

Configuring Multiservice Physical Interface Properties

The adaptive services (AS), collector, monitoring services, and monitoring services II interfaces are multiservice interfaces specifically designed to enable IP services. To configure multiservice physical interface properties on the collector, monitoring services, and AS interfaces, include the **multiservice-options** statement:

```
multiservice-options {  
    (core-dump | no-core-dump);  
    ([Unresolved xref] | no-[Unresolved xref]);  
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces cp-fpc/pic/port]
- [edit interfaces mo-fpc/pic/port]
- [edit interfaces sp-fpc/pic/port]

For more information about the services interfaces, see the *JUNOS Services Interfaces Configuration Guide*.
