

## Configuring MAC Limiting (J-Web Procedure)

---

MAC limiting protects against flooding of the Ethernet switching table on an EX-series switch. MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

JUNOS software provides two MAC limiting methods:

- Maximum number of dynamic MAC addresses allowed per interface—As soon as the limit is reached, incoming packets with new MAC addresses are dropped.
- Specific “allowed” MAC addresses for the access interface—Any MAC address that is not in the list of configured addresses is not learned.

You configure MAC limiting for each interface, not for each VLAN. In the default configuration, the limit for dynamically learned MAC addresses for each interface is 5 and the action that the switch will take if that limit is exceeded is **none**.

To enable MAC limiting on one or more interfaces using the J-Web interface:

1. Select **Configure>Security>Port Security**.
2. Select one or more interfaces from the Port list.
3. Click the **Edit** button. If a message appears asking if you want to enable port security, click **Yes**.
4. To set a dynamic MAC limit:
  1. Type a limit value in the **MAC Limit** box.
  2. Select an action from the **MAC Limit Action** box. The switch takes this action when the limit is exceeded.
5. To set allowed MAC addresses:
  1. Click **Add**.
  2. Type the allowed MAC address and click **OK**.

Repeat this step to add more allowed MAC addresses.

6. Click **OK** when you have finished setting MAC limits.
7. Click **OK** after the command has been successfully delivered.

**NOTE:** You can enable or disable port security on the switch at any time by clicking the **Activate** or **Deactivate** button on the Port Security Configuration page. If security status is shown as **Disabled** when you try to edit settings for any VLANs or interfaces (ports), the message asking if you want to enable port security appears.
