertise-interval milliseconds;
    preempt {
        hold-time seconds;
    }
    priority number;
    virtual-inet6-address;
    virtual-link-local-address
}

Hierarchy Level
[edit interfaces interface-name unit logical-unit-number family inet6 address address]

Release Information
Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description
Configure a Virtual Router Redundancy Protocol (VRRP) IPv6 group.

Options
group-id—VRRP group identifier. If you enable MAC source address filtering on the
interface, you must include the virtual MAC address in the list of source MAC
addresses that you specify in the source-address-filter statement. MAC addresses
ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP,
as defined in RFC 3768. The VRRP group number must be the decimal equivalent
of the last hexadecimal byte of the virtual MAC address.

Range: 0 through 255

The remaining statements are explained separately.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

CHAPTER 43
Administration

- Verification Tasks on page 2247
- Operational Commands on page 2249

Verification Tasks

- Verifying Power Configuration and Use on page 2247

Verifying Power Configuration and Use

**Purpose** Verify on an EX Series switch:

- The power redundancy and line card priority settings
- The PoE power budgets for line cards that support PoE
- Whether the \(N+1\) or \(N+N\) power requirements are being met
- Whether the switch has sufficient power for a new line card or an \(N+N\) configuration

**Action** Enter the following command:

```
user@switch> show chassis power-budget-statistics
```

Example output for an EX6200 switch:

```
  PSU 0  (EX6200-PWR-AC2500)     :    2500 W   Online
  PSU 1  (EX6200-PWR-AC2500)     :    2500 W   Online
  PSU 2  (EX6200-PWR-AC2500)     :    2500 W   Online
  PSU 3  (EX6200-PWR-AC2500)     :    2500 W   Online
  Total Power supplied by all Online PSUs :   10000 W
  Power Redundancy Configuration :     N+1
  Power Reserved for the Chassis :     500 W

  Fan Tray Statistics
  FTC 0                         :     300 W      43.04 W

  FPC Statistics
  Base power   Power Used   PoE power   Priority
  FPC 1  (EX6200-48P)           :     220 W    49.47 W     1440 W       1
  FPC 2  (EX6200-48P)           :     220 W    47.20 W     800 W        2
  FPC 3  (EX6200-48P)           :     220 W 1493.57 W    1440 W       0
  FPC 4  (EX6200-SRE64-4XS)     :     100 W    51.38 W     0 W         0
  FPC 5  (EX6200-SRE64-4XS)     :     100 W    50.28 W     0 W         0
  FPC 6  (EX6200-48P)           :     220 W    49.38 W     800 W        6
  FPC 7  (EX6200-48P)           :     220 W    61.41 W    1440 W       9
```
**FPC 9 (EX6200-48T)**

- Total (non-PoE) Power allocated: 150 W
- Total Power allocated for PoE: 12.49 W
- Power Available (Redundant case): 0 W
- Total Power Available: 9 W

**Example output for an EX8200 switch:**

- **PSU 0 (EX8200-AC2K)**: 1200 W Online
- **PSU 1 (EX8200-AC2K)**: 1200 W Online
- **PSU 2 (EX8200-AC2K)**: 1200 W Online
- **PSU 3 (EX8200-AC2K)**: 1200 W Online
- Total Power supplied by all Online PSUs: 4800 W
- Power Redundancy Configuration: N+1
- Power Reserved for the Chassis: 1600 W

- Total (non-PoE) Power allocated: 3451 W
- Total Power allocated for PoE: 950 W
- Power Available (Redundant case): 149 W
- Total Power Available: 510 W

**Meaning**

Example output for an EX6200 switch — The online power supplies can supply a total of 10,000 W to the switch. The switch is configured for \( N+1 \) redundancy, which means 7500 W of redundant power can be supplied. The **Power Available (Redundant case)** field shows that the switch is meeting the \( N+1 \) power requirements, with an additional 5750 W available. This value is calculated by subtracting all power allocations except PoE power allocations from redundant power (7500 W).

The total amount of power available on the switch is 2515 W. This value is calculated by subtracting all power allocations, including PoE power allocations, from the total power (10,000 W). On a switch with PoE line cards, if **Total Power Available** is 0, some or all of the PoE line cards might not be allocated their configured PoE power budgets, which means power to some or all PoE ports might be disabled.

The power priority order of the line cards, from highest priority line card to the lowest priority line card, is 4, 5, 3, 1, 2, 6, 8, 9. Slots 4 and 5, which contain the Switch Fabric and Routing Engine (SRE) modules, always have highest priority, even if a lower-numbered slot, such as slot 3 in this example, has a priority of 0. Should two or more 2500 W power supplies fail, power management will remove or reduce the PoE power allocations from the PoE line cards in the following order to balance the power budget: 8, 6, 2, 1, and 3.

The **Power Used** values for the fan tray and line cards shows the actual power being consumed for these components at the time the command was executed. These values are for your information only; power management uses allocated power, which is based on the maximum power the component might consume, and not actual power consumed, in determining its power budget.
Example output for an EX8200 switch—The online power supplies can supply a total of 4800 W to the switch. The switch is configured for N+1 redundancy, which means 3600 W of redundant power can be supplied. The **Power Available (Redundant case)** field shows that the switch is meeting the N+1 power requirements, with an additional 149 W available. This value is calculated by subtracting all power allocations except PoE power allocations from redundant power (3600 W). Because 149 W is insufficient power for a line card, another line card cannot be added to the switch while maintaining N+1 redundancy.

The total amount of power available on the switch is 510 W. This value is calculated by subtracting all power allocations, including PoE power allocations, from the total power (4800 W). On a switch with PoE line cards, if **Total Power Available** is 0, some or all of the PoE line cards might not be allocated their configured PoE power budgets, which means power to some or all PoE ports might be disabled.

The power priority order of the line cards, from highest priority line card to the lowest priority line card, is 1, 4, 0, 2, 5, 6. Should one or more 1200 W power supplies fail, power management will remove or reduce the PoE power allocations from the PoE line cards in the following order to balance the power budget: 2, 4, and 1.

show vrrp

Syntax

show vrrp
  <brief | detail | extensive | summary>
  <interface interface-name>
  <track interfaces>

Release Information
Statement introduced in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Display information and status about VRRP groups.

Options

none—(Same as brief) Display brief status information about all VRRP interfaces.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

interface interface-name—(Optional) Display information and status about the specified VRRP interface.

track interfaces—(Optional) Display information and status about VRRP track interfaces.

Required Privilege
Level view

<tbody>
<tr>
<td><strong>Type and Address</strong></td>
<td>Identifier for the address and the address itself:</td>
<td>none, brief, summary</td>
</tr>
<tr>
<td></td>
<td>• lcl—Configured local interface address.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• mas—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• vip—Configured virtual IP addresses.</td>
<td></td>
</tr>
<tr>
<td><strong>Interface state or Int state</strong></td>
<td>State of the physical interface:</td>
<td>none, brief, extensive, summary</td>
</tr>
<tr>
<td></td>
<td>• down—The device is present and the link is unavailable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• not present—The interface is configured, but no physical device is present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• unknown—The VRRP process has not had time to query the kernel about the state of the interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• up—The device is present and the link is established.</td>
<td></td>
</tr>
<tr>
<td><strong>Group</strong></td>
<td>VRRP group number.</td>
<td>none, brief, extensive, summary</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>VRRP state:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• backup—The interface is acting as the backup router interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• bringup—VRRP is just starting, and the physical device is not yet present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• idle—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• initializing—VRRP is initializing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• master—The interface is acting as the master router interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• transition—The interface is changing between being the backup and being the master router.</td>
<td></td>
</tr>
<tr>
<td><strong>Priority</strong></td>
<td>Configured VRRP priority for the interface.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Advertisement interval</strong></td>
<td>Configured VRRP advertisement interval.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Authentication type</strong></td>
<td>Configured VRRP authentication type: none, simple, or md5.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Preempt</strong></td>
<td>Whether preemption is allowed on the interface: yes or no.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Accept-data mode</strong></td>
<td>Whether the interface is configured to accept packets destined for the virtual IP address: yes or no.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>VIP count</strong></td>
<td>Number of virtual IP addresses that have been configured on the interface.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>VIP</strong></td>
<td>List of virtual IP addresses configured on the interface.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Advertisement timer</strong></td>
<td>Time until the advertisement timer expires.</td>
<td>detail, extensive</td>
</tr>
</tbody>
</table>
### Table 281: show vrrp Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Master router</strong></td>
<td>IP address of the interface that is acting as the master. If the VRRP interface is down, the output is N/A.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Virtual router uptime</strong></td>
<td>Time that the virtual router has been up.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Master router uptime</strong></td>
<td>Time that the master router has been up.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Virtual MAC</strong></td>
<td>MAC address associated with the virtual IP address.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Tracking</strong></td>
<td>Whether tracking is <strong>enabled</strong> or <strong>disabled</strong>.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Current priority</strong></td>
<td>Current operational priority for being the VRRP master.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Configured priority</strong></td>
<td>Configured base priority for being the VRRP master.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Priority hold-time</strong></td>
<td>Minimum time interval, in seconds, between successive changes to the current priority. <strong>Disabled</strong> indicates no minimum interval.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Remaining-time</strong></td>
<td><em>(track option only)</em> Displays the time remaining in the priority hold-time interval.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Interface tracking</strong></td>
<td>Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Interface/Tracked interface</strong></td>
<td>Name of the tracked interface.</td>
<td>detail extensive</td>
</tr>
<tr>
<td><strong>Int state/Interface state</strong></td>
<td>Current operational state of the tracked interface: <strong>up</strong> or <strong>down</strong>.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Int speed/Speed</strong></td>
<td>Current operational speed, in bits per second, of the tracked interface.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Incurred priority cost</strong></td>
<td>Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Threshold</strong></td>
<td>Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred. An entry of <strong>down</strong> means that the corresponding priority cost is incurred when the interface is down.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Route tracking</strong></td>
<td>Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td><strong>Route count</strong></td>
<td>The number of routes being tracked.</td>
<td>detail, extensive</td>
</tr>
</tbody>
</table>
Table 281: show vrrp Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route</td>
<td>The IP address of the route being tracked.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>VRF name</td>
<td>The VPN routing and forwarding (VRF) routing instance that the tracked route is in.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Route state</td>
<td>The state of the route being tracked: up, down, or unknown.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Priority cost</td>
<td>Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.</td>
<td>detail, extensive</td>
</tr>
<tr>
<td>Group VRRP PDU statistics</td>
<td>Number of VRRP advertisements sent and received by the group.</td>
<td>extensive</td>
</tr>
<tr>
<td>Group VRRP PDU error statistics</td>
<td>Errored statistics for the VRRP group:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Bad authentication type received—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be none, simple, or md5 and must be the same for all routers in the VRRP group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Bad password received—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Bad MD5 digest received—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Bad advertisement timer received—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Bad VIP count received—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Bad VIPADDR received—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance.</td>
<td></td>
</tr>
<tr>
<td>Group state transition statistics</td>
<td>State transition statistics for the VRRP group:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Idle to master transitions—Number of times that the VRRP instance transitioned from the idle state to the master state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Idle to backup transitions—Number of times that the VRRP instance transitioned from the idle state to the backup state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Backup to master transitions—Number of times that the VRRP instance transitioned from the backup state to the master state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Master to backup transitions—Number of times that the VRRP instance transitioned from the master state to the backup state.</td>
<td></td>
</tr>
<tr>
<td>Vlan-id</td>
<td>ID of Vlan</td>
<td>detail</td>
</tr>
</tbody>

EX Series Switches Interfaces Overview

Juniper Networks EX Series Ethernet Switches have two types of interfaces: network interfaces and special interfaces. This topic provides brief information about these interfaces. For additional information, see the Junos OS Interfaces Fundamentals Configuration Guide.

For information about interface-naming conventions on EX Series switches, see “Understanding Interface Naming Conventions on EX Series Switches” on page 2270.

This topic describes:

• Network Interfaces on page 2267
• Special Interfaces on page 2268

Network Interfaces

Network interfaces connect to the network and carry network traffic. Table 282 on page 2268 lists the types of network interfaces supported on EX Series switches.
Table 282: Network Interface Types and Purposes

<table>
<thead>
<tr>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregated Ethernet interfaces</td>
<td>All EX Series switches allow you to group Ethernet interfaces at the physical layer to form a single link layer interface, also known as a link aggregation group (LAG) or bundle. These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth.</td>
</tr>
<tr>
<td>LAN access interfaces</td>
<td>Use these EX Series switch interfaces to connect a personal computer, laptop, file server, or printer to the network. When you power on an EX Series switch and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports. The default configuration also enables autonegotiation for both speed and link mode.</td>
</tr>
<tr>
<td>Power over Ethernet (PoE) interfaces</td>
<td>EX Series switches provide PoE network ports with various switch models. These ports can be used to connect voice over IP (VoIP) telephones, wireless access points, video cameras, and point-of-sale devices to safely receive power from the same access ports that are used to connect personal computers to the network. PoE interfaces are enabled by default in the factory configuration.</td>
</tr>
<tr>
<td>Trunk interfaces</td>
<td>EX Series access switches can be connected to a distribution switch or customer-edge (CE) switches or routers. To use a port for this type of connection, you must explicitly configure the network interface for trunk mode. The interfaces from the distribution switch or CE switch to the access switches must also be configured for trunk mode.</td>
</tr>
</tbody>
</table>

Special Interfaces
Table 283 on page 2268 lists the types of special interfaces supported on EX Series switches.

Table 283: Special Interface Types and Purposes

<table>
<thead>
<tr>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Console port</td>
<td>Each EX Series switch has a serial port, labeled CON or CONSOLE, for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch. On an EX3300 Virtual Chassis, an EX4200 Virtual Chassis, or an EX4500 Virtual Chassis, you can access the master and configure all members of the Virtual Chassis through any member’s console port. For more information about the console port in a Virtual Chassis, see “Understanding Global Management of an EX Series Virtual Chassis” on page 4469.</td>
</tr>
<tr>
<td>Loopback</td>
<td>All EX Series switches have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch.</td>
</tr>
<tr>
<td>Management interface</td>
<td>The Juniper Networks Junos operating system (Junos OS) for EX Series switches automatically creates the switch’s management Ethernet interface, me0. The management Ethernet interface provides an out-of-band method for connecting to the switch. To use me0 as a management port, you must configure its logical port, me0.0, with a valid IP address. You can connect to the management interface over the network using utilities such as SSH or Telnet. SNMP can use the management interface to gather statistics from the switch. (The management interface me0 is analogous to the fxp0 interfaces on routers running Junos OS.)</td>
</tr>
</tbody>
</table>
### Table 283: Special Interface Types and Purposes (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integrated Routing and Bridging (IRB) Interface or Routed VLAN Interface (RVI)</td>
<td>EX Series switches use an integrated routing and bridging (IRB) interface or Routed VLAN Interface (RVI) to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network. The IRB interface or RVI functions as a logical router, eliminating the need for having both a switch and a router. These interfaces must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed from.</td>
</tr>
<tr>
<td>Virtual Chassis port (VCP) interfaces</td>
<td>Virtual Chassis ports (VCPs) are used to interconnect switches in a Virtual Chassis:</td>
</tr>
<tr>
<td></td>
<td>• EX3300 switches—Port 2 and port 3 of the SFP+ uplink ports are preconfigured as VCPs and can be used to interconnect up to six EX3300 switches in an EX3300 Virtual Chassis. See “Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)” on page 4497.</td>
</tr>
<tr>
<td></td>
<td>• EX4200 and EX4500 switches—Each EX4200 switch or each EX4500 switch with a Virtual Chassis module installed has two dedicated VCPs on its rear panel. These ports can be used to interconnect up to ten EX4200 switches in an EX4200 Virtual Chassis, up to ten EX4500 switches in an EX4500 Virtual Chassis, and up to ten switches in a mixed EX4200 and EX4500 Virtual Chassis. When you power on switches that are interconnected in this manner, the software automatically configures the VCP interfaces for the dedicated ports that have been interconnected. These VCP interfaces are not configurable or modifiable. See Understanding the High-Speed Interconnection of the Dedicated Virtual Chassis Ports Connecting EX4200, EX4500, and EX4550 Member Switches. You can also interconnect EX4200 and EX4500 switches by using uplink module ports. Using uplink ports allows you to connect switches over longer distances than you can by using the dedicated VCPs. To use the uplink ports as VCPs, you must explicitly configure the uplink module ports on the members you want to connect as VCPs. See “Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)” on page 4497 or Setting an Uplink Port as a Virtual Chassis Port on an EX4500 or EX4550 Switch (CLI Procedure).</td>
</tr>
<tr>
<td></td>
<td>• EX4300 switches—All QSFP+ ports are configured as VCPs, by default. See “Understanding EX4300 Virtual Chassis” on page 4459. You can also interconnect EX4300 switches into a Virtual Chassis by using SFP+ uplink module ports as VCPs. Using uplink ports as VCPs allows you to connect switches over longer distances than you can by using the QSFP+ ports as VCPs. To use the uplink ports as VCPs, you must explicitly configure the uplink module ports on the members you want to connect as VCPs. See “Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)” on page 4497.</td>
</tr>
<tr>
<td></td>
<td>• EX8200 switches—EX8200 switches can be connected to an XRE200 External Routing Engine to create an EX8200 Virtual Chassis. The XRE200 External Routing Engine has dedicated VCPs that connect to ports on the internal Routing Engines of the EX8200 switches and can connect to another XRE200 External Routing Engine for redundancy. These ports require no configuration. You can also connect two members of an EX8200 Virtual Chassis so that they can exchange Virtual Chassis Control Protocol (VCCP) traffic. To do so, you explicitly configure network ports on the EX8200 switches as VCPs. See Understanding Virtual Chassis Ports in an EX8200 Virtual Chassis.</td>
</tr>
<tr>
<td>Virtual management Ethernet (VME) interface</td>
<td>EX3300, EX4200, EX4300, and EX4500 switches have a VME interface. This is a logical interface that is used for Virtual Chassis configurations and allows you to manage all the members of the Virtual Chassis through the master. For more information about the VME interface, see “Understanding Global Management of an EX Series Virtual Chassis” on page 4469. EX8200 switches do not use a VME interface. An EX8200 Virtual Chassis is managed through the management Ethernet (me0) interface on the XRE200 External Routing Engine.</td>
</tr>
</tbody>
</table>
Understanding Interface Naming Conventions on EX Series Switches

Juniper Networks EX Series Ethernet Switches use a naming convention for defining the interfaces that is similar to that of other platforms running under Juniper Networks Junos operating system (Junos OS). This topic provides brief information about the naming conventions used for interfaces on EX Series switches. For additional information, see the Junos OS Network Interfaces Configuration Guide.

This topic describes:

- Physical Part of an Interface Name on page 2270
- Logical Part of an Interface Name on page 2272
- Wildcard Characters in Interface Names on page 2272

Physical Part of an Interface Name

Network interfaces in Junos OS are specified as follows:

`type-fpc / pic / port`

EX Series switches apply this convention as follows:

- **type**—EX Series interfaces use the following media types:
  
  - `ge`—Gigabit Ethernet interface
  
  - `xe`—10 Gigabit Ethernet interface
  
  - `et`—40 Gigabit Ethernet interface

- **fpc**—Flexible PIC Concentrator. EX Series interfaces use the following convention for the FPC number in interface names:
- On an EX2200 switch, an EX3200 switch, a standalone EX3300 switch, a standalone EX4200 switch, a standalone EX4300 switch, a standalone EX4500, and a standalone EX4550 switch, FPC refers to the switch itself. The FPC number is 0 by default on these switches.

- On an EX3300 Virtual Chassis, an EX4200 Virtual Chassis, an EX4300 Virtual Chassis, an EX4500 Virtual Chassis, an EX4550 Virtual Chassis, or a mixed Virtual Chassis, the FPC number indicates the member ID of the switch in the Virtual Chassis.

- On an EX6200 switch and a standalone EX8200 switch, the FPC number indicates the slot number of the line card that contains the physical interface. On an EX6200 switch, the FPC number also indicates the slot number of the Switch Fabric and Routing Engine (SRE) module that contains the uplink port.

- On an EX8200 Virtual Chassis, the FPC number indicates the slot number of the line card on the Virtual Chassis. The line card slots on Virtual Chassis member 0 are numbered 0 through 15; on member 1, they are numbered 16 through 31, and so on.

- **pic**—EX Series interfaces use the following convention for the PIC (Physical Interface Card) number in interface names:
  - On EX2200, EX3200, EX3300, EX4200, EX4500 switch, and EX4550 switches, the PIC number is 0 for all built-in interfaces (interfaces that are not uplink ports).
  - On EX2200, EX3200, EX3300, and EX4200 switches, the PIC number is 1 for uplink ports.
  - On EX4300 switches, the PIC number is 0 for built-in network ports, 1 for built-in QSFP+ ports (located on the rear panel of the switch), and 2 for uplink module ports.
  - On EX4500 switches, the PIC number is 1 for ports on the left-hand uplink module and 2 for ports on the right-hand uplink module.
  - On EX4550 switches, the PIC number is 1 for ports in the expansion module or Virtual Chassis module installed in the module slot on the front panel of the switch and 2 for those in the expansion module or Virtual Chassis module installed in the module slot on the rear panel of the switch.
  - On EX6200 and EX8200 switches, the PIC number is always 0.

- **port**—EX Series interfaces use the following convention for port numbers:
  - On EX2200, EX3200, EX3300, EX4200, EX4300, EX4500, and EX4550 switches, built-in network ports are numbered from left to right. On models that have two rows of ports, the ports on the top row start with 0 followed by the remaining even-numbered ports, and the ports on the bottom row start with 1 followed by the remaining odd-numbered ports.
  - Uplink ports in EX2200, EX3200, EX3300, EX4200, EX4300, EX4500, and EX4550 switches are labeled from left to right, starting with 0.
  - On EX6200 and EX8200 switches, the network ports are numbered from left to right on each line card. On line cards that have two rows of ports, the ports on the top row...
start with 0 followed by the remaining even-numbered ports, and the ports on the bottom row start with 1 followed by the remaining odd-numbered ports.

- Uplink ports on an SRE module in an EX6200 switch are labeled from left to right, starting with 0.

Logical Part of an Interface Name

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16384. In the virtual part of the name, a period (.) separates the port and logical unit numbers: `type-fpc/pic/port.logical-unit-number`. For example, if you issue the `show ethernet-switching interfaces` command on a system with a default VLAN, the resulting display shows the logical interfaces associated with the VLAN:

<table>
<thead>
<tr>
<th>Interface</th>
<th>State</th>
<th>VLAN members</th>
<th>Blocking</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge-0/0/0.0</td>
<td>down</td>
<td>remote-analyzer</td>
<td>unblocked</td>
</tr>
<tr>
<td>ge-0/0/1.0</td>
<td>down</td>
<td>default</td>
<td>unblocked</td>
</tr>
<tr>
<td>ge-0/0/10.0</td>
<td>down</td>
<td>default</td>
<td>unblocked</td>
</tr>
</tbody>
</table>

Wildcard Characters in Interface Names

In the `show interfaces` and `clear interfaces` commands, you can use wildcard characters in the `interface-name` option to specify groups of interface names without having to type each name individually. You must enclose all wildcard characters except the asterisk (*) in quotation marks (" ").

Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single link layer interface, also known as a link aggregation group (LAG) or bundle.

Aggregating multiple links between physical interfaces creates a single logical point-to-point trunk link or a LAG. The LAG balances traffic across the member links within an aggregated Ethernet bundle and effectively increases the uplink bandwidth. Another advantage of link aggregation is increased availability, because the LAG is composed of multiple member links. If one member link fails, the LAG continues to carry traffic over the remaining links.

Link Aggregation Control Protocol (LACP), a component of IEEE 802.3ad, provides additional functionality for LAGs.

This topic describes:

- Link Aggregation Group (LAG) on page 2273
- Link Aggregation Control Protocol (LACP) on page 2274
Link Aggregation Group (LAG)

You configure a LAG by specifying the link number as a physical device and then associating a set of interfaces (ports) with the link. All the interfaces must have the same speed and be in full-duplex mode. Juniper Networks Junos operating system (Junos OS) for EX Series Ethernet Switches assigns a unique ID and port priority to each interface. The ID and priority are not configurable.

The number of interfaces that can be grouped into a LAG and the total number of LAGs supported on a switch varies according to switch model. Table 284 on page 2273 lists the EX Series switches and the maximum number of interfaces per LAG and the maximum number of LAGs they support. MX Series devices can support up to 64 LAGs.

Table 284: Maximum Interfaces per LAG and Maximum LAGs per Switch

<table>
<thead>
<tr>
<th>Switch</th>

<td>EX8200</td>
<td>12</td>
<td>255</td>
</tr>
<tr>
<td>EX8200 Virtual Chassis</td>
<td>12</td>
<td>239</td>
</tr>
</tbody>
</table>

When configuring LAGs, consider the following guidelines:

- You must configure the LAG on both sides of the link.
- You must set the interfaces on either side of the link to the same speed.
- You can configure and apply firewall filters on a LAG.
- You can optionally configure LACP for link negotiation.
- You can optionally configure LACP for link protection.
You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a LAG. See “Understanding EX Series Virtual Chassis Port Link Aggregation” on page 4472 and Understanding Link Aggregation in an EX8200 Virtual Chassis.

NOTE: The interfaces that are included within a LAG are sometimes referred to as member interfaces. Do not confuse this term with member switches, which refers to switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

A LAG creates a single logical point-to-point connection. A typical deployment for a LAG would be to aggregate trunk links between an access switch and a distribution switch or customer edge (CE) router.

**Link Aggregation Control Protocol (LACP)**

When LACP is configured, it detects misconfigurations on the local end or the remote end of the link. Thus, LACP can help prevent communication failure:

- When LACP is not enabled, a local LAG might attempt to transmit packets to a remote single interface, which causes the communication to fail.
- When LACP is enabled, a local LAG cannot transmit packets unless a LAG with LACP is also configured on the remote end of the link.

By default, Ethernet links do not exchange LACP protocol data units (PDUs), which contain information about the state of the link. You can configure Ethernet links to actively transmit LACP PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when the Ethernet link receives them from the remote end. The transmitting link is known as the actor and the receiving link is known as the partner.

In a scenario where a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server might not be able to exchange LACP PDUs. In such a situation, you can configure an interface to be in the up state even if no PDUs are exchanged. Use the force-up statement to configure an interface when the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When PDUs are not received, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In such a scenario, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

### Related Documentation

- Understanding Link Aggregation in an EX8200 Virtual Chassis
- Understanding Redundant Trunk Links on EX Series Switches on page 2068
Understanding Layer 3 Subinterfaces

A Layer 3 subinterface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 subinterfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks EX Series Ethernet Switch to a Layer 2 switch. Only one physical connection is required between the switches. This topology is often called a router on a stick or a one-armed router when the Layer 3 device is a router.

To create Layer 3 subinterfaces on an EX Series switch, you enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

You can partition one physical interface into up to 4094 different subinterfaces, one for each VLAN. We recommend that you use the VLAN ID as the subinterface number when you configure the subinterface. Juniper Networks Junos operating system (Junos OS) reserves VLAN IDs 0 and 4095.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on EX Series switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces. Double-tagging is not supported.
Understanding Unicast RPF for EX Series Switches

Unicast reverse-path forwarding (RPF) helps protect the switch against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled. It also helps ensure that traffic arriving on ingress interfaces comes from a network source that the receiving interface can reach.

When you enable unicast RPF, the switch forwards a packet only if the receiving interface is the best return path to the packet's unicast source address. This is known as strict mode unicast RPF.

**NOTE:** On Juniper Networks EX3200, EX4200, and EX4300 Ethernet Switches, the switch applies unicast RPF *globally* to all interfaces when unicast RPF is configured on any interface. For additional information, see “Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches” on page 2279.

This topic covers:
- Unicast RPF for EX Series Switches Overview on page 2276
- Unicast RPF Implementation for EX Series Switches on page 2277
- When to Enable Unicast RPF on page 2277

**Unicast RPF for EX Series Switches Overview**

Unicast RPF functions as an ingress filter that reduces the forwarding of IP packets that might be spoofing an address. By default, unicast RPF is disabled on the switch interfaces.

The type of unicast RPF provided on the switches—that is, strict mode unicast RPF—is especially useful on untrusted interfaces. An untrusted interface is an interface where untrusted users or processes can place packets on the network segment.

The switch supports only the active paths method of determining the best return path back to a unicast source address. The active paths method looks up the best reverse path entry in the forwarding table. It does not consider alternate routes specified using routing-protocol-specific methods when determining the best return path.

If the forwarding table lists the receiving interface as the interface to use to forward the packet back to its unicast source, it is the best return path interface. Strict mode unicast RPF recognizes only one best return path to a unicast source address.

Use strict mode unicast RPF only on symmetrically routed interfaces. (For information about symmetrically routed interfaces, see “When to Enable Unicast RPF” on page 2277.)
For more information about strict unicast RPF, see RFC 3704, Ingress Filtering for Multihomed Networks at http://www.ietf.org/rfc/rfc3704.txt.

Unicast RPF Implementation for EX Series Switches

This section includes:

- Unicast RPF Packet Filtering on page 2277
- Bootstrap Protocol (BOOTP) and DHCP Requests on page 2277
- Default Route Handling on page 2277

Unicast RPF Packet Filtering

When you enable unicast RPF on the switch, the switch handles traffic in the following manner:

- If the switch receives a packet on the interface that is the best return path to the unicast source address of that packet, the switch forwards the packet.
- If the best return path from the switch to the packet's unicast source address is not the receiving interface, the switch discards the packet.
- If the switch receives a packet that has a source IP address that does not have a routing entry in the forwarding table, the switch discards the packet.

Bootstrap Protocol (BOOTP) and DHCP Requests

Bootstrap protocol (BOOTP) and DHCP request packets are sent with a broadcast MAC address and therefore the switch does not perform unicast RPF checks on them. The switch forwards all BOOTP packets and DHCP request packets without performing unicast RPF checks.

Default Route Handling

If the best return path to the source is the default route (0.0.0.0) and the default route points to reject, the switch discards all unicast RPF packets. If the default route points to a valid network interface, the switch performs a normal unicast RPF check on the packets.

When to Enable Unicast RPF

Enable unicast RPF when you want to ensure that traffic arriving on a network interface comes from a source that resides on a network that that interface can reach. You can enable unicast RPF on untrusted interfaces to filter spoofed packets. For example, a common application for unicast RPF is to help defend an enterprise network from DoS/DDoS attacks coming from the Internet.

Enable unicast RPF only on symmetrically routed interfaces. A symmetrically routed interface uses the same route in both directions between the source and the destination, as shown in Figure 36 on page 2278. Symmetrical routing means that if an interface receives a packet, the switch uses the same interface to send a reply to the packet source (the receiving interface matches the forwarding-table entry for the best return path to the source).
Enabling unicast RPF on asymmetrically routed interfaces (where different interfaces receive a packet and reply to its source) results in packets from legitimate sources being filtered (discarded) because the best return path is not the same interface that received the packet.

The following switch interfaces are most likely to be symmetrically routed and thus are candidates for unicast RPF enabling:

- The service provider edge to a customer
- The customer edge to a service provider
- A single access point out of the network (usually on the network perimeter)
- A terminal network that has only one link

**NOTE:** Because unicast RPF is enabled globally on EX3200, EX4200, and EX4300 switches, ensure that all interfaces are symmetrically routed before you enable unicast RPF on these switches. Enabling unicast RPF on asymmetrically routed interfaces results in packets from legitimate sources being filtered.

**TIP:** Enabling unicast RPF as close as possible to the traffic source stops spoofed traffic before it can proliferate or reach interfaces that do not have unicast RPF enabled.

**When Not to Enable Unicast RPF**

Typically, you will not enable unicast RPF if:

- Switch interfaces are multihomed.
- Switch interfaces are trusted interfaces.
- BGP is carrying prefixes and some of those prefixes are not advertised or are not accepted by the ISP under its policy. (The effect in this case is the same as filtering an interface by using an incomplete access list.)
- Switch interfaces face the network core. Core-facing interfaces are usually asymmetrically routed.

An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, as shown in Figure 37 on page 2279. This means
that if an interface receives a packet, that interface does not match the forwarding table entry as the best return path back to the source. If the receiving interface is not the best return path to the source of a packet, unicast RPF causes the switch to discard the packet even though it comes from a valid source.

**Figure 37: Asymmetrically Routed Interfaces**

![Diagram of Asymmetrically Routed Interfaces]

**NOTE:** Do not enable unicast RPF on EX3200, EX4200, and EX4300 switches if any switch interfaces are asymmetrically routed, because unicast RPF is enabled globally on all interfaces of these switches. All switch interfaces must be symmetrically routed for you to enable unicast RPF without the risk of the switch discarding traffic that you want to forward.

**Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches**

On EX3200, EX4200, and EX4300 switches, the switch implements unicast RPF on a global basis. You cannot enable unicast RPF on a per-interface basis. Unicast RPF is globally disabled by default.

- When you enable unicast RPF on any interface, it is automatically enabled on all switch interfaces, including link aggregation groups (LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs).
- When you disable unicast RPF on the interface (or interfaces) on which you enabled unicast RPF, it is automatically disabled on all switch interfaces.

**NOTE:** You must explicitly disable unicast RPF on every interface on which it was explicitly enabled or unicast RPF remains enabled on all switch interfaces.

The EX3200 and EX4200 switches do not perform unicast RPF filtering on equal-cost multipath (ECMP) traffic. The unicast RPF check examines only one best return path to the packet source, but ECMP traffic employs an address block consisting of multiple paths.

Using unicast RPF to filter ECMP traffic on EX3200 and EX4200 switches can result in the switch discarding packets that you want to forward because the unicast RPF filter does not examine the entire ECMP address block.
Understanding IP Directed Broadcast for EX Series Switches

IP directed broadcast helps you implement remote administration tasks such as backups and wake-on-LAN (WOL) application tasks by sending broadcast packets targeted at the hosts in a specified destination subnet. IP directed broadcast packets traverse the network in the same way as unicast IP packets until they reach the destination subnet. When they reach the destination subnet and IP directed broadcast is enabled on the receiving switch, the switch translates (explodes) the IP directed broadcast packet into a broadcast that floods the packet on the target subnet. All hosts on the target subnet receive the IP directed broadcast packet.

This topic covers:

- IP Directed Broadcast for EX Series Switches Overview on page 2280
- IP Directed Broadcast Implementation for EX Series Switches on page 2280
- When to Enable IP Directed Broadcast on page 2281
- When Not to Enable IP Directed Broadcast on page 2281

IP Directed Broadcast for EX Series Switches Overview

IP directed broadcast packets have a destination IP address that is a valid broadcast address for the subnet that is the target of the directed broadcast (the target subnet). The intent of an IP directed broadcast is to flood the target subnet with the broadcast packets without broadcasting to the entire network. IP directed broadcast packets cannot originate from the target subnet.

When you send an IP directed broadcast packet, as it travels to the target subnet, the network forwards it in the same way as it forwards a unicast packet. When the packet reaches a switch that is directly connected to the target subnet, the switch checks to see whether IP directed broadcast is enabled on the interface that is directly connected to the target subnet:

- If IP directed broadcast is enabled on that interface, the switch broadcasts the packet on that subnet by rewriting the destination IP address as the configured broadcast IP address for the subnet. The switch converts the packet to a link-layer broadcast packet that every host on the network processes.
- If IP directed broadcast is disabled on the interface that is directly connected to the target subnet, the switch drops the packet.

IP Directed Broadcast Implementation for EX Series Switches

You configure IP directed broadcast on a per-subnet basis by enabling IP directed broadcast on the Layer 3 interface of the subnet’s VLAN. When the switch that is
connected to that subnet receives a packet that has the subnet’s broadcast IP address as the destination address, the switch broadcasts the packet to all hosts on the subnet.

By default, IP directed broadcast is disabled.

**When to Enable IP Directed Broadcast**

IP directed broadcast is disabled by default. Enable IP directed broadcast when you want to perform remote management or administration services such as backups or WOL tasks on hosts in a subnet that does not have a direct connection to the Internet.

Enabling IP directed broadcast on a subnet affects only the hosts within that subnet. Only packets received on the subnet’s Layer 3 interface that have the subnet’s broadcast IP address as the destination address are flooded on the subnet.

**When Not to Enable IP Directed Broadcast**

Typically, you do not enable IP directed broadcast on subnets that have direct connections to the Internet. Disabling IP directed broadcast on a subnet’s Layer 3 interface affects only that subnet. If you disable IP directed broadcast on a subnet and a packet that has the broadcast IP address of that subnet arrives at the switch, the switch drops the broadcast packet.

If a subnet has a direct connection to the Internet, enabling IP directed broadcast on it increases the network’s susceptibility to denial-of-service (DoS) attacks.

For example, a malicious attacker can spoof a source IP address (use a source IP address that is not the actual source of the transmission to deceive a network into identifying the attacker as a legitimate source) and send IP directed broadcasts containing Internet Control Message Protocol (ICMP) echo (ping) packets. When the hosts on the network with IP directed broadcast enabled receive the ICMP echo packets, they all send replies to the victim that has the spoofed source IP address. This creates a flood of ping replies in a DoS attack that can overwhelm the spoofed source address; this is known as a smurf attack. Another common DoS attack on exposed networks with IP directed broadcast enabled is a fraggle attack, which is similar to a smurf attack except that the malicious packet is a User Datagram Protocol (UDP) echo packet instead of an ICMP echo packet.

**Understanding Interface Ranges on EX Series Switches**

**NOTE:** This concept uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Understanding Interface Ranges on EX Series Switches. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Copyright © 2013, Juniper Networks, Inc. 2281
You can use the interface ranges to group interfaces of the same type that share a common configuration profile. This helps reduce the time and effort in configuring interfaces on Juniper Networks EX Series Ethernet Switches. The configurations common to all the interfaces can be included in the interface range definition.

The interface range definition contains the name of the interface range defined, the names of the individual member interfaces that do not fall in a series of interfaces, a range of interfaces defined in the member range, and the configuration statements common to all the interfaces. An interface range defined with member ranges and individual members but without any common configurations, is also a valid definition.

**NOTE:** The interface range definition is supported only for Gigabit, 10-Gigabit, 40-Gigabit, and Fast Ethernet interfaces.

The common configurations defined in the interface range will be overridden by the local configuration.

The defined interface ranges can be used at places where the `interface` node is used in the following configuration hierarchies:

- `forwarding-options analyzer name input egress interface`
- `forwarding-options analyzer name input ingress interface`
- `poe interface`
- `protocols dot1x authenticator interface`
- `protocols igmp interface`
- `protocols isis interface`
- `protocols layer2-control bpdu-block interface`
- `protocols link-management peer name lmp-control-channel`
- `protocols link-management te-link name interface`
- `protocols lldp interface`
- `protocols lldp-med interface`
- `protocols mstp interface`
- `protocols oam ethernet link-fault-management interface`
- `protocols ospf area area-id interface`
- `protocols pim interface`
- `protocols router-advertisement interface`
- `protocols router-discovery interface`
- `protocols rsvp interface`
- `protocols sflow interfaces`

802.1Q VLANs Overview

For Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet interfaces supporting VPLS, the Junos OS supports a subset of the IEEE 802.1Q standard for channelizing an Ethernet interface into multiple logical interfaces, allowing many hosts to be connected to the same Gigabit Ethernet switch, but preventing them from being in the same routing or bridging domain.

- Configuring Aggregated Ethernet Interfaces (J-Web Procedure) on page 2336
- Configuring Aggregated Ethernet LACP (CLI Procedure) on page 2339
An Ethernet interface must be configured for optimal performance in a high-traffic network. EX Series switches include a factory default configuration that:

- Enables all the network interfaces on the switch
- Sets a default interface mode (access)
- Sets default link settings
- Specifies a logical unit (unit 0) and assigns it to `family ethernet-switching` (except on EXB200 switches and Virtual Chassis)
- Specifies Rapid Spanning Tree Protocol (RSTP) and Link Layer Discovery Protocol (LLDP)

This topic describes:

- Configuring VLAN Options and Interface Mode
- Configuring the Link Settings
- Configuring the IP Options

**Configuring VLAN Options and Interface Mode**

By default, when you boot a switch and use the factory default configuration, or when you boot the switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named `default`. You can optionally configure another VLAN and use that instead of `default`. You
can also configure a port to accept untagged packets from the user-configured VLAN. For details on this concept (native VLAN), see “Understanding Bridging and VLANs on EX Series Switches” on page 2049.

If you are connecting either a desktop phone, wireless access point or a security camera to a Power over Ethernet (PoE) port, you can configure some parameters for the PoE interface. PoE interfaces are enabled by default. For detailed information about PoE settings, see “Configuring PoE (CLI Procedure)” on page 3942.

If you are connecting a device to other switches and to routers on the LAN, you need to assign the interface to a logical port and configure the logical port as a trunk port. See “Port Role Configuration with the J-Web Interface (with CLI References)” on page 2295 for more information about port configuration.

If you are connecting to a server that contains virtual machines and a VEPA for packet aggregation from those virtual machines, configure the port as a tagged-access port. See “Understanding Bridging and VLANs on EX Series Switches” on page 2049 for more information about tagged access.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk port mode:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching interface-mode trunk
```

**Configuring the Link Settings**

EX Series switches include a factory default configuration that enables interfaces with the following link settings:

- All Gigabit Ethernet interfaces are set to auto-negotiation.
- The speed for Gigabit Ethernet interfaces is set to auto, allowing the interface to operate at 10m, 100m, or 1g. The link operates at the highest possible speed, depending on the capabilities of the remote end.
- The flow control for Gigabit Ethernet interfaces and 10-Gigabit Ethernet interfaces is set to enabled.
- The link mode is set to auto, allowing the interface to operate as either full duplex or half duplex. The link operates as full duplex unless this mode is not supported at the remote end.
- The 10-Gigabit Ethernet interfaces default to no auto-negotiation. The default speed is 10g and the default link mode is full duplex.
To configure the link settings:

- Set link settings for a Gigabit Ethernet interface:
  
  ```
  [edit]
  user@switch# set interfaces ge-fpc/pic/port ether-options
  ```

- Set link settings for a 10-Gigabit Ethernet interface:
  
  ```
  [edit]
  user@switch# set interfaces xe-fpc/pic/port ether-options
  ```

- Set link settings for a 40-Gigabit Ethernet interface:
  
  ```
  [edit]
  user@switch# set interfaces et-fpc/pic/port ether-options
  ```

For detailed information about the FPC, PIC, and port numbers used for EX Series switches, see “Understanding Interface Naming Conventions on EX Series Switches” on page 2270.

The `ether-options` statement allows you to modify the configuration:

- 802.3ad—Specify an aggregated Ethernet bundle. See “Configuring Aggregated Ethernet Links (CLI Procedure)” on page 2335.
- auto-negotiation—Enable or disable autonegotiation of flow control, link mode, and speed.
- flow-control—Enable or disable flow control.
- loopback—Enable or disable loopback mode.

### Configuring the IP Options

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

**NOTE:** Access interfaces on EX2200, EX3200, EX3300, EX4200, EX4300, and EX4500 switches are set to family ethernet-switching by default. You might have to delete this or any other user-configured family setting before changing the setting to family inet or family inet6.

Configuring Gigabit Ethernet Interfaces (J-Web Procedure)

You can configure specific properties on your Ethernet interface to ensure optimal performance of your network in a high-traffic environment.

To configure properties on a Gigabit Ethernet interface, a 10-Gigabit Ethernet interface, and a 40-Gigabit Ethernet interface on an EX Series switch:

1. Select Interfaces > Ports.

The page that is displayed lists Gigabit Ethernet, 10-Gigabit Ethernet interfaces, and 40-Gigabit Ethernet interfaces, and their link statuses.

NOTE: After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See “Using the Commit Options to Commit Configuration Changes (J-Web Procedure)” on page 511 for details about all commit options.

2. Select the interface you want to configure. For an EX8200 Virtual Chassis configuration, select the member and the FPC slot if the interface you want to configure is not listed under Ports in the top table on the page.

Details for the selected interface, such as administrative status, link status, speed, duplex, and flow control, are displayed in the Details of port table on the page.

NOTE: You can select multiple interfaces and modify their settings at the same time. However, while doing this, you cannot modify the IP address or enable or disable the administrative status of the selected interfaces.

NOTE: In the J-Web interface, you cannot configure interface ranges and interface groups.

3. Click Edit and select the set of options you want to configure first:
• Port Role—Enables you to assign a profile for the selected interface.

NOTE: When you select a particular port role, preconfigured port security parameters are set for the VLAN that the interface belongs to. For example, if you select the port role Desktop, the port security options examine-dhcp and arp-inspection are enabled on the VLAN that the interface belongs to. If there are interfaces in the VLAN that have static IP addresses, those interfaces might lose connectivity because those static IP addresses might not be present in the DHCP pool. Therefore, when you select a port role, ensure that the corresponding port security settings for the VLAN are applicable to the interface.

For basic information about port security features such as DHCP snooping (CLI option examine-dhcp) or dynamic ARP inspection (DAI) (CLI option arp-inspection), see “Configuring Port Security (J-Web Procedure)” on page 4024. For detailed descriptions of port security features, see the Port Security topics in the EX Series documentation at http://www.juniper.net/techpubs/.

Click Details to view the configuration parameters for the selected port role.

• VLAN—Enables you to configure VLAN options for the selected interface.

• Link—Enables you to modify the following link options for the selected interface:
  - Speed
  - MTU
  - Autonegotiation
  - Flow Control
  - Duplex
  - Media Type

• IP—Enables you to configure an IP address for the interface.

4. Configure the interface by configuring options in the selected option set. See Table 285 on page 2291 for details of the options.

5. Repeat Steps 3 and 4 for the remaining option sets that you want to configure for the interface.

NOTE: To enable or disable the administrative status of a selected interface, click Enable Port or Disable Port.

Port Role Configuration with the J-Web Interface (with CLI References)

When you configure Gigabit Ethernet interface properties with the J-Web interface (Configure > Interfaces) you can optionally select pre-configured port roles for those interfaces. When you select a role from the Port Role field and apply it to a port, the J-Web interface modifies the switch configuration using CLI commands. Table 287 on page 2295 lists the CLI commands applied for each port role.

**NOTE:** If there is an existing port role configuration, it is cleared before the new port role configuration is applied.

Adding a Logical Unit Description to the Configuration

You can include a text description of each logical unit in the configuration file. Any descriptive text you include is displayed in the output of the `show interfaces` commands, and is also exposed in the `ifAlias` Management Information Base (MIB) object. It has no impact on the interface’s configuration. To add a text description, include the `description` statement:

```
description text;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

The description can be a single line of text. If the text contains spaces, enclose it in quotation marks.

**NOTE:** You can configure the extended DHCP relay to include the interface description in the option 82 Agent Circuit ID suboption. See “Enabling and Disabling Insertion of Option 82 Information” on page 1303” in the Junos OS Subscriber Management and Services Library.

For information about describing physical interfaces, see Configuring Interface Description.

Disabling a Physical Interface

You can disable a physical interface, marking it as being down, without removing the interface configuration statements from the configuration. To do this, include the `disable` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]
disable;
```
**CAUTION:** Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.

**NOTE:** On the router, when you use the `disable` statement at the `edit interfaces` hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet PICs with SFP and XFP transceivers do support it and the laser will be turned off when the interface is disabled.

**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

**Example: Disabling a Physical Interface**

Sample interface configuration:

```plaintext
[edit interfaces]
user@host# show
ge-0/3/2 {
  unit 0 {
    description CE2-to-PE1;
    family inet {
      address 20.1.1.6/24;
    }
  }
}
```

Disabling the interface:

```plaintext
[edit interfaces]
user@host# set ge-0/3/2 disable
```

Verifying the interface configuration:

```plaintext
[edit interfaces]
user@host# show
ge-0/3/2 {
  disable; # Interface is marked as disabled.
  unit 0 {
    description CE2-to-PE1;
    family inet {
      address 20.1.1.6/24;
    }
  }
}
```
Disabling a Logical Interface

You can unconfigure a logical interface, effectively disabling that interface, without removing the logical interface configuration statements from the configuration. To do this, include the `disable` statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

When an interface is disabled, a route (pointing to the reserved target "REJECT") with the IP address of the interface and a 32-bit subnet mask is installed in the routing table. See Routing Protocols.

Configuring Flow Control

By default, the router or switch imposes flow control to regulate the amount of traffic sent out on a Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interface. Flow control is not supported on the 4-port Fast Ethernet PIC. This is useful if the remote side of the connection is a Fast Ethernet or Gigabit Ethernet switch.

You can disable flow control if you want the router or switch to permit unrestricted traffic. To disable flow control, include the `no-flow-control` statement:

```
no-flow-control;
```

To explicitly reinstate flow control, include the `flow-control` statement:

```
flow-control;
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name aggregated-ether-options]`
- `[edit interfaces interface-name ether-options]`
- `[edit interfaces interface-name fastether-options]`
- `[edit interfaces interface-name gigether-options]`

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

Related Documentation

- flow-control on page 2426
- Ethernet Interfaces Overview
You assign an address to an interface by specifying the address when configuring the protocol family. For the inet or inet6 family, configure the interface IP address. For the iso family, configure one or more addresses for the loopback interface. For the ccc, ethernet-switching, tcc, mpls, tnp, and vpls families, you never configure an address.

NOTE: The point-to-point (PPP) address is taken from the loopback interface address that has the primary attribute. When the loopback interface is configured as an unnumbered interface, it takes the primary address from the donor interface.

To assign an address to an interface, include the address statement:

```
address address {
    broadcast address;
    destination address;
    destination-profile name;
    eui-64;
    preferred;
    primary;
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number family family]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

In the address statement, specify the network address of the interface.

For each address, you can optionally configure one or more of the following:

- Broadcast address for the interface subnet—Specify this in the broadcast statement; this applies only to Ethernet interfaces, such as the management interface fxp0, em0, or me0 the Fast Ethernet interface, and the Gigabit Ethernet interface.
- Address of the remote side of the connection (for point-to-point interfaces only)—Specify this in the destination statement.
- PPP properties to the remote end—Specify this in the destination-profile statement. You define the profile at the [edit access group-profile name ppp] hierarchy level (for point-to-point interfaces only).
- Whether the router or switch automatically generates the host number portion of interface addresses—The eui-64 statement applies only to interfaces that carry IPv6 traffic, in which the prefix length of the address is 64 bits or less, and the low-order 64
bits of the address are zero. This option does not apply to the loopback interface (lo0) because IPv6 addresses configured on the loopback interface must have a 128-bit prefix length.

• Whether this address is the preferred address—Each subnet on an interface has a preferred local address. If you configure more than one address on the same subnet, the preferred local address is chosen by default as the source address when you originate packets to destinations on the subnet.

By default, the preferred address is the lowest-numbered address on the subnet. To override the default and explicitly configure the preferred address, include the preferred statement when configuring the address.

• Whether this address is the primary address—Each interface has a primary local address. If an interface has more than one address, the primary local address is used by default as the source address when you send packets from an interface where the destination provides no information about the subnet (for example, some ping commands).

By default, the primary address on an interface is the lowest-numbered non-127 (in other words, non-loopback) preferred address on the interface. To override the default and explicitly configure the preferred address, include the primary statement when configuring the address.

• Configuring Interface IPv4 Addresses on page 2303
  • Configuring Interface IPv6 Addresses on page 2305

**Configuring Interface IPv4 Addresses**

You can configure router or switch interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To configure an IPv4 address on routers and switches running Junos OS, use the edit interface interface-name unit number family inet address a.b.c.d/nn statement at the [edit interfaces] hierarchy level.

**NOTE:** Juniper Networks routers and switches support /31 destination prefixes when used in point-to-point Ethernet configurations; however, they are not supported by many other devices, such as hosts, hubs, routers, or switches. You must determine if the peer system also supports /31 destination prefixes before configuration.

**Operational Behavior of Interfaces when the Same IPv4 Address is Assigned to Them**

You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point.
NOTE: By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.

The following examples show the sample configuration of assigning the same IPv4 address to implicitly and explicitly point-to-point interfaces, and their corresponding `show interfaces terse` command outputs to see their operational status.

**Configuring same IPv4 address on implicitly PPP interfaces:**

```plaintext
[edit]
user@host# show
ge-0/1/0 {
    unit 0 {
        family inet {
            address 200.1.1.1/24;
        }
    }
}
ge-3/0/1 {
    unit 0 {
        family inet {
            address 200.1.1.1/24;
        }
    }
}
```

The sample output shown below for the above configuration reveals that only `ge-0/1/0.0` was assigned the same IPv4 address `200.1.1.1/24` and its link state was up, while `ge-3/0/1.0` was not assigned the IPv4 address, though its link state was up, which means that it will be operational only when it gets a unique IPv4 address other than `200.1.1.1/24`.

```plaintext
user@host> show interfaces terse ge*
Interface         Admin Link  Proto Local       Remote
ge-0/1/0          up       up    inet      200.1.1.1/24
ge-0/1/0.0        up       up    inet      200.1.1.1/24 multiservice
ge-0/1/1          up       down
ge-3/0/0          up       down
ge-3/0/1          up       up
ge-3/0/1.0        up       up    inet      200.1.1.1/24 multiservice
```

**Configuring same IPv4 address on explicitly PPP interfaces:**

```plaintext
[edit]
user@host# show
so-0/0/0 {
    unit 0 {
        family inet {
            address 200.1.1.1/24;
        }
    }
}
```

```plaintext
Copyright © 2013, Juniper Networks, Inc.
```
The sample output shown below for the above configuration reveals that both
so-0/0/0.0 and so-0/0/3.0 were assigned the same IPv4 address 200.1.1.1/24
and that their link states were down, which means that to make them operational at least
one of them will have be configured with a unique IPv4 address other than 200.1.1.1/24.

user@host> show interfaces terse so*

Configuring Interface IPv6 Addresses

NOTE: IPv6 is not currently supported for the QFX Series.

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values.

You assign a 128-bit IPv6 address to an interface by including the address statement:

address aaaa:bbbb:....:zzzz/nn;

NOTE: You cannot configure a subnet zero IPv6 address because RFC 2461 reserves the subnet-zero address for anycast addresses, and Junos OS complies with the RFC.

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number family inet6]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet6]
The double colon (::) represents all bits set to 0, as shown in the following example:

```plaintext
interfaces fe-0/0/1 {
  unit 0 {
    family inet6 {
      address fec0:1:1:1::2/64;
    }
  }
}
```

**NOTE:** You must manually configure the router or switch advertisement and advertise the default prefix for autoconfiguration to work on a specific interface.

### Configuring the Interface Bandwidth

By default, the Junos OS uses the physical interface’s speed for the MIB-II object, `ifSpeed`. You can configure the logical unit to populate the `ifSpeed` variable by configuring a bandwidth value for the logical interface. The `bandwidth` statement sets an informational-only parameter; you cannot adjust the actual bandwidth of an interface with this statement.

**NOTE:** We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the `bandwidth` statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

\[
\text{cost} = \frac{\text{reference-bandwidth}}{\text{bandwidth}},
\]

where `bandwidth` is the physical interface speed. However, if you specify a value for bandwidth using the `bandwidth` statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

To configure the bandwidth value for a logical interface, include the `bandwidth` statement:

```plaintext
bandwidth rate;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`
rate is the peak rate, in bps or cps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation c; values expressed in cells per second are converted to bits per second using the formula 1 cps = 384 bps. The value can be any positive integer. The bandwidth statement is valid for all logical interfaces, except multilink interfaces.

Configuring the Media MTU

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation.

This topic contains the following sections:

- Media MTU Overview on page 2307
- How to Configure the Media MTU on page 2308
- Encapsulation Overhead by Encapsulation Type on page 2309

- Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers on page 2318

Media MTU Overview

The default media MTU size used on a physical interface depends on the encapsulation used on that interface. In some cases, the default IP Protocol MTU depends on whether the protocol used is IP version 4 (IPv4) or International Organization for Standardization (ISO).

The default media MTU is calculated as follows:

Default media MTU = Default IP MTU + encapsulation overhead

When you are configuring point-to-point connections, the MTU sizes on both sides of the connections must be the same. Also, when you are configuring point-to-multipoint
connections, all interfaces in the subnet must use the same MTU size. For details about encapsulation overhead, see “Encapsulation Overhead by Encapsulation Type” on page 2309.

**NOTE:** The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the media MTU. For example, the media MTU for a Gigabit Ethernet Version 2 interface is specified as 1514 bytes, but the largest possible frame size is actually 1518 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

The physical MTU for Ethernet interfaces does not include the 4-byte frame check sequence (FCS) field of the Ethernet frame.

A SONET/SDH interface operating in concatenated mode has a “c” added to the rate descriptor. For example, a concatenated OC48 interface is referred to as OC48c.

If you do not configure an MPLS MTU, the Junos OS derives the MPLS MTU from the physical interface MTU. From this value, the software subtracts the encapsulation-specific overhead and space for the maximum number of labels that might be pushed in the Packet Forwarding Engine. Currently, the software provides for three labels of four bytes each, for a total of 12 bytes.

In other words, the formula used to determine the MPLS MTU is the following:

\[
\text{MPLS MTU} = \text{physical interface MTU} - \text{encapsulation overhead} - 12
\]

If you configure an MTU value by including the `mtu` statement at the [edit interfaces interface-name unit logical-unit-number family mpls] hierarchy level, the configured value is used.

**How to Configure the Media MTU**

To modify the default media MTU size for a physical interface, include the `mtu` statement at the [edit interfaces interface-name] hierarchy level:

```plaintext
[edit interfaces interface-name]
mtu bytes;
```

If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead.

**NOTE:** Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

You configure the protocol MTU by including the `mtu` statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
Because tunnel services interfaces are considered logical interfaces, you cannot configure the MTU setting for the physical interface. This means you cannot include the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level for the following interface types: generic routing encapsulation (gr-), IP-IP (ip-), loopback (lo-), link services (ls-), multilink services (ml-), and multicast (pe-, pd-). You can, however, configure the protocol MTU on tunnel interfaces, as described in “Setting the Protocol MTU” on page 2318.

**NOTE:** On Gigabit Ethernet ePIMs in J4350 and J6350 Services Routers, you can configure a maximum transmission unit (MTU) size of only 9018 bytes even though the CLI indicates that you can configure an MTU of up to 9192 bytes. If you configure an MTU greater than 9018 bytes, the router does not accept the configuration and generates a system log error message similar to the following:

```
/kernel: ge-0/0/0: Illegal media change. MTU invalid: 9192. Max MTU supported on this PIC: 9018
```

On 4-port Fast Ethernet ePIMs in J4350 and J6350 Services Routers, you can configure a maximum transmission unit (MTU) size of only 1518 bytes even though the CLI indicates that you can configure an MTU of up to 9192 bytes. If you configure an MTU greater than 1518 bytes, the router does not accept the configuration and generates a system log error message similar to the following:

```
/kernel: fe-3/0/1: Illegal media change. MTU invalid: 9192. Max MTU supported on this PIC: 1518
```

### Setting the Protocol MTU

When you initially configure an interface, the protocol maximum transmission unit (MTU) is calculated automatically. If you subsequently change the media MTU, the protocol MTU on existing address families automatically changes.

For a list of default protocol MTU values, see "Configuring the Media MTU" on page 2307.

To modify the MTU for a particular protocol family, include the `mtu` statement:

```
mtu bytes;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
If you increase the size of the protocol MTU, you must ensure that the size of the media MTU is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. For a list of encapsulation overhead values, see Table 289 on page 2309. If you reduce the media MTU size, but there are already one or more address families configured and active on the interface, you must also reduce the protocol MTU size. (You configure the media MTU by including the \texttt{mtu} statement at the \texttt{[edit interfaces interface-name]} hierarchy level, as discussed in “Configuring the Media MTU” on page 2307.)

\textbf{NOTE:} Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

The maximum number of data-link connection identifiers (DLCIs) is determined by the MTU on the interface. If you have keepalives enabled, the maximum number of DLCIs is 1000, with the MTU set to 5012.

The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the MTU. For example, the default protocol MTU for a Gigabit Ethernet interface is 1500 bytes, but the largest possible frame size is actually 1504 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

\subsection*{Interface Ranges}

\textbf{NOTE:} This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Interface Ranges. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Junos OS allows you to group a range of identical interfaces into an \textit{interface range}. You first specify the group of identical interfaces in the interface range. Then you can apply a common configuration to the specified interface range, reducing the number of configuration statements required and saving time while producing a compact configuration.

- Configuring Interface Ranges on page 2320
- Expanding Interface Range Member and Member Range Statements on page 2322
- Configuration Inheritance for Member Interfaces on page 2323
- Member Interfaces Inheriting Configuration from Configuration Groups on page 2324
- Interfaces Inheriting Common Configuration on page 2326
- Configuring Inheritance Range Priorities on page 2326
- Configuration Expansion Where Interface Range Is Used on page 2326
Configuring Interface Ranges

To configure an interface range, include the `interface-range` statement at the [edit interfaces] hierarchy level.

The `interface-range` statement accepts only physical networking interface names in its definition.

Interfaces can be grouped either as a range of interfaces or using a number range under the `interface-range` statement definition.

Interfaces in an `interface-range` definition can be added as part of a member range or as individual members or multiple members using a number range.

To specify a member range, use the `member-range` statement at the [edit interfaces interface-range name] hierarchy level.

To specify interfaces in lexical order, use the `member-range start-range to end-range` statement.

A range for a member statement must contain the following:

- `*`—All, specifies sequential interfaces from 0 through 47.

  **CAUTION:** The wildcard `*` in a member statement does not take into account the interface numbers supported by a specific interface type. Irrespective of the interface type, `*` includes interface numbers ranging from 0 through 47 to the interface group. Therefore, use `*` in a member statement with caution.

- `num`—Number; specifies one specific interface by its number.

- `[low-high]`—Numbers between low to high; specifies a range of sequential interfaces.

- `[num1, num2, num3]`—Numbers `num1`, `num2`, and `num3` specify multiple specific interfaces.

**Example:** Specifying an Interface Range Member Range

```plaintext
member-range ge-0/0/0 to ge-4/0/40;
```

To specify one or multiple members, use the `member` statement at the [edit interfaces interface-range name] hierarchy level.

To specify the list of interface range members individually or for multiple interfaces using regex, use the `member list of interface names` statement.

**Example:** Specifying an Interface Range Member

```plaintext
member ge-0/0/0;
member ge-0/*/*/
member ge-0/[1-10]/0;
member ge-0/[1,2,3]/3;
```
Regex or wildcards are not supported for interface-type prefixes. For example, prefixes `ge`, `fe`, and `xe` must be mentioned explicitly.

An **interface-range** definition can contain both **member** and **member-range** statements within it. There is no maximum limit on the number of **member** or **member-range** statements within an interface-range. However, at least one **member** or **member-range** statement must exist within an **interface-range** definition.

**Example: Interface Range Common Configuration**

Configuration common to an interface range can be added as a part of the **interface-range** definition, as follows:

```
[edit]
interfaces {
    + interface-range foo {
        + member-range ge-1/0/0 to ge-4/0/40;
        + member ge-0/1/1;
        + member ge-5/[1-10]/*

        /* Common configuration is added as part of interface-range definition */
        mtu 256;
        hold-time up 10;
        ether-options {
            flow-control;
            speed {
                100m;
            }
            802.3ad primary;
        }
    }
}
```

An **interface-range** definition having just **member** or **member-range** statements and no common configurations statements is valid.

These defined interface ranges can be used in other configuration hierarchies, in places where an **interface** node exists.

**Example: Interface-Range foo Used Under the Protocols Hierarchy**

```
protocols {
    dot1x {
        authenticator {
            interface foo{
                retries 1;
            }
        }
    }
}
```

`foo` should be an **interface-range** defined at the [interfaces] hierarchy level. In the above example, the **interface** node can accept both individual interfaces and interface ranges.

**TIP:** To view an interface range in expanded configuration, use the (show | display inheritance) command. For more information, see the **CLI User Guide**.
The defined interface ranges can be used at places where the interface node is used in the following configuration hierarchies:

- forwarding-options analyzer name input egress interface
- forwarding-options analyzer name input ingress interface
- poe interface
- protocols dot1x authenticator interface
- protocols igmp interface
- protocols isis interface
- protocols layer2-control bpdu-block interface
- protocols link-management peer name lmp-control-channel
- protocols link-management te-link name interface
- protocols lldp interface
- protocols lldp-med interface
- protocols mstp interface
- protocols oam ethernet link-fault-management interface
- protocols ospf area area-id interface
- protocols pim interface
- protocols router-advertisement interface
- protocols router-discovery interface
- protocols rsvp interface
- protocols sflow interfaces
- protocols vstp vlan vlan-id interface
- switch-options redundant-trunk-group group-name interface
- switch-options voip interface

**Expanding Interface Range Member and Member Range Statements**

All member and member-range statements in an interface range definition are expanded to generate the final list of interface names for the specified interface range.

```
[edit]
interfaces {
    interface-range range-1 {
        member-range ge-0/0/0 to ge-4/0/20;
        member ge-10/1/1;
        member ge-5/0-5)*;
        /*Common configuration is added part of the interface-range definition*/
        mtu 256;
        hold-time up 10;
        ether-options {
```
flow-control;
speed {
  100m;
}
802.3ad primary;
}
}
}

For the **member-range** statement, all possible interfaces between **start-range** and **end-range** are considered in expanding the members. For example, the following **member-range** statement:

**member-range** ge-0/0/0 to ge-4/0/20

expands to:

```
[ge-0/0/0, ge-0/0/1 ... ge-0/0/max_ports
 ge-0/1/0  ge-0/1/1 ... ge-0/1/max_ports
 ge-0/2/0  ge-0/2/1 ... ge-0/2/max_ports
  ...
 ge-0/MAX_PICS/0 ... ge-0/max_pics/max_ports
 ge-1/0/0  ge-1/0/1 ... ge-1/0/max_ports
  ...
 ge-1/MAX_PICS/0 ... ge-1/max_pics/max_ports
  ...
 ge-4/0/0 ge-4/0/1 ... ge-4/0/max_ports]
```

The following **member** statement:

**ge-5/[0-5]/**

expands to:

```
ge-5/0/0 ... ge-5/0/max_ports
 ge-5/1/0 ... ge-5/0/max_ports
  ...
 ge-5/5/0 ... ge-5/5/max_ports
```

The following **member** statement:

**ge-5/1/[2,3,6,10]***

expands to:

```
ge-5/1/2
 ge-5/1/3
 ge-5/1/6
 ge-5/1/10
```

**Configuration Inheritance for Member Interfaces**

When Junos OS expands the **member** and **member-range** statements present in an **interface-range**, it creates **interface objects** if they are not explicitly defined in the configuration. The common configuration is copied to all its member interfaces in the **interface-range**.
Example: Configuration Priorities

Foreground interface configuration takes priority over configuration inherited by the interface through the interface-range.

```
interfaces {
  interface-range range-1 {
    member-range ge-1/0/0/ to ge-10/0/47;
    mtu 256;
  }
  ge-1/0/1 {
    mtu 1024;
  }
}
```

In the preceding example, interface `ge-1/0/1` will have an MTU value of 1024.

This can be verified with output of the `show interfaces | display inheritance` command, as follows:

```
user@host: # show interfaces | display inheritance
## 'ge-1/0/0' was expanded from interface-range 'range-1'
##
ge-1/0/0 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
ge-1/0/1 {
  mtu 1024;
}
##
## 'ge-1/0/2' was expanded from interface-range 'range-1'
##
ge-1/0/2 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
```

Member Interfaces Inheriting Configuration from Configuration Groups

Interface range member interfaces inherit the config-groups configuration like any other foreground configuration. `interface-range` is similar to any other foreground configuration statement. The only difference is that the `interface-range` goes through a member interfaces expansion before Junos OS reads this configuration.

```
groups {
```
global {
    interfaces {
        <*> {
            hold-time up 10;
        }
    }
} apply-groups [global];

interfaces {
    interface-range range-1 {
        member-range ge-1/0/0 to ge-10/0/47;
        mtu 256;
    }
}

The **hold-time** configuration is applied to all members of **interface-range range-1**.

This can be verified with **show interfaces | display inheritance** as follows:

```plaintext
user@host# show interfaces | display inheritance
ge-1/0/0 {
    ##
    ## '256' was expanded from interface-range 'range-1'
    ##
    mtu 256;
    ##
    ## 'hold-time' was inherited from group 'global'
    ## '10' was inherited from group 'global'
    ##
    hold-time up 10;
}

ge-1/0/1 {
    ##
    ## '256' was expanded from interface-range 'range-1'
    ##
    mtu 256;
    ##
    ## 'hold-time' was inherited from group 'global'
    ## '10' was inherited from group 'global'
    ##
    hold-time up 10;
}

ge-10/0/47 {
    ##
    ## '256' was expanded from interface-range 'range-1'
    ##
    mtu 256;
    ##
    ## 'hold-time' was inherited from group 'global'
    ## '10' was inherited from group 'global'
    ##
    hold-time up 10;
}
```
**Interfaces Inheriting Common Configuration**

If an interface is a member of several interface ranges, that interface will inherit the common configuration from all of those interface ranges.

```plaintext
[edit]
interfaces {
  interface-range range-1 {
    member-range ge-1/0/0 to ge-10/0/47;
    mtu 256;
  }
}
```

In this example, interfaces ge-10/0/0 through ge-10/0/47 will have both `hold-time` and `mtu`.

**Configuring Inheritance Range Priorities**

The interface ranges are defined in the order of inheritance priority, with the first interface range configuration data taking priority over subsequent interface ranges.

```plaintext
[edit]
interfaces {
  interface-range int-grp-one {
    member-range ge-0/0/0 to ge-4/0/40;
    member ge-1/1/1;
    /*Common config is added part of the interface-range definition*/
    mtu 256;
    hold-time up 10;
  }
}
```

Interface `ge-1/1/1` exists in both `interface-range int-grp-one` and `interface-range int-grp-two`. This interface inherits `mtu 256` from `interface-range int-grp-one` because it was defined first.

**Configuration Expansion Where Interface Range Is Used**

In this example, `interface-range range-1` is used under the `protocols` hierarchy:

```plaintext
[edit]
interfaces {
  interface-range range-1 {
    member ge-10/1/1;
  }
}
```
member ge-5/5/1;
mTU 256;
hold-time up 10;
ether-options {
  flow-control;
speed {
    100m;
  }
  802.3ad primary;
}
}
protocols {
  dot1x {
    authenticator {
      interface range-1 {
        retries 1;
      }
    }
  }
}

The interface node present under authenticator is expanded into member interfaces of the interface-range range-1 as follows:

protocols {
  dot1x {
    authenticator {
      interface ge-10/1/1 {
        retries 1;
      }
      interface ge-5/5/1 {
        retries 1;
      }
    }
  }
}

The interface range-1 statement is expanded into two interfaces, ge-10/1/1 and ge-5/5/1, and configuration retries 1 is copied under those two interfaces.

This configuration can be verified using the show protocols dot1x | display inheritance command.

Configuring Accounting for the Physical Interface

Juniper Networks routers and switches can collect various kinds of data about traffic passing through the router and switch. You can set up one or more accounting profiles that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The polling period that the system uses to record the data
You configure the profiles and define a unique name for each profile using statements at the [edit accounting-options] hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the interface-profile statement at the [edit accounting-options] hierarchy level. You configure filter profiles by including the filter-profile statement at the [edit accounting-options] hierarchy level. For more information, see the Network Management Administration Guide for Routing Devices.

You apply filter profiles by including the accounting-profile statement at the [edit firewall filter filter-name] and [edit firewall family family filter filter-name] hierarchy levels. For more information, see the Routing Policy Feature Guide for Routing Devices.

**Applying an Accounting Profile to the Physical Interface**

To enable accounting on an interface, include the accounting-profile statement at the [edit interfaces interface-name] hierarchy level:

```plaintext
[edit interfaces interface-name]
accounting-profile name;
```

You can also reference profiles by logical unit; for more information, see “Configuring Accounting for the Logical Interface” on page 2329.

**Example: Applying an Accounting Profile to the Physical Interface**

Configure an accounting profile for an interface and apply it to a physical interface:

```plaintext
[edit]
accounting-options {
  file_if_stats {
    size 4m files 10 transfer-interval 15;
    archive-sites {
      "ftp://login:password@host/path";
    }
  }
  interface-profile if_profile {
    interval 15;
    file_if_stats {
      fields {
        input-bytes;
        output-bytes;
        input-packets;
        output-packets;
        input-errors;
        output-errors;
      }
    }
  }
}
[edit interfaces ge-1/0/1]
accounting-profile if_profile;
```
Configuring Accounting for the Logical Interface

Juniper Networks routers or switches can collect various kinds of data about traffic passing through the router or switch. You can set up one or more accounting profiles that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the [edit accounting-options] hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the interface-profile statement at the [edit accounting-options] hierarchy level. You configure filter profiles by including the filter-profile statement at the [edit accounting-options] hierarchy level. For more information, see the Network Management Administration Guide for Routing Devices.

You apply filter profiles by including the accounting-profile statement at the [edit firewall filter filter-name] and [edit firewall family family filter filter-name] hierarchy levels. For more information, see the Routing Policy Feature Guide for Routing Devices.

Applying an Accounting Profile to the Logical Interface

To enable accounting on a logical interface, include the accounting-profile statement:

```
accounting-profile name;
```

You can include this statement at the following hierarchy level:

- [edit interfaces interface-name unit logical-unit-number]

You can also reference profiles for the physical interface; for more information, see “Configuring Accounting for the Physical Interface” on page 2327.

**Example: Applying an Accounting Profile to the Logical Interface**

Configure an accounting profile for an interface and apply it to a logical interface:

```
[edit]
accounting-options {
    file if_stats {
        size 4m files 10 transfer-interval 15;
        archive-sites {

To reference profiles by physical interface, see “Applying an Accounting Profile to the Physical Interface” on page 2328. For information about configuring a firewall filter accounting profile, see the Routing Policy Feature Guide for Routing Devices.

Configuring Ethernet Loopback Capability

By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system. To place an interface in loopback mode, include the loopback statement:

```
loopback;
```

**NOTE:** If you configure a local loopback on a 1-port 10-Gigabit IQ2 and IQ2-E PIC using the loopback statement at the [edit interfaces interface-name gigether-options] hierarchy level, the transmit-path stops working, causing the remote end to detect a link down.

To return to the default—that is, to disable loopback mode—delete the loopback statement from the configuration:

```
[edit]
user@host# delete interfaces fe-fpc/pic/port fastether-options loopback
```

To explicitly disable loopback mode, include the no-loopback statement:

```
noloopback;
```

You can include the loopback and no-loopback statements at the following hierarchy levels:

- [edit interfaces interface-name aggregated-ether-options]
- [edit interfaces interface-name ether-options]
- [edit interfaces interface-name fastether-options]
- [edit interfaces interface-name gigether-options]

**Related Documentation**
- loopback on page 2439
- Ethernet Interfaces Overview
- EX Series Switches Interfaces Overview on page 2267
Configuring Gratuitous ARP

Gratuitous Address Resolution Protocol (ARP) requests provide duplicate IP address detection. A gratuitous ARP request is a broadcast request for a router’s own IP address. If a router or switch sends an ARP request for its own IP address and no ARP replies are received, the router- or switch-assigned IP address is not being used by other nodes. If a router or switch sends an ARP request for its own IP address and an ARP reply is received, the router- or switch-assigned IP address is already being used by another node.

By default, the router or switch responds to gratuitous ARP requests. On Ethernet interfaces, you can disable responses to gratuitous ARP requests. To disable responses to gratuitous ARP requests, include the `no-gratuitous-arp-request` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]
no-gratuitous-arp-request;
```

To return to the default—that is, to respond to gratuitous ARP requests—delete the `no-gratuitous-arp-request` statement from the configuration:

```
[edit]
user@host# delete interfaces interface-name no-gratuitous-arp-request
```

Gratuitous ARP replies are reply packets sent to the broadcast MAC address with the target IP address set to be the same as the sender’s IP address. When the router or switch receives a gratuitous ARP reply, the router or switch can insert an entry for that reply in the ARP cache.

By default, updating the ARP cache on gratuitous ARP replies is disabled on the router or switch. On Ethernet interfaces, you can enable handling of gratuitous ARP replies on a specific interface by including the `gratuitous-arp-reply` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]
gratuitous-arp-reply;
```

To restore the default behavior, include the `no-gratuitous-arp-reply` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]
no-gratuitous-arp-reply;
```
Configuring Static ARP Table Entries

To configure static ARP table entries, include the `arp` statement:

```
arp ip-address (mac | multicast-mac) mac-address <publish>;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number family inet address address]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address]

The IP address that you specify must be part of the subnet defined in the enclosing `address` statement.

To associate a multicast MAC address with a unicast IP address, include the `multicast-mac` statement.

Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nn:nn:nn:nn:nn:nn`, for example, `0011:2233:4455` or `00:11:22:33:44:55`.

For unicast MAC addresses only, if you include the `publish` option, the router or switch replies to proxy ARP requests.

---

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the family inet statement. By including the `arp` statement at the [edit interfaces interface-name unit logical-unit-number family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the unnumbered-address statement at the [edit interfaces interface-name unit logical-unit-number family inet] hierarchy level.

---

**NOTE:** The Junos OS supports the IPv6 static neighbor discovery cache entries, similar to the static ARP entries in IPv4.

---

### Example: Configuring Static ARP Table Entries

Configure two static ARP table entries on the router or switch's management interface:

```
[edit interfaces]
fxp0 {
    unit 0 {
        family inet {
            address 10.10.0.11/24 {
                arp 10.10.0.99 mac 0001.0002.0003;
            }
        }
    }
}
```
Disabling the Transmission of Redirect Messages on an Interface

By default, the interface sends protocol redirect messages. To disable the sending of these messages on an interface, include the `no-redirects` statement:

```
no-redirects;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

To disable the sending of protocol redirect messages for the entire router or switch, include the `no-redirects` statement at the `[edit system]` hierarchy level.

Configuring Restricted and Unrestricted Proxy ARP

To configure restricted or unrestricted proxy ARP, include the `proxy-arp` statement:

```
proxy-arp (restricted |unrestricted);
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number ]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ]`

To return to the default—that is, to disable restricted or unrestricted proxy ARP—delete the `proxy-arp` statement from the configuration:

```
[edit]
user@host# delete interfaces interface-name unit logical-unit-number proxy-arp
```

You can track the number of restricted or unrestricted proxy ARP requests processed by the router or switch by issuing the `show system statistics arp` operational mode command.
NOTE: When proxy ARP is enabled as default or unrestricted, the router or switch responds to any ARP request as long as the device has an active route to the target address of the ARP request. This gratuitous ARP behavior can result in an error when the receiving interface and target response interface are the same and the end device (for example, a client) performs a duplicate address check. To prevent this error, configure the router or switch interface with the no-gratuitous-arp-reply statement. See “Configuring Gratuitous ARP” on page 2331 for information about how to disable responses to gratuitous ARP requests.

Enabling or Disabling SNMP Notifications on Logical Interfaces

By default, Simple Network Management Protocol (SNMP) notifications are sent when the state of an interface or a connection changes. To explicitly enable these notifications on the logical interface, include the traps statement; to disable these notifications on the logical interface, include the no-traps statement:

(traps | no-traps);

You can include these statements at the following hierarchy levels:

- [edit interfaces interface-name unit logical-unit-number]
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

NOTE: Gigabit Ethernet interfaces on J Series routers do not support SNMP.
Configuring Aggregated Ethernet Links (CLI Procedure)

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregation group.

To configure aggregated Ethernet interfaces, using the CLI:

1. Specify the number of aggregated Ethernet interfaces to be created:
   
   ```
   [edit chassis]
   user@switch# set aggregated-devices ethernet device-count number
   ```

2. Specify the minimum number of links for the aggregated Ethernet interface (ae), that is, the defined bundle, to be labeled up:
   
   **NOTE:** By default, only one link must be up for the bundle to be labeled up.

   ```
   [edit interfaces]
   user@switch# set ae0 aggregated-ether-options minimum-links number
   ```

3. Specify the link speed for the aggregated Ethernet bundle:
   
   ```
   [edit interfaces]
   user@switch# set ae0 aggregated-ether-options link-speed speed
   ```

4. Specify the members to be included within the aggregated Ethernet bundle:
   
   ```
   [edit interfaces]
   user@switch# set xe-fpc/pic/port ether-options 802.3ada ae0
   user@switch# set xe-fpc/pic/port ether-options 802.3ada ae0
   ```

5. Specify an interface family for the aggregated Ethernet bundle:
   
   ```
   [edit interfaces]
   user@switch# set ae0 unit 0 family inet address address
   ```

For information about adding LACP to a LAG, see “Configuring Aggregated Ethernet LACP (CLI Procedure)” on page 2339.

Verifying the Status of a LAG Interface on page 2465
Understanding Aggregated Ethernet Interfaces and LACP on page 2272

Configuring Aggregated Ethernet Interfaces (J-Web Procedure)

Use the link aggregation feature to aggregate one or more Ethernet interfaces to form a virtual link or link aggregation group (LAG) on an EX Series switch. The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability. You can use the J-Web interface to configure aggregated Ethernet interfaces, or a LAG, on the switch.

NOTE: Interfaces that are already configured with MTU, duplex, flow control, or logical interfaces are listed but are not available for aggregation.

To configure an aggregated Ethernet interface (also referred to as a LAG):

1. Select Configure > Interfaces > Link Aggregation.
   The list of aggregated interfaces is displayed.

   NOTE: After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following:
   - **Add**—Creates an aggregated Ethernet interface, or LAG. Enter information as specified in Table 302 on page 2337.
   - **Edit**—Modifies a selected LAG.
     - **Aggregation**—Modifies settings for the selected LAG. Enter information as specified in Table 302 on page 2337.
     - **VLAN**—Specifies VLAN options for the selected LAG. Enter information as specified in Table 303 on page 2338.
     - **IP Option**—Specifies IP options for the selected LAG. Enter information as specified in Table 304 on page 2338.
   - **Delete**—Deletes the selected LAG.
   - **Disable Port or Enable Port**—Disables or enables the administrative status on the selected interface.
   - **Device Count**—Configures the number of aggregated logical devices available to the switch. Select the number and click OK.

Configuring Aggregated Ethernet LACP (CLI Procedure)

For aggregated Ethernet interfaces on EX Series switches, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet interfaces with or without LACP enabled.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the bundle without user intervention
- Link monitoring to check whether both ends of the bundle are connected to the correct group

NOTE: You can also configure LACP link protection on aggregated Ethernet interfaces. For information, see “Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)” on page 2340.

The Junos OS implementation of LACP provides link monitoring but not automatic addition and deletion of links.

Before you configure LACP, be sure you have:

- Configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs). See “Configuring Aggregated Ethernet Links (CLI Procedure)” on page 2335

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), which contain information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them (sending out LACP PDUs only when they receive them from another link). One side of the link must be configured as active for the link to be up.

NOTE: Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Configure at least one side of the aggregated Ethernet link as active:

   ```
   [edit interfaces]
   user@switch# set aeX aggregated-ether-options lACP active
   ```

2. Specify the interval at which the interfaces send LACP packets:

   ```
   [edit interfaces]
   user@switch# set aeX aggregated-ether-options lACP periodic interval
   ```
The LACP process exists in the system only if you configure the system in either active or passive LACP mode.

**Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)**

You can configure LACP link protection and system priority at the global level on the switch or for a specific aggregated Ethernet interface. When using LACP link protection, you can configure only two member links for an aggregated Ethernet interface: one active and one standby. LACP link protection ensures that only one link—the link with the higher priority—is used for traffic. The other link is forced to stay in a waiting state.

By default LACP link protection reverts to a higher-priority (lower-numbered) link when the higher-priority link becomes operational or when a higher-priority link is added to the aggregated Ethernet bundle. However, you can suppress link calculation by adding the non-revertive statement to the link protection configuration. In nonrevertive mode, when a link is active in sending and receiving LACP packets, adding a higher-priority link to the bundle does not change the status of the currently active link. It remains active.

If LACP link configuration is specified to be nonrevertive at the global [edit chassis] hierarchy level, you can specify the revertive statement in the LACP link protection configuration at the aggregated Ethernet interface level to override the nonrevertive setting for the interface. In revertive mode, adding a higher-priority link to the aggregated Ethernet bundle results in LACP recalculating the priority and switching the status from the currently active link to the newly added, higher-priority link.

**NOTE:** When LACP link protection is enabled on both local and remote sides of the link, both sides must use the same mode (either revertive or nonrevertive).

Configuring LACP link configuration at the aggregated Ethernet level results in only the configured interfaces using the defined configuration. LACP interface configuration also enables you to override global (chassis) LACP settings.
Before you configure LACP link protection, be sure you have:

- Configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs). See "Configuring Aggregated Ethernet Links (CLI Procedure)" on page 2335.
- Configured LACP for the interface. See "Configuring Aggregated Ethernet LACP (CLI Procedure)" on page 2339.

You can configure LACP link protection for all aggregated Ethernet interfaces on the switch by enabling it at the global level on the switch or configure it for a specific aggregated Ethernet interface by enabling it on that interface.

- Configuring LACP Link Protection at the Global Level on page 2341
- Configuring LACP Link Protection at the Aggregated Interface Level on page 2341

**Configuring LACP Link Protection at the Global Level**

To configure LACP link protection for aggregated Ethernet interfaces at the global level:

1. Enable LACP link protection on the switch:
   ```
   [edit chassis aggregated-devices ethernet lacp]
   user@switch# set link-protection
   ```

2. (Optional) Configure the LACP link protection for the aggregated Ethernet interfaces to be in nonrevertive mode:
   ```
   [edit chassis aggregated-devices ethernet lacp link-protection]
   user@switch# set non-revertive
   ```

3. (Optional) To configure LACP system priority for the aggregated Ethernet interfaces:
   ```
   [edit chassis aggregated-devices ethernet lacp]
   user@switch# set system-priority
   ```

**Configuring LACP Link Protection at the Aggregated Interface Level**

To enable LACP link protection for a specific aggregated Ethernet interface:

1. Enable LACP link protection for the interface:
   ```
   [edit interfaces aeX aggregated-ether-options lacp]
   user@switch# set link-protection
   ```

2. (Optional) Configure the LACP link protection for the aggregated Ethernet interface to be in revertive or nonrevertive mode:

   - To specify revertive mode:
     ```
     [edit interfaces aeX aggregated-ether-options lacp link-protection]
     user@switch# set revertive
     ```
   - To specify nonrevertive mode:
     ```
     [edit interfaces aeX aggregated-ether-options lacp link-protection]
     user@switch# set non-revertive
     ```

3. (Optional) To configure LACP system priority for an aggregated Ethernet interface:
Related Documentation

- Understanding Aggregated Ethernet Interfaces and LACP on page 2272

Configuring Aggregated Ethernet Link Protection

You can configure link protection for aggregated Ethernet interfaces to provide QoS on the links during operation.

On aggregated Ethernet interfaces, you designate a primary and backup link to support link protection. Egress traffic passes only through the designated primary link. This includes transit traffic and locally generated traffic on the router or switch. When the primary link fails, traffic is routed through the backup link. Because some traffic loss is unavoidable, egress traffic is not automatically routed back to the primary link when the primary link is reestablished. Instead, you manually control when traffic should be diverted back to the primary link from the designated backup link.

NOTE: Link protection is not supported on MX80.

- Configuring Link Protection for Aggregated Ethernet Interfaces on page 2342
- Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces on page 2342
- Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link on page 2343
- Disabling Link Protection for Aggregated Ethernet Interfaces on page 2343

Configuring Link Protection for Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces support link protection to ensure QoS on the interface.

To configure link protection:

1. Specify that you want to configure the options for an aggregated Ethernet interface.
   
   `user@host# edit interfaces aex aggregated-ether-options`

2. Configure the link protection mode.
   
   `[edit interfaces aex aggregated-ether-options]
   user@host# set link-protection`

Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces

To configure link protection, you must specify a primary and a secondary, or backup, link.
To configure a primary link and a backup link:

1. Configure the primary logical interface.

```
[edit interfaces interface-name]
user@host# set (fastether-options | gigether-options) 802.3adae primary
```

2. Configure the backup logical interface.

```
[edit interfaces interface-name]
user@host# set (fastether-options | gigether-options) 802.3adae backup
```

**Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link**

On aggregated Ethernet interfaces, you designate a primary and backup link to support link protection. Egress traffic passes only through the designated primary link. This includes transit traffic and locally generated traffic on the router or switch. When the primary link fails, traffic is routed through the backup link. Because some traffic loss is unavoidable, egress traffic is not automatically routed back to the primary link when the primary link is reestablished. Instead, you manually control when traffic should be diverted back to the primary link from the designated backup link.

To manually control when traffic should be diverted back to the primary link from the designated backup link, enter the following operational command:

```
user@host> request interface revert aex
```

**Disabling Link Protection for Aggregated Ethernet Interfaces**

To disable link protection, issue the `delete interface revert aex` configuration command.

```
user@host# delete interfaces aex aggregated-ether-options link-protection
```

**Configuring Aggregated Ethernet Link Speed**

On aggregated Ethernet interfaces, you can set the required link speed for all interfaces included in the bundle. Generally, all interfaces that make up a bundle must have the same speed. If you include in the aggregated Ethernet interface an individual link that has a speed different from the speed that you specify in the `link-speed` parameter, an error message is logged. However, starting with Junos OS Release 13.2, aggregated Ethernet supports the following mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)
NOTE:

- Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-ICE-CFP-FPC4).
- Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

To configure member links of mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers, you need to configure the `mixed` option for the `[edit interfaces aex aggregated-ether-options link-speed]` statement.

To set the required link speed:

1. Specify that you want to configure the aggregated Ethernet options.
   ```
   user@host# edit interfaces interface-name aggregated-ether-options
   ```
2. Configure the link speed.
   ```
   user@host# set link-speed speed
   ```
   
   The `speed` can be in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

   Aggregated Ethernet interfaces on the M120 router can have one of the following speeds:
   - `100m`—Links are 100 Mbps.
   - `10g`—Links are 10 Gbps.
   - `1g`—Links are 1 Gbps.
   - `oc192`—Links are OC192 or STM64c.

   Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:
   - `10m`—Links are 10 Mbps.
   - `100m`—Links are 100 Mbps.
   - `1g`—Links are 1 Gbps.
   - `10g`—Links are 10 Gbps.
   - `50g`—Links are 50 Gbps.
Aggregated Ethernet links on T Series routers can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**Configuring Aggregated Ethernet Minimum Links**

On aggregated Ethernet interfaces, you can configure the minimum number of links that must be up for the bundle as a whole to be labeled up. By default, only one link must be up for the bundle to be labeled up.

To configure the minimum number of links:

1. Specify that you want to configure the aggregated Ethernet options.
   
   user@host# edit interfaces interface-name aggregated-ether-options

2. Configure the minimum number of links.
   
   [edit interfaces interface-name aggregated-ether-options]
   
   user@host# set minimum-links number

On MX120, MX320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, and EX 9200 switches, the valid range for **minimum-links number** is 1 through 16. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up.

On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for **minimum-links number** is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.

On EX8200 switches, the range of valid values for **minimum-links number** is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up.
If the number of links configured in an aggregated Ethernet interface is less than the minimum link value configured under the `aggregated-ether-options` statement, the configuration commit fails and an error message is displayed.

### Configuring Tagged Aggregated Ethernet Interfaces

To specify aggregated Ethernet interfaces, include the `vlan-tagging` statement at the `[edit interfaces ae X]` hierarchy level:

```
[edit interfaces ae X]
vlan-tagging;
```

You must also include the `vlan-id` statement:

```
vlan-id number;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

For more information about the `vlan-tagging` and `vlan-id` statements, see “802.1Q VLANs Overview” on page 2283.

**Related Documentation**
- `vlan-id`
- `vlan-tagging on page 2461`

### Configuring a Layer 3 Subinterface (CLI Procedure)

EX Series switches use Layer 3 subinterfaces to divide a physical interface into multiple logical interfaces, each corresponding to a VLAN. The switch uses the Layer 3 subinterfaces to route traffic between subnets.

To configure Layer 3 subinterfaces, you enable VLAN tagging and partition one or more physical ports into multiple logical interfaces, each corresponding to a VLAN ID.

Before you begin, make sure you set up your VLANs. See *Configuring VLANs for EX Series Switches (CLI Procedure)* or “Configuring VLANs for EX Series Switches (J-Web Procedure)” on page 2117.

To configure Layer 3 subinterfaces:

1. Enable VLAN tagging:
   ```
   [edit interfaces interface-name]
   user@switch# set vlan-tagging
   ```
2. Bind each VLAN ID to a logical interface:

```
[edit interfaces interface-name]
user@switch# set unit logical-unit-number vlan-id (Layer 3 Subinterfaces) vlan-id-number
```

Configuring Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Enabling unicast RPF on the switch interfaces filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. When a packet comes into an interface, if that interface is not the best return path to the source, the switch discards the packet. If the incoming interface is the best return path to the source, the switch forwards the packet.

---

NOTE: On EX3200, EX4200, and EX4300 switches, you can enable unicast RPF only globally—that is, on all switch interfaces. You cannot enable unicast RPF on a per-interface basis.

---

Before you begin:

- On an EX8200 and EX6200 switches, ensure that the selected switch interface is symmetrically routed before you enable unicast RPF. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.

- On an EX3200, EX4200, or EX4300 switch, ensure that all switch interfaces are symmetrically routed before you enable unicast RPF on an interface. When you enable unicast RPF on any interface, it is enabled globally on all switch interfaces. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.
To enable unicast RPF, configure it explicitly on a selected customer-edge interface:

```
[edit interfaces]
user@switch# set ge-1/0/10 unit 0 family inet rpf-check
```

**BEST PRACTICE:** On EX3200, EX4200, and EX4300 switches, unicast RPF is enabled globally on all switch interfaces, regardless of whether you configure it explicitly on only one interface or only on some interfaces.

On EX3200, EX4200, and EX4300 switches, we recommend that you enable unicast RPF explicitly on either all interfaces or only one interface. To avoid possible confusion, do not enable it on only some interfaces:

- Enabling unicast RPF explicitly on only one interface makes it easier if you choose to disable it in the future because you must explicitly disable unicast RPF on every interface on which you explicitly enabled it. If you explicitly enable unicast RPF on two interfaces and you disable it on only one interface, unicast RPF is still implicitly enabled globally on the switch. The drawback of this approach is that the switch displays the flag that indicates that unicast RPF is enabled only on interfaces on which unicast RPF is explicitly enabled, so even though unicast RPF is enabled on all interfaces, this status is not displayed.

- Enabling unicast RPF explicitly on all interfaces makes it easier to know whether unicast RPF is enabled on the switch because every interface shows the correct status. (Only interfaces on which you explicitly enable unicast RPF display the flag that indicates that unicast RPF is enabled.) The drawback of this approach is that if you want to disable unicast RPF, you must explicitly disable it on every interface. If unicast RPF is enabled on any interface, it is implicitly enabled on all interfaces.

**Related Documentation**

- *Understanding Unicast RPF for EX Series Switches on page 2276*

**Disabling Unicast RPF (CLI Procedure)**

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Unicast RPF filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. If the network configuration changes so that an interface that has unicast RPF enabled becomes a trusted interface or becomes asymmetrically routed (the interface that receives a packet is not the best return path to the packet's source), disable unicast RPF.
To disable unicast RPF on an EX3200, EX4200, or EX4300 switch, you must delete it from every interface on which you explicitly configured it. If you do not disable unicast RPF on every interface on which you explicitly enabled it, it remains implicitly enabled on all interfaces. If you attempt to delete unicast RPF from an interface on which it was not explicitly enabled, the warning: statement not found message appears. If you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces of the EX3200, EX4200, or EX4300 switch.

On EX8200 and EX6200 switches, the switch does not apply unicast RPF to an interface unless you explicitly enable that interface for unicast RPF.

To disable unicast RPF, delete its configuration from the interface:

```
[edit interfaces]
user@switch# delete ge-1/0/10 unit 0 family inet rpf-check
```

---

**NOTE:** On EX3200, EX4200, and EX4300 switches, if you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces.

---

---

**Configuring IP Directed Broadcast (CLI Procedure)**

---

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring IP Directed Broadcast (CLI Procedure). For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

You can use IP directed broadcast on an EX Series switch to facilitate remote network management by sending broadcast packets to hosts on a specified subnet without broadcasting to the entire network. IP directed broadcast packets are broadcast on only the target subnet. The rest of the network treats IP directed broadcast packets as unicast packets and forwards them accordingly.

Before you begin to configure IP directed broadcast:

- Ensure that the subnet on which you want broadcast packets using IP direct broadcast is not directly connected to the Internet.
- Configure an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) for the subnet that will be enabled for IP direct broadcast. See “Configuring
Integrated Routing and Bridging Interfaces (CLI Procedure) on page 2122, Configuring Routed VLAN Interfaces (CLI Procedure), or Configuring VLANs for EX Series Switches (J-Web Procedure) on page 2117.

NOTE: We recommend that you do not enable IP directed broadcast on subnets that have a direct connection to the Internet because of increased exposure to denial-of-service (DoS) attacks.

To enable IP directed broadcast for a specified subnet:

1. Add the target subnet’s logical interfaces to the VLAN:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0.0 family ethernet-switching vlan members v1
   user@switch# set ge-0/0/1.0 family ethernet-switching vlan members v1
   ```

2. Configure the Layer 3 interface on the VLAN that is the target of the IP directed broadcast packets:

   ```
   [edit interfaces]
   user@switch# set irb.1 family inet address 10.1.2.1/24
   ```

3. Associate a Layer 3 interface with the VLAN:

   ```
   [edit vlans]
   user@switch# set v1 l3-interface (VLANs) irb.1
   ```

4. Enable the Layer 3 interface for the VLAN to receive IP directed broadcasts:

   ```
   [edit interfaces]
   user@switch# set irb.1 family inet targeted-broadcast
   ```

Tracing Operations of an Individual Router or Switch Interface

To trace the operations of individual router or switch interfaces, include the `traceoptions` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]
traceoptions { flag flag; }
```

You can specify the following interface tracing flags:

- `all`—Trace all interface operations.
- `event`—Trace all interface events.
- `ipc`—Trace all interface interprocess communication (IPC) messages.
- `media`—Trace all interface media changes.

The interfaces `traceoptions` statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` files.
Tracing Operations of the Interface Process

To trace the operations of the router or switch interface process, dcd, include the `traceoptions` statement at the `[edit interfaces]` hierarchy level:

```
[edit interfaces]
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-world-readable>;
    flag flag <disable>;
    no-remote-trace;
}
```

By default, interface process operations are placed in the file named dcd and three 1-MB files of tracing information are maintained.

You can specify the following flags in the `interfaces traceoptions` statement:

- `change-events`—Log changes that produce configuration events.
- `config-states`—Log the configuration state machine changes.
- `kernel`—Log configuration IPC messages to kernel.
- `kernel-detail`—Log details of configuration messages to kernel.

For general information about tracing, see the tracing and logging information in the `Junos OS Administration Library for Routing Devices`.

[edit interfaces et] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit interfaces et] hierarchy level on EX Series switches.

- **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.
- **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

- Supported Statements in the [edit interfaces et] Hierarchy Level on page 2360
- Unsupported Statements in the [edit interfaces et] Hierarchy Level on page 2363

**Supported Statements in the [edit interfaces et] Hierarchy Level**

The following hierarchy shows the [edit interfaces et] configuration statements supported on EX Series switches.

```
interfaces {
  et-fpc/pic/port {
    accounting-profile name;
    description text;
    disable;
    encapsulation type;
    ether-options {

Unsupported Statements in the [edit interfaces interface-range] Hierarchy Level

All statements in the [edit interfaces interface-range] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

[edit interfaces irb] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit interfaces irb] hierarchy level on EX Series switches.

• **Supported** statements are those that you can use to configure some aspect of a software feature on the switch.

• **Unsupported** statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

• Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see “EX Series Switch Software Features Overview” on page 27.

This topic lists:

• Supported Statements in the [edit interfaces irb] Hierarchy Level on page 2379

• Unsupported Statements in the [edit interfaces irb] Hierarchy Level on page 2382

Supported Statements in the [edit interfaces irb] Hierarchy Level

The following hierarchy shows the [edit interfaces irb] configuration statements supported on EX Series switches.

interfaces {

802.3ad

Syntax

802.3ad {
  aex;
  (backup | primary);
  lacp {
    force-up;
    port-priority
  }
}

Hierarchy Level  [edit interfaces interface-name ether-options]

Release Information  Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure membership in a link aggregation group (LAG).

Options

- **aex**—Name of the LAG.
- **backup**—Designate the interface as the backup interface for link-protection mode.
- **primary**—Designate the interface as the primary interface for link-protection mode.

The remaining statements are described separately.

Required Privilege Level  interface—To view this statement in the configuration.

interfaced-control—To add this statement to the configuration.

Related Documentation

accounting-profile

Syntax  accounting-profile name;

Hierarchy Level  [edit interfaces interface-name],
                 [edit interfaces interface-name unit logical-unit-number],
                 [edit interfaces interface-range name]

Release Information  Statement introduced before Junos OS Release 7.4.
                    Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Enable collection of accounting data for the specified physical or logical interface or interface range.

Options  name—Name of the accounting profile.

Required Privilege  Level

       interface—To view this statement in the configuration.
       interface-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description  
For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses.

Options  
- `ip-address`—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing `address` statement.

- `mac mac-address`—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nn:nn:nn:nn:nn:nn`. For example, `0011.2233.4455` or `00:11:22:33:44:55`.

- `multicast-mac mac-address`—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` or `nn:nn:nn:nn:nn:nn`. For example, `0011.2233.4455` or `00:11:22:33:44:55`.

- `publish`—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

---

**NOTE:** The `edit logical-systems` hierarchy is not available on QFabric systems.

Required Privilege Level  
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

**auto-negotiation**

**Syntax**

(auto-negotiation | no-auto-negotiation) <remote-fault (local-interface-online | local-interface-offline)>;

**Hierarchy Level**

[edit interfaces interface-name ether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]

**Release Information**

Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 8.4 for J Series Services Routers.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description**

For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches and J Series Services Routers, explicitly enable autonegotiation only.

- **auto-negotiation**—Enables autonegotiation. This is the default.
- **no-auto-negotiation**—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

---

**NOTE:** On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the no-auto-negotiation statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

On J Series Services Routers with universal Physical Interface Modules (uPIMs) and on EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

---

**NOTE:** On T4000 routers, the auto-negotiation command is ignored for interfaces other than Gigabit Ethernet.
<table>
<thead>
<tr>
<th>Default</th>
<th>Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.</th>

## bandwidth (Interfaces)

**Syntax**

```
bandwidth rate;
```

**Hierarchy Level**

- [edit interfaces interface-name unit logical-unit-number],
- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure an informational-only bandwidth value for an interface. This statement is valid for all logical interface types except multilink and aggregated interfaces.

**NOTE:** We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the `bandwidth` statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

\[
\text{cost} = \frac{\text{reference-bandwidth}}{\text{bandwidth}},
\]

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the `bandwidth` statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

**Options**

- `rate`—Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation `c`; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

**Range:** Not limited.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

### broadcast

**Syntax**

```
broadcast address;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**

Set the broadcast address on the network or subnet. On a subnet you cannot specify a host address of 0, nor can you specify a broadcast address.

**Default**

The default broadcast address has a host portion of all ones.

**Options**

`address`—Broadcast address. The address must have a host portion of either all ones or all zeros. You cannot specify the addresses `0.0.0.0` or `255.255.255.255`.

**NOTE:** The `edit logical-systems` hierarchy is not available on QFabric systems.

**Required Privilege Level**

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**

description (Interfaces)

Syntax
description text;

Hierarchy Level
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Description
Provide a textual description of the interface or the logical unit. Any descriptive text you include is displayed in the output of the show interfaces commands, and is also exposed in the ifAlias Management Information Base (MIB) object. It has no effect on the operation of the interface on the router or switch.

The textual description can also be included in the extended DHCP relay option 82 Agent Circuit ID suboption.

Options
text—Text to describe the interface. If the text includes spaces, enclose the entire text in quotation marks.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

disable (Interface)

**Syntax**
```plaintext
disable;
```

**Hierarchy Level**
- `[edit interfaces interface-name]`
- `[edit interfaces interface-name unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]`

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description**
Disable a physical or a logical interface, effectively unconfiguring it.

---

**CAUTION:**
- Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.
- If aggregated SONET links are configured between a T1600 router and a T4000 router, interface traffic is disrupted when you disable the physical interface configured on the T1600 router. If you want to remove the interface, we recommend that you deactivate the interface instead of disabling it.

---

**NOTE:**
- When you use the disable statement at the `[edit interfaces]` hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet (GE) PICs with SFP and XFP transceivers do support it and the laser will be turned off when the interface is disabled.
- When you disable or deactivate an interface, then all the references made to the deactivated interface must be removed from the routing instance.

---

**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.
**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

}

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range name unit logical-unit-number]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches, including options ethernet-switching, inet, and iso.
Option inet6 introduced in Junos OS Release 9.3 for EX Series switches.
Options ccc introduced in Junos OS Release 9.5 for EX Series switches.

Description

Configure protocol family information for the logical interface on the switch.

You must configure a logical interface to be able to use the physical device.

Default

Interfaces on EX4300 switches are set to family ethernet-switching by the default factory configuration. Before you can change the family setting for an interface to another family type, you must delete this default setting or any user-configured family setting.
Options  See Table 177 on page 1484 for protocol families available on the switch interfaces. Different protocol families support different subsets of the interface types on the switch.

Interface types on the switch are:

- Aggregated Ethernet (ae0)
- 40-Gigabit Ethernet (et)
- Gigabit Ethernet (ge)
- Interface-range configuration (interface-range)
- Loopback (lo0)
- Management Ethernet (me0)
- Integrated Routing and Bridging (IRB) interfaces (IRB) (irb)
- Virtual management Ethernet (vme)
- 10-Gigabit Ethernet (xe)

If you are using an interface range, the supported protocol families are the ones supported by the interface types that compose the range.

Not all interface types support all family substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

- [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure them under the `family ethernet-switching`, `inet`, `inet6`, `mpls`, or `vpls` only.

Options

- **group filter-group-number**—Define an interface to be part of a filter group.
  - Range: 1 through 255

- **input filter-name**—Name of one filter to evaluate when packets are received on the interface.

- **output filter-name**—Name of one filter to evaluate when packets are transmitted on the interface.

The remaining statements are explained separately.

Required Privilege Level

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Hierarchy Level**
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces interface-name multiservice-options],
[edit interfaces interface-range name aggregated-ether-options],
[edit interfaces interface-range name ether-options]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 in EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description**
For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

---

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

**Default**
Flow control is enabled.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 in EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description**
For Ethernet interfaces, enable updating of the Address Resolution Protocol (ARP) cache for gratuitous ARPs.

**Default**
Updating of the ARP cache is disabled on all Ethernet interfaces.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- Configuring Gratuitous ARP on page 2331
- no-gratuitous-arp-request on page 2447
hold-time (Physical Interface)

Syntax

hold-time up milliseconds down milliseconds;

Hierarchy Level

[edit interfaces interface-name],
[edit interfaces interface-range interface-range-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 10.4R5 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Description

Specify the hold-time value to use to damp interface transitions. When an interface goes from up to down, it is not advertised to the rest of the system as being down until it has remained down for the hold-time period. Similarly, an interface is not advertised as being up until it has remained up for the hold-time period.

NOTE:

• We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment.

• The hold-time option is not available for controller interfaces.

Default

Interface transitions are not damped.

Options

down milliseconds—Hold time to use when an interface transitions from up to down. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

Range: 0 through 4,294,967,295 milliseconds
Default: 0 milliseconds (interface transitions are not damped)

up milliseconds—Hold time to use when an interface transitions from down to up. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

Range: 0 through 4,294,967,295 milliseconds
Default: 0 milliseconds (interface transitions are not damped)

Required Privilege Level

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

### interface-mode

**Syntax**

```plaintext
interface-mode (access | trunk);
```

**Hierarchy Level**

- `[edit interfaces interface-name unit logical-unit-number family bridge]`
- `[edit interfaces interface-name unit logical-unit-number family ethernet-switching]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family bridge]`

**Release Information**

Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description**

(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the `trunk` option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the `vlan-id` or `vlan-id-list` statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the `access` option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the `vlan-id` statement.

**NOTE:** On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure `interface-mode` and `irb` for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see `Configuring a Trunk Interface on a Bridge Network`.

**Options**

- **access**—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the `vlan-id` statement.

- **trunk**—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the `vlan-id` or `vlan-id-list` statement.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

        proxy-arp (restricted | unrestricted);
        (traps | no-traps);
        vlan-id (Layer 3 Subinterfaces) vlan-id-number;
    }
    vlan-tagging;
}
```

Hierarchy Level

[edit interfaces]

Release Information

Statement introduced in Junos OS Release 10.0 for EX Series switches.

Description

Group interfaces that share a common configuration profile.

NOTE: You can specify interface ranges only for Gigabit and 10-Gigabit Ethernet interfaces.
## Options

**name**—Name of the interface range.

**NOTE:** You can use regular expressions and wildcards to specify the interfaces in the member configuration. Do not use wildcards for interface types.

The remaining statements are explained separately.

**lcap (Aggregated Ethernet)**

**Syntax**
```
lcap {
  (active | passive);
  admin-key key;
  accept-data;
  fast-failover;
  link-protection {
    disable;
    (revertive | non-revertive);
  }
  periodic interval;
  system-id mac-address;
  system-priority priority;
}
```

**Hierarchy Level**
```
[edit interfaces ae
X
aggregated-ether-options]
```

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- `fast-failover` option introduced in Junos OS Release 12.2.

**Description**
For aggregated Ethernet interfaces only, configure the Link Aggregation Control Protocol (LACP).

When you configure the `accept-data` statement at the `[edit interfaces ae
X
aggregated-ether-options lcap]` hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

**NOTE:** When you use the `accept-data` statement at the `[edit interfaces ae
X
aggregated-ether-options lcap]` hierarchy level, this behavior occurs:

- By default, the `accept-data` statement is not configured when LACP is enabled.
- You can configure the `accept-data` statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the `accept-data` statement is configured.

**Default**
If you do not specify LACP as either `active` or `passive`, LACP remains passive.

**Options**
- `active`—Initiate transmission of LACP packets.
- `admin-key number`—Specify an administrative key for the router or switch.
NOTE: You must also configure Multichassis Link Aggregation (MC-LAG) when you configure the admin-key.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

# link-mode

## Syntax

```
Syntax   link-mode mode;
```

## Hierarchy Level

```
Hierarchy Level  [edit interfaces interface-name],
                 [edit interfaces interface-name ether-options],
                 [edit interfaces ge-pim/0/0 switch-options switch-port port-number]
```

## Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

## Description

Set the device's link connection characteristic.

## Options

- `mode`—Link characteristics:
  - `automatic`—Link mode is negotiated. This is the default for EX Series switches.
  - `full-duplex`—Connection is full duplex.
  - `half-duplex`—Connection is half duplex.

**Default:** Fast Ethernet interfaces, except the J Series ePIM Fast Ethernet interfaces, can operate in either full-duplex or half-duplex mode. The router’s management Ethernet interface, `fxp0` or `em0`, the built-in Fast Ethernet interfaces on the FIC (M7i router), and the Gigabit Ethernet ports on J Series Services Routers with uPIMs installed and configured for access switching mode autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.

**NOTE:** On J Series ePIM Fast Ethernet interfaces, if you specify half-duplex (or if full-duplex mode is not autonegotiated), the following message is written to the system log: "Half-duplex mode not supported on this PIC, forcing full-duplex mode."

## NOTE:

On EX Series switches, if no-auto-negotiation is specified in `[edit interfaces interface-name ether-options]`, you can select only full-duplex or half-duplex. If auto-negotiation is specified, you can select any mode.

**NOTE:** Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Related Documentation

**link-protection**

**Syntax**

```
link-protection {
  disable;
  (revertive | non-revertive);
}
```

**Hierarchy Level**

- `[edit interfaces aex aggregated-ether-options]`
- `[edit interfaces aex aggregated-ether-options lACP]`

**Release Information**

- Statement introduced in Junos OS Release 8.3.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for `disable`, `revertive`, and `non-revertive` statements added in Junos OS Release 9.3.

**Description**

On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the `primary` and `backup` statements at the `[edit interfaces ge-fpc/pic/port gigether-options 802.3ad aex]` hierarchy level or the `[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]` hierarchy level.

On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.

For Junos OS link protection, specify `link-protection` at the following hierarchy levels:

- `[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]`
- `[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]`

For LACP standards link protection, specify `link-protection` at the following hierarchy levels:

- For global LACP link protection, specify at `[edit chassis aggregated-devices ethernet lACP]`
- For a specific aggregated Ethernet interface, specify at `[edit interfaces aeX aggregated-ether-options lACP]`

**Options**

The statements are explained separately.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- **Configuring Aggregated Ethernet Link Protection on page 2342**

link-speed (Aggregated Ethernet)

Syntax

```
link-speed speed;
```

Hierarchy Level

```
[edit interfaces aex aggregated-ether-options],
[edit interfaces interface-range name aggregated-ether-options],
[edit interfaces interface-range name aggregated-sonet-options]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

For aggregated Ethernet interfaces only, set the required link speed.

Options

`speed`—For aggregated Ethernet links, you can specify `speed` in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

Aggregated Ethernet links on the M120 router can have one of the following speeds:

- `100m`—Links are 100 Mbps.
- `10g`—Links are 10 Gbps.
- `1g`—Links are 1 Gbps.
- `oc192`—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- `10m`—Links are 10 Mbps.
- `100m`—Links are 100 Mbps.
- `1g`—Links are 1 Gbps.
- `10g`—Links are 10 Gbps.

Aggregated Ethernet links on T Series routers can be configured to operate at one of the following speeds:

- `100g`—Links are 100 Gbps.
- `100m`—Links are 100 Mbps.
- `10g`—Links are 10 Gbps.
- `1g`—Links are 1 Gbps.
- `40g`—Links are 40 Gbps.
- `50g`—Links are 50 Gbps.
- `80g`—Links are 80 Gbps.
- `8g`—Links are 8 Gbps.
• **mixed**—Links are of various speeds.
• **oc192**—Links are OC192.

members

Syntax:  
members [{all | names | vlan-ids}];

Hierarchy Level:  
[edit interfaces interface-name unit logical-unit-number family ethernet-switching vlan (802.1Q Tagging)]

Release Information:  
Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement updated with enhanced \( ? \) (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

Description:  
For trunk interfaces, configure the VLANs that can carry traffic.

TIP:  
To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type \( ? \) after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

NOTE:  
The number of VLANs supported per switch varies for each model. Use the configuration-mode command set vlans id vlan-id ? to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum.

On an EX Series switch that runs Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style, the maximum number of VLAN members allowed on the switch is 8 times the maximum number of VLANs the switch supports \((v_{member\ limit} = vlan\ max \times 8)\). If the switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process \((eswd)\) due to memory allocation failure.

On an EX Series switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs the switch supports \((v_{member\ limit} = vlan\ max \times 24)\). If the configuration of one of these switches exceeds the recommended VLAN member maximum, a warning message appears in the system log \((syslog)\).

Options:  
all—Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.
NOTE: Since VLAN members are limited, specifying all could cause the number of VLAN members to exceed the limit at some point.

*names*—Name of one or more VLANs. VLAN IDs are applied automatically in this case.

NOTE: *all* cannot be a VLAN name.

*vlan-ids*—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, 10–20 or 10–20 23–30.

NOTE: Each configured VLAN must have a specified VLAN ID to successfully commit the configuration; otherwise, the configuration commit fails.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for Layer 2 VPNs and VPLS introduced in Junos OS Release 10.4.
- Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
- Support at the [set interfaces interface-name unit logical-unit-number family ccc] hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.

**Description**

Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

To route jumbo data packets on an integrated routing and bridging (irb) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces and also on the IRB interface or RVI itself (the irb or vlan interface, respectively).

---

**CAUTION:** For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.
NOTE: If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.

NOTE: Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxf0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.

For more information about configuring MTU for specific interfaces and router or switch combinations, see “Configuring the Media MTU” on page 2307.

native-vlan-id

**Syntax**

native-vlan-id number;

**Hierarchy Level**

[edit interfaces ge-fpc/pic/port],
[edit interfaces interface-name]

**Release Information**

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**

For 1-, 4-, and 8-port Gigabit Ethernet IQ2 and IQ2-E PICs, for 1-port 10-Gigabit Ethernet
IQ2 and IQ2-E PICs configured for 802.1Q flexible VLAN tagging, for all Ethernet interfaces
on MX Series routers, and for aggregated Ethernet interfaces on IQ2 and IQ2-E PICs or
MX Series DPCs, and for 100-Gigabit Ethernet Type 5 PIC with CFP, configure mixed
tagging support for untagged packets on a port. When the `native-vlan-id` statement is
included with the `flexible-vlan-tagging` statement, untagged packets are accepted on
the same mixed VLAN-tagged port.

---

**NOTE:** Mixed VLAN tagging is not supported on EX Series switches.

---

The logical interface on which untagged packets are received must be configured with
the same VLAN ID as the native VLAN ID configured on the physical interface. To configure
the logical interface, include the `vlan-id` statement (matching the `native-vlan-id` statement
on the physical interface) at the `[edit interfaces interface-name unit logical-unit-number]`
hierarchy level.

When the `native-vlan-id` statement is included with the `interface-mode` statement,
untagged packets are accepted and forwarded within the bridge domain or VLAN that
is configured with the matching VLAN ID.

**Options**

- `number`—VLAN ID number.
  
  **Range:** (ACX Series routers and EX Series switches) 0 through 4094.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Mixed Tagging Support for Untagged Packets
- Configuring a Logical Interface for Access Mode

no-gratuitous-arp-request

Syntax  
no-gratuitous-arp-request;

Hierarchy Level  
[edit interfaces interface-name]

Release Information  
Statement introduced in Junos OS Release 9.6 for EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Description  
For Ethernet interfaces and pseudowire logical interfaces, do not respond to gratuitous ARP requests.

Default  
Gratuitous ARP responses are enabled on all Ethernet interfaces.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  
• Configuring Gratuitous ARP on page 2331  
• gratuitous-arp-reply on page 2427

no-redirects

Syntax  
no-redirects;

Hierarchy Level  
[edit interfaces interface-name unit logical-unit-number family family]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  
Do not send protocol redirect messages on the interface.

To disable the sending of protocol redirect messages for the entire router or switch, include the no-redirects statement at the [edit system] hierarchy level.

Default  
Interfaces send protocol redirect messages.

Required Privilege Level  
interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

Related Documentation  
• Disabling the Transmission of Redirect Messages on an Interface on page 2333  
• Junos OS Administration Library for Routing Devices
**periodic**

**Syntax**

```plaintext
periodic interval;
```

**Hierarchy Level**

```
[edit interfaces aex aggregated-ether-options lACP],
[edit interfaces interface-range name aggregated-ether-options lACP]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

For aggregated Ethernet interfaces only, configure the interval for periodic transmission of LACP packets.

**Options**

`interval`—Interval for periodic transmission of LACP packets.

- `fast`—Transmit packets every second.
- `slow`—Transmit packets every 30 seconds.

Default: fast

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

**Related Documentation**

- Configuring Aggregated Ethernet LACP
- Configuring Aggregated Ethernet LACP (CLI Procedure) on page 2339
- Example: Configuring Aggregated Ethernet High-Speed Uplinks Between an EX4200 Virtual Chassis Access Switch and an EX4200 Virtual Chassis Distribution Switch
preferred

Syntax

preferred;

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure this address to be the preferred address on the interface. If you configure more than one address on the same subnet, the preferred source address is chosen by default as the source address when you initiate frame transfers to destinations on the subnet.

NOTE: The edit logical-systems hierarchy is not available on QFabric systems.

Default

The lowest-numbered address on the subnet is the preferred address.

Required Privilege

interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation

• Configuring the Interface Address on page 2302
primary (Address on Interface)

Syntax primary;

Hierarchy Level [edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure this address to be the primary address of the protocol on the interface. If the logical unit has more than one address, the primary address is used by default as the source address when packet transfer originates from the interface and the destination address does not indicate the subnet.

NOTE: The edit logical-systems hierarchy is not available on QFabric systems.

Default For unicast traffic, the primary address is the lowest non-127 (in other words, non-loopback) preferred address on the unit.

Required Privilege Level interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation • Configuring the Interface Address on page 2302
proxy-arp

Syntax

proxy-arp (restricted | unrestricted);

Hierarchy Level

[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.6 for EX Series switches.
restricted added in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description

For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request’s target address.

NOTE: You must configure the IP address and the inet family for the interface when you enable proxy ARP.

Default

Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.

Options

- none—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.
- restricted—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address.
- unrestricted—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.

Default: unrestricted

Required Privilege

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

**rpf-check**

**Syntax**
```plaintext
rpf-check;
```

**Hierarchy Level**
```plaintext
[edit interfaces interface-name unit logical-unit-number family inet],
[edit interfaces interface-name unit logical-unit-number family inet6]
```

**Release Information**
Statement introduced in Junos OS Release 9.3 for EX Series switches.

**Description**
On EX3200 and EX4200 switches, enable a reverse-path forwarding (RPF) check on unicast traffic (except ECMP packets) on all ingress interfaces.

On EX8200 switches, enable an RPF check on unicast traffic, including ECMP packets, on the selected ingress interface.

**Default**
Unicast RPF is disabled on all interfaces.

**Required Privilege Level**
- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

**Related Documentation**
- *Example: Configuring Unicast RPF on an EX Series Switch*

speed (Ethernet)

**Syntax**

```
speed (10m | 100m | 1g | auto | auto-10m-100m);
```

**Hierarchy Level**

```
[edit interfaces interface-name],
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

Configure the interface speed. This statement applies to the management Ethernet interface (`fxp0` or `em0`), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), the built-in Ethernet interfaces on J Series Services Routers, Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, Gigabit Ethernet ports on J Series Services Routers with uPIMs installed and configured for access switching mode, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

**Options**

You can specify the speed as either `10m` (10 Mbps), `100m` (100 Mbps), or on J Series routers with uPIMs installed and on MX Series routers, `1g` (1 Gbps). You can also specify the `auto` option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

- `10m`—10 Mbps
- `100m`—100 Mbps
- `1g`—1 Gbps
- `auto`—Automatically negotiate the speed (10 Mbps, 100 Mbps, or 1 Gbps) based on the speed of the other end of the link.
- `auto-10m-100m`—Automatically negotiate the speed (10 Mbps or 100 Mbps) based on the speed of the other end of the link.

**Required Privilege Level**

- `interface`—To view this statement in the configuration.
- `interface-control`—To add this statement to the configuration.

traceoptions (Individual Interfaces)

Syntax

traceoptions {
  file name <files name> <size size> <world-readable | no-world-readable>;
  flag flag;
  match;
}

Hierarchy Level

[edit interfaces interface-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Description

Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple flag statements.

The interfaces traceoptions statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system syslog file in the directory /var/log.

Default

If you do not include this statement, no interface-specific tracing operations are performed.

Options

- **file name**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, interface process tracing output is placed in the file filesnumber.

- **files name**—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

- **match**—(Optional) Regular expression for lines to be traced.

- **no-world-readable**—(Optional) Prevent any user from reading the log file.

- **world-readable**—(Optional) Allow any user to read the log file.

- **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the interface-specific tracing options.

  - **all**—All interface tracing operations
  - **event**—Interface events
- **ipc**—Interface interprocess communication (IPC) messages
- **media**—Interface media changes
- **q921**—Trace ISDN Q.921 frames
- **q931**—Trace ISDN Q.931 frames

**Required Privilege**
- **interface**—To view this statement in the configuration.
- **interface-control**—To add this statement to the configuration.

**Related Documentation**
- *Tracing Operations of an Individual Router Interface*
traceoptions (Interface Process)

Syntax

```plaintext
traceoptions {
  file <filename> <files number> <match regular-expression> <size size> <world-readable |
  no-world-readable>;
  flag flag <disable>;
  no-remote-trace;
}
```

Hierarchy Level
[edit interfaces]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
Define tracing operations for the interface process (dcd).

Default
If you do not include this statement, no interface-specific tracing operations are performed.

Options

- **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

- **filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, interface process tracing output is placed in the file `dcd`.

- **files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

  **Range:** 2 through 1000

  **Default:** 3 files

- **flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

  - **all**
  - **change-events**—Log changes that produce configuration events
  - **config-states**—Log the configuration state machine changes
  - **kernel**—Log configuration IPC messages to kernel
  - **kernel-detail**—Log details of configuration messages to kernel
  - **no-world-readable**—(Optional) Disallow any user to read the log file.
size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

Syntax: `xk` to specify kilobytes, `xm` to specify megabytes, or `xg` to specify gigabytes

Range: 10 KB through the maximum file size supported on your router

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

match regex—(Optional) Refine the output to include only those lines that match the given regular expression.

Required Privilege Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation
• Tracing Operations of the Interface Process

traps

Syntax (traps | no-traps);

Hierarchy Level
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range name],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Description
Enable or disable the sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.

Required Privilege Level
interface—to view this statement in the configuration.
interface-control—to add this statement to the configuration.

Related Documentation
• Enabling or Disabling SNMP Notifications on Physical Interfaces
• Enabling or Disabling SNMP Notifications on Logical Interfaces on page 2334
unit

Syntax

unit logical-unit-number {
  accounting-profile name;
  bandwidth rate;
  description text;
  disable;
  family family-name {...}
  proxy-arp (restricted | unrestricted);
  (traps | no-traps);
  vlan-id (Layer 3 Subinterfaces) vlan-id-number;
}

Hierarchy Level

[edit interfaces interface-name],
[edit interfaces interface-range name]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description

Configure a logical interface on the physical device. You must configure a logical interface
to be able to use the physical device.

Options

logical-unit-number—Number of the logical unit.

Range: 0 through 16,384

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**vlan-id (Layer 3 Subinterfaces)**

**Syntax**

```
vlan-id vlan-id-number;
```

**Hierarchy Level**

```
[edit interfaces interface-name unit logical-unit-number]
```

**Release Information**

Statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Bind an 802.1Q VLAN tag ID to a logical interface.

**NOTE:** The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

**Options**

- **vlan-id-number**—A valid VLAN identifier.
  
  **Range:** 1 through 4094

**Required Privilege Level**

vlan-tagging

Syntax  

```sh
vlan-tagging;
```

Hierarchy Level  

- [edit interfaces interface-name],
- [edit logical-systems logical-system-name interfaces interface-name]

Release Information  

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
- Statement introduced in Junos OS Release 13.2 for PTX Series Routers.

Description  

For Fast Ethernet and Gigabit Ethernet interfaces, aggregated Ethernet interfaces configured for VPLS, and pseudowire subscriber interfaces, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

Required Privilege Level  

- interface—to view this statement in the configuration.
- interface-control—to add this statement to the configuration.

- Verifying IP Directed Broadcast Status on page 2469

Monitoring Interface Status and Traffic

**Purpose**

Use the monitoring functionality to view interface status or to monitor interface bandwidth utilization and traffic statistics on the EX Series switches.

The J-Web interface monitors interface bandwidth utilization and plots real-time charts to display input and output rates in bytes per second. In addition, the Interface monitoring page displays input and output packet counters and error counters in the form of charts.

Alternatively, you can enter the `show` commands in the CLI to view interface status and traffic statistics.

---

**NOTE:** For logical interfaces on EX Series switches, the traffic statistics fields in `show interfaces` commands show only control traffic; the traffic statistics do not include data traffic.

---

**NOTE:** EX Series switches do not support the collection and reporting of IPv6 transit statistics. Therefore, the IPv6 transit statistics field in the `show interfaces` commands displays all values as 0.
**Action**  
To view general interface information in the J-Web interface such as available interfaces, select **Monitor > Interfaces**. Click any interface to view details about its status.

To set up interface monitoring for Virtual Chassis and EX8200 switches, select a member from the **Port for Member** list. Details such as the admin status and link status are displayed in the table. For an EX8200 Virtual Chassis setup, select the member, **FPC**, and the required interface.

---

**NOTE:** By default, the details of the first member in the **FPC** list is displayed. In an EX8200 Virtual Chassis setup, details of the first member and the first **FPC** is displayed.

You have the following options:

- **Start/Stop**—Starts or stops monitoring the selected interface.
- **Show Graph**—Displays input and output packet counters and error counters in the form of charts. Click the pop-up icon to view the graph in a separate window.
- **Details**—Displays interface information such as general details, traffic statistics, I/O errors, CoS counters, and Ethernet statistics.
- **Refresh Interval (sec)**—Displays the time interval you have set for page refresh.
- **Clear Statistics**—Clears the statistics for the interface selected from the table.

**Using the CLI:**

- To view interface status for all the interfaces, enter `show interfaces xe-`.
- To view status and statistics for a specific interface, enter `show interfaces xe-interface-name`.
- To view status and traffic statistics for all interfaces, enter either `show interfaces xe-detail` or `show interfaces xe-extensive`.

**Meaning**  
In the J-Web interface the charts displayed are:

- **Bar charts**—Display the input and output error counters.
- **Pie charts**—Display the number of broadcast, unicast, and multicast packet counters.

For details about output from the CLI commands, see `show interfaces ge-` (Gigabit Ethernet) or `show interfaces xe-` (10-Gigabit Ethernet).

- Configuring Gigabit Ethernet Interfaces (CLI Procedure) on page 2286
Verifying the Status of a LAG Interface

**Purpose**
Verify that a LAG (ae0) has been created on the switch.

**Action**
Enter the following command:

```
user@switch> show interfaces ae0 terse
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin</th>
<th>Link</th>
<th>Proto</th>
<th>Local</th>
<th>Remote</th>
</tr>
</thead>
<tbody>
<tr>
<td>ae0</td>
<td>up</td>
<td>up</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ae0.0</td>
<td>up</td>
<td>up</td>
<td>inet</td>
<td>10.10.10.2/24</td>
<td></td>
</tr>
</tbody>
</table>

**Meaning**
The output confirms that the ae0 link is up and shows the family and IP address assigned to this link.

**Related Documentation**
- Configuring Aggregated Ethernet Links (CLI Procedure) on page 2335
- Configuring Aggregated Ethernet Interfaces (J-Web Procedure) on page 2336
- Example: Configuring Aggregated Ethernet High-Speed Uplinks Between an EX4200 Virtual Chassis Access Switch and an EX4200 Virtual Chassis Distribution Switch

Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets

Verify that LACP has been set up correctly and that the bundle members are transmitting LACP protocol packets.

1. Verifying the LACP Setup on page 2465
2. Verifying That LACP Packets Are Being Exchanged on page 2466

**Verifying the LACP Setup**

**Purpose**
Verify that the LACP has been set up correctly.

**Action**
To verify that LACP has been enabled as active on one end:

```
user@switch> show lacp interfaces xe-0/1/0
```

<table>
<thead>
<tr>
<th>Aggregated interface: ae0</th>
</tr>
</thead>
<tbody>
<tr>
<td>LACP state:</td>
</tr>
<tr>
<td>Role</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>xe-0/1/0</td>
</tr>
<tr>
<td>xe-0/1/0</td>
</tr>
<tr>
<td>LACP protocol:</td>
</tr>
<tr>
<td>Receive State</td>
</tr>
<tr>
<td>xe-0/1/0</td>
</tr>
</tbody>
</table>
Meaning This output shows that LACP has been configured with one side as active and the other as passive. When LACP is enabled, at least one side must be set as active for the bundled link to be up.

**Verifying That LACP Packets Are Being Exchanged**

**Purpose** Verify that LACP packets are being exchanged between interfaces.

**Action** Use the `show interfaces ae0 statistics` command to display LACP BPDU exchange information.

```
show interfaces ae0 statistics

```

**Meaning** The output here shows that the link is down and that no PDUs are being exchanged (when there is no other traffic flowing on the link).

**Related Documentation**

**Verifying That Layer 3 Subinterfaces Are Working**

**Purpose** After configuring Layer 3 subinterfaces, verify they are set up properly and transmitting data.
1. Use the `show interfaces` command to determine whether you successfully created the subinterfaces and the links are up:

```
user@switch> show interfaces interface-name terse
Interface Admin Link Proto Local    Remote
ge-0/0/0    up    up
ge-0/0/0.0  up    up    inet     1.1.1.1/24
ge-0/0/0.1  up    up    inet     2.1.1.1/24
ge-0/0/0.2  up    up    inet     3.1.1.1/24
ge-0/0/0.3  up    up    inet     4.1.1.1/24
ge-0/0/0.4  up    up    inet     5.1.1.1/24
ge-0/0/0.32767 up    up
```

2. Use the `ping` command from a device on one subnet to an address on another subnet to determine whether packets were transmitted correctly on the subinterface VLANs:

```
user@switch> ping ip-address
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=64 time=0.157 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=64 time=0.238 ms
64 bytes from 1.1.1.1: icmp_seq=2 ttl=64 time=0.255 ms
64 bytes from 1.1.1.1: icmp_seq=3 ttl=64 time=0.128 ms
--- 1.1.1.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
```

**Meaning**
The output confirms that the subinterfaces are created and the links are up.

### Verifying Unicast RPF Status

**Purpose**
Verify that unicast reverse-path forwarding (RPF) is enabled and is working on the interface.

**Action**
Use one of the `show interfaces interface-name` commands with either the `extensive` or `detail` options to verify that unicast RPF is enabled and working on the switch. The following example displays output from the `show interfaces ge-1/0/10 extensive` command.

```
user@switch> show interfaces ge-1/0/10 extensive
Physical interface: ge-1/0/10, Enabled, Physical link is Down
Interface index: 139, SNMP ifIndex: 58, Generation: 140

Logical interface ge-1/0/10.0 (Index 69) (SNMP ifIndex 59) (Generation 135)
Flags: Device-Down SNMP-Traps 0x0 Encapsulation: ENET2
Traffic statistics:
Meaning  The `show interfaces ge-1/0/10 extensive` command (and the `show interfaces ge-1/0/10 detail` command) displays in-depth information about the interface. The Flags: output field near the bottom of the display reports the unicast RPF status. If unicast RPF has not been enabled, the `uRPF` flag is not displayed.

On EX3200, EX4200, and EX4300 switches, unicast RPF is implicitly enabled on all switch interfaces, including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVis) when you enable unicast RPF on a single interface. However, the unicast RPF status is shown as enabled only on interfaces for which you have explicitly configured unicast RPF. Thus, the `uRPF` flag is not displayed on interfaces for which you have not explicitly configured unicast RPF even though unicast RPF is implicitly enabled on all interfaces on EX3200 and EX4200 switches.

Verifying IP Directed Broadcast Status

Purpose  Verify that IP directed broadcast is enabled and is working on the subnet.
Action  Use the `show vlans extensive` command to verify that IP directed broadcast is enabled and working on the subnet as shown in Example: Configuring IP Directed Broadcast on an EX Series Switch.

Operational Commands
monitor interface

Syntax

monitor interface

<interface-name | traffic <detail>>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

NOTE: This command is not supported on the QFX3000 QFabric system.

Options
none—Display real-time statistics for all interfaces.

detail—(Optional) With traffic option only, display detailed output.

interface-name—(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

traffic—(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

Additional Information
The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the c key. For a description of the statistical information provided in the output of this command, see the show interfaces extensive command for a particular interface type in the Junos OS Operational Mode Commands. To control the output of the monitor interface command while it is running, use the keys listed in Table 314 on page 2471. The keys are not case-sensitive.

Table 314: Output Control Keys for the monitor interface Command

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Clears (returns to zero) the delta counters since monitor interface was started. This does not clear the accumulative counter. To clear the accumulative counter, use the clear interfaces interval command.</td>
</tr>
<tr>
<td>f</td>
<td>Freezes the display, halting the display of updated statistics and delta counters.</td>
</tr>
<tr>
<td>i</td>
<td>Displays information about a different interface. The command prompts you for the name of a specific interface.</td>
</tr>
</tbody>
</table>
Table 314: Output Control Keys for the monitor interface Command (continued)

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Displays information about the next interface. The <code>monitor interface</code> command displays the physical or logical interfaces in the same order as the <code>show interfaces terse</code> command.</td>
</tr>
<tr>
<td>q or Esc</td>
<td>Quits the command and returns to the command prompt.</td>
</tr>
<tr>
<td>t</td>
<td>Thaws the display, resuming the update of the statistics and delta counters.</td>
</tr>
</tbody>
</table>

To control the output of the `monitor interface traffic` command while it is running, use the keys listed in Table 315 on page 2472. The keys are not case-sensitive.

Table 315: Output Control Keys for the monitor interface traffic Command

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Displays the statistics in units of bytes and bytes per second (Bps).</td>
</tr>
<tr>
<td>c</td>
<td>Clears (return to 0) the delta counters in the <code>Current Delta</code> column. The statistics counters are not cleared.</td>
</tr>
<tr>
<td>d</td>
<td>Displays the <code>Current Delta</code> column (instead of the rate column) in Bps or packets per second (pps).</td>
</tr>
<tr>
<td>p</td>
<td>Displays the statistics in units of packets and packets per second (pps).</td>
</tr>
<tr>
<td>q or Esc</td>
<td>Quits the command and returns to the command prompt.</td>
</tr>
<tr>

request diagnostics tdr

Syntax
request diagnostics tdr (abort | start) interface interface-name

Release Information
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Start a time domain reflectometry (TDR) diagnostic test on the specified interface. This test characterizes and locates faults on twisted-pair Ethernet cables. For example, it can detect a broken twisted pair and provide the approximate distance to the break. It can also detect polarity swaps, pair swaps, and excessive skew.

The TDR test is supported on the following switches and interfaces:

- EX2200, EX3200, EX3300, and EX4200 switches—RJ-45 network interfaces. The TDR test is not supported on management interfaces and SFP interfaces.
- EX6200 and EX8200 switches—RJ-45 interfaces on line cards.

NOTE: We recommend running the TDR test when there is no traffic on the interface under test.

You view the results of the TDR test with the show diagnostics tdr command.

Options
- abort—Stop the TDR test currently in progress on the specified interface. No results are reported, and previous results, if any, are cleared.
- interface-name—The name of the interface.
- start—Start a TDR test on the specified interface.

Required Privilege Level
maintenance

### Sample Output

```plaintext
request diagnostics tdr start interface ge-0/0/19

user@switch> request diagnostics tdr start interface ge-0/0/19

Interface TDR detail:
Test status : Test successfully executed ge-0/0/19
```
### show diagnostics tdr

**Syntax**

```plaintext
show diagnostics tdr
  <interface interface-name>
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display the results of a time domain reflectometry (TDR) diagnostic test run on an interface. A TDR test characterizes and locates faults on twisted-pair Ethernet cables. For example, it can detect a broken twisted pair and provide the approximate distance to the break. It can also detect polarity swaps, pair swaps, and excessive skew.

The TDR test is supported on the following switches and interfaces:

- EX2200, EX3200, EX3300, and EX4200 switches—RJ-45 network interfaces. The TDR test is not supported on management interfaces and SFP interfaces.
- EX6200 and EX8200 switches—RJ-45 interfaces on line cards.

Use the `request diagnostics tdr` command to request a TDR test on a specified interface. Use the `show diagnostic tdr` command to display the last TDR test results for a specified interface or the last TDR test results for all network interfaces on the switch that support the TDR test.

**Options**

- `none`—Show summarized last results for all interfaces on the switch that support the TDR test.
- `interface interface-name`—(Optional) Show detailed last results for the specified interface or a range of interfaces. Specify a range of interfaces by entering the beginning and ending interface in the range, separated by a dash—for example, `ge-0/0/15-ge-0/0/20`.

**Required Privilege Level**

`view`

**Related Documentation**

- `request diagnostics tdr` on page 2479
- `Diagnosing a Faulty Twisted-Pair Cable (CLI Procedure)` on page 2547

**List of Sample Output**

- `show diagnostics tdr interface ge-0/0/19 (Normal Cable)` on page 2483
- `show diagnostics tdr interface ge-2/0/2 (Faulty Cable)` on page 2484
- `show diagnostics tdr (All Supported Interfaces)` on page 2484

**Output Fields**

Table 318 on page 2482 lists the output fields for the `show diagnostics tdr` command. Output fields are listed in the approximate order in which they appear.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name or Interface</td>
<td>Name of interface for which TDR test results are being reported.</td>
</tr>
<tr>
<td>Test status</td>
<td>Status of TDR test:</td>
</tr>
<tr>
<td></td>
<td>• Aborted—Test was terminated by operator before it was complete.</td>
</tr>
<tr>
<td></td>
<td>• Failed—Test was not completed successfully.</td>
</tr>
<tr>
<td></td>
<td>• Interface interface-name not found—Specified interface does not exist.</td>
</tr>
<tr>
<td></td>
<td>• Not Started—No TDR test results are available for the interface.</td>
</tr>
<tr>
<td></td>
<td>• Passed—Test completed successfully. The cable, however, might still have a fault—see the Cable status field for information on the cable.</td>
</tr>
<tr>
<td></td>
<td>• Started—Test is currently running and not yet complete.</td>
</tr>
<tr>
<td></td>
<td>• VCT not supported on interface-name—TDR test is not supported on the interface.</td>
</tr>
<tr>
<td>Link status</td>
<td>Operating status of link: UP or Down.</td>
</tr>
<tr>
<td>MDI pair</td>
<td>Twisted pair for which test results are being reported, identified by pin numbers. (Displayed only when the interface option is used.)</td>
</tr>
<tr>
<td>Cable status</td>
<td>When detailed information is displayed, status for a twisted pair:</td>
</tr>
<tr>
<td></td>
<td>• Failed—TDR test failed on the cable pair.</td>
</tr>
<tr>
<td></td>
<td>• Impedance Mismatch—Impedance on the twisted pair is not correct. Possible reasons for an impedance mismatch include:</td>
</tr>
<tr>
<td></td>
<td>• The twisted pair is not connected properly.</td>
</tr>
<tr>
<td></td>
<td>• The twisted pair is damaged.</td>
</tr>
<tr>
<td></td>
<td>• The connector is faulty.</td>
</tr>
<tr>
<td></td>
<td>• Normal—No cable fault detected for the twisted pair.</td>
</tr>
<tr>
<td></td>
<td>• Open—Lack of continuity between the pins at each end of the twisted-pair.</td>
</tr>
<tr>
<td></td>
<td>• Short on Pair-n—A short-circuit was detected on the twisted pair.</td>
</tr>
<tr>
<td>Distance fault or Max distance fault</td>
<td>Distance to the fault in whole meters. If there is no fault, this value is 0. When summary information for all interfaces is displayed, this value is the distance to the most distant fault if there is more than one twisted pair with a fault.</td>
</tr>
</tbody>
</table>
Table 318: show diagnostics tdr Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polarity swap</td>
<td>Indicates the polarity status of the twisted pair:</td>
</tr>
<tr>
<td></td>
<td>• Normal—Polarity is normal. Each conductor in the twisted pair has been connected the same pins at the both ends of the connection. For example, a conductor connected to pin 1 at the near end of the connection is connected to pin 1 at the far end.</td>
</tr>
<tr>
<td></td>
<td>• Reversed—Polarity has been reversed. For the twisted pair, the conductors have switched which pins they are connected to at the near and far ends of the connection. For example, the conductor connected to pin 1 at the near end is connected to pin 2 at the far end.</td>
</tr>
<tr>
<td></td>
<td>(Not available on EX8200 switches.) (Displayed only when the interface option is used)</td>
</tr>
<tr>
<td>Skew time</td>
<td>Difference in nanoseconds between the propagation delay on this twisted pair and the twisted pair with the shortest propagation delay. (Not available on EX8200 switches.) (Displayed only when the interface option is used.)</td>
</tr>
<tr>
<td>Channel Pair</td>
<td>Number of the 10/100BASE-T transmit/receive pair being reported on.</td>
</tr>
<tr>
<td>Pair Swap</td>
<td>Indicates whether or not the twisted pairs are swapped:</td>
</tr>
<tr>
<td></td>
<td>• MDI—The pairs are not swapped (straight-through cable).</td>
</tr>
<tr>
<td></td>
<td>• MDIX—The pairs are swapped (cross-over cable).</td>
</tr>
<tr>
<td></td>
<td>(Displayed only when the interface option is used.)</td>
</tr>
<tr>
<td>Downshift</td>
<td>Indicates whether the connection speed is being downshifted:</td>
</tr>
<tr>
<td></td>
<td>• No Downshift—No downshifting of connection speed.</td>
</tr>
<tr>
<td></td>
<td>• Downshift occurs—Connection speed is downshifted to 10 or 100 Mbs. This occurs if the cable is a two-pair cable rather than the four-pair cable required by Gigabit Ethernet.</td>
</tr>
<tr>
<td></td>
<td>(Displayed only when the interface option is used.)</td>
</tr>
</tbody>
</table>

Sample Output

**show interfaces diagnostics optics**

**Syntax**  
show interfaces diagnostics optics *interface-name*

**Release Information**  
Command introduced in Junos OS Release 10.0 for EX Series switches.

**Description**  
Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP, SFP+, or XFP) installed in EX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.

**Options**  
*interface-name*—Name of the interface associated with the port in which the transceiver is installed: *ge-fpc/pic/port* or *xe-fpc/pic/port*.

**Required Privilege Level**

**show interfaces ge-**

**Syntax**
```
show interfaces ge-fpc/pic/port
  <brief | detail | extensive | terse>
  <media>
  <statistics>
```

**Release Information**
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display status information about the specified Gigabit Ethernet interface.

**NOTE:** You must have a transceiver plugged into an SFP or SFP+ port before information about the interface can be displayed.

**Options**
- `ge-fpc/pic/port`—Display standard information about the specified Gigabit Ethernet interface.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `media`—(Optional) Display media-specific information about network interfaces.

</tr>
<tr>
<td></td>
<td>• Errors—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Framing errors—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Runts—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the headers. For example, a frame with less than 20 bytes of available IP header is discarded.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
</tbody>
</table>
Table 320: show interfaces ge- Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Carrier transitions—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Errors—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>

<td></td>
</tr>
<tr>
<td></td>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
</tr>
<tr>
<td>Egress queues</td>
<td>Total number of egress queues supported on the specified interface.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Queue counters (Egress)</td>
<td>CoS queue number and its associated user-configured forwarding class name.</td>
<td>detail extensive</td>
</tr>
<tr>
<td></td>
<td>• Queued packets—Number of queued packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Transmitted packets—Number of transmitted packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Dropped packets—Number of packets dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td>Active alarms and Active defects</td>
<td>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain time, it is promoted to an alarm. Based on the switch configuration, a defect can activate the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value <strong>None</strong> or <strong>Link</strong>.</td>
<td>detail extensive none</td>
</tr>
<tr>
<td></td>
<td>• None—There are no active defects or alarms.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</td>
<td></td>
</tr>
</tbody>
</table>
Table 320: show interfaces ge- Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MAC statistics</strong></td>
<td><strong>Receive and Transmit</strong> statistics reported by the PIC’s MAC subsystem.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Total octets</strong> and <strong>total packets</strong>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unicast packets, Broadcast packets, and Multicast packets</strong>—Number of unicast, broadcast, and multicast packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>CRC/Align errors</strong>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO error</strong>—Number of FIFO errors reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC control frames</strong>—Number of MAC control frames.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC pause frames</strong>—Number of MAC control frames with pause operational code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Oversized frames</strong>—Number of frames that exceed 1518 octets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Jabber frames</strong>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fragment frames</strong>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Code violations</strong>—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</td>
<td></td>
</tr>
<tr>
<td><strong>Filter Statistics</strong></td>
<td><strong>Receive and Transmit</strong> statistics reported by the PIC’s MAC address filter subsystem.</td>
<td>extensive</td>

show interfaces irb

Syntax

```
show interfaces irb
  <brief | detail | extensive | terse>
  <descriptions>
  <media>
  <routing-instance instance-name>
  <snmp-index snmp-index>
  <statistics>
```

Release Information

Command introduced in Junos OS Release 12.3R2.
Command introduced in Junos OS Release 12.3R2 for EX Series switches.
Command introduced in Junos OS Release 13.2 for the QFX Series

Description

Display integrated routing and bridging interfaces information.

Options

- `brief | detail | extensive | terse`—(Optional) Display the specified level of output.
- `descriptions`—(Optional) Display interface description strings.
- `media`—(Optional) Display media-specific information about network interfaces.
- `routing-instance instance-name`—(Optional) Display information for the interface with the specified SNMP index.
- `snmp-index snmp-index`—(Optional) Display information for the interface with the specified SNMP index.

Additional Information

Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another VLAN that has a Layer 3 protocol configured.

Required Privilege

- `view`

List of Sample Output

- `show interfaces irb extensive on page 2509`
- `show interfaces irb snmp-index on page 2510`

Output Fields

Table 274 on page 2192 lists the output fields for the `show interfaces irb` command. Output fields are listed in the approximate order in which they appear.

 Flags: Is-Primary
**show interfaces me0**

**Syntax**

```
show interfaces me0
<brief | detail | extensive | terse>
<descriptions>
<media>
<routing-instance>
<statistics>
```

**Release Information**

Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display status information about the management Ethernet interface.

**Options**

- **none**—Display standard information about the management Ethernet interface.
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **descriptions**—(Optional) Display interface description strings.
- **media**—(Optional) Display media-specific information about network interfaces.
- **routing-instance**—(Optional) Display the name of the routing instance.
- **statistics**—(Optional) Display static interface statistics.

**Required Privilege**

`view`

**Related Documentation**

- Example: Configuring a Firewall Filter on a Management Interface on an EX Series Switch on page 4179
- Configuring Firewall Filters (CLI Procedure) on page 4192

**List of Sample Output**

- `show interfaces me0` on page 2515
- `show interfaces me0 brief` on page 2515
- `show interfaces me0 detail` on page 2515
- `show interfaces me0 extensive` on page 2516

**Output Fields**

Table 322 on page 2511 lists the output fields for the `show interfaces me0` command. Output fields are listed in the approximate order in which they appear.

<table>
<thead>
<tr>

show interfaces queue

Syntax

show interfaces queue
<both-ingress-egress>
<egress>
<forwarding-class forwarding-class>
<ingress>
@interface-name>

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display class-of-service (CoS) queue information for physical interfaces.

Options

none—Show detailed CoS queue statistics for all physical interfaces.

both-ingress-egress—(Optional) Show both ingress and egress queue statistics. (Ingress statistics are not available for all interfaces.)

egress—(Optional) Show egress queue statistics only.

forwarding-class forwarding-class—(Optional) Show queue statistics only for the specified forwarding class.

ingress—(Optional) Show ingress queue statistics only. (Ingress statistics are not available for all interfaces.)

@interface-name—(Optional) Show queue statistics for the specified interface.

Packet Forwarding Engine Chassis Queues

For an interface on a line card with oversubscribed ports, the number of Packet Forwarding Engine chassis queues supported and in use for the port group to which the interface belongs. The queue statistics reflect the traffic flowing on all the interfaces in the port group.

Sample Output

show interfaces queue ge-0/0/0 (EX2200 Switch)

```
user@switch>  show interfaces queue ge–0/0/0
Physical interface: ge-0/0/0, Enabled, Physical link is Down
            Interface index: 130, SNMP ifIndex: 501
            Forwarding classes: 16 supported, 4 in use
            Egress queues: 8 supported, 4 in use
            Queue: 0, Forwarding classes: best-effort
            Queued:
            Transmitted:

show interfaces xe-

Syntax

```
show interfaces xe-fpc/pic/port
<brief | detail | extensive | terse>
<media>
<statistics>
```

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display status information about the specified 10-Gigabit Ethernet interface.

**NOTE:** You must have a transceiver plugged into an SFP+ or an XFP port before information about the interface can be displayed.

**NOTE:** On an EX Series switch, the traffic statistics for a LAG might vary slightly from the cumulative traffic statistics of the member interfaces of the LAG. This difference is more likely to be seen when the traffic is bursty in nature, and because the statistics are not fetched from the LAG and the members in the same instant. For accurate traffic statistics for a LAG, use the aggregated Ethernet counters.

Options

```
xepc/pic/port — Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse — (Optional) Display the specified level of output.

media — (Optional) Display media-specific information about network interfaces. For 10-Gigabit Ethernet interfaces, using the media option does not provide you with new or additional information. The output is the same as when the media option is not used.

statistics — (Optional) Display static interface statistics. For 10-Gigabit Ethernet interfaces, using the statistics option does not provide you with new or additional information. The output is the same as when the statistics option is not used.
```

</thead>
<tbody>
<tr>
<td>IPv6 transit statistics</td>
<td>EX Series switches do not support the collection and reporting of IPv6 transit statistics.</td>
<td>detail extensive</td>
</tr>
<tr>
<td>Input errors</td>
<td>Input errors on the interface:</td>
<td>extensive</td>
</tr>
<tr>
<td>• Errors—Sum of the incoming frame aborts and FCS errors.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Framing errors—Number of packets received with an invalid frame checksum (FCS).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Runs—Number of frames received that are smaller than the runt threshold.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the ignore-l3-incompletes statement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Resource errors—Sum of transmit drops.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 324: show interfaces xe- Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output errors</td>
<td>Output errors on the interface:</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• <strong>Carrier transitions</strong>—Number of times the interface has gone from <strong>down</strong> to <strong>up</strong>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Errors</strong>—Sum of the outgoing frame aborts and FCS errors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Drops</strong>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC’s RED mechanism.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Collisions</strong>—Number of Ethernet collisions. A 10-Gigabit Ethernet interface supports only full-duplex operation, so for 10-Gigabit Ethernet interfaces, this number should always remain 0. If it is nonzero, there is a software bug.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Aged packets</strong>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>FIFO errors</strong>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>HS link CRC errors</strong>—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces.</td>

show lACP interfaces

Syntax

show lACP interfaces
<interface-name>

Release Information

Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet or Gigabit Ethernet interface.

Options

none—Display LACP information for all interfaces.

interface-name—(Optional) Display LACP information for the specified interface:

Aggregated Ethernet—ae
Gigabit Ethernet—ge-fpc/pic/port
10-Gigabit Ethernet—xe-fpc/pic/port

Required Privilege

view

show lACP interfaces (QFX Series) on page 2541

Output Fields

Table 325 on page 2539 lists the output fields for the show lACP interfaces command. Output fields are listed in the approximate order in which they appear.
### Table 325: show lacp interfaces Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregated interface</td>
<td>Aggregated Ethernet interface name.</td>
</tr>
<tr>
<td>LACP State</td>
<td>LACP state information for each aggregated Ethernet interface:</td>
</tr>
<tr>
<td></td>
<td>• For a child interface configured with the <strong>force-up</strong> statement, LACP state displays <strong>FUP</strong> along with the interface name.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Role</strong>—Role played by the interface. It can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Actor</strong>—Local device participating in the LACP negotiation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Partner</strong>—Remote device participating in the LACP negotiation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Exp</strong>—Expired state. <strong>Yes</strong> indicates that the actor or partner is in an expired state. <strong>No</strong> indicates that the actor or partner is not in an expired state.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Def</strong>—Default. <strong>Yes</strong> indicates that the actor’s receive machine is using the default operational partner information, which is administratively configured for the partner. <strong>No</strong> indicates that the operational partner information in use has been received in an LACP PDU.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dist</strong>—Distribution of outgoing frames. <strong>No</strong> indicates that the distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <strong>Yes</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Col</strong>—Collection of incoming frames. <strong>Yes</strong> indicates that the collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <strong>No</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Syn</strong>—Synchronization. If the value is <strong>Yes</strong>, the link is considered to be synchronized. The link has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <strong>No</strong>, the link is not synchronized. The link is currently not in the right aggregation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Aggr</strong>—Ability of the aggregation port to aggregate (<strong>Yes</strong>) or to operate only as an individual link (<strong>No</strong>).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Timeout</strong>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or a fast transmission rate, depending upon the expressed LACP timeout preference (<strong>Long Timeout</strong> or <strong>Short Timeout</strong>).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Activity</strong>—Actor’s or partner’s port activity. <strong>Passive</strong> indicates the port’s preference for not transmitting LAC PDUs unless its partner’s control value is <strong>Active</strong>. <strong>Active</strong> indicates the port’s preference to participate in the protocol regardless of the partner’s control value.</td>
</tr>
</tbody>
</table>

<td>LACP protocol information for each aggregated interface:</td>
</tr>
</tbody>
</table>

- Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.
- **Receive State**—One of the following values:
  - **Current**—The state machine receives an LACP PDU and enters the *Current* state.
  - **Defaulted**—If no LACP PDU is received before the timer for the *Current* state expires a second time, the state machine enters the *Defaulted* state.
  - **Expired**—If no LACP PDU is received before the timer for the *Current* state expires once, the state machine enters the *Expired* state.
  - **Initialize**—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the *Initialize* state.
  - **LACP Disabled**—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to *LACP Disabled*. This state is similar to the *Defaulted* state, except that the port is forced to operate as an individual port.
  - **Port Disabled**—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the *Port Disabled* state.
- **Transmit State**—Transmit state of the state machine. The transmit state is one of the following values:
  - **Fast periodic**—Periodic transmissions are enabled at a fast transmission rate.
  - **No periodic**—Periodic transmissions are disabled.
  - **Periodic timer**—Transitory state entered when the periodic timer expires.
  - **Slow periodic**—Periodic transmissions are enabled at a slow transmission rate.
- **Mux State**—State of the multiplexer state machine for the aggregation port. The state is one of the following values:
  - **Attached**—The multiplexer state machine initiates the process of attaching the port to the selected aggregator.
  - **Collecting**—Yes indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. No indicates the receive function of this link is not enabled.
  - **Collecting distributing**—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.
  - **Detached**—Process of detaching the port from the aggregator is in progress.
  - **Distributing**—Yes indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames can be passed down from the aggregator’s distribution function for transmission. No indicates the transmit function of this link is not enabled.
  - **Waiting**—The multiplexer state machine is in a holding process, awaiting an outcome.

**Sample Output**

`show lacp interfaces (EX Series Switches)`

```
user@switch> show lacp interfaces ae5
Aggregated interface: ae5

LACP state: Role Exp Def Dist Col Syn Aggr Timeout Activity
xe-2/0/7 Actor No No Yes Yes Yes Yes Fast Active
xe-2/0/7 Partner No No Yes Yes Yes Yes Fast Passive
```

**test interface restart-auto-negotiation**

**Syntax**

```
test interface restart-auto-negotiation interface-name
```

**Release Information**

Command introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Restarts auto-negotiation on a Fast Ethernet or Gigabit Ethernet interface.

**Options**

`interface-name`—Interface name: `fe-fpc/pic/port` or `ge-fpc/pic/port`.

**Required Privilege**

View

**List of Sample Output**

```
test interface restart-auto-negotiation on page 2543
```

**Output Fields**

Use the `show interfaces extensive` command to see the state for auto-negotiation.

**Sample Output**

```
test interface restart-auto-negotiation

user@host> test interface restart-auto-negotiation fe-1/0/0
```
CHAPTER 47

Troubleshooting Procedures

• Troubleshooting an Aggregated Ethernet Interface on page 2545
• Troubleshooting Interface Configuration and Cable Faults on page 2546
• Troubleshooting Unicast RPF on page 2547
• Diagnosing a Faulty Twisted-Pair Cable (CLI Procedure) on page 2547

Troubleshooting an Aggregated Ethernet Interface

Troubleshooting issues for aggregated Ethernet interfaces:

• Show Interfaces Command Shows the LAG is Down on page 2545
• Logical Interface Statistics Do Not Reflect All Traffic on page 2545
• IPv6 Interface Traffic Statistics Are Not Supported on page 2546

Show Interfaces Command Shows the LAG is Down

Problem  The show interfaces terse command shows that the LAG is down.

Solution  Check the following:

• Verify that there is no configuration mismatch.
• Verify that all member ports are up.
• Verify that a LAG is part of family ethernet—switching (Layer 2 LAG) or family inet (Layer 3 LAG).
• Verify that the LAG member is connected to the correct LAG at the other end.
• Verify that the LAG members belong to the same switch (or the same Virtual Chassis).

Logical Interface Statistics Do Not Reflect All Traffic

Problem  The traffic statistics for a logical interface do not include all of the traffic.

Solution  Traffic statistics fields for logical interfaces in show interfaces commands show only control traffic; the traffic statistics do not include data traffic. You can view the statistics for all traffic only per physical interface.
IPv6 Interface Traffic Statistics Are Not Supported

Problem The IPv6 transit statistics in the show interfaces command display all 0 values.

Solution EX Series switches do not support the collection and reporting of IPv6 transit statistics.

Troubleshooting Interface Configuration and Cable Faults

Troubleshooting interface configuration and connectivity on the EX Series switch:

1. Interface Configuration or Connectivity Is Not Working on page 2546

Interface Configuration or Connectivity Is Not Working

Problem You encounter errors when you attempt to configure an interface on the switch, or the interface is exhibiting connectivity problems.

Solution Use the port troubleshooter feature in the J-Web interface to identify and rectify port configuration and connectivity related problems.

To use the J-Web interface port troubleshooter:

1. Select the option Troubleshoot from the main menu.
2. Click Troubleshoot Port. The Port Troubleshooting wizard is displayed. Click Next.
3. Select the ports to troubleshoot.
4. Select the test cases to be executed on the selected port. Click Next.

When the selected test cases are executed, the final result and the recommended action is displayed.

If there is a cable fault, the port troubleshooter displays details and the recommended action. For example, the cable must be replaced.

If the port configuration needs to be modified, the port troubleshooter displays details and the recommended action.

Troubleshooting Unicast RPF

Troubleshooting issues for unicast reverse-path forwarding (RPF) on EX Series switches include:

1. Legitimate Packets Are Discarded on page 2547

Legitimate Packets Are Discarded

**Problem**  The switch filters valid packets from legitimate sources, which results in the switch’s discarding packets that should be forwarded.

**Solution**  The interface or interfaces on which legitimate packets are discarded are asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, so the interface that receives a packet is not the same interface the switch uses to reply to the packet’s source.

Unicast RPF works properly only on symmetrically routed interfaces. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Unicast RPF filters packets by checking the forwarding table for the best return path to the source of an incoming packet. If the best return path uses the same interface as the interface that received the packet, the switch forwards the packet. If the best return path uses a different interface than the interface that received the packet, the switch discards the packet.

---

**NOTE:** On EX3200, EX4200, and EX4300 switches, unicast RPF works properly only if all switch interfaces—including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs)—are symmetrically routed, because unicast RPF is enabled globally on all switch interfaces.

---

Diagnosing a Faulty Twisted-Pair Cable (CLI Procedure)

**Problem**  A 10/100/1000BASE-T Ethernet interface has connectivity problems that you suspect might be caused by a faulty cable.
**Solution**

Use the time domain reflectometry (TDR) test to determine whether a twisted-pair Ethernet cable is faulty.

The TDR test:

- Detects and reports faults for each twisted pair in an Ethernet cable. Faults detected include open circuits, short circuits, and impedance mismatches.
- Reports the distance to fault to within 1 meter.
- Detects and reports pair swaps, pair polarity reversals, and excessive pair skew.

The TDR test is supported on the following switches and interfaces:

- EX2200, EX3200, EX3300, and EX4200 switches—RJ-45 network interfaces. The TDR test is not supported on management interfaces and SFP interfaces.
- EX6200 and EX8200 switches—RJ-45 network interfaces on line cards.

---

**NOTE:** We recommend running the TDR test on an interface when there is no traffic on the interface.

---

To diagnose a cable problem by running the TDR test:

1. Run the `request diagnostics tdr` command.
   
   ```text
   user@switch> request diagnostics tdr start interface ge-0/0/10
   Interface TDR detail:
   Test status : Test successfully executed ge-0/0/10
   ```

2. View the results of the TDR test with the `show diagnostics tdr` command.
   
   ```text
   user@switch> show diagnostics tdr interface ge-0/0/10
   Interface TDR detail:
   Interface name : ge-0/0/10
   Test status : Passed
   Link status : Down
   MDI pair : 1-2
   Cable status : Normal
   Distance fault : 0 Meters
   Polarity swap : N/A
   Skew time : N/A
   MDI pair : 3-6
   Cable status : Normal
   Distance fault : 0 Meters
   Polarity swap : N/A
   Skew time : N/A
   MDI pair : 4-5
   Cable status : Open
   Distance fault : 1 Meters
   Polarity swap : N/A
   Skew time : N/A
   MDI pair : 7-8
   Cable status : Normal
   ```
3. Examine the **Cable status** field for the four MDI pairs to determine if the cable has a fault. In the preceding example, the twisted pair on pins 4 and 5 is broken or cut at approximately one meter from the **ge-0/0/10** port connection.

**NOTE:** The **Test Status** field indicates the status of the TDR test, not the cable. The value **Passed** means the test completed—it does not mean that the cable has no faults.

The following is additional information about the TDR test:

- The TDR test can take some seconds to complete. If the test is still running when you execute the **show diagnostics tdr** command, the **Test status** field displays **Started**. For example:

  ```
  user@switch> show diagnostics tdr interface ge-0/0/22
  Interface TDR detail:
  Interface name                  : ge-0/0/22
  Test status                     : Started
  ```

- You can terminate a running TDR test before it completes by using the **request diagnostics tdr abort interface interface-name** command. The test terminates with no results, and the results from any previous test are cleared.

- You can display summary information about the last TDR test results for all interfaces on the switch that support the TDR test by not specifying an interface name with the **show diagnostics tdr** command. For example:

  ```
  user@switch> show diagnostics tdr
  ```

• EX Series Switch Software Features Overview on page 27
You can use the J-Web interface to create BGP peering sessions on a routing device.

**NOTE:** To configure BGP sessions, you must have a license for BGP installed on the EX Series switch.

To configure a BGP peering session:

1. Select **Configure > Routing > BGP**.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:

   - **Add**—Adds a BGP group. Enter information into the configuration page as described in Table 328 on page 2558.
   - **Edit**—Modifies an existing BGP group. Enter information into the configuration page as described in Table 328 on page 2558.
   - **Delete**—Deletes an existing BGP group.
   - **Disable**—Disables BGP configuration.
3. To modify BGP global settings, click **Edit** in the Global Information section. Enter information as described in [Table 329 on page 2559](#).

</table>
To configure a static neighbor:
1. Specify the IP address.
2. Specify the address of the local end of a BGP session.
3. Specify the degree of preference for an external route.
4. Enter a description.
5. Specify the hold-time value to use when negotiating a connection with the peer.
6. Specify how long a route must be present in the routing table before it is exported to BGP. Use this time delay to help bundle routing updates.
7. Select **Passive** if you do not want to send active open messages to the peer.
8. Select the option to compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.
9. Specify an import policy and export policy.
10. Click **OK**.

### Policies tab

**Import Policy**
- Specifies one or more routing policies to routes being imported into the routing table from BGP.
- Click **Add** to add an import policy. Select the policy and click **OK**.
- Click **Move up** or **Move down** to move the selected policy up or down the list of policies.
- Select the policy and click **Remove**.

**Export Policy**
- Specifies one or more policies to routes being exported from the routing table into BGP.
- Click **Add** to add an export policy. Select the policy and click **OK**.
- Click **Move up** or **Move down** to move the selected policy up or down the list of policies.
- Select the policy and click **Remove**.

Release Information

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Specify that a single-hop EBGP peer accepts a remote next hop with which it does not share a common subnet. Configure a separate import policy on the EBGP peer to specify the remote next hop. You cannot configure multihop and accept-remote-nexthop statements for the same EPBG peer.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information
Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Specify BGP to advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.

In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.

The advertise-external statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.

In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external. When configuring the advertise-external statement for an AS confederation, it is recommended that EBGP peers belonging to different autonomous systems are configured in a separate EBGP peer group. This ensures consistency while BGP sends the best external route to peers in the configured peer group.

To configure the advertise-external statement on a route reflector, you must disable intracluster reflection with the no-client-reflect statement.

When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.

The conditional option causes BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric
is evaluated. As a result, an external route with an AS path longer than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes.

**Default**

BGP does not advertise the external route with the highest local preference value to internal peers unless it is the best route.

**Options**

conditional—(Optional) Advertise the best external path only if the route selection process reaches the point at which the multiple exit discriminator (MED) metric is evaluated. The conditional option restricts advertisement to when the best external path and the active path are equal until the MED step of the route selection process. This implies that external routes with a longer AS path length than the active path, for instance, are not advertised. The criteria used for selecting the best external path is the same whether or not the conditional option is configured.

**Required Privilege**

routing—To view this statement in the configuration.

route-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp],
[edit routing-instances routing-instance-name protocols bgp group group-name],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure the routing table to export to BGP the best route learned by BGP even if Junos OS did not select this route to be an active route.

One way to achieve multivendor compatibility is to include the advertise-inactive statement in the external BGP (EBGP) configuration. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The advertise-inactive statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the advertise-inactive statement, the Junos OS device uses, for example, the OSPF route for forwarding, and the other vendor’s device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors’ devices appear to behave the same way.

Default
By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers.

Required Privilege Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  
Disable the default behavior of suppressing AS routes.

If you include the `advertise-peer-as` statement in the configuration, BGP advertises routes learned from one external BGP (EBGP) peer back to another EBGP peer in the same autonomous system (AS).

Another way to disable the route suppression default behavior is with the `as-override` statement. If you include both the `as-override` and `no-advertise-peer-as` statements in the configuration, the `no-advertise-peer-as` statement is ignored.

Default  
By default, Junos OS does not advertise the routes learned from one EBGP peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGP peers that are in the same AS as the originating peer, regardless of the routing instance.

Required Privilege  
Level  
routing—to view this statement in the configuration.

routing-control—to add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.

NOTE: The as-override statement is specific to a particular BGP group. This statement does not affect peers from the same remote AS configured in different groups.

Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The as-override statement overrides this default behavior.

Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]

Release Information

Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update mechanism for BGP, you cannot commit the 0.0.0.0/allow statement with authentication keys or key chains. The CLI issues a warning and fails to commit such configurations.

Options

key-chain—Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
asdot-notation option introduced in Junos OS Release 9.3.
asdot-notation option introduced in Junos OS Release 9.3 for EX Series switches.
no-attrset option introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description
Specify the routing device’s AS number.

An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (http://www.isi.edu).

If you are using BGP on the routing device, you must configure an AS number.

The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.

In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, BGP Support for Four-octet AS Number Space. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <16-bit high-order value in decimal>.<16-bit low-order value in decimal>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 110 in the AS-dot notation format.

Options
autonomous-system—AS number. Use a number assigned to you by the NIC.
Range: 1 through 4,294,967,295 \( (2^{32} - 1) \) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
  routing-options {
    autonomous-system 65546;
  }
```

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
  routing-options {
    autonomous-system 1.10;
  }
```

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
  routing-options {
    autonomous-system 60000;
  }
```

Asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

Default: Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

Loops number—(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure loops 1, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure loops 2, the route is hidden if the AS number is detected in the path two or more times.

Range: 1 through 10

Default: 1

NOTE: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the independent-domain option if the loops statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.
Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

```

**Release Information**

Statement introduced in Junos OS Release 8.1.
Support for logical routers introduced in Junos OS Release 8.3.
Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.
**hold-down-interval** statement introduced in Junos OS Release 8.5. You can configure this statement only for EBGP peers at the [edit protocols bgp group group-name neighbor address] hierarchy level.
**no-adaptation** statement introduced in Junos OS Release 9.0.
Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGP support, configure the `bfd-liveness-detection` statement at the global `[edit bgp protocols]` hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.
Options

**authenticationalgorithm algorithm-name** (Optional)—Configure the algorithm used to authenticate the specified BFD session: simple-password, keyed-md5, keyed-sha-1, meticulous-keyed-md5, meticulous-keyed-sha-1.

**authenticationkey-chain key-chain-name** (Optional)—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the [edit security] hierarchy level.

**authenticationloose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold milliseconds** (Optional)—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval milliseconds** (Optional)—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. When you configure the hold-down interval for the BFD protocol for EBGP, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes it is down and does not send a state change notification. The **holddown-interval** statement is supported only for EBGP peers at the [edit protocols bgp group group-name neighbor address] hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGP peers. If you configure the hold-down interval for a multihop EBGP session, you must also configure a local IP address by including the **local-address** statement at the [edit protocols bgp group group-name] hierarchy level.

**Range:** 0 through 255,000

**Default:** 0

**minimum-interval milliseconds** (Required)—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately (using the **minimum-receive-interval** and **transmit-interval** statements).

**Range:** 1 through 255,000

**minimum-receive-interval milliseconds** (Optional)—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000
**multiplier number** (Optional)—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255  
**Default:** 3

**no-adaptation** (Optional)—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

**transmit-interval threshold milliseconds** (Optional)—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ($2^{32} - 1$)

**transmit-interval minimum-interval milliseconds** (Optional)—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**version** (Optional)—Configure the BFD version to detect.

**Range:** 1 or **automatic** (autodetect the BFD version)  
**Default:** automatic

The remaining statements are explained separately.

**Required Privilege Level**  
 routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  
Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.

CAUTION:
If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

NOTE:  If you change the address family specified in the [edit protocols bgp family] hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.
Options  

cluster-identifier—4-byte identifier (such as an IPv4 address).

Required Privilege
Level

routing—To view this statement in the configuration.
route-control—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Support for flap damping at the address family level introduced in Junos OS Release 12.2.

Description
Enable route flap damping. BGP route flapping describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. Flap damping reduces the number of update messages sent between BGP
peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

**Default**
Flap damping is disabled on the routing device.

**Required Privilege**
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Apply one or more policies to routes being exported from the routing table into BGP. If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route’s metric to 500, this route matches the criterion of metric 500 defined in the next policy.

Options

policy-names—Name of one or more policies.

Required Privilege

Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

    }
}
Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.
Options

any—Configure the family type to be both unicast and multicast.

evpn—Configure NLRI parameters for Ethernet VPNs (EVPNs).

inet—Configure NLRI parameters for IPv4.

inet6—Configure NLRI parameters for IPv6.

inet-mdt—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.

inet-mvpn—Configure NLRI parameters for IPv4 for multicast VPNs.

inet6-mvpn—Configure NLRI parameters for IPv6 for multicast VPNs.

inet-vpn—Configure NLRI parameters for IPv4 for Layer 3 VPNs.

inet6-vpn—Configure NLRI parameters for IPv6 for Layer 3 VPNs.

iso-vpn—Configure NLRI parameters for IS-IS for Layer 3 VPNs.

l2vpn—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.

labeled-unicast—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with inet and inet6.

multicast—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.

unicast—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is unicast.

The remaining statements are explained separately.

Required Privilege

Level
routing—to view this statement in the configuration.

routing-control—to add this statement to the configuration.

graceful-restart (Protocols BGP)

Syntax

graceful-restart {
  disable;
  restart-time seconds;
  stale-routes-time seconds;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols bgp],
[edit logical-systems logical-system-name protocols bgp group group-name],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address],
[edit protocols bgp],
[edit protocols bgp group group-name],
[edit protocols bgp group group-name neighbor address]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Enable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.

To configure the duration of the BGP graceful restart period, include the restart-time statement at the [edit protocols bgp graceful-restart] hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the stale-routes-time statement at the [edit protocols bgp graceful-restart] hierarchy level.

NOTE: If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

For graceful restart to function properly, graceful restart must be enabled at the [edit routing-instance instance-name routing-options] or [edit routing-options] hierarchy level as well as in the protocol level.

For example:

  protocols {
    bgp {
      group ext {
        graceful-restart;
      }
    }
  }
  routing-options {
    graceful-restart;
  }
Graceful restart is enabled both at the `[edit routing-options]` hierarchy level, as well as at the routing protocol level. If graceful restart is not configured in both sections, the peer might have its route removed after a restart, which is not the intended behavior.

The remaining statements are explained separately.

**Required Privilege Level**
- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.

The hold time is three times the interval at which keepalive messages are sent.

BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value received in the open message as the hold time for the BGP connection between the two peers.

Starting in Junos OS Release 12.3, the BGP hold-time value can be zero (0). This implies that the speaker does not expect keepalive messages from its peer to maintain the BGP session. When negotiating between two peers, if one side requests a nonzero hold time and the other requests a zero hold time, the negotiation settles on the nonzero value and keepalive intervals are determined accordingly. Both sides must be set to zero for keepalive messages to stop being sent.

Options

- `seconds`—Hold time.
  - Range: 10 through 65,535 seconds (or 0 for infinite hold time)
  - Default: 90 seconds
TIP: When you set a hold-time value of 1 through 19 seconds, we recommend that you also configure the BGP precision-timers statement. The precision-timers statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the precision-timers statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

Required Privilege

Release Information
Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 9.5 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure the routing device so that it does not automatically reestablish BGP peer sessions after a nonstop active routing (NSR) switchover. This feature is particularly useful if you are using dynamic routing policies because the dynamic database is not synchronized with the backup Routing Engine when NSR is enabled.

Options
forever—Do not reestablish a BGP peer session after an non-stop routing switchover until the clear bgp neighbor command is issued.

seconds—Do not reestablish a BGP peer session after an non-stop routing switchover until after the specified period.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route’s metric to 500, this route matches the criterion of `metric 500` defined in the next policy.

It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the `show route receive-protocol bgp neighbor-address hidden` command. The hidden routes can then be retained or dropped from the routing table by configuring the `keep all | none` statement at the `[edit protocols bgp]` or `[edit protocols bgp group group-name]` hierarchy level.
The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the `keep all` statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the `keep none` statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options**

`policy-names`—Name of one or more policies.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Control whether or not Junos OS keeps in memory and hides certain routes.

If the keep none statement is used, Junos OS does not retain in memory and hide routes that are rejected because of a BGP import policy. Nor does BGP keep in memory and hide routes that are declared unfeasible due to BGP sanity checks. The keep none statement causes Junos OS to discard from memory the routes that are rejected due to BGP-specific logic or BGP evaluation. When a route is rejected because of some non-BGP-specific reason, the keep none statement has no effect on this route. This rejected route is retained in memory and hidden even though keep none is configured. An example of this type of hidden route is a route for which the protocol nexthop is unresolved.

The routing table can retain the route information learned from BGP in one of the following ways:

- Default (omit the keep statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.
- keep all—Keep all route information that was learned from BGP.
- keep none—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure keep none for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.
In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and keep all.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.
  
  This can happen in the following cases:

  - Another vendor's routing device advertises the routes back to the sending peer.
  - The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring advertise-peer-as.

- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When keep all is configured, the behavior of discarding routes received in the above scenarios is overridden.

**CAUTION:** When you configure keep (all | none), the associated BGP sessions are restarted.

**Default**

By default, BGP retains incoming rejected routes in memory and hides them. If you do not include the keep statement, most routes are retained in the routing table. BGP keeps all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.

**Options**

- **all**—Retain all routes.

- **none**—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking. When keep none is configured for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Description**
Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.

You generally configure a local address to explicitly configure the system's IP address from BGP's point of view. This IP address can be either an IPv6 or IPv4 address. Typically, an IP address is assigned to a loopback interface, and that IP address is configured here.

For internal BGP (IBGP) peering sessions, generally the loopback interface (lo0) is used to establish connections between the IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus, the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.

When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The local-address statement enables you to specify the source information in BGP update messages. If you omit the local-address statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally result in the egress interface address being the expected source of update messages. When this happens, the peering session is not established because a mismatch exists between the expected source address (the egress interface
of the peer) and the actual source (the loopback interface of the peer). To ensure that the expected source address matches the actual source address, specify the loopback interface address in the `local-address` statement.

**NOTE:** Although a BGP session can be established when only one of the paired routing devices has local-address configured, we strongly recommend that you configure local-address on both paired routing devices for IBGP and multihop EBGP sessions. The local-address statement ensures that deterministic fixed addresses are used for the BGP session end-points.

If you include the `default-address-selection` statement in the configuration, the software chooses the system default address as the source for most locally generated IP packets. For protocols in which the local address is unconstrained by the protocol specification, for example IBGP and multihop EBGP, if you do not configure a specific local address when configuring the protocol, the local address is chosen using the same methods as other locally generated IP packets.

**Default**  
If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

**Options**  
`address`—IPv6 or IPv4 address of the local end of the connection.

**Required Privilege Level**  
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- `alias` option introduced in Junos OS Release 9.5.

**Description**

Specify the local autonomous system (AS) number. An AS is a set of routing devices that are under a single technical administration and generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices.

Internet service providers (ISPs) sometimes acquire networks that belong to a different AS. When this occur, there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. In this case, it might not be desirable to modify peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a `local AS`.

---

**NOTE:** If you are using BGP on the routing device, you must configure an AS number before you specify the local as number.

In Junos OS Release 9.1 and later, the AS numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: `<16-bit high-order value in decimal>.<16-bit low-order value in decimal>`. For
example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

**Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>(Optional) Configure the local AS as an alias of the global AS number configured for the router at the [edit routing-options] hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the alias option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.</td>
</tr>
<tr>
<td>autonomous-system</td>
<td>AS number. Range: 1 through 4,294,967,295 ((2^{32} - 1)) in plain-number format Range: 0.0 through 65535.65535 in AS-dot notation format</td>
</tr>
<tr>
<td>loops number</td>
<td>(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure loops 1, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure loops 2, the route is hidden if the AS number is detected in the path two or more times.</td>
</tr>
</tbody>
</table>

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the E-BGP or I-BGP peer is the same as the current AS, do not use the local-as statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the local-as statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

<table>
<thead>
<tr>
<th>Range</th>
<th>1 through 10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no-prepend-global-as</td>
<td>(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.</td>
</tr>
<tr>
<td>private</td>
<td>(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.</td>
</tr>
</tbody>
</table>

**NOTE:** The private and alias options are mutually exclusive. You cannot configure both options with the same local-as statement.
**Required Privilege**

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Modify the value of the **LOCAL_PREF** path attribute, which is a metric used by BGP sessions to indicate the degree of preference for an external route. The route with the highest local preference value is preferred.

The **LOCAL_PREF** path attribute always is used in inbound routing policy and is advertised to internal BGP peers and to neighboring confederations. It is never advertised to external BGP peers.

**Default**

If you omit this statement, the **LOCAL_PREF** path attribute, if present, is not modified.

**Options**

**local-preference**—Preference to assign to routes learned from BGP or from the group or peer.

**Range:** 0 through 4,294,967,295 (\(2^{32} - 1\))

**Default:** If the **LOCAL_PREF** path attribute is present, do not modify its value. If a BGP route is received without a **LOCAL_PREF** attribute, the route is handled locally (it is stored in the routing table and advertised by BGP) as if it were received with a **LOCAL_PREF** value of 100. By default, non-BGP routes that are advertised by BGP are advertised with a **LOCAL_PREF** value of 100.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

- [edit routing-instances routing-instance-name protocols bgp],
- [edit routing-instances routing-instance-name protocols bgp group group-name],
- [edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Option `delay-med-update` introduced in Junos OS Release 9.0.

**Description**
Specify the metric for all routes sent using the multiple exit discriminator (MED, or MULTI_EXIT_DISC) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.

You can specify a constant metric value by including the `metric` option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the `multihop` command—you can specify a variable metric by including the `minimum-igp` or `igp` option.

You can increase or decrease the variable metric calculated from the IGP metric (either from the `igp` or `minimum-igp` statement) by specifying a value for `offset`. The metric is increased by specifying a positive value for `offset`, and decreased by specifying a negative value for `offset`.

In Junos OS Release 9.0 and later, you can specify that a BGP group or peer not advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the `med-igp-update-interval minutes` statement at the `[edit routing-options]` hierarchy level.

**Options**
- `delay-med-update`—Specify that a BGP group or peer configured with the `metric-out igp` statement not advertise MED updates unless the current MED value is lower than
the previously advertised MED value, or another attribute associated with the route has changed, or the BGP peer is responding to a refresh route request.

NOTE: You cannot configure the `delay-med-update` statement at the global BGP level.

**igp**—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop. Routes learned from an EBGP peer usually have a next hop on a directly connected interface and thus the IGP value is equal to zero. This is the value advertised.

**metric**—Primary metric on all routes sent to peers.

Range: 0 through 4,294,967,295 \((2^{32} - 1)\)

Default: No metric is sent.

**minimum-igp**—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value. When you change a neighbor’s export policy from any configuration to a configuration that sets the minimum IGP offset on an exported route, the advertised MED is not updated if the value would increase as a result, even if the previous configuration does not use a minimum IGP-based MED value. This behavior helps to prevent unnecessary route flapping when an IGP cost changes, by not forcing a route update if the metric value increases past the previous lowest known value.

**offset**—Increases or decreases the metric by this value.

Range: \(-2^{31}\) through \(2^{31} - 1\)

Default: None

**Required Privilege**

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure TCP path maximum transmission unit (MTU) discovery.

TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.

When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.

Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don’t Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device’s MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure an EBGP multihop session.

For Layer 3 VPNs, you configure the EBGP multihop session between the PE and CE routing devices. This allows you to configure one or more routing devices between the PE and CE routing devices.

An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case because multihop behavior is implied.

If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.

---

**NOTE:** You cannot configure the accept-remote-nexthop statement at the same time.

---

**Default**

If you omit this statement, all EBGP peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or “regular,” BGP session), and the default time-to-live (TTL) value is 1.
The remaining statements are explained separately.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Allow load sharing among multiple EBGP paths and multiple IBGP paths. A path is considered a BGP equal-cost path (and will be used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor, are considered.

Options

- `multiple-as`—Disable the default check requiring that paths accepted by BGP multipath must have the same neighboring AS.

- `vpn-unequal-cost equal-external-internal`—Enable load-balancing in a Layer 3 VPN with unequal cost paths.

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple neighbor statements.

By default, the peer’s options are identical to those of the group. You can override these options by including peer-specific option statements within the neighbor statement.

The neighbor statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an allow all statement in place of a neighbor statement.)

Options

address—IPv6 or IPv4 address of a single peer.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.

Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attribute. The `no-aggregator-id` statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.

**Default**
If you omit this statement, the router ID is included in the BGP aggregator path attribute.

**Required Privilege Level**

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Disable intracluster route redistribution by the system acting as the route reflector. Include this statement when the client cluster is fully meshed to prevent the sending of redundant route advertisements. Route reflection provides a way to decrease BGP control traffic and minimizing the number of update messages sent within the AS.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

no-validate

Syntax: no-validate policy-name;

Hierarchy Level: [edit protocols bgp group group-name family (inet | inet flow)],
[edit protocols bgp group group-name neighbor address family (inet | inet flow)],
[edit routing-instances routing-instance-name protocols bgp group group-name family (inet | inet flow)],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address family (inet | inet flow)]

Release Information: Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description: When BGP is carrying flow-specification network layer reachability information (NLRI) messages, the no-validate statement omits the flow route validation procedure after packets are accepted by a policy.

The receiving BGP-enabled device accepts a flow route if it passes the following criteria:

- The originator of a flow route matches the originator of the best match unicast route for the destination address that is embedded in the route.
- There are no more specific unicast routes, when compared to the destination address of the flow route, for which the active route has been received from a different next-hop autonomous system.

The first criterion ensures that the filter is being advertised by the next-hop used by unicast forwarding for the destination address embedded in the flow route. For example, if a flow route is given as 10.1.1.1, proto=6, port=80, the receiving BGP-enabled device selects the more specific unicast route in the unicast routing table that matches the destination prefix 10.1.1.1/32. On a unicast routing table containing 10.1/16 and 10.1.1/24, the latter is chosen as the unicast route to compare against. Only the active unicast route entry is considered. This follows the concept that a flow route is valid if advertised by the originator of the best unicast route.

The second criterion addresses situations in which a given address block is allocated to different entities. Flows that resolve to a best-match unicast route that is an aggregate route are only accepted if they do not cover more specific routes that are being routed to different next-hop autonomous systems.

You can bypass the validation process and use your own specific import policy. To disable the validation procedure and use an import policy instead, include the no-validate statement in the configuration.

Flow routes configured for VPNs with family inet-vpn are not automatically validated, so the no-validate statement is not supported at the [edit protocols bgp group group-name family inet-vpn] hierarchy level. No validation is needed if the flow routes are configured locally between devices in a single AS.
Options  *policy-name*—Import policy to match NLRI messages.

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Control how often BGP and the routing table exchange route information by specifying how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates and to avoid sending updates too often.

Alternatively or in addition, external BGP (EBGP) sessions can also use the route-flap damping mechanism upon the reception of BGP messages coming from an external neighbor.

BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. The `out-delay` statement enables a form of rate limiting. The delay is added to each update for each prefix individually. When a routing device changes its best path to a destination prefix, the device does not inform its peer about the change unless the route has been present in its routing table for the specified `out-delay`. If you use `out-delay` to perform rate-limiting, you can expect a less bursty pattern of updates. You will see a pattern in which updates arrive in a steady flow, and two updates for the same prefix are always spaced by at least the `out-delay` timer value (for example, 30 seconds). Thus, the `out-delay` setting is useful for limiting oscillation (sometimes called churn) in a network. Keep in mind that, regardless of the `out-delay` setting, BGP peers exchange routes immediately after neighbor establishment. The `out-delay` setting is only designed to delay the exchange of routes between BGP and the local routing table.
Caution is warranted because an **out-delay** can delay convergence. If your network is configured in a way that avoids oscillation, setting an **out-delay** is not necessary.

When configured, the **out-delay** value displays as Outbound Timer when using `show bgp group` or `show bgp group neighbor` commands.

**Default**

By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

**Options**

- **seconds**—Output delay time.
  - **Range:** 0 through 65,535 seconds
  - **Default:** 0 seconds

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure the routing device so that active open messages are not sent to the peer. Once you configure the routing device to be passive, the routing device will wait for the peer to issue an open request before a message is sent.

Default

If you omit this statement, all explicitly configured peers are active, and each peer periodically sends open requests until its peer responds.

Required Privilege Level

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Specify the neighbor (peer) autonomous system (AS) number.

For EBGP, the peer is in another AS, so the AS number you specify in the `peer-as` statement must be different from the local router's AS number, which you specify in the `autonomous-system` statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the `autonomous-system` and `peer-as` statements must be the same.

The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: `<16-bit high-order value in decimal>.<16-bit low-order value in decimal>`. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:
- *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.*

**Options**  
**autonomous-system**—AS number.  
**Range:** 1 through 4,294,967,295 \( (2^{32} - 1) \) in plain-number format for 4-byte AS numbers  
**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)  
**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

**Required Privilege**

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Specify the preference for routes learned from BGP.

At the BGP global level, the preference statement sets the preference for routes learned from BGP. You can override this preference in a BGP group or peer preference statement.

At the group or peer level, the preference statement sets the preference for routes learned from the group or peer. Use this statement to override the preference set in the BGP global preference statement when you want to favor routes from one group or peer over those of another.

**Options**

- `preference`—Preference to assign to routes learned from BGP or from the group or peer.
- **Range:** 0 through 4,294,967,295 (\(2^{32} - 1\))
- **Default:** 170 for the primary preference

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Limit the number of prefixes received on a BGP peer session and a rate-limit logging when injected prefixes exceed a set limit.

This functionality is identical to the accepted-prefix-limit functionality except that it operates against received prefixes rather than accepted prefixes.

Options

maximum number—When you set the maximum number of prefixes, a message is logged when that number is exceeded.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

teardown <percentage>—If you include the teardown statement, the session is torn down when the maximum number of prefixes is reached. If you specify a percentage, messages are logged when the number of prefixes exceeds that percentage. After the session is torn down, it is reestablished in a short time unless you include the idle-timeout statement. Then the session can be kept down for a specified amount of time.
of time, or forever. If you specify forever, the session is reestablished only after you issue a clear bgp neighbor command.

Range: 1 through 100

idle-timeout (forever | timeout-in-minutes)—(Optional) If you include the idle-timeout statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify forever, the session is reestablished only after you intervene with a clear bgp neighbor command.

Range: 1 through 2400

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

NOTE: As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the as-override statement instead of the remove-private statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.

The set of reserved AS numbers is in the range from 64,512 through 65,535.

Options
all—Remove all private AS numbers from the original path. Do not stop the process of removing private AS numbers, even if a public AS number is encountered.
nearest—When you use the all and replace options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the replace option for information about the default replacement value.)

replace—When you use the all option, instead of removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the show bgp group group-name command.

Required Privilege
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Add unicast prefixes to unicast and multicast tables.

Options
\textit{group-name}—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens. You generally specify only one routing table group.

Required Privilege
Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

                      Statement introduced in Junos OS Release 9.0 for EX Series switches.
                      Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors.
              The MSS is only valid in increments of 2 KB. The value used is based on the value set, but
              is rounded down to the nearest multiple of 2048.

Options  segment-size—MSS for the TCP connection.

Range:  1 through 4096

Required Privilege Level  routing—To view this statement in the configuration.
                          routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
`4byte-as` statement introduced in Junos OS Release 9.2.
`4byte-as` statement introduced in Junos OS Release 9.2 for EX Series switches.

Description

Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

Default

The default BGP protocol-level tracing options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level. The default group-level trace options are inherited from the BGP protocol-level `traceoptions` statement. The default peer-level trace options are inherited from the group-level `traceoptions` statement.

Options

- **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.
- **file name**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. We recommend that you place BGP tracing output in the file `bgp-log`.
files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files
Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

BGP Tracing Flags

• 4byte-as—4-byte AS events.
• bfd—BFD protocol events.
• damping—Damping operations.
• graceful-restart—Graceful restart events.
• keepalive—BGP keepalive messages. If you enable the the BGP update flag only, received keepalive messages do not generate a trace message.
• nsr-synchronization—Nonstop routing synchronization events.
• open—Open packets. These packets are sent between peers when they are establishing a connection.
• packets—All BGP protocol packets.
• refresh—BGP refresh packets.
• update—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the keepalive flag to generate a trace message for keepalive messages.

Global Tracing Flags

• all—All tracing operations
• general—A combination of the normal and route trace operations
• normal—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

• policy—Policy operations and actions
• route—Routing table changes
• state—State transitions
• task—Routing protocol task processing
• timer—Routing protocol timer processing
flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **filter**—Provide filter trace information. Applies only to `route`, `damping`, and `update` tracing flags.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

**Syntax:** `xk` to specify KB, `xm` to specify MB, or `xg` to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

**Required Privilege Level**
- routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**
- log-updown on page 2617 statement
- Understanding Trace Operations for BGP Protocol Traffic
- Configuring OSPF Refresh and Flooding Reduction in Stable Topologies
type (Protocols BGP)

Syntax  

```
type type;
```

Hierarchy Level  

- [edit logical-systems logical-system-name protocols bgp group group-name],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp group group-name],
- [edit protocols bgp group group-name],
- [edit routing-instances routing-instance-name protocols bgp group group-name]

Release Information  

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  

Specify the type of BGP peer group.

When configuring a BGP group, you can indicate whether the group is an IBGP group or an EBGP group. All peers in an IBGP group are in the same AS, while peers in an EBGP group are in different ASs and normally share a subnet.

Options  

```
type—Type of group:
```
- **external**—External group, which allows inter-AS BGP routing
- **internal**—Internal group, which allows intra-AS BGP routing

Required Privilege Level  

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

Routine Monitoring

Monitoring BGP Routing Information

Purpose
Use the monitoring functionality to monitor BGP routing information on the routing device.

Action
To view BGP routing information in the J-Web interface, select Monitor > Routing > BGP Information.

To view BGP routing information in the CLI, enter the following commands:

- `show bgp summary`
- `show bgp neighbor`

Meaning
Table 330 on page 2649 summarizes key output fields in the BGP routing display in the J-Web interface.

Table 330: Summary of Key BGP Routing Output Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Values</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP Peer Summary</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total Groups</td>
<td>Number of BGP groups.</td>
<td></td>

**Operational Commands**
clear bgp damping

Syntax

```
clear bgp damping
  \<logical-system (all | logical-system-name)>
  \<prefix>
```

Syntax (EX Series Switch and QFX Series)

```
clear bgp damping
  \<prefix>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Clear BGP route flap damping information.

Options

- **none**—Clear all BGP route flap damping information.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **prefix**—(Optional) Clear route flap damping information for only the specified destination prefix.

Required Privilege

```
clear
```

Related Documentation

- show policy damping on page 2685
- show route damping on page 3170

List of Sample Output

```
clear bgp damping on page 2652
```

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear bgp damping

user@host> clear bgp damping
```
clear bgp neighbor

Syntax

```
clear bgp neighbor
  <as as-number>
  <instance instance-name>
  <logical-system (all | logical-system-name)>
  <malformed-route>
  <neighbor>
  <soft | soft-inbound>
  <soft-minimum-igp>
```

Syntax (EX Series Switch and QFX Series)

```
clear bgp neighbor
  <as as-number>
  <instance instance-name>
  <malformed-route>
  <neighbor>
  <soft | soft-inbound>
  <soft-minimum-igp>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

```
malformed-route option introduced in Junos OS Release 13.2.
```

Description

Perform one of the following tasks:

- Change the state of one or more BGP neighbors to **IDLE**. For neighbors in the **ESTABLISHED** state, this command drops the TCP connection to the neighbors and then reestablishes the connection.

- (soft or soft-inbound keyword only) Reapply export policies or import policies, respectively, and send refresh updates to one or more BGP neighbors without changing their state.

Options

- **none**—Change the state of all BGP neighbors to **IDLE**.

- **as as-number**—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

- **instance instance-name**—(Optional) Apply this command only to neighbors for the specified routing instance.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

- **malformed-route**—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have malformed attributes, run the **show route hidden** command, and look for routes marked with **MalformedAttr** in the AS path field.
**neighbor**—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

**soft**—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

**soft-inbound**—(Optional) Reapply any import policies and send refresh updates to neighbors without clearing the state.

**soft-minimum-igp**—(Optional) Provides soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

**Required Privilege Level**

**clear**

**Related Documentation**

- show bgp neighbor on page 2666

**List of Sample Output**

**clear bgp neighbor on page 2654**

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

**Sample Output**

```
clear bgp neighbor
```

```
user@host> clear bgp neighbor
```
**clear bgp table**

**Syntax**

```
clear bgp table table-name
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and QFX Series)**

`clear bgp table table-name`

**Release Information**

Command introduced in Junos OS Release 9.0.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Request that BGP refresh routes in a specified routing table.

**Options**

`logical-system (all | logical-system-name)`: (Optional) Perform this operation on all logical systems or on a particular logical system.

`table-name`: Request that BGP refresh routes in the specified table.

**Additional Information**

In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the `clear bgp table` command to request that BGP refresh routes in a VPN instance table.

**Required Privilege**

`clear`

**List of Sample Output**

- `clear bgp table private.inet.0 on page 2655`
- `clear bgp table inet.6 logical-system all on page 2655`
- `clear bgp table private.inet.6 logical-system ls1 on page 2655`
- `clear bgp table logical-system all inet.0 on page 2655`
- `clear bgp table logical-system ls2 private.inet.0 on page 2656`

**Output Fields**

This command produces no output.

**Sample Output**

```
clear bgp table private.inet.0
    user@host> clear bgp table private.inet.0

clear bgp table inet.6 logical-system all
    user@host> clear bgp table inet.6 logical-system all

clear bgp table private.inet.6 logical-system ls1
    user@host> clear bgp table private.inet.6 logical-system ls1

clear bgp table logical-system all inet.0
    user@host> clear bgp table logical-system all inet.0
```
clear bgp table logical-system ls2 private.inet.0

user@host> clear bgp table logical-system ls2 private.inet.0
show bgp bmp

Syntax: show bgp bmp

Release Information

Description
Display information about the BGP Monitoring Protocol (BMP).

Options
This command has no options.

Required Privilege
view

List of Sample Output: show bgp bmp on page 2657

Output Fields
Table 331 on page 2657 lists the output fields for the show bgp bmp command. Output fields are listed in the approximate order in which they appear.

Table 331: show bgp bmp Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BMP station address/port</td>
<td>IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.</td>

<tr>
<td>Memory consumed by BMP</td>
<td>Memory used by the active BMP session.</td>
</tr>
<tr>
<td>Statistics timeout</td>
<td>Amount of time, in seconds, between transmissions of BMP data to the monitoring station.</td>
</tr>
<tr>
<td>Memory limit</td>
<td>Threshold, in bytes, at which the routing device stops collecting BMP data.</td>
</tr>
<tr>
<td>Memory-connect retry timeout</td>
<td>Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded.</td>
</tr>
</tbody>
</table>

Sample Output

show bgp bmp

user@host> show bgp bmp
BMP station address/port: 172.24.24.157+5454
BMP session state: DOWN
Memory consumed by BMP: 0
Statistics timeout: 15
Memory limit: 10485760
Memory connect retry timeout: 600
### show bgp group

**Syntax**

```
show bgp group
<brief | detail | summary>
<group-name>
<exact-instance instance-name>
<instance instance-name>
<logical-system (all | logical-system-name)>
<rtf>
```

**Syntax (EX Series Switch and QFX Series)**

```
show bgp group
<brief | detail | summary>
<group-name>
<exact-instance instance-name>
<instance instance-name>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- `exact-instance` option introduced in Junos OS Release 11.4.

**Description**

Display information about the configured BGP groups.

**Options**

- `none`—Display group information about all BGP groups.
  - `brief | detail | summary`—(Optional) Display the specified level of output.
  - `group-name`—(Optional) Display group information for the specified group.
  - `exact-instance instance-name`—(Optional) Display information for the specified instance only.
  - `instance instance-name`—(Optional) Display information about BGP groups for all routing instances whose name begins with this string (for example, `cust1`, `cust11`, and `cust111` are all displayed when you run the `show bgp group instance cust1` command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.
  - `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
  - `rtf`—(Optional) Display BGP group route targeting information.

**Required Privilege Level**

- `view`

**List of Sample Output**

- `show bgp group` on page 2663
- `show bgp group brief` on page 2663
- `show bgp group detail` on page 2664
- `show bgp group rtf detail` on page 2665
- `show bgp group summary` on page 2665
Output Fields  Table 332 on page 2660 describes the output fields for the `show bgp group` command. Output fields are listed in the approximate order in which they appear.

**Table 332: show bgp group Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>

</table>
Table 332: show bgp group Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Active/Received/Accepted/Damped</strong></td>
<td>Multipurpose field that displays information about BGP peer sessions. The field’s contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</td>
<td>summary</td>
</tr>
<tr>
<td></td>
<td>• If a peer is not established, the field shows the state of the peer session: <strong>Active</strong>, <strong>Connect</strong>, or <strong>Idle</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table.</td>
<td></td>
</tr>
<tr>
<td><strong>ip-addresses</strong></td>
<td>List of peers who are members of the group. The address is followed by the peer’s port number.</td>
<td>All levels</td>
</tr>
<tr>
<td><strong>Route Queue Timer</strong></td>
<td>Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>Route Queue</strong></td>
<td>Number of prefixes that are queued up for sending to the peers in the group.</td>
<td>detail</td>
</tr>
<tr>
<td><strong>inet.number</strong></td>
<td>Number of active, received, accepted, and damped routes in the routing table. For example, <strong>inet.0: 7/10/9/0</strong> indicates the following:</td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>• 7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the inet.0 routing table.</td>
<td></td>
</tr>

**show bgp neighbor**

**Syntax**
```
show bgp neighbor
<exact-instance instance-name>
<instance instance-name>
<logical-system (all | logical-system-name)>
<neighbor-address>
<orf (detail | neighbor-address)
```

**Syntax (EX Series Switch and QFX Series)**
```
show bgp neighbor
<instance instance-name>
<exact-instance instance-name>
<neighbor-address>
<orf (neighbor-address | detail)
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
- orf option introduced in Junos OS Release 9.2.
- exact-instance option introduced in Junos OS Release 11.4.

**Description**
Display information about BGP peers.

**Options**
- **none**—Display information about all BGP peers.
- **exact-instance instance-name**—(Optional) Display information for the specified instance only.
- **instance instance-name**—(Optional) Display information about BGP peers for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the `show bgp neighbor instance cust1` command).
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **neighbor-address**—(Optional) Display information for only the BGP peer at the specified IP address.
- **orf (detail | neighbor-address)**—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the **detail** option to display detailed output.

**Additional Information**
For information about the `local-address`, `nlri`, `hold-time`, and `preference` statements, see the Junos OS Routing Protocols Library for Routing Devices.

**Required Privilege Level**

Output Fields

Table 333 on page 2667 describes the output fields for the `show bgp neighbor` command. Output fields are listed in the approximate order in which they appear.

Table 333: show bgp neighbor Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer</td>
<td>Address of the BGP neighbor. The address is followed by the neighbor port number.</td>
</tr>
<tr>
<td>AS</td>
<td>AS number of the peer.</td>
</tr>
<tr>
<td>Local</td>
<td>Address of the local routing device. The address is followed by the peer port number.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of peer: <strong>Internal</strong> or <strong>External</strong>.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the BGP session:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Active</strong>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Connect</strong>—BGP is waiting for the transport protocol connection to be completed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Established</strong>—The BGP session has been established, and the peers are exchanging update messages.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Idle</strong>—This is the first stage of a connection. BGP is waiting for a Start event.</td>
</tr>
<tr>
<td></td>
<td>• <strong>OpenConfirm</strong>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>OpenSent</strong>—BGP has sent an open message and is waiting to receive an open message from the peer.</td>
</tr>
<tr>
<td>Flags</td>
<td>Internal BGP flags:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Aggregate Label</strong>—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label.</td>
</tr>
<tr>
<td></td>
<td>• <strong>CleanUp</strong>—The peer session is being shut down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Delete</strong>—This peer has been deleted.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Idled</strong>—This peer has been permanently idled.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ImportEval</strong>—At the last commit operation, this peer was identified as needing to reevaluate all received routes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Initializing</strong>—The peer session is initializing.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SendRtn</strong>—Messages are being sent to the peer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Sync</strong>—This peer is synchronized with the rest of the peer group.</td>
</tr>
<tr>
<td></td>
<td>• <strong>TryConnect</strong>—Another attempt is being made to connect to the peer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unconfigured</strong>—This peer is not configured.</td>
</tr>
<tr>
<td></td>
<td>• <strong>WriteFailed</strong>—An attempt to write to this peer failed.</td>
</tr>
</tbody>
</table>

<tr>
<td>Restart flag received from the peer</td>
<td>When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the end-of-rib marker from the speaker before advertising routing information to the speaker.</td>
</tr>
<tr>
<td>NLRI that peer supports restart for</td>
<td>Neighbor supports graceful restart for this address family.</td>
</tr>
<tr>
<td>NLRI peer can save forwarding state</td>
<td>Neighbor supporting this address family saves all forwarding states.</td>
</tr>
<tr>
<td>NLRI that peer saved forwarding for</td>
<td>Neighbor saves all forwarding states for this address family.</td>
</tr>
<tr>
<td>NLRI that restart is negotiated for</td>
<td>Router supports graceful restart for this address family.</td>
</tr>
<tr>
<td>NLRI of received end-of-rib markers</td>
<td>Address families for which end-of-routing-table markers are received from the neighbor.</td>
</tr>
<tr>
<td>NLRI of all end-of-rib markers sent</td>
<td>Address families for which end-of-routing-table markers are sent to the neighbor.</td>
</tr>
<tr>
<td>Peer supports 4 byte AS extension (peer-as 1)</td>
<td>Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.</td>
</tr>
<tr>
<td>NLRI(s) for which peer can receive multiple paths</td>
<td>Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route. Possible value is <code>inet-unicast</code>.</td>
</tr>
<tr>
<td>NLRI(s) for which peer can send multiple paths: inet-unicast</td>
<td>Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route. Possible value is <code>inet-unicast</code>.</td>
</tr>

show bgp summary

Syntax

show bgp summary
<exact-instance instance-name>
<instance instance-name>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switch and QFX Series)

show bgp summary
<exact-instance instance-name>
<instance instance-name>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
exact-instance option introduced in Junos OS Release 11.4.

Description

Display BGP summary information.

Options

none—Display BGP summary information for all routing instances.

exact-instance instance-name—(Optional) Display information for the specified instance only.

instance instance-name—(Optional) Display information for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show bgp summary instance cust1 command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Output Fields

Table 334 on page 2680 describes the output fields for the show bgp summary command. Output fields are listed in the approximate order in which they appear.

Table 334: show bgp summary Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Groups</td>
<td>Number of BGP groups.</td>
</tr>
<tr>
<td>Peers</td>
<td>Number of BGP peers.</td>
</tr>
</tbody>
</table>
Table 334: show bgp summary Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Down peers</td>
<td>Number of down BGP peers.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of routing table.</td>
</tr>
<tr>
<td>Tot Paths</td>
<td>Total number of paths.</td>
</tr>
<tr>
<td>Act Paths</td>
<td>Number of active routes.</td>
</tr>
<tr>
<td>Suppressed</td>
<td>Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</td>
</tr>
<tr>
<td>History</td>
<td>Number of withdrawn routes stored locally to keep track of damping history.</td>
</tr>
<tr>
<td>Damp State</td>
<td>Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.</td>
</tr>
<tr>
<td>Pending</td>
<td>Routes in process by BGP import policy.</td>
</tr>
<tr>
<td>Peer</td>
<td>Address of each BGP peer. Each peer has one line of output.</td>
</tr>
<tr>
<td>AS</td>
<td>Peer's AS number.</td>
</tr>
<tr>
<td>InPkt</td>
<td>Number of packets received from the peer.</td>
</tr>
<tr>
<td>OutPkt</td>
<td>Number of packets sent to the peer.</td>
</tr>
<tr>
<td>OutQ</td>
<td>Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.</td>
</tr>
<tr>
<td>Flaps</td>
<td>Number of times the BGP session has gone down and then come back up.</td>
</tr>
<tr>
<td>Last Up/Down</td>
<td>Last time since the neighbor transitioned to or from the established state.</td>
</tr>
</tbody>
</table>
Table 334: show bgp summary Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
</table>
| State/#Active/Received/Accepted/Damped | Multipurpose field that displays information about BGP peer sessions. The field’s contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.  
  - If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**.  
    In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: **Idle (Removal in progress)** or **Idle (LicenseFailure)**.  
  - If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the `inet.0` (main) and `inet.2` (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following:  
    - 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the `inet.0` routing table.  
    - 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the `inet.2` routing table.  
  - If a BGP session is established in a routing instance, the field indicates the established (**Establ**) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, **Establ VPN-AB.inet.0:2/4/0** indicates the following:  
    - The BGP session is established.  
    - Routes are received in the `VPN-AB.inet.0` routing table.  
    - The local routing device has two active routes, four received routes, and no damped routes from a BGP peer.  
When a BGP session is established, the peers are exchanging update messages.

**show policy damping**

**Syntax**

```
show policy damping
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and QFX Series)**

```
show policy damping
```

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Display information about BGP route flap damping parameters.

**Options**

- `none`—Display information about BGP route flap damping parameters.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information**

In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.

**Required Privilege Level**

- `view`

**Related Documentation**

- `show route damping` on page 3170

**List of Sample Output**

- `show policy damping` on page 2686

**Output Fields**

Table 335 on page 2685 describes the output fields for the `show policy damping` command. Output fields are listed in the approximate order in which they appear.

**Table 335: show policy damping Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Halflife</td>
<td>Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.</td>
</tr>
</tbody>
</table>
### Table 335: show policy damping Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reuse merit</td>
<td>Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.</td>
</tr>
<tr>
<td>Suppress/cutoff merit</td>
<td>Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.</td>
</tr>
<tr>
<td>Maximum suppress time</td>
<td>Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.</td>
</tr>
<tr>
<td>Computed values</td>
<td>• <strong>Merit ceiling</strong>—Maximum merit that a flapping route can collect.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Maximum decay</strong>—Maximum decay half-life, in minutes.</td>
</tr>
</tbody>
</table>

### Sample Output

show policy damping

```bash
user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453
```

Configuration Statements

authentication-key (Protocols IS-IS)

Syntax:  
```
authentication-key key;
```

Hierarchy Level:  
```
[edit logical-systems logical-system-name protocols isis level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis level level-number],
[edit protocols isis level level-number],
[edit routing-instances routing-instance-name protocols isis level level-number]
```

Release Information:  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description:  
Authentication key (password). Neighboring routing devices use the password to verify  
the authenticity of packets sent from this interface. For the key to work, you also must  
include the `authentication-type` statement.

All routing devices must use the same password. If you are using the Junos OS IS-IS  
software with another implementation of IS-IS, the other implementation must be  
configured to use the same password for the domain, the area, and all interfaces adjacent  
to the Juniper Networks routing device.

Default:  
If you do not include this statement and the `authentication-type` statement, IS-IS  
authentication is disabled.

Options:  
```
key—Authentication password. The password can be up to 1024 characters long.  
Characters can include any ASCII strings. If you include spaces, enclose all characters  
in quotation marks (" ").
```

**CAUTION:** A simple password for authentication is truncated if it exceeds  
254 characters.

Required Privilege:  
```
routing—to view this statement in the configuration.  
routing-control—to add this statement to the configuration.
```

Related Documentation:  
```
• Example: Configuring Hitless Authentication Key Rollover for IS-IS
```
**authentication-type (Protocols IS-IS)**

**Syntax**

```
authentication-type authentication;
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols isis level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis level level-number],
[edit protocols isis level level-number],
[edit routing-instances routing-instance-name protocols isis level level-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Enable authentication and specify the authentication scheme for IS-IS. If you enable authentication, you must specify a password by including the `authentication-key` statement.

**Default**

If you do not include this statement and the `authentication-key` statement, IS-IS authentication is disabled.

**Options**

`authentication`—Authentication scheme:

- `md5`—Use HMAC authentication in combination with MD5. HMAC-MD5 authentication is defined in RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*.

- `simple`—Use a simple password for authentication. The password is included in the transmitted packet, making this method of authentication relatively insecure. We recommend that you *not* use this authentication method.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- *Example: Configuring Hitless Authentication Key Rollover for IS-IS*

bfd-liveness-detection (Protocols IS-IS)

**Syntax**

```
bfd-liveness-detection {
  authentication {
    algorithm algorithm-name;
    key-chain key-chain-name;
    loose-check;
  }
  detection-time {
    threshold milliseconds;
  }
  minimum-interval milliseconds;
  minimum-receive-interval milliseconds;
  multiplier number;
  no-adaptation;
  transmit-interval {
    minimum-interval milliseconds;
    threshold milliseconds;
  }
  version (1 | automatic);
}
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name],
[edit protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
detection-time threshold and transmit-interval threshold options added in Junos OS Release 8.2.
Support for logical systems introduced in Junos OS Release 8.3.
no-adaptation statement introduced in Junos OS Release 9.0.
authentication algorithm, authentication key-chain, and authentication loose-check options introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure bidirectional failure detection timers and authentication.

**Options**

- **authentication algorithm algorithm-name**—Configure the algorithm used to authenticate the specified BFD session: simple-password, keyed-md5, keyed-sha-1, meticulous-keyed-md5, meticulous-keyed-sha-1.

- **authentication key-chain key-chain-name**—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the authentication-key-chains key-chain statement at the [edit security] hierarchy level.

- **authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.
**detection-time threshold milliseconds**—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval milliseconds**—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the `transmit-interval minimum-interval` and `minimum-receive-interval` statements.

**Range:** 1 through 255,000

**minimum-receive-interval milliseconds**—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement.

**Range:** 1 through 255,000

**multiplier number**—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold milliseconds**—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 \( (2^{32} - 1) \)

**transmit-interval minimum-interval milliseconds**—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the `minimum-interval` statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: 1 (BFD version 1) or automatic (autodetect the BFD version)

**Default:** automatic
**checksum (Protocols IS-IS)**

**Syntax**
```
checksum;
```

**Hierarchy Level**
```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name],
[edit protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Enable checksums for packets on this interface.

Junos OS supports IS-IS checksums as documented in RFC 3358, *Optional Checksums in Intermediate System to Intermediate System (ISIS)*.

The checksum cannot be enabled with MD5 hello authentication on the same interface.

**Required Privilege**
```
route—To view this statement in the configuration.
route-control—To add this statement to the configuration.
```

**Related Documentation**
- Example: *Enabling Packet Checksums on IS-IS Interfaces*
csnp-interval

Syntax

csnp-interval (seconds | disable);

Hierarchy Level

[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name],
[edit protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name]

Release Information

Statement introduced before Junos OS Release 7.4,
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure the interval between complete sequence number PDUs (CSNPs) on a LAN interface.

If the routing device is the designated router on a LAN, IS-IS sends CSN packets every 10 seconds. If the routing device is on a point-to-point interface, it sends CSN packets every 5 seconds. To protect against link-state PDU flooding, we recommend modifying the default interval.

To modify the CSNP interval, include the csnp-interval statement.

To configure the interface not to send any CSNPs, specify the disable option.

Default

By default, IS-IS sends CSNPs periodically. If the routing device is the designated router on a LAN, IS-IS sends CSNPs every 10 seconds. If the routing device is on a point-to-point interface, it sends CSNPs every 5 seconds.

Options

disable—Do not send CSNPs on this interface.

seconds—Number of seconds between the sending of CSNPs.

Range: 1 through 65,535 seconds
Default: 10 seconds on LAN broadcast links. 5 seconds on point-to-point links.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

• Example: Configuring the Transmission Frequency for CSNP Packets on IS-IS Interfaces
disable (Protocols IS-IS)

Syntax disable;

- [edit routing-instances routing-instance-name protocols isis interface interface-name level level-number],
- [edit routing-instances routing-instance-name protocols isis traffic-engineering]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Disable IS-IS on the routing device, on an interface, or on a level.

At the [edit protocols isis traffic-engineering] hierarchy level, disable IS-IS support for traffic engineering.

Enabling IS-IS on an interface (by including the interface statement at the [edit protocols isis] or the [edit routing-instances routing-instance-name protocols isis] hierarchy level), disabling it (by including the disable statement), and not actually having IS-IS run on an interface (by including the passive statement) are mutually exclusive states.

Default

IS-IS is enabled for Level 1 and Level 2 routers on all interfaces on which family iso is enabled.

IS-IS support for traffic engineering is enabled.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

### export (Protocols IS-IS)

**Syntax**

```
export [ policy-names ];
```

**Hierarchy Level**

- [edit logical-systems logical-system-name protocols isis],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
- [edit protocols isis],
- [edit routing-instances routing-instance-name protocols isis]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Apply one or more policies to routes being exported from the routing table into IS-IS.

All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.

For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a *routing policy* for that protocol.

**NOTE:** For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.

**Options**

- **policy-names**—Name of one or more policies.

**Required Privilege Level**

- routing—To view this statement in the configuration.

external-preference (Protocols IS-IS)

Syntax

```
external-preference preference;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis level level-number],
[edit protocols isis level level-number],
[edit routing-instances routing-instance-name protocols isis level level-number]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure the preference of external routes.

Options

```
preference—Preference value.
```

Range: 0 through 4,294,967,295 (2^{32} – 1)

Default: 15 (for Level 1 internal routes), 18 (for Level 2 internal routes), 160 (for Level 1 external routes), 165 (for Level 2 external routes)

Required Privilege

Level routing—To view this statement in the configuration.

Level routing-control—To add this statement to the configuration.

graceful-restart (Protocols IS-IS)

Syntax  graceful-restart {
  disable;
  helper-disable;
  restart-duration seconds;
}

Hierarchy Level  [edit logical-systems logical-system-name protocols isis],
                 [edit protocols isis]

Release Information  Statement introduced before Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure graceful restart parameters for IS-IS.

Graceful restart allows a routing device to restart with minimal effects to the network,
and is enabled for all routing protocols at the [edit routing-options] hierarchy level. When
graceful restart is enabled, the restarting routing device is not removed from the network
topology during the restart period. The adjacencies are reestablished after restart is
complete.

On LAN interfaces where IS-IS is configured on a transit router that serves as the
designated router (DR), a graceful restart causes:

- The ingress router of the label-switched path (LSP), which passes through the DR, to
  break the LSP.
- The ingress router to re-signal the LSP.

Options  disable—Disable graceful restart for IS-IS.

  helper-disable—Disable graceful restart helper capability. Helper mode is enabled by
default.

  restart-duration seconds—Time period for the restart to last, in seconds.
  Range: 30 through 300 seconds
  Default: 30 seconds

Required Privilege Level  routing—To view this statement in the configuration.
                          routing-control—To add this statement to the configuration.

```
[edit logical-systems logical-system-name protocols isis interface interface-name level number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name level number],
[edit protocols isis interface interface-name level number],
[edit routing-instances routing-instance-name protocols isis interface interface-name level number]
```

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Configure an authentication key (password) for hello packets. Neighboring routing devices use the password to verify the authenticity of packets sent from an interface. For the key to work, you also must include the `hello-authentication-type` statement.

**Default**
By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.

**Options**
- `password`—Authentication password. The password can be up to 255 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**
- authentication-key on page 2694
- authentication-type on page 2695
- hello-authentication-type on page 2705

```
[edit logical-systems logical-system-name protocols isis interface interface-name level number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name level number],
[edit protocols isis interface interface-name level number],
[edit routing-instances routing-instance-name protocols isis interface interface-name level number]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Enable authentication on an interface for hello packets. If you enable authentication on hello packets, you must specify a password by including the `hello-authentication-key` statement.

You can configure authentication for a given IS-IS level on an interface. On a point-to-point link, if you enable hello authentication for both IS-IS levels, the password configured for Level 1 is used for both levels.

**CAUTION:** If no authentication is configured for Level 1 on a point-to-point link with both levels enabled, the hello packets are sent without any password, regardless of the Level 2 authentication configurations.

**Default**
By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.

**Options**
- `md5`—Specifies Message Digest 5 as the packet verification type.
- `simple`—Specifies simple authentication as the packet verification type.

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**
- `authentication-key` on page 2694
- `authentication-type` on page 2695
- `hello-authentication-key` on page 2704
**hello-interval (Protocols IS-IS)**

**Syntax**

```
hello-interval seconds;
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols isis interface interface-name level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name level level-number],
[edit protocols isis interface interface-name level level-number],
[edit routing-instances routing-instance-name protocols isis interface interface-name level level-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Modify the frequency with which the routing device sends hello packets out of an interface, in seconds.

Routing devices send hello packets at a fixed interval on all interfaces to establish and maintain neighbor relationships. This interval is advertised in the hello interval field in the hello packet.

You can send out hello packets in subsecond intervals. To send out hello packets every 333 milliseconds, set the `hello-interval` value to 1.

**Options**

- `seconds`—Frequency of transmission for hello packets.
  - **Range:** 1 through 20,000 seconds
  - **Default:** 3 seconds (for designated intermediate system [DIS] routers), 9 seconds (for non-DIS routers)

**Required Privilege**

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

**Related Documentation**

- `hold-time`
**hello-padding**

**Syntax**

```
hello-padding (adaptive | disable | loose | strict);
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name],
[edit protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name]
```

**Release Information**

Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.

This helps to prevent a premature adjacency Up state when one routing device's MTU does not meet the requirements to establish the adjacency.

As an OSI Layer 2 protocol, IS-IS does not support data fragmentation. Therefore, maximum packet sizes must be established and supported between two routers. During adjacency establishment, the IS-IS protocol makes sure that the link supports a packet size of 1492 bytes by padding outgoing hello packets up to the maximum packet size of 1492 bytes.

This is the default behavior of the Junos OS IS-IS implementation. However, Junos OS provides an option to disable hello padding that can override this behavior.

There are four types of hello padding:

- **Adaptive padding**—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state type, length, and value (TLV) tuple. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. Adaptive padding has more overhead than loose padding and is able to detect MTU asymmetry from one side of the connection. This one-sided detection can result in generation of extra link-state PDUs that are flooded throughout the network. Specify the **adaptive** option to configure enough padding to establish an adjacency to neighbors.

- **Disabled padding**—Padding is disabled on all types of interfaces for all adjacency states. Specify the **disable** option to accommodate interfaces that support less than the default packet size of 1492 bytes.

- **Loose padding** (the default)—The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. Loose padding might not be able to detect certain situations such as asymmetrical MTUs between the routing devices. Specify the **loose** option to configure enough padding to initialize an adjacency to neighbors.
• Strict padding—Padding is done on all interface types and for all adjacency states, and is continuous. Strict padding has the most overhead. The advantage is that strict padding detects MTU issues on both sides of a link. Specify the strict option to configure padding to allow all adjacency states with neighbors.

Options

- adaptive—Configure padding until the neighbor adjacency is established and active.
- disable—Disable padding on all types of interfaces for all adjacency states.
- loose—Configure padding until the state of the adjacency is initialized.
- strict—Configure padding for all adjacency states.

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

### ignore-attached-bit

**Syntax**

```plaintext
ignore-attached-bit;
```

**Hierarchy Level**

```plaintext
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement enables the routing device to ignore the attached bit on incoming Level 1 link-state PDUs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.

There might be times, such as during a denial-of-service (DoS) attack, that you do not want a Level 1 router to be able to forward traffic based on a default route.

To prevent a routing device from being able to reach interarea destinations, you can prevent the routing device from installing the default route without affecting the status of its IS-IS adjacencies. The `ignore-attached-bit` statement is used to tell the routing device to ignore the presence of the attached bit in Level 1 link-state PDUs, which blocks the installation of the IS-IS default route.

**Default**

The `ignore-attached-bit` statement is disabled by default.

**Required Privilege**

[edit routing-instances routing-instance-name protocols isis]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Configure interface-specific IS-IS properties. To configure more than one interface, include the interface statement multiple times.

Enabling IS-IS on an interface (by including the interface statement at the [edit protocols isis] or the [edit routing-instances routing-instance-name protocols isis] hierarchy level), disabling it (by including the disable statement), and not actually having IS-IS run on an interface (by including the passive statement) are mutually exclusive states.

Options
all—Have Junos OS create IS-IS interfaces automatically. If you include this option, disable IS-IS on the management interface (fxp0).

interface-name—Name of an interface. Specify the full interface name, including the physical and logical address components.

The remaining statements are explained separately.

Required Privilege
level routing—To view this statement in the configuration.
level routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols isis]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description  
Configure the global-level properties.

You can administratively divide a single AS into smaller groups called areas. You configure each routing device interface to be in an area. Any interface can be in any area. The area address applies to the entire routing device. You cannot specify one interface to be in one area and another interface in a different area. To route between areas, you must have two adjacent Level 2 routers that communicate with each other.

Level 1 routers can only route within their IS-IS area. To send traffic outside their area, Level 1 routers must send packets to the nearest intra-area Level 2 router. A routing device can be a Level 1 router, a Level 2 router, or both. You specify the router level on a per-interface basis, and a routing device becomes adjacent to other routing devices on the same level on that link only.

You can configure one Level 1 routing process and one Level 2 routing process on each interface, and you can configure the two levels differently.

Options  
level-number—IS-IS level number.
Values: 1 or 2

The remaining statements are explained separately.

Required Privilege  
Level  
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

**Description**

Configure the link-state PDU interval time.

By default, the routing device sends one link-state PDU packet out an interface every 100 milliseconds. To disable the transmission of all link-state PDUs, set the interval to 0.

Link-state PDU throttling by use of the `lsp-interval` statement controls the flooding pace to neighboring routing devices in order to not overload them.

Also, consider that control traffic (such as link-state PDUs and related packets) might delay user traffic (information packets) because control traffic always has precedence in terms of scheduling on the routing device interface cards. Unfortunately, the control traffic transmission rate is not decreased on low-bandwidth interfaces, such as DS-0 or fractional T1 and E1 interface. Line control traffic stays the same. On a low-bandwidth circuit that is transmitting 30 full-MTU-sized packets, there is not much bandwidth left over for other types of packets.

**Default**

By default, the routing device sends one link-state PDU out an interface every 100 milliseconds.

**Options**

`milliseconds`—Number of milliseconds between the sending of link-state PDUs. Specifying a value of 0 blocks all link-state PDU transmission.

**Range:** 0 through 1000 milliseconds

**Default:** 100 milliseconds

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

[edit routing-instances routing-instance-name protocols isis]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.

Because link-state PDUs have a maximum lifetime, they need to be refreshed. Refreshing means that a routing device needs to re-originate its link-state PDUs periodically. The re-origination interval must be less than the link-state PDU’s lifetime. For example, if the link-state PDU is valid for 1200 seconds, the routing device needs to refresh the link-state PDU in less than 1200 seconds to avoid removal of the link-state PDU from the link-state database by other routing devices. The recommended maximum link-state PDU origination interval is the lifetime minus 300 seconds. So, in a default environment this would be 900 seconds. In Junos OS, the refresh interval is derived from the lifetime and is equal to the lifetime minus 317 seconds. You can change the lifetime to a higher value to reduce the number of refreshes in the network. (You would rarely want to increase the number of refreshes.) Often these periodic link-state PDU refreshes are referred to as refresh noise, and network administrators want to reduce this noise as much as possible.

The `show isis overview` command displays the link-state PDU lifetime.

**Default**

By default, link-state PDUs are maintained in network databases for 1200 seconds (20 minutes) before being considered invalid. This length of time, called the **LSP lifetime**, normally is sufficient to guarantee that link-state PDUs never expire.

**Options**

- `seconds`—link-state PDU lifetime, in seconds.
  - **Range:** 350 through 65,535 seconds
  - **Default:** 1200 seconds

**Required Privilege Level**

- **Routing**—To view this statement in the configuration.
- **Routing-Control**—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Modify the maximum number of IS-IS areas advertised.

This value is included in the Maximum Address Area field of the IS-IS common PDU header included in all outgoing PDUs.

The maximum number of areas you can advertise is restricted to 36 to ensure that the IIH PDUs have enough space to include other type, length, and value (TLV) fields, such as the Authentication and IPv4 and IPv6 Interface Address TLVs.

**Options**

*number*—Maximum number of areas to include in the IS-IS hello (IIH) PDUs and link-state PDUs.

**Range**: 3 through 36

**Default**: 3

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- `[edit protocols isis interface interface-name]`
- `[edit routing-instances routing-instance-name protocols isis interface interface-name]`

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure an interface to be part of a mesh group, which is a set of fully connected nodes.

A *mesh group* is a set of routing devices that are fully connected. That is, they have a fully meshed topology. When link-state PDUs are being flooded throughout an area, each router within a mesh group receives only a single copy of a link-state PDU instead of receiving one copy from each neighbor, thus minimizing the overhead associated with the flooding of link-state PDUs.

To create a mesh group and designate that an interface be part of the group, assign a mesh-group number to all the routing device interfaces in the group. To prevent an interface in the mesh group from flooding link-state PDUs, configure blocking on that interface.

**Options**

- **blocked**—Configure the interface so that it does not flood link-state PDUs.

- **value**—Number that identifies the mesh group.

  **Range:** 1 through 4,294,967,295 ($2^{32} - 1$; 32 bits are allocated to identify a mesh group)

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols isis interface interface-name level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis interface interface-name level level-number],
[edit protocols isis interface interface-name level level-number],
[edit routing-instances routing-instance-name protocols isis interface interface-name level level-number]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Specify the metric value for the level.

All IS-IS routes have a cost, which is a routing metric that is used in the IS-IS link-state calculation. The cost is an arbitrary, dimensionless integer that can be from 1 through 63, or from 1 through 16,777,215 \((2^{24} – 1)\) if you are using wide metrics.

Similar to other routing protocols, IS-IS provides a way of exporting routes from the routing table into the IS-IS network. When a route is exported into the IS-IS network without a specified metric, IS-IS uses default metric values for the route, depending on the protocol that was used to learn the route.

Table 338 on page 2725 depicts IS-IS route export metric default values.

### Table 338: Default Metric Values for Routes Exported into IS-IS

<table>
<thead>
<tr>
<th>Protocol Used for Learning the Route</th>
<th>Default Metric Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct</td>
<td>10</td>
</tr>
<tr>
<td>Static</td>
<td>Same as reported by the protocol used for exporting the route</td>
</tr>
<tr>
<td>Aggregate</td>
<td>10</td>
</tr>
<tr>
<td>Generate</td>
<td>10</td>
</tr>
<tr>
<td>RIP</td>
<td>Same as reported by the protocol used for exporting the route</td>
</tr>
<tr>
<td>OSPF</td>
<td>Same as reported by the protocol used for exporting the route</td>
</tr>
<tr>
<td>BGP</td>
<td>10</td>
</tr>
</tbody>
</table>

The default metric values behavior can be customized by using routing policies.

**Options**

- **metric**—Metric value.
- **Range:** 1 through 63, or 1 through 16,777,215 (if you have configured wide metrics)
Default: 10 (for all interfaces except lo0), 0 (for the lo0 interface)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Hierarchy Level [edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]

Release Information Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Disable the hold-down timer for IS-IS adjacencies.

A hold-down timer delays the advertising of adjacencies by waiting until a time period has elapsed before labeling adjacencies in the up state. You can disable this hold-down timer, which labels adjacencies up faster. However, disabling the hold-down timer creates more frequent link-state PDU updates and SPF computation.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols isis],  
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],  
[edit protocols isis],  
[edit routing-instances routing-instance-name protocols isis]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description  
Disable IP version 4 (IPv4) routing.

Disabling IPv4 routing has the following results:

- The routing device does not advertise the network layer protocol identifier (NLPID) for IPv4 in the Junos OS link-state PDU fragment zero.
- The routing device does not advertise any IPv4 prefixes in Junos OS link-state PDUs.
- The routing device does not advertise the NLPID for IPv4 in Junos OS hello packets.
- The routing device does not advertise any IPv4 addresses in Junos OS hello packets.
- The routing device does not calculate any IPv4 routes.

NOTE: Note: Even when no-ipv4-routing is configured, an IS-IS traceoptions log can list rejected IPv4 addresses. When a configuration is committed, IS-IS schedules a scan of the routing table to determine whether any routes need to be exported into the IS-IS link state database. The implicit default export policy action is to reject everything. IPv4 addresses from the routing table are examined for export, rejected by the default policy, and the rejections are logged.

Required Privilege Level  
- routing—To view this statement in the configuration.  
- routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure the local routing device so that it appears to be overloaded. This statement causes the routing device to continue participating in IS-IS routing, but prevents it from being used for transit traffic. Traffic destined to immediately attached subnets continues to transit the routing device.

You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.

You configure or disable overload mode in IS-IS with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the IS-IS instance started is less than the specified timeout.

A timer is started for the difference between the timeout and the time elapsed since the instance started. If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set. When the timer expires, overload mode is cleared. In overload mode, the routing device IS-IS advertisements are originated with the overload bit set. This causes the transit traffic to take paths around the routing device. However, the overloaded routing device's own links are still accessible.

The value of the overload bit depends on these three scenarios:

1. When the overload bit has already been set to a given value and the routing process is restarted: Link-state PDUs are regenerated with the overload bit cleared.
2. When the overload bit is reset to a lesser value while the routing process is running: Link-state PDUs are regenerated with the overload bit cleared.
3. When the overload bit is reset to a greater value while the routing process is running: Link-state PDUs are regenerated with the overload bit set to the difference between the old and new value.

In overload mode, the routing device advertisement is originated with all the transit routing device links (except stub) set to a metric of 0xFFFF. The stub routing device links are
advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and take paths around the routing device.

To understand the reason for setting the overload bit, consider that BGP converges slowly. It is not very good at detecting that a neighbor is down because it has slow-paced keepalive timers. Once the BGP neighbor is determined to be down, it can take up to 2 minutes for a BGP router to declare the neighbor down. IS-IS is much quicker. IS-IS only takes 10-30 seconds to detect absent peers. It is the slowness of BGP, more precisely the slowness of internal BGP (IBGP), that necessitates the use of the overload bit. IS-IS and BGP routing are mutually dependent on each other. If both do not converge at the same time, traffic is dropped without notification (black holed).

You might want to configure the routing device so that it appears to be overloaded when you are restarting routing on the device. Setting the overload bit for a fixed amount of time right after a restart of the routing protocol process (rpd) ensures that the router does not receive transit traffic while the routing protocols (especially IBGP) are still converging.

Setting the overload bit is useful when performing hardware or software maintenance work on a routing device. After the maintenance work, clear the overload bit to carry on forwarding transit traffic. Manual clearing of the overload bit is not always possible. What is needed is an automated way of clearing the overload bit after some amount of time. Most networks use a time value of 300 seconds. This 5-minute value provides a good balance, allowing time to bring up even large internal IBGP meshes, while still relatively quick.

Another appropriate application for setting for the overload bit is on dedicated devices such as BGP route reflectors, which are intentionally not meant to carry any transit traffic. In this case, you would not use the timer.

You can verify that the overload bit is set by running the `show isis database` command.
**Options**  
**advertise-high-metrics**—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

The **advertise-high-metric** setting is only valid while the routing device is in overload mode. When **advertise-high-metric** is configured, IS-IS does not set the overload bit. Rather, it sets the metric to 63 or 16,777,214, depending whether wide metrics are enabled. This allows the overloaded routing device to be used for transit as a last resort.

An L1-L2 router in overload mode stops leaking route information between L1 and L2 levels and clears its attached bit. This is also true when **advertise-high-metrics** is configured.

**allow-route-leaking**—Enable leaking of route information into the network even if the overload bit is set.

---

**NOTE:** The **allow-route-leaking** option does not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit.

---

**timeout seconds**—Number of seconds at which the overloading is reset.  
**Range:** 60 through 1800 seconds  
**Default:** 0 seconds

---

**Required Privilege**  
**Level**  
route—To view this statement in the configuration.

[edit routing-instances routing-instance-name protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name level level-number]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Advertise the direct interface addresses on an interface or into a level on the interface without actually running IS-IS on that interface or level.

This statement effectively prevents IS-IS from running on the interface. To enable IS-IS on an interface, include the ```interface``` statement at the [edit protocols isis] or the [edit routing-instances routing-instance-name protocols isis] hierarchy level. To disable it, include the ```disable``` statement at those hierarchy levels. The three states—enabling, disabling, or not running IS-IS on an interface—are mutually exclusive.

---

**NOTE:** Configuring IS-IS on a loopback interface automatically renders it as a passive interface, irrespective of whether the passive statement was used in the configuration of the interface.

If neither passive mode nor the ```family iso``` option is configured on the IS-IS interface, then the routing device treats the interface as not being operational, and no direct IPv4/IPv6 routes are exported into IS-IS. (You configure the ```family iso``` option at the [edit interfaces interface-name unit logical-unit-number] hierarchy level.)

**Default**
By default, IS-IS must be configured on an interface or a level for direct interface addresses to be advertised into that level.

**Required Privilege Level**
- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

**Related Documentation**

[edit protocols isis interface interface-name],  
[edit routing-instances routing-instance-name protocols isis interface interface-name]

**Release Information**  
Statement introduced before Junos OS Release 7.4,  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**  
Configure an IS-IS interface to behave like a point-to-point connection.

You can use the **point-to-point** statement to configure a LAN interface to act like a point-to-point interface for IS-IS. You do not need an unnumbered LAN interface, and it has no effect if configured on an interface that is already point-to-point.

The **point-to-point** statement affects only IS-IS protocol procedures on that interface. All other protocols continue to treat the interface as a LAN interface. Only two IS-IS routing devices can be connected to the LAN interface, and both must be configured as point-to-point.

**Required Privilege Level**  
- routing—To view this statement in the configuration.  
- routing-control—To add this statement to the configuration.

**Related Documentation**

**preference (Protocols IS-IS)**

**Syntax**

`preference preference;`

**Hierarchy Level**

- `[edit logical-systems logical-system-name protocols isis level level-number]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis level level-number]`
- `[edit protocols isis level level-number]`
- `[edit routing-instances routing-instance-name protocols isis level level-number]`

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure the preference of internal routes.

Route preferences (also known as administrative distances) are used to select which route is installed in the forwarding table when several protocols calculate routes to the same destination. The route with the lowest preference value is selected.

To change the preference values, include the `preference` statement (for internal routes) or the `external-preference` statement.

**Options**

- `preference`—Preference value.
  - **Range:** 0 through 4,294,967,295 (2^{32} – 1)
  - **Default:** 15 (for Level 1 internal routes), 18 (for Level 2 internal routes), 160 (for Level 1 external routes), 165 (for Level 2 external routes)

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

prefix-export-limit (Protocols IS-IS)

**Syntax**
```
prefix-export-limit number;
```

**Hierarchy Level**
- [edit logical-systems logical-system-name protocols isis level level-number],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis level level-number],
- [edit protocols isis level level-number],
- [edit routing-instances routing-instance-name protocols isis level level-number]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Configure a limit to the number of prefixes exported into IS-IS.

By default, there is no limit to the number of prefixes that can be exported into IS-IS. To configure a limit to the number of prefixes that can be exported into IS-IS, include the `prefix-export-limit` statement. The `prefix-export-limit` statement protects the rest of the network from a malicious policy by applying a threshold filter for exported routes.

The number of prefixes depends on the size of your network. Good design advice is to set it to double the total number of IS-IS Level 1 and Level 2 routing devices in your network.

If the number of prefixes exported into IS-IS exceeds the configured limit, the overload bit is set and the overload state is reached. When other routers detect that this bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes. The overload state can be cleared by using the `clear isis overload` command.

The `show isis overview` command displays the prefix export limit when it is configured.

**Options**
- **number**—Prefix limit.
  - **Range:** 0 through 4,294,967,295 (2^{32} – 1)
  - **Default:** None

**Required Privilege**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**
- Example: Redistributing BGP Routes with a Specific Community Tag into IS-IS
- Example: Redistributing OSPF Routes into IS-IS
priority (Protocols IS-IS)

Syntax

```
priority number;
```

[edit protocols isis interface interface-name level level-number],
[edit routing-instances routing-instance-name protocols isis interface interface-name level level-number]
```

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure the interface’s priority for becoming the designated router. The interface with the highest priority value becomes that level’s designated router.

The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.

A routing device advertises its priority to become a designated router in its hello packets. On all multiaccess networks, IS-IS uses the advertised priorities to elect a designated router for the network. This routing device is responsible for sending network link-state advertisements, which describe all the routing devices attached to the network. These advertisements are flooded throughout a single area.

A routing device’s priority for becoming the designated router is indicated by an arbitrary number from 0 through 127. Routing devices with a higher value are more likely to become the designated router.

Options

- **number**—Priority value.
  - Range: 0 through 127
  - Default: 64

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**reference-bandwidth (Protocols IS-IS)**

**Syntax**
```
reference-bandwidth reference-bandwidth;
```

**Hierarchy Level**
- `[edit logical-systems logical-system-name protocols isis]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis]`
- `[edit protocols isis]`
- `[edit routing-instances routing-instance-name protocols isis]`

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Optimize routing based on bandwidth by setting the reference bandwidth used in calculating the default interface cost.

All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When there are several equal-cost routes to a destination, traffic is distributed equally among them.

The cost of a route is described by a single dimensionless metric that is determined using the following formula:

\[
\text{cost} = \frac{\text{reference-bandwidth}}{\text{bandwidth}}
\]

For example, if you set the reference bandwidth to 1 Gbps (that is, `reference-bandwidth` is set to 1,000,000,000), a 100-Mbps interface has a routing metric of 10.

All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics.

**Options**
- `reference-bandwidth`—Reference bandwidth value in bits per second.

  **Range:** 9600 through 1,000,000,000,000 bps
  **Default:** None

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

rib-group (Protocols IS-IS)

Syntax

```
rib-group {
    inet group-name;
    inet6 group-name;
}
```

Hierarchy Level

- [edit logical-systems logical-system-name protocols isis],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
- [edit protocols isis],
- [edit routing-instances routing-instance-name protocols isis]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Install routes learned from IS-IS routing instances into routing tables in the IS-IS routing table group. You can install IPv4 routes or IPv6 routes.

Support for IPv6 routing table groups in IS-IS enables IPv6 routes that are learned from IS-IS routing instances to be installed into other routing tables defined in an IS-IS routing table group.

Options

- **group-name**—Name of the routing table group.
- **inet**—Install IPv4 IS-IS routes.
- **inet6**—Install IPv6 IS-IS routes.

Required Privilege Level

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

### spf-options (Protocols IS-IS)

**Syntax**

```json
spf-options {
    delay milliseconds;
    holddown milliseconds;
    rapid-runs number;
}
```

**Hierarchy Level**

- [edit logical-systems logical-system-name protocols isis],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
- [edit protocols isis],
- [edit routing-instances routing-instance-name protocols isis]

**Release Information**

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Configure options for running the shortest-path-first (SPF) algorithm.

Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.

You can configure the following SPF options:

- The delay in the time between the detection of a topology change and when the SPF algorithm actually runs.
- The maximum number of times that the SPF algorithm can run in succession before the hold-down timer begins.
- The time to hold down, or wait, before running another SPF calculation after the SPF algorithm has run in succession the configured maximum number of times.

If the network stabilizes during the hold-down period and the SPF algorithm does not need to run again, the system reverts to the configured values for the `delay` and `rapid-runs` statements.

**Options**

- `delay milliseconds`—Time interval between the detection of a topology change and when the SPF algorithm runs.
  
  **Range:** 50 through 1000 milliseconds
  
  **Default:** 200 milliseconds

- `holddown milliseconds`—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run in succession the configured maximum number of times in succession.
  
  **Range:** 2000 through 10,000 milliseconds
  
  **Default:** 5000 milliseconds
rapid-runs number—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the holddown interval begins.

Range: 1 through 5
Default: 3

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**topologies (Protocols IS-IS)**

Syntax
topologies {
ipv4-multicast;
ipv6-multicast;
ipv6-unicast;
}

Hierarchy Level
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Configure alternate IS-IS topologies.

The remaining statements are explained separately.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies
- Example: Configuring IS-IS Multicast Topology
**traceoptions (Protocols IS-IS)**

**Syntax**

```
traceoptions {
    file name <size size> <files number> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

**Hierarchy Level**

- [edit logical-systems logical-system-name protocols isis],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis],
- [edit protocols isis],
- [edit routing-instances routing-instance-name protocols isis]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple `flag` statements.

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Default**

The default IS-IS protocol-level tracing options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

**Options**

- `disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

- `file name`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory `/var/log`. We recommend that you place IS-IS tracing output in the file `isis-log`.

- `files number`—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

  If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

  **Range:** 2 through 1000 files

  **Default:** 10 files

- `flag flag`—Tracing operation to perform. To specify more than one flag, include multiple `flag` statements.

**IS-IS Protocol-Specific Tracing Flags**
- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets
- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDUs
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

**Global Tracing Flags**

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.
size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file.0*. When the *trace-file* again reaches its maximum size, *trace-file.0* is renamed *trace-file.1* and *trace-file* is renamed *trace-file.0*. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

Syntax:  xk to specify KB, xm to specify MB, or xg to specify GB

Range:  10 KB through the maximum file size supported on your system

Default:  128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

- routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

### wide-metrics-only

**Syntax**

wide-metrics-only;

**Hierarchy Level**

[edit logical-systems logical-system-name protocols isis level level-number],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols isis level level-number],
[edit protocols isis level level-number],
[edit routing-instances routing-instance-name protocols isis level level-number]

**Release Information**

Statement introduced before Junos OS Release 7.4,
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure IS-IS to generate metric values greater than 63 on a per IS-IS level basis.

Normally, IS-IS metrics can have values up to 63, and IS-IS generates two type, length, and value (TLV) tuples, one for an IS-IS adjacency and the second for an IP prefix. To allow IS-IS to support traffic engineering, a second pair of TLVs has been added to IS-IS, one for IP prefixes and the second for IS-IS adjacency and traffic engineering information. With these TLVs, IS-IS metrics can have values up to 16,777,215 ($2^{24} - 1$).

To configure IS-IS to generate only the new pair of TLVs and thus to allow the wider range of metric values, include the `wide-metrics-only` statement.

**Default**

By default, Junos OS supports the sending and receiving of wide metrics. Junos OS allows a maximum metric value of 63 and generates both pairs of TLVs.

**Required Privilege**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

clear isis database

Syntax

```
clear isis database
<entries>
<instance instance-name>
<logical-system (all | logical-system-name)>
<purge>
```

Syntax (EX Series Switches and QFX Series)

```
clear isis database
<entries>
<instance instance-name>
<purge>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`purge` option introduced in Junos OS Release 9.0.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Remove the entries from the IS-IS link-state database, which contains prefixes and topology information. You can also use `purge` with any of the options to initiate a network-wide purge of link-state PDUs rather than the local deletion of entries from the IS-IS link-state database.

**CAUTION:** In a production network, the `purge` command option might cause short-term network-wide traffic disruptions.

Options

- **none**—Remove all entries from the IS-IS link-state database for all routing instances.
- **entries**—(Optional) Name of the database entry.
- **instance instance-name**—(Optional) Clear all entries for the specified routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **purge**—(Optional) Discard all entries in the IS-IS link-state database.

```

Syntax (EX Series Switches and QFX Series)

```plaintext
clear isis overload
<instance instance-name>
```

Release Information

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Reset the IS-IS dynamic overload bit. This command can appear to not work, continuing to display overload after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.

When other routers detect that the overload bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device’s directly connected networks and IP prefixes.

Options

- `none`—Reset the IS-IS dynamic overload bit.
- `instance instance-name`—(Optional) Reset the IS-IS dynamic overload bit for the specified routing instance.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

**clear isis statistics**

**Syntax**
```
clear isis statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches and QFX Series)**
```
clear isis statistics
<instance instance-name>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Set statistics about IS-IS traffic to zero.

**Options**
- **none**—Set IS-IS traffic statistics to zero for all routing instances.
- **instance instance-name**—(Optional) Set IS-IS traffic statistics to zero for the specified routing instance only.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**
```
view
```

**Related Documentation**
- [show isis statistics on page 2798](#)

**List of Sample Output**
```
clear isis statistics on page 2758
```

**Output Fields**
See [show isis statistics](#) for an explanation of output fields.

**Sample Output**
```
clear isis statistics
```

The following sample output displays IS-IS statistics before and after the `clear isis statistics` command is entered:

```
user@host> show isis statistics
IS-IS statistics for merino:

show isis adjacency

Syntax

show isis adjacency
<system-id>
<brief | detail | extensive>
<instance instance-name>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches and QFX Series)

show isis adjacency
<system-id>
<brief | detail | extensive>
<instance instance-name>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Display information about IS-IS neighbors.

Options

none—Display standard information about IS-IS neighbors for all routing instances.

system-id—(Optional) Display information about IS-IS neighbors for the specified intermediate system.

brief | detail | extensive—(Optional) Display standard information about IS-IS neighbors with the specified level of output.

instance instance-name—(Optional) Display information about IS-IS neighbors for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Display information about IS-IS neighbors for all logical systems or for a particular logical system.

**show isis authentication**

**Syntax**
```
show isis authentication
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches and QFX Series)**
```
show isis authentication
<instance instance-name>
```

**Release Information**
Command introduced in Junos OS Release 7.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Support for hitless authentication key rollover introduced in Junos OS Release 11.2.
Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Display information about IS-IS authentication.

**Options**
- `none`—Display information about IS-IS authentication.
- `instance instance-name`—(Optional) Display IS-IS authentication for the specified routing instance.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**

L2 LSP Authentication: MD5
```

show isis authentication (With Hitless Authentication Key Rollover Configured)

```
user@host> show isis authentication
Interface          Level IIH Auth  CSN Auth  PSN Auth
so-0/1/3.0          2     hakrhello MD5       MD5

L2 LSP Authentication: MD5
```
**show isis backup coverage**

Syntax

```
show isis backup coverage
<instance instance-name>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches and QFX Series)

```
show isis backup coverage
<instance instance-name>
```

Release Information

Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Display information about the level of backup coverage available.

Options

- **none**—Display information about the level of backup coverage available for all the nodes and prefixes in the network.

- **instance instance-name**—(Optional) Display information about the level of backup coverage for a specific IS-IS routing instance.

- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

</table>

Sample Output

show isis backup label-switched-path

user@host> show isis backup label-switched-path
Backup MPLS LSPs:
  f-to-g, Egress: 192.168.1.4, Status: up, Last change: 06:12:03
    TE-metric: 9, Metric: 0
**show isis backup spf results**

**Syntax**

```
show isis backup spf results
<instance instance-name>
<level (1 | 2)>
<logical-system (all | logical-system-name)>
<no-coverage>
<topology (ipv4-unicast | ipv6-multicast | ipv6-unicast | unicast)>
```

**Syntax (EX Series Switches)**

```
show isis backup spf results
<instance instance-name>
<level (1 | 2)>
<no-coverage>
<topology (ipv4-unicast | unicast)>
```

**Release Information**

Command introduced in Junos OS Release 9.5.

**Description**

Display information about IS-IS shortest-path-first (SPF) calculations for backup paths.

**Options**

- `none`—Display information about IS-IS SPF calculations for all backup paths for all destination nodes.
- `instance instance-name`—(Optional) Display SPF calculations for backup paths for the specified routing instance.
- `level (1 | 2)`—(Optional) Display SPF calculations for the backup paths for the specified IS-IS level.
- `logical-system logical-system-name`—(Optional) Display SPF calculations for the backup paths for all logical systems or on a particular logical system.
- `no-coverage`—(Optional) Display SPF calculations only for destinations that do not have backup coverage.
- `topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)`—(Optional) Display SPF calculations for backup paths for the specified topology only.

**Required Privilege**

- **Level**
  - `view`

show isis database

**Syntax**
```plaintext
show isis database
<system-id>
<brief | detail | extensive>
<instance instance-name>
<level (1 | 2)>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches and QFX Series)**
```plaintext
show isis database
<system-id>
<brief | detail | extensive>
<level (1 | 2)>
<instance instance-name>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Display the entries in the IS-IS link-state database, which contains data about PDU packets.

**Options**
- **none**—Display standard information about IS-IS link-state database entries for all routing instances.
- **system id**—(Optional) Display IS-IS link-state database entries for the specified intermediate system.
- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **instance instance-name**—(Optional) Display IS-IS link-state database entries for the specified routing instance.
- **level (1 | 2)**—(Optional) Display IS-IS link-state database entries for the specified IS-IS level.
- **logical-system (all | logical-system-name)**—(Optional) Display standard information about IS-IS link-state database entries for all logical systems or for a particular logical system.

**Required Privilege Level**
- view

**Related Documentation**
- clear isis database on page 2754

**List of Sample Output**
- show isis database on page 2776
- show isis database brief on page 2777
- show isis database detail on page 2777
- show isis database extensive on page 2777
Output Fields

Table 344 on page 2775 describes the output fields for the `show isis database` command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

**Table 344: show isis database Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>Name of the interface on which the link-state PDU has been received; always IS-IS for this command.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
| level         | Level of intermediate system:  
• 1—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system.  
• 2—Intermediate system routes between areas and toward other ASs. | All levels      |
| LSP ID        | Link-state PDU identifier.                                                        | All levels      |
| Sequence      | Sequence number of the link-state PDU.                                            | All levels      |
| Checksum      | Checksum value of the link-state PDU.                                             | All levels      |
| Lifetime (secs) | Remaining lifetime of the link-state PDU, in seconds.                           | All levels      |
| Attributes    | Attributes of the specified database: L1, L2, Overload, or Attached (L1 only).    | none brief      |
| # LSPs        | Total number of link-state PDUs in the specified link-state database.            | none brief      |
| IP prefix     | Prefix advertised by this link-state PDU.                                         | detail extensive|
| IS neighbor   | IS-IS neighbor of the advertising system.                                         | detail extensive|
| ES neighbor   | (J Series routers only) An ES-IS neighbor of the advertising system.              | detail extensive|
| IP prefix     | IPv4 prefix advertised by this link-state PDU.                                    | detail extensive|
| V6 prefix     | IPv6 prefix advertised by this link-state PDU.                                    | detail extensive|
| Metric        | Metric of the prefix or neighbor.                                                | detail extensive|
| Header        |  
• LSP ID—Link state PDU identifier of the header.  
• Length—Header length.  
• Allocated Length—Amount of length available for the header.  
• Router ID—Address of the local routing device.  
• Remaining Lifetime—Remaining lifetime of the link-state PDU, in seconds. | extensive        |
Table 344: show isis database Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packet</td>
<td>• LSP ID—The identifier for the link-state PDU.</td>
<td>extensive</td>
</tr>
<tr>
<td></td>
<td>• Length—Packet length.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Lifetime—Remaining lifetime, in seconds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Checksum—The checksum of the link-state PDU.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Sequence—The sequence number of the link-state PDU. Every time the link-state</td>
<td></td>
</tr>
<tr>
<td></td>
<td>PDU is updated, this number increments.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Attributes—Packet attributes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• NLPID—Network layer protocol identifier.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fixed length—Specifies the set length for the packet.</td>
<td></td>
</tr>
</tbody>
</table>

| TLVs       | • Area Address—Area addresses that the routing device can reach.                  | extensive       |
|            | • Speaks—Supported routing protocols.                                             |                 |
|            | • IP router id—ID of the routing device (usually the IP address).                 |                 |
|            | • IP address—IPv4 address.                                                        |                 |
|            | • Hostname—Assigned name of the routing device.                                   |                 |
|            | • IP prefix—IP prefix of the routing device.                                       |                 |
|            | • Metric—IS-IS metric that measures the cost of the adjacency between the         |                 |
|            |   originating routing device and the advertised routing device.                   |                 |
|            | • IP extended prefix—Extended IP prefix of the routing device.                    |                 |
|            | • IS neighbor—Directly attached neighbor’s name and metric.                       |                 |
|            | • IS extended neighbor—Directly attached neighbor’s name, metric, and IP address. |                 |

show isis hostname

**Syntax**

show isis hostname
<logical-system (all | logical-system-name)>

**Syntax (EX Series Switches and QFX Series)**

show isis hostname

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Display IS-IS hostname database information.

**Options**

- **none**—Display IS-IS hostname database information.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

- **Level**
- **view**

**List of Sample Output**

*show isis hostname on page 2781*

**Output Fields**

Table 345 on page 2781 describes the output fields for the `show isis hostname` command. Output fields are listed in the approximate order in which they appear.

**Table 345: show isis hostname Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System id</td>
<td>System identifier mapped to the hostname.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname mapped to the system identifier.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of mapping between system identifier and hostname.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Dynamic</strong>—Hostname mapping determined as described in RFC 2763, <em>Dynamic Hostname Exchange Mechanism for IS-IS</em>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Static</strong>—Hostname mapping configured by user.</td>
</tr>
</tbody>
</table>

**Sample Output**

*show isis hostname*

```
user@host> show isis hostname
IS-IS hostname database:  
System Id          Hostname   Type
1921.6800.4201    isis1      Dynamic
1921.6800.4202    isis2      Static
1921.6800.4203    isis3      Dynamic
```
show isis interface

Syntax

show isis interface
<brief | detail | extensive>
@interface-name>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches and QFX Series)

show isis interface
<brief | detail | extensive>
@interface-name>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Display status information about IS-IS-enabled interfaces.

NOTE: If the configured metric for an IS-IS level is above 63, and the wide-metrics-only statement is not configured, the show isis interface detail command and the show isis interface extensive command display 63 as the metric value for that level. Configure the wide-metrics-only statement to generate metric values greater than 63 on a per IS-IS level basis.

The show isis interface command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.

Options

none—Display standard information about all IS-IS-enabled interfaces.

brief | detail | extensive—(Optional) Display the specified level of output.

@interface-name—(Optional) Display information about the specified interface only.

loglogical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show isis route

Syntax

```xml
show isis route
<destination>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>
```

Syntax (EX Series Switches and QFX Series)

```xml
show isis route
<destination>
<inet | inet6>
<instance instance-name>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Display the routes in the IS-IS routing table.

Options

```
none—Display all routes in the IS-IS routing table for all supported address families for all routing instances.

destination—(Optional) Destination address for the route.

inet | inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.

instance instance-name—(Optional) Display routes for the specified routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.

**show isis spf**

**Syntax**

`show isis spf (brief | log | results)`

- `<instance instance-name>`
- `<level (1 | 2)>`
- `<logical-system (all | logical-system-name)>`
- `<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>`

**Syntax (EX Series Switches)**

`show isis spf (brief | log | results)`

- `<instance instance-name>`
- `<level (1 | 2)>`
- `<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>`

**Release Information**

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display information about IS-IS shortest-path-first (SPF) calculations.

**Options**

- `brief`—Display an overview of SPF calculations.
- `instance instance instance-name`—(Optional) Display SPF calculations for the specified routing instance.
- `level (1 | 2)`—(Optional) Display SPF calculations for the specified IS-IS level.
- `log`—Display the log of SPF calculations.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.
- `results`—Display the results of SPF calculations.
- `topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)`—(Optional) Display SPF calculations for the specified topology only.

**Required Privilege**

`view`

**List of Sample Output**

- `show isis spf log on page 2794`
- `show isis spf results logical-system on page 2795`
- `show isis spf results (CLNS) on page 2796`

**Output Fields**

Table 349 on page 2793 describes the output fields for the `show isis spf` command. Output fields are listed in the approximate order in which they appear.

**Table 349: show isis spf Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node</td>
<td>System ID of a node.</td>
</tr>
<tr>
<td>Metric</td>
<td>Metric to the node.</td>
</tr>
</tbody>
</table>
Table 349: show isis spf Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Interface of the next hop.</td>
</tr>
<tr>
<td>Via</td>
<td>System ID of the next hop.</td>
</tr>
<tr>
<td>SNPA</td>
<td>Subnetwork point of attachment (MAC address of the next hop).</td>
</tr>
<tr>
<td>Start time</td>
<td><em>(log option only)</em> Time that the SPF computation started.</td>
</tr>
<tr>
<td>Elapsed (secs)</td>
<td><em>(log option only)</em> Length of time, in seconds, required to complete the SPF computation.</td>
</tr>
<tr>
<td>Count</td>
<td><em>(log option only)</em> Number of times the SPF was triggered.</td>
</tr>
<tr>
<td>Reason</td>
<td><em>(log option only)</em> Reason that the SPF computation was completed.</td>
</tr>
</tbody>
</table>

Sample Output

show isis spf log

```
user@host> show isis spf log logical-system lsl

**show isis statistics**

**Syntax**
```
show isis statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches and QFX Series)**
```
show isis statistics
<instance instance-name>
```

**Release Information**
- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**
Display statistics about IS-IS traffic.

**Options**
- **none**—Display IS-IS traffic statistics for all routing instances.
- **instance instance-name**—(Optional) Display statistics for the specified routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**
view

<tbody>
<tr>
<td><strong>PDU type</strong></td>
<td>PDU type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>CSNP</strong>—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</td>
</tr>
<tr>
<td></td>
<td>• <strong>IIH</strong>—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</td>
</tr>
<tr>
<td></td>
<td>• <strong>LSP</strong>—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</td>
</tr>
<tr>
<td></td>
<td>• <strong>PSNP</strong>—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.</td>
</tr>
<tr>

- Understanding IPsec Authentication for OSPF Packets on EX Series Switches on page 2807
Understanding IPsec Authentication for OSPF Packets on EX Series Switches

IP Security (IPsec) provides a secure way to authenticate senders and encrypt IP version 4 (IPv4) traffic between network devices. IPsec offers network administrators for Juniper Networks EX Series Ethernet Switches and their users the benefits of data confidentiality, data integrity, sender authentication, and anti-replay services.

IPsec is a framework for ensuring secure private communication over IP networks and is based on standards developed by the International Engineering Task Force (IETF). IPsec provides security services at the network layer of the Open Systems Interconnection (OSI) model by enabling a system to select required security protocols, determine the algorithms to use for the security services, and implement any cryptographic keys required to provide the requested services. You can use IPsec to protect one or more paths between a pair of hosts, between a pair of security gateways (such as switches), or between a security gateway and a host.

OSPF version 3 (OSPFv3), unlike OSPF version 2 (OSPFv2), does not have a built-in authentication method and relies on IPsec to provide this functionality. You can secure specific OSPFv3 interfaces and protect OSPFv3 virtual links.

- Authentication Algorithms on page 2807
- Encryption Algorithms on page 2808
- IPsec Protocols on page 2808
- Security Associations on page 2808
- IPsec Modes on page 2809

Authentication Algorithms

Authentication is the process of verifying the identity of the sender. Authentication algorithms use a shared key to verify the authenticity of the IPsec devices. The Juniper Networks Junos operating system (Junos OS) uses the following authentication algorithms:

- Message Digest 5 (MD5) uses a one-way hash function to convert a message of arbitrary length to a fixed-length message digest of 128 bits. Because of the conversion process, it is mathematically infeasible to calculate the original message by computing it backwards from the resulting message digest. Likewise, a change to a single character in the message will cause it to generate a very different message digest number.

To verify that the message has not been tampered with, Junos OS compares the calculated message digest against a message digest that is decrypted with a shared key. Junos OS uses the MD5 hashed message authentication code (HMAC) variant that provides an additional level of hashing. MD5 can be used with an authentication header (AH) and Encapsulating Security Payload (ESP).

- Secure Hash Algorithm 1 (SHA-1) uses a stronger algorithm than MD5. SHA-1 takes a message of less than 264 bits in length and produces a 160-bit message digest. The large message digest ensures that the data has not been changed and that it originates from the correct source. Junos OS uses the SHA-1 HMAC variant that provides an
additional level of hashing. SHA-1 can be used with AH, ESP, and Internet Key Exchange (IKE).

Encryption Algorithms

Encryption encodes data into a secure format so that it cannot be deciphered by unauthorized users. As with authentication algorithms, a shared key is used with encryption algorithms to verify the authenticity of IPsec devices. Junos OS uses the following encryption algorithms:

- Data Encryption Standard cipher-block chaining (DES-CBC) is a symmetric secret-key block algorithm. DES uses a key size of 64 bits, where 8 bits are used for error detection and the remaining 56 bits provide encryption. DES performs a series of simple logical operations on the shared key, including permutations and substitutions. CBC takes the first block of 64 bits of output from DES, combines this block with the second block, feeds this back into the DES algorithm, and repeats this process for all subsequent blocks.

- Triple DES-CBC (3DES-CBC) is an encryption algorithm that is similar to DES-CBC but provides a much stronger encryption result because it uses three keys for 168-bit (3 x 56-bit) encryption. 3DES works by using the first key to encrypt the blocks, the second key to decrypt the blocks, and the third key to reencrypt the blocks.

IPsec Protocols

IPsec protocols determine the type of authentication and encryption applied to packets that are secured by the switch. Junos OS supports the following IPsec protocols:

- AH—Defined in RFC 2402, AH provides connectionless integrity and data origin authentication for IPv4. It also provides protection against replays. AH authenticates as much of the IP header as possible, as well as the upper-level protocol data. However, some IP header fields might change in transit. Because the value of these fields might not be predictable by the sender, they cannot be protected by AH. In an IP header, AH can be identified with a value of 51 in the Protocol field of an IPv4 packet.

- ESP—Defined in RFC 2406, ESP can provide encryption and limited traffic flow confidentiality or connectionless integrity, data origin authentication, and an anti-replay service. In an IP header, ESP can be identified with a value of 50 in the Protocol field of an IPv4 packet.

Security Associations

An IPsec consideration is the type of security association (SA) that you wish to implement. An SA is a set of IPsec specifications that are negotiated between devices that are establishing an IPsec relationship. These specifications include preferences for the type of authentication, encryption, and IPsec protocol to be used when establishing the IPsec connection. An SA can be either unidirectional or bidirectional, depending on the choices made by the network administrator. An SA is uniquely identified by a Security Parameter Index (SPI), an IPv4 or IPv6 destination address, and a security protocol (AH or ESP) identifier.
IPsec Modes

Junos OS supports the following IPsec modes:

- Tunnel mode is supported for both AH and ESP in Junos OS. In tunnel mode, the SA and associated protocols are applied to tunneled IPv4 or IPv6 packets. For a tunnel mode SA, an outer IP header specifies the IPsec processing destination and an inner IP header specifies the ultimate destination for the packet. The security protocol header appears after the outer IP header and before the inner IP header. In addition, there are slight differences for tunnel mode when you implement it with AH and ESP:
  - For AH, portions of the outer IP header are protected, as well as the entire tunneled IP packet.
  - For ESP, only the tunneled packet is protected, not the outer header.

When one side of an SA is a security gateway (such as a switch), the SA must use tunnel mode. However, when traffic (for example, SNMP commands or BGP sessions) is destined for a switch, the system acts as a host. Transport mode is allowed in this case because the system does not act as a security gateway and does not send or receive transit traffic.

**NOTE:** Tunnel mode is not supported for OSPFv3 control packet authentication.

- Transport mode provides an SA between two hosts. In transport mode, the protocols provide protection primarily for upper-layer protocols. A transport mode security protocol header appears immediately after the IP header and any options and before any higher-layer protocols (for example, TCP or UDP). There are slight differences for transport mode when you implement it with AH and ESP:
  - For AH, selected portions of the IP header are protected, as well as selected portions of the extension headers and selected options within the IPv4 header.
  - For ESP, only the higher-layer protocols are protected, not the IP header or any extension headers preceding the ESP header.

- Configuration Statements on page 2817

Configuration Tasks

- Configuring an OSPF Network (J-Web Procedure) on page 2811
- Using IPsec to Secure OSPFv3 Networks (CLI Procedure) on page 2815

Configuring an OSPF Network (J-Web Procedure)

You can use the J-Web interface to create multiarea OSPF networks on an EX Series switch.

To configure a multiarea OSPF network:

1. Select Configure > Routing > OSPF.

   NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:
   - Add—Adds an OSPF area. Enter information into the configuration page as described in Table 353 on page 2812.
   - Edit—Modifies an existing OSPF area. Enter information into the configuration page as described in Table 353 on page 2812.
   - Delete—Deletes an existing OSPF area.

3. To modify OSPF global settings, click Edit. Enter information as described in Table 354 on page 2813.

4. To disable OSPF, click Disable.

Using IPsec to Secure OSPFv3 Networks (CLI Procedure)

OSPF version 3 (OSPFv3) does not have a built-in authentication method and relies on IP Security (IPsec) to provide this functionality. You can use IPsec to secure OSPFv3 interfaces on EX Series switches.

This topic includes:
- Configuring Security Associations on page 2815
- Securing OPSFv3 Networks on page 2816

Configuring Security Associations

When you configure a security association (SA), include your choices for authentication, encryption, direction, mode, protocol, and security parameter index (SPI).

To configure a security association:

1. Specify a name for the security association:
   ```
   [edit security ipsec]
   user@switch# set security-association sa-name
   ```
2. Specify the mode of the security association:
   ```
   [edit security ipsec security-association sa-name]
   user@switch# set mode transport
   ```
3. Specify the type of security association:
   ```
   [edit security ipsec security-association sa-name]
   user@switch# set type manual
   ```
4. Specify the direction of the security association:
   ```
   [edit security ipsec security-association sa-name]
   user@switch# set direction bidirectional
   ```
5. Specify the value of the security parameter index:
   ```
   [edit security ipsec security-association sa-name]
   user@switch# set spi spi-value
   ```
6. Specify the type of authentication to be used:
   ```
   [edit security ipsec security-association sa-name]
   ```
7. Specify the encryption algorithm and key:

   [edit security ipsec security-association sa-name]
   user@switch# set encryption algorithm algorithm key type

Securing OSPFv3 Networks

You can secure the OSPFv3 network by applying the SA to the OSPFv3 configuration.

To secure the OSPFv3 network:

   [edit protocols ospf3 area area-number interface interface-name]
   user@switch# set ipsec-sa sa-name

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the `realm` statement introduced in Junos OS Release 9.2.
Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.

Specify multiple `area` statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas. Use the `area-range` statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the `virtual-link` statement.

To specify that the routing device is directly connected to the OSPF backbone, include the `area 0.0.0.0` statement.

All routing devices on the backbone must be contiguous. If they are not, use the `virtual-link` statement to create the appearance of connectivity to the backbone.
You can also configure any interface that belongs to one or more topologies to advertise the direct interface addresses without actually running OSPF on that interface. By default, OSPF must be configured on an interface in order for direct interface addresses to be advertised as interior routes.

**NOTE:** If you configure an interface with the `passive` statement, it applies to all the topologies to which the interface belongs. You cannot configure an interface as passive for only one specific topology and have it remain active for any other topologies to which it belongs.

### Options

- **area-id**—Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number `0.0.0.0` is reserved for the OSPF backbone area.

### Required Privilege

- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  (Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple area-range statements.

For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple area-range statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.

Default  By default, area border routing devices do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.

Options  exact—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.

mask-length—Number of significant bits in the network mask.

network—IP address. You can specify one or more IP addresses.
override-metric metric—(Optional) Override the metric for the IP address range and configure a specific metric value.

restrict—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

Range: 1 through 16,777,215

Required Privilege Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 9.5 for EX Series switches.

**Description**

Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.

**Options**

- **bandwidth value**—Specify the bandwidth threshold in bits per second.
  - **Range:** 9600 through 1,000,000,000,000,000

- **metric number**—Specify a metric value to associate with a specific bandwidth value.
  - **Range:** 1 through 65,535

**NOTE:** You must also configure a static metric value for the OSPF interface or topology with the metric statement. Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.
Required Privilege
Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
`detection-time threshold` and `transmit-interval threshold` options added in Junos OS Release 8.2.
Support for logical systems introduced in Junos OS Release 8.3.
`no-adaptation` option introduced in Junos OS Release 9.0.
`no-adaptation` option introduced in Junos OS Release 9.0 for EX Series switches.
Support for OSPFv3 introduced in Junos OS Release 9.3.
Support for OSPFv3 introduced in Junos OS Release 9.3 for EX Series switches.
`full-neighbors-only` option introduced in Junos OS Release 9.5.
`full-neighbors-only` option introduced in Junos OS Release 9.5 for EX Series switches.
authentication algorithm, authentication key-chain, and authentication loose-check options introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**  Configure bidirectional failure detection timers and authentication for OSPF.

The remaining statements are explained separately.
Options  

**authentication algorithm algorithm-name** — Configure the algorithm used to authenticate the specified BFD session: simple-password, keyed-md5, keyed-sha-1, meticulous-keyed-md5, or meticulous-keyed-sha-1.

**authentication key-chain key-chain-name** — Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the authentication-key-chains key-chain statement at the [edit security] hierarchy level.

**authentication loose-check** — (Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold milliseconds** — Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**full-neighbors-only** — Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

**minimum-interval milliseconds** — Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the transmit-interval minimum-interval and minimum-receive-interval statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval milliseconds** — Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the minimum-interval statement.

**Range:** 1 through 255,000 milliseconds

**multiplier number** — Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation** — Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold milliseconds** — Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 (2^{32} – 1)

**transmit-interval minimum-interval milliseconds** — Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established
a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the `minimum-interval` statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: 1 (BFD version 1) or `automatic` (autodetect the BFD version).

**Default:** automatic

**Required Privilege**

- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

Description
On area border routers only, for a not-so-stubby area (NSSA), inject a default link-state advertisement (LSA) with a specified metric value into the area. The default route matches any destination that is not explicitly reachable from within the area.

The remaining statements are explained separately.

Required Privilege
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Disable OSPF, an OSPF interface, or an OSPF virtual link.

By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that
are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the `disable` statement at the [edit protocols ospf area area-id virtual-link neighbor-id router-id transit-area area-id topology name] hierarchy level.

**NOTE:** If you disable the virtual link by including the `disable` statement at the [edit protocols ospf area area-id virtual-link neighbor-id router-id transit-area area-id] hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

**Default**
The configured object is enabled (operational) unless explicitly disabled.

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

### domain-id

**Syntax**
domain-id domain-id;

**Hierarchy Level**
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols (ospf | ospf3)],
- [edit routing-instances routing-instance-name protocols (ospf | ospf3)]

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify a domain ID for a route. The domain ID identifies the OSPF domain from which the route originated.

**Options**
- **domain-id**—You can specify either an IP address or an IP address and a local identifier using the following format: `ip-address:local-identifier`. If you do not specify a local identifier with the IP address, the identifier is assumed to have a value of 0.

**Default:** If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance.

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

graceful-restart (Protocols OSPF)

Syntax
graceful-restart {
  disable;
  helper-disable (standard | restart-signaling | both);
  no-strict-lsa-checking;
  notify-duration seconds;
  restart-duration seconds;
}

Hierarchy Level
[edit logical-systems logical-system-name protocols (ospf | ospf3)],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols (ospf | ospf3)],
[edit protocols (ospf | ospf3)],
[edit routing-instances routing-instance-name protocols ospf]

Release Information
Statement introduced before Junos OS Release 7.4.
Support for the no-strict-lsa-checking statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the helper mode standard, restart-signaling, and both options introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Configure graceful restart for OSPF.

Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level.

Options
disable—Disable graceful restart for OSPF.

helper-disable (standard | restart-signaling | both)—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The standard, restart-signaling, and both options are only supported for OSPFv2. Specify standard to disable helper mode for standard graceful restart (based on RFC 3623). Specify restart-signaling to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify both to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.

Default: Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.

no-strict-lsa-checking—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.

NOTE: The helper-disable statement and the no-strict-lsa-checking statement cannot be configured at the same time. If you attempt to configure both
Statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.  
**Range:** 1 through 3600 seconds  
**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.  
**Range:** 1 through 3600 seconds  
**Default:** 180 seconds

**Required Privilege Level**  
- **routing**—To view this statement in the configuration.  
- **routing-control**—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the topology statement introduced in Junos OS Release 9.0.
Support for the topology statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.
Support for the no-interface-state-traps statement introduced in Junos OS Release 10.3.
This statement is supported only for OSPFv2.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Enable OSPF routing on a routing device interface.

You must include at least one interface statement in the configuration to enable OSPF on the routing device.

Options
interface-name—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify all. Specifying a particular interface and all produces an invalid configuration.

NOTE: For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as interface-name.

The remaining statements are explained separately.

NOTE: You cannot run both OSPF and ethernet-tcc encapsulation between two Juniper Networks routing devices.

Required Privilege
Level
routing—To view this statement in the configuration.
routeing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-multicast | ipv4-unicast | ipv6-multicast) area area-id interface interface-name],
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for OSPFv3 for interface type p2p only introduced in Junos OS Release 9.4. You cannot configure other interface types for OSPFv3.
Support for OSPFv3 for interface type p2p only introduced in Junos OS Release 9.4 for EX Series switches.

Description

Specify the type of interface.

By default, the software chooses the correct interface type based on the type of physical interface. Therefore, you should never have to set the interface type. The exception to this is for NBMA interfaces, which default to an interface type of point-to-multipoint. To have these interfaces explicitly run in Nonbroadcast multiaccess (NBMA) mode, configure the nbma interface type, using the IP address of the local ATM interface.

In Junos OS Release 9.3 and later, a point-to-point interface can be an Ethernet interface without a subnet.

Default

The software chooses the correct interface type based on the type of physical interface.

Options

- **nbma** (OSPFV2 only)—Nonbroadcast multiaccess (NBMA) interface.
- **p2mp** (OSPFV2 only)—Point-to-multipoint interface.
- **p2p**—Point-to-point interface.

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Support for Multitopology Routing introduced in Junos OS Release 9.0 for EX Series switches.
Support for the `realm` statement introduced in Junos OS Release 9.2.
Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Specify the cost of an OSPF interface. The cost is a routing metric that is used in the link-state calculation.

To set the cost of routes exported into OSPF, configure the appropriate routing policy.

**Options**

- **metric**—Cost of the route.

  **Range:** 1 through 65,535

  **Default:** By default, the cost of an OSPF route is calculated by dividing the reference-bandwidth value by the bandwidth of the physical interface. Any specific value you configure for the `metric` overrides the default behavior of using the reference-bandwidth value to calculate the cost of the route for that interface.
Required Privilege
Level routing—To view this statement in the configuration.
          routing-control—To add this statement to the configuration.

```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for the `realm` statement introduced in Junos OS Release 9.2.
- Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Specify the external metric type for the default LSA.

The configured metric determines the method used to compute the cost to a destination:

- The Type 1 external metric is equivalent to the link-state metric. The path cost uses the advertised external path cost and the path cost to the AS boundary router (the route is equal to the sum of all internal costs and the external cost).
- The Type 2 external metric uses the cost assigned by the AS boundary router (the route is equal to the external cost alone). By default, OSPF uses the Type 2 external metric.

**Options**

```
type—Metric type: 1 or 2
```

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure the local routing device so that it appears to be overloaded. You might do this when you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic.

NOTE: Traffic destined to directly attached interfaces continues to reach the routing device.

Options
timeout seconds—(Optional) Number of seconds at which the overloading is reset. If no timeout interval is specified, the routing device remains in overload state until the overload statement is deleted or a timeout is set.

Range: 60 through 1800 seconds
Default: 0 seconds
NOTE: Multitopology Routing does not support the timeout option.

Required Privilege
Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.

traffic-engineering and remote-node-id address statements introduced in Junos OS Release 8.0.

traffic-engineering and remote-node-id address statements introduced in Junos OS Release 8.0 for EX Series switches.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Support for the realm statement introduced in Junos OS Release 9.2.

Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Advertise the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.

To configure an interface in OSPF passive traffic engineering mode, include the traffic-engineering statement. Configuring OSPF passive traffic engineering mode enables the dynamic discovery of OSPF AS boundary routers.

Enable OSPF on an interface by including the interface statement at the [edit protocols (ospf | ospf3) area area-id] or the [edit routing-instances routing-instance-name protocols ospf area area-id] hierarchy levels. Disable it by including the disable statement. To prevent OSPF from running on an interface, include the passive statement. These three states are mutually exclusive.

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

Description

Specify the routing device’s priority for becoming the designated routing device. The routing device that has the highest priority value on the logical IP network or subnet becomes the network’s designated router. You must configure at least one routing device on each logical IP network or subnet to be the designated router. You also should specify a routing device’s priority for becoming the designated router on point-to-point interfaces.

Options

```
number—Routing device’s priority for becoming the designated router. A priority value of 0 means that the routing device never becomes the designated router. A value of 1 means that the routing device has the least chance of becoming a designated router.
```

Range: 0 through 255
Default: 128

Required Privilege Level

```
routing—to view this statement in the configuration.
```

```
routing-control—to add this statement to the configuration.
```

realm

Syntax  realm (ipv4-unicast | ipv4-multicast | ipv6-unicast) {
  area area-id {
    interface interface-name;
  }
}

Hierarchy Level  [edit logical-systems logical-system-name protocols ospf3],
  [edit logical-systems logical-system-name routing-instances routing-instance-name protocols ospf3],
  [edit protocols ospf3],
  [edit routing-instances routing-instance-name protocols ospf3]

  Statement introduced in Junos OS Release 9.2 for EX Series switches.

Description  Configure OSPFv3 to advertise address families other than unicast IPv6. Junos OS maps each address family you configure to a separate realm with its own set of neighbors and link-state database.

Options  ipv4-unicast—Configure a realm for IPv4 unicast routes.
  ipv4-multicast—Configure a realm for IPv4 multicast routes.
  ipv6-multicast—Configure a realm for IPv6 multicast routes.

The remaining statements are explained separately.

Required Privilege Level  routing—to view this statement in the configuration.
  routing-control—to add this statement to the configuration.

- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for the `realm` statement introduced in Junos OS Release 9.2.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Set the reference bandwidth used in calculating the default interface cost. The cost is calculated using the following formula:

\[
\text{cost} = \frac{\text{ref-bandwidth}}{\text{bandwidth}}
\]

**Options**
- `reference-bandwidth`—Reference bandwidth, in bits per second.
  - **Range:** 9600 through 1,000,000,000,000 bits
  - **Default:** 100 Mbps (100,000,000 bits)

**NOTE:** The default behavior is to use the reference-bandwidth value to calculate the cost of OSPF interfaces. You can override this behavior for any OSPF interface by configuring a specific cost with the `metric` statement.

**Required Privilege Level**
- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

**Related Documentation**

- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for the `realm` statement introduced in Junos OS Release 9.2.
- Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**
Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements (LSAs) to an interface’s neighbors.

**Options**
- **seconds**—Interval to wait.
  - **Range:** 1 through 65,535 seconds
  - **Default:** 5 seconds

**NOTE:** You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.
Required Privilege  routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

- Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure options for running the shortest-path-first (SPF) algorithm. You can configure the following:

- A delay for when to run the SPF algorithm after a network topology change is detected.
- The maximum number of times the SPF algorithm can run in succession.
- A hold-down interval after the SPF algorithm runs the maximum number of times.

Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.
Options  delay milliseconds—Time interval between the detection of a topology change and when
the SPF algorithm runs.
Range: 50 through 8000 milliseconds
Default: 200 milliseconds

holddown milliseconds—Time interval to hold down, or to wait before a subsequent SPF
algorithm runs after the SPF algorithm has run the configured maximum number of
times in succession.
Range: 2000 through 20,000 milliseconds
Default: 5000 milliseconds

rapid-runs number—Maximum number of times the SPF algorithm can run in succession.
After the maximum is reached, the hold down interval begins.
Range: 1 through 10
Default: 3

Required Privilege Level  routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

Description

Specify that this area not be flooded with AS external link-state advertisements (LSAs).
You must include the stub statement when configuring all routing devices that are in the stub area.

The backbone cannot be configured as a stub area.

You cannot configure an area to be both a stub area and a not-so-stubby area (NSSA).

Options

no-summaries—(Optional) Do not advertise routes into the stub area. If you include the default-metric option, only the default route is advertised.

summaries—(Optional) Flood summary LSAs into the stub area.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

- [edit routing-instances routing-instance-name protocols (ospf | ospf3)],
- [edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for the `realm` statement introduced in Junos OS Release 9.2.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure OSPF protocol-level tracing options.

To specify more than one tracing operation, include multiple `flag` statements.

NOTE: The traceoptions statement is not supported on QFabric systems.

Default

The default OSPF protocol-level tracing options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

Options

- `disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

- `file filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. We recommend that you place OSPF tracing output in the file `ospf-log`.

- `files number`—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.
If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

**Range:** 2 through 1000 files  
**Default:** 10 files

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

**OSPF Tracing Flags**

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP.
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events.
- **spf**—Shortest-path-first (SPF) calculations.

**Global Tracing Flags**
• **all**—All tracing operations.
• **general**—A combination of the normal and route trace operations.
• **normal**—All normal operations. If you do not specify this option, only unusual or abnormal operations are traced.
• **policy**—Policy operations and actions.
• **route**—Routing table changes.
• **state**—State transitions.
• **task**—Routing protocol task processing.
• **timer**—Routing protocol timer processing.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

• **detail**—Detailed trace information.
• **receive**—Packets being received.
• **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size** size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** xk to specify KB, xm to specify MB, or xg to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level**
- routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.
- `multicast-rpf-routes` option introduced in Junos OS Release 7.5.
- `advertise-unnumbered-interfaces` option introduced in Junos OS Release 8.5.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for OSPFv3 (`ospf3`) introduced in Junos OS Release 9.4.
- Support for OSPFv3 (`ospf3`) introduced in Junos OS Release 9.4 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Enable the OSPF traffic engineering features.

Default

Traffic engineering support is disabled.

Options

- `advertise-unnumbered-interfaces`—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477.

- `credibility-protocol-preference`—(Optional) (OSPFv2 only) Use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior, in which the traffic engineering database prefers IS-IS routes even if OSPF routes are configured with a lower, that is, preferred, preference value. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502.
whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.

**multicast-rpf-routes**—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the inet.2 routing table. The inet.2 routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check whether the packet is coming in on an interface that is also sending data back to the packet source.

NOTE: You must enable OSPF traffic engineering shortcuts to use the multicast-rpf-routes statement. You must not allow LSP advertisements into OSPF when configuring the multicast-rpf-routes statement.

**no-topology**—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

CAUTION: When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

**Required Privilege**  
Level routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description**

Set the estimated time required to transmit a link-state update on the interface. When calculating this time, make sure to account for transmission and propagation delays.

You should never have to modify the transit delay time.

**Options**

seconds—Estimated time, in seconds.

Range: 1 through 65,535 seconds

Default: 1 second

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information  

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the realm statement introduced in Junos OS Release 9.2.
Support for the realm statement introduced in Junos OS Release 9.2 for EX Series switches.

Description  

Flood Type 7 default link-state advertisements (LSAs) if the nosummaries statement is configured.

By default, when the nosummaries statement is configured, a Type 3 LSA is injected into
not-so-stubby areas (NSSAs) for Junos OS Release 5.0 and later. To support backward
compatibility with earlier Junos OS releases, include the type-7 statement. This statement
enables NSSA ABRs to advertise a Type 7 default LSA into the NSSA if you have also
included the nosummaries statement in the configuration.

Required Privilege  

Level  

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols ospf area area-id]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description
For backbone areas only, create a virtual link to use in place of an actual physical link. All
area border routers and other routing devices on the backbone must be contiguous. If
this is not possible and there is a break in OSPF connectivity, use virtual links to create
connectivity to the OSPF backbone. When configuring virtual links, you must configure
links on the two routing devices that form the end points of the link, and both of these
routing devices must be area border routers. You cannot configure links through stub
areas.

Options
neighbor-id router-id—IP address of the routing device at the remote end of the virtual
link.

transit-area area-id—Area identifier of the area through which the virtual link transits.
Virtual links are not allowed to transit the backbone area.

The remaining statements are explained separately.

Required Privilege
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Administration

- Routine Monitoring on page 2881
- Operational Commands on page 2883

Routine Monitoring

- Monitoring OSPF Routing Information on page 2881

Monitoring OSPF Routing Information

**Purpose**  Use the monitoring functionality to monitor OSPF routing information on routing devices.

**Action**  To view OSPF routing information in the J-Web interface, select Monitor > Routing > OSPF Information.

To view OSPF routing information in the CLI, enter the following CLI commands:

- `show ospf neighbor`
- `show ospf interface`
- `show ospf statistics`

**Meaning**  Table 355 on page 2881 summarizes key output fields in the OSPF routing display in the J-Web interface.

Table 355: Summary of Key OSPF Routing Output Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Values</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPF Interfaces</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interface</td>
<td>Name of the interface running OSPF.</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>State of the interface: <strong>BDR, Down, DR, DRother, Loop, PtToPt, or Waiting.</strong></td>
<td>The Down state, indicating that the interface is not functioning, and PtToPt state, indicating that a point-to-point connection has been established, are the most common states.</td>
</tr>
<tr>
<td>Area</td>
<td>Number of the area that the interface is in.</td>

**Operational Commands**
clear (ospf | ospf3) database

**Syntax**

```
clear (ospf | ospf3) database
<advertising-router (router-id | self)>
<area area-id>
<asbrsummary>
<external>
<instance instance-name>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<logical-system (all | logical-system-name)>
<lsa-id lsa-id>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<router>
```

**Syntax (EX Series Switch and QFX Series)**

```
clear (ospf | ospf3) database
<advertising-router (router-id | self)>
<area area-id>
<asbrsummary>
<external>
<instance instance-name>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<lsa-id lsa-id>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<router>
```

**Release Information**

Command introduced before Junos OS Release 7.4,
- advertising-router router-id, area area-id, asbrsummary, external, inter-area-prefix, inter-area-router, intra-area-prefix, link-local, lsa-id lsa-id, netsummary, network, nssa, opaque-area, and router options added in Junos OS Release 8.3. You must use the **purge** command with these options.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- **realm** option added in Junos OS Release 9.2.
- advertising-router (router-id | self) option added in Junos OS Release 9.5.
- advertising-router (router-id | self) option introduced in Junos OS Release 9.5 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.
**Description**

With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine. You can also use the `purge` command with any of the options to discard rather than delete the specified LSA entries.

[CAUTION: This command is useful only for testing. Use it with care, because it causes significant network disruption.]

**Options**

- **none**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

  - **advertising-router (router-id | self)**—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.
  - **area area-id**—(Optional) Discard entries for the LSAs in the specified area.
  - **asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.
  - **external**—(Optional) Discard external LSAs.
  - **instance instance-name**—(Optional) Delete or discard entries for the specified routing instance only.
  - **inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.
  - **inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.
  - **intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.
  - **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
  - **link-local**—(Optional) Delete link-local LSAs.
  - **lsa-id lsa-id**—(Optional) Discard the LSA entries with the specified LSA identifier.
  - **netsummary**—(Optional) Discard summary network LSAs.
  - **network**—(Optional) Discard network LSAs.
  - **nssa**—(Optional) Discard not-so-stubby area (NSSA) LSAs.
  - **opaque-area**—(Optional) Discard opaque area-scope LSAs.
  - **realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.
router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to MAXAGE and are flooded. The database is repopulated when the originators of the link-state advertisements receive the MAXAGE link-state advertisements and reissue them.

show (ospf | ospf3) io-statistics

Syntax
show (ospf | ospf3) io-statistics
<logical-system (all | logical-system-name)>

Syntax (EX Series Switch and QFX Series)
show (ospf | ospf3) io-statistics

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Display Open Shortest Path First (OSPF) input and output statistics.

Options
- none—Display OSPF input and output statistics.
- logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
view

Related Documentation
- clear (ospf | ospf3) statistics on page 2890

List of Sample Output
show ospf io-statistics on page 2899

Output Fields
Table 357 on page 2899 lists the output fields for the show ospf io-statistics command. Output fields are listed in the approximate order in which they appear.

Table 357: show (ospf | ospf3) io-statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packets read</td>
<td>Number of OSPF packets read since the last time the routing protocol was started.</td>
</tr>
<tr>
<td>average per run</td>
<td>Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.</td>
</tr>
<tr>
<td>max run</td>
<td>Maximum number of packets for a given run among all scheduled runs.</td>
</tr>
<tr>
<td>Receive errors</td>
<td>Number of faulty packets received with errors.</td>
</tr>
</tbody>
</table>

Sample Output

show ospf io-statistics

user@host> show ospf io-statistics

Packets read: 7361, average per run: 1.00, max run: 1
Receive errors:
None
show (ospf | ospf3) log

Syntax
show (ospf | ospf3) log
<instance instance-name>
<logical-system (all | logical-system-name)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<topology topology-name>

Syntax (EX Series Switch and QFX Series)
show (ospf | ospf3) log
<instance instance-name>
<topology topology-name>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
topology option introduced in Junos OS Release 9.0.
topology option introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

Options
none—Display entries in the OSPF log of SPF calculations for all routing instances.

instance instance-name—(Optional) Display entries for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology topology-name—(Optional) (OSPFv2 only) Display entries for the specified topology.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show (ospf | ospf3) neighbor

**Syntax**

```
show (ospf | ospf3) neighbor
  <brief | detail | extensive>
  <area area-id>
  <instance (all | instance-name)>
  <interface interface-name>
  <logical-system (all | logical-system-name)>
  <neighbor>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
```

**Syntax (EX Series Switches and QFX Series)**

```
show (ospf | ospf3) neighbor
  <brief | detail | extensive>
  <area area-id>
  <instance (all | instance-name)>
  <interface interface-name>
  <neighbor>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- `instance all` option introduced in Junos OS Release 9.1.
- `instance all` option introduced in Junos OS Release 9.1 for EX Series switches.
- `area`, `interface`, and `realm` options introduced in Junos OS Release 9.2.
- `area` and `interface` options introduced in Junos OS Release 9.2 for EX Series switches.
- Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the `show (ospf | ospf3) neighbor` command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the `show (ospf | ospf3) neighbor` command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

**Options**

- **none**—Display standard information about all OSPF neighbors for all routing instances.
- **brief | detail | extensive**—(Optional) Display the specified level of output.
- **area area-id**—(Optional) Display information about the OSPF neighbors for the specified area.
- **instance (all | instance-name)**—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.
- **interface interface-name**—(Optional) Display information about OSPF neighbors for the specified logical interface.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
**neighbor**—(Optional) Display information about the specified OSPF neighbor.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Output Fields**

Table 359 on page 2905 lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 359: show (ospf | ospf3) neighbor Output Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Address of the neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface through which the neighbor is reachable.</td>
<td>All levels</td>
</tr>
</tbody>
</table>
### Table 359: show (ospf | ospf3) neighbor Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the neighbor:</td>
<td>All levels</td>
</tr>
<tr>
<td></td>
<td>• <strong>Attempt</strong>—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Down</strong>—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the <strong>Down</strong> state, although at a reduced frequency.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Exchange</strong>—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>ExStart</strong>—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Full</strong>—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Init</strong>—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state might occur, for example, because the routing device itself did not appear in the neighbor’s hello packet.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Loading</strong>—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the <strong>Exchange</strong> state.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>2Way</strong>—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state <strong>2Way</strong> or greater.</td>
<td></td>
</tr>
<tr>
<td>ID</td>
<td>Router ID of the neighbor.</td>
<td>All levels</td>
</tr>
<tr>
<td>Pri</td>
<td>Priority of the neighbor to become the designated router.</td>
<td>All levels</td>
</tr>
<tr>
<td>Dead</td>
<td>Number of seconds until the neighbor becomes unreachable.</td>
<td>All levels</td>
</tr>
<tr>
<td>Link state acknowledgment list</td>
<td>Number of link-state acknowledgments received.</td>
<td><strong>extensive</strong></td>
</tr>
<tr>
<td>Link state retransmission list</td>
<td>Total number of link-state advertisements retransmitted. For <strong>extensive</strong> output only, the following information is also displayed:</td>
<td><strong>detail extensive</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>—Type of link advertisement: ASBR, Sum, Extern, Network, NSSA, OpaqArea, Router, or Summary.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>LSA ID</strong>—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Adv rtr</strong>—Address of the routing device that sent the advertisement.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Seq</strong>—Link sequence number of the advertisement.</td>
<td></td>
</tr>
</tbody>
</table>

<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
```

**Syntax (EX Series Switch and QFX Series)**

```
show (ospf | ospf3) overview

<brief | extensive>

<instance instance-name>
```

**Release Information**

Command introduced in Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Database protection introduced in Junos 10.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Display Open Shortest Path First (OSPF) overview information.

**Options**

- **none**—Display standard information about all OSPF neighbors for all routing instances.
- **brief | extensive**—(Optional) Display the specified level of output.
- **instance instance-name**—(Optional) Display all OSPF interfaces under the named routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level**

view

**List of Sample Output**

show (ospf | ospf3) route

Syntax

show (ospf | ospf3) route
  <brief | detail | extensive>
  <abr | asbr | extern | inter | intra>
  <destination>
  <instance (default | ipv4-multicast | instance-name)>
  <logical-system (default | ipv4-multicast | logical-system-name)>
  <network>
  <no-backup-coverage>
  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
  <router>
  <topology (default | ipv4-multicast | topology-name)>
  <transit>

Syntax (EX Series Switch and QFX Series)

show (ospf | ospf3) route
  <brief | detail | extensive>
  <abr | asbr | extern | inter | intra>
  <destination>
  <instance instance-name>
  <network>
  <no-backup-coverage>
  <router>
  <topology (default | ipv4-multicast | topology-name)>
  <transit>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
topology option introduced in Junos OS Release 9.0.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display the entries in the Open Shortest Path First (OSPF) routing table.

Options

none—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

destination—Display routes to the specified IP address (with optional destination prefix length).

brief | detail | extensive—(Optional) Display the specified level of output.

abr—(Optional) Display routes to area border routers.

asbr—(Optional) Display routes to autonomous system border routers.

extern—(Optional) Display external routes.

inter—(Optional) Display interarea routes.

intra—(Optional) Display intra-area routes.
**instance (default | ipv4-multicast | instance-name)**—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

**logical-system (default | ipv4-multicast | logical-system-name)**—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

**network**—(Optional) Display routes to networks.

**no-backup-coverage**—(Optional) Display routes with no backup coverage.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Display routes to all routers.

**topology (default | ipv4-multicast | topology-name)**—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

**transit**—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

**Required Privilege**

**Level**

**view**

**List of Sample Output**

show (ospf | ospf3) statistics

Syntax

show (ospf | ospf3) statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)

Syntax (EX Series Switch and QFX Series)

show (ospf | ospf3) statistics
<instance instance-name>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Display OSPF statistics.

Options

none—Display OSPF statistics for all routing instances.

instance instance-name—(Optional) Display all statistics for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBDs retransmitted</td>
<td>Total number of database description packets retransmitted, and number retransmitted in the last 5 seconds.</td>
</tr>
<tr>
<td>LSAs flooded</td>
<td>Total number of link-state advertisements flooded, and number flooded in the last 5 seconds.</td>
</tr>
</tbody>
</table>
| LSAs flooded high-prio      | Total number of high priority link-state advertisements flooded, and number flooded in the last 5 seconds.  
A link-state advertisement is deemed a high priority if it has changed since it was last sent. |
| LSAs retransmitted          | Total number of link-state advertisements retransmitted, and number retransmitted in the last 5 seconds. |
| LSAs transmitted to nbr     | Total number of link-state advertisements transmitted to a neighbor, and number transmitted in the last 5 seconds. |
| LSAs requested              | Total number of link-state advertisements requested by neighboring devices, and number requested in the last 5 seconds. |
| LSAs acknowledged           | Total number of link-state advertisements acknowledged, and number acknowledged in the last 5 seconds. |
| Flood queue depth           | Total number of entries in the extended queue.                                     |
| Total rexmit entries        | Total number of retransmission entries waiting to be sent from the OSPF routing instance. |
| db summaries                | Total number of database description summaries waiting to be sent from the OSPF routing instance. |
| Isreq entries               | Total number of link-state request entries waiting to be sent from the OSPF routing instance. |
| Receive errors              | Number and type of receive errors. Some sample receive errors include:               |
|                             | - mtu mismatches                                                                  |
|                             | - no interface found                                                               |
|                             | - no virtual link found                                                            |
|                             | - nssa mismatches                                                                 |
|                             | - stub area mismatches                                                             |
|                             | - subnet mismatches                                                                |
|                             | If there are no receive errors, the output displays none.                           |

**show ospf database**

**Syntax**
```
show ospf database
  <brief | detail | extensive | summary>
  <advertising-router (address | self)>
  <area area-id>
  <asbrsummary>
  <external>
  <instance instance-name>
  <link-local>
  <logical-system (all | logical-system-name)>
  <lsa-id lsa-id>
  <netsummary>
  <network>
  <nssa>
  <opaque-area>
  <router>
```

**Syntax (EX Series Switches and QFX Series)**
```
show ospf database
  <brief | detail | extensive | summary>
  <advertising-router (address | self)>
  <area area-id>
  <asbrsummary>
  <external>
  <instance instance-name>
  <link-local>
  <logical-system (all | logical-system-name)>
  <lsa-id lsa-id>
  <netsummary>
  <network>
  <nssa>
  <opaque-area>
  <router>
```

**Release Information**
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
`advertising-router self (address | self)` option introduced in Junos OS Release 9.5.
`advertising-router self (address | self)` option introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**
- `none`—Display standard information about entries in the OSPFv2 link-state database for all routing instances.
- `brief | detail | extensive | summary`—(Optional) Display the specified level of output.
- `advertising-router (address | self)`—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.
- `area area-id`—(Optional) Display the LSAs in a particular area.
asbr-summary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance instance-name—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id lsa-id—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

Output Fields

Table 363 on page 2926 describes the output fields for the show ospf database command. Output fields are listed in the approximate order in which they appear.

Table 363: show ospf database Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>area</td>
<td>Area number. Area 0.0.0.0 is the backbone area.</td>
<td>All levels</td>
</tr>
</tbody>
</table>

Type

Type of link advertisement: ASBRSum, Extern, Network, NSSA, OpaqArea, Router, or Summary.

ID

LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.

Adv Rtr

Address of the routing device that sent the advertisement.

Seq

Link sequence number of the advertisement.
Table 363: show ospf database Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
<th>Level of Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age</td>
<td>Time elapsed since the LSA was originated, in seconds.</td>
<td>All levels</td>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
advertising-router (address | self) option introduced in Junos Release 9.5.
advertising-router (address | self) option introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

Options
none—Display standard information about all entries in the OSPFv3 link-state database.
brief | detail | extensive | summary—(Optional) Display the specified level of output.
advertising-router (address | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.
area area-id—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance instance-name—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about interarea-prefix LSAs.

inter-area-router—(Optional) Display information about interarea-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id lsa-id—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the realm option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

Configuration Tasks

- Configuring a RIP Network (J-Web Procedure) on page 2951

Configuring a RIP Network (J-Web Procedure)

You can use the J-Web interface to create RIP networks.

To configure a RIP network:

1. Select **Configure > Routing > RIP**.

   **NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:

   - **Add**—Configures a RIP instance. Enter information into the RIP Configuration page as described in **Table 367 on page 2952**.
   - **Edit**—Modifies an existing RIP instance. Enter information into the configuration page for RIP as described in **Table 367 on page 2952**.
   - **Delete**—Deletes an existing RIP instance.

3. To modify RIP global settings, click **Edit**. Enter information in the configuration as described in **Table 368 on page 2952**.

                     [edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]

Release Information     Statement introduced in Junos OS Release 8.0.
                          Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description     Disable strict sender address checks.

If the sender of a RIP message does not belong to the subnet of the interface, the message is discarded. This situation might cause problems with dropped packets when RIP is running on point-to-point interfaces, or when the addresses on the interfaces do not fall in the same subnet. You can resolve this by disabling strict address checks on the RIP traffic.

NOTE: The any-sender statement is supported only for peer-to-peer interfaces.

Required Privilege Level     routing—To view this statement in the configuration.
                              routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure the type of authentication for RIP route queries received on an interface.

Default

If you do not include this statement and the `authentication-key` statement, RIP authentication is disabled.

Options

```
type—Authentication type:
```

- `md5`—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.

- `none`—Disable authentication. If `none` is configured, the configured authentication key is ignored.

- `simple`—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.

Required Privilege Level

```
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.
```

Related Documentation

- [edit protocols rip group group-name],
- [edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]

**Release Information**

- Statement introduced in Junos OS Release 8.0.
- Options detection-time threshold and transmit-interval threshold introduced in Junos OS Release 8.2.
- Support for logical systems introduced in Junos OS Release 8.3.
- Option no-adaptation introduced in Junos OS Release 9.0.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Options authentication algorithm, authentication key-chain, and authentication loose-check introduced in Junos OS Release 9.6.
- Options authentication algorithm, authentication key-chain, and authentication loose-check introduced in Junos OS Release 9.6 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure bidirectional failure detection timers and authentication.

**Options**

- **authentication algorithm algorithm-name** — Configure the algorithm used to authenticate the specified BFD session: simple-password, keyed-md5, keyed-sha-1, meticulous-keyed-md5, or meticulous-keyed-sha-1.
- **authentication key-chain key-chain-name** — Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the authentication-key-chains key-chain statement at the [edit security] hierarchy level.
authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication is not configured at both ends of the BFD session.

detection-time threshold milliseconds—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

minimum-interval milliseconds—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the transmit-interval minimum-interval and minimum-receive-interval statements.

Range: 1 through 255,000 milliseconds

minimum-receive-interval milliseconds—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the minimum-interval statement.

Range: 1 through 255,000 milliseconds

multiplier number—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255
Default: 3

no-adaptation—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold milliseconds—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 (2^{32} – 1)

transmit-interval minimum-interval milliseconds—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the minimum-interval statement.

Range: 1 through 255,000

version—Configure the BFD version to detect: 1 (BFD version 1) or automatic (autodetect the BFD version).

Default: automatic

- [edit protocols rip],
- [edit protocols rip group group-name neighbor neighbor-name],
- [edit routing-instances routing-instance-name protocols rip],
- [edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Some of the reserved fields in RIP version 1 packets must be zero, whereas in RIP version 2 packets, most of these reserved fields can contain nonzero values. By default, RIP discards version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.

If you find that you are receiving RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero, you can configure RIP to receive these packets even though they are being sent in violation of the specifications in RFC 1058 and RFC 2453.

Check whether the reserved fields in a RIP packet are zero:

- **check-zero**—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.

- **no-check-zero**—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.

**Default**

check-zero

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

### export (Protocols RIP)

**Syntax**

```conlang
eexport [ policy-names ];
```

**Hierarchy Level**

- `[edit logical-systems logical-system-name protocols rip group group-name]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip group group-name]`
- `[edit protocols rip group group-name]`
- `[edit routing-instances routing-instance-name protocols rip group group-name]`

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Apply a policy to routes being exported to the neighbors.

By default, RIP does not export routes it has learned to its neighbors. To enable RIP to export routes, apply one or more export policies.

If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the `metric-in` and `metric-out` statements.

**NOTE:** The export policy on RIP does not support manipulating routing information of the next hop.

**Options**

- `policy-names`—Name of one or more policies.

**Required Privilege**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- *Example: Configuring RIP*
- *import on page 2967*
### graceful-restart (Protocols RIP)

**Syntax**
```
graceful-restart {
    disable;
    restart-time seconds;
}
```

**Hierarchy Level**
```
[edit logical-systems logical-system-name protocols rip],
[edit protocols rip]
```

**Release Information**
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Configure graceful restart for RIP.

**Options**
- `disable`—Disables graceful restart for RIP.
  
The remaining statement is explained separately.

**Required Privilege Level**
- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

}
}

Hierarchy Level
[edit logical-systems logical-system-name protocols rip],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip],
[edit protocols rip],
[edit routing-instances routing-instance-name protocols rip]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description
Configure a set of RIP neighbors that share an export policy and metric. The export policy and metric govern what routes to advertise to neighbors in a given group. Each group must contain at least one neighbor. You should create a group for every export policy.

Options
group-name—Name of a group, up to 16 characters long.
The remaining statements are explained separately.

Required Privilege
routing—To view this statement in the configuration.
route-control—To add this statement to the configuration.

**holddown (Protocols RIP)**

**Syntax**

`holddown seconds;`

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols rip],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip],
[edit protocols rip],
[edit routing-instances routing-instance-name protocols rip]
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Configure how long the expired route is retained in the routing table before being removed.

When the hold-down timer runs on RIP demand circuits, routes are advertised as unreachable on other interfaces. When the hold-down timer expires, the route is removed from the routing table if all destinations detect that the route is unreachable or the remaining destinations are down.

**Options**

`seconds`—Estimated time to wait before making updates to the routing table.

- **Range:** 10 through 180 seconds
- **Default:** 120 seconds

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

[edit logical-systems logical-system-name protocols rip group group-name neighbor neighbor-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name],
[edit protocols rip],
[edit protocols rip group group-name neighbor neighbor-name],
[edit routing-instances routing-instance-name protocols rip],
[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]
```

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement for SRX Series devices introduced in Junos OS Release 9.5.  
Statement for J Series platform introduced in Junos OS Release 8.5.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**  
Specify the number of route entries to be included in every RIP update message.

**TIP:** To ensure interoperability with other vendors' equipment, use the standard of 25 route entries per message. Do not change the default number of route entries in a RIP update message.

**Options**  
- `number`—Number of route entries per update message.  
  - **Range:** 25 through 255 entries  
  - **Default:** 25 entries

**Required Privilege**  
- `routing`—To view this statement in the configuration.  
- `routing-control`—To add this statement to the configuration.

[edit protocols rip],
[edit protocols rip group group-name neighbor neighbor-name],
[edit routing-instances routing-instance-name protocols rip],
[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Specify the metric to add to incoming routes when the routing device advertises into RIP routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIP routes learned through a specific neighbor.

**Options**

- **metric**—Metric value.
  - **Range**: 1 through 16
  - **Default**: 1

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

## metric-out (Protocols RIP)

### Syntax

```
metric-out metric;
```

### Hierarchy Level

- `[edit logical-systems logical-system-name protocols rip group group-name neighbor neighbor-name]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]`
- `[edit protocols rip group group-name neighbor neighbor-name]`
- `[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]`

### Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

### Description

Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIP routes sent from this neighbor.

If you have included the `export` statement, RIP exports routes it has learned to the neighbors configured by including the `neighbor` statement.

The metric associated with a RIP route (unless modified by an export policy) is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with a `metric-in` value of 2 is advertised with a combined metric of 7 when advertised to RIP neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the `metric-out` statement.

The metric for a route can be modified with an export policy. That metric is seen when the route is exported to the next hop.

To increase the metric for routes advertised outside a group, include the `metric-out` statement.

### Options

- **metric**—Metric value.
  - **Range**: 1 through 16
  - **Default**: 1

### Required Privilege Level

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

---

**preference (Protocols RIP)**

**Syntax**
```
preference preference;
```

**Hierarchy Level**
- [edit logical-systems logical-system-name protocols rip group group-name],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip group group-name],
- [edit protocols rip group group-name],
- [edit routing-instances routing-instance-name protocols rip group group-name]

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Specify the preference of external routes learned by RIP as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIP. When Junos OS determines a route’s preference to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

**Options**
- `preference`—Preference value. A lower value indicates a more preferred route.
- **Range**: 0 through 4,294,967,295 (2^32 – 1)
- **Default**: 100

---

**Required Privilege**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**
- Route Preferences Overview
receive (Protocols RIP)

Syntax

[edit protocols rip],
[edit protocols rip group group-name neighbor neighbor-name],
[edit routing-instances routing-instance-name protocols rip],
[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure RIP receive options.

Options

```
receive-options—One of the following:

- both—Accept both RIP version 1 and version 2 packets.
- none—Do not receive RIP packets.
- version-1—Accept only RIP version 1 packets.
- version-2—Accept only RIP version 2 packets.
```

Default: both

Required Privilege Level

```
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.
```

traceoptions (Protocols RIP)

Syntax

traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols rip],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip],
[edit protocols rip],
[edit routing-instances routing-instance-name protocols rip]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Set RIP protocol-level tracing options.

NOTE: The traceoptions statement is not supported on QFabric systems.

Default

The default RIP protocol-level trace options are inherited from the global traceoptions statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as all.

file filename—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file /var/log/rip-log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files
Default: 10 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

RIP Tracing Options

- auth—RIP authentication
- error—RIP error packets
• **expiration**—RIP route expiration processing
• **holddown**—RIP hold-down processing
• **nsr-synchronization**—Nonstop routing synchronization events
• **packets**—All RIP packets
• **request**—RIP information packets such as request, poll, and poll entry packets
• **trigger**—RIP triggered updates
• **update**—RIP update packets

**Global Tracing Options**

• **all**—All tracing operations
• **general**—A combination of the **normal** and **route** trace operations
• **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

• **policy**—Policy operations and actions
• **route**—Routing table changes
• **state**—State transitions
• **task**—Routing protocol task processing
• **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

• **detail**—Provide detailed trace information.
• **receive**—Trace the packets being received.
• **receive-detail**—Provide detailed trace information for packets being received.
• **send**—Trace the packets being transmitted.
• **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.
**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file.0*. When the *trace-file* again reaches its maximum size, *trace-file.0* is renamed *trace-file.1* and *trace-file* is renamed *trace-file.0*. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:**  \(x\) to specify KB,  \(x\) to specify MB, or  \(x\) to specify GB

**Range:**  10 KB through the maximum file size supported on your system

**Default:**  128 KB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege**  
- **Level**  
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name protocols rip group group-name],  
[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-name]

Release Information  
Statement introduced in Junos OS Release 7.6.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description  
Configure the interval at which routes learned by RIP are sent to neighbors. This timer controls the interval between routing updates. This timer is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can happen if all routing devices update their neighbors simultaneously.

Options  
seconds—Estimated time to wait before making updates to the routing table.  
Range: 10 through 60 seconds  
Default: 30 seconds

Required Privilege  
level routing—to view this statement in the configuration.  
level routing-control—to add this statement to the configuration.

Related Documentation

export (Protocols RIPng)

Syntax

```
export [ policy-names ];
```

Hierarchy Level

- [edit logical-systems logical-system-name protocols ripng group group-name],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng group group-name],
- [edit protocols ripng group group-name],
- [edit routing-instances routing-instance-name protocols ripng group group-name]

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for routing instances introduced in Junos OS Release 9.0.

Description

Apply a policy or list of policies to routes being exported to the neighbors.

By default, RIPng does not export routes it has learned to its neighbors. To have RIPng export routes, apply one or more export policies. To apply export policies and to filter routes being exported from the local routing device to its neighbors, include the `export` statement and list the name of the policy to be evaluated.

You can define one or more export policies. If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the `metric-in` and `metric-out` statements.

Options

- `policy-names`—Name of one or more policies.

Required Privilege

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Related Documentation

graceful-restart (Protocols RIPng)

Syntax
graceful-restart {
  disable;
  restart-time seconds;
}

Hierarchy Level
[edit logical-systems logical-system-name protocols ripng],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng],
[edit protocols ripng],
[edit routing-instances routing-instance-name protocols ripng]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for routing instances introduced in Junos OS Release 9.0.

Description
Configure graceful restart for RIPng.

Options
disable—Disables graceful restart for RIPng.
The remaining statement is explained separately.

Required Privilege
Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

group (Protocols RIPng)

Syntax

```plaintext
group group-name {
  export [policy-names];
  metric-out metric;
  neighbor neighbor-name {
    import policy-name;
    metric-in metric;
    receive <none>;
    route-timeout seconds;
    send <none>;
    update-interval seconds;
  }
  preference number;
  route-timeout seconds;
  update-interval seconds;
}
```

Hierarchy Level

- [edit logical-systems logical-system-name protocols ripng],
- [edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng],
- [edit protocols ripng],
- [edit routing-instances routing-instance-name protocols ripng]

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for routing instances introduced in Junos OS Release 9.0.

Description

Configure a set of RIPng neighbors that share an export policy and metric. The export policy and metric govern what routes to advertise to neighbors in a given group.

Each group must contain at least one neighbor. You should create a group for each export policy that you have.

Options

- `group-name`—Name of a group, up to 16 characters long.

The remaining statements are explained separately.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

holddown (Protocols RIPng)

Syntax

holddown seconds;

Hierarchy Level

[edit logical-systems logical-system-name protocols ripng],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng],
[edit protocols ripng],
[edit routing-instances routing-instance-name protocols ripng]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for routing instances introduced in Junos OS Release 9.0.

Description

Configure how long the expired route is retained in the routing table before being removed.

Options

seconds—Estimated time to wait before removing expired routes from the routing table.
Default: 180 seconds
Range: 10 through 180 seconds

Required Privilege

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

- [edit protocols ripng group group-name neighbor neighbor-name]
- [edit routing-instances routing-instance-name protocols ripng]
- [edit routing-instances routing-instance-name protocols ripng group group-name neighbor neighbor-name]

Release Information

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for routing instances introduced in Junos OS Release 9.0.

Description

Specify the metric to add to incoming routes when advertising into RIPng routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIPng routes learned through a specific neighbor.

Options

- **metric**—Metric value.
  - **Range:** 1 through 16
  - **Default:** 1

Required Privilege Level

- routing—to view this statement in the configuration.
- routing-control—to add this statement to the configuration.

[edit logical-systems logical-system-name protocols ripng group group-name neighbor neighbor-name],  
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng group group-name neighbor neighbor-name],  
[edit protocols ripng group group-name neighbor neighbor-name],  
[edit routing-instances routing-instance-name protocols ripng group group-name neighbor neighbor-name]
```

**Release Information**  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Support for routing instances introduced in Junos OS Release 9.0.

**Description**  
Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIPng routes sent from this neighbor.

When an export policy is configured, RIPng exports all learned routes to neighbors configured with the `neighbor` statement.

If a route being exported was learned from a member of the same RIPng group, the metric associated with that route (unless modified by an export policy) is the normal RIPng metric. For example, a RIPng route with a metric of 5 learned from a neighbor configured with a `metric-in` value of 2 is advertised with a combined metric of 7 when advertised to RIPng neighbors in the same group. However, if this route was learned from a RIPng neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the `metric-out` statement. The default value for `metric-out` is 1.

To modify the metric for routes advertised outside a group, include the `metric-out` statement.

**Options**  
- `metric`—Metric value.  
  - **Range:** 1 through 16  
  - **Default:** 1

**Required Privilege Level**  
- `routing`—To view this statement in the configuration.  
- `routing-control`—To add this statement to the configuration.

**Related Documentation**  
- [Example: Configuring the Metric Value Added to Imported RIPng Routes](#)
neighbor (Protocols RIPng)

Syntax

neighbor neighbor-name
  import [policy-names ];
  metric-in metric;
  receive <none>;
  route-timeout seconds;
  send <none>;
  update-interval seconds;
}

Hierarchy Level
[edit logical-systems logical-system-name protocols ripng group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng group group-name],
[edit protocols ripng group group-name],
[edit routing-instances routing-instance-name protocols ripng group group-name]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for routing instances introduced in Junos OS Release 9.0.

Description
Configure neighbor-specific RIPng parameters, thereby overriding the defaults set for the routing device.

Options
neighbor-name—Name of an interface over which a routing device communicates to its neighbors.

The remaining statements are explained separately.

Required Privilege
level routing—to view this statement in the configuration.
level routing-control—to add this statement to the configuration.

Related Documentation
• Example: Configuring RIPng
preference (Protocols RIPng)

Syntax

preference preference;

Hierarchy Level

[edit logical-systems logical-system-name protocols ripng group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng group group-name],
[edit protocols ripng group group-name],
[edit routing-instances routing-instance-name protocols ripng group group-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for routing instances introduced in Junos OS Release 9.0.

Description

Specify the preference of external routes learned by RIPng as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIPng. When Junos OS determines that a route is to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

To modify the default RIPng preference value, include the preference statement.

Options

preference—Preference value. A lower value indicates a more preferred route.
Range: 0 through 4,294,967,295 (2^{32} – 1)
Default: 100

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions (Protocols RIPng)

Syntax

traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}

Hierarchy Level

[edit logical-systems logical-system-name protocols ripng],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ripng],
[edit protocols ripng],
[edit routing-instances routing-instance-name protocols ripng]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for routing instances introduced in Junos OS Release 9.0.

Description

Set RIPng protocol-level tracing options.

Default

The default RIPng protocol-level trace options are inherited from the global traceoptions statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as all.

file filename—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIPng tracing output in the file /var/log/ripng-log.

files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files
Default: 10 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.

RIPng Tracing Options

• error—RIPng error packets
• expiration—RIPng route expiration processing
• holddown—RIPng hold-down processing
• nsr-synchronization—Nonstop routing synchronization events
• packets—All RIPng packets
- **request**—RIPng information packets such as request, poll, and poll entry packets
- **trigger**—RIPng triggered updates
- **update**—RIPng update packets

**Global Tracing Options**
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:
- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** \( xk \) to specify KB, \( xm \) to specify MB, or \( xg \) to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

Monitoring RIP Routing Information

**Purpose**
Use the monitoring functionality to monitor RIP routing on routing devices.

**Action**
To view RIP routing information in the J-Web interface, select **Monitor > Routing > RIP Information**.

To view RIP routing information in the CLI, enter the following CLI commands:

- show rip statistics
- show rip neighbor

**Meaning**
Table 369 on page 2997 summarizes key output fields in the RIP routing display in the J-Web interface.

<name>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description
Display information about RIP neighbors.

Options
none—Display information about all RIP neighbors for all instances.

instance (all | instance-name)—(Optional) Display RIP neighbor information for all instances or for only the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name—(Optional) Display detailed information about only the specified RIP neighbor.

Required Privilege Level
view

List of Sample Output
show rip neighbor on page 3004
show rip neighbor (With Demand Circuits Configured) on page 3004

Output Fields
Table 371 on page 3003 lists the output fields for the show rip neighbor command. Output fields are listed in the approximate order in which they appear.

Table 371: show rip neighbor Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the RIP neighbor.</td>
</tr>
</tbody>
</table>

NOTE: Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.

If you configure demand circuits at the [edit protocols rip group group-name neighbor neighbor-name] hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the [edit protocols rip group group-name] hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.
Table 371: show rip neighbor Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the connection: <strong>Up</strong> or <strong>Dn</strong> (Down).</td>
</tr>
<tr>
<td>Source Address</td>
<td>Address of the port on the local router.</td>
</tr>
<tr>
<td>Destination Address</td>
<td>Address of the port on the remote router.</td>
</tr>
<tr>
<td>Send Mode</td>
<td>Send options: <strong>broadcast</strong>, <strong>multicast</strong>, <strong>none</strong>, or <strong>version 1</strong>.</td>
</tr>
<tr>
<td>Receive Mode</td>
<td>Type of packets to accept: <strong>both</strong>, <strong>none</strong>, <strong>version 1</strong>, or <strong>version 2</strong>.</td>
</tr>
<tr>

so-0/1/0.0(DC) Up    10.10.10.2        224.0.0.9        mcast            both           1
so-0/2/0.0(DC) Up    13.13.13.2        224.0.0.9        mcast            both           1
```
show rip statistics

**Syntax**

```
show rip statistics
<instance (all | instance-name)>
<logical-system (all | logical-system-name)>
<name>
<peer (all | address)>
```

**Syntax (EX Series Switches and QFX Series)**

```
show rip statistics
<instance (all | instance-name)>
<name>
```

**Release Information**

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.0 for EX Series switches.
- Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**

Display RIP statistics about messages sent and received on an interface, as well as information received from advertisements from other routing devices.

**Options**

- **none**—Display RIP statistics for all routing instances.
- **instance (all | instance-name)**—(Optional) Display RIP statistics for all instances or for only the specified routing instance.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- **name**—(Optional) Display detailed information about only the specified RIP neighbor.
- **peer (all | address)**—(Optional) Display RIP statistics for a single peer or all peers.

**Required Privilege Level**

**Output Fields**

Table 372 on page 3006 lists the output fields for the show rip statistics command. Output fields are listed in the approximate order in which they appear.
## Table 372: show rip statistics Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RIP info</strong></td>
<td>Information about RIP on the specified interface:</td>
</tr>
<tr>
<td>port</td>
<td>UDP port number used for RIP.</td>
</tr>
<tr>
<td>update interval</td>
<td>Interval between routing table updates, in seconds.</td>
</tr>
<tr>
<td>holddown</td>
<td>Hold-down interval, in seconds.</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout interval, in seconds.</td>
</tr>
<tr>
<td>restart in progress</td>
<td>Graceful restart status. Displayed when RIP is or has been in the process of graceful restart.</td>
</tr>
<tr>
<td>restart time</td>
<td>Estimated time for the graceful restart to finish, in seconds.</td>
</tr>
<tr>
<td>restart will complete in</td>
<td>Remaining time for the graceful restart to finish, in seconds.</td>
</tr>
<tr>
<td>rts learned</td>
<td>Number of routes learned through RIP.</td>
</tr>
<tr>
<td>rts held down</td>
<td>Number of routes held down by RIP.</td>
</tr>
<tr>
<td>rqsts dropped</td>
<td>Number of received request packets that were dropped.</td>
</tr>
<tr>
<td>resps dropped</td>
<td>Number of received response packets that were dropped.</td>
</tr>
<tr>
<td><strong>logical-interface</strong></td>
<td>Name of the logical interface and its statistics:</td>
</tr>
<tr>
<td>routes learned</td>
<td>Number of routes learned on the logical interface.</td>
</tr>
<tr>
<td>routes advertised</td>
<td>Number of routes advertised by the logical interface.</td>
</tr>
<tr>
<td><strong>Counter</strong></td>
<td>List of counter types:</td>
</tr>
<tr>
<td>Updates Sent</td>
<td>Number of update messages sent.</td>
</tr>
<tr>
<td>Triggered Updates Sent</td>
<td>Number of triggered update messages sent.</td>
</tr>
<tr>
<td>Responses Sent</td>
<td>Number of response messages sent.</td>
</tr>
<tr>
<td>Bad Messages</td>
<td>Number of invalid messages received.</td>

**Operational Commands:** RIPng
clear ripng general-statistics

Syntax
clear ripng general-statistics
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)
clear ripng general-statistics

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description
Clear RIP next generation (RIPng) general statistics.

Options
none—Clear RIPng general statistics.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege
Level
clear

### Understanding Distributed Periodic Packet Management on EX Series Switches

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the Juniper Networks EX Series Ethernet Switch can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocols, and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on EX3200, EX4200, and EX4500 switches) or
the line cards (on EX6200 and EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

**BEST PRACTICE:** We recommend that, generally, you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

- Configuring Static Routing (J-Web Procedure) on page 3024
- Configuring Distributed Periodic Packet Management on an EX Series Switch (CLI Procedure) on page 3026
Configuring Static Routing (CLI Procedure)

Static routes are routes that are manually configured and entered into the routing table. Dynamic routes, in contrast, are learned by the EX Series switch and added to the routing table using a protocol such as OSPF or RIP.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) preference value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, 0 is the lowest and 255 is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:

  ```
  [edit]
  user@switch# set routing-options static route 0.0.0.0/0 next-hop 10.0.1.1
  ```

- To configure a static route and specify the next address to be used when routing traffic to the static route:

  ```
  [edit]
  user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
  ```

- To always keep the static route in the forwarding table:

  ```
  [edit]
  user@switch# set routing-options static route 20.0.0.0/24 retain
  ```

- To prevent the static route from being readvertised:

  ```
  [edit]
  user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
  ```

- To remove inactive routes from the forwarding table:

  ```
  [edit]
  user@switch# set routing-options static route 20.0.0.0/24 active
  ```

Configuring Static Routing (J-Web Procedure)

You can use the J-Web interface to configure static routes for EX Series switches.

To configure static routes:

1. Select **Configure > Routing > Static Routing**. The Static Routing page displays details of the configured routes.
NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See Using the Commit Options to Commit Configuration Changes for details about all commit options.

2. Click one of the following options:

- **Add**—To configure a route. Enter information into the routing page as described in Table 378 on page 3025.

- **Edit**—To modify an existing route. Enter information into the routing page as described in Table 378 on page 3025.

- **Delete**—To delete an existing route.

### Table 378: Static Routing Configuration Summary

<table>
<thead>
<tr>

### Configuring Distributed Periodic Packet Management on an EX Series Switch (CLI Procedure)

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes on the EX Series switch can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on EX3200, EX4200, and EX4500 switches) or the line cards (on EX6200 and EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

**BEST PRACTICE:** We recommend that, generally, you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

This topic describes:
- Disabling or Enabling Distributed Periodic Packet Management Globally on page 3027
- Disabling or Enabling Distributed Periodic Packet Management for LACP Packets on page 3027
Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:
```
[edit routing-options]
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:
```
[edit routing-options]
user@switch# delete ppm no-delegate-processing
```

Disabling or Enabling Distributed Periodic Packet Management for LACP Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:
```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:
```
[edit protocols]
user@switch# delete lacp ppm centralized
```

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description
Determine whether static, aggregate, or generated routes are removed from the routing and forwarding tables when they become inactive. Static routes are only removed from the routing table if the next hop becomes unreachable. This can occur if the local or neighbor interface goes down. Routes that have been configured to remain continually installed in the routing and forwarding tables are marked with reject next hops when they are inactive.

- active—Remove a route from the routing and forwarding tables when it becomes inactive.
- passive—Have a route remain continually installed in the routing and forwarding tables even when it becomes inactive.

Include the active statement when configuring an individual route in the route portion of the static statement to override a passive option specified in the defaults portion of the statement.

Default active

Required Privilege Level
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure aggregate routes.

Options

aggregate-options—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in aggregate-options. Each option is explained separately.

- (active | passive);
- as-path <as-path> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator as-number ip-address>;
- (brief | full);
- community [ community-ids ];
- discard;
- (metric | metric2 | metric3 | metric4) value <type type>;
- (preference | preference2 | color | color2) preference <type type>;
- tag string;

defaults—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults
and apply to all the aggregate routes you configure in the `aggregate` statement. This part of the `aggregate` statement is optional.

`route destination-prefix`—Configure a nondefault aggregate route:

- `default`—For the default route to the destination. This is equivalent to specifying an IP address of 0.0.0.0/0.
- `destination-prefix/prefix-length`—`destination-prefix` is the network portion of the IP address, and `prefix-length` is the destination prefix length.

The `policy` statement is explained separately.

**Required Privilege**
- Level
  - `routing`—To view this statement in the configuration.
  - `routing-control`—To add this statement to the configuration.

```

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description
Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.

In Junos OS Release 9.1 and later, the numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4 Path and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: `<16-bit high-order value in decimal>.<16-bit low-order value in decimal>`. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.

Default
No AS path information is associated with static routes.

Options
```
aggregator—(Optional) Attach the BGP aggregator path attribute to the aggregate route.

You must specify the last AS number that formed the aggregate route (encoded as two octets) for as-number, followed by the IP address of the BGP system that formed the aggregate route for ip-address.
```
**as-path**—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ([ ]). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for **as-path**. You must use a complete, valid AS path.

**atomic-aggregate**—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

**origin egp**—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

**origin igp**—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

**origin incomplete**—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

**Required Privilege**

- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

```

### Release Information

- Statement introduced in Junos OS Release 7.6.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Support for the BFD protocol introduced in Junos OS Release 9.6.
- Support for the BFD protocol introduced in Junos OS Release 9.6 for EX Series switches.
- Support for IS-IS introduced in JUNOS OS Release 11.2.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

### Description

Configure authentication key updates for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol. When the `authentication-key-chains` statement is configured at the `[edit security]` hierarchy level, and is associated with the BGP, LDP, or IS-IS protocols at the `[edit protocols]` hierarchy level or with the BFD protocol using the `bfd-liveness-detection` statement, authentication key updates can occur without interrupting routing and signaling protocols such as Open Shortest Path First (OSPF) and Resource Reservation Setup Protocol (RSVP).

The remaining statements are explained separately.

### Required Privilege Level

- admin—To view this statement in the configuration.
- admin-control—To add this statement to the configuration.

**Description**
Specify the routing device’s AS number.

An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States ([http://www.isi.edu](http://www.isi.edu)).

If you are using BGP on the routing device, you must configure an AS number.

The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.

In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: `<16-bit high-order value in decimal>.<16-bit low-order value in decimal>`. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 110 in the AS-dot notation format.

**Options**
- **autonomous-system**—AS number. Use a number assigned to you by the NIC.
Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
  routing-options {
    autonomous-system 65546;
  }
```

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
  routing-options {
    autonomous-system 1.10;
  }
```

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
  routing-options {
    autonomous-system 60000;
  }
```

asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

Default: Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

loops number—(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure loops 1, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure loops 2, the route is hidden if the AS number is detected in the path two or more times.

Range: 1 through 10

Default: 1

NOTE: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the independent-domain option if the loops statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.

[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]

Release Information  
Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 9.5 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description  
Configure a backup provider edge (PE) group for ingress PE redundancy when point-to-multipoint label-switched paths (LSPs) are used for multicast distribution.

Options  
backups addresses—Specify the address of backup PE routers for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.
local-address address—Specify the address of the local PE router for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.
pe-group-name—Specify the name for the group of PE routers that provide ingress PE router redundancy for point-to-multipoint LSPs.
### backups

**Syntax**

```
backups [ addresses ];
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast backup-pe-group group-name],
[edit logical-systems logical-system-name routing-options multicast backup-pe-group group-name],
[edit routing-instances routing-instance-name routing-options multicast backup-pe-group group-name],
[edit routing-options multicast backup-pe-group group-name]
```

**Release Information**

- Statement introduced in Junos OS Release 9.0.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure the addresses of backup PEs for ingress PE redundancy when point-to-multipoint label-switched paths (LSPs) are used for multicast distribution.

**Options**

- `addresses`—Addresses of other PEs in the backup group.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**

- [Example: Configuring Ingress PE Redundancy](#)
**bandwidth (Multicast Flow Map)**

**Syntax**  
bandwidth ( bps | adaptive );

**Hierarchy Level**  
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast flow-map],  
[edit logical-systems logical-system-name routing-options multicast flow-map],  
[edit routing-instances routing-instance-name routing-options multicast flow-map],  
[edit routing-options multicast flow-map]

**Release Information**  
Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**  
Configure the bandwidth property for multicast flow maps.

**Options**  
adaptive—Specify that the bandwidth is measured for the flows that are matched by the flow map.

- **bps**—Bandwidth, in bits per second, for the flow map.
  
  **Range:** 0 through any amount of bandwidth
  
  **Default:** 2 Mbps

**Required Privilege Level**  
routing—To view this statement in the configuration.

- routing-control—To add this statement to the configuration.

**Related Documentation**

Release Information
Statement introduced before Junos OS Release 7.4.
detection-time threshold and transmit-interval threshold options introduced in Junos OS Release 8.2.
local-address statement introduced in Junos OS Release 8.2.
minimum-receive-tti statement introduced in Junos OS Release 8.2.
Support for logical routers introduced in Junos OS Release 8.3.
holddown-interval statement introduced in Junos OS Release 8.5.
no-adaptation statement introduced in Junos OS Release 9.0.
Support for IPv6 static routes introduced in Junos OS Release 9.1.
authentication algorithm, authentication key-chain, and authentication loose-check statements introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.1 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description
Configure bidirectional failure detection timers and authentication criteria for static routes.
Options

authentication algorithm algorithm-name — Configure the algorithm used to authenticate the specified BFD session: simple-password, keyed-md5, keyed-sha-1, meticulous-keyed-md5, or meticulous-keyed-sha-1.

authentication key-chain key-chain-name — Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the authentication-key-chains key-chain statement at the [edit security] hierarchy level.

authentication loose-check — (Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold milliseconds — Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

holddown-interval milliseconds — Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

Range: 0 through 255,000
Default: 0

local-address ip-address — Enable a multihop BFD session and configure the source address for the BFD session.

minimum-interval milliseconds — Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the transmit-interval minimum-interval and minimum-receive-interval statements.

Range: 1 through 255,000

minimum-receive-interval milliseconds — Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the minimum-interval statement at the [edit routing-options static route destination-prefix bfd-liveness-detection] hierarchy level.

Range: 1 through 255,000

minimum-receive-ttl number — Configure the time to live (TTL) for the multihop BFD session.

Range: 1 through 255
Default: 255

multiplier number — Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

Range: 1 through 255
Default: 3
neighbor address—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

no-adaptation—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold milliseconds—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295

transmit-interval minimum-interval milliseconds—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the minimum-interval statement at the [edit routing-options static route destination-prefix bfd-liveness-detection] hierarchy level.

Range: 1 through 255,000

version—Configure the BFD version to detect: 1 (BFD version 1) or automatic (autodetect the BFD version).

Default: automatic

Required Privilege
Level routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**bmp**

**Syntax**

```plaintext
bmp {
  memory-limit bytes;
  station-address (ip-address | name);
  station-port port-number;
  statistics-timeout seconds;
}
```

**Hierarchy Level**

[edit routing-options]

**Release Information**

Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 9.5 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP Adjacency-RIB-In routing tables and periodically send that data to a monitoring station.

**Options**

- **memory-limit bytes**—(Optional) Specify a threshold at which to stop collecting BMP data if the limit is exceeded.

  **Default:** 10 MB

  **Range:** 1,048,576 through 52,428,800

- **station-address (ip-address | name)**—Specify the IP address or a valid URL for the monitoring where BMP data should be sent.

- **station-port port-number**—Specify the port number of the monitoring station to use when sending BMP data.

- **statistics-timeout seconds**—(Optional) Specify how often to send BMP data to the monitoring station.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-options rib routing-table-name (aggregate | generate) (defaults | route)],

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 11.3 for the QFX Series.

Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure all AS numbers from all contributing paths to be included in the aggregate or generated route's path.

- **brief**—Include only the longest common leading sequences from the contributing AS paths. If this results in AS numbers being omitted from the aggregate route, the BGP ATOMIC_ATTRIBUTE path attribute is included with the aggregate route.

- **full**—Include all AS numbers from all contributing paths in the aggregate or generated route's path. Include this option when configuring an individual route in the `route` portion of the `generate` statement to override a `retain` option specified in the `defaults` portion of the statement.

**Default**

full

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**Related Documentation**

- Example: Summarizing Routes Through Route Aggregation
- Example: Conditionally Generating Static Routes
  - aggregate on page 3030
  - generate on page 3062
centralized

Syntax  centralized;

Hierarchy Level  [edit protocols lACP ppm]

Release Information  Statement introduced in Junos OS Release 10.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  Disable distributed periodic packet management (PPM) processing for Link Aggregation
Control Protocol (LACP) packets and run all PPM processing for LACP packets on the
Routing Engine.

This statement disables distributed PPM processing for only LACP packets. You can
disable distributed PPM processing for all packets that use PPM and run all PPM
processing on the Routing Engine by configuring the no-delegate-processing statement
in the [edit routing-options ppm] hierarchy.

BEST PRACTICE: We generally recommend that you disable distributed PPM
only if Juniper Networks Customer Service advises you to do so. You should
disable distributed PPM only if you have a compelling reason to disable it.

Default  Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege  Level  routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation  • Configuring Distributed Periodic Packet Management on an EX Series Switch (CLI Procedure) on page 3026
• Configuring Aggregated Ethernet LACP (CLI Procedure) on page 2339

[edit routing-options routing-table-name (aggregate | generate | static) (defaults | route)],
[edit routing-optionsrib routing-table-name (aggregate | generate | static) (defaults | route)],

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description  
Associate BGP community information with a static, aggregate, or generated route.

Default  
No BGP community information is associated with static routes.

Options  
community-ids—One or more community identifiers. The community-ids format varies according to the type of attribute that you use.

The BGP community attribute format is as-number:community-value:

- as-number—AS number of the community member. It can be a value from 1 through 65,535. The AS number can be a decimal or hexadecimal value.
- community-value—Identifier of the community member. It can be a number from 0 through 65,535.

For more information about BGP community attributes, see the “Configuring the Extended Communities Attribute” section in the Routing Policy Feature Guide for Routing Devices.

For specifying the BGP community attribute only, you also can specify community-ids as one of the following well-known community names defined in RFC 1997:

- no-advertise—Routes containing this community name are not advertised to other BGP peers.
- no-export—Routes containing this community name are not advertised outside a BGP confederation boundary.
- no-export-subconfed—Routes containing this community name are not advertised to external BGP peers, including peers in other members’ ASs inside a BGP confederation.
NOTE: Extended community attributes are not supported at the [edit routing-options] hierarchy level. You must configure extended communities at the [edit policy-options] hierarchy level. For information about configuring extended communities, see the Routing Policy Feature Guide for Routing Devices.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

### confederation

**Syntax**

```
confederation confederation-autonomous-system members [ autonomous-systems ];
```

**Hierarchy Level**

- [edit logical-systems logical-system-name routing-options],
- [edit routing-options]

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Specify the routing device's confederation AS number.

If you administer multiple ASs that contain a very large number of BGP systems, you can group them into one or more confederations. Each confederation is identified by its own AS number, which is called a confederation AS number. To external ASs, a confederation appears to be a single AS. Thus, the internal topology of the ASs making up the confederation is hidden.

The BGP path attributes `NEXT_HOP`, `LOCAL_PREF`, and `MULTI_EXIT_DISC`, which normally are restricted to a single AS, are allowed to be propagated throughout the ASs that are members of the same confederation.

Because each confederation is treated as if it were a single AS, you can apply the same routing policy to all the ASs that make up the confederation.

Grouping ASs into confederations reduces the number of BGP connections required to interconnect ASs.

If you are using BGP, you can enable the local routing device to participate as a member of an AS confederation. To do this, include the `confederation` statement.

Specify the AS confederation identifier, along with the peer AS numbers that are members of the confederation.

Note that peer adjacencies do not form if two BGP neighbors disagree about whether an adjacency falls within a particular confederation.

**Options**

- `autonomous-systems`—AS numbers of the confederation members.
  - **Range:** 1 through 65,535

- `confederation-autonomous-system`—Confederation AS number. Use one of the numbers assigned to you by the NIC.
  - **Range:** 1 through 65,535

**Required Privilege**

- **Level:**
  - `routing`—To view this statement in the configuration.
  - `routing-control`—To add this statement to the configuration.

[edit logical-systems logical-system-name routing-options (aggregate | generate) (defaults | route)],
```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

To propagate static routes into the routing protocols, include the `discard` statement when you define the route, along with a routing policy.

**NOTE:** In other vendors' software, a common way to propagate static routes into routing protocols is to configure the routes so that the next-hop routing device is the loopback address (commonly, 127.0.0.1). However, configuring static routes in this way (by including a statement such as `route address/mask-length next-hop 127.0.0.1`) does not propagate the static routes, because the forwarding table ignores static routes whose next-hop routing device is the loopback address.

**Default**

When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

[edit routing-options forwarding-table]
```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Apply one or more policies to routes being exported from the routing table into the forwarding table.

In the `export` statement, list the name of the routing policy to be evaluated when routes are being exported from the routing table into the forwarding table. Only active routes are exported from the routing table.

You can reference the same routing policy one or more times in the same or a different `export` statement.

You can apply export policies to routes being exported from the routing table into the forwarding table for the following features:

- Per-packet load balancing
- Class of service (CoS)

Options

`policy-name`—Name of one or more policies.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

fate-sharing

Syntax
fate-sharing {  
group group-name {  
cost value;  
from address <to address>;  
}  
}  

Hierarchy Level  
[edit logical-systems logical-system-name routing-options],  
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],  
[edit routing-options],  
[edit routing-instances routing-instance-name routing-options]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Specify a backup path in case the primary path becomes unusable.

You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.

Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.

Options
cost value—Cost assigned to the group.  
Range: 1 through 65,535  
Default: 1

from address—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate from addresses in the group.

group group-name—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.

to address—(Optional) Address of egress router. For point-to-point link objects, you must specify both a from and a to address.

Required Privilege Level  
routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits, the threshold at which a warning message is logged, and timeout values.

Specify a value for the threshold at which to suppress new multicast forwarding cache entries and an optional reuse value for the threshold at which the router begins to create new multicast forwarding cache entries. The range for both is from 1 through 200,000. If configured, the reuse value should be less than the suppression threshold value. The suppression value is mandatory. If you do not specify the optional reuse value, then the number of multicast forwarding cache entries is limited to the suppression value. A new entry is created as soon as the number of multicast forwarding cache entries falls below the suppression value.

You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the `threshold` statement globally for the multicast forwarding cache or including the `family` statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.

**Default**

By default, there are no limits on the number of multicast forwarding cache entries.

**Options**

- `family (inet | inet6)`—(Optional) Apply the configured thresholds to either IPv4 or IPv6 multicast forwarding cache entries.

**Default**

By default, the configured thresholds are applied to both IPv4 and IPv6 multicast forwarding cache entries.
The remaining statements are explained separately.

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options rib routing-table-name],
[edit routing-options],
[edit routing-options rib routing-table-name]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure generated routes, which are used as routes of last resort.

Options

**defaults**—(Optional) Specify global generated route options. These options only set default attributes inherited by all newly created generated routes. These are treated as global defaults and apply to all the generated routes you configure in the `generate` statement.

**generate-options**—Additional information about generated routes, which is included with the route when it is installed in the routing table. Specify zero or more of the following options in **generate-options**. Each option is explained separately.

- (active | passive);
- as-path <as-path> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator as-number in-address>;
- (brief | full);
- community [ community-ids ];
- discard;
- (metric | metric2 | metric3 | metric4) value <type type>;
- (preference | preference2 | color | color2) preference <type type>;
- tag string;

**route destination-prefix**—Configure a non-default generated route:

- default—For the default route to the destination. This is equivalent to specifying an IP address of 0.0.0.0/0.
- **destination-prefix/prefix-length**—/destination-prefix is the network portion of the IP address, and **prefix-length** is the destination prefix length.

The **policy** statement is explained separately.

**Required Privilege**

**Level** routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

import-policy [ policy-names ];
```

Hierarchy Level  
```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options rib-groups group-name],
[edit logical-systems logical-system-name routing-options rib-groups group-name],
[edit routing-instances routing-instance-name routing-options rib-groups group-name],
[edit routing-options rib-groups group-name]
```

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  
Apply one or more policies to routes imported into the routing table group. The `import-policy` statement complements the `import-rib` statement and cannot be used unless you first specify the routing tables to which routes are being imported.

NOTE: On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

Options  
- `policy-names`—Name of one or more policies.

Required Privilege
- Level  
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

import-rib

**Syntax**

import-rib [ **routing-table-names** ];

**Hierarchy Level**

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options rib-groups group-name],
[edit logical-systems logical-system-name routing-options rib-groups group-name],
[edit routing-instances routing-instance-name routing-options rib-groups group-name],
[edit routing-options rib-groups group-name]

**Release Information**

Statement introduced before Junos OS Release 7.4,
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Specify the name of the routing table into which Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be inet.0 or **routing-instance-name.inet.0**. For IPv6 import routing tables, the primary routing table must be inet6.0.

In Junos OS Release 9.5 and later, you can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4. In releases prior to Junos OS Release 9.5, you could configure an import routing table with only either IPv4 or IPv6 routing tables.

---

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

---

**Options**

**routing-table-names**—Name of one or more routing tables.

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

indirect-next-hop

**Syntax**
(indirect-next-hop | no-indirect-next-hop);

**Hierarchy Level**
[edit logical-systems logical-system-name routing-options forwarding-table],
[edit routing-options forwarding-table]

**Release Information**
Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Enable indirectly connected next hops for route convergence. This statement is implemented on the Packet Forward Engine to speed up forwarding information base (FIB) updates. Configuring this statement significantly speeds convergence times. The only downside of configuring this statement is that some additional FIB memory overhead is required. Unless routes have an extremely high number of next hops, this increased memory usage should not be noticeable.

**NOTE:**
- When virtual private LAN service (VPLS) is configured on the routing device, the indirect-next-hop statement is configurable at the [edit routing-options forwarding-table] hierarchy level. However, this configuration is not applicable to indirect nexthops specific to VPLS routing instances.
- By default, the Junos Trio Modular Port Concentrator (MPC) chipset on MX Series routers is enabled with indirectly connected next hops, and this cannot be disabled using the no-indirect-next-hop statement.

**Default**
Disabled.

**Options**
indirect-next-hop—Enable indirectly connected next hops.

no-indirect-next-hop—Explicitly disable indirect next hops.

**Required Privilege Level**
routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

**Related Documentation**
- Example: Optimizing Route Reconvergence by Enabling Indirect Next Hops on the Packet Forwarding Engine
install (Routing Options)

Syntax  (install | no-install);

Hierarchy Level  [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options static (defaults | route)],
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options rib routing-table-name static (defaults | route)],

Release Information

Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Enable multicast traffic on an interface.

By default, multicast packets are forwarded by enabling Protocol Independent Multicast (PIM) on an interface. PIM adds multicast routes into the routing table.

You can also configure multicast packets to be forwarded over a static route, such as a static route associated with an LSP next hop. Multicast packets are accepted on an interface and forwarded over a static route in the forwarding table. This is useful when you want to enable multicast traffic on a specific interface without configuring PIM on the interface.

You cannot enable multicast traffic on an interface and configure PIM on the same interface simultaneously.

Static routes must be configured before you can enable multicast on an interface. Configuring the `interface` statement alone does not install any routes into the routing table. This feature relies on the static route configuration.

Options

- `interface-names`—Name of one or more interfaces on which to enable multicast traffic.

The remaining statements are explained separately.

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

[edit routing-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

NOTE: On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

Description

Associate a routing table group with the routing device’s interfaces, and specify routing table groups into which interface routes are imported.

By default, IPv4 interface routes (also called direct routes) are imported into routing table inet.0, and IPv6 interface routes are imported into routing table inet6.0. If you are configuring alternate routing tables for use by some routing protocols, it might be necessary to import the interface routes into the alternate routing tables. To define the routing tables into which interface routes are imported, you create a routing table group and associate it with the routing device’s interfaces.

To create the routing table groups, include the passive statement at the [edit routing-options] hierarchy level.

If you have configured a routing table, configure the OSPF primary instance at the [edit protocols ospf] hierarchy level with the statements needed for your network so that routes are installed in inet.0 and in the forwarding table. Make sure to include the routing table group.

To export local routes, include the export statement.

To export LAN routes, include the lan option. To export point-to-point routes, include the point-to-point option.
Only local routes on point-to-point interfaces configured with a destination address are exportable.

**Options**
- **inet**—Specify the IPv4 address family.
- **inet6**—Specify the IPv6 address family.
- **lan**—Export LAN routes.
- **point-to-point**—Export point-to-point routes.

The remaining statements are explained separately.

**Required Privilege**
- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

```

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure martian addresses.

**Options**

- `allow`—(Optional) Explicitly allow a subset of a range of addresses that has been disallowed. The `allow` option is the only supported action.

- `destination-prefix`—Destination route you are configuring:
  - `destination-prefix/prefix-length`—`destination-prefix` is the network portion of the IP address, and `prefix-length` is the destination prefix length.
  - `default`—Default route to use when routing packets do not match a network or host in the routing table. This is equivalent to specifying the IP address `0.0.0.0/0`.

- `match-type`—Criteria that the destination must match:
  - `exact`—Exactly match the route’s mask length.
  - `longer`—The route’s mask length is greater than the specified mask length.
  - `orlonger`—The route’s mask length is equal to or greater than the specified mask length.
  - `through destination-prefix`—The route matches the first prefix, the route matches the second prefix for the number of bits in the route, and the number of bits in the route is less than or equal to the number of bits in the second prefix.
  - `upto prefix-length`—The route’s mask length falls between the two destination prefix lengths, inclusive.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

```

**Release Information**

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
**dynamic-profiles** hierarchy level added in Junos OS Release 11.2.

**Description**

Configure the multicast bandwidth for the interface.

**Options**

- **bps**—Bandwidth rate, in bits per second, for the multicast interface.

**Range:** 0 through any amount of bandwidth

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

**Related Documentation**

- *Example: Configuring Martian Addresses*

- *Example: Defining Interface Bandwidth Maximums*
maximum-paths

Syntax

maximum-paths path-limit <log-interval seconds> <log-only | threshold value>;

Hierarchy Level

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information

Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Configure a limit for the number of routes installed in a routing table based upon the route path.

NOTE: The maximum-paths statement is similar to the maximum-prefixes statement. The maximum-prefixes statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

OSPF 10.10.10.0/24
ISIS 10.10.10.0/24

These are two routes, but only one destination (prefix). The maximum-paths limit applies the total number of routes (two). The maximum-prefixes limit applies to the total number of unique prefixes (one).

Options

log-interval seconds—(Optional) Minimum time interval (in seconds) between log messages.
Range: 5 through 86,400

log-only—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.

path-limit—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.
Range: 1 through 4,294,967,295 (2^{32} – 1)
Default: No default

threshold value—(Optional) Percentage of the maximum number of routes that starts triggering a warning. You can configure a percentage of the path-limit value that starts triggering the warnings.
Range: 1 through 100
NOTE: When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the path-limit value, then additional routes are rejected.

Required Privilege Level
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

maximum-prefixes

Syntax
maximum-prefixes prefix-limit <log-interval seconds> <log-only | threshold percentage>;

Hierarchy Level
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information
Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure a limit for the number of routes installed in a routing table based upon the route prefix.

Using a prefix limit, you can curtail the number of prefixes received from a CE router in a VPN. Prefix limits apply only to dynamic routing protocols and are not applicable to static or interface routes.

NOTE: The maximum-prefixes statement is similar to the maximum-paths statement. The maximum-prefixes statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

OSPF 10.10.10.0/24
ISIS 10.10.10.0/24

These are two routes, but only one destination (prefix). The maximum-paths limit applies the total number of routes (two). The maximum-prefixes limit applies to the total number of unique prefixes (one).

Options
log-interval seconds—(Optional) Minimum time interval (in seconds) between log messages.
Range: 5 through 86,400

log-only—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.

prefix-limit—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.
Range: 1 through 4,294,967,295
Default: No default

threshold value—(Optional) Percentage of the maximum number of prefixes that starts triggering a warning. You can configure a percentage of the prefix-limit value that starts triggering the warnings.
Range: 1 through 100

NOTE: When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the prefix-limit value, then additional routes are rejected.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

med-igp-update-interval

Syntax med-igp-update-interval minutes;

Hierarchy Level [edit routing-options]

Release Information Statement introduced in Junos OS Release 9.0
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure a timer for how long to delay updates for the multiple exit discriminator (MED) path attribute for BGP groups and peers configured with the metric-out igp offset delay-med-update statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

Options minutes—Interval to delay MED updates.
Range: 10 through 600
Default: 10 minutes

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

**metric (Aggregate, Generated, or Static Route)**

**Syntax**

```
(metric | metric2 | metric3 | metric4) metric <type type>;
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-options (aggregate | generate | static) 
 (defaults | route )],
[edit routing-options (aggregate | generate | static) (defaults | route )]
```

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Specify the metric value for an aggregate, generated, or static route. You can specify up to four metric values, starting with `metric` (for the first metric value) and continuing with `metric2`, `metric3`, and `metric4`.

**Options**

- `metric`—Metric value.
  
  **Range:** 0 through 4,294,967,295 ($2^{32} – 1$)

- `type type`—(Optional) Type of route.

  When routes are exported to OSPF, type 1 routes are advertised in type 1 externals, and routes of any other type are advertised in type 2 externals. Note that if a qualified-next-hop metric value is configured, this value overrides the route metric.

  **Range:** 1 through 16

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure the types of system logging messages sent about the routing protocols process to the system message logging file. These messages are also displayed on the system console. You can log messages at a particular level, or up to and including a particular level.

Options

- `level level`—Severity of the message. It can be one or more of the following levels, in order of decreasing urgency:
  - `alert`—Conditions that should be corrected immediately, such as a corrupted system database.
  - `critical`—Critical conditions, such as hard drive errors.
  - `debug`—Software debugging messages.
  - `emergency`—Panic or other conditions that cause the system to become unusable.
  - `error`—Standard error conditions.
  - `info`—Informational messages.
  - `notice`—Conditions that are not error conditions, but might warrant special handling.
  - `warning`—System warning messages.
  - `upto level level`—Log all messages up to a particular level.

Required Privilege Level

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Internet Group Management Protocol (IGMP) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the pim-to-igmp-proxy statement enables you to use IGMP to forward IPv4 multicast traffic across the PIM sparse mode domains.

The remaining statement is explained separately.

Required Privilege

Level

routing—to view this statement in the configuration.
routing-control—to add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Associate a routing policy when configuring an aggregate or generated route's destination prefix in the `routes` part of the `aggregate` or `generate` statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route.

If the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or `primary`, contributor. A rejected contributor still can contribute to a less specific aggregate route.

If you do not specify a policy filter, all candidate routes contribute to an aggregate route.

The following algorithm is used to compare two generated contributing routes in order to determine which one is the primary or preferred contributor:

1. Compare the protocol's `preference` of the contributing routes. The lower the preference, the better the route. This is similar to the comparison that is done while determining the best route for the routing table.
2. Compare the protocol's `preference2` of the contributing routes. The lower `preference2` value is better. If only one route has `preference2`, then this route is preferred.
3. The preference values are the same. Proceed with a numerical comparison of the prefixes' values.
   a. The primary contributor is the numerically smallest prefix value.
   b. If the two prefixes are numerically equal, the primary contributor is the route that has the smallest prefix length value.
At this point, the two routes are the same. The primary contributor does not change. An additional next hop is available for the existing primary contributor.

A rejected contributor still can contribute to less specific generated route. If you do not specify a policy filter, all candidate routes contribute to a generated route.

**Options**

- **policy-name**—Name of a routing policy.

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

ppm

Syntax  ppm {
  no-delegate-processing;
}

Hierarchy Level  [edit logical-systems logical-system-name routing-options],
                 [edit routing-options]

                     Statement introduced in Junos OS Release 10.2 for EX Series switches.
                     Statement introduced in Junos OS Release 11.3 for the QFX Series.
                     Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description  (M120, M320, MX Series, T Series, TX Matrix routers, M7i and M10i routers with Enhanced
             CFEB [CFEB-E], EX Series switches, and QFX Series only) Disable distributed periodic
             packet management (PPM) to the Packet Forwarding Engine (on routers), to access
             ports (on EX3200 and EX4200 switches, and QFX Series), or to line cards (on EX6200
             and EX8200 switches).

             After you disable PPM, PPM processing continues to run on the Routing Engine.

             In Junos OS Release 8.2, PPM was moved from the Routing Engine to the Packet
             Forwarding Engine, access ports, or line cards. The no-delegate-processing statement
             disables the default behavior and restores the legacy behavior.

Default  Distributed PPM processing is enabled for all protocols that use PPM.

Options  no-delegate-processing—Disable PPM to the Packet Forwarding Engine, access ports, or
         line cards. Distributed PPM is enabled by default.

Required Privilege Level  routing—To view this statement in the configuration.
                          routing-control—To add this statement to the configuration.

Related Documentation  • Configuring Distributed Periodic Packet Management on an EX Series Switch (CLI

### ppm (Ethernet Switching)

**Syntax**

```plaintext
ppm {
    centralized;
}
```

**Hierarchy Level**

```
[edit protocols lacp]
```

**Release Information**

- Statement introduced in Junos OS Release 10.2 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- Statement introduced in Junos OS Release 12.1 for T Series devices.

**Description**

Configure PPM processing options for Link Aggregation Control Protocol (LACP) packets.

This command configures the PPM processing options for LACP packets only. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the `no-delegate-processing` configuration statement in the `[edit routing-options ppm]` configuration hierarchy.

**Default**

Distributed PPM processing is enabled for all packets that use PPM.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Release Information**

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Preference value for a static, aggregate, or generated route. You also can specify a secondary preference value (`preference2`), as well as colors, which are even finer-grained preference values (`color` and `color2`).

If the Junos OS routing table contains a dynamic route to a destination that has a better (lower) preference value than the static, aggregate, or generated route, the dynamic route is chosen as the active route and is installed in the forwarding table.

**Options**

`preference`—Preference value. A lower number indicates a more preferred route.

- **Range**: 0 through 4,294,967,295 (2^{32} – 1)
- **Default**: 5 (for static routes), 130 (for aggregate and generated routes)

`type type`—(Optional) Type of route.

- **Range**: 1 through 16

**Required Privilege Level**

- **routing**—To view this statement in the configuration.
- **routing-control**—To add this statement to the configuration.

[edit routing-options static route destination-prefix]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure a static route with multiple possible next hops, each of which can have its own preference value, IGP metric that is used when the route is exported into an IGP, and Bidirectional Forwarding Detection (BFD) settings. If multiple links are operational, the one with the most preferred next hop is used. The most preferred next hop is the one with the lowest preference value.

Options

address—IPv4, IPv6, or ISO network address of the next hop.

interface-name—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered interface as the next-hop..
interface for a static route, specify qualified-next-hop interface-name, where
interface-name is the name of the IPv4 or IPv6 unnumbered interface.

NOTE: For an Ethernet interface to be configured as the qualified next hop
for a static route, it must be an unnumbered interface.

To configure an Ethernet interface as an unnumbered interface, configure
the unnumbered-address <interface-name> statement at the [edit interfaces
<interface-name> unit <logical-unit-number> family <family-name>] hierarchy
level as described in Configuring an Unnumbered Interface.

The remaining statements are explained separately.

Required Privilege
Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

  (defaults | route)],
[edit routing-instances routing-instance-name routing-options static (defaults | route)],
[edit routing-optionsrib routing-table-name static (defaults | route)],
[edit routing-options static (defaults | route)]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description
Configure whether static routes are eligible to be readvertised by routing protocols:

Default
Static routes are eligible to be readvertised (that is, exported from the routing table into
dynamic routing protocols) if a policy to do so is configured. To mark an IPv4 static route
as being ineligible for readvertisement, include the no-readvertise statement.

Options
readvertise—Readvertise static routes. Include the readvertise statement when configuring
an individual route in the route portion of the static statement to override a
no-readvertise option specified in the defaults portion of the statement.

no-readvertise—Mark a static route as being ineligible for readvertisement. Include the
no-readvertise option when configuring the route.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

### redundant-sources

**Syntax**

```plaintext
redundant-sources [ addresses ];
```

**Hierarchy Level**

- `edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast flow-map flow-map-name`
- `edit logical-systems logical-system-name routing-options multicast flow-map flow-map-name`
- `edit routing-instances routing-instance-name routing-options multicast flow-map flow-map-name`
- `edit routing-options multicast flow-map flow-map-name`

**Release Information**

- Statement introduced in Junos OS Release 8.3.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Configure a list of redundant sources for multicast flows defined by a flow map.

**Options**

- **addresses**—List of IPv4 or IPv6 addresses for use as redundant (backup) sources for multicast flows defined by a flow map.

**Required Privilege**

- **Level**
  - **rout**ing—To view this statement in the configuration.
  - **route**ing-control—To add this statement to the configuration.

**Related Documentation**

resolution

Syntax  
resolution {
rib routing-table-name {
import [policy-names ];
resolution-ribs [routing-table-names ];
}
}

Hierarchy Level  
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information  
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  
Configure the router to perform custom route resolution on protocol next hops of routes in a certain routing table. The protocol next hop is used to determine the forwarding next-hop.

For example, you might want to direct inet.2 route resolution to use topology routing tables :red.inet.0 and :blue.inet.0 for protocol next-hop IP address lookups. Or you might want to direct bgp.l3vpn.0 to use the information in inet.0 to resolve routes, thus overriding the default behavior, which is to use inet.3.

You can specify up to two routing tables in the resolution-ribs statement. The route resolution scheme first checks the first-listed routing table for the protocol next-hop address. If the address is found, it uses this entry. If it is not found, the resolution scheme checks second-listed routing table. Hence, only one routing table is used for each protocol nexthop address. For example, if you configure resolutionribbgp.l3vpn.0 resolution-ribs [inet.0 inet.3], inet.0 is checked first and then inet.3 is checked.

NOTE: Customizing route resolution might cause the routing protocol process (rpd) to consume more memory resources than it ordinarily would. When you customize route resolution, we recommend that you check the memory resources by running the show system processes and the show task memory commands. For more information, see Routing Protocol Process Memory FAQs.

The remaining statements are explained separately.

Required Privilege Level  
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
resolution-ribs

Syntax  resolution-ribs [ routing-table-names ];

Hierarchy Level  [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options resolution rib],
[edit logical-systems logical-system-name routing-options resolution rib],
[edit routing-instances routing-instance-name routing-options resolution rib],
[edit routing-options resolution rib]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  Specify one or more routing tables to use for route resolution.

This statement enables you to override the default routing tables that Junos OS uses for route resolution. For example, suppose that the resolution routing table is inet.3, but you want to allow fallback resolution through inet.0. One example use case is overriding the bgp.rtarget.0 (family route-target) routing table resolution from using only inet.3 to using both inet.3 and inet.0.

Options  routing-table-names—Name of one or more routing tables.

Required Privilege Level  routing—To view this statement in the configuration.
route-control—To add this statement to the configuration.

Related Documentation  • Example: Configuring Route Resolution on PE Routers
• Example: Configuring Multitopology Routing Based on a Multicast Source
** resolve **

**Syntax**  
resolve;

**Hierarchy Level**
- [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options rib routing-table-name static (defaults | route)],
- [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options static (defaults | route)],
- [edit logical-systems logical-system-name routing-options rib routing-table-name static (defaults | route)],
- [edit logical-systems logical-system-name routing-options static (defaults | route)],
- [edit routing-instances routing-instance-name routing-options rib routing-table-name static (defaults | route)],
- [edit routing-instances routing-instance-name routing-options static (defaults | route)],
- [edit routing-options rib routing-table-name static (defaults | route)],
- [edit routing-options static (defaults | route)]

**Release Information**
- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**
Statically configure routes to be resolved to a next hop that is not directly connected. The route is resolved through the inet.0 and inet.3 routing tables.

**Default**
Static routes can point only to a directly connected next hop.

**Required Privilege Level**
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**
- static on page 3118
restart-duration (Routing Options)

Syntax     restart-duration seconds;

Hierarchy Level  [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options graceful-restart],
                  [edit logical-systems logical-system-name routing-options graceful-restart],
                  [edit routing-instances routing-instance-name routing-options graceful-restart],
                  [edit routing-options graceful-restart]

Release Information  Statement introduced before Junos OS Release 7.4.
                       Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure the restart timer for graceful restart.

Options  
seconds—Configure the time period for the restart to last.

Range:  120 through 900 seconds
Default:  300 seconds

Required Privilege Level  routing—To view this statement in the configuration.
                          routing-control—To add this statement to the configuration.

[edit logical-systems routing-optionsrib routing-table-name static (defaults | route)],  
[edit routing-instances routing-instance-name routing-optionsrib routing-table-name static (defaults | route)],  
[edit routing-instances routing-instance-name routing-options static (defaults | route)],  
[edit routing-optionsrib routing-table-name static (defaults | route)],  
[edit routing-options static (defaults | route)]

Release Information  
Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  
Configure statically configured routes to be deleted from or retained in the forwarding table when the routing protocol process shuts down normally:

Default  
Statically configured routes are deleted from the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.

Options  
no-retain—Delete statically configured routes from the forwarding table when the routing protocol process shuts down normally. To explicitly specify that routes be deleted from the forwarding table, include the no-retain statement. Include this statement when configuring an individual route in the route portion of the static statement to override a retain option specified in the defaults portion of the statement.

retain—Have a static route remain in the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.

Required Privilege Level  
- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

## rpf-check-policy (Routing Options RPF)

**Syntax**

```
rfp-check-policy [ policy-names ];
```

**Hierarchy Level**

- [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast]
- [edit logical-systems logical-system-name routing-options multicast]
- [edit routing-instances routing-instance-name routing-options multicast]
- [edit routing-options multicast]

**Release Information**

- Statement introduced in Junos OS Release 8.1.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Apply policies for disabling RPF checks on arriving multicast packets. The policies must be correctly configured.

**Options**

- **policy-names**—Name of one or more multicast RPF check policies.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

- Example: Configuring RPF Policies
rib (General)

Syntax

```
rib routing-table-name {
  aggregate {
    defaults {
      ... aggregate-options ...
    }
    route destination-prefix {
      policy policy-name;
      ... aggregate-options ...
    }
  }
  generate {
    defaults {
      generate-options;
    }
    route destination-prefix {
      policy policy-name;
      generate-options;
    }
  }
  martians {
    destination-prefix match-type <allow>;
  }
  static {
    defaults {
      static-options;
    }
    rib-group group-name;
    route destination-prefix {
      next-hop;
      static-options;
    }
  }
}
```

Hierarchy Level

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Create a routing table.

Explicitly creating a routing table with `routing-table-name` is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group.
NOTE: The IPv4 multicast routing table (inet.1) and the IPv6 multicast routing table (inet6.1) are not supported for this statement.

**Default**
If you do not specify a routing table name with the `routing-table-name` option, the software uses the default routing tables, which are `inet.0` for unicast routes and `inet.1` for the multicast cache.

**Options**
`routing-table-name`—Name of the routing table, in the following format:

```
protocol [ identifier ]
```

In a routing instance, the routing table name must include the routing instance name.
For example, if the routing instance name is `link0`, the routing table name might be `link0.inet6.0`.

- `protocol` is the protocol family. It can be `inet6` for the IPv6 family, `inet` for the IPv4 family, `iso` for the ISO protocol family, or `instance-name.iso.0` for an ISO routing instance.
- `identifier` is a positive integer that specifies the instance of the routing table.

**Default:** `inet.0`

The remaining statements are explained separately.

**Required Privilege Level**
- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

**Related Documentation**
- `Example: Creating Routing Tables`
- `passive`
rib (Route Resolution)

Syntax

rib routing-table-name {
  import [policy-names ];
  resolution-ribs [routing-table-names ];
}

Hierarchy Level
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options resolution ],
[edit logical-systems logical-system-name routing-options resolution ],
[edit routing-instances routing-instance-name routing-options resolution ],
[edit routing-options resolution ]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Specify a routing table name for route resolution.

The remaining statements are explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ribbon

Syntax

```
rib-groups {
  group-name {
    export-rib group-name;
    import-policy [ policy-names ];
    import-rib [ group-names ];
  }
}
```

Hierarchy Level

[edit logical-systems logical-system-name routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description

Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.

Each routing table group must contain one or more routing tables that Junos OS uses when importing routes (specified in the `import-rib` statement) and optionally can contain one routing table group that Junos OS uses when exporting routes to the routing protocols (specified in the `export-rib` statement).

The first routing table you specify is the primary routing table, and any additional routing tables are the secondary routing tables.

The primary routing table determines the address family of the routing table group. To configure an IP version 4 (IPv4) routing table group, specify `inet.0` as the primary routing table. To configure an IP version 6 (IPv6) routing table group, specify `inet6.0` as the primary routing table. If you configure an IPv6 routing table group, the primary and all secondary routing tables must be IPv6 routing tables (`inet6.x`).

In Junos OS Release 9.5 and later, you can include both IPv4 and IPv6 routing tables in an IPv4 import routing table group using the `import-rib` statement. In releases prior to Junos OS Release 9.5, you can only include either IPv4 or IPv6 routing tables in the same `import-rib` statement. The ability to configure an import routing table group with both IPv4 and IPv6 routing tables enables you, for example, to populate the `inet6.3` routing table with IPv6 addresses that are compatible with IPv4. Specify `inet.0` as the primary routing table, and specify `inet6.3` as a secondary routing table.

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.
NOTE: If you configure an import routing table group that includes both IPv4 and IPv6 routing tables, any corresponding export routing table group must include only IPv4 routing tables.

If you have configured a routing table, configure the OSPF primary instance at the [edit protocols ospf] hierarchy level with the statements needed for your network so that routes are installed in inet.0 and in the forwarding table. Make sure to include the routing table group. For more information, see Example: Configuring Multiple Routing Instances of OSPF.

After specifying the routing table from which to import routes, you can apply one or more policies to control which routes are installed in the routing table group. To apply a policy to routes being imported into the routing table group, include the import-policy statement.

Options

**group-name**—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

Required Privilege

Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- rib-group on page 3106
route-distinguisher-id

Syntax    
route-distinguisher-id ip-address;

Hierarchy Level    
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information    
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description    
Automatically assign a route distinguisher to the routing instance.

If you configure the route-distinguisher statement in addition to the route-distinguisher-id statement, the value configured for route-distinguisher supersedes the value generated from route-distinguisher-id.

NOTE: To avoid a conflict in the two route distinguisher values, it is recommended to ensure that the first half of the route distinguisher obtained by configuring the route-distinguisher statement is different from the first half of the route distinguisher obtained by configuring the route-distinguisher-id statement.

Options    
ip-address—Address for routing instance.

Required Privilege Level    
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation    
• Example: Configuring BGP Route Target Filtering for VPNs
• Configuring Routing Instances on PE Routers in VPNs
route-record

Syntax       route-record;

Hierarchy Level       [edit logical-systems logical-system-name routing-options],
                      [edit routing-options]

Release Information  Statement introduced before Junos OS Release 7.4.
                      Statement introduced in Junos OS Release 9.0 for EX Series switches.
                      Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description  Export the AS path and routing information to the traffic sampling process.

Before you can perform flow aggregation, the routing protocol process must export the
AS path and routing information to the sampling process.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

router-id

Syntax

router-id address;

Hierarchy Level

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Specify the routing device’s IP address.

The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier usually is the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

NOTE: We strongly recommend that you configure the router identifier under the [edit routing-options] hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

For more information about the router identifier in OSPF, see Example: Configuring an OSPF Router Identifier.

Options

address—IP address of the routing device.

Default: Address of the first interface encountered by Junos OS

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

• Examples: Configuring External BGP Peering
• Examples: Configuring Internal BGP Peering
routing-options

Syntax  routing-options { ... }

Hierarchy Level  [edit],
[edit logical-systems logical-system-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description  Configure protocol-independent routing properties.

Required Privilege Level  routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

scope

Syntax  scope scope-name {
    interface [ interface-names ];
    prefix destination-prefix;
}

Hierarchy Level  [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]

Release Information  Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description  Configure multicast scoping.

Options  scope-name—Name of the multicast scope.

The remaining statements are explained separately.

Required Privilege Level  routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation  • Example: Creating a Named Scope for Multicast Scoping
### scope-policy

**Syntax**

```
scope-policy [ policy-names ];
```

**Hierarchy Level**

- [edit logical-systems logical-system-name routing-options multicast],
- [edit routing-options multicast]

**NOTE:** You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the scope statement to a specific routing instance at the [edit routing-instances routing-instance-name routing-options multicast] or [edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast] hierarchy level.

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 11.3 for the QFX Series.
- Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Apply policies for scoping. The policy must be correctly configured at the edit policy-options policy-statement hierarchy level.

**Options**

- `policy-names`—Name of one or more multicast scope policies.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

**Related Documentation**

source-routing

| Syntax          | source-routing [ (ip | ipv6) ] |
|-----------------|---------------------------------|
| Hierarchy Level | [edit routing-options]          |
| Description     | Enable source routing. Source routing allows a sender of a packet to partially or completely specify the route the packet takes through the network. In contrast, in non-source routing protocols, routers in the network determine the path based on the packet’s destination. |
| Default         | Disabled                        |
| Required Privilege Level | routing—To view this statement in the configuration. routing-control—To add this statement to the configuration. |
| Related Documentation | • Example: Configuring Filter-Based Forwarding on the Source Address |
# ssm-groups

**Syntax**

```bash
ssm-groups [ ip-addresses ];
```

**Hierarchy Level**

- `edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast`
- `edit logical-systems logical-system-name routing-options multicast`
- `edit routing-instances routing-instance-name routing-options multicast`
- `edit routing-options multicast`

**Release Information**

- Statement introduced before Junos OS Release 7.4.
- Statement introduced in Junos OS Release 9.0 for EX Series switches.
- Statement introduced in Junos OS Release 12.1 for the QFX Series.
- Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Configure source-specific multicast (SSM) groups.

By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the `ssm-groups` statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the `ssm-groups` statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.

IGMPv3 supports SSM groups. By utilizing inclusion lists, only sources that are specified send to the SSM group.

**Options**

`ip-addresses`—List of one or more additional SSM group addresses separated by a space.

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

          threshold milliseconds;
        }
        version (1 | automatic);
      }
    }
  }
}
```
Configure static routes to be installed in the routing table. You can specify any number of routes within a single static statement, and you can specify any number of static options in the configuration.
**Options**

**defaults**—(Optional) Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the `static` statement.

---

**NOTE:** Specifying the global static route options does not create default routes. These options only set default attributes inherited by all newly created static routes.

---

**route**—Configure individual static routes. In this part of the `static` statement, you optionally can configure static route options. These options apply to the individual destination only and override any options you configured in the `defaults` part of the `static` statement.

- **destination-prefix/prefix-length**—`destination-prefix` is the network portion of the IP address, and `prefix-length` is the destination prefix length.

When you configure an individual static route in the `route` part of the `static` statement, specify the destination of the route (in `route destination-prefix`) in one of the following ways:

- **network/mask-length**, where `network` is the network portion of the IP address and `mask-length` is the destination prefix length.
- **default** if this is the default route to the destination. This is equivalent to specifying an IP address of 0.0.0.0/0.

---

**NOTE:** IPv4 packets with a destination of 0.0.0.0 (the obsoleted limited broadcast address) and IPv6 packets with a destination of 0:0 are discarded by default. To forward traffic destined to these addresses, you can add a static route to 0.0.0.0/32 for IPv4 or 0::/128 for IPv6.

---

- **nsap-prefix**—`nsap-prefix` is the network service access point (NSAP) address for ISO.
- **next-hop address**—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).

IPv4 or IPv6 address of the next hop to the destination, specified as:

- IPv4 or IPv6 address of the next hop
- Interface name (for point-to-point interfaces only)
- `address` or `interface-name` to specify an IP address of a multipoint interface or an interface name of a point-to-point interface.

---

**NOTE:** If an interface becomes unavailable, all configured static routes on that interface are withdrawn from the routing table.
NOTE: Load balancing is not supported on management and internal Ethernet (fxo) interfaces because this type of interface cannot handle the routing process. On fxp interfaces, you cannot configure multiple next hops and enable load balancing.

**next-hop options**—Additional information for how to manage forwarding of packets to the next hop.

- **discard**—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP (or ICMPv6) unreachable messages to the packets’ originators, and install a reject route for this destination into the routing table.

- **iso-net**—Reach the next-hop routing device by specifying an ISO NSAP.
- **next-table routing-table-name**—Name of the next routing table to the destination.

If you use the `next-table` action, the configuration must include a term qualifier that specifies a different table than the one specified in the `next-table` action. In other words, the term qualifier in the `from` statement must exclude the table in the `next-table` action. In the following example, the first term contains `rib vrf-customer2.inet.0` as a matching condition. The action specifies a next-hop in a different routing table, `vrf-customer1.inet.0`. The second term does the opposite by using `rib vrf-customer1.inet.0` in the match condition and `vrf-customer2.inet.0` in the `next-table` action.

```plaintext
term1 {
  from {
    protocol bgp;
    rib vrf-customer2.inet.0;
    community customer;
  }
  then {
    next-hop next-table vrf-customer1.inet.0;
  }
}
term2 {
  from {
    protocol bgp;
    rib vrf-customer1.inet.0;
    community customer;
  }
  then {
    next-hop next-table vrf-customer2.inet.0;
  }
}
```

**NOTE:** Within a routing instance, you cannot configure a static route with the `next-table inet.0` statement if any static route in the main routing instance is already configured with the `next-table` statement to point to the `inet.0` routing table of the routing instance. For example, if you configure on the main routing instance a static route 192.168.88.88/32 with the `next-table test.inet.0` statement and the routing instance test is also configured with a static route 192.168.88.88/32 with the `next-table inet.0` statement, the commit operation fails. Instead, you must configure a routing table group both on the main instance and on the routing instance, which enables you to install the static route into both routing tables.
• **receive**—Install a route for this next-hop destination into the routing table.

The **receive** option forces the packet to be sent to the Routing Engine.

The **receive** option can be useful in the following cases:

  • For receiving MPLS packets destined to a VRF instance's loopback address
  • For receiving packets on a link's subnet address, with zeros in the host portion of the address

• **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP (or ICMPv6) unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

**static-options**—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in **static-options**. Each of the options is explained separately.

  • **(active | passive):**
  • **as-path** `<as-path> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator as-number in-address>**;
  • **community [ community-ids ];**
  • **(install | no-install);**
  • **(metric | metric2 | metric3 | metric4) value <type type>;**
  • **(preference | preference2 | color | color2) preference <type type>;**
  • **(readvertise | no-readvertise);**
  • **(resolve | no-resolve);**
  • **(retain | no-retain);**
  • **tag string;**

The remaining statements are explained separately.

**Required Privilege**

- **Level**
  - routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

```

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Configure the global suppression, reuse, and warning log message thresholds for multicast forwarding cache limits. You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the `threshold` statement globally for the multicast forwarding cache or including the `family` statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.

To confirm the configured threshold values, use the `show multicast forwarding-cache statistics` command.

Options

- `reuse value`—(Optional) Value at which to begin creating new multicast forwarding cache entries. If configured, this number should be less than the `suppress` value.
  
  **Range:** 1 through 200,000

- `suppress value`—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the `reuse` value.
  
  **Range:** 1 through 200,000

The remaining statement is explained separately.

Required Privilege

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Related Documentation

```

Release Information  
Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description  
Configure the timeout value for multicast forwarding cache entries associated with the flow map.

Options  
- `minutes`—Length of time that the forwarding cache entry remains active.  
  Range: 1 through 720
- `never non-discard-entry-only`—Specify that the forwarding cache entry always remain active. If you omit the `non-discard-entry-only` option, all multicast forwarding entries, including those in forwarding and pruned states, are kept forever. If you include the `non-discard-entry-only` option, entries with forwarding states are kept forever, and entries with pruned states time out.

Required Privilege  
- **Level**
  - routing—To view this statement in the configuration.  
  - routing-control—To add this statement to the configuration.
timeout (Multicast)

Syntax  
timeout minutes <family (inet | inet6)>

Hierarchy Level  
[edit logical-systems logical-system-name routing-instances routing-instance-name 
  routing-options multicast forwarding-cache],

nsr-synchronization flag for MSDP added in Junos OS Release 12.1.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description

Define tracing operations that track all routing protocol functionality in the routing device.
To specify more than one tracing operation, include multiple flag statements.

Default

If you do not include this statement, no global tracing operations are performed.

Options

Values:

disable—(Optional) Disable the tracing operation. You can use this option to disable a
  single operation when you have defined a broad group of tracing operations, such
  as all.

file filename—Name of the file to receive the output of the tracing operation. Enclose the
  name within quotation marks. All files are placed in the directory /var/log. We
  recommend that you place global routing protocol tracing output in the file
  routing-log.

files number—(Optional) Maximum number of trace files. When a trace file named
  trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and
so on, until the maximum number of trace files is reached. Then, the oldest trace file
is overwritten. Note that if you specify a maximum number of files, you also must
specify a maximum file size with the size option.

**Range:** 2 through 1000 files

**Default:** 10 files

flag — Tracing operation to perform. To specify more than one tracing operation,
include multiple flag statements. These are the global routing protocol tracing
options:

- **all** — All tracing operations
- **condition-manager** — Condition-manager events
- **config-internal** — Configuration internals
- **general** — All normal operations and routing table changes (a combination of the normal
  and route trace operations)
- **graceful-restart** — Graceful restart operations
- **normal** — All normal operations
- **nsr-packet** — Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization** — Tracing operations for nonstop active routing
- **nsr-synchronization-detail** — (MPLS only) Tracing operations for nonstop active routing
  in detail
- **parse** — Configuration parsing
- **policy** — Routing policy operations and actions
- **regex-parse** — Regular-expression parsing
- **route** — Routing table changes
- **state** — State transitions
- **task** — Interface transactions and processing
- **timer** — Timer usage

no-world-readable — (Optional) Prevent any user from reading the log file.

size size — (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB),
or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed
trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed
trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues
until the maximum number of trace files is reached. Then, the oldest trace file is
overwritten. Note that if you specify a maximum file size, you also must specify a
maximum number of trace files with the files option.

**Syntax:** xk to specify KB, xm to specify MB, or xg to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB
**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level**
- routing and trace—To view this statement in the configuration.
- routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**

```

**Release Information**

Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description**

Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the `pim-to-igmp-proxy` statement), or into corresponding MLD report or leave messages (if you include the `pim-to-mld-proxy` statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.

**Options**

`interface-names`—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets (`[]`).

**Required Privilege Level**

- `routing`—To view this statement in the configuration.
- `routing-control`—To add this statement to the configuration.

Administration

• Routine Monitoring on page 3133
• Operational Commands on page 3135

Routine Monitoring

• Monitoring Routing Information on page 3133

Monitoring Routing Information

**Purpose**  Use the monitoring functionality to view the inet.0 routing table on the routing device.

**Action**  To view the routing tables in the J-Web interface, select Monitor > Routing > Route Information. Apply a filter or a combination of filters to view messages. You can use filters to display relevant events.

To view the routing table in the CLI, enter the following commands in the CLI interface:

- `show route terse`
- `show route detail`

**Meaning**  Table 379 on page 3133 describes the different filters, their functions, and the associated actions.

Table 380 on page 3134 summarizes key output fields in the routing information display.

<tbody>
<tr>
<td>Static Route Addresses</td>
<td>The list of static route addresses.</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>Protocol from which the route was learned: Static, Direct, Local, or the name of a particular protocol.</td>
<td></td>
</tr>
<tr>
<td>Preference</td>
<td>The preference is the individual preference value for the route.</td>
<td>The route preference is used as one of the route selection criteria.</td>
</tr>
<tr>
<td>Next-Hop</td>
<td>Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.</td>
<td>If a next hop is listed as Discard, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the discard attribute has been set. If a next hop is listed as Reject, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected. If a next hop is listed as Local, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</td>
</tr>
<tr>
<td>Age</td>
<td>How long the route has been active.</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>Flags for this route.</td>
<td>There are many possible flags.</td>
</tr>

**Operational Commands**
clear ipv6 neighbors

Syntax

```
clear ipv6 neighbors
<all | host hostname>
```

Release Information

- Command introduced before Junos OS Release 7.4.
- Command introduced in Junos OS Release 9.3 for EX Series switches.
- Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Clear IPv6 neighbor cache information.

Options

- **none**—Clear all IPv6 neighbor cache information.
- **all**—(Optional) Clear all IPv6 neighbor cache information.
- **host hostname**—(Optional) Clear the information for the specified IPv6 neighbors.

Required Privilege

- **Level** view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear ipv6 neighbors
```

```
user@host> clear ipv6 neighbors
```
### show as-path

#### Syntax

```
show as-path
<brief | detail>
<logical-system (all | logical-system-name)>
```

#### Syntax (EX Series Switches)

```
show as-path
<brief | detail>
```

#### Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

#### Description

Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the `as-path-prepend` action) or through aggregation.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.

#### Options

- **none**—Display basic information about AS paths that the local routing device is using (same as brief).
- **brief | detail**—(Optional) Display the specified level of output.
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

#### Required Privilege

show as-path summary

Syntax

show as-path summary
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show as-path summary

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display autonomous system (AS) path summary information.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.

Options

none—(Optional) Display AS path summary information for all routing instances.

Output Fields  Table 385 on page 3148 describes the output fields for the \texttt{show route} command. Output fields are listed in the approximate order in which they appear.

Table 385: show route Output Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{routing-table-name}</td>
<td>Name of the routing table (for example, inet.0).</td>
</tr>
<tr>
<td>\texttt{number destinations}</td>
<td>Number of destinations for which there are routes in the routing table.</td>
</tr>
<tr>
<td>\texttt{number routes}</td>
<td>Number of routes in the routing table and total number of routes in the following states:</td>
</tr>
<tr>
<td></td>
<td>\begin{itemize} \item active (routes that are active). \item holddown (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly. However, if you have configured advertisement of multiple routes (with the \texttt{add-path} or \texttt{advertise-inactive} statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong. \item hidden (routes that are not used because of a routing policy). \end{itemize}</td>
</tr>
<tr>
<td>\texttt{destination-prefix}</td>
<td>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</td>
</tr>
<tr>
<td></td>
<td>\begin{itemize} \item \texttt{MPLS-label} (for example, 80001). \item \texttt{interface-name} (for example, ge-1/0/2). \item \texttt{neighbor-address}:\texttt{control-word-status}:\texttt{encapsulation type}:\texttt{vc-id}:\texttt{source} (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): \begin{itemize} \item \texttt{neighbor-address}—Address of the neighbor. \item \texttt{control-word-status}—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. \item \texttt{encapsulation type}—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. \item \texttt{vc-id}—Virtual circuit identifier. \item \texttt{source}—Source of the advertisement: Local or Remote. \end{itemize} \end{itemize}</td>
</tr>
<tr>
<td>\texttt{protocol, preference}</td>
<td>Protocol from which the route was learned and the preference value for the route.</td>
</tr>
<tr>
<td></td>
<td>\begin{itemize} \item +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. \item -—A hyphen indicates the last active route. \item *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. \end{itemize}</td>
</tr>
</tbody>
</table>

In every routing metric except for the BGP \texttt{LocalPref} attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the \texttt{1}'s complement of the \texttt{LocalPref} value in the \texttt{Preference2} field. For example, if the \texttt{LocalPref} value for Route 1 is 100, the \texttt{Preference2} value is -101. If the \texttt{LocalPref} value for Route 2 is 155, the \texttt{Preference2} value is -156. Route 2 is preferred because it has a higher \texttt{LocalPref} value and a lower \texttt{Preference2} value.
### Table 385: show route Output Fields *(continued)*

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>weeks:days hours:minutes:seconds</code></td>
<td>How long the route been known (for example, <code>2w4d13:11:14</code>, or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).</td>
</tr>
<tr>
<td>metric</td>
<td>Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</td>
</tr>
<tr>
<td>localpref</td>
<td>Local preference value included in the route.</td>
</tr>
<tr>
<td>from</td>
<td>Interface from which the route was received.</td>
</tr>
</tbody>
</table>
| AS path               | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:  
  - I—IGP.  
  - E—EGP.  
  - ?—Incomplete; typically, the AS path was aggregated.  
  When AS path numbers are included in the route, the format is as follows:  
    - `[ ]`—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.  
    - `{ }`—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.  
    - `( )`—Parentheses enclose a confederation.  
    - `(()`—Parentheses and brackets enclose a confederation set.  
  **NOTE:** In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance. |
| validation-state      | (BGP-learned routes) Validation status of the route:  
  - **Invalid**—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.  
  - **Unknown**—Indicates that the prefix is not among the prefixes or prefix ranges in the database.  
  - **Valid**—Indicates that the prefix and autonomous system pair are found in the database. |
| to                    | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route. If the destination is **Discard**, traffic is dropped.                                                                 |
Table 385: show route Output Fields (continued)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>via</td>
<td>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected. This field can also contain the following information:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Weight</strong>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Balance</strong>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</td>
</tr>
<tr>
<td></td>
<td>• <strong>lsp-path-name</strong>—Name of the LSP used to reach the next hop.</td>
</tr>
<tr>
<td></td>
<td>• <strong>label-action</strong>—MPLS label and operation occurring at the next hop. The operation can be <strong>pop</strong> (where a label is removed from the top of the stack), <strong>push</strong> (where another label is added to the label stack), or <strong>swap</strong> (where a label is replaced by another label). For VPNs, expect to see multiple push operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</td>
</tr>
</tbody>
</table>

Sample Output

```
user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
   *[MVPN/70] 19:53:41, metric2 1
      Indirect
1:65500:1:10.0.0.40/240
   *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
      AS path: I
         > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
   *[BGP/170] 19:53:29, localpref 100, from 10.0.0.33
      AS path: I
         > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD

1:65500:1:10.0.0.60/240
   *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
      AS path: I
         > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toD
   *[BGP/170] 19:53:25, localpref 100, from 10.0.0.33
      AS path: I
         > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toD
```

show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 70.0.0.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0 hidden)
```
show route destination-prefix

user@host> show route 172.16.0.0/12

**show route active-path**

**Syntax**

```
show route active-path
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switches)**

```
show route active-path
<brief | detail | extensive | terse>
```

**Release Information**

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**

Display all active routes for destinations. An active route is a route that is selected as the best path.Inactive routes are not displayed.

**Options**

- `none`—Display all active routes.
- `brief | detail | extensive | terse`—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to `brief`.
- `logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege**

`view`

**List of Sample Output**

- show route active-path on page 3152
- show route active-path brief on page 3153
- show route active-path detail on page 3153
- show route active-path extensive on page 3154
- show route active-path terse on page 3156

**Output Fields**

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

**Sample Output**

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32   *[Direct/0] 21:33:52

show route all
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show route all

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display information about all routes in all routing tables, including private, or internal, tables.

Options

none—Display information about all routes in all routing tables, including private, or internal, tables.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

view

List of Sample Output

show route all on page 3157

Output Fields

In Junos OS Release 9.5 and later, only the output fields for the show route all command display all routing tables, including private, or hidden, routing tables. The output field table of the show route command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later.

Sample Output

The following example displays a snippet of output from the show route command and then displays the same snippet of output from the show route all command:

user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

### show route aspath-regex

| Syntax | show route aspath-regex regular-expression <logical-system (all | logical-system-name)> |
|--------|-----------------------------------------------------------------------------------|
| Syntax (EX Series Switches) | show route aspath-regex regular-expression |

**Release Information**
Command introduced before Junos OS Release 7.4. 
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**
Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.

**Options**
- **regular-expression**—Regular expression that matches an entire AS path. 
- **logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information**
You can specify a regular expression as:

- An individual AS number
- A period wildcard used in place of an AS number
- An AS path regular expression that is enclosed in parentheses

You also can include the operators described in the table of AS path regular expression operators in the *Junos Policy Framework Configuration Guide*. The following list summarizes these operators:

- **{m,n}**—At least $m$ and at most $n$ repetitions of the AS path term.
- **{m}**—Exactly $m$ repetitions of the AS path term.
- **{m,}**—$m$ or more repetitions of the AS path term.
- **\*\**—Zero or more repetitions of an AS path term.
- **\+\**—One or more repetitions of an AS path term.
- **?\**—Zero or one repetition of an AS path term.
- **aspath_term | aspath_term**—Match one of the two AS path terms.

When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:

```
show route aspath-regex ".*234.*"
```

**Required Privilege**

```
show route best

Syntax

show route best destination-prefix
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>

Syntax (EX Series Switches)

show route best destination-prefix
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

destination-prefix—Address or range of addresses.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege

view

List of Sample Output

show route best on page 3161
show route best detail on page 3162
show route best extensive on page 3163
show route best terse on page 3163

Output Fields

For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output

show route best
