#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

	About the Documentation . . . . .	lvii
	Documentation and Release Notes . . . . .	lvii
	Supported Platforms . . . . .	lvii
	Using the Examples in This Manual . . . . .	lvii
	Merging a Full Example . . . . .	lviii
	Merging a Snippet . . . . .	lviii
	Documentation Conventions . . . . .	lix
	Documentation Feedback . . . . .	lxi
	Requesting Technical Support . . . . .	lxi
	Self-Help Online Tools and Resources . . . . .	lxi
	Opening a Case with JTAC . . . . .	lxii
<b>Part 1</b>	<b>Junos OS Getting Started Guide for Branch SRX Series</b>	
<b>Chapter 1</b>	<b>Overview . . . . .</b>	<b>3</b>
	SRX Series Basics . . . . .	3
	SRX Series Overview . . . . .	3
	Understanding Factory Default Configuration Settings of an SRX210 . . . . .	3
	Default Configuration Topology . . . . .	4
	Default Port Settings . . . . .	5
	Default Settings for Interfaces, Zones, Policy, and NAT . . . . .	5
	Default System Services . . . . .	6
	Autoinstallation . . . . .	6
	Understanding Methods to Manage Your Branch SRX Series . . . . .	6
	SRX Series Security . . . . .	7
	Understanding Branch SRX Series Stateful Firewall Functionality . . . . .	7
	Understanding Security Zones and Policies for SRX Series . . . . .	8
	Zones . . . . .	8
	Security Policy . . . . .	8
	Understanding NAT for SRX Series . . . . .	9
	Understanding Unified Threat Management for Branch SRX Series . . . . .	10
	Understanding Intrusion Detection and Prevention for SRX Series . . . . .	12
	Understanding IPsec VPN for SRX Series . . . . .	12
	Understand Chassis Cluster for SRX Series . . . . .	13

<b>Chapter 2</b>	<b>Configuration</b>	<b>15</b>
	SRX Series Basics	15
	Mandatory Settings to Configure Your Branch SRX Series	15
	Connecting Your Branch SRX Series for the First Time	16
	Connecting Your Branch SRX Series Through the Console Port for the First Time	16
	Configuring System Identification and User Classes for Your Branch SRX Series	18
	Configuring Internet Access for Your Branch SRX Series	18
	Configuring a Network Time Protocol Server for Your Branch SRX Series	23
	Validating Your Branch SRX Series Configuration	23
	Verifying Your Branch SRX Series Configuration	24
	Connecting Your Branch SRX Series Through the Console Port for the First Time	25
	Configuring System Identification and User Classes for Your Branch SRX Series	26
	Configuring Internet Access for Your Branch SRX Series	27
	Configuring a Network Time Protocol Server for Your Branch SRX Series	31
	Validating Your Branch SRX Series Configuration	32
	Verifying Your Branch SRX Series Configuration	33
	SRX210 Factory Default Setting—A Sample	34
	Resetting Your Branch SRX Series	38
	Resetting Your Branch SRX Series	38
	SRX Series Security	38
	Example: Configuring Security Zones and Policies for SRX Series	39
	Example: Configuring Destination NAT for SRX Series	43
	Updating Licenses for a Branch SRX Series	48
	Example: Configuring Unified Threat Management for a Branch SRX Series	50
	Example: Configuring Intrusion Detection and Prevention for SRX Series	53
	Configuration Statements	57
	Security Configuration Statement Hierarchy	58
	[edit security address-book] Hierarchy Level	59
	[edit security policies] Hierarchy Level	59
	[edit security nat] Hierarchy Level	64
	[edit security utm] Hierarchy Level	67
	[edit security idp] Hierarchy Level	74
	[edit security ike] Hierarchy Level	83
	[edit security ipsec] Hierarchy Level	85
	[edit security zones] Hierarchy Level	87
<b>Chapter 3</b>	<b>Administration</b>	<b>89</b>
	SRX Series Security	89
	Default UTM Policy for Branch SRX Series	89
	Default UTM Policy	89
	Predefined UTM Profile Configuration for Branch SRX Series	89
	Antispam	90
	Antivirus	90

Web Filtering .....	92
Operational Commands .....	96
request system license update .....	98
show security idp active-policy .....	99
show security idp status .....	100
show security flow session .....	102
show security nat destination summary .....	107
show security policies .....	109
show security utm session .....	116
show security utm status .....	117
show security zones .....	118
show system license (View) .....	121
show system services dhcp client .....	124

## Part 2

### Chapter 4

## Installation and Upgrade Guide for Security Devices

<b>Overview .....</b>	<b>129</b>
Product Overview .....	129
Junos OS Overview .....	129
One Operating System .....	129
One Software Release .....	130
One Modular Software Architecture .....	130
Junos OS Editions .....	130
Installation Categories on the J Series Services Routers .....	131
Software Naming Convention .....	131
Junos OS Release Numbers .....	132
Hardware Overview (J Series Services Routers) .....	134
System Memory .....	134
Storage Media .....	135
Software Installation and Upgrade .....	135
Installation Type Overview .....	136
Standard Installation .....	136
Category Change Installation .....	136
Recovery Installation .....	136
Software Package Information Security .....	137
Understanding Junos OS Upgrades for SRX Series Devices .....	137
Understanding Junos OS Upgrades for J Series Devices .....	138
Junos OS Upgrade Methods on the SRX Series Devices .....	138
Understanding Junos OS Upgrade and Downgrade Procedures for on SRX Series Devices .....	139
Understanding Junos OS Upgrade and Downgrade Procedures for J Series Devices .....	140
Junos OS Upgrade Packages .....	140
Junos OS Recovery Packages .....	141
Installation Modules .....	142
Understanding Download Manager .....	143
Overview .....	143
Using Download Manager to Upgrade Junos OS .....	143
Handling Errors .....	144

Considerations . . . . .	144
Dual-Root Partitioning and Autorecovery . . . . .	145
Dual-Root Partitioning Scheme Overview . . . . .	145
Boot Media and Boot Partition on the SRX Series Devices . . . . .	146
Important Features of the Dual-Root Partitioning Scheme . . . . .	146
Understanding Integrity Check and Autorecovery of Configuration, Licenses, and Disk Information . . . . .	147
Overview . . . . .	147
How Autorecovery Works . . . . .	147
How to Use Autorecovery . . . . .	148
Data That Is Backed Up in an Autorecovery . . . . .	148
Troubleshooting Alarms . . . . .	148
Considerations . . . . .	149
BIOS Upgrade . . . . .	149
Understanding Auto BIOS Upgrade Using Junos CLI . . . . .	149
Understanding Manual BIOS Upgrade Using Junos CLI . . . . .	150
Autoinstallation . . . . .	151
Autoinstallation Overview . . . . .	151
Automatic Installation of Configuration Files . . . . .	152
Supported Autoinstallation Interfaces and Protocols . . . . .	152
Typical Autoinstallation Process on a New Device . . . . .	153
Automatic Installation of Configuration Files (J Series Services Routers and SRX Series Services Gateways) . . . . .	154
J Series Automatic Installation Overview . . . . .	154
SRX Series Services Gateways Automatic Installation Overview . . . . .	156
Licenses . . . . .	156
Junos OS License Overview . . . . .	156
License Enforcement . . . . .	157
License Key Components . . . . .	157
License Management Fields Summary . . . . .	157
License Enforcement . . . . .	159
Junos OS Feature License Model Number for J Series Services Routers and SRX Series Services Gateways . . . . .	159
<b>Chapter 5</b>	
<b>Installation . . . . .</b>	<b>163</b>
Software Installation and Upgrade . . . . .	163
Upgrading Individual Software Packages . . . . .	164
Preparing Your SRX Series Device for Junos OS Upgrades . . . . .	166
Preparing Your J Series Services Router for Junos OS Upgrades . . . . .	167
Preparing the USB Flash Drive to Upgrade Junos OS . . . . .	168
Determining the Junos OS Version . . . . .	170
Connecting to the Console Port . . . . .	170
Backing Up the Current Installation (J Series Services Routers and SRX Series Services Gateways) . . . . .	171
Downloading Software . . . . .	172
Downloading Software with a Browser . . . . .	172
Downloading Software Using the Command-Line Interface . . . . .	173
Downloading Junos OS Upgrades for SRX Series Devices . . . . .	174
Downloading Junos OS Upgrades for J Series Devices . . . . .	175

Checking the Current Configuration and Candidate Software	
Compatibility . . . . .	175
Verifying Available Disk Space on SRX Series Devices . . . . .	176
Example: Installing Junos OS Upgrades on SRX Series Devices . . . . .	177
Example: Installing Junos OS Upgrades on J Series Devices . . . . .	179
Installing Junos OS Using TFTP on SRX Series Devices . . . . .	181
Installing Junos OS Using a USB Flash Drive on SRX Series Devices . . . . .	184
Installing Junos OS Upgrades from a Remote Server on the SRX Series	
Devices . . . . .	185
Installing Junos OS Upgrades from a Remote Server on J Series Devices . .	186
Dual-Root Partitioning and Autorecovery . . . . .	187
Understanding Automatic Recovery of the Primary Junos OS Image with	
Dual-Root Partitioning . . . . .	188
Understanding How the Primary Junos OS Image with Dual-Root Partitioning	
Recovers on SRX Series Devices . . . . .	190
Junos OS Release 9.6 or Earlier Installation on SRX Series Devices with	
Dual-Root Partitioning . . . . .	191
Junos OS Release 10.0 or Later Upgrades with Dual-Root Partitioning on	
SRX Series Devices . . . . .	192
Example: Installing Junos OS on SRX Series Devices Using the Partition	
Option . . . . .	193
Reinstalling the Single-Root Partition Using request system software add	
Command . . . . .	196
Boot Loaders and Boot Devices . . . . .	197
Installing Junos OS from the Boot Loader Using a USB Storage Device on	
an SRX Series Device . . . . .	197
Upgrading the Boot Loader on SRX Series Devices . . . . .	198
Software Downgrade . . . . .	199
Example: Downgrading Junos OS on SRX Series Devices . . . . .	199
Example: Downgrading Junos OS on J Series Devices . . . . .	201
<b>Chapter 6 Configuration . . . . .</b>	<b>205</b>
Autoinstallation . . . . .	205
Example: Configuring Autoinstallation . . . . .	205
Backup and Snapshot Configuration Files . . . . .	208
Configuring a Boot Device to Receive Junos OS Failure Memory Snapshots	
in J Series Devices . . . . .	208
Configuring External CompactFlash on SRX650 Devices . . . . .	209
Boot Loaders and Boot Devices . . . . .	210
Example: Configuring Boot Devices for SRX Series Devices . . . . .	210
Example: Configuring Boot Devices for J Series Devices . . . . .	213
Configuration Statements . . . . .	215
System Configuration Statement Hierarchy . . . . .	215
autoinstallation . . . . .	246
configuration-servers . . . . .	247
interfaces (Autoinstallation) . . . . .	248
license . . . . .	249
usb . . . . .	251

<b>Chapter 7</b>	<b>Administration . . . . .</b>	<b>253</b>
	Auto BIOS . . . . .	253
	Disabling Auto BIOS Upgrade on SRX Series Devices . . . . .	253
	Licenses . . . . .	253
	Displaying License Keys . . . . .	254
	Generating a License Key . . . . .	254
	Downloading License Keys . . . . .	255
	Saving License Keys . . . . .	255
	Updating License Keys . . . . .	256
	Example: Adding a New License Key . . . . .	257
	Example: Deleting a License Key . . . . .	260
	Software Stop and Restart . . . . .	261
	Example: Rebooting SRX Series Devices . . . . .	262
	Example: Rebooting J Series Devices . . . . .	263
	Restarting the Chassis on SRX Series Devices . . . . .	265
	Restarting the Chassis on J Series Devices . . . . .	266
	Example: Halting SRX Series Devices . . . . .	266
	Example: Halting J Series Devices . . . . .	268
	Bringing Chassis Components Online and Offline on SRX Series Devices . . . . .	270
	Bringing Chassis Components Online and Offline on J Series Devices . . . . .	271
	Operational Commands . . . . .	271
	request system autorecovery state . . . . .	273
	request system download abort . . . . .	275
	request system download clear . . . . .	276
	request system download pause . . . . .	277
	request system download resume . . . . .	278
	request system download start . . . . .	279
	request system firmware upgrade . . . . .	280
	request system license update . . . . .	281
	request system partition compact-flash . . . . .	282
	request system power-off fpc . . . . .	283
	request system snapshot (Maintenance) . . . . .	284
	request system software abort in-service-upgrade (ICU) . . . . .	287
	request system software add (Maintenance) . . . . .	288
	request system reboot . . . . .	289
	request system software rollback (Maintenance) . . . . .	290
	show chassis usb storage . . . . .	291
	show system autorecovery state . . . . .	292
	show system auto-snapshot . . . . .	294
	show system download . . . . .	296
	show system license (View) . . . . .	298
	show system login logout . . . . .	301
	show system snapshot media . . . . .	302
	show system storage (View SRX Series) . . . . .	303
	show system storage partitions (View SRX Series) . . . . .	305
	show version . . . . .	306

<b>Part 3</b>	<b>CLI User Guide</b>	
<b>Chapter 8</b>	<b>Overview</b>	<b>309</b>
	CLI Overview	309
	Introducing the Junos OS Command-Line Interface	309
	Key Features of the CLI	310
	Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies	311
	Junos OS CLI Command Modes	311
	CLI Command Hierarchy	312
	Configuration Statement Hierarchy	312
	Moving Among Hierarchy Levels	313
	Other Tools to Configure and Monitor Devices Running Junos OS	314
	Commands and Configuration Statements for Junos-FIPS	314
	CLI Online Help	315
	Getting Online Help from the Junos OS Command-Line Interface	315
	Getting Help About Commands	315
	Getting Help About a String in a Statement or Command	316
	Getting Help About Configuration Statements	316
	Getting Help About System Log Messages	317
	Junos OS CLI Online Help Features	317
	Help for Omitted Statements	317
	Using CLI Command Completion	318
	Using Command Completion in Configuration Mode	318
	Displaying Tips About CLI Commands	318
	CLI Operational Mode	319
	Overview of Junos OS CLI Operational Mode Commands	319
	CLI Command Categories	319
	Commonly Used Operational Mode Commands	320
	Junos OS Operational Mode Commands That Combine Other Commands	322
	Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands	322
	Controlling the Scope of an Operational Mode Command	323
	Operational Mode Commands on a TX Matrix Router or TX Matrix Plus Router	324
	Examples of Routing Matrix Command Options	325
	Using the Pipe (   ) Symbol to Filter Junos Command Output	327
	Using Regular Expressions with the Pipe (   ) Symbol to Filter Junos Command Output	327
	Pipe (   ) Filter Functions in the Junos OS command-line interface	328
	Comparing Configurations	329
	Counting the Number of Lines of Output	330
	Displaying Output in XML Tag Format	330
	Displaying the RPC tags for a Command	331
	Ignoring Output That Does Not Match a Regular Expression	331
	Displaying Output from the First Match of a Regular Expression	331
	Retaining Output After the Last Screen	332
	Displaying Output Beginning with the Last Entries	332

Displaying Output That Matches a Regular Expression . . . . .	332
Preventing Output from Being Paginated . . . . .	333
Sending Command Output to Other Users . . . . .	333
Resolving IP Addresses . . . . .	333
Saving Output to a File . . . . .	334
Trimming Output by Specifying the Starting Column . . . . .	334
CLI Configuration Mode . . . . .	334
Understanding Junos OS CLI Configuration Mode . . . . .	334
Configuration Mode Commands . . . . .	336
Configuration Statements and Identifiers . . . . .	337
Configuration Statement Hierarchy . . . . .	339
Modifying the Junos OS Configuration . . . . .	341
Commit Operation When Multiple Users Configure the Software . . . . .	341
Forms of the configure Command . . . . .	342
Additional Details About Specifying Junos Statements and Identifiers . . . . .	344
Specifying Statements . . . . .	344
Performing CLI Type-Checking . . . . .	346
CLI Advanced Features . . . . .	347
Using Keyboard Sequences to Move Around and Edit the Junos OS CLI . . . . .	347
Using Wildcard Characters in Interface Names . . . . .	349
Using Global Replace in a Junos Configuration . . . . .	349
CLI Commit Operations . . . . .	350
Junos OS Commit Model for Router or Switch Configuration . . . . .	350
Commit Operation When Multiple Users Configure the Software . . . . .	351
Junos OS Batch Commits Overview . . . . .	352
Aggregation and Error Handling . . . . .	352
Configuration Groups . . . . .	353
Understanding the Junos Configuration Groups . . . . .	353
Configuration Groups Overview . . . . .	353
Inheritance Model . . . . .	354
Configuring Configuration Groups . . . . .	354
Configuration Management . . . . .	354
Understanding How the Junos Configuration Is Stored . . . . .	354
<b>Chapter 9 Configuration . . . . .</b>	<b>357</b>
Getting Started with Junos OS Configuration . . . . .	357
Entering and Exiting the Junos OS CLI Configuration Mode . . . . .	358
Displaying the Current Junos OS Configuration . . . . .	360
Example: Displaying the Current Junos OS Configuration . . . . .	360
Displaying set Commands from the Junos OS Configuration . . . . .	361
Example: Displaying set Commands from the Configuration . . . . .	362
Example: Displaying Required set Commands at the	
Current Hierarchy Level . . . . .	362
Example: Displaying set Commands with the match Option . . . . .	363
Displaying Users Currently Editing the Configuration . . . . .	364
Displaying Additional Information About the Configuration . . . . .	364
Using the configure exclusive Command . . . . .	367
Updating the configure private Configuration . . . . .	368
Getting Started with the Junos OS Command-Line Interface . . . . .	368

Switching Between Junos OS CLI Operational and Configuration Modes . .	370
Configuring a User Account on a Device Running Junos OS . . . . .	372
Example: Configuring a Routing Protocol . . . . .	374
Shortcut . . . . .	375
Longer Configuration . . . . .	375
Making Changes to a Routing Protocol Configuration . . . . .	377
Updating the Junos OS Configuration . . . . .	380
Adding Junos Configuration Statements and Identifiers . . . . .	380
Deleting a Statement from a Junos Configuration . . . . .	382
Example: Deleting a Statement from the Junos Configuration . . . . .	383
Copying a Junos Statement in the Configuration . . . . .	384
Example: Copying a Statement in the Junos Configuration . . . . .	384
Issuing Relative Junos Configuration Mode Commands . . . . .	385
Renaming an Identifier in a Junos Configuration . . . . .	385
Example: Renaming an Identifier in a Junos Configuration . . . . .	386
Inserting a New Identifier in a Junos Configuration . . . . .	386
Example: Inserting a New Identifier in a Junos Configuration . . . . .	386
Deactivating and Reactivating Statements and Identifiers in a Junos Configuration . . . . .	388
Examples: Deactivating and Reactivating Statements and Identifiers in a Junos Configuration . . . . .	389
Adding Comments in a Junos Configuration . . . . .	390
Example: Including Comments in a Junos Configuration . . . . .	391
Using Regular Expressions to Delete Related Items from a Junos Configuration . . . . .	393
Example: Using the Wildcard Command with the Range Option . . . . .	394
Committing a Junos OS Configuration . . . . .	398
Verifying a Junos Configuration . . . . .	399
Example: Protecting the Junos OS Configuration from Modification or Deletion . . . . .	399
Committing a Junos OS Configuration . . . . .	406
Committing a Junos Configuration and Exiting Configuration Mode . . . . .	408
Activating a Junos Configuration but Requiring Confirmation . . . . .	409
Scheduling a Junos Commit Operation . . . . .	410
Monitoring the Junos Commit Process . . . . .	411
Adding a Comment to Describe the Committed Configuration . . . . .	412
Backing Up the Committed Configuration on the Alternate Boot Drive . . . .	413
Example: Configuring Junos OS Batch Commits . . . . .	414
Junos OS Batch Commits Overview . . . . .	414
Example: Configuring Batch Commit Server Properties . . . . .	414
Loading a Junos OS Configuration . . . . .	421
Loading a Configuration from a File . . . . .	421
Examples: Loading a Configuration from a File . . . . .	424
Synchronizing the Junos OS Configuration . . . . .	426
Synchronizing Routing Engines . . . . .	426

Creating and Applying Junos OS Configuration Groups . . . . .	427
Creating a Junos Configuration Group . . . . .	428
Applying a Junos Configuration Group . . . . .	429
Example: Configuring and Applying Junos Configuration Groups . . . . .	431
Example: Creating and Applying Configuration Groups on a TX Matrix Router . . . . .	432
Disabling Inheritance of a Junos OS Configuration Group . . . . .	433
Using Wildcards with Configuration Groups . . . . .	435
Example: Using Conditions to Apply Configuration Groups . . . . .	438
Using Conditions to Apply Configuration Groups Overview . . . . .	438
Example: Configuring Conditions for Applying Configuration Groups . .	438
Example : Configuring Sets of Statements with Configuration Groups . . .	440
Example: Configuring Interfaces Using Junos OS Configuration Groups . .	442
Example: Configuring a Consistent IP Address for the Management Interface . . . . .	444
Example: Configuring Peer Entities . . . . .	445
Establishing Regional Configurations . . . . .	447
Selecting Wildcard Names . . . . .	448
Using Junos OS Defaults Groups . . . . .	450
Example: Referencing the Preset Statement From the Junos defaults Group . . . . .	451
Example: Viewing Default Statements That Have Been Applied to the Configuration . . . . .	452
CLI Online Help . . . . .	452
Examples: Using Command Completion in Configuration Mode . . . . .	452
Examples: Using the Junos OS CLI Command Completion . . . . .	454
Displaying the Junos OS CLI Command and Word History . . . . .	455
CLI Configuration Mode . . . . .	455
Example: Using the configure Command . . . . .	455
Controlling the CLI Environment . . . . .	456
Example: Controlling the CLI Environment . . . . .	456
CLI Advanced Features . . . . .	456
Example: Using Global Replace in a Junos Configuration—Using the \n Back Reference . . . . .	456
Example: Using Global Replace in a Junos Configuration—Replacing an Interface Name . . . . .	457
Example: Using Global Replace in a Junos Configuration—Using the upto Option . . . . .	458
Configuration Statements . . . . .	460
apply-groups . . . . .	461
apply-groups-except . . . . .	461
commit-interval (Batch Commits) . . . . .	462
groups . . . . .	463
days-to-keep-error-logs (Batch Commits) . . . . .	465

## Part 5

## Administration Library for Security Devices

## Chapter 16

## Administration Guide for Security Devices ..... 663

Overview .....	663
Secure Web Access .....	663
Secure Web Access Overview .....	663
J-Web User Interface .....	664
Understanding the User Interfaces .....	664
Starting the J-Web User Interface .....	666
Understanding the J-Web Interface Layout .....	667
J-Web Commit Options Guidelines .....	669
Getting Help in the J-Web User Interface .....	670
Establishing J-Web Sessions .....	671
User Authentication and Access .....	671
Understanding User Authentication Methods .....	671
Understanding User Accounts .....	672
Understanding Login Classes .....	673
Understanding Template Accounts .....	676
USB Modems for Remote Management Setup .....	676
USB Modem Interface Overview .....	676
USB Modem Configuration Overview .....	679
Telnet and SSH Device Control .....	681
Securing the Console Port Configuration Overview .....	681
Reverse Telnet Overview .....	683
DHCP for IP Address Device .....	684
DHCP Server, Client, and Relay Agent Overview .....	684
DHCP Configuration Overview .....	685
Understanding DHCP Server Operation .....	686
Understanding DHCP Client Operation .....	687
Understanding DHCP Relay Agent Operation .....	687
DHCP Settings and Restrictions Overview .....	688
Understanding DHCP Services in a Routing Instance .....	689
DHCPv6 Client .....	692
DHCPv6 Client Overview .....	693
Understanding DHCPv6 Client and Server Identification .....	693
DHCPv6 Local Server .....	694
DHCPv6 Server Overview .....	694
File Management .....	695
File Management Overview .....	695
Licenses .....	695
Junos OS License Overview .....	696
Junos OS Feature License Model Number for J Series Services Routers and SRX Series Services Gateways .....	698
Configuration .....	699
USB Modems for Remote Management Setup .....	699
Example: Configuring a USB Modem Interface .....	699
Example: Configuring a Dialer Interface .....	702

Example: Configuring a Dialer Interface for USB Modem Dial-In . . . . .	705
Configuring a Dial-Up Modem Connection Remotely . . . . .	707
DHCP for IP Address Device . . . . .	708
Example: Configuring the Device as a DHCP Server . . . . .	709
Example: Configuring the Device as a DHCP Client . . . . .	714
Example: Configuring the Device as a BOOTP or DHCP Relay Agent . . . . .	718
Configuring a DHCP Local Server . . . . .	723
Configuring a DHCP Client . . . . .	727
Configuring a DHCP Relay Agent . . . . .	729
Minimum DHCP Local Server Configuration . . . . .	730
Configuring Address-Assignment Pools . . . . .	731
Configuring an Address-Assignment Pool Name and Addresses . . . . .	731
Configuring DHCP Client-Specific Attributes . . . . .	732
Configuring a Named Address Range for Dynamic Address Assignment . . . . .	732
Configuring Static Address Assignments . . . . .	733
Enabling TCP/IP Propagation on a DHCP Local Server . . . . .	734
Minimum DHCP Client Configuration . . . . .	734
Configuring Optional DHCP Client Attributes . . . . .	735
Minimum DHCP Relay Agent Configuration . . . . .	736
DHCPv6 Client . . . . .	736
Minimum DHCPv6 Client Configuration . . . . .	736
Configuring Optional DHCPv6 Client Attributes . . . . .	737
Configuring Nontemporary Address Assignment . . . . .	738
Configuring Identity Associations for Nontemporary Addresses and Prefix Delegation . . . . .	739
Configuring Auto-Prefix Delegation . . . . .	739
Configuring the DHCPv6 Client Rapid Commit Option . . . . .	740
Configuring a DHCPv6 Client in Autoconfig Mode . . . . .	741
Configuring TCP/IP Propagation on a DHCPv6 Client . . . . .	741
DHCPv6 Local Server . . . . .	742
Creating a Security Policy for DHCPv6 . . . . .	742
Example: Configuring DHCPv6 Server Options . . . . .	743
Example: Configuring an Address-Assignment Pool . . . . .	745
Configuring a Named Address Range for Dynamic Address Assignment . . . . .	748
Configuring Address-Assignment Pool Linking . . . . .	748
Configuring DHCP Client-Specific Attributes . . . . .	749
Configuring an Address-Assignment Pool for Router Advertisement . . . . .	750
Configuration Statements . . . . .	750
[edit security certificates] Hierarchy Level . . . . .	752
[edit security ssh-known-hosts] Hierarchy Level . . . . .	752
Interfaces Configuration Statement Hierarchy . . . . .	753
Groups Configuration Statement Hierarchy . . . . .	768
address-assignment (Access) . . . . .	769

### Chapter 18

## Monitoring and Troubleshooting Library for Security Devices

### Network Monitoring and Troubleshooting Guide for Security Devices . . . 1231

Overview	1231
Monitoring and Troubleshooting	1231
Monitoring Overview	1231
Diagnostic Tools Overview	1232
Accounting, Source Class Usage, and Destination Class Usage Options . .	1235
Accounting Options Overview	1235
Understanding Source Class Usage and Destination Class Usage Options	1236
Alarms	1237
Alarm Overview	1237
Data Path Debugging and Trace Options	1242
Understanding Data Path Debugging for SRX Series Devices	1242
Understanding Security Debugging Using Trace Options	1243
Understanding Flow Debugging Using Trace Options	1243
MPLS	1244
MPLS Connection Checking Overview	1244
Packet Capture	1246
Packet Capture Overview	1246

RPM .....	1248
RPM Overview .....	1248
RPM Support for VPN Routing and Forwarding .....	1252
Configuration .....	1253
Accounting, Source Class Usage, and Destination Class Usage Options ..	1253
Configuration Statements at the [edit accounting-options] Hierarchy	
Level .....	1253
Accounting Options Configuration .....	1254
Configuring Accounting-Data Log Files .....	1257
Configuring the Interface Profile .....	1260
Configuring the Filter Profile .....	1263
Example: Configuring a Filter Profile .....	1265
Example: Configuring Interface-Specific Firewall Counters	
and Filter Profiles .....	1265
Configuring SCU or DCU .....	1267
Configuring SCU on a Virtual Loopback Tunnel Interface .....	1269
Configuring Class Usage Profiles .....	1270
Configuring the MIB Profile .....	1272
Configuring the Routing Engine Profile .....	1274
Alarms .....	1276
Example: Configuring Interface Alarms .....	1276
Data Path Debugging and Trace Options .....	1278
Debugging the Data Path (CLI Procedure) .....	1279
Setting Security Trace Options (CLI Procedure) .....	1279
Setting Flow Debugging Trace Options (CLI Procedure) .....	1281
MPLS .....	1281
Configuring Ping MPLS .....	1281
Packet Capture .....	1282
Example: Enabling Packet Capture on a Device .....	1282
Example: Configuring Packet Capture on an Interface .....	1286
Example: Configuring a Firewall Filter for Packet Capture .....	1287
Example: Configuring Packet Capture for Datapath Debugging .....	1289
Disabling Packet Capture .....	1292
Deleting Packet Capture Files .....	1292
Changing Encapsulation on Interfaces with Packet Capture	
Configured .....	1293
RPM .....	1294
Example: Configuring Basic RPM Probes .....	1294
Example: Configuring RPM Using TCP and UDP Probes .....	1298
Example: Configuring RPM Probes for BGP Monitoring .....	1301
Directing RPM Probes to Select BGP Devices .....	1303
Configuring RPM Timestamping .....	1304
Tuning RPM Probes .....	1305
RPM Configuration Options .....	1306
Configuration Statements .....	1310
Configuration Statements at the [edit accounting-options] Hierarchy	
Level .....	1311
[edit security alarms] Hierarchy Level .....	1312
[edit security datapath-debug] Hierarchy Level .....	1313

[edit security traceoptions] Hierarchy Level .....	1314
accounting-options .....	1315
action-profile .....	1316
archive-sites .....	1317
capture-file (Security) .....	1318
class-usage-profile .....	1319
counters .....	1320
datapath-debug .....	1321
decryption-failures .....	1322
destination-classes .....	1323
destination-interface .....	1324
destination-port .....	1325
fields (for Interface Profiles) .....	1326
fields (for Routing Engine Profiles) .....	1327
file (Associating with a Profile) .....	1328
file (Configuring a Log File) .....	1329
files .....	1330
filter-profile .....	1330
flow (Security Flow) .....	1331
hardware-timestamp .....	1333
idp (Security Alarms) .....	1333
interface-profile .....	1334
interval .....	1335
maximum-capture-size (Datapath Debug) .....	1336
mib-profile .....	1336
mpls (Security Forwarding Options) .....	1337
next-hop .....	1337
nonpersistent .....	1338
object-names .....	1338
operation .....	1339
packet-capture .....	1340
packet-filter .....	1341
probe .....	1342
probe-interval .....	1343
probe-limit .....	1343
probe-server .....	1344
probe-type .....	1345
routing-engine-profile .....	1346
rpm (Services) .....	1347
size .....	1349
source-classes .....	1349
start-time .....	1350
target .....	1350
thresholds .....	1351
traceoptions (Security Datapath Debug) .....	1352
transfer-interval .....	1353
traps .....	1354

Administration .....	1354
Monitoring Security Devices .....	1355
Displaying Multicast Path Information .....	1356
Displaying Real-Time Interface Information .....	1358
Displaying Real-Time Monitoring Information .....	1360
Monitoring Address Pools .....	1362
Monitoring Antivirus Scan Engine Status .....	1363
Monitoring Antivirus Scan Results .....	1364
Monitoring Antivirus Session Status .....	1366
Monitoring Class-of-Service Performance .....	1367
Monitoring Content Filtering Configurations .....	1374
Monitoring CoS Classifiers .....	1375
Monitoring DHCP Client Bindings .....	1376
Monitoring Ethernet Switching .....	1377
Monitoring Events .....	1378
Monitoring GVRP .....	1380
Monitoring H.323 ALG Information .....	1381
Monitoring Interfaces .....	1382
Monitoring MGCP ALGs .....	1384
Monitoring MPLS Traffic Engineering Information .....	1387
Monitoring NAT .....	1392
Monitoring Policy Statistics .....	1402
Monitoring PPP .....	1403
Monitoring PPPoE .....	1404
Monitoring Reports .....	1407
Monitoring Routing Information .....	1413
Monitoring SCCP ALGs .....	1421
Monitoring Security Events by Policy .....	1423
Monitoring Security Features .....	1425
Monitoring SIP ALGs .....	1439
Monitoring Spanning Tree .....	1443
Monitoring the System .....	1444
Monitoring Voice ALG H.323 .....	1452
Monitoring Voice ALG MGCP .....	1454
Monitoring Voice ALG SCCP .....	1457
Monitoring Voice ALG SIP .....	1460
Monitoring Voice ALG Summary .....	1465
Monitoring VPNs .....	1466
Monitoring the WAN Acceleration Interface .....	1476
Monitoring Web Filtering Configurations .....	1476
Alarms .....	1477
Monitoring Active Alarms on a Device .....	1477
Monitoring Alarms .....	1478
Data Path Debugging and Trace Options .....	1479
Displaying a List of Devices .....	1480
Displaying Log and Trace Files .....	1481
Displaying Output for Security Trace Options .....	1481
Displaying Multicast Trace Operations .....	1482

Using the J-Web Traceroute Tool .....	1483
J-Web Traceroute Results and Output Summary .....	1484
MPLS .....	1485
Using the ping Command .....	1486
Using the J-Web Ping Host Tool .....	1488
J-Web Ping Host Results and Output Summary .....	1490
Using the J-Web Ping MPLS Tool .....	1491
J-Web Ping MPLS Results and Output Summary .....	1494
Pinging Layer 2 Circuits .....	1494
Pinging Layer 2 VPNs .....	1495
Pinging Layer 3 VPNs .....	1497
Pinging RSVP-Signaled LSPs and LDP-Signaled LSPs .....	1498
Packet Capture .....	1499
Displaying Packet Headers .....	1499
Using the J-Web Packet Capture Tool .....	1503
J-Web Packet Capture Results and Output Summary .....	1506

	Troubleshooting .....	1611
	Troubleshooting Security Devices .....	1611
	Recovering the Root Password for J Series Devices .....	1612
	Recovering the Root Password for SRX Series Devices .....	1614
	Troubleshooting Access Manager Client-Side Problems .....	1615
	Troubleshooting DNS Name Resolution in Logical System Security Policies .....	1616
	Troubleshooting the Link Services Interface .....	1616
	Troubleshooting Security Policies .....	1625
	Troubleshooting the TGM550 Module and VoIP Interface .....	1627
	Troubleshooting ISSU-Related Problems Using Log Error Messages ..	1628
<b>Chapter 19</b>	<b>System Log Monitoring and Troubleshooting Guide for Security Devices .....</b>	<b>1633</b>
	Overview .....	1633
	System Log Messages .....	1633
	Junos OS System Log Configuration Overview .....	1633
	Junos OS Platform-Specific Default System Log Messages .....	1634
	Displaying and Interpreting System Log Message Descriptions .....	1635
	Interpreting Messages Generated in Structured-Data Format .....	1636
	Interpreting Messages Generated in Standard Format by Services on a PIC .....	1641
	Junos OS System Logging Facilities and Message Severity Levels ..	1642
	Security Devices .....	1643
	Understanding System Logging for Security Devices .....	1643
	Understanding Binary Format for Security Logs .....	1645
	Single-Chassis Systems .....	1646
	Displaying a Log File from a Single-Chassis System .....	1646
	The message-source Field on a Single-Chassis System .....	1646
	Configuration .....	1647
	System Log Messages .....	1647
	Examples: Configuring System Logging .....	1647
	Examples: Assigning an Alternative Facility .....	1649
	Examples: Displaying a Log File .....	1649
	Examples: Displaying System Log Message Descriptions .....	1650
	Security Devices .....	1651
	Configuring Binary Security Log Files .....	1651
	Sending System Log Messages to a File .....	1652
	Setting the System to Send All Log Messages Through eventd .....	1653
	Setting the System to Stream Security Logs Through Revenue Ports .....	1654
	Single-Chassis Systems .....	1654
	Junos OS Minimum System Logging Configuration .....	1655
	Junos OS Default System Log Settings .....	1656
	Junos OS Platform-Specific Default System Log Messages .....	1657
	Specifying the Facility and Severity of Messages to Include in the Log .....	1658
	Directing System Log Messages to a Log File .....	1658
	Logging Messages in Structured-Data Format .....	1659

Directing System Log Messages to a User Terminal . . . . .	1660
Directing System Log Messages to the Console . . . . .	1660
System Log Default Facilities for Messages Directed to a Remote Destination . . . . .	1660
Adding a Text String to System Log Messages . . . . .	1661
Adding a String . . . . .	1662
Including Priority Information in System Log Messages . . . . .	1662
Including the Year or Millisecond in Timestamps . . . . .	1663
Using Regular Expressions to Refine the Set of Logged Messages . . .	1664
Disabling the System Logging of a Facility . . . . .	1666
Configuration Statements . . . . .	1666
allow-duplicates . . . . .	1668

<b>Chapter 20</b>	<b>SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices . . . . .</b>	<b>1715</b>
	Overview . . . . .	1715
	SNMP . . . . .	1715
	Understanding the SNMP Implementation in Junos OS . . . . .	1716
	Standard SNMP MIBs Supported by Junos OS . . . . .	1719
	Juniper Networks Enterprise-Specific MIBs . . . . .	1733
	List of SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways Supported Enterprise-Specific MIBs . . . . .	1740
	List of SRX1400, SRX3400, and SRX3600 Services Gateways Supported Enterprise-Specific MIBs . . . . .	1745
	List of SRX5400, SRX5600 and SRX5800 Services Gateways Supported Enterprise-Specific MIBs . . . . .	1750
	Enterprise-Specific MIBs and Supported Devices . . . . .	1756
	MIB Support Details . . . . .	1766
	SNMP MIB Objects Supported by Junos OS for the Set Operation . . . . .	1775
	SNMPv3 . . . . .	1782
	SNMPv3 Overview . . . . .	1782
	Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage . . . . .	1783
	SNMP Traps . . . . .	1785
	Juniper Networks Enterprise-Specific SNMP Traps . . . . .	1785
	Standard SNMP Traps Supported on Devices Running Junos OS . . . . .	1785
	Standard SNMP Version 1 Traps . . . . .	1786
	Standard SNMP Version 2 Traps . . . . .	1789
	Unsupported Standard SNMP Traps . . . . .	1793
	Routing Instances . . . . .	1796
	Identifying a Routing Instance . . . . .	1797
	Understanding SNMP Support for Routing Instances . . . . .	1797
	Trap Support for Routing Instances . . . . .	1799
	Device Management . . . . .	1799
	Understanding Device Management Functions in Junos OS . . . . .	1799
	Understanding the Integrated Local Management Interface . . . . .	1801
	Remote Operations . . . . .	1801
	SNMP Remote Operations Overview . . . . .	1801

Remote Monitoring, Health Monitoring, and Service Quality . . . . .	1804
Understanding RMON Alarms . . . . .	1804
Understanding RMON Events . . . . .	1806
Understanding Measurement Points, Key Performance Indicators, and Baseline Values . . . . .	1807
Understanding RMON for Monitoring Service Quality . . . . .	1808
Configuration . . . . .	1812
SNMP . . . . .	1812
Configuring SNMP on a Device Running Junos OS . . . . .	1813
Configuring the System Contact on a Device Running Junos OS . . . . .	1815
Configuring the System Description on a Device Running Junos OS . . . . .	1815
Configuring the System Location for a Device Running Junos OS . . . . .	1816
Configuring the System Name . . . . .	1816
Configuring the Commit Delay Timer . . . . .	1817
Loading MIB Files to a Network Management System . . . . .	1817
Filtering Duplicate SNMP Requests . . . . .	1819
Configuring the Interfaces on Which SNMP Requests Can Be Accepted . . . . .	1820
Example: Configuring Secured Access List Checking . . . . .	1820
Filtering Interface Information Out of SNMP Get and GetNext Output . . . . .	1820
Configuring MIB Views . . . . .	1821
Example: Ping Proxy MIB . . . . .	1822
Configuring the Local Engine ID . . . . .	1823
Configuring SNMP Informs . . . . .	1823
SNMPv3 . . . . .	1824
Creating SNMPv3 Users . . . . .	1824
Example: SNMPv3 Configuration . . . . .	1825
Minimum SNMPv3 Configuration on a Device Running Junos OS . . . . .	1828
Configuring the SNMPv3 Authentication Type . . . . .	1830
Configuring the Encryption Type . . . . .	1831
Assigning Security Model and Security Name to a Group . . . . .	1833
Example: Security Group Configuration . . . . .	1834
Example: Configuring the Tag List . . . . .	1835
Example: Creating SNMPv3 Users Configuration . . . . .	1835
SNMP Traps . . . . .	1836
Configuring SNMP Trap Options . . . . .	1837
Configuring the Trap Notification Filter . . . . .	1840
Configuring SNMP Trap Groups . . . . .	1841
Configuring SNMP Trap Options and Groups on a Device Running Junos OS . . . . .	1843
Configuring SNMPv3 Traps on a Device Running Junos OS . . . . .	1844
Configuring the SNMPv3 Trap Notification . . . . .	1845
Example: Configuring SNMP Trap Groups . . . . .	1846
Configuring the Trap Target Address . . . . .	1846
Defining and Configuring the Trap Target Parameters . . . . .	1849
Example: Configuring SNMPv3 Trap Notification . . . . .	1852

Access Privileges . . . . .	1852
Defining Access Privileges for an SNMP Group . . . . .	1853
Configuring the Access Privileges Granted to a Group . . . . .	1854
Example: Access Privilege Configuration . . . . .	1857
Routing Instances . . . . .	1858
Enabling SNMP Access over Routing Instances . . . . .	1858
Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community . . . . .	1858
Example: Configuring Interface Settings for a Routing Instance . . . . .	1859
Configuring Access Lists for SNMP Access over Routing Instances . . . . .	1861
Community Strings . . . . .	1861
Configuring the SNMP Community String . . . . .	1862
Examples: Configuring the SNMP Community String . . . . .	1862
Adding a Group of Clients to an SNMP Community . . . . .	1863
Configuring the SNMPv3 Community . . . . .	1864
Example: SNMPv3 Community Configuration . . . . .	1866
Inform Notifications . . . . .	1867
Configuring the Inform Notification Type and Target Address . . . . .	1867
Example: Configuring the Inform Notification Type and Target Address . . . . .	1868
Remote Operations . . . . .	1869
Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS . . . . .	1869
Remote Monitoring, Health Monitoring, and Service Quality . . . . .	1869
Understanding RMON Alarms and Events Configuration . . . . .	1869
Configuring an Alarm Entry and Its Attributes . . . . .	1870
Configuring an Event Entry and Its Attributes . . . . .	1874
Example: Configuring an RMON Alarm and Event Entry . . . . .	1875
Configuring Health Monitoring on Devices Running Junos OS . . . . .	1875
Example: Configuring Health Monitoring . . . . .	1878
Configuration Statements . . . . .	1879
Configuration Statements at the [edit snmp] Hierarchy Level . . . . .	1882
Complete SNMPv3 Configuration Statements . . . . .	1885
access-list . . . . .	1887
address . . . . .	1888
address-mask . . . . .	1888
agent-address . . . . .	1889
alarm . . . . .	1890
authentication-md5 . . . . .	1891
authentication-none . . . . .	1892
authentication-password . . . . .	1893

### Chapter 22

## Standards Reference

Overview . . . . .	2269
Accessing Standards Documents . . . . .	2269
Accessing Standards Documents on the Internet . . . . .	2269

<b>Chapter 23</b>	<b>Supported Standards</b>	<b>2271</b>
	Chassis and System Standards	2271
	Supported BOOTP and DHCP Standards	2271
	Supported Mobile IP Standards	2272
	Supported Network Management Standards	2273
	Supported RADIUS and TACACS+ Standards for User Authentication	2282
	Supported System Access Standards	2283
	Supported Time Synchronization Standard	2283
	Interface Standards	2284
	Supported ATM Interface Standards	2284
	Supported Ethernet Interface Standards	2284
	Supported Frame Relay Interface Standards	2285
	Supported GRE and IP-IP Interface Standards	2286
	Supported PPP Interface Standards	2286
	Supported SDH and SONET Interface Standards	2287
	Supported Serial Interface Standards	2288
	Supported T3 Interface Standard	2288
	Layer 2 Standards	2289
	Supported Layer 2 Networking Standards	2289
	Supported L2TP Standards	2289
	Supported Layer 2 Circuit Standards	2290
	Supported Layer 2 VPN Standard	2290
	MPLS Applications Standards	2291
	Supported GMPLS Standards	2291
	Supported LDP Standards	2292
	Supported MPLS Standards	2293
	Supported RSVP Standards	2295
	Packet Processing Standards	2296
	Supported CoS Standards	2296
	Supported Packet Filtering Standards	2297
	Supported Policing Standard	2297
	Routing Protocol Standards	2298
	Supported BGP Standards	2298
	Supported ES-IS Standards	2300
	Supported ICMP and Neighbor Discovery Standards	2300
	Supported IP Multicast Protocol Standards	2301
	Supported IPv4, TCP, and UDP Standards	2302
	Supported IPv6 Standards	2303
	Supported IS-IS Standards	2306
	Supported OSPF and OSPFv3 Standards	2307
	Supported RIP and RIPvng Standards	2309
	Services PIC and DPC Standards	2309
	Supported DTCP Standard	2309
	Supported Flow Monitoring and Discard Accounting Standards	2310
	Supported IPsec and IKE Standards	2310
	Supported L2TP Standards	2311
	Supported Link Services Standards	2311
	Supported NAT and SIP Standards	2312
	Supported RPM Standard	2312

Supported Voice Services Standards . . . . .	2313
VPLS and VPN Standards . . . . .	2313
Supported Carrier-of-Carriers and Interprovider VPN Standards . . . . .	2313
Supported Layer 2 VPN Standard . . . . .	2313
Supported Layer 3 VPN Standards . . . . .	2314
Supported Multicast VPN Standards . . . . .	2315
Supported VPLS Standards . . . . .	2315

- Supported Platforms on page lvii
- Using the Examples in This Manual on page lvii
- Documentation Conventions on page lix
- Documentation Feedback on page lxi
- Requesting Technical Support on page lxi

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

## Supported Platforms

---

For the features described in this document, the following platforms are supported:

- [SRX Series](#)

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

## Documentation Conventions

[Table 1 on page lix](#) defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

[Table 2 on page lix](#) defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"><li>Introduces or emphasizes important new terms.</li><li>Identifies guide names.</li><li>Identifies RFC and Internet draft titles.</li></ul>	<ul style="list-style-type: none"><li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li><li><i>Junos OS CLI User Guide</i></li><li>RFC 1997, <i>BGP Communities Attribute</i></li></ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"><li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols ospf area area-id] hierarchy level.</li><li>The console port is labeled <b>CONSOLE</b>.</li></ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub &lt;default-metric <i>metric</i>&gt;;</b>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  <b>(<i>string1</i>   <i>string2</i>   <i>string3</i>)</b>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members [</b> <i>community-ids</i> <b>]</b>
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"><li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li><li>To cancel the configuration, click <b>Cancel</b>.</li></ul>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page of the Juniper Networks TechLibrary site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <http://www.juniper.net/techpubs/feedback/>.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:  
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:  
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:  
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

## SRX Series Overview

Juniper Networks SRX Series Services Gateways provide high-performance security, routing, and network solutions for enterprise and service providers. The SRX Series pack high port density, advanced security, and flexible connectivity into a single, easily managed platform that supports fast, secure, and highly available data center and branch operations.

The SRX Series are based on Junos OS, a full-featured networking operating system that is optimized to provide maximum performance and efficient network security.

The SRX Series range from lower-end branch devices designed to secure small distributed enterprise locations to high-end devices designed to secure enterprise infrastructure, data centers, and server farms. The branch SRX Series include the SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, and SRX650 devices.

### Related Documentation

## Understanding Factory Default Configuration Settings of an SRX210

This topic includes the following sections:

- [Default Configuration Topology on page 4](#)
- [Default Port Settings on page 5](#)
- [Default Settings for Interfaces, Zones, Policy, and NAT on page 5](#)

- [Default System Services on page 6](#)
- [Autoinstallation on page 6](#)

### Default Configuration Topology

Figure 1 on page 4 provides a topology of a simple network consisting of the SRX210.

Figure 1: SRX210 Deployment Topology

In a typical deployment scenario of the SRX210, the following configurations are used:

- The SRX Series interface ge-0/0/0 is connected to a typical Internet service provider (ISP) cable or DSL modem.
- The protected network is connected to interface ge-0/0/1, fe-0/0/2 to fe-0/0/7 in the trust zone.
- The IP address of interface ge-0/0/0 is assigned from ISP either statically or by DHCP.
- The interfaces ge-0/0/1, fe-0/0/2 to fe-0/0/7 are a part of the default VLAN (**vlan-trust**). The protected hosts can be connected to any one of the ports that are part of the default VLAN.
- The DHCP server is running on vlan.0 and assigns IP addresses to other interfaces for the local LAN.
- The default security policy allows traffic from the trust zone to the untrust zone and denies traffic from the untrust to trust zone.
- System services such as SSH, Telnet, FTP, HTTP, HTTPS, and xnm-clear-text are enabled by default.

## Default Port Settings

When an SRX210 is powered on for the first time, it boots using the factory default configuration.

The SRX210 has the following factory default port settings:

- WAN interface—The Ethernet interface labeled **0/0** on the services gateway chassis (called as ge-0/0/0 in J-Web and the CLI ) is in Layer 3 (routing) mode.

This WAN interface is used to connect your services gateway to your ISP. By default, the WAN port is a Dynamic Host Control Protocol (DHCP) client and configured to receive an IP address through DHCP.

- LAN interfaces—Ethernet interfaces labeled **0/1** through **0/7** (called as ge-0/0/1, fe-0/0/2 to fe-0/0/7 ) are in Layer 2 mode (Ethernet switching mode) and assigned to a VLAN (**vlan-trust**).

A VLAN interface (Layer 3 interface) is created to route traffic from the interfaces in the LAN (ge-0/0/1, fe-0/0/2 to fe-0/0/7) to WAN (ge-0/0/0) interface and vice versa. All traffic between the ports within the VLAN is locally switched. The trust zone VLAN interface (vlan.0) has a default static IP of 192.168.1.1/24, and assigns IP addresses in the 192.168.1.2 to 192.168.1.254 range to any device plugged into the trust interfaces.

## Default Settings for Interfaces, Zones, Policy, and NAT

Table 3 on page 5 provides the default configuration of the interfaces on an SRX210.

**Table 3: Default Interfaces Settings**

Interface	Security Zones	DHCP State	IP Address
ge-0/0/0	Untrust	Client	Dynamically assigned
vlan.0	Trust	Server	192.168.1.1/24

**NOTE:** Because Ethernet interfaces (ge-0/0/1, fe-0/0/2 to fe-0/0/7) are assigned to the trust zone (vlan-trust), any traffic originating from these interfaces is treated as trust.

Table 4 on page 5 provides the default security policies to block traffic coming from the untrust zone to devices in the trust zone.

**Table 4: Default Security Policy Settings**

Source Zone	Destination Zone	Policy Action
Trust	Untrust	Permit
Untrust	Trust	Deny

**NOTE:** In default configuration, all LAN interfaces are in Layer 2 mode and they communicate with each other without need of any policy.

Table 5 on page 6 provides outbound Internet access using source NAT with port address translation, permitting traffic from the trust zone to the untrust zone.

**Table 5: Default NAT Settings**

Source Zone	Destination Zone	Policy Action
Trust	Untrust	Source NAT to the untrust zone interface

See “SRX210 Factory Default Setting—A Sample” on page 34 to view the factory default configuration of the device.

### Default System Services

The following system services are enabled by default on a branch SRX Series:

- DHCP
- FTP
- HTTP
- HTTPS
- SSH
- Telnet
- xnm-clear-text

### Autoinstallation

Autoinstallation provides automatic configuration for a new device that you connect to the network. Autoinstallation is active by default and is deactivated when you commit the device for the first time.

You can use the **delete system autoinstallation** command to delete autoinstallation.

For more details on Autoinstallation, see “Autoinstallation Overview” on page 151.

## Understanding Methods to Manage Your Branch SRX Series

You can use a PC or laptop to configure and monitor your SRX Series. The branch SRX Series have a factory default configuration that enables you to connect to devices through any of the following methods right out of the box:

- Connecting through the console port—Use an Ethernet cable with an RJ-45 to DB-9 serial port adapter to connect the console port on the SRX Series to the serial port on the PC or laptop. This connection method does not require any prior configuration on the SRX Series.
- Connecting through the J-Web interface—J-Web is a powerful Web-based interface that allows you to manage the SRX Series through a graphical interface on a Web browser. Use an RJ-45 Ethernet cable to connect the PC or laptop to one of the Ethernet ports labeled 0/1 through 0/7 on the front panel of your services gateway.

To access the J-Web setup wizard, open a Web browser on the PC or laptop and enter the IP address 192.168.1.1 in the address field. Log in using the default user name “root”, with a blank password field. No prior configuration is required.

- Connecting through SSH and Telnet—Use an RJ-45 Ethernet cable to connect the PC or laptop to one of the Ethernet ports labeled 0/1 through 0/7 on the front panel of your services gateway.

**NOTE:** To access the device through SSH and Telnet, you need to set up a root password. For more details, see [“Connecting Your Branch SRX Series for the First Time” on page 16](#).

### Understanding Branch SRX Series Stateful Firewall Functionality

Your branch SRX Series includes a stateful firewall, which tracks the state of each traffic flow or stream and uses dynamic packet inspection to identify patterns in data packets that might represent a threat to your network. This feature protects hosts from communicating with compromised or malicious users or applications.

The branch SRX Series uses zones and policies to provide firewall configuration.

Although zones and policies can have user-defined configurations, the factory-default configuration contains, at a minimum, a “trust” and “untrust” zone. The trust zone is used

for configuration and attaching the internal LAN to the branch SRX Series. The untrust zone is commonly used for the WAN or untrusted Internet interface.

To simplify installation and make configuration easier, a default policy is in place that allows traffic originating from the trust zone to the untrust zone. You are not required to configure a deny policy from the untrust zone to any other zones, because the device drops the traffic by default if there is no policy defined for any traffic.

By using the J-Web interface or CLI, you can create a series of security policies that can control the traffic from within and in between zones by defining policies.

**Related  
Documentation**

- [Understanding Security Zones and Policies for SRX Series on page 8](#)
- [Example: Configuring Security Zones and Policies for SRX Series on page 39](#)

## Understanding Security Zones and Policies for SRX Series

This topic includes the following sections:

- [Zones on page 8](#)
- [Security Policy on page 8](#)

### Zones

---

A zone is a collection of one or more network segments sharing identical security requirements. To group network segments within a zone, you must assign logical interfaces from the device to a zone.

Security zones are used to identify traffic flow direction in security policies to control traffic. On a single device, you can configure multiple security zones and at a minimum, you must define two security zones, basically to protect one area of the network from the other.

To configure the security zones, you must:

- Define zone (security or functional)
- Add logical interfaces to the zone
- Define permitted services (example: Telnet, SSH) and protocols (example: OSPF) destined to device itself.

Default configuration of the branch SRX Series includes two security zones--trust and untrust. The vlan.0 belongs to the trust zone and ge-0/0/0 belongs to the untrust zone.

For more details on security zones, see *Security Zones and Interfaces Feature Guide for Security Devices*.

### Security Policy

---

A security policy is a set of statements that controls traffic from a specified source to a specified destination using a specified service.

If the SRX Series receives a packet that matches those specifications, it performs the action specified in the policy. Actions for traffic matching the specified criteria include permit, deny, reject, log, or count.

Security policies enforce a set of rules for transit traffic, identifying which traffic can pass through the firewall and the actions taken on the traffic as it passes through the firewall.

[Table 6 on page 9](#) provides details of factory default settings for security policies on branch SRX Series devices.

**Table 6: Factory-Default Settings for Security Policies for Branch SRX Series Devices**

From Zone	To Zone	Action
Trust zone	Untrust zone	Allow
Trust zone	Trust zone	Allow
Untrust zone	Trust zone	Deny

For more details on security policies, see *Security Policies Feature Guide for Security Devices*.

## Understanding NAT for SRX Series

Network Address Translation (NAT) is a method for modifying or translating network address information in packet headers. Either of the source and destination addresses or both addresses in a packet can be translated. NAT can include the translation of IP addresses as well as port numbers.

The following types of NAT are supported on an SRX Series:

- **Static NAT**—Static NAT defines a one-to-one mapping from one IP subnet to another IP subnet. The mapping includes destination IP address translation in one direction and source IP address translation in the reverse direction.

Static NAT allows connections to be originated from either side of the network, but translation is limited to one-to-one or between blocks of addresses of the same size.

- **Destination NAT**—Destination NAT is the translation of the destination IP address of a packet entering the SRX Series. Destination NAT is used to redirect traffic destined to a virtual host (identified by the original destination IP address) to the real host (identified by the translated destination IP address).

In general, destination NAT allows connections to be initiated for incoming network connections—for example, from the Internet to a private network.

- **Source NAT**—Source NAT is the translation of the source IP address of a packet leaving the SRX Series. Source NAT is used to allow hosts with private IP addresses to access a public network. On the SRX210, source NAT from the trust to the untrust zone is enabled by default.

In general, source NAT allows connections to be initiated for outgoing network connections—for example, from a private network to the Internet.

For more details, see *Network Address Translation Feature Guide for Security Devices*.

- [Example: Configuring Destination NAT for SRX Series on page 43](#)

## Understanding Unified Threat Management for Branch SRX Series

Unified Threat Management (UTM) is an optional function for the branch SRX Series that provides an integrated suite of network security features to protect against multiple threat types including spam and phishing attacks, viruses, trojans and spyware infected files, unapproved website access, and unapproved content.

With UTM, you can implement a comprehensive set of security features that include antispam, antivirus, Web filtering, and content filtering protection.

The UTM features provide the ability to prevent threats at the SRX Series device before the threats enter the network.

The following UTM modules are supported:

- **Antispam**—Antispam blocks and filters unwanted e-mail traffic by scanning inbound and outbound SMTP e-mail traffic by using some combination of spam block lists (SBL) and user-configured blacklists and whitelists.
- **Antivirus**—Antivirus feature uses an integrated scanning engine and virus signature databases to protect against viruses, trojans, rootkits, worms, and other types of malicious code from reaching devices on your network.
- **Web filtering**—Web filtering allows you to permit or block access to specific websites individually or based on the categories to which the website belongs.
- **Content filtering**—Content filtering provides basic data loss prevention functionality. Content filtering filters traffic based on MIME type, file extension, and protocol commands.

The SRX Series has predefined system profiles (antispam, antivirus, or Web filtering) designed to provide basic protection. You can use a predefined profile to bind to the UTM policy or you can also create a component (antispam, antivirus, Web filtering, or content filtering) profile.

[Table 7 on page 11](#) provides UTM modules, feature profiles, and supported protocol details.

Table 7: Default UTM Profiles on Branch SRX Series

UTM Modules	Categories	Types	Default Profiles	Supported Protocols
Antispam	NA	smtp-profile	junos-as-defaults	SMTP
Antivirus	Full antivirus	kaspersky-lab-engine	junos-av-defaults	SMTP, POP3, IMAP, HTTP and FTP
	Express antivirus	juniper-express-engine	junos-eav-defaults	
	Sophos antivirus	sophos-engine	junos-sophos-av-defaults	
Web filtering	Integrated Web filtering	surf-control-integrated	junos-wf-cpa-default	HTTP
	Redirect Web filtering	websense-redirect	junos-wf-websense-default	
	Local Web filtering	juniper-local	junos-wf-local-default	
	Enhanced Web filtering	juniper-enhanced	junos-wf-enhanced-default	
Content filtering	NA	NA	NA	SMTP, POP3, IMAP, HTTP, and FTP

To enable UTM on your SRX Series , you must:

- Install UTM licenses (See [“Updating Licenses for a Branch SRX Series” on page 48.](#))
- Create UTM profiles for UTM components (antispam, antivirus, content filtering, and Web filtering)
- Map a UTM profile to a UTM policy
- Map a UTM policy to a security policy

For more details on UTM, see *Junos OS UTM Library for Security Devices*.

- [Example: Configuring Unified Threat Management for a Branch SRX Series on page 50](#)

## Understanding Intrusion Detection and Prevention for SRX Series

An Intrusion Detection and Prevention (IDP) policy lets you selectively enforce various attack detection and prevention techniques on the network traffic passing through your SRX Series. The SRX Series offer the same set of IDP signatures that are available on Juniper Networks IDP Series Intrusion Detection and Prevention Appliances to secure networks against attacks. The basic IDP configuration involves the following tasks:

- Download and install the IDP license—See [“Updating Licenses for a Branch SRX Series” on page 48](#).
- Download and install the signature database—You must download and install the IDP signature database. The signature databases are available as a security package on the Juniper Networks website. This database includes attack object and attack object groups that you can use in IDP policies to match traffic against known attacks.
- Configure recommended policy as the IDP policy—Juniper Networks provides predefined policy templates to use as a starting point for creating your own policies. Each template is a set of rules of a specific rulebase type that you can copy and then update according to your requirements.

To get started, we recommend you use the predefined policy named “Recommended”.

- Enable a security policy for IDP inspection—For transit traffic to pass through IDP inspection, you configure a security policy and enable IDP application services on all traffic that you want to inspect.

For more details on IDP, see *Junos OS Intrusion Detection and Prevention (IDP) Library for Security Devices*.

## Understanding IPsec VPN for SRX Series

A virtual private network (VPN) provides a means for securely communicating between remote computers across a public wide area network (WAN), such as the Internet. A VPN connection can link two local area networks (LAN) or a remote dialup user and a LAN. The traffic that flows between these two points passes through shared resources such as routers, switches, and other network equipment that make up the public WAN.

To secure VPN communication while passing through the WAN, the two participants create an IP Security (IPsec) tunnel.

IPsec is a suite of protocols designed to authenticate and encrypt all IP traffic between two locations. IPsec allows trusted data to pass through networks that would otherwise be considered insecure. An IPsec tunnel consists of a pair of unidirectional Security Associations (SA); one at each end of the tunnel that specify the security parameter index (SPI), destination IP address, and security protocol (Authentication Header or Encapsulating Security Payload) employed.

Through the SA, an IPsec tunnel can provide the following security functions:

- Privacy (through encryption)
- Content integrity (through data authentication)
- Sender authentication

For more information, see *IPsec VPN Feature Guide for Security Devices*.

**Related Documentation**

- *Junos OS VPN Library for Security Devices*

## Understand Chassis Cluster for SRX Series

Chassis clustering provides network node redundancy by grouping a pair of the same kind of supported SRX Series into a cluster. The devices must be running Junos OS. To form a chassis cluster, a pair of the same kind of supported SRX Series are combined to act as a single system that enforces the same overall security. The two nodes back each other up, with one node acting as the primary node and the other as the secondary node; this ensures stateful failover of processes and services in the event of system or hardware failure.

For more information, see *Chassis Cluster Feature Guide for Security Devices*.

- [Verifying Your Branch SRX Series Configuration on page 33](#)
- [SRX210 Factory Default Setting—A Sample on page 34](#)
- [Resetting Your Branch SRX Series on page 38](#)

### Mandatory Settings to Configure Your Branch SRX Series

[Table 8 on page 15](#) provides the details on configuration settings that you need to enter when configuring the device for the first time.

**Table 8: Settings Used to Configure the SRX210**

Settings	Details
Administrator Username	Record the login name of the services gateway administrator. Default is root, which you must change during your first J-Web session.
Administrator Password	Record the password for this administrator account.

**Table 8: Settings Used to Configure the SRX210 (continued)**

Settings	Details
Hostname	Record the name of your SRX210 to identify itself on your network.
Network Time Protocol (NTP) Server	Network security often depends on knowing the exact time, when a specific event occurs. If you do not have access to a private NTP server, you can enter the name or IP address of a public NTP server. For information about public time servers, see <a href="http://tf.nist.gov/tf-cgi/servers.cgi">http://tf.nist.gov/tf-cgi/servers.cgi</a> .
Time Zone	Record the time zone to be used by your services gateway.
IP address assignment	<p>Your Internet Service Provider might use the Dynamic Host Configuration Protocol (DHCP) to assign an IP address and routing information to your services gateway.</p> <p><b>NOTE:</b> The DHCP client configuration is by default enabled on port 0/0 (ge-0/0/0).</p> <p><b>NOTE:</b> If your ISP does not support DHCP, you should ask your ISP what settings (IP address, default gateway, DNS server) to use to configure the WAN interface on your services gateway.</p>

**Related Documentation**

- [Understanding Factory Default Configuration Settings of an SRX210 on page 3](#)
- [Connecting Your Branch SRX Series for the First Time on page 16](#)

**Connecting Your Branch SRX Series for the First Time**

This topic includes the following sections:

- [Connecting Your Branch SRX Series Through the Console Port for the First Time on page 16](#)
- [Configuring System Identification and User Classes for Your Branch SRX Series on page 18](#)
- [Configuring Internet Access for Your Branch SRX Series on page 18](#)
- [Configuring a Network Time Protocol Server for Your Branch SRX Series on page 23](#)
- [Validating Your Branch SRX Series Configuration on page 23](#)
- [Verifying Your Branch SRX Series Configuration on page 24](#)

**Connecting Your Branch SRX Series Through the Console Port for the First Time**

The following procedure describes the steps required to connect a branch SRX Series through the console port for the first time.

To connect the device:

1. Connect your computer or laptop to the console port on the SRX Series .
2. Start the terminal emulation program on the computer or laptop, select the COM port, and configure the following port settings:
  - Bits per second—9600
  - Data bits—8
  - Parity—none
  - Stop bits—1
  - Flow control—none
3. Click Open or Connect (the term varies in different applications).
4. Press the **POWER** button on the device, and wait till the Power LED turns green.
5. Log in to the device as root and leave the password field blank. When you boot the device with the factory default configuration, you do not need a password.
6. Enter the UNIX shell after you are authenticated through the CLI:

```
Amnesiac (ttyu0)
login: root
Password:
--- JUNOS 12.1X44-D10.4 built 2013-01-08 05:15:31 UTC
```

7. At the % prompt, type **cli** to start the CLI and press Enter. The prompt changes to an angle bracket (>) when you enter CLI operational mode.

```
root@% cli
root>
```

8. At the (>) prompt, type **configure** and press Enter. The prompt changes from > to # when you enter configuration mode.

```
root> configure
Entering configuration mode
[edit]
root#
```

9. Create a password for the root user to manage the SRX Series.

#### **set system root authentication plain-text-password**

Enter a password at the New password prompt, then confirm by entering the same password at the Retype New password prompt.

```
New password:
Retype New password:
```

At the CLI prompt, type **commit** to activate the configuration.

Now, proceed with configuring system identification settings, users and classes. See [“Configuring System Identification and User Classes for Your Branch SRX Series” on page 18](#).

**NOTE:** If you are unable to log in with the username `root` and no password, it could be because the device has a different configuration than the factory settings. If you do not know the password of the `root` account, or any another account with super-user privileges, then a password reset is required. The process to do a password recovery can be found here: <http://kb.juniper.net/KB12167>.

---

### Configuring System Identification and User Classes for Your Branch SRX Series

After assigning a root password, you must set up a hostname, domain name, and user accounts. All the users logging in to the SRX Series must be mapped to a login class. You can use the predefined login classes: `operator`, `read-only`, `super-user`, and `unauthorized`, or create a new login class. You can then apply one login class to an individual user account.

To configure system identification settings and user classes:

1. Set the system hostname.

```
[edit]
root@host# set system host-name srx210-host
```

2. Create an administrative user to manage the SRX Series.

```
[edit]
root@host# set system login user admin-user class super-user
root@host# set system login user admin-user authentication plain-text-password
```

Enter the password and retype the password when prompted.

3. Create a read-only administrative user.

```
[edit]
root@host# set system login user read-only-user class read-only
root@host# set system login user read-only-user authentication plain-text-password
```

Enter the password and retype the password when prompted.

---

### Configuring Internet Access for Your Branch SRX Series

In this example you create a configuration for connecting your branch SRX Series device to the Internet, allowing users and devices connected to your branch SRX Series device to send and receive traffic to a remote site.

**NOTE:** This procedure applies to most branch SRX Series devices. Any differences might be related to the types of interfaces available on your branch SRX Series device. For example, you might have to substitute `fe-x/x/x` interfaces for `ge-x/x/x` interfaces when configuring this procedure. This procedure uses the SRX210 as example.

**NOTE:** This procedure assumes that the branch SRX Series device still has the factory default zones, policies, and source Network Address Translation (NAT) configuration commands in place. If your branch SRX Series device is unable to connect to the Internet after you have completed the tasks in this document, the information in [“SRX210 Factory Default Setting—A Sample” on page 34](#) might help you diagnose and fix the problem.

Connect the port on the branch SRX Series device that you want to use for Internet access (typically the port labeled **0/0**) to the connection device provided by your Internet service provider (ISP). You can enable Internet access in the following ways:

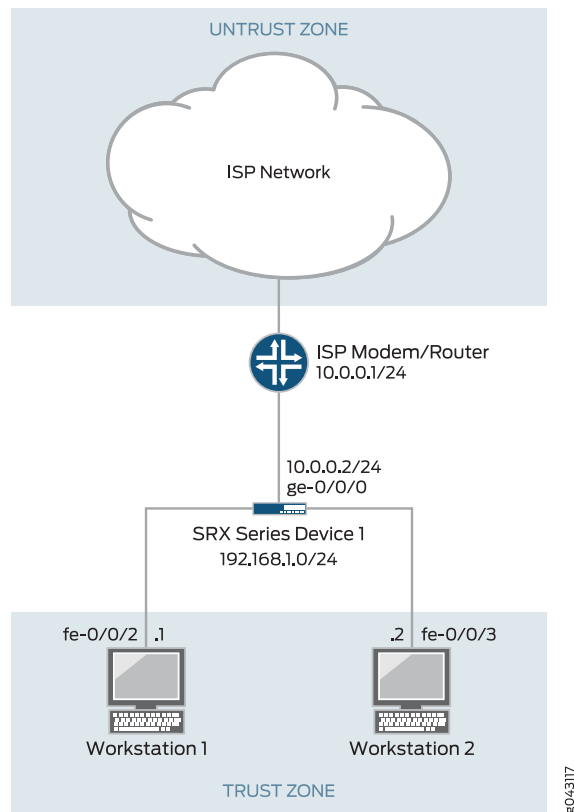

- **Autoinstallation**—The interface ge-0/0/0 (the interface used to connect to your ISP) does not have IP options configured when the SRX Series device is removed from its box and powered on, or you reload the factory default configuration.

Interface ge-0/0/0 is configured with the BOOTP command when you commit the configuration without configuring either DHCP or an IP address on interface ge-0/0/0. When interface ge-0/0/0 is configured to use BOOTP, the SRX Series device attempts to use BOOTP to obtain its configuration from a BOOTP server in the ISP’s network (using BOOTP to download a configuration for any Juniper Networks device is referred to as autoinstallation). When you commit a configuration that was obtained through a BOOTP, the **autoinstallation** command is removed from the configuration of your branch SRX Series device automatically. This method is not explained in this example. For more details on autoinstallation, see [“Autoinstallation Overview” on page 151](#).

- **DHCP**—Assign the Internet connectivity information to the branch SRX Series device automatically using DHCP from the ISP—If your ISP supports DHCP, the branch SRX Series device will acquire an IP address and other settings (a domain name server IP address and a default route) from your ISP automatically. This method is explained in this example.
- **Manually**—Assign the Internet connectivity information to the branch SRX Series device manually—If your ISP does not provide IP address information through DHCP, you can configure the Internet interface with a static IP address, a DNS IP address, and a default route pointing to the ISP’s Internet router. This method is explained in this example.

[Figure 2 on page 20](#) shows how to connect a branch SRX Series device to the Internet.

Figure 2: Connecting a Branch SRX Series Services Gateway to the Internet

To acquire the IP connectivity information for the branch SRX Series device automatically using DHCP from your ISP:

1. Open a terminal session with your branch SRX Series device using either a console port connection or SSH.

**NOTE:** If you have not yet configured a password for the root user account then you can only communicate with the branch SRX Series device through the console port. If you need information on how to configure the console port on your device, see [“Connecting Your Branch SRX Series Through the Console Port for the First Time”](#) on page 16.

2. At the login prompt, log in as root, or another user account with superuser privileges, and enter the password when prompted for it.

**NOTE:** If this is the first time you are using your branch SRX Series device, log in as root (prompt for password does not appear). If you have previously configured a password for the root user account, or created another user account, enter the credentials at the prompt. If you have already configured a system hostname, that name will appear in the prompts.

```
Amnesiac (ttyu0)
login: root
Password:
root@%
```

**NOTE:** If you are unable to log in because you do not know the correct password, a password recovery is required. The password recovery process can be found here: <http://kb.juniper.net/KB12167>.

- At the **root@%** prompt, type the **cli** command and press Enter. The prompt changes to **root>** when you enter CLI operational mode.

```
root> cli
root@% cli
root>
```

- At the **root>** prompt, type the **configure** command and press Enter. The prompt changes from **root>** to **root#** when you enter configuration mode.

```
root# configure
root> configure
Entering configuration mode
[edit]
root#
```

- Delete the Autoinstallation system process. This is required because the Autoinstallation system process and using DHCP to set up the Internet connection on interface ge-0/0/0 cannot coexist in the configuration.

```
[edit]
root# delete system autoinstallation
```

- Configure interface ge-0/0/0 to acquire an IP address, a DNS IP address, and a default route from your ISP using DHCP.

```
[edit]
root@host# set interfaces ge-0/0/0 unit 0 family inet dhcp
```

- When your ISP assigns the Internet connectivity information using DHCP, the process usually also assigns a DNS IP address.

If your ISP instructed you to enter the DNS IP address manually, configure the IP address of the DNS that your ISP provided you with.

```
[edit]
root# set system name-server 10.45.67.1
```

**NOTE:** The ISP might give you more than one DNS IP address to enter manually.

**NOTE:** The DNS IP addresses 208.67.222.222 and 208.67.222.220 are available as part of the default configuration on a branch SRX Series device. You can leave them in the configuration, or remove them.

To assign an IP address, a DNS IP address, and a default route on the branch SRX Series device manually:

1. Configure interface ge-0/0/0 with the IP address that your ISP provided you with.

[edit]

```
root@host# set interfaces ge-0/0/0 unit 0 family inet address 10.0.0.6/30
```

2. Configure a static default route pointing to the ISP's Internet router with IP address 10.0.0.5 as the next hop.

[edit]

```
root# set routing-options static route 0.0.0.0/0 next-hop 10.0.0.5
```

3. Configure the IP address of the DNS that your ISP provided you with.

[edit]

```
root# set system name-server 10.45.67.1
```

**NOTE:** The ISP might give you more than one DNS IP address to enter manually.

**NOTE:** The DNS IP addresses 208.67.222.222 and 208.67.222.220 are available as part of default configuration on branch SRX Series device. You can leave them in the configuration, or remove them.

4. At the CLI prompt, type the **commit** command to activate the configuration.

[edit]

```
root# commit
```

[edit]

```
root# commit
commit complete
```

[edit]

```
root#
```

5. Access <http://www.juniper.net> or any webpage to ensure that you are connected to the Internet. This connectivity ensures that you can pass traffic through the services gateway.

### Configuring a Network Time Protocol Server for Your Branch SRX Series

Network Time Protocol (NTP) can be used to synchronize network devices to a common, and preferably accurate, time source. By synchronizing all network devices, timestamps on log messages are both accurate and meaningful.

1. Configure the NTP server and time zone.

```
[edit]
root@host# set system ntp server 160.90.182.55
```

```
[edit]
root@host# set system time-zone GMT-8
```

2. Update the system clock to make use of the new NTP server settings from operational mode.

```
root@host>set date NTP
```

### Validating Your Branch SRX Series Configuration

**Purpose** Verify that the device was configured with a hostname, user classes, name server, and an NTP server.

**Action** From configuration mode, confirm your configuration by entering the **show** commands such as **show system host-name**, **show system login**, and **show system name-server** as shown in the following samples:

- Verify system hostname details.

```
[edit]
root@host# show system host-name
host-name srx210-host;
```

- Verify system user classes and login details.

```
[edit]
root@host# show system login
user admin-user {
  class super-user;
  authentication {
    encrypted-password "$ABC123/"; ## SECRET-DATA
  }
}
user read-only-user {
  class read-only;
  authentication {
    encrypted-password "$A1B1C1"; ## SECRET-DATA
  }
}
```

- Verify system name server details.

```
[edit]
root@host# show system name-server
208.67.222.222;
208.67.220.220;
```

11.11.11.11

- Use **run show interface terse** to verify the acquired IP address.

If you are done configuring the device, enter **commit** from configuration mode.

### Verifying Your Branch SRX Series Configuration

---

**Purpose** Verify that your SRX Series configuration is working properly.

**Action** From configuration mode, confirm your configuration by entering the **show system services dhcp client** command.

- Verify DHCP client configuration.

```
user@srx210-host> show system services dhcp client ge-0/0/0.0
```

```
Logical Interface Name   ge-0/0/1.0
Hardware address        00:12:1e:a9:7b:81
Client Status           bound
Address obtained        1.1.1.20
update server           enables
Lease Obtained at       2007-05-10 18:16:04 PST
Lease Expires at        2007-05-11 18:16:04 PST
```

DHCP Options:

```
Name: name-server, Value: [ 1.1.1.2 ]
Code: 1, Type: ip-address, Value: 255.255.255.0
Name: name-server, Value: [11.11.11.11]
Name: domain-name, Value: dept.example.net
```

- Verify the Internet connection on your SRX Series.
  - To verify the connectivity from your device, ping to the gateway and DNS from your SRX Series to verify the connectivity.
  - To verify that your SRX Series is connected and everything is working properly, access <http://www.juniper.net/techpubs/> or other Web destinations to ensure that you are connected to the Internet.

- Verify that the login classes you have created are working properly.

Log out from the device and log in again using the credentials that you have configured for the newly created user classes.

- Verify NTP server details.

```
user@srx210-host# show system ntp
```

```
server 160.90.182.55;
```

## Connecting Your Branch SRX Series Through the Console Port for the First Time

The following procedure describes the steps required to connect a branch SRX Series through the console port for the first time.

To connect the device:

1. Connect your computer or laptop to the console port on the SRX Series .
2. Start the terminal emulation program on the computer or laptop, select the COM port, and configure the following port settings:
  - Bits per second —9600
  - Data bits—8
  - Parity—none
  - Stop bits—1
  - Flow control—none
3. Click Open or Connect (the term varies in different applications).
4. Press the **POWER** button on the device, and wait till the Power LED turns green.
5. Log in to the device as root and leave the password field blank. When you boot the device with the factory default configuration, you do not need a password.

6. Enter the UNIX shell after you are authenticated through the CLI:

```
Amnesiac (ttyu0)
login: root
Password:
--- JUNOS 12.1X44-D10.4 built 2013-01-08 05:15:31 UTC
```

7. At the % prompt, type **cli** to start the CLI and press Enter. The prompt changes to an angle bracket (>) when you enter CLI operational mode.

```
root@% cli
root>
```

8. At the (>) prompt, type **configure** and press Enter. The prompt changes from > to # when you enter configuration mode.

```
root> configure
Entering configuration mode
[edit]
root#
```

9. Create a password for the root user to manage the SRX Series.

**set system root authentication plain-text-password**

Enter a password at the New password prompt, then confirm by entering the same password at the Retype New password prompt.

```
New password:
Retype New password:
```

At the CLI prompt, type **commit** to activate the configuration.

Now, proceed with configuring system identification settings, users and classes. See “Configuring System Identification and User Classes for Your Branch SRX Series” on page 18.

**NOTE:** If you are unable to log in with the username root and no password, it could be because the device has a different configuration than the factory settings. If you do not know the password of the root account, or any another account with super-user privileges, then a password reset is required. The process to do a password recovery can be found here: <http://kb.juniper.net/KB12167>.

## Configuring System Identification and User Classes for Your Branch SRX Series

After assigning a root password, you must set up a hostname, domain name, and user accounts. All the users logging in to the SRX Series must be mapped to a login class. You can use the predefined login classes: operator, read-only, super-user, and unauthorized, or create a new login class. You can then apply one login class to an individual user account.

To configure system identification settings and user classes:

1. Set the system hostname.

```
[edit]
root@host# set system host-name srx210-host
```

2. Create an administrative user to manage the SRX Series.

```
[edit]
root@host# set system login user admin-user class super-user
root@host# set system login user admin-user authentication plain-text-password
```

Enter the password and retype the password when prompted.

3. Create a read-only administrative user.

```
[edit]
root@host# set system login user read-only-user class read-only
root@host# set system login user read-only-user authentication plain-text-password
```

Enter the password and retype the password when prompted.

- [Validating Your Branch SRX Series Configuration on page 23](#)
- [Verifying Your Branch SRX Series Configuration on page 24](#)

## Configuring Internet Access for Your Branch SRX Series

In this example you create a configuration for connecting your branch SRX Series device to the Internet, allowing users and devices connected to your branch SRX Series device to send and receive traffic to a remote site.

**NOTE:** This procedure applies to most branch SRX Series devices. Any differences might be related to the types of interfaces available on your branch SRX Series device. For example, you might have to substitute fe-x/x/x interfaces for ge-x/x/x interfaces when configuring this procedure. This procedure uses the SRX210 as example.

**NOTE:** This procedure assumes that the branch SRX Series device still has the factory default zones, policies, and source Network Address Translation (NAT) configuration commands in place. If your branch SRX Series device is unable to connect to the Internet after you have completed the tasks in this document, the information in [“SRX210 Factory Default Setting—A Sample” on page 34](#) might help you diagnose and fix the problem.

Connect the port on the branch SRX Series device that you want to use for Internet access (typically the port labeled 0/0) to the connection device provided by your Internet service provider (ISP). You can enable Internet access in the following ways:

- **Autoinstallation**—The interface ge-0/0/0 (the interface used to connect to your ISP) does not have IP options configured when the SRX Series device is removed from its box and powered on, or you reload the factory default configuration.

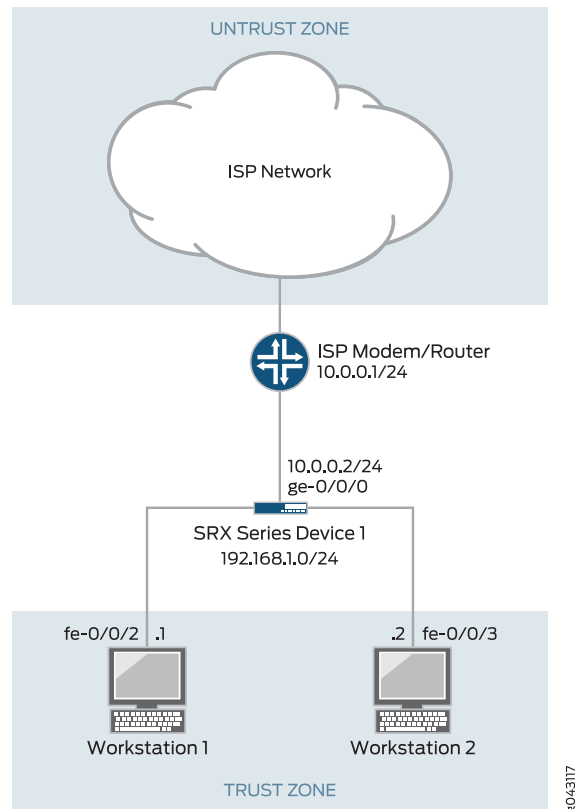

Interface ge-0/0/0 is configured with the BOOTP command when you commit the configuration without configuring either DHCP or an IP address on interface ge-0/0/0. When interface ge-0/0/0 is configured to use BOOTP, the SRX Series device attempts to use BOOTP to obtain its configuration from a BOOTP server in the ISP's network (using BOOTP to download a configuration for any Juniper Networks device is referred to as autoinstallation). When you commit a configuration that was obtained through a BOOTP, the **autoinstallation** command is removed from the configuration of your branch SRX Series device automatically. This method is not explained in this example. For more details on autoinstallation, see [“Autoinstallation Overview” on page 151](#).

- **DHCP**—Assign the Internet connectivity information to the branch SRX Series device automatically using DHCP from the ISP—If your ISP supports DHCP, the branch SRX Series device will acquire an IP address and other settings (a domain name server IP address and a default route) from your ISP automatically. This method is explained in this example.

- Manually—Assign the Internet connectivity information to the branch SRX Series device manually—If your ISP does not provide IP address information through DHCP, you can configure the Internet interface with a static IP address, a DNS IP address, and a default route pointing to the ISP's Internet router. This method is explained in this example.

Figure 2 on page 20 shows how to connect a branch SRX Series device to the Internet.

**Figure 3: Connecting a Branch SRX Series Services Gateway to the Internet**

To acquire the IP connectivity information for the branch SRX Series device automatically using DHCP from your ISP:

1. Open a terminal session with your branch SRX Series device using either a console port connection or SSH.

**NOTE:** If you have not yet configured a password for the root user account then you can only communicate with the branch SRX Series device through the console port. If you need information on how to configure the console port on your device, see “[Connecting Your Branch SRX Series Through the Console Port for the First Time](#)” on page 16.

2. At the login prompt, log in as root, or another user account with superuser privileges, and enter the password when prompted for it.

**NOTE:** If this is the first time you are using your branch SRX Series device, log in as root (prompt for password does not appear). If you have previously configured a password for the root user account, or created another user account, enter the credentials at the prompt. If you have already configured a system hostname, that name will appear in the prompts.

```
Amnesiac (ttyu0)
login: root
Password:
root@%
```

**NOTE:** If you are unable to log in because you do not know the correct password, a password recovery is required. The password recovery process can be found here: <http://kb.juniper.net/KB12167>.

3. At the **root@%** prompt, type the **cli** command and press Enter. The prompt changes to **root>** when you enter CLI operational mode.

```
root> cli
root@% cli
root>
```

4. At the **root>** prompt, type the **configure** command and press Enter. The prompt changes from **root>** to **root#** when you enter configuration mode.

```
root# configure
root> configure
Entering configuration mode
[edit]
root#
```

5. Delete the Autoinstallation system process. This is required because the Autoinstallation system process and using DHCP to set up the Internet connection on interface ge-0/0/0 cannot coexist in the configuration.

[edit]

```
root# delete system autoinstallation
```

6. Configure interface ge-0/0/0 to acquire an IP address, a DNS IP address, and a default route from your ISP using DHCP.

[edit]

```
root@host# set interfaces ge-0/0/0 unit 0 family inet dhcp
```

7. When your ISP assigns the Internet connectivity information using DHCP, the process usually also assigns a DNS IP address.

If your ISP instructed you to enter the DNS IP address manually, configure the IP address of the DNS that your ISP provided you with.

[edit]

```
root# set system name-server 10.45.67.1
```

**NOTE:** The ISP might give you more than one DNS IP address to enter manually.

**NOTE:** The DNS IP addresses 208.67.222.222 and 208.67.222.220 are available as part of the default configuration on a branch SRX Series device. You can leave them in the configuration, or remove them.

To assign an IP address, a DNS IP address, and a default route on the branch SRX Series device manually:

1. Configure interface ge-0/0/0 with the IP address that your ISP provided you with.

[edit]

```
root@host# set interfaces ge-0/0/0 unit 0 family inet address 10.0.0.6/30
```

2. Configure a static default route pointing to the ISP's Internet router with IP address 10.0.0.5 as the next hop.

[edit]

```
root# set routing-options static route 0.0.0.0/0 next-hop 10.0.0.5
```

3. Configure the IP address of the DNS that your ISP provided you with.

[edit]

```
root# set system name-server 10.45.67.1
```

**NOTE:** The ISP might give you more than one DNS IP address to enter manually.

**NOTE:** The DNS IP addresses 208.67.222.222 and 208.67.222.220 are available as part of default configuration on branch SRX Series device. You can leave them in the configuration, or remove them.

4. At the CLI prompt, type the **commit** command to activate the configuration.

```
[edit]
root# commit

[edit]
root# commit
commit complete

[edit]
root#
```

5. Access <http://www.juniper.net> or any webpage to ensure that you are connected to the Internet. This connectivity ensures that you can pass traffic through the services gateway.

## Validating Your Branch SRX Series Configuration

**Purpose** Verify that the device was configured with a hostname, user classes, name server, and an NTP server.

**Action** From configuration mode, confirm your configuration by entering the **show** commands such as **show system host-name**, **show system login**, and **show system name-server** as shown in the following samples:

- Verify system hostname details.

```
[edit]
root@host# show system host-name
host-name srx210-host;
```

- Verify system user classes and login details.

```
[edit]
root@host# show system login
user admin-user {
  class super-user;
  authentication {
    encrypted-password "$ABC123/"; ## SECRET-DATA
  }
}
user read-only-user {
  class read-only;
  authentication {
    encrypted-password "$A1B1C1"; ## SECRET-DATA
  }
}
```

- Verify system name server details.

```
[edit]
root@host# show system name-server
208.67.222.222;
208.67.220.220;
11.11.11.11
```

- Use **run show interface terse** to verify the acquired IP address.

If you are done configuring the device, enter **commit** from configuration mode.

## Verifying Your Branch SRX Series Configuration

**Purpose** Verify that your SRX Series configuration is working properly.

**Action** From configuration mode, confirm your configuration by entering the **show system services dhcp client** command.

- Verify DHCP client configuration.

```
user@srx210-host> show system services dhcp client ge-0/0/0.0
```

```
Logical Interface Name    ge-0/0/1.0
Hardware address         00:12:1e:a9:7b:81
Client Status            bound
Address obtained          1.1.1.20
update server             enables
Lease Obtained at         2007-05-10 18:16:04 PST
Lease Expires at          2007-05-11 18:16:04 PST
```

### DHCP Options:

```
Name: name-server, Value: [ 1.1.1.2 ]
Code: 1, Type: ip-address, Value: 255.255.255.0
Name: name-server, Value: [11.11.11.11]
Name: domain-name, Value: dept.example.net
```

- Verify the Internet connection on your SRX Series.
  - To verify the connectivity from your device, ping to the gateway and DNS from your SRX Series to verify the connectivity.
  - To verify that your SRX Series is connected and everything is working properly, access <http://www.juniper.net/techpubs/> or other Web destinations to ensure that you are connected to the Internet.

- Verify that the login classes you have created are working properly.

Log out from the device and log in again using the credentials that you have configured for the newly created user classes.

- Verify NTP server details.

```
user@srx210-host# show system ntp
server 160.90.182.55;
```

## Resetting Your Branch SRX Series

---

### Resetting Your Branch SRX Series

#### *Resetting Your SRX Series to a Rescue Configuration*

If someone accidentally commits an invalid configuration file, you can delete the invalid configuration and replace it with a previously stored rescue configuration.

To reset your services gateway to its rescue configuration, use a small probe, such as a straightened paperclip, to press and immediately release the **RESET CONFIG** button. Your services gateway will load and commit the rescue configuration. During this operation, the Status light on the front panel of your services gateway glows amber.

#### *Resetting Your SRX Series to Factory Settings*

If resetting your device to its rescue configuration does not resolve your access problem, you can reset your services gateway to its factory-default configuration, which deletes all previous configurations and loads the device's default settings.

To reset your services gateway to its factory-default configuration, use a small probe, such as a straightened paperclip, to press the **RESET CONFIG** button for 15 seconds or more.

- [Example: Configuring Intrusion Detection and Prevention for SRX Series on page 53](#)

## Example: Configuring Security Zones and Policies for SRX Series

This example shows how to set up a new zone and add three servers to that zone. Then you provide communication between a host (PC) in the trust zone to the servers in the newly created zone and also facilitate communication between two servers within the zone.

To meet this requirement, you need an interzone security policy to allow traffic between two zones and an intrazone policy to allow traffic between servers within a zone.

### Requirements

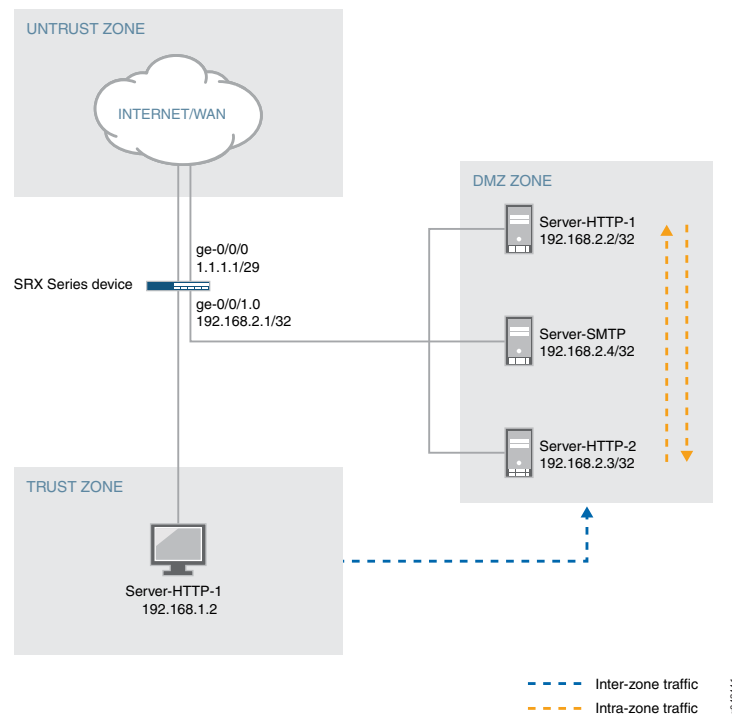

This example uses the following hardware and software components:

- An SRX210
- Junos OS Release 12.1X44-D10

### Overview

This example uses the network topology shown in [Figure 4 on page 39](#).

**Figure 4: Topology for Security Policy Configuration**

In this example, you perform the following tasks:

- Move the ge-0/0/1.0 interface, which was part of trust zone, to the DMZ zone and assign IP address 192.168.2.1/24. Change ge-0/0/1 from family ethernet-switching (factory configuration setting) to family inet.
- Assign IP address 192.168.1.2/24 to the host connected to the fe-0/0/2.0 interface in the trust zone.
- Set up two HTTP servers (Server-HTTP-1 and Server-HTTP-2) and one SMTP server and assign IP addresses 192.168.2.2/24, 192.168.2.3/24, and 192.168.2.4/24 respectively in the DMZ zone.
- Configure an address book and create addresses for use in the policy as shown in [Table 9 on page 40](#).

**Table 9: Address Books Configuration**

Zones	Address Book	Server IP Address-
DMZ	Server-HTTP-1	192.168.2.2/24
	Server-HTTP-2	192.168.2.3/24
	Server-SMTP	192.168.2.4/24
Trust	PC-Trust	192.168.1.2/24

- Create security policies as shown in [Table 10 on page 40](#).

**Table 10: Security Policy Configuration**

Policy Name	From Zone	To Zone	Action
permit-mail-trust-DMZ	Trust	DMZ	Permit SMTP traffic
permit-http-in-DMZ	DMZ	DMZ	Permit HTTP traffic

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
delete interfaces ge-0/0/1 unit 0 family ethernet-switching
set interfaces ge-0/0/1 unit 0 family inet address 192.168.2.1/24
set security zones security-zone DMZ interfaces ge-0/0/1 host-inbound-traffic
  system-services all
set security zones security-zone DMZ address-book address Server-HTTP-1 192.168.2.2/24
set security zones security-zone DMZ address-book address Server-HTTP-2 192.168.2.3/24
set security zones security-zone DMZ address-book address Server-SMTP 192.168.2.4/24
set security zones security-zone DMZ address-book address-set DMZ-address-set-http
  address Server-HTTP-1
```

```

set security zones security-zone DMZ address-book address-set DMZ-address-set-http
address Server-HTTP-2
set security zones security-zone trust address-book address PC-Trust 192.168.1.2/32
set security policies from-zone trust to-zone DMZ policy permit-mail-trust-DMZ match
source-address PC-Trust
set security policies from-zone trust to-zone DMZ policy permit-mail-trust-DMZ match
destination-address Server-SMTP
set security policies from-zone trust to-zone DMZ policy permit-mail-trust-DMZ match
application junos-smtp
set security policies from-zone trust to-zone DMZ policy permit-mail-trust-DMZ then
permit
set security policies from-zone DMZ to-zone DMZ policy permit-http-in-DMZ match
source-address DMZ-address-set-http
set security policies from-zone DMZ to-zone DMZ policy permit-http-in-DMZ match
destination-address DMZ-address-set-http
set security policies from-zone DMZ to-zone DMZ policy permit-http-in-DMZ match
application junos-http
set security policies from-zone DMZ to-zone DMZ policy permit-http-in-DMZ then permit

```

To configure security zones and policies:

1. Delete the interface ge-0/0/1 from family ethernet-switching (factory configuration) and assign an IP address.

[edit]

```

user@srx210-host# delete interfaces ge-0/0/1 unit 0 family ethernet-switching
user@srx210-host# set interfaces ge-0/0/1 unit 0 family inet address 192.168.2.1/24

```

2. Configure a new security zone (DMZ) and assign interfaces.

[edit]

```

user@srx210-host# set security zones security-zone DMZ interfaces ge-0/0/1
host-inbound-traffic system-services all

```

3. Create address books in the DMZ zone.

[edit]

```

user@srx210-host# set security zones security-zone DMZ address-book address
Server-HTTP-1 192.168.2.2/32
user@srx210-host# set security zones security-zone DMZ address-book address
Server-HTTP-2 192.168.2.3/32
user@srx210-host# set security zones security-zone DMZ address-book address
Server-SMTP 192.168.2.4/32

```

4. Create address sets in the DMZ zone to group HTTP server addresses together.

[edit]

```

user@srx210-host# set security zones security-zone DMZ address-book address-set
DMZ-address-set-http address Server-HTTP-1
user@srx210-host# set security zones security-zone DMZ address-book address-set
DMZ-address-set-http address Server-HTTP-2

```

5. Create address books in the trust zone.

[edit]

```

user@srx210-host# set security zones security-zone trust address-book address
PC-Trust 192.168.1.2/32

```

6. Create an interzone policy to permit SMTP traffic from the trust zone to the DMZ zone.

```
[edit]
user@srx210-host# set security policies from-zone trust to-zone DMZ policy
  permit-mail-trust-DMZ match source-address PC-Trust
user@srx210-host# set security policies from-zone trust to-zone DMZ policy
  permit-mail-trust-DMZ match destination-address Server-SMTP
user@srx210-host# set security policies from-zone trust to-zone DMZ policy
  permit-mail-trust-DMZ match application junos-smtp
user@srx210-host# set security policies from-zone trust to-zone DMZ policy
  permit-mail-trust-DMZ then permit
```

7. Create an intrazone policy to permit HTTP traffic between the two servers in the DMZ zone.

```
[edit]
user@srx210-host# set security policies from-zone DMZ to-zone DMZ policy
  permit-http-in-DMZ match source-address DMZ-address-set-http
user@srx210-host# set security policies from-zone DMZ to-zone DMZ policy
  permit-http-in-DMZ match destination-address DMZ-address-set-http
user@srx210-host# set security policies from-zone DMZ to-zone DMZ policy
  permit-http-in-DMZ match application junos-http
user@srx210-host# set security policies from-zone DMZ to-zone DMZ policy
  permit-http-in-DMZ then permit
```

**Results** From configuration mode, confirm your configuration by entering the **show security zones** and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@srx210-host# show security zones security-zone DMZ
address-book {
  address Server-HTTP-1 192.168.2.2/24;
  address Server-HTTP-2 192.168.2.3/24;
  address Server-SMTP 192.168.2.4/24;
  address-set DMZ-address-set-http {
    address Server-HTTP-1;
    address Server-HTTP-2;
  }
}
interfaces {
  ge-0/0/1.0 {
    host-inbound-traffic {
      system-services {
        all;
      }
    }
  }
}
```

```
[edit]
user@srx210-host# show security policies from-zone trust to-zone DMZ
policy permit-mail-trust-DMZ {
  match {
    source-address PC-Trust;
    destination-address Server-SMTP;
```

```

        application junos-smtp;
    }
    then {
        permit;
    }
}

[edit]
user@srx210-host# show security policies from-zone DMZ to-zone DMZ
policy permit-http-in-DMZ {
    match {
        source-address DMZ-address-set-http;
        destination-address DMZ-address-set-http;
        application junos-http;
    }
    then {
        permit;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying Policy Configuration

**Purpose** Verify information about security policies.

**Action** You can pass traffic between servers in different zones and verify the traffic data by using the **show security flow session** command from operational mode.

For samples of the **show security flow session** command output, see [show security flow session](#).

**Related Documentation**

- [Understanding Security Zones and Policies for SRX Series on page 8](#)
- [Understanding Factory Default Configuration Settings of an SRX210 on page 3](#)
- [Connecting Your Branch SRX Series for the First Time on page 16](#)

## Example: Configuring Destination NAT for SRX Series

Before you can get access to your internal network from the outside, you need to configure destination NAT. In this example, you are applying destination NAT to allow connections from the Internet to a private network (in the DMZ zone) after translating the public IP address to the private address.

### Requirements

Before you begin, create security zones and assign interfaces to them. See [“Example: Configuring Security Zones and Policies for SRX Series” on page 39](#).

This example uses the following hardware and software components:

- An SRX210
- Junos OS Release 12.1X44-D10

### Overview

Using the topology shown in [Figure 5 on page 44](#), you are applying destination NAT to the traffic destined to 1.1.1.3 coming from the untrust zone. This traffic should be translated into the private IP address of 192.168.2.2 as shown in [Table 11 on page 45](#).

**Figure 5: Destination NAT Single Address Translation**

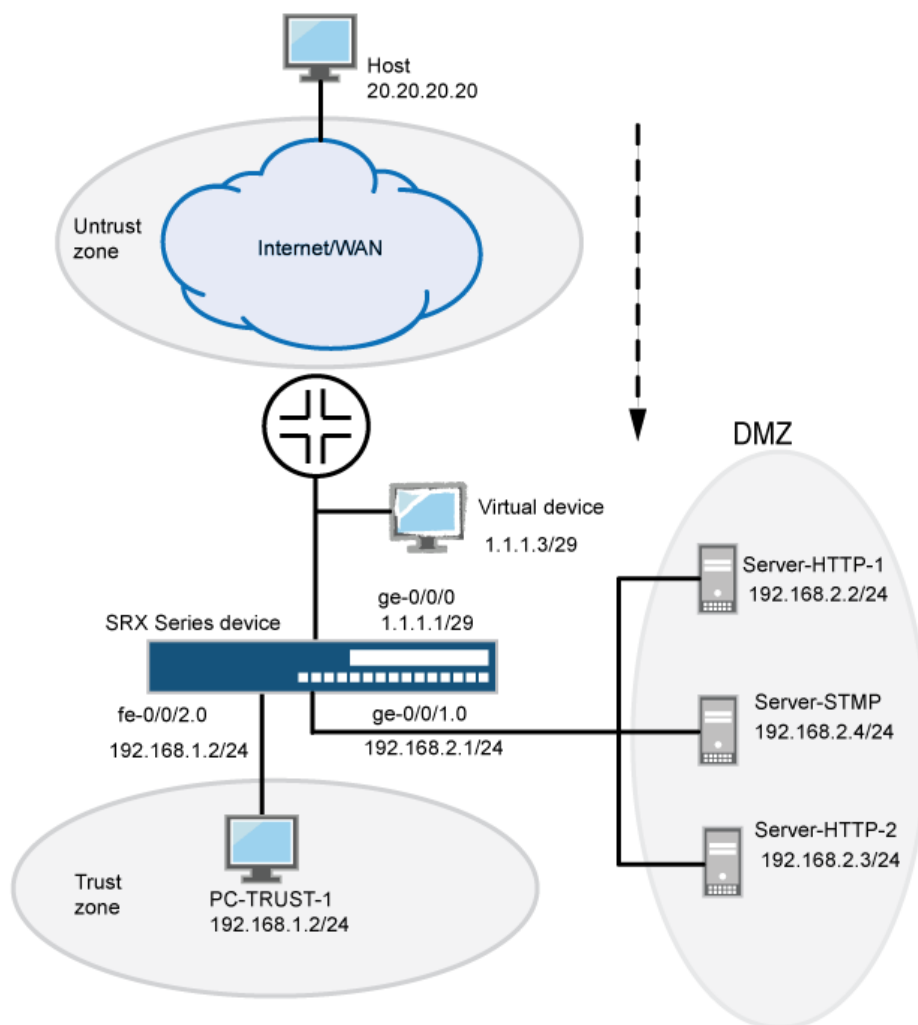

Table 11: Destination NAT Mapping

Before Translation		After Translation	
Source IP Address	Destination IP Address	Source IP Address	Translated Destination IP Address
20.20.20.20	1.1.1.3	1.1.1.3	192.168.2.2

In this topology, you provide access to the server ( Server-HTTP-1) in the DMZ zone from the Internet after translating the public IP address 1.1.1.3 to the private address 192.168.2.2 and forward traffic to the internal network if the request is coming from ge-0/0/0.0.

In this example, you perform the following tasks:

- Create a destination NAT pool called dst-nat-pool-1 to include the IP address 192.168.2.2.
- Create a destination NAT rule set rs1, where rule r1 matches the packets received from the ge-0/0/0.0 interface with the destination IP address 1.1.1.3. For matching packets, the destination address is translated to the address in the dst-nat-pool-1 pool.
- Use an existing address book (as applicable) or create a new address book for Server-HTTP-1.
- Configure traffic from the untrust zone with a destination address of 1.1.1.3 to be translated to the private address 192.168.2.2 in the DMZ zone.
- Configure the device to respond to proxy ARP for the addresses in the IP pool.
- Create a security policy to permit HTTP traffic from the untrust zone to the DMZ zone.

**NOTE:** Because the destination NAT rule-sets are evaluated before a security policy, the address referred to in the security policy must be the real IP address of the end host.

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```
set security nat destination pool dst-nat-pool-1 address 192.168.2.2/32
set security nat destination rule-set rs1 from interface ge-0/0/0.0
set security nat destination rule-set rs1 rule r1 match destination-address 1.1.1.3/29
set security nat destination rule-set rs1 rule r1 then destination-nat pool dst-nat-pool-1
set security nat proxy-arp interface ge-0/0/0.0 address 1.1.1.3/29
set security zones security-zone DMZ address-book address Server-HTTP-1 192.168.2.2/32
set security policies from-zone untrust to-zone DMZ policy server-access match
  source-address any
set security policies from-zone untrust to-zone DMZ policy server-access match
  destination-address Server-HTTP-1
set security policies from-zone untrust to-zone DMZ policy server-access match application
  junos-http
```

**set security policies from-zone untrust to-zone DMZ policy server-access then permit**

To configure a destination NAT rule:

1. Create the destination NAT pool to include the IP address of the server (Server-HTTP-1).

```
[edit]
user@srx210-host# set security nat destination pool dst-nat-pool-1 address
192.168.2.2/32
```

2. Create a destination NAT rule set.

```
[edit]
user@srx210-host# set security nat destination rule-set rs1 from interface ge-0/0/0.0
```

3. Configure a rule that matches packets and translates the destination address (1.1.1.3/29) to the address in the pool (dst-nat-pool-1 that includes IP address 192.168.2.2/32).

```
[edit]
user@srx210-host# set security nat destination rule-set rs1 rule r1 match
destination-address 1.1.1.3/29
user@srx210-host# set security nat destination rule-set rs1 rule r1 then destination-nat
pool dst-nat-pool-1
```

4. Configure proxy ARP for the address 1.1.1.3/29 on interface ge-0/0/0.0.

```
[edit]
user@srx210-host# set security nat proxy-arp interface ge-0/0/0.0 address 1.1.1.3/29
```

5. Configure an address in the address book for Server-HTTP-1.

```
[edit]
user@srx210-host# edit security zones security-zone DMZ address-book address
Server-HTTP-1 192.168.2.2/32
```

6. Configure a security policy to allow traffic from the untrust zone to the server (Server-HTTP-1) in the DMZ zone.

```
[edit]
user@srx210-host# set security policies from-zone untrust to-zone DMZ policy
server-access match source-address any
user@srx210-host# set security policies from-zone untrust to-zone DMZ policy
server-access match destination-address Server-HTTP-1
user@srx210-host# set security policies from-zone untrust to-zone DMZ policy
server-access match application junos-http
user@srx210-host# set security policies from-zone untrust to-zone DMZ policy
server-access then permit
```

**Results** From configuration mode [edit], confirm your configuration by entering the **show security nat destination** and **show security policies from-zone untrust to-zone DMZ** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@srx210-host# show security nat destination
pool dst-nat-pool-1 {
  address 192.168.2.2/32;
```

```

}
rule-set rs1 {
  from interface ge-0/0/0.0;
  rule r1 {
    match {
      destination-address 1.1.1.3/29;
    }
    then {
      destination-nat {
        pool {
          dst-nat-pool-1;
        }
      }
    }
  }
}
}

[edit]
user@srx210-host# show security policies from-zone untrust to-zone DMZ
policy server-access {
  match {
    source-address any;
    destination-address Server-HTTP-1;
    application junos-http;
  }
  then {
    permit;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verify the Destination NAT Rule on page 47](#)
- [Verifying NAT Application to Traffic on page 48](#)

### Verify the Destination NAT Rule

**Purpose** Verify that there is traffic using IP addresses from the destination NAT pool.

**Action** From operational mode, enter the **show security nat destination summary** command. View the translation hits field to check for traffic using IP addresses from the pool.

```

Total pools: 1
Pool name      Address                               Routing      Port  Total
dst-nat-pool-1 192.168.2.2 - 192.168.2.2 Instance default 0      1

Total rules: 1
Rule name      Rule set      From      Action
r1             rs1           ge-0/0/0.0
dst-nat-pool-1

```

**Meaning** Displays a summary of NAT destination pool information.

***Verifying NAT Application to Traffic***

**Purpose** Verify that NAT is being applied to the specified traffic.

**Action** From operational mode, enter the **show security flow session** command to display information about all currently active security sessions on the device.

## Updating Licenses for a Branch SRX Series

You need to install a license for some of the advanced security features such as UTM and IDP, on a branch SRX Series.

Licensing is usually ordered when the device is purchased, and this information is bound to the chassis serial number. These instructions assume that you already have the license. If you have not ordered the licenses during the purchase of the device, contact your account team or Juniper customer care for assistance.

For more information, refer to the Knowledge Base article KB9731 at <http://kb.juniper.net/KB9731>.

You can install the license on the SRX Series using either the automatic method or manual method as follows:

- Install your license automatically on the device

To install or update your license automatically, your device must be connected to the Internet.

```
user@srx210-host> request system license update
```

Trying to update license keys from <https://ae1.juniper.net>, use 'show system license' to check status.

- Install the licenses manually on the device.

```
user@srx210-host> request system license add terminal
```

[Type ^D at a new line to end input,  
enter blank line between each license key]

Paste the license key and press Enter to continue.

To verify the license installed on your system, use the **show system license** command as shown in the following examples:

- View license usage:

Feature name	Licenses installed	Licenses used	Expiry needed

## Example: Configuring Unified Threat Management for a Branch SRX Series

This example shows how to configure UTM quickly on your branch SRX Series by using the predefined UTM components.

### Requirements

---

Before you begin, install or verify a UTM feature license. See [“Updating Licenses for a Branch SRX Series” on page 48](#).

This example uses the following hardware and software components:

- An SRX210
- Junos OS Release 12.1X44-D10

### Overview

---

In this example, you enable UTM components (antispam, antivirus, and Web filtering) on the SRX210 by applying the following preconfigured profiles:

- Antispam protection by using the junos-as-defaults profile to block and filter spam e-mail messages.
- Antivirus protection by using the junos-av-defaults profile to detect and block malicious codes.
- Web filtering by using the junos-wf-cpa-default profile to block access to (HTTP) websites based on IP address or URL.

After you create a UTM policy, attach the UTM policy to the default security policy.

### Configuration

---

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set security utm utm-policy policy-utm-all anti-spam smtp-profile junos-as-defaults
set security utm utm-policy policy-utm-all anti-virus http-profile junos-av-defaults
set security utm utm-policy policy-utm-all web-filtering http-profile junos-wf-cpa-default
set security policies from-zone trust to-zone untrust policy trust-to-untrust match
source-address any destination-address any application any
set security policies from-zone trust to-zone untrust policy trust-to-untrust then permit
application-services utm-policy policy-utm-all
```

#### Step-by-Step Procedure

To configure UTM components:

1. Create a UTM policy and apply the default antispam profile to the UTM policy.  
**[edit]**  
user@srx210-host# **set security utm utm-policy policy-utm-all anti-spam smtp-profile junos-as-defaults**
2. Attach a predefined antivirus profile for the HTTP protocol to the UTM policy.

```
[edit]
user@srx210-host# set security utm utm-policy policy-utm-all anti-virus http-profile
junos-av-defaults
```

**NOTE:** A separate antivirus profile is required for each protocol. The available protocols include HTTP, SMTP, POP3, and IMAP.

3. Attach a predefined Web filtering profile for HTTP to the UTM policy.

```
[edit]
user@srx210-host# set security utm utm-policy policy-utm-all web-filtering
http-profile junos-wf-cpa-default
```

4. Attach the UTM policy to the default security policy (policy from the trust zone to the untrust zone), and set the application services to be allowed.

```
[edit]
user@srx210-host# set security policies from-zone trust to-zone untrust policy
trust-to-untrust match source-address any destination-address any application
any
user@srx210-host# set security policies from-zone trust to-zone untrust policy
trust-to-untrust then permit application-services utm-policy policy-utm-all
```

**Results** From configuration mode, confirm your configuration by entering the **show security utm** and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@srx210-host# show security utm
utm-policy policy-utm-all {
  anti-virus {
    http-profile junos-av-defaults;
  }
  web-filtering {
    http-profile junos-wf-cpa-default;
  }
  anti-spam {
    smtp-profile junos-as-defaults;
  }
}
```

```
[edit]
user@srx210-host# show security policies from-zone trust to-zone untrust policy
trust-to-untrust
policy trust-to-untrust {
  match {
    source-address any;
    destination-address any;
    application any;
  }
  then {
    permit {
      application-services {
        utm-policy policy-utm-all;
      }
    }
  }
}
```

```
    }  
  }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Web Filtering Status on page 52](#)
- [Verifying Antispam Status on page 52](#)
- [Verifying Antivirus Protection on page 52](#)

#### **Verifying Web Filtering Status**

**Purpose** Verify that the Web filtering status configuration is working properly.

**Action** From operational mode, enter the **show security utm web-filtering status** command.

```
user@srx210-host# show security utm web-filtering status
```

```
UTM web-filtering status:  
Server status: SC-CPA server up
```

#### **Verifying Antispam Status**

**Purpose** Verify that the antispam filtering configuration is active.

**Action** From operational mode, enter the **show security utm anti-spam status** command.

```
user@srx210-host>show security utm anti-spam status
```

```
SBL Whitelist Server:  
SBL Blacklist Server:  
msgsecurity.example.net
```

```
DNS Server:  
Primary   : 208.67.222.222, Src Interface: ge-0/0/0  
Secondary : 208.67.220.220, Src Interface: ge-0/0/1  
Ternary   : 10.189.132.70, Src Interface: fe-0/0/2
```

#### **Verifying Antivirus Protection**

**Purpose** Verify that the antivirus protection configuration is working properly.

**Action** From operational mode, enter the **show security utm anti-virus status** command.

```
user@srx210-host>show security utm anti-virus status
```

```
UTM anti-virus status:
```

```
Anti-virus key expire date: 2010-12-31 00:00:00  
Update server: http://update.juniper-updates.net/AV/SRX210  
Interval: 120 minutes  
Pattern update status: next update in 54 minutes
```

```

Last result: already have latest database
Anti-virus signature version: 09/03/2009 07:01 GMT-8, virus records: 467973
Anti-virus signature compiler version: N/A
Scan engine type: kaspersky-lab-engine
Scan engine information: last action result: No error(0x00000000)

```

## Example: Configuring Intrusion Detection and Prevention for SRX Series

For transit traffic to pass through IDP inspection, you configure a security policy and enable IDP application services on all traffic that you want to inspect.

This example shows how to configure a security policy to enable IDP services for the first time on traffic flowing on the device.

- [Requirements on page 53](#)
- [Overview on page 53](#)
- [Configuration on page 54](#)
- [Verification on page 56](#)

### Requirements

Before you begin, install or verify an intrusion detection and prevention (IDP) feature license. See [“Updating Licenses for a Branch SRX Series” on page 48](#).

This example uses the following hardware and software components:

- An SRX210
- Junos OS Release 12.1X44-D10.

### Overview

In this example, you configure a policy `idp-app-policy-1` to enable IDP services on the traffic flowing on an SRX210. The `idp-app-policy-1` policy directs all traffic flowing from the untrust zone to the previously configured DMZ zone against the IDP rulebases.

As a first step, you must download and install the signature database from the Juniper Networks website. Next, download and install the predefined IDP policy templates and activate the predefined policy Recommended as the active policy.

Next, you must create a security policy from the untrust zone to the DMZ zone and specify actions to be taken on the traffic that matches the conditions specified in the policy.

## Configuration

### Downloading and Installing the Signature Database

**CLI Quick Configuration** CLI quick configuration is not available for this example because manual intervention is required during the configuration.

**Step-by-Step Procedure** To configure an IDP policy:

1. Download the signature database.

[edit]

```
user@srx210-host# run request security idp security-package download
```

Will be processed in async mode. Check the status using the status checking CLI

**NOTE:** Downloading the database might take some time depending on the database size and the speed of your internet connection.

2. Check the security package download status.

[edit]

```
user@srx210-host# run request security idp security-package download status
```

```
Done;Successfully downloaded
from(https://services.netscreen.com/cgi-bin/index.cgi).
Version info:2230(Mon Feb 4 19:40:13 2013 GMT-8, Detector=12.6.160121210)
```

3. Install the attack database.

[edit]

```
user@srx210-host# run request security idp security-package install
```

Will be processed in async mode. Check the status using the status checking CLI

**NOTE:** Installing the attack database might take some time depending on the security database size.

4. Check the attack database install status. The command output displays information about the downloaded and installed versions of the attack database.

[edit]

```
user@srx210-host# run request security idp security-package install status
```

```
Done;Attack DB update : successful - [UpdateNumber=2230,ExportDate=Mon Feb
4 19:40:13 2013 GMT-8,Detector=12.6.160121210]
Updating control-plane with new detector : successful
Updating data-plane with new attack or detector : successful
```

5. Confirm your IDP security package version.

[edit]

```
user@srx210-host# run show security idp security-package-version
```

```
Attack database version:2230(Mon Feb  4 19:40:13 2013 GMT-8)
Detector version :12.6.160121210
Policy template version :2230
```

6. Download the predefined IDP policy templates.

```
[edit]
user@srx210-host# run request security idp security-package download
policy-templates
```

```
Will be processed in async mode. Check the status using the status checking
CLI
```

7. Check the security package download status.

```
[edit]
user@srx210-host# run request security idp security-package download status
```

```
Done;Successfully downloaded
from(https://services.netscreen.com/cgi-bin/index.cgi).
Version info:2248
```

8. Install the IDP policy templates.

```
[edit]
user@srx210-host# run request security idp security-package install policy-templates
```

```
Will be processed in async mode. Check the status using the status checking
CLI
```

9. Verify the installation status update.

```
[edit]
user@srx210-host# run request security idp security-package install status
```

```
Done;policy-templates has been successfully updated into internal repository
(=>/var/db/scripts/commit/templates.xml)!
```

10. Enable the templates.xml scripts file. On commit, the Junos OS management process (mgd) looks in to templates.xml and installs the required policy.

```
[edit]
user@srx210-host# set system scripts commit file templates.xml
```

11. Commit the configuration. The downloaded templates are saved to the Junos OS configuration database, and they are available in the CLI at the **[edit security idp idp-policy]** hierarchy level.

```
[edit]
user@srx210-host# commit
```

12. Display the list of downloaded templates.

```
[edit]
user@srx210-host# set security idp active-policy ?
```

```
Possible completions:
(active-policy)      Set active policy
DMZ_Services
DNS_Service
File_Server
Getting_Started
IDP_Default
```

```
Recommended
Web_Server
idp-engine
```

13. Activate the predefined Recommended policy as the active policy.

```
[edit]
user@srx210-host# set security idp active-policy Recommended
```

14. Confirm the active-policy enabled on your device.

```
[edit]
user@srx210-host>show security idp active-policy

active-policy Recommended;
```

15. Create a security policy for the traffic from the untrust zone to the DMZ zone.

```
[edit]
user@srx210-host# set security policies from-zone untrust to-zone DMZ policy
idp-app-policy-1 match source-address any destination-address any application
any
```

16. Specify the action to be taken on traffic that matches conditions specified in the policy.

```
[edit]
user@srx210-host# set security policies from-zone untrust to-zone DMZ policy
idp-app-policy-1 then permit application-services idp
```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@srx210-host# show security policies
from-zone untrust to-zone DMZ {
  policy idp-app-policy-1 {
    match {
      source-address any;
      destination-address any;
      application any;
    }
    then {
      permit {
        application-services {
          idp;
        }
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

**Verifying the IDP Configuration**

**Purpose** Verify that the IDP configuration is working properly.

**Action** From operational mode, enter the **show security idp status** command.

```

user@srx210-host>show security idp status detail

## request system license update

---

<b>Syntax</b>	request system license update
<b>Release Information</b>	Command introduced in Junos OS Release 9.5.
<b>Description</b>	Start autoupdating license keys from the LMS server.
<b>Options</b>	<b>trial</b> —Starts autoupdating trial license keys from the LMS server.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Administration Guide for Security Devices</i></li><li>• <i>UTM Overview Feature Guide for Security Devices</i></li><li>• <i>Installation and Upgrade Guide for Security Devices</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request system license update on page 98</a> <a href="#">request system license update trial on page 98</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system license update

```
user@host> request system license update
```

```
Request to automatically update license keys from https://ae1.juniper.net has  
been sent, use show system license to check status.
```

#### request system license update trial

```
user@host> request system license update trial
```

```
Request to automatically update trial license keys from https://ae1.juniper.net  
has been sent, use show system license to check status.
```

## show security idp active-policy

<b>Syntax</b>	show security idp active-policy
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display information about the policy name and running detector version with which the policy is compiled from the IDP data plane module.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request security idp security-package download on page 2200</a></li> <li>• <a href="#">request security idp security-package install on page 2202</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Class of Service Action Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp active-policy on page 99</a>
<b>Output Fields</b>	Table 12 on page 99 lists the output fields for the <b>show security idp active-policy</b> command. Output fields are listed in the approximate order in which they appear.

Table 12: show security idp active-policy Output Fields

Field Name	Field Description
Policy Name	Name of the running policy.
Running Detector Version	Current version of the running detector.

## Sample Output

### show security idp active-policy

```

user@host> show security idp active-policy
Policy Name : viking-policy
Running Detector Version : 9.1.140080300

```

## show security idp status

<b>Syntax</b>	show security idp status
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Multiple detector information introduced in Junos OS Release 10.1. Output changed to support IDP dedicated mode in Junos OS Release 11.2.
<b>Description</b>	Display the status of the current IDP policy.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp status on page 101</a>
<b>Output Fields</b>	<a href="#">Table 13 on page 100</a> lists the output fields for the <b>show security idp status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 13: show security idp status Output Fields**

Field Name	Field Description
State of IDP	Status of current IDP policy.
Packets/second	The aggregated throughput (packets per second) for the system.
KBits/second	The aggregated throughput (kilobits per second) for the system.
Latency	<ul style="list-style-type: none"> <li>• min—Minimum delay for a packet to receive and return by a node in microseconds.</li> <li>• max—Maximum delay for a packet to receive and return by a node in microseconds.</li> <li>• ave—Average delay for a packet to receive and return by a node in microseconds.</li> </ul>
Packet Statistics	Statistics for ICMP, TCP, and UDP packets.
Flow Statistics	Flow-related system statistics for ICMP, TCP, and UDP packets.
Session Statistics	Session-related system statistics for ICMP, TCP, and UDP packets.
Number of SSL Sessions	Number of current SSL sessions.
Policy Name	Name of the running policy. If IDP is configured for logical systems, <b>idp-policy-combined</b> is displayed.
Running Detector Version	Current version of the running detector.
Forwarding process mode	IDP dedicated mode: <b>default</b> , <b>equal</b> , <b>idp</b> , or <b>firewall</b> .

## Sample Output

### show security idp status

```
user@host> show security idp status
State of IDP: 2-default, Up since: 2010-02-04 13:37:16 UTC (17:15:02 ago)

Packets/second: 5                Peak: 11 @ 2010-02-05 06:51:58 UTC
KBits/second   : 2                Peak: 5 @ 2010-02-05 06:52:06 UTC
Latency (microseconds): [min: 0] [max: 0] [avg: 0]

Packet Statistics:
[ICMP: 0] [TCP: 82] [UDP: 0] [Other: 0]

Flow Statistics:

## show security flow session

---

<b>Syntax</b>	<b>show security flow session</b> [ <i>filter</i> ] [brief   extensive   summary ]
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. Support for filter and view options added in Junos OS Release 10.2. Application firewall, dynamic application, and logical system filters added in Junos OS Release 11.2.
<b>Description</b>	Display information about all currently active security sessions on the device.
<b>Options</b>	<ul style="list-style-type: none"><li>• <i>filter</i>—Filter the display by the specified criteria.  The following filters reduce the display to those sessions that match the criteria specified by the filter. Refer to the specific <b>show</b> command for examples of the filtered output.  <b>application</b>—Predefined application name  <b>application-firewall</b>—Application firewall enabled  <b>application-firewall-rule-set</b>—Application firewall enabled with the specified rule set  <b>application-traffic-control</b>—Application traffic control rule set name and rule name  <b>destination-port</b>—Destination port  <b>destination-prefix</b>—Destination IP prefix or address  <b>dynamic-application</b>—Dynamic application or nested dynamic application  <b>dynamic-application-group</b>—Dynamic application or nested dynamic application group  <b>encrypted</b>—Encrypted traffic  <b>family</b>—Display session by family  <b>idp</b>—IDP enabled sessions  <b>interface</b>—Name of incoming or outgoing interface  <b>logical-system</b> (<b>all</b>   <i>logical-system-name</i>)—Name of a specific logical system or <b>all</b> to display all logical systems  <b>nat</b>—Display sessions with network address translation  <b>protocol</b>—IP protocol number  <b>resource-manager</b>—Resource manager  <b>session-identifier</b>—Session identifier  <b>source-port</b>—Source port</li></ul>

**source-prefix**—Source IP prefix

**tunnel**—Tunnel sessions

- **brief | extensive | summary**—Display the specified level of output.
- **none**—Display information about all active sessions.

**Required Privilege Level**

**Output Fields**

Table 14 on page 103 lists the output fields for the **show security flow session** command. Output fields are listed in the approximate order in which they appear.

**Table 14: show security flow session Output Fields**

Field Name	Field Description
<b>Session ID</b>	Number that identifies the session. Use this ID to get more information about the session.
<b>Policy name</b>	Policy that permitted the traffic.
<b>Timeout</b>	Idle timeout after which the session expires.
<b>In</b>	Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).
<b>Out</b>	Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).
<b>Total sessions</b>	Total number of sessions.
<b>Status</b>	Session status.
<b>Flag</b>	Internal flag depicting the state of the session, used for debugging purposes.

Table 14: show security flow session Output Fields (*continued*)

Field Name	Field Description
<b>Policy name</b>	Name and ID of the policy that the first packet of the session matched.
<b>Source NAT pool</b>	The name of the source pool where NAT is used.
<b>Dynamic application</b>	Name of the application.
<b>Application traffic control rule-set</b>	AppQoS rule set for this session.
<b>Rule</b>	AppQoS rule for this session.
<b>Forwarding class</b>	The AppQoS forwarding class name for this session that distinguishes the transmission priority
<b>DSCP code point</b>	Differentiated Services (DiffServ) code point (DSCP) value remarked by the matching rule for this session.
<b>Loss priority</b>	One of four priority levels set by the matching rule to control discarding a packet during periods of congestion. A high loss priority means a high probability that the packet could be dropped during a period of congestion.
<b>Rate limiter client to server</b>	The rate-limiter profile assigned to the client-to-server traffic defining a unique combination of <b>bandwidth-limit</b> and <b>burst-size-limit</b> specifications.
<b>Rate limiter server to client</b>	The rate-limiter profile assigned to the server-to-client traffic defining a unique combination of <b>bandwidth-limit</b> and <b>burst-size-limit</b> specifications.
<b>Maximum timeout</b>	Maximum session timeout.
<b>Current timeout</b>	Remaining time for the session unless traffic exists in the session.
<b>Session State</b>	Session state.
<b>Start time</b>	Time when the session was created, offset from the system start time.
<b>Unicast-sessions</b>	Number of unicast sessions.
<b>Multicast-sessions</b>	Number of multicast sessions.
<b>Failed-sessions</b>	Number of failed sessions.
<b>Sessions-in-use</b>	Number of sessions in use. <ul style="list-style-type: none"> <li>Valid sessions</li> <li>Pending sessions</li> <li>Invalidated sessions</li> <li>Sessions in other states</li> </ul>
<b>Maximum-sessions</b>	Maximum number of sessions permitted.

## Sample Output

### show security flow session

```

root> show security flow session
Flow Sessions on FPC4 PIC1:
Total sessions: 0

Flow Sessions on FPC5 PIC0:

Session ID: 200000001, Policy name: default-policy/2, Timeout: 1794, Valid
  In: 40.0.0.111/32852 --> 30.0.0.100/21;tcp, If: ge-0/0/2.0, Pkts: 25, Bytes:
1138
  Out: 30.0.0.100/21 --> 40.0.0.111/32852;tcp, If: ge-0/0/1.0, Pkts: 20, Bytes:

## show security nat destination summary

<b>Syntax</b>	show security nat destination summary <logical-system ( <i>logical-system-name</i>   all)> <root-logical-system>
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Support for IPv6 logical systems added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Display a summary of Network Address Translation (NAT) destination pool information.
<b>Options</b>	<p><b>none</b>—Display summary information about the destination NAT pool.</p> <p><b>logical-system (<i>logical-system-name</i>   all)</b>—Display summary information about the destination NAT for the specified logical system or for all logical systems.</p> <p><b>root-logical-system</b>—Display summary information about the destination NAT for the master (root) logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>pool (Security Destination NAT)</i></li> <li>• <i>rule (Security Destination NAT)</i></li> <li>• <i>Network Address Translation Feature Guide for Security Devices</i></li> <li>• <i>Junos OS Logical Systems Library for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security nat destination summary on page 108</a>
<b>Output Fields</b>	<a href="#">Table 15 on page 107</a> lists the output fields for the <b>show security nat destination summary</b> command. Output fields are listed in the approximate order in which they appear.

**Table 15: show security nat destination summary Output Fields**

Field Name	Field Description
Total destination nat pool number	Number of destination NAT pools.
Pool name	Name of the destination address pool.
Address range	IP address or IP address range for the pool.
Routing Instance	Name of the routing instance.
Port	Port number.
Total	Number of IP addresses that are in use.
Available	Number of IP addresses that are free for use.

Table 15: show security nat destination summary Output Fields (*continued*)

Field Name	Field Description
<b>Total destination nat rule number</b>	Number of destination NAT rules.
<b>Total hit times</b>	Number of times a translation in the translation table is used for all the destination NAT rules.
<b>Total fail times</b>	Number of times a translation in the translation table failed to translate for all the destination NAT rules.

## Sample Output

### show security nat destination summary

```
user@host> show security nat destination summary
```

```

Total pools: 2
Pool name      Address Range      Routing Instance  Port  Total Address
dst-p1         1.1.1.1 - 1.1.1.1      default          0      1
dst-p2         2001::1 - 2001::1  default          0      1

Total rules: 171
Rule name      Rule set  From      Action
dst2-rule      dst2      ri1

...

```

## show security policies

<b>Syntax</b>	<pre>show security policies &lt;detail&gt; &lt;none&gt; policy-name <i>policy-name</i> &lt;detail&gt; &lt;global&gt;</pre>
<b>Release Information</b>	<p>Command modified in Junos OS Release 9.2. Support for IPv6 addresses added in Junos OS Release 10.2. Support for IPv6 addresses in active/active chassis cluster configurations in addition to the existing support of active/passive chassis cluster configurations added in Junos OS Release 10.4. Support for wildcard addresses added in Junos OS Release 11.1. Support for global policy added in Junos OS Release 11.4. Support for services offloading added in Junos OS Release 11.4. Support for source-identities added in Junos OS Release 12.1. The <b>Description</b> output field added in Junos OS Release 12.1. Support for negated address added in Junos OS Release 12.1X45-D10.</p>
<b>Description</b>	<p>Display a summary of all security policies configured on the device. If a particular policy is specified, display information particular to that policy.</p>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Display basic information about all configured policies.</li> <li>• <b>detail</b>—(Optional) Display a detailed view of all of the policies configured on the device.</li> <li>• <b>policy-name <i>policy-name</i></b>—(Optional) Display information about the specified policy.</li> <li>• <b>global</b>—Display information about global policies.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Ethernet Port Switching Feature Guide for Security Devices</i></li> <li>• <i>Layer 2 Bridging and Transparent Mode Feature Guide for Security Devices</i></li> <li>• <i>Infranet Authentication Feature Guide for Security Devices</i></li> <li>• <i>Junos OS UTM Library for Security Devices</i></li> <li>• <i>Security Policies Feature Guide for Security Devices</i></li> <li>• <i>Junos OS Logical Systems Library for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show security policies on page 112</a>  <a href="#">show security policies policy-name p1 detail on page 112</a>  <a href="#">show security policies (services-offload) on page 113</a>  <a href="#">show security policies detail on page 114</a>  <a href="#">show security policies policy-name p1 (Negated Address) on page 114</a>  <a href="#">show security policies policy-name p1 detail (Negated Address) on page 115</a></p>
<b>Output Fields</b>	<p><a href="#">Table 16 on page 110</a> lists the output fields for the <b>show security policies</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 16: show security policies Output Fields

Field Name	Field Description
From zone	Name of the source zone.
To zone	Name of the destination zone.
Policy	Name of the applicable policy.
Description	Description of the applicable policy.
State	<p>Status of the policy:</p> <ul style="list-style-type: none"> <li>• <b>enabled:</b> The policy can be used in the policy lookup process, which determines access rights for a packet and the action taken in regard to it.</li> <li>• <b>disabled:</b> The policy cannot be used in the policy lookup process, and therefore it is not available for access control.</li> </ul>
Index	An internal number associated with the policy.
Sequence number	Number of the policy within a given context. For example, three policies that are applicable in a from-zoneA-to-zoneB context might be ordered with sequence numbers 1, 2, and 3. Also, in a from-zoneC-to-zoneD context, four policies might have sequence numbers 1, 2, 3, and 4.
Source addresses	<p>For standard display mode, the names of the source addresses for a policy. Address sets are resolved to their individual names.</p> <p>For detail display mode, the names and corresponding IP addresses of the source addresses for a policy. Address sets are resolved to their individual address name-IP address pairs.</p>
Destination addresses	Name of the destination address (or address set) as it was entered in the destination zone's address book. A packet's destination address must match this value for the policy to apply to it.
Source addresses (excluded)	Name of the source address excluded from the policy.
Destination addresses (excluded)	Name of the destination address excluded from the policy.
Source identities	One or more user roles specified for a policy.

Table 16: show security policies Output Fields (*continued*)

Field Name	Field Description
Applications	<p>Name of a preconfigured or custom application whose type the packet matches, as specified at configuration time.</p> <ul style="list-style-type: none"> <li>• <b>IP protocol</b>: The IP protocol used by the application—for example, TCP, UDP, ICMP.</li> <li>• <b>ALG</b>: If an ALG is explicitly associated with the policy, the name of the ALG is displayed. If <b>application-protocol ignore</b> is configured, ignore is displayed. Otherwise, 0 is displayed. However, even if this command shows ALG: 0, ALGs might be triggered for packets destined to well-known ports on which ALGs are listening, unless ALGs are explicitly disabled or when <b>application-protocol ignore</b> is not configured for custom applications.</li> <li>• <b>Inactivity timeout</b>: Elapsed time without activity after which the application is terminated.</li> <li>• <b>Source port range</b>: The low-high source port range for the session application.</li> </ul>
Destination Address Translation	<p>Status of the destination address translation traffic:</p> <ul style="list-style-type: none"> <li>• drop translated—Drop the packets with translated destination addresses.</li> <li>• drop untranslated—Drop the packets without translated destination addresses.</li> </ul>
Application Firewall	<p>An application firewall includes the following:</p> <ul style="list-style-type: none"> <li>• <b>Rule-set</b>—Name of the rule set.</li> <li>• <b>Rule</b>—Name of the rule. <ul style="list-style-type: none"> <li>• <b>Dynamic applications</b>—Name of the applications.</li> <li>• <b>Dynamic application groups</b>—Name of the application groups.</li> <li>• <b>Action</b>—The action taken with respect to a packet that matches the application firewall rule set. Actions include the following: <ul style="list-style-type: none"> <li>• <b>permit</b></li> <li>• <b>deny</b></li> </ul> </li> </ul> </li> <li>• <b>Default rule</b>—The default rule applied when the identified application is not specified in any rules of the rule set.</li> </ul>
Action or Action-type	<ul style="list-style-type: none"> <li>• The action taken in regard to a packet that matches the policy's tuples. Actions include the following: <ul style="list-style-type: none"> <li>• <b>permit</b></li> <li>• <b>firewall-authentication</b></li> <li>• <b>tunnel ipsec-vpn <i>vpn-name</i></b></li> <li>• <b>pair-policy <i>pair-policy-name</i></b></li> <li>• <b>source-nat pool <i>pool-name</i></b></li> <li>• <b>pool-set <i>pool-set-name</i></b></li> <li>• <b>interface</b></li> <li>• <b>destination-nat <i>name</i></b></li> <li>• <b>deny</b></li> <li>• <b>reject</b></li> <li>• <b>services-offload</b></li> </ul> </li> </ul>
Session log	<p>Session log entry that indicates whether the <b>at-create</b> and <b>at-close</b> flags were set at configuration time to log session information.</p>

Table 16: show security policies Output Fields (*continued*)

Field Name	Field Description
<b>Scheduler name</b>	Name of a preconfigured scheduler whose schedule determines when the policy is active (or inactive) to check an incoming packet to determine how to treat the packet.
<b>Policy statistics</b>	<p>Policy statistics include the following:</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—The number of bytes presented for processing by the device.</li> <li>• <b>Output bytes</b>—The number of bytes actually processed by the device.</li> <li>• <b>Input packets</b>—The number of packets presented for processing by the device.</li> <li>• <b>Active sessions</b>—The number of sessions currently present because of access control lookups that used this policy.</li> <li>• <b>Session deletions</b>—The number of sessions deleted since system startup.</li> <li>• <b>Policy lookups</b>—Number of times the policy was accessed to check for a match.</li> </ul> <p><b>NOTE:</b> Configure the Policy P1 with the <b>count</b> option to display policy statistics.</p>

## Sample Output

## show security utm session

---

<b>Syntax</b>	show security utm session
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for UTM in chassis cluster added in Junos OS Release 11.4.
<b>Description</b>	Display general UTM session information including all allocated sessions and active sessions. Also, display information from both nodes in a chassis cluster.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>clear security utm session</i></li><li>• <a href="#">show security utm status on page 117</a></li><li>• <i>Junos OS UTM Library for Security Devices</i></li></ul>
<b>Output Fields</b>	show security utm session  Output fields are listed in the approximate order in which they appear.

## show security utm session

```
user@host> show security utm session
Maximum sessions:      4000
Total allocated sessions: 0
Total freed sessions:  0
Active sessions:       0
```

## show security utm status

---

<b>Syntax</b>	show security utm status
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for UTM in chassis cluster added in Junos OS Release 11.4.
<b>Description</b>	Display whether the UTM service is running or not and status of both the nodes (with full chassis cluster support for UTM).
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>clear security utm session</i></li><li>• <a href="#">show security utm session on page 116</a></li><li>• <i>Junos OS UTM Library for Security Devices</i></li></ul>
<b>Output Fields</b>	show security utm status  Output fields are listed in the approximate order in which they appear.

## show security utm status

```
user@host> show security utm status
UTM service status: Running
```

## show security zones

<b>Syntax</b>	<b>show security zones</b> <b>&lt;detail   terse&gt;</b> <b>&lt; zone-name &gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. The <b>Description</b> output field added in Junos OS Release 12.1.
<b>Description</b>	Display information about security zones.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Display information about all zones.</li> <li>• <b>detail   terse</b>—(Optional) Display the specified level of output.</li> <li>• <b>zone-name</b> —(Optional) Display information about the specified zone.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Ethernet Port Switching Feature Guide for Security Devices</i></li> <li>• <i>Layer 2 Bridging and Transparent Mode Feature Guide for Security Devices</i></li> <li>• <i>security-zone</i></li> <li>• <i>Security Zones and Interfaces Feature Guide for Security Devices</i></li> <li>• <i>Junos OS Logical Systems Library for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security zones on page 119</a> <a href="#">show security zones abc on page 119</a> <a href="#">show security zones abc detail on page 119</a> <a href="#">show security zones terse on page 120</a>
<b>Output Fields</b>	Table 17 on page 118 lists the output fields for the <b>show security zones</b> command. Output fields are listed in the approximate order in which they appear.

**Table 17: show security zones Output Fields**

Field Name	Field Description
Security zone	Name of the security zone.
Description	Description of the security zone.
Policy configurable	Whether the policy can be configured or not.
Interfaces bound	Number of interfaces in the zone.
Interfaces	List of the interfaces in the zone.
Zone	Name of the zone.

Table 17: show security zones Output Fields (*continued*)

Field Name	Field Description
Type	Type of the zone.

## Sample Output

### show security zones

```

user@host> show security zones
Functional zone: management
  Description: This is the management zone.
  Policy configurable: No
  Interfaces bound: 1
  Interfaces:
    ge-0/0/0.0
Security zone: Host
  Description: This is the host zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    fxp0.0
Security zone: abc
  Description: This is the abc zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/1.0
Security zone: def
  Description: This is the def zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/2.0

```

## Sample Output

### show security zones abc

```

user@host> show security zones abc
Security zone: abc
  Description: This is the abc zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/1.0

```

## Sample Output

### show security zones abc detail

```

user@host> show security zones abc detail
Security zone: abc
  Description: This is the abc zone.

```

```
Send reset for non-SYN session TCP packets: Off
Policy configurable: Yes
Interfaces bound: 1
Interfaces:
  ge-0/0/1.0
```

## Sample Output

**show security zones terse**

```
user@host> show security zones terse
Zone                Type
my-internal         Security
my-external         Security
dmz                 Security
```

## show system license (View)

<b>Syntax</b>	show system license <installed   keys   status   usage>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Logical system status option added in Junos OS Release 11.2.
<b>Description</b>	Display licenses and information about how licenses are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>status</b>—(Optional) Display license status for a specified logical system or for all logical systems.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Administration Guide for Security Devices</i></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show system license on page 122</a></p> <p><a href="#">show system license installed on page 122</a></p> <p><a href="#">show system license keys on page 123</a></p> <p><a href="#">show system license usage on page 123</a></p> <p><a href="#">show system license status logical-system all on page 123</a></p>
<b>Output Fields</b>	Table 18 on page 121 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

Table 18: show system license Output Fields

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
<b>Licenses used</b>	Number of licenses used by the device. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.

Table 18: show system license Output Fields (*continued*)

Field Name	Field Description
<b>Licenses installed</b>	Information about the installed license key: <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Features</b>—Feature associated with a license.</li> </ul>
<b>Licenses needed</b>	Number of licenses required for features being used but not yet properly licensed.
<b>Expiry</b>	Time remaining in the grace period before a license is required for a feature being used.
<b>Logical system license status</b>	Displays whether a license is enabled for a logical system.

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:
```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
av_key_kaspersky_engine 01:00:00 IST	1	1	0	2012-03-30

LSYS1	enabled
LSYS2	enabled

## show system services dhcp client

<b>Syntax</b>	<b>show system services dhcp client</b> <b>&lt; <i>interface-name</i> &gt;</b> <b>&lt;statistics&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Display information about DHCP clients.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Display DHCP information for all interfaces.</li> <li>• <b><i>interface-name</i></b> —(Optional) Display DHCP information for the specified interface.</li> <li>• <b>statistics</b>—(Optional) Display DHCP client statistics.</li> </ul>
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>dhcp (Interfaces)</i></li> <li>• <a href="#">request system services dhcp on page 987</a></li> <li>• <i>Administration Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp client on page 125</a> <a href="#">show system services dhcp client ge-0/0/1.0 on page 126</a> <a href="#">show system services dhcp client statistics on page 126</a>
<b>Output Fields</b>	<a href="#">Table 19 on page 124</a> lists the output fields for the <b>show system services dhcp client</b> command. Output fields are listed in the approximate order in which they appear.

**Table 19: show system services dhcp client Output Fields**

Field Name	Field Description
Logical Interface Name	Name of the logical interface.
Client Status	State of the client binding.
Vendor Identifier	Vendor ID.
Server Address	IP address of the DHCP server.
Address obtained	IP address obtained from the DHCP server.
Lease Obtained at	Date and time the lease was obtained.
Lease Expires at	Date and time the lease expires.

Table 19: show system services dhcp client Output Fields (*continued*)

Field Name	Field Description
DHCP Options	<ul style="list-style-type: none"> <li>• <b>Name:</b> server-identifier, <b>Value:</b> IP address of the name server.</li> <li>• <b>Name:</b> device, <b>Value:</b> IP address of the name device.</li> <li>• <b>Name:</b> domain-name, <b>Value:</b> Name of the domain.</li> </ul>
Packets dropped	Total packets dropped.
Messages received	<p>Number of the following DHCP messages received:</p> <ul style="list-style-type: none"> <li>• <b>DHCPOFFER</b>—First packet received on a logical interface when DHCP is enabled.</li> <li>• <b>DHCPACK</b>—When received from the server, the client sends an ARP request for that address and adds a (ARP response) timer for 4 seconds and stops the earlier timer added for DHCPACK.</li> <li>• <b>DHCPNAK</b>—When a DHCPNAK is received instead of DHCPACK, the logical interface sends a DHCPDISCOVER packet.</li> </ul>
Messages sent	<p>Number of the following DHCP messages sent:</p> <ul style="list-style-type: none"> <li>• <b>DHCPDECLINE</b>—Packet sent when ARP response is received and there is a conflict. The logical interface sends a new DHCPDISCOVER packet.</li> <li>• <b>DHCPDISCOVER</b>—Packet sent on the interface for which the DHCP client is enabled.</li> <li>• <b>DHCPREQUEST</b>—Packet sent to the DHCP server after accepting the DHCPOFFER. After sending the DHCPREQUEST, the device adds a retransmission-interval timer.</li> <li>• <b>DHCPINFORM</b>—Packet sent to the DHCP server for local configuration parameters.</li> <li>• <b>DHCPRELEASE</b>—Packet sent to the DHCP server to relinquish network address and cancel remaining lease.</li> <li>• <b>DHCPRENEW</b>—Packet sent to the DHCP server to renew the address. The next message to be sent will be a DHCPREQUEST message, which will be unicast directly to the server.</li> <li>• <b>DHCPREBIND</b>—Packet sent to any server to renew the address. The next message to be sent will be a DHCPREQUEST message, which will be broadcast.</li> </ul>

## Sample Output

### show system services dhcp client

```

user@host> show system services dhcp client
Logical Interface Name    ge-0/0/1.0
Hardware address         00:0a:12:00:12:12
Client Status            bound
Vendor Identifier        ether
Server Address           10.1.1.1
Address obtained         10.1.1.89
update server            enabled
Lease Obtained at        2006-08-24 18:13:04 PST
Lease Expires at         2006-08-25 18:13:04 PST
DHCP Options :
  Name: name-server, Value: [ 10.209.194.131, 2.2.2.2, 3.3.3.3 ]
  Name: server-identifier, Value: 10.1.1.1
  Name: router, Value: [ 10.1.1.80 ]
  Name: domain-name, Value: netscreen-50

```

## Sample Output

### show system services dhcp client ge-0/0/1.0

```
user@host> show system services dhcp client ge-0/0/1.0
Logical Interface name      ge-0/0/1.0
Hardware address           00:12:1e:a9:7b:81
Client status              bound
Address obtained           30.1.1.20
Update server              disabled
Lease obtained at          2007-05-10 18:16:18 UTC
Lease expires at           2007-05-11 18:16:18 UTC
DHCP options:
  Name: server-identifier, Value: 30.1.1.2
  Code: 1, Type: ip-address, Value: 255.255.255.0
  Name: name-server, Value: [ 77.77.77.77, 55.55.55.55 ]
  Name: domain-name, Value: mylab.example.net
```

## Sample Output

### show system services dhcp client statistics

```
user@host> show system services dhcp client statistics
Packets dropped:

### Junos OS Overview

Juniper Networks provides high-performance network devices that create a responsive and trusted environment for accelerating the deployment of services and applications over a single network. Junos OS is the foundation of these high-performance networks. Unlike other complex, monolithic software architectures, Junos OS incorporates key design and developmental differences to deliver increased network availability, operational efficiency, and flexibility. The key advantages to this approach are:

- [One Operating System on page 129](#)
- [One Software Release on page 130](#)
- [One Modular Software Architecture on page 130](#)

#### One Operating System

---

Unlike other network operating systems that share a common name but splinter into many different programs, Junos OS is a single, cohesive operating system that is shared across all network devices and product lines. This allows Juniper Networks engineers to

develop software features once and share these features across all product lines simultaneously. Because features are common to a single source, they generally are implemented the same way for all product lines, thus reducing the training required to learn different tools and methods for each product. Because all Juniper Networks products use the same code base, interoperability between products is not an issue.

### One Software Release

---

Each new version of Junos OS is released concurrently for all product lines following a preset quarterly schedule. Furthermore, each new version of software must include all working features released in previous releases of the software, and must have no critical regression errors. This discipline ensures reliable operations for the entire release.

### One Modular Software Architecture

---

Although individual modules of the Junos OS communicate through well-defined interfaces, each module runs in its own protected memory space, preventing one module from disrupting another. This separation enables the independent restart of each module as necessary. This is in contrast to monolithic operating systems where a malfunction in one module can ripple to other modules and cause a full system crash or restart. This modular architecture then provides for high performance, high availability, security, and device scalability not found in other operating systems.

The Junos OS is preinstalled on your Juniper Networks device when you receive it from the factory. Thus, when you first power on the device, all software starts automatically. You simply need to configure the software so that the device can participate in the network.

You can upgrade the device software as new features are added or software problems are fixed. You normally obtain new software by downloading the software installation packages from the Juniper Networks Support Web page onto your device or onto another system on your local network. You then install the software upgrade onto the device.

Juniper Networks routing platforms run only binaries supplied by Juniper Networks, and currently do not support third-party binaries. Each Junos OS image includes a digitally signed manifest of executables that are registered with the system only if the signature can be validated. Junos OS will not execute any binary without a registered signature. This feature protects the system against unauthorized software and activity that might compromise the integrity of your device.

#### Related Documentation

- *Installation and Upgrade Guide for Security Devices*

## Junos OS Editions

Junos OS is released in the following editions:

- Domestic—Junos OS for customers in the United States and Canada, and for all other customers with a valid encryption agreement. This edition includes high-encryption capabilities such as ipsec and ssh for data leaving the router or switch.

- Export—Junos OS for all other customers. This edition does not include any high-encryption capabilities for data leaving the router or switch.
- Junos-FIPS—Junos OS that provides advanced network security for customers who need software tools to configure a network of Juniper Networks routers and switches in a Federal Information Processing Standards (FIPS) 140-2 environment.

- [Installation Categories on the J Series Services Routers on page 131](#)
- *Installation and Upgrade Guide for Security Devices*

## Installation Categories on the J Series Services Routers

The following installation categories are available with the J Series routers:

- Junos OS, domestic—**junos-jsr-<release>-domestic.tgz**

This software includes high-encryption capabilities for data leaving the router. Because of U.S. government export restrictions, this software can only be installed on systems within the United States and Canada. For all other customers, a valid encryption agreement is required to use this software edition. Furthermore, no router can be shipped out of the United States or Canada without the domestic edition first being overwritten by the export edition. There are no current system-enforced restrictions when you install this software category.

- Junos OS, export—**junos-jsr-<release>-export.tgz**

This software does not include high-encryption capabilities. It can be installed on any system worldwide. There are no current system-enforced restrictions when you install this software category.

- [Software Naming Convention on page 131](#)
- *Installation and Upgrade Guide for Security Devices*

## Software Naming Convention

All Junos OS conforms to the following naming convention:

*package-release-edition-cfxxx-signed.comp*

For example:

**jinstall-9.2R1.8-domestic-signed.tgz**

where:

- **package** is the name of the Junos OS package. For 64-bit Junos OS, the package name is **package64**.
- **cfxxx** designates the CompactFlash card size to use with the software. This value is optional.
- **signed** means that the software includes a digital signature for verification purposes. This value is not used with all software packages.

## Junos OS Release Numbers

The Junos OS release number represents a particular revision of the software that runs on a Juniper Networks routing platform, for example, Junos OS Release 8.5, 9.1, or 9.2. Each Junos OS release has certain new features that complement the software processes that support Internet routing protocols, control the device's interfaces and the device chassis itself, and allow device system management. On the Juniper Networks Support Web page, you download Junos OS for a particular Junos OS release number.

The following example shows how the software release number is formatted:

***m.nZb.s***

For example:

**9.2R1.8**

Where:

- **m** is the major release number of the product
- **n** is the minor release number of the product
- **Z** is the type of software release. The following release types are used:
  - **R**—FRS/Maintenance release software
  - **B**—Beta release software
  - **I**—Internal release software: Private software release for verifying fixes
  - **S**—Service release software: Released to customers to solve a specific problem—this release will be maintained along with the life span of the underlying release
  - **X**—Special (eXception) release software: Releases that follow a numbering system that differs from the standard Junos OS release numbering.

Starting with Junos OS Release 12.1X44-D10, SRX Series devices follow a special naming convention for Junos OS releases. For more information, refer to the

Knowledge Base article KB30092 at  
<http://kb.juniper.net/InfoCenter/index?page=home>.

- **b** is the build number of the product
  - if **b=1**: Software is the FRS release
  - if **b>1**: Software is a maintenance release
- **s** is the spin number of the product

**Related  
Documentation**

- *Installation and Upgrade Guide for Security Devices*

## Hardware Overview (J Series Services Routers)

The Junos OS is installed on the internal CompactFlash card. This internal CompactFlash card is the primary and only boot drive on the J Series routers when they are delivered from the factory. All J Series routers have one or more USB ports. The 4300 and 6300 J Series routers also include an external CompactFlash card slot. You can install external storage devices through the USB ports and CompactFlash card slots. When external storage devices are installed, these external devices can be used as backup boot drives. You can also create a backup internal boot drive on any externally attached CompactFlash card. This CompactFlash card can then be used to replace the internal CompactFlash card on the J Series router in the event that the internal card is damaged or otherwise made unusable by the router. Figure 6 on page 134 shows the location of the memory and ports on a J Series router.

Figure 6: J Series Services Routers (J4300 Shown)

The J Series routers include the following:

- [System Memory on page 134](#)
- [Storage Media on page 135](#)

### System Memory

Starting with Junos OS Release 9.1, all J Series routers require a minimum of 512 MB of router memory on each Routing Engine. Any router without this minimum requires a system memory upgrade before you install Junos OS Release 9.1. To determine the amount of memory currently installed on your router, use the CLI **show chassis routing-engine** command.

For more information about memory requirements for the J Series routers, see the Customer Support Center JTAC Technical Bulletin PSN-2008-04-021:  
<http://www.juniper.net/alerts/viewalert.jsp?txtAlertNumber=PSN-2008-04-021&actionBtn=Search>.

## Storage Media

The J Series routers use the following media storage devices:

- Internal CompactFlash card—The CompactFlash card is the primary boot device.
- External media device—Depending on the system, this external device can be a CompactFlash card or a USB storage device. Juniper Networks recommends that you attach an external device to the system and use this external device as the backup boot device for the system.

[Table 20 on page 135](#) specifies the storage media names used by the J Series routers. The storage media device names are displayed as the router boots.

**Table 20: Routing Engines and Storage Media Names (J Series Routers)**

Routing Engine	Internal CompactFlash Card	External CompactFlash Card J4300 and J6300 Routers Only	USB Storage Media Devices
J Series Routers	ad0	ad2	da0

To view the storage media currently available on your system, use the CLI **show system storage** command. For more information about this command, see the *CLI User Guide*.

The router attempts to boot from the storage media in the following order:

1. Internal CompactFlash card
2. External CompactFlash card (J4300 and J6300 routers only)
3. USB storage media device

- [Installation Modules on page 142](#)
- [Understanding Download Manager on page 143](#)

## Installation Type Overview

The three types of installations used to upgrade or downgrade your routing platform are standard installation, category change, and recovery. The standard installation is the standard method of upgrading and downgrading the software. Use a category change installation when you are moving from one software category to another; for example, if you are changing the device from using the standard Junos OS to the Junos-FIPS category. Perform a recovery installation when the software on the device is damaged or otherwise unable to accommodate a software upgrade or downgrade.

### Standard Installation

---

A standard installation is the typical method used to upgrade or downgrade software on the server. This method uses the installation package that matches the installation package already installed on the system. For example, you might upgrade an M120 router running the Junos OS installed using the `jinstall*` installation package. If you upgrade the router from the 9.0R2.10 release to the 9.1R1.8 release, you use the `jinstall-9.1R1.8-domestic-signed.tgz` installation package.

### Category Change Installation

---

The category change installation process is used to move from one category of the Junos OS to another on the same router; for example, moving from a Junos OS standard installation on an M Series, MX Series, or T Series router to a Junos-FIPS installation. When moving from one installation category to another, you need to be aware of the restrictions regarding this change.

**NOTE:** Juniper Networks does not support using the `request system software rollback` command to restore a different installation category on the device. When installing a different Junos OS category on a device, once the installation is complete, you should execute a `request system snapshot` command to delete the backup installation from the system.

---

### Recovery Installation

---

A recovery installation is performed to repair a device with damaged software or a condition that prevents the upgrade, downgrade, or change in installation category of the software.

For example, you may need to perform a recovery installation to change a device's software category from Junos-FIPS to standard Junos OS.

## Software Package Information Security

All Junos OS is delivered in signed packages that contain digital signatures, Secure Hash Algorithm (SHA-1), and Message Digest 5 (MD5) checksums. A package is installed only if the checksum within it matches the hash recorded in its corresponding file. Which checksum is used depends on the software version:

- Digital signatures are used when you upgrade or downgrade between Junos OS Release 7.0 and a later version.
- The SHA-1 checksum is used when you upgrade or downgrade between Junos OS Release 6.4 and a later version.
- The MD5 checksum is used when you upgrade or downgrade between Junos OS Release 6.3 or earlier and a later version.

## Understanding Junos OS Upgrades for SRX Series Devices

SRX Series devices are delivered with Junos OS preinstalled on them. When you power on the device, it starts (boots) up using its primary boot device. These devices also support secondary boot devices, allowing you to back up your primary boot device and configuration.

As new features and software fixes become available, you must upgrade your software to use them. Before an upgrade, we recommend that you back up your primary boot device.

On a services gateway, you can configure the primary or secondary boot device with a snapshot of the current configuration, default factory configuration, or rescue configuration. You can also replicate the configuration for use on another device.

If the SRX Series device does not have a secondary boot device configured and the primary boot device becomes corrupted, you can reload the Junos OS package onto the corrupted internal media from a USB flash drive or TFTP server.

## Understanding Junos OS Upgrades for J Series Devices

J Series devices are delivered with Junos OS preinstalled. When you power on the device, it starts (boots) up using its primary boot device. These devices also support secondary boot devices, allowing you to back up your primary boot device and configuration.

As new features and software fixes become available, you must upgrade Junos OS to use them. Before an upgrade, we recommend that you back up your primary boot device.

On a device, you can configure the primary or secondary boot device with a “snapshot” of the current configuration, default factory configuration, or rescue configuration. You can also replicate the configuration for use on another device, or configure a boot device to receive core dumps for troubleshooting.

If the J Series device does not have a secondary boot device configured and the primary boot device becomes corrupted, you can reload the Junos OS package onto the corrupted CompactFlash (CF) card with either a UNIX or Microsoft Windows computer.

**NOTE:** The terms *Junos OS (legacy services)* and *Junos OS* are used frequently in this section. Junos OS (legacy services) denotes the packet-based software for the J Series device, whereas Junos OS denotes the flow-based software for the J Series device.

## Junos OS Upgrade Methods on the SRX Series Devices

SRX Series devices that ship from the factory with Junos OS Release 10.0 or later are formatted with the dual-root partitioning scheme.

Existing SRX Series devices that are running Junos OS Release 9.6 or earlier use the single-root partitioning scheme. While upgrading these devices to Junos OS Release 10.0 or later, you can choose to format the storage media with dual-root partitioning (strongly recommended) or retain the existing single-root partitioning.

Certain Junos OS upgrade methods format the internal media before installation, whereas other methods do not. To install Junos OS Release 10.0 or later with the dual-root partitioning scheme, you must use an upgrade method that formats the internal media before installation.

**NOTE:** If you are upgrading to Junos OS Release 10.0 without transitioning to dual-root partitioning, use the conventional CLI and J-Web user interface installation methods.

These upgrade methods format the internal media before installation:

- Installation from the boot loader using a TFTP server
- Installation from the boot loader using a USB storage device
- Installation from the CLI using the **partition** option (available in Junos OS Release 10.0)
- Installation using the J-Web user interface

These upgrade methods retain the existing partitioning scheme:

- Installation using the CLI
- Installation using the J-Web user interface

**WARNING:** Upgrade methods that format the internal media before installation wipe out the existing contents of the media. Only the current configuration will be preserved. Any important data should be backed up before starting the process.

**NOTE:** Once the media has been formatted with the dual-root partitioning scheme, you can use conventional CLI or J-Web user interface installation methods, which retain the existing partitioning and contents of the media, for subsequent upgrades.

## Understanding Junos OS Upgrade and Downgrade Procedures for on SRX Series Devices

Typically, you upgrade your device software by downloading a software image to your device from another system on your local network. Using the J-Web user interface or the CLI to upgrade, the device downloads the software image, decompresses the image, and installs the decompressed software. Finally, you reboot the device, at which time it boots

from the upgraded software. Junos OS is delivered in signed packages that contain digital signatures to ensure official Juniper Networks software.

An upgrade software package name is in the following format:

**package-name-m.nZx-distribution.tgz**

- **package-name**—Name of the package; for example, junos-srxsme.
- **m.n**—Junos OS release, with m representing the major release number and n representing the minor release number; for example, 10.0.
- **Z**—Type of Junos OS release; for example, R indicates released software, and B indicates beta-level software.
- **x.y**—Junos OS build number and spin number; for example, 1.8.
- **distribution**—Area for which the Junos OS package is provided. It is domestic for the United States and Canada, and it is export for worldwide distribution.

The following package name is an example of an SRX Series device upgrade Junos OS package:

**junos-srxsme-10.0R1.8-domestic-tgz**

## Understanding Junos OS Upgrade and Downgrade Procedures for J Series Devices

Typically, you upgrade Junos OS by downloading a Junos OS image to your device from another system on your local network. Using the J-Web user interface or the CLI to upgrade, the device downloads the Junos OS image, decompresses the image, and installs the decompressed Junos OS. Finally, you reboot the device, at which time it boots from the upgraded Junos OS. Junos OS is delivered in signed packages that contain digital signatures to ensure official Juniper Networks software.

- [Junos OS Upgrade Packages on page 140](#)
- [Junos OS Recovery Packages on page 141](#)

### Junos OS Upgrade Packages

A Junos OS upgrade package name is in the following format:

**package-name-m.nZx-distribution.tgz.**

- **package-name**—Name of the package; for example, junos-jsr.
- **m.n** —Junos OS release, with m representing the major release number and n representing the minor release number; for example, 8.5.
- **Z**—Type of Junos OS release. For example, R indicates released software, and B indicates beta-level software.
- **x.y**—Junos OS build number and spin number; for example, 1.1.
- **distribution**—Area for which the Junos OS package is provided. It is domestic for the United States and Canada, and it is export for worldwide distribution.

The following example is of a Junos OS upgrade package name:

**junos-jsr-8.5R1.1-domestic.tgz.**

### Junos OS Recovery Packages

Download a Junos OS recovery package, also known as an install media package, to recover a primary CompactFlash (CF) card.

A Junos OS recovery package name is in the following format:

**package-name-m.nZx-export-cfnnn.gz.**

- **package-name**—Name of the package; for example, junos-jsr.
- **m.n** —Junos OS release, with m representing the major release number; for example, 8.5.
- **Z**—Type of Junos OS release. For example, R indicates released software, and B indicates beta-level software.
- **x.y**—Junos OS build number and spin number; for example, 1.1.
- **export**—Export indicates that the Junos OS recovery package is the exported worldwide software package version.
- **cfnnn**—Size of the target CF card in megabytes; for example, cf256. The following CF card sizes are supported:
  - 512 MB
  - 1024 MB

**NOTE:** The CF cards with less than 512 MB of storage capacity are not supported

The following example is of a Junos OS recovery package name:

**junos-jsr-8.5R1.1-export-cf256.gz**

## Installation Modules

Installation modules are used to upgrade individual software modules within the software. For example, you can upgrade only the Routing Engine software by installing the **jroute\*** installation module.

**NOTE:** You should only use installation module files under the direction of a Juniper Networks support representative.

The following installation module files are available for download:

Installation Module	Description
<b>jkernel*</b>	The kernel and network tools package. This package contains the basic operating system files.
<b>jbase*</b>	The base package for the Junos OS. This package contains additions to the operating system.
<b>jroute*</b>	The Routing Engine package. This package contains the Routing Engine software.
<b>jpfe*</b>	The Packet Forwarding Engine package. This package contains the PFE software.
<b>jdocs*</b>	The documentation package. This package contains the documentation set for the software.
<b>jcrypto*</b>	The encryption package. This package contains the domestic version of the security software.
<b>jweb*</b>	The J-Web package. This package contains the graphical user interface software for M Series, MX Series, T Series, TX Matrix, TX Matrix Plus, and J Series routers.

- [Installation and Upgrade Guide for Security Devices](#)

## Understanding Download Manager

This topic includes the following sections:

- [Overview on page 143](#)
- [Using Download Manager to Upgrade Junos OS on page 143](#)
- [Handling Errors on page 144](#)
- [Considerations on page 144](#)

### Overview

This download manager feature facilitates download of large files over low-bandwidth links. It enables you to download large Junos OS packages over low-bandwidth/flaky links so that the system can be upgraded. This feature allows you to download multiple files while monitoring their status and progress individually. It takes automatic action when required and displays status information when requested.

This feature is supported on SRX100, SRX210, SRX220, SRX240, and SRX650 Services Gateways.

This feature provides the following functions:

- Bandwidth-limited downloads
- Scheduled downloads
- Automatic resume on error
- Automatic resume on reboot

**NOTE:** This feature supports only the FTP and HTTP protocols.

### Using Download Manager to Upgrade Junos OS

The download manager acts as a substitute for the FTP utility. You can use the download manager CLI commands for all the functions where you previously used the FTP utility.

The download manager requires the following:

- FTP or HTTP server with a Junos OS image
- Server that is reachable from the device being upgraded

The download manager consists of the following CLI commands:

1. To download the Junos OS image to your device, use the **request system download start** command (set a bandwidth limit, if required). The file is saved to the **/var/tmp** directory on your device.

You can continue to use the device while the download runs in the background.

2. Use the **show system download** command to verify that the file has been downloaded. The command displays the state as "completed" when the downloaded file is ready to be installed.
3. Use the **request system software add** command to install the downloaded image file from the `/var/tmp` directory.

### Handling Errors

If you encounter any problem with a download, use the **show system download *id*** command to obtain details about the download.

Table 21 on page 144 lists the output fields for the **show system download** command. Use this information to diagnose problems. Output fields are listed in the approximate order in which they appear.

**Table 21: show system download Output Fields**

Output Field	Description
Status	State of the download.
Creation Time	Time the <b>start</b> command was issued.
Scheduled Time	Time the download was scheduled to start.
Start Time	Time the download actually started (if it has already started).
Retry Time	Time for next retry (if the download is in the error state).
Error Count	Number of times an error was encountered by this download.
Retries Left	Number of times the system will retry the download automatically before stopping.
Most Recent Error	Message indicating the cause of the most recent error.

### Considerations

- When no download limit is specified for a specific download or for all downloads, a download uses all available network bandwidth.
- Because the download limit that you set indicates an average bandwidth limit, it is possible that certain bursts might exceed the specified limit.
- When a download from an HTTP server fails, the server returns an HTML page. Occasionally, the error page is not recognized as an error page and is downloaded in place of the Junos image file.
- Remote server logins and passwords are stored by the download manager for the duration of a download. To encrypt these credentials provided along with the login keyword, define an encryption key with the **request system set-encryption-key** command.

Any changes to encryption settings while download is in progress can cause the download to fail.

- A download command issued on a particular node in a chassis cluster takes place only on that node and is not propagated to the other nodes in the cluster. Downloads on different nodes are completely independent of each other. In the event of a failover, a download continues only if the server remains reachable from the node from which the command was issued. If the server is no longer reachable on that node, the download stops and returns an error.

## Dual-Root Partitioning and Autorecovery

- [Dual-Root Partitioning Scheme Overview on page 145](#)
- [Understanding Integrity Check and Autorecovery of Configuration, Licenses, and Disk Information on page 147](#)

### Dual-Root Partitioning Scheme Overview

Junos OS Release 10.0 and later support dual-root partitioning on SRX Series devices. Dual-root partitioning allows the SRX Series device to remain functional even if there is file system corruption and to facilitate easy recovery of the file system.

**NOTE:** Junos OS Release 12.1X45 and later do not support single root partitioning.

SRX Series devices running Junos OS Release 9.6 or earlier support a single-root partitioning scheme where there is only one root partition. Because both the primary and backup Junos OS images are located on the same root partition, the system fails to boot if there is corruption in the root file system. The dual-root partitioning scheme guards against this scenario by keeping the primary and backup Junos OS images in two independently bootable root partitions. If the primary root partition becomes corrupted, the system can still boot from the backup Junos OS image located in the other root partition and remain fully functional.

SRX Series devices that ship with Junos OS Release 10.0 or later are formatted with dual-root partitions from the factory. SRX Series devices that are running Junos OS Release 9.6 or earlier can be formatted with dual-root partitions when they are upgraded to Junos OS Release 10.0 or later.

**NOTE:** Although you can install Junos OS Release 10.0 or later on SRX Series devices with the single-root partitioning scheme, we strongly recommend the use of the dual-root partitioning scheme.

This section contains the following topics:

- [Boot Media and Boot Partition on the SRX Series Devices on page 146](#)
- [Important Features of the Dual-Root Partitioning Scheme on page 146](#)

### Boot Media and Boot Partition on the SRX Series Devices

When the SRX Series device powers on, it tries to boot the Junos OS from the default storage media. If the device fails to boot from the default storage media, it tries to boot from the alternate storage media.

[Table 22 on page 146](#) provides information on the storage media available on SRX Series devices.

**Table 22: Storage Media on SRX Series Devices**

SRX Series Devices	Storage Media
SRX100, SRX210, and SRX240	<ul style="list-style-type: none"> <li>• Internal NAND flash (default; always present)</li> <li>• USB storage device (alternate)</li> </ul>
SRX650	<ul style="list-style-type: none"> <li>• Internal CF (default; always present)</li> <li>• External flash card (alternate)</li> <li>• USB storage device (alternate)</li> </ul>

With the dual-root partitioning scheme, the SRX Series device first tries to boot the Junos OS from the primary root partition and then from the backup root partition on the default storage media. If both primary and backup root partitions of a media fail to boot, then the SRX Series device tries to boot from the next available type of storage media. The SRX Series device remains fully functional even if it boots the Junos OS from the backup root partition of the storage media.

### Important Features of the Dual-Root Partitioning Scheme

The dual-root partitioning scheme has the following important features:

- The primary and backup copies of Junos OS images reside in separate partitions. The partition containing the backup copy is mounted only when required. With the single-root partitioning scheme, there is one root partition that contains both the primary and the backup Junos OS images.
- The **request system software add** command for a Junos OS package erases the contents of the other root partition. The contents of the other root partition will not be valid unless software installation is completed successfully.
- Add-on packages, such as **jais** or **jfirmware**, can be reinstalled as required after a new Junos OS image is installed.
- The **request system software rollback** command does not delete the current Junos OS image. It is possible to switch back to the image by issuing the **rollback** command again.
- The **request system software delete-backup** and **request system software validate** commands do not take any action.

## Understanding Integrity Check and Autorecovery of Configuration, Licenses, and Disk Information

- [Overview on page 147](#)
- [How Autorecovery Works on page 147](#)
- [How to Use Autorecovery on page 148](#)
- [Data That Is Backed Up in an Autorecovery on page 148](#)
- [Troubleshooting Alarms on page 148](#)
- [Considerations on page 149](#)

### Overview

---

The autorecovery feature is supported on dual-partitioned SRX100, SRX210, SRX220, SRX240, and SRX650 Services Gateways. With this feature, information on disk partitioning, configuration, and licenses is recovered automatically in the event it becomes corrupted.

Autorecovery provides the following functions:

- Detect corruption in disk partitioning during system bootup and attempt to recover partitions automatically
- Detect corruption in the Junos OS rescue configuration during system bootup and attempt to recover the rescue configuration automatically
- Detect corruption in Junos OS licenses during system bootup and attempt to recover licenses automatically

### How Autorecovery Works

---

The feature works in the following ways:

- The feature provides the **request system autorecovery state save** command, which backs up important data such as disk partitioning information, licenses, and Junos OS rescue configuration.

- Once the backup copies are saved, they are used to check the integrity of the working copies of the data on every bootup.
- The working copies are automatically recovered if any corruption is detected.

### How to Use Autorecovery

You use autorecovery in the following ways:

- Prepare the router for deployment with the necessary licenses and configuration.
- After you finalize the state, execute the **request system autorecovery state save** command to back up the state.
- After you save the state, integrity check and recovery actions (if any) occur automatically on every bootup.
- If subsequent maintenance activities change the state of the router by adding licenses or updating the configuration, you need to execute the **request system autorecovery state save** command again to update the saved state.
- Execute the **show system autorecovery state** command any time to view the status of the saved information and the integrity check status of each saved item.
- Execute the **request system autorecovery state clear** command to delete all backed up data and disable autorecovery, if required.

### Data That Is Backed Up in an Autorecovery

The following data is backed up during the autorecovery process:

- Rescue configuration (regenerated from the current configuration)
- License keys
- BSD labels (disk-partitioning information)

Data is backed up only when you execute the **request system autorecovery state save** command. Disk-partitioning information is backed up automatically from factory defaults (for new systems), on installation from the boot loader, and on snapshot creation.

### Troubleshooting Alarms

Table 23 on page 148 lists types of autorecovery alarms, descriptions, and required actions.

**Table 23: Autorecovery Alarms**

Alarm	Alarm Type	Description	Action Required
Autorecovery information needs to be saved	Minor	This alarm indicates: <ul style="list-style-type: none"> <li>• Unsaved data needs to be saved, or saved data contains problems and another save is required.</li> </ul>	<ul style="list-style-type: none"> <li>• Ensure that the system has all required licenses and configuration.</li> <li>• Execute the <b>request system autorecovery state save</b> command.</li> </ul>

Table 23: Autorecovery Alarms (*continued*)

Alarm	Alarm Type	Description	Action Required
Autorecovery has recovered corrupted information	Minor	This alarm indicates: <ul style="list-style-type: none"> <li>• Boot time integrity check failed for certain items; however, the items have been recovered successfully.</li> </ul>	<ul style="list-style-type: none"> <li>• No action is required.</li> <li>• Alarm will be cleared on next bootup.</li> </ul>
Autorecovery was unable to recover data completely	Major	This alarm indicates: <ul style="list-style-type: none"> <li>• Boot time integrity check failed for certain items, which could not be recovered successfully.</li> </ul>	<ul style="list-style-type: none"> <li>• The system might be experiencing a fatal malfunction.</li> </ul>

### Considerations

- Devices must have dual-root partitioning for autorecovery to work.
- The **request system configuration rescue save** command regenerates the rescue configuration from the current Junos OS configuration and then saves it. Therefore, executing the **save** command overwrites any existing rescue configuration.
- In general, the saved contents of the rescue configuration are not updated automatically. If you add licenses, you should execute the **request system autorecovery state save** command again.

**NOTE:** The rescue configuration is backed up. If `/config` is corrupted, the system boots from the rescue configuration.

### Related Documentation

## BIOS Upgrade

- [Understanding Auto BIOS Upgrade Using Junos CLI on page 149](#)
- [Understanding Manual BIOS Upgrade Using Junos CLI on page 150](#)

### Understanding Auto BIOS Upgrade Using Junos CLI

The BIOS version listed in the **bios-autoupgrade.conf** file is the minimum supported version. If the current device has a BIOS version earlier than the minimum compatible version, then the auto BIOS upgrade feature upgrades the BIOS automatically to the latest version.

The BIOS upgrades automatically in the following scenarios:

- During Junos OS upgrade through either the J-Web user interface or the CLI (using the **request system software add no-copy no-validate software-image**). In this case, only the active BIOS is upgraded.

- During loader installation using TFTP or USB (using the `install tftp:///software-image` command). In this case, only the active BIOS is upgraded.
- During system boot-up. In this case, both the active BIOS and the backup BIOS are upgraded.

#### Related Documentation

- [Understanding Junos OS Upgrades for SRX Series Devices on page 137](#)
- [Understanding Manual BIOS Upgrade Using Junos CLI on page 150](#)
- [Disabling Auto BIOS Upgrade on SRX Series Devices on page 253](#)
- *Installation and Upgrade Guide for Security Devices*

## Understanding Manual BIOS Upgrade Using Junos CLI

For SRX Series appliances, the BIOS consists of a U-boot and the Junos loader. Additionally, a backup BIOS is supported which includes a backup copy of the U-boot in addition to the active copy from which the system generally boots up.

Table 24 on page 150 lists the CLI commands used for manual BIOS upgrade.

**Table 24: CLI Commands for Manual BIOS Upgrade**

Active BIOS	Backup BIOS
<code>request system firmware upgrade re bios</code>	<code>request system firmware upgrade re bios backup</code>

BIOS upgrade procedure:

#### 1. Install the `jloader-srxsme` package.

1. Copy the `jloader-srxsme` signed package to the device.

**NOTE:** The version of the `jloader-srxsme` package you install must match the version of Junos OS.

2. Install the package using the `request system software add <path to jloader-srxsme package> no-copy no-validate` command.

**NOTE:** Installing the `jloader-srxsme` package places the necessary images under `directory/boot`.

2. Verify that the required images for upgrade are installed. Use the `show system firmware` to verify that the correct BIOS image version is available for upgrade.
3. Upgrade the BIOS (Active and backup) image.

**Active BIOS:**

1. Initiate the upgrade using the **request system firmware upgrade re bios** command.
2. Monitor the upgrade status using the **show system firmware** command.

**NOTE:** The device must be rebooted for the upgraded active BIOS to take effect.

**Backup BIOS:**

1. Initiate the upgrade using the **request system firmware upgrade re bios backup** command.
2. Monitor the upgrade status using the **show system firmware** command.

## Autoinstallation

---

- [Autoinstallation Overview on page 151](#)
- [Automatic Installation of Configuration Files \(J Series Services Routers and SRX Series Services Gateways\) on page 154](#)

### Autoinstallation Overview

If you are setting up many devices, autoinstallation can help automate the configuration process by loading configuration files onto new or existing devices automatically over the network. You can use either the J-Web configuration editor or the CLI configuration editor to configure a device for autoinstallation.

Autoinstallation provides automatic configuration for a new device that you connect to the network and turn on, or for a device configured for autoinstallation. The autoinstallation process begins anytime a device is powered on and cannot locate a valid configuration file in the CompactFlash (CF) card. Typically, a configuration file is unavailable when a device is powered on for the first time, or if the configuration file is deleted from the CF card. The autoinstallation feature enables you to deploy multiple devices from a central location in the network.

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the device.

Autoinstallation takes place automatically when you connect an Ethernet or serial port on a new Juniper Networks device to the network and power on the device. To simplify the process, you can explicitly enable autoinstallation on a device and specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This section contains the following topics:

- [Automatic Installation of Configuration Files on page 152](#)
- [Supported Autoinstallation Interfaces and Protocols on page 152](#)
- [Typical Autoinstallation Process on a New Device on page 153](#)

### Automatic Installation of Configuration Files

On SRX Series devices, you can specify a remote server where configuration files are located. If a configuration file cannot be found on the device's CompactFlash card, the device automatically retrieves the configuration file from this remote server. For security purposes, you can encrypt these remote files using the DES cipher, and once they have been retrieved, the device decrypts them for use on the server.

To encrypt the files, we recommend the openssl tool. You can get the open SSL tool at: <http://www.openssl.org/>. To encrypt the file, use the following syntax:

```
% openssl enc -des -k passphrase -in original-file -out encrypted-file
```

- ***passphrase***—Passphrase used to encrypt the configuration file. The passphrase should be the name of the file without the path information or file extension.
- ***original-file***—Unencrypted configuration file.
- ***encrypted-file***—Name of the encrypted configuration file.

For example, if you are encrypting the active configuration file **juniper.conf.gz**, the passphrase is **juniper.conf**. The openssl syntax used to encrypt the file is:

```
% openssl enc -des -k juniper.conf -in juniper.conf.gz -out juniper.conf.gz.enc
```

### Supported Autoinstallation Interfaces and Protocols

Before autoinstallation on a device can take place, the device must acquire an IP address. The protocol or protocols you choose for IP address acquisition determine the device interface to connect to the network for autoinstallation. The device detects the connected interface and requests an IP address with a protocol appropriate for the interface. Autoinstallation is supported over an Ethernet LAN interface or a serial LAN or WAN interface. [Table 25 on page 152](#) lists the protocols that the device can use on these interfaces for IP address acquisition.

**Table 25: Interfaces and Protocols for IP Address Acquisition During Autoinstallation**

Interface and Encapsulation Type	Protocol for Autoinstallation
Ethernet LAN interface with High-Level Data Link Control (HDLC)	DHCP, BOOTP, or Reverse Address Resolution Protocol (RARP)

Table 25: Interfaces and Protocols for IP Address Acquisition During Autoinstallation (*continued*)

Interface and Encapsulation Type	Protocol for Autoinstallation
Serial WAN interface with HDLC	Serial Line Address Resolution Protocol (SLARP)
Serial WAN interface with Frame Relay	BOOTP

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new device through which the new device can send Trivial File Transfer Protocol (TFTP), BOOTP, and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

### Typical Autoinstallation Process on a New Device

When a device is powered on for the first time, it performs the following autoinstallation tasks:

1. The new device sends out DHCP, BOOTP, RARP, or SLARP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds, it provides the device with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the TFTP (typically), Hypertext Transfer Protocol (HTTP), or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides only the hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the new device.
2. After the new device acquires an IP address, the autoinstallation process on the device attempts to download a configuration file in the following ways:
    - a. If the DHCP server specifies the host-specific configuration file (boot file) **hostname.conf**, the device uses that filename in the TFTP server request. (In the filename, **hostname** is the hostname of the new device.) The autoinstallation process on the new device makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the device broadcasts three requests to any available TFTP server for the file.
    - b. If the new device cannot locate **hostname.conf**, the autoinstallation process unicasts or broadcasts TFTP requests for a default device configuration file called **network.conf**, which contains hostname-to-IP address mapping information, to attempt to find its hostname.

- c. If **network.conf** contains no hostname entry for the new device, the autoinstallation process sends out a DNS request and attempts to resolve the new device's IP address to a hostname.
  - d. If the new device can determine its hostname, it sends a TFTP request for the **hostname.conf** file.
  - e. If the new device is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **router.conf**.
3. After the new device locates a configuration file on a TFTP server, autoinstallation downloads the file, installs the file on the device, and commits the configuration.

---

**NOTE:**

- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the DNS server in the network.
  - If the new device is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS service. Connect this interface to the new device.
- 

**Related Documentation**

- *Automatic Installation of Configuration Files (J Series Routers and SRX Series Services Gateway)*
- [Example: Configuring Autoinstallation on page 205](#)
- *Installation and Upgrade Guide for Security Devices*

## Automatic Installation of Configuration Files (J Series Services Routers and SRX Series Services Gateways)

Autoinstallation provides automatic configuration for a new device that you connect to the network and turn on, or for a device configured for autoinstallation.

### J Series Automatic Installation Overview

On J Series routers, you can specify a remote server where configuration files are located. If a configuration file cannot be found on the router's CompactFlash card, the router automatically retrieves the configuration file from this remote server. For security purposes, you can encrypt these remote files using the DES cipher, and once they have been retrieved, the router decrypts them for use on the server.

To encrypt the files, we recommend the openssl tool. You can get the open SSL tool at: <http://www.openssl.org/>. To encrypt the file, use the following syntax:

```
% openssl enc -des -k passphrase -in original-file -out encrypted-file
```

- ***passphrase***—Passphrase used to encrypt the configuration file. The passphrase should be the name of the file without the path information or file extension.
- ***original-file***—Unencrypted configuration file.
- ***encrypted-file***—Name of the encrypted configuration file.

For example, if you are encrypting the active configuration file **juniper.conf.gz**, the passphrase is **juniper.conf**. The openssl syntax used to encrypt the file is:

```
% openssl enc -des -k juniper.conf -in juniper.conf.gz -out juniper.conf.gz.enc
```

## SRX Series Services Gateways Automatic Installation Overview

---

The autoinstallation process begins any time a services gateway is powered on and cannot locate a valid configuration file in the internal flash. Typically, a configuration file is unavailable when a services gateway is powered on for the first time or if the configuration file is deleted from the internal flash. The autoinstallation feature enables you to deploy multiple services gateways from a central location in the network.

If you are setting up many devices, autoinstallation can help automate the configuration process by loading configuration files onto new or existing devices automatically over the network. You can use either the J-Web configuration editor or the CLI configuration editor to configure a device for autoinstallation.

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the services gateway.

Autoinstallation takes place automatically when you connect an Ethernet port on a new services gateway to the network and power on the device. To simplify the process, you can explicitly enable autoinstallation on a device and specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

## Licenses

---

- [Junos OS License Overview on page 156](#)
- [License Enforcement on page 159](#)
- [Junos OS Feature License Model Number for J Series Services Routers and SRX Series Services Gateways on page 159](#)

### Junos OS License Overview

To enable some Junos OS features, you must purchase, install, and manage separate software licenses. For those features that require a license, the presence on the device of the appropriate software license keys (passwords) determines whether you can use the feature.

For information about how to purchase software licenses for your device, contact your Juniper Networks sales representative.

Certain Junos OS features require licenses. Each license is valid for only a single device. To manage the licenses, you must understand license enforcement and the components of a license key.

This section contains the following topics:

- [License Enforcement on page 157](#)
- [License Key Components on page 157](#)
- [License Management Fields Summary on page 157](#)

### License Enforcement

For features that require a license, you must install and properly configure the license to use the feature. Although the device allows you to commit a configuration that specifies a feature requiring a license when the license is not present, you are prohibited from actually using the feature.

Successful commitment of a configuration does not imply that the required licenses are installed. If a required license is not present, the system provides a warning message after it commits the configuration rather than failing to commit it because of a license violation.

### License Key Components

A license key consists of two parts:

- **License ID**—Alphanumeric string that uniquely identifies the license key. When a license is generated, it is given a license ID.
- **License data**—Block of binary data that defines and stores all license key objects.

For example, in the following typical license key, the string **XXXXXXXXXX** is the license ID, and the trailing block of data is the license data:

```
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx
```

The license data defines the device ID for which the license is valid and the version of the license.

### License Management Fields Summary

The Licenses page displays a summary of licensed features that are configured on the device and a list of licenses that are installed on the device. The information on the license management page is summarized in [Table 26 on page 157](#).

**Table 26: Summary of License Management Fields**

Field Name	Definition
<b>Feature Summary</b>	
Feature	<p>Name of the licensed feature:</p> <ul style="list-style-type: none"> <li>• <b>Features</b>—Software feature licenses.</li> <li>• <b>All features</b>—All-inclusive licenses</li> </ul>

Table 26: Summary of License Management Fields (*continued*)

Field Name	Definition
Licenses Used	Number of licenses currently being used on the device. Usage is determined by the configuration on the device. If a feature license exists and that feature is configured, the license is considered used.
Licenses Installed	Number of licenses installed on the device for the particular feature.
Licenses Needed	Number of licenses required for legal use of the feature. Usage is determined by the configuration on the device: If a feature is configured and the license for that feature is not installed, a single license is needed.
<b>Installed Licenses</b>	
ID	Unique alphanumeric ID of the license.
State	<b>Valid</b> —The installed license key is valid. <b>Invalid</b> —The installed license key is not valid.
Version	Numeric version number of the license key.
Group	If the license defines a group license, this field displays the group definition. If the license requires a group license, this field displays the required group definition. <b>NOTE:</b> Because group licenses are currently unsupported, this field is always blank.
Enabled Features	Name of the feature that is enabled with the particular license.
Expiry	Verify that the expiration information for the license is correct. For Junos OS, only permanent licenses are supported. If a license has expired, it is shown as invalid.

  - *Administration Guide for Security Devices*

## License Enforcement

For features or scaling levels that require a license, you must install and properly configure the license to meet the requirements for using the licensable feature or scale level. The router or switch enables you to commit a configuration that specifies a licensable feature or scale without a license for a 30-day grace period. The grace period is a short-term grant that enables you to start using features in the pack or scale up to the system limits (regardless of the license key limit) without a license key installed. The grace period begins when the licensable feature or scaling level is actually used by the device (not when it is first committed). In other words, you can commit licensable features or scaling limits to the device configuration, but the grace period does not begin until the device uses the licensable feature or exceeds a licensable scaling level.

**NOTE:** Configurations might include both licensed and nonlicensed features. For these situations, the license is enforced up to the point where the license can be clearly distinguished. For example, an authentication-order configuration is shared by both Authentication, Authorization, and Accounting (AAA), which is licensed, and by Layer 2 Tunneling Protocol (L2TP), which is not licensed. When the configuration is committed, the device does not issue any license warnings, because it is not yet known whether AAA or L2TP is using the configuration. However, at runtime, the device checks for a license when AAA authenticates clients, but does not check when L2TP authenticates clients.

The device reports any license breach as a warning log message whenever a configuration is committed that contains a feature or scale limit usage that requires a license. Following the 30-day grace period, the device periodically reports the breach to syslog messages until a license is installed and properly configured on the device to resolve the breach.

**NOTE:** Successful commitment of a licensable feature or scaling configuration does not imply that the required licenses are installed or not required. If a required license is not present, the system issues a warning message after it commits the configuration.

## Junos OS Feature License Model Number for J Series Services Routers and SRX Series Services Gateways

For information about how to purchase a software license, contact your Juniper Networks sales representative at <http://www.juniper.net/in/en/contact-us/>.

Each feature license is tied to exactly one software feature, and that license is valid for exactly one device. [Table 27 on page 160](#) describes the Junos OS features that require licenses.

**Table 27: Junos OS Feature Licenses**

Junos OS License Requirements										
Feature	SRX100	SRX110	SRX210	SRX220	SRX240	SRX550	SRX650	SRX1400	SRX3000 line	SRX5000 line
Access Manager	X	X	X	X	X	X	X			
BGP Route Reflectors							X			
Dynamic VPN	X	X	X	X	X	X	X			
IDP Signature Update	X *	X	X *	X *	X *	X	X	X	X	X
Application Signature Update (Application Identification)	X	X	X	X	X	X	X	X	X	X
Juniper-Kaspersky Antivirus	X	X	X	X	X	X	X			
Juniper-Sophos Antivirus	X	X	X	X	X	X	X	X	X	X
Juniper-Sophos Antispam	X	X	X	X	X	X	X	X	X	X
Juniper-Enhanced Web filtering	X	X	X	X	X	X	X	X	X	X
Juniper-Websense Web filtering	X	X	X	X	X	X	X			
Logical Systems								X	X	X
SRX100 Memory Upgrade	X									
UTM	X*	X	X *	X	X *	X	X	X	X	X

\* Indicates support on high-memory devices only.

Each license allows you to run the specified advanced software features on a single device.

## Upgrading Individual Software Packages

To upgrade an individual Junos OS package, follow these steps:

1. Download the software packages you need from the Juniper Networks Support Web site at <http://www.juniper.net/support/>. Choose either the Canada and U.S. Version or the Worldwide Version.

To download the software packages, you must have a service contract and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks Web site: <https://www.juniper.net/registration/Register.jsp>.

**NOTE:** We recommend that you upgrade all individual software packages using an out-of-band connection from the console or management Ethernet interface, because in-band connections can be lost during the upgrade process.

2. Back up the currently running and active file system so that you can recover to a known, stable environment in case something goes wrong with the upgrade:

```
user@host> request system snapshot
```

High-end SRX Series devices, the root file system is backed up to `/altroot`, and `/config` is backed up to `/altconfig`. The root and `/config` file systems are on the router's CompactFlash card, and the `/altroot` and `/altconfig` file systems are on the router's hard disk or solid-state drive (SSD).

**NOTE:** This step is optional for branch SRX Series devices. For branch SRX Series devices, ensure that a USB flash drive is plugged into the USB port of the device.

**NOTE:** Running the `request system snapshot` command overwrites the previous version of the software stored in the backup media.

**NOTE:** After you issue the `request system snapshot` command, you cannot return to the previous version of the software, because the running copy and the backup copy of the software are identical.

3. If you are copying multiple software packages to the device, copy them to the `/var/tmp` directory on the hard disk or solid-state drive (SSD):

```
user@host> file copy ftp://username :prompt@ftp.hostname  
          .net/filename/var/tmp/filename
```

4. Add the new software package:

```
user@host> request system software add/var/tmp/ installation package validate
```

*installation-package* is the full URL to the file.

**WARNING:** For high-end SRX Series devices, do not include the *re0 | re1* option when you install a package using the `request system software add` command, if the Routing Engine on which the package is located and the Routing Engine on which you want to install the package is the same. In such cases, the package gets deleted after a successful upgrade.

The system might display the following message:

```
pkg_delete: couldn't entirely delete package
```

This message indicates that someone manually deleted or changed an item that was in a package. You do not need to take any action; the package is still properly deleted.

If you are upgrading more than one package at the same time, add **jbase** first. If you are using this procedure to upgrade all packages at once, add them in the following order:

```
user@host> request system software add /var/tmp/jbase-release-signed.tgz
user@host> request system software add /var/tmp/jkernel-release-signed.tgz
user@host> request system software add /var/tmp/jpfe-release-signed.tgz
user@host> request system software add /var/tmp/jdocs-release-signed.tgz
user@host> request system software add /var/tmp/jweb-release-signed.tgz
user@host> request system software add /var/tmp/jroute-release-signed.tgz
user@host> request system software add /var/tmp/jcrypto-release-signed.tgz
```

5. Reboot the router to start the new software:

```
user@host> request system reboot
```

6. After you have upgraded or downgraded the software and are satisfied that the new software is successfully running, issue the `request system snapshot` command to back up the new software:

```
user@host> request system snapshot
```

**NOTE:** This step is optional for branch SRX Series devices. For branch SRX Series devices, ensure that a USB flash drive is plugged into the USB port of the device.

For high-end SRX Series devices, the root file system is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. The root and **/config** file systems are on the router's CompactFlash card, and the **/altroot** and **/altconfig** file systems are on the router's hard disk or solid-state drive (SSD).

**NOTE:** After you issue the `request system snapshot` command, you cannot return to the previous version of the software, because the running copy and backup copy of the software are identical.

**NOTE:** Running the `request system snapshot` command overwrites the previous version of the software stored in backup media.

## Preparing Your SRX Series Device for Junos OS Upgrades

Before you begin upgrading Junos OS on an SRX Series device, make sure that you have completed the following:

- Obtained a Juniper Networks Web account and a valid support contract. You must have an account to download software upgrades. To obtain an account, complete the registration form at the Juniper Networks website:  
<https://www.juniper.net/registration/Register.jsp>.
- Backed up your primary boot device onto a secondary storage device.

Creating a backup has the following advantages:

- If, during an upgrade, the primary boot device fails or becomes corrupted, the device can boot from backup and come back online
- Your active configuration files and log files are retained.
- If an upgrade is unsuccessful, the device can recover using a known, stable environment.

You can use either the J-Web user interface or the CLI to back up the primary boot device on the secondary storage device.

[Table 28 on page 166](#) lists the secondary storage devices available on an SRX Series devices.

**Table 28: Secondary Storage Devices for SRX Series Devices**

Storage Device	Available on Services Gateways	Minimum Storage Required
USB storage device	SRX100, SRX210, SRX220, and SRX240 Services Gateways	1 GB
	SRX650 Services Gateway	2 GB
External CompactFlash (CF)	SRX650 Services Gateway	2 GB

**NOTE:**

- During a successful upgrade, the upgrade package completely reinstalls the existing Junos OS. It retains configuration files, log files, and similar information from the previous version.
- After a successful upgrade, remember to back up the new current configuration to the secondary device.

**Related Documentation**

## Preparing Your J Series Services Router for Junos OS Upgrades

Before you begin upgrading Junos OS on J Series devices:

- Obtain a Juniper Networks Web account and a valid support contract. You must have an account to download Junos OS upgrades. To obtain an account, complete the registration form at the Juniper Networks website:  
<https://www.juniper.net/registration/Register.jsp>
- Back up your primary boot device onto a secondary storage device. Creating a backup has the following advantages:
  - The device can boot from backup and come back online in case of failure or corruption of the primary boot device in the event of power failure during an upgrade.
  - Your active configuration files and log files are retained.
  - The device can recover from a known, stable environment in case of an unsuccessful upgrade.

You can use either the J-Web user interface or the CLI to back up the primary boot device on the secondary storage device.

[Table 29 on page 167](#) lists the secondary storage devices available in a J Series device for backup.

**Table 29: Secondary Storage Devices for Backup**

Storage Device	Available on J Series Devices	Minimum Storage Required
External CompactFlash (CF) card	J2320 and J2350	512 MB

**NOTE:**

- During a successful upgrade, the upgrade package completely reinstalls the existing Junos OS. It retains configuration files, log files, and similar information from the previous version.
- After a successful upgrade, back up the new current configuration to the secondary device.

**NOTE:** Previously, upgrading images on J Series devices with a 256 MB CF card from Junos OS Release 8.5 and earlier involved removing unwanted files in the images and removing the Swap Partition. From Junos OS Release 9.2 and later, as an alternative, Junos OS accomplishes the upgrade efficiently to take another snapshot of the CF card, install the image, and restore configurations.

## Preparing the USB Flash Drive to Upgrade Junos OS

**NOTE:** This topic is applicable only to SRX100, SRX210, SRX220, SRX240, and SRX650 devices.

This feature simplifies the upgrading of Junos OS images in cases where there is no console access to an SRX Series device located at a remote site. This functionality allows you to upgrade the Junos OS image with minimum configuration effort by simply copying the image onto a USB flash drive, inserting it into the USB port of the SRX Series device, and performing a few simple steps. You can also use this feature to reformat a boot device and recover an SRX Series device after boot media corruption.

You can use any USB flash drive device formatted with FAT/FAT 32 file systems for the installation process.

**NOTE:** This feature is not supported on chassis clusters.

Before you begin:

- Copy the Junos OS upgrade image and its `autoinstall.conf` file to the USB device.
- Ensure that adequate space is available on the SRX Series device to install the software image.

To prepare the USB flash drive and copy the Junos OS image onto the USB flash drive:

1. Insert the USB flash drive into the USB port of a PC or laptop computer running Windows.
2. From My Computer, right-click the drive Devices with Removable Storage.
3. Format the drive with the FAT/FAT32 file system.
4. Copy the Junos OS image onto the USB device.

For the installation process to succeed, copy only one image onto the USB device. Only images named `junos-srxsme*` are recognized by the system.

5. Check the drive name detected in My Computer for the USB device. Open the command prompt window and type:

```
echo " " > <drive-name>:\autoinstall.conf
```

For example, if the drive detected is drive F, type `echo " " > F:\autoinstall.conf` at the command prompt. This empty file indicates to the system that the automatic installation of the Junos OS image from the USB device is supported.

6. (Optional) Create a text file named `junos-config.conf` and copy the file to the USB device. For example, the following file supports an automatic configuration update during the installation process:

```
system {
  host-name host-1;
  domain-name example.net;
  domain-search [ abc.example.net example.net device1.example.net];
  root-authentication {
    encrypted-password "$ABC123"; ## SECRET-DATA
  }
}
...
...
routing-options {
  static {
    route 0.0.0.0/0 next-hop 10.207.31.254;
  }
}
```

**NOTE:** The `junos-config.conf` file is optional, and it is not necessary for the automatic installation of the Junos OS image from the USB device. You can use the `junos-config.conf` file for a backup configuration for recovery or if the existing configuration is accidentally deleted.

#### Related Documentation

- [Upgrading Individual Software Packages on page 164](#)

- *Installation and Upgrade Guide for Security Devices*

## Determining the Junos OS Version

To determine which software packages are running on the device and to get information about these packages, use the **show version** operational mode command at the top level of the command-line interface (CLI).

**NOTE:** The **show version** command does not show the software category installed, only the release number of the software.

### Related Documentation

- [Upgrading Individual Software Packages on page 164](#)
- [Connecting to the Console Port on page 170](#)
- [Backing Up the Current Installation \(J Series Services Routers and SRX Series Services Gateways\) on page 171](#)
- *Installation and Upgrade Guide for Security Devices*

## Connecting to the Console Port

The console port is a data terminal equipment (DTE) interface, providing a direct and continuous interface with the device. It is important to connect to the console during installation procedures so you can respond to any required user input and detect any errors that may occur.

Console ports allow root access to the Junos operating system (Junos OS) devices through a terminal or laptop interface, regardless of the state of the Junos OS device, unless it is completely powered off. By connecting to the console port, you can access the root level of the Junos OS device without using the network to which the device might or might not be connected. This creates a secondary path to the Junos OS device without relying on the network. Using the terminal interface provides a technician sitting in a Network Operations Center a long distance away the ability to restore a Junos OS device or perform an initialization configuration securely, using a modem, even if the primary network has failed. Without a connection to the console port, a technician would have to visit the site to perform repairs or initialization.

To configure the device initially, you must connect a terminal or laptop computer to the device through the console port, as shown in [Figure 7 on page 171](#).

Figure 7: Connecting to the Console Port on a Junos OS Device

9034114

A remote connection to the Junos OS device through a modem requires the cable and connector (provided in the device accessory box), plus a DB-9 male to DB-25 male (or similar) adapter for your modem, which you must purchase separately.

For more information about connecting to the console port, see the [Hardware Documentation](#) for your particular device.

## Backing Up the Current Installation (J Series Services Routers and SRX Series Services Gateways)

You should back up the current installation so that you can return to the current software installation. In a dual Routing Engine system, you need to back up both Routing Engines.

The installation process using the installation package (**junos-jsr\***) removes all stored files on the router except the **juniper.conf** and SSH files. Therefore, you should back up your current configuration in case you need to return to the current software installation after running the installation program.

The following instructions offer the minimum steps required to create a backup on a J Series router during the installation process.

To back up the Junos OS on the J Series routers:

1. Attach an external memory device to the router.

**NOTE:** Even when attached to a J Series router, the USB memory device is not listed as a storage device in the `show system storage` CLI command output. You can view the installed USB memory device on the J-Web interface's system monitor screen.

2. Issue the `request system snapshot media usb` command.

The current software installation and configuration are saved on the external USB storage device.

**Related Documentation**

- [Downloading Software on page 172](#)
- [Downloading Junos OS Upgrades for SRX Series Devices on page 174](#)
- *Installation and Upgrade Guide for Security Devices*

## Downloading Software

You can download the software in one of the two ways:

- [Downloading Software with a Browser on page 172](#)
- [Downloading Software Using the Command-Line Interface on page 173](#)

### Downloading Software with a Browser

---

You download the software package you need from the Juniper Networks Support Web site at <http://www.juniper.net/support/>.

**NOTE:** To access the download section, you must have a service contract and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks Web site: <https://www.juniper.net/registration/Register.jsp>.

To download the software:

1. In a browser, go to <http://www.juniper.net/support/>.  
The Support page opens.
2. In the Download Software section, select the software version to download.  
Depending on your location, select Junos Canada and US, or Junos Worldwide.
3. Select the current release to download.
4. Click the Software tab and select the Junos Installation Package to download.

A dialog box opens.

5. Save the file to your system. If you are placing the file on a remote system, you must make sure that the file can be accessible by the router or switch using HTTP, FTP, or scp.

### Downloading Software Using the Command-Line Interface

Download the software package you need from the Juniper Networks Support Web site at <http://www.juniper.net/support/>, and place the package on a local system. You can then transfer the downloaded package to the device using either the router or switch command-line interface, or the local system command-line interface.

**NOTE:** To access the download section, you must have a service contract and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks Web site: <https://www.juniper.net/registration/Register.jsp>.

Before you transfer the software package, ensure that the FTP service is enabled on the device.

Enable the FTP service using the **set system services ftp** command:

```
user@host# set system services ftp
```

To transfer the software package using the device command-line interface:

1. From the router or switch command line, initiate an FTP session with the local system (host) where the package is located using the **ftp** command:

```
user@host> ftp host
```

*host* is the Hostname or address of the local system.

2. Log in with your customer support–supplied username and password:

```
User Name: username
331 Password required for username.
Password: password
```

Once your credentials have been validated, the FTP session opens.

3. Navigate to the software package location on the local system, and transfer the package using the **get** command:

```
user@host> get installation-package
```

Following is an example of an *installation-package* name:

```
jinstall-9.2R1.8-domestic-signed.tgz
```

4. Close the FTP session using the **bye** command:

```
user@host> bye
Goodbye
```

To transfer the package using the local system command-line interface:

1. From the local system command line, initiate an FTP session with the device using the **ftp** command:

```
user@host> ftp host
```

*host* is the Hostname or address of the router or switch.

2. Log in with your customer support–supplied username and password:

```
User Name: username
331 Password required for username.
Password: password
```

Once your credentials have been validated, the FTP session opens.

3. Navigate to the software package location on the local system, and transfer the package using the **put** command:

```
user@host> put installation-package
```

Following is an example of an *installation-package* name:

**jinstall-9.2R1.8–domestic-signed.tgz**

4. Close the FTP session using the **bye** command:

```
user@host> bye
Goodbye
```

## Downloading Junos OS Upgrades for SRX Series Devices

To download Junos OS upgrades from Juniper Networks:

1. Using a Web browser, follow the links to the download URL on the Juniper Networks webpage. Depending on your location, select the Canada and U.S. version (domestic) or the Worldwide version (ww):
  - <https://www.juniper.net/support/csc/swdist-domestic/>
  - <https://www.juniper.net/support/csc/swdist-ww/>
2. Log in to the Juniper Networks website using the username (generally your e-mail address) and password supplied by your Juniper Networks representative.
3. Select the appropriate software image for your platform.
4. Download Junos OS to a local host or to an internal software distribution site.

- Related Documentation**

  - [Checking the Current Configuration and Candidate Software Compatibility on page 175](#)
  - *Installation and Upgrade Guide for Security Devices*

## Downloading Junos OS Upgrades for J Series Devices

To download software upgrades from Juniper Networks:

1. Using a Web browser, follow the links to the download URL on the Juniper Networks webpage. Depending on your location, select either Canada and U.S. Version or Worldwide Version:
  - <https://www.juniper.net/support/csc/swdist-domestic/>
  - <https://www.juniper.net/support/csc/swdist-ww/>
2. Log in to the Juniper Networks website using the username (generally your e-mail address) and password supplied by Juniper Networks representatives.
3. Select the appropriate software image for your platform.
4. Download the software to a local host or to an internal software distribution site.

- Related Documentation**

  - [Example: Downgrading Junos OS on J Series Devices on page 201](#)
  - *Installation and Upgrade Guide for Security Devices*

## Checking the Current Configuration and Candidate Software Compatibility

When you upgrade or downgrade Junos OS, we recommend that you include the **validate** option with the **request system software add** command to check that the candidate software is compatible with the current configuration. By default, when you add a package with a different release number, the validation check is done automatically.

- Related Documentation**
- [Downloading Software on page 172](#)
  - *Installation and Upgrade Guide for Security Devices*

## Verifying Available Disk Space on SRX Series Devices

The amount of free disk space necessary to upgrade a device with a new version of the Junos OS can vary from one release to another. Check the Junos OS software version you are installing to determine the free disk space requirements.

If the amount of free disk space on a device is insufficient for installing the Junos OS, you might receive a warning similar to the following messages, that the /var filesystem is low on free disk space:

*WARNING: The /var filesystem is low on free disk space.*

*WARNING: This package requires 1075136k free, but there is only 666502k available.*

To determine the amount of free disk space on the device, issue the **show system storage detail** command. The command output displays statistics about the amount of free disk space in the device file systems.

A sample of the **show system storage detail** command output is shown below:

```
user@host> show system storage detail
```

Filesystem	1024-blocks	Used	Avail	Capacity	Mounted on
/dev/da0s2a	300196	154410	121772	56%	/
devfs	1	1	0	100%	/dev
/dev/md0	409000	409000	0	100%	/junos
/cf	300196	154410	121772	56%	/junos/cf
devfs	1	1	0	100%	/junos/dev/
procfs	4	4	0	100%	/proc
/dev/bo0s3e	25004	52	22952	0%	/config
/dev/bo0s3f	350628	178450	144128	55%	/cf/var
/dev/md1	171860	16804	141308	11%	/mfs
/cf/var/jail	350628	178450	144128	55%	/jail/var
/cf/var/log	350628	178450	144128	55%	/jail/var/log
devfs	1	1	0	100%	/jail/dev
/dev/md2	40172	4	36956	0%	/mfs/var/run/utm
/dev/md3	1884	138	1596	8%	/jail/mfs

When the system file storage space on the device is full, rebooting the device does not solve the problem. The following error message is displayed during a typical operation on the device after the file storage space is full.

```
user@host% cli
user@host> configure/var: write failed, filesystem is full
```

You can clean up the file storage on the device by deleting system files using the **request system storage cleanup** command as shown in following procedure:

1. Request to delete system files on the device.

```
user@host> request system storage cleanup
```

The list of files to be deleted is displayed.

List of files to delete:

```
Size Date      Name
11B Oct 28 23:40 /var/jail/tmp/alarmd.ts
```

```

```

Delete these files ? [yes,no] (no)

2. Enter the option **yes** to proceed with deleting of the files.

#### Related Documentation

- [Downloading Software on page 172](#)
- [Example: Installing Junos OS Upgrades on SRX Series Devices on page 177](#)
- [Example: Installing Junos OS Upgrades on J Series Devices on page 179](#)
- [Installation and Upgrade Guide for Security Devices](#)

## Example: Installing Junos OS Upgrades on SRX Series Devices

This example shows how to install upgrades on the SRX Series devices.

- [Requirements on page 177](#)
- [Overview on page 178](#)
- [Configuration on page 178](#)
- [Verification on page 179](#)

### Requirements

Before you begin:

- Verify the available space on the internal media. See "[Verifying Available Disk Space on SRX Series Devices](#)" on page 176.

- Download the software package. See “[Downloading Junos OS Upgrades for SRX Series Devices](#)” on page 174.
- Copy the software package to the device if you are installing the software package from a local directory on the device. We recommend that you copy it to the `/var/tmp` directory.

---

### Overview

By default, the **request system software add *package-name*** command uses the **validate** option to validate the software package against the current configuration as a prerequisite to adding the software package. This validation ensures that the device can reboot successfully after the software package is installed. This is the default behavior when you are adding a software package.

In this example, add the software package `junos-srxsme-10.0R2-domestic.tgz` with the following options:

- **no-copy** option to install the software package but do not save the copies of package files. You should include this option if you do not have enough space on the internal media to perform an upgrade that keeps a copy of the package on the device.
- **no-validate** option to bypass the compatibility check with the current configuration before installation starts.
- **reboot** option to reboots the device after installation is completed.

---

### Configuration

#### CLI Quick Configuration

To quickly install Junos OS upgrades on SRX Series devices, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host> request system software add /var/tmp/junos-srxsme-10.0R2-domestic.tgz
no-copy no-validate reboot
```

#### GUI Step-by-Step Procedure

To install Junos OS upgrades on SRX Series devices:

1. In the J-Web user interface, select **Maintain>Software>Upload Package**.
2. On the Upload Package page, specify the software package to upload. Click **Browse** to navigate to the software package location and select `junos-srxsme-10.0R2-domestic.tgz`.
3. Select the **Reboot If Required** check box to set the device to reboot automatically when the upgrade is complete.
4. Select the **Do not save backup** check box to bypass saving the backup copy of the current Junos OS package.
5. Click **Upload Package**. The software is activated after the device has rebooted.

6. Click **OK** to check your configuration and save it as a candidate configuration.
7. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To install Junos OS upgrades on SRX Series devices:

From operational mode, install the new package on the device with the `no-copy` and `no-validate` options, and format and re-partition the media before installation, and reboot the device after installation is completed.

```
user@host> request system software add /var/tmp/junos-srxsme-10.0R2-domestic.tgz
no-copy no-validate reboot
```

When the reboot is complete, the device displays the login prompt.

**Results** From configuration mode, confirm your configuration by entering the `show system` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter `commit` from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Junos OS Upgrade Installation

**Purpose** Verify that the Junos OS upgrade was installed.

**Action** From operational mode, enter the `show system` command.

**Related Documentation**

- [Example: Configuring Boot Devices for SRX Series Devices on page 210](#)
- [Junos OS Upgrade Methods on the SRX Series Devices on page 138](#)
- [Example: Downgrading Junos OS on SRX Series Devices on page 199](#)
- [Installing Junos OS Using a USB Flash Drive on SRX Series Devices on page 184](#)

## Example: Installing Junos OS Upgrades on J Series Devices

This example shows how to install Junos OS upgrades on J Series devices.

- [Requirements on page 180](#)
- [Overview on page 180](#)
- [Configuration on page 180](#)
- [Verification on page 181](#)

## Requirements

---

Before you begin:

- Verify the available space on the CompactFlash card. See the *Junos OS Release Notes*.
- Download the Junos OS package. See “[Downloading Junos OS Upgrades for J Series Devices](#)” on page 175.
- Copy the software package to the device if you are installing the Junos OS package from a local directory on the device. We recommend that you copy it to the `/var/tmp` directory.

## Overview

---

**NOTE:** This procedure applies only to upgrading from one Junos OS software release to another or from one Junos OS services release to another.

---

By default, the **request system software add *package-name*** command uses the **validate** option to validate the software package against the current configuration as a prerequisite to adding the software package. This validation ensures that the device can reboot successfully after the software package is installed. This is the default behavior when you are adding a software package.

For this example, install the `junos-jsr-8.5R1.1.domestic.tgz` software package and copy it to the `/var/tmp` directory. Set the **unlink** option to remove the package at the earliest opportunity so that the device has enough storage capacity to complete the installation, and set the **no-copy** option to specify that the software package is installed but a copy of the package is not saved.

## Configuration

---

### CLI Quick Configuration

To quickly install Junos OS upgrades on J Series devices, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host>  
request system software add unlink no-copy /var/tmp/junos-jsr-8.5R1.1.domestic.tgz  
request system reboot
```

### GUI Step-by-Step Procedure

To install Junos OS upgrades on J Series devices:

1. In the J-Web user interface, select **Maintain>Software>Upload Package**.
2. On the Upload Package page, in the File to Upload field, type the location of the software package, or click **Browse** to navigate to the location.
3. Select the Reboot If Required check box to have the device reboot automatically when the upgrade is complete.

4. Click **Upload Package**. Junos OS is activated after the device has rebooted.
5. Click **OK** to check your configuration and save it as a candidate configuration.
6. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To install Junos OS upgrades on J Series devices:

1. From operational mode, install the new package on the device.

```
user@host> request system software add unlink no-copy
/var/tmp/junos-jsr-8.5R1.1.domestic.tgz
```

2. Reboot the device.

```
user@host> request system reboot
```

When the reboot is complete, the device displays the login prompt.

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### *Verifying the Junos OS Upgrade Installation*

**Purpose** Verify that the Junos OS upgrade was installed.

**Action** From operational mode, enter the **show system** command.

**Related Documentation**

## Installing Junos OS Using TFTP on SRX Series Devices

You can install the Junos OS using the Trivial File Transfer Protocol (TFTP) method. The device is shipped with the Junos OS loaded on the primary boot device. During the Junos

OS installation from the loader, the device retrieves the Junos OS package from a TFTP server. The internal media is then formatted, and the Junos OS image is installed.

From the loader installation, you can:

- Install the Junos OS on the device for the first time.
- Recover the system from a file system corruption.

**NOTE:** Installation from a TFTP server can only be performed using the first onboard Ethernet interface.

Installation from the loader-over-TFTP method does not work reliably over slow speeds or large latency networks.

Before you begin, verify that:

- You have access to the TFTP server with the Junos OS package to be installed.
- That the TFTP server supports BOOTP or DHCP. If the TFTP server does not support BOOTP or DHCP, you must set the environment variables before performing the installation from the TFTP server.
- Functional network connectivity exists between the device and the TFTP server over the first onboard Ethernet interface.

To install the Junos OS image on the internal media of the device:

1. To access the U-boot prompt, use the console connection to connect to the device.
2. Reboot the device.

The following messages appear:

**Clearing DRAM..... done BIST check passed. Net: pic init done (err = 0)octeth0 POST Passed**

After this message appears, you see the following prompt:

**Press SPACE to abort autoboot in 3 seconds**

3. Press the space bar to stop the autoboot process.

The => U-boot prompt appears.

4. From the U-boot prompt, configure the environment variables listed in [Table 30 on page 182](#).

**Table 30: Environment Variables Settings**

Environment Variables	Description
gatewayip	IP address of the gateway device
ipaddr	IP address of the SRX Series device

Table 30: Environment Variables Settings (*continued*)

Environment Variables	Description
netmask	network mask
serverip	IP address of the TFTP server

This example shows you how to configure the environment variables:

```

Clearing DRAM..... done
BIST check passed.
Net: pic init done (err = 0)octeth0
POST Passed
Press SPACE to abort autoboot in 3 seconds
=>
=> setenv ipaddr 10.157.70.170
=> setenv netmask 255.255.255.0
=> setenv gatewayip 10.157.64.1
=> setenv serverip 10.157.60.1
=> saveenv

```

5. Reboot the system using the **reset** command.
6. To access the loader prompt, enter use the console connection to connect to the device.
7. Reboot the device.

The following message appears:

**Loading /boot/defaults/loader.conf**

After this message appears, you see the following prompt:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

8. Press the space bar to access the loader prompt.

The **loader>** prompt appears. Enter:

```
loader> install tftp://10.77.25.12/junos-srxsme-10.0R2-domestic.tgz
```

**NOTE:** The URL path is relative to the TFTP server's TFTP root directory, where the URL is in the form: `tftp://tftp-server-ipaddress/package`.

When this command is executed:

- The Junos OS package is downloaded from the TFTP server.
- The internal media on the system is formatted.
- The Junos OS package is installed on the internal media.

**NOTE:** The Installation from the loader-over-TFTP method installs Junos OS on the internal CF on SRX100, SRX210, SRX220, and SRX240 devices, whereas on SRX650 devices, this method can install Junos OS on the internal or external CF card.

After Junos OS is installed, the device boots from the internal media. Once the system boots up with Junos OS Release 10.0 or later, you should upgrade the U-boot and boot loader immediately.

**CAUTION:** When you install Junos OS using the loader-over-TFTP method, the media is formatted. The process attempts to save the current configuration. We recommend that you back up all important information on the device before using this process.

## Installing Junos OS Using a USB Flash Drive on SRX Series Devices

To install the Junos OS image on an SRX Series device using a USB flash drive:

1. Insert the USB flash drive into the USB port of the SRX Series device and wait for the LEDs to blink amber indicating that the SRX Series device detects the Junos OS image.

If the LEDs do not change to amber, press the Power button or turn the device off and then on again and wait for the LEDs to blink amber.

2. Press the **Reset Config** button on the SRX Series device to start the installation and wait for the LEDs to glow steadily amber.

When the LEDs glow green, the Junos OS upgrade image has been successfully installed.

If the USB device is plugged in, the **Reset Config** button always performs as an image upgrade button. Any other functionality of this button is overridden until you remove the USB flash drive.

3. Remove the USB flash drive.

The SRX Series device restarts automatically and loads the new Junos OS version.

**NOTE:** If an installation error occurs, the LEDs glow red, which might indicate that the Junos OS image on the USB flash drive is corrupted. An installation error can also occur if the current configuration on the SRX Series device is not compatible with the new Junos OS version on the USB or if there is not enough space on the SRX Series device to install the image. You must have console access to the SRX Series device to troubleshoot an installation error.

**NOTE:** You can use the `set system autoinstallation usb disable` command to prevent the automatic installation from the USB device. After using this command, if you insert the USB device into the USB port of the SRX Series device, the installation process does not work.

## Installing Junos OS Upgrades from a Remote Server on the SRX Series Devices

You can use the J-Web user interface to install Junos OS packages that are retrieved with FTP or HTTP from the specified location.

Before you begin:

- Verify the available space on the internal media. See [“Verifying Available Disk Space on SRX Series Devices” on page 176](#).
- Download the Junos OS package. See [“Downloading Junos OS Upgrades for SRX Series Devices” on page 174](#).

To install Junos OS upgrades from a remote server:

1. In the J-Web user interface, select **Maintain>Software>Install Package**.
2. On the Install Remote page, enter the required information into the fields described in [Table 31 on page 186](#).

Table 31: Install Package Summary

Field	Function	Your Action
Package Location (required)	Specifies the FTP or HTTP server, file path, and Junos OS package name.	Type the full address of the Junos OS package location on the FTP or HTTP server—one of the following:  <i>ftp://hostname/pathname/package-name</i> <i>http://hostname/pathname/package-name</i>
User	Specifies the username, if the server requires one.	Type the username.
Password	Specifies the password, if the server requires one.	Type the password.
Reboot If Required	Specifies that the device is automatically rebooted when the upgrade is complete.	Check the box if you want the device to reboot automatically when the upgrade is complete.
Do not save backup	Specifies that the backup copy of the current Junos OS package is not saved.	Check the box if you want to save the backup copy of the Junos OS package.
Format and re-partition the media before installation	Specifies that the storage media is formatted and new partitions are created.	Check the box if you want to format the internal media with dual-root partitioning.

3. Click **Fetch and Install Package**. Junos OS is activated after the device reboots.

## Installing Junos OS Upgrades from a Remote Server on J Series Devices

You can use the J-Web interface to install Junos OS packages that are retrieved with FTP or HTTP from the specified location.

**NOTE:** This procedure applies only to upgrading from one Junos OS release to another.

Before installing the Junos OS upgrade:

- Verify the available space on the CompactFlash (CF) card. See the *Junos OS Release Notes*.
- Download the software package.

To install Junos OS upgrades from a remote server:

1. In the J-Web user interface, select **Maintain>Software>Install Package**.
2. On the Install Remote page, enter the required information described in [Table 32 on page 187](#).

**Table 32: Install Remote Summary**

Field	Function	Your Action
Package Location (required)	Specifies the FTP or HTTP server, file path, and software package name.	Type the full address of the software package location on the FTP or HTTP server—one of the following:  <i>ftp://hostname/pathname/package-name</i>  <i>http://hostname/pathname/package-name</i>
User	Specifies the username, if the server requires one.	Type the username.
Password	Specifies the password, if the server requires one.	Type the password.
Reboot If Required	Specifies that the device is automatically rebooted when the upgrade is complete.	Select the check the box if you want the device to reboot automatically when the upgrade is complete.

3. Click **Fetch and Install Package**. Junos OS is activated after the device reboots.

## Understanding Automatic Recovery of the Primary Junos OS Image with Dual-Root Partitioning

The auto-snapshot feature repairs the corrupted primary root when the device reboots from the alternate root. This is accomplished by taking a snapshot of the alternate root onto the primary root automatically rather than manually from the CLI.

```
login: user

Password:

*****

**                                                                 **

**  WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE  **

**                                                                 **

**  It is possible that the primary copy of JUNOS failed to boot up  **

**  properly, and so this device has booted from the backup copy.    **

**                                                                 **

**  The primary copy will be recovered by auto-snapshot feature now. **

**                                                                 **

*****
```

When this feature is enabled, and the device reboots from the alternate root (because of a corrupted primary root or power cycle during restart), the following actions take place:

1. A prominent message is displayed indicating a failure to boot from the primary root.
2. A system **boot from backup root** alarm is set. This is useful for devices that do not have console access.
3. A snapshot of the alternate root onto the primary root is made.
4. Once the snapshot is complete, the system **boot from backup root** alarm is cleared.

During the next reboot, the system determines the good image on the primary root and boots normally.

**NOTE:** We recommend performing the snapshot once all the processes start. This is done to avoid any increase in the reboot time.

**NOTE:**

- Auto-snapshot feature is supported on branch SRX Series devices.
- By default the auto-snapshot feature is disabled.
- If you do not maintain the same version of Junos OS in both partitions, ensure that the automatic snapshot feature remains disabled. Otherwise, if you have an earlier version of Junos OS in the alternate partition and the system reboots from the alternate root partition, the automatic snapshot feature causes the later Junos OS version to be replaced with the earlier version.
- When automatic snapshot is disabled and the system reboots from the alternate root partition, it triggers an alarm indicating that the system has rebooted from its alternate partition.

Enable this feature with the **set system auto-snapshot** command. Once the primary root partition is recovered using this method, the device will successfully boot from the primary root partition on the next reboot.

Execute the **delete system auto-snapshot** command to delete all backed up data and disable auto-snapshot, if required.

Use the **show system auto-snapshot** command to check the auto-snapshot status.

When auto-snapshot is in progress, you cannot run a manual snapshot command concurrently and the following error message appears:

Snapshot already in progress. Please try after sometime.

**NOTE:** If you log into the device when the snapshot is in progress, the following banner appears: **The device has booted from the alternate partition, auto-snapshot is in progress.**

#### Related Documentation

- *Installation and Upgrade Guide for Security Devices*

## Understanding How the Primary Junos OS Image with Dual-Root Partitioning Recovers on SRX Series Devices

If the SRX Series Services Gateway is unable to boot from the primary Junos OS image, and boots up from the backup Junos OS image in the backup root partition, a message appears on the console at the time of login indicating that the device has booted from the backup Junos OS image.

```
login: user

Password:

*****

**                                                                 **

**  WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE  **

**                                                                 **

**  It is possible that the active copy of JUNOS failed to boot up **

**  properly, and so this device has booted from the backup copy.  **

**                                                                 **

**  Please re-install JUNOS to recover the active copy in case    **

**  it has been corrupted.                                         **

**                                                                 **

*****
```

Because the system is left with only one functional root partition, you should immediately restore the primary Junos OS image using one of the following methods:

- Install a new image using the CLI or J-Web user interface. The newly installed image will become the primary image, and the device will boot from it on the next reboot.
- Use a snapshot of the backup root partition by entering the **request system snapshot slice alternate** command. Once the primary root partition is recovered using this method, the device will successfully boot from the primary root partition on the next reboot. After the procedure, the primary root partition will contain the same version of Junos OS as the backup root partition.

**NOTE:** You can use the CLI command `request system snapshot slice alternate` to back up the currently running root file system (primary or secondary) to the other root partition on the system.

You can use this command to:

- Save an image of the primary root partition in the backup root partition when system boots from the primary root partition.
- Save an image of the backup root partition in the primary root partition when system boots from the backup root partition.

**WARNING:** The process of restoring the alternate root by using the CLI command `request system snapshot slice alternate` takes several minutes to complete. If you terminate the operation before completion, the alternate root might not have all required contents to function properly.

- *Installation and Upgrade Guide for Security Devices*

## Junos OS Release 9.6 or Earlier Installation on SRX Series Devices with Dual-Root Partitioning

Junos OS Release 9.6 and earlier is not compatible with the dual-root partitioning scheme. These releases can only be installed if the media is reformatted with single-root partitioning. Any attempt to install Junos OS Release 9.6 or earlier on a device with dual-root partitioning without reformatting the media will fail with an error. You must install the Junos OS Release 9.6 or earlier image from the boot loader using a TFTP server or USB storage device.

**NOTE:** Junos OS Release 12.1X45 and later do not support single root partitioning.

**NOTE:** You do not need to reinstall the earlier version of the boot loader if you are installing the Junos OS Release 9.6.

You cannot install a Junos OS Release 9.6 or earlier package on a system with dual-root partitioning using the Junos OS CLI or J-Web. If this is attempted, an error will be returned.

You can install the Junos OS Release 9.6 (9.6R3 and 9.6R4 [only]) on a system with dual-root partitioning using `request system software add` command with `partition` option.

**Related  
Documentation**

## Junos OS Release 10.0 or Later Upgrades with Dual-Root Partitioning on SRX Series Devices

**NOTE:** If you are upgrading to Junos OS Release 10.0 without transitioning to dual-root partitioning, use the conventional CLI and J-Web user interface installation methods.

To format the media with dual-root partitioning while upgrading to Junos OS Release 10.0 or later, use one of the following installation methods:

- Installation from the boot loader using a TFTP server. We recommend this if console access to the system is available and a TFTP server is available in the network. See [“Installing Junos OS Using TFTP on SRX Series Devices” on page 181](#)
- Installation from the boot loader using a USB storage device. We recommend this method if console access to the system is available and the system can be physically accessed to plug in a USB storage device. See [“Installing Junos OS Using a USB Flash Drive on SRX Series Devices” on page 184](#)
- Installation from the CLI using the **partition** option. We recommend this method only if console access is not available. This installation can be performed remotely.

**NOTE:** After upgrading to Junos OS Release 10.0 or later, the U-boot and boot loader must be upgraded for the dual-root partitioning scheme to work properly.

- [Installation and Upgrade Guide for Security Devices](#)

### Example: Installing Junos OS on SRX Series Devices Using the Partition Option

This example shows how to install Junos OS Release 10.0 or later with the **partition** option.

- [Requirements on page 193](#)
- [Overview on page 193](#)
- [Configuration on page 194](#)
- [Verification on page 196](#)

#### Requirements

Before you begin, back up any important data.

#### Overview

This example formats the internal media and installs the new Junos OS image on the media with dual-root partitioning. Reinstall the Release 10.0 or later image from the CLI using the **request system software add** command with the **partition** option. This copies the image to the device, and then reboots the device for installation. The device boots up with the Release 10.0 or later image installed with the dual-root partitioning scheme. When the **partition** option is used, the format and install process is scheduled to run on the next reboot. Therefore, we recommend that this option be used together with the **reboot** option.

**NOTE:** The process might take 15 to 20 minutes. The system is not accessible over the network during this time.

**WARNING:** Using the **partition** option with the **request system software add** command erases the existing contents of the media. Only the current

configuration is preserved. You should back up any important data before starting the process.

**NOTE:** Partition install is supported on the default media on SRX100, SRX210, and SRX240 devices (internal NAND flash) and on SRX650 devices (internal CF card).

Partition install is *not* supported on the alternate media on SRX100, SRX210, and SRX240 devices (USB storage key) or on SRX650 devices (external CF card or USB storage key).

In this example, add the software package `junos-srxsme-10.0R2-domestic.tgz` with the following options:

- **no-copy** option to install the software package but do not save the copies of package files. You should include this option if you do not have enough space on the internal media to perform an upgrade that keeps a copy of the package on the device.
- **no-validate** option to bypass the compatibility check with the current configuration before installation starts.
- **partition** option to format and re-partition the media before installation.
- **reboot** option to reboots the device after installation is completed.

### Configuration

#### CLI Quick Configuration

To quickly install Junos OS Release 10.0 or later with the **partition** option, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host>request system software add junos-srxsme-10.0R2-domestic.tgz no-copy
no-validate partition reboot
```

#### GUI Step-by-Step Procedure

To install Junos OS Release 10.0 or later with the **partition** option:

1. In the J-Web user interface, select **Maintain>Software>Install Package**.
2. On the Install Package page, specify the FTP or HTTP server, file path, and software package name. Type the full address of the software package location on the FTP (<ftp://hostname/pathname/junos-srxsme-10.0R2-domestic.tgz>) or HTTP server (<http://hostname/pathname/junos-srxsme-10.0R2-domestic.tgz>).

**NOTE:** Specify the username and password, if the server requires one.

3. Select the **Reboot If Required** check box to set the device to reboot automatically when the upgrade is complete.
4. Select the **Do not save backup** check box to bypass saving the backup copy of the current Junos OS package.
5. Select the **Format and re-partition the media before installation** check box to format the internal media with dual-root partitioning.
6. Click **Fetch and Install Package**. The software is activated after the device reboots.  
This formats the internal media and installs the new Junos OS image on the media with dual-root partitioning.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To install Junos OS Release 10.0 or later with the **partition** option:

1. Upgrade the device to Junos OS Release 10.0 or later using the CLI.
2. After the device reboots, upgrade the boot loader to the latest version. See [“Upgrading the Boot Loader on SRX Series Devices” on page 198](#).
3. Reinstall the Release 10.0 or later image.

```
user@host>request system software add junos-srxsme-10.0R2-domestic.tgz no-copy
no-validate partition reboot
Copying package junos-srxsme-10.0R2-domestic.tgz to var/tmp/install
Rebooting ...
```

**Results** From configuration mode, confirm your configuration by entering the **show system storage partitions** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

Sample output on a system with single root partitioning:

```
user@host> show system storage partitions
```

```
Boot Media: internal (da0)
```

```
Partitions Information:
```

Partition	Size	Mountpoint
s1a	898M	/
s1e	24M	/config
s1f	61M	/var

Sample output on a system with dual-root partitioning:

```
user@host> show system storage partitions
```

```
Boot Media: internal (da0)
```

```
Active Partition: da0s2a
```

```
Backup Partition: da0s1a
```

```
Currently booted from: active (da0s2a)
```

**Partitions Information:**

Partition	Size	Mountpoint
s1a	293M	altroot
s2a	293M	/
s3e	24M	/config
s3f	342M	/var
s4a	30M	recovery

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

---

Confirm that the configuration is working properly.

- [Verifying the Partitioning Scheme Details on page 196](#)

#### *Verifying the Partitioning Scheme Details*

**Purpose** Verify that the partitioning scheme details on the SRX Series device were configured.

**Action** From operational mode, enter the **show system storage partitions** command.

#### **Related Documentation**

- [Dual-Root Partitioning Scheme Overview on page 145](#)
- [Junos OS Release 10.0 or Later Upgrades with Dual-Root Partitioning on SRX Series Devices on page 192](#)
- [Junos OS Release 9.6 or Earlier Installation on SRX Series Devices with Dual-Root Partitioning on page 191](#)

- [Installation and Upgrade Guide for Security Devices](#)

## Reinstalling the Single-Root Partition Using **request system software add** Command

You cannot install a Junos OS Release 9.6 or earlier package on a system with dual-root partitioning using the Junos OS CLI or J-Web. An error will be returned if this is attempted.

**NOTE:** Junos OS Release 12.1X45 and later do not support single root partitioning.

You can install the Junos OS Release 9.6 (9.6R3 and 9.6R4 [only]) on a system with dual-root partitioning using **request system software add** command with **partition** option.

To reinstall the single-root partition:

1. Enter the **request system software add partition** command to install the previous Junos OS version (9.6R3 and 9.6R4):

```
user@host>request system software add partition
```

2. Reboot the device

```
user@host>request system reboot
```

The previous software version gets installed after rebooting the device.

**NOTE:** Using the `request system software add` CLI command with the `partition` option to install Junos OS Release 9.6 (9.6R3 and 9.6R4) reformats the media with single-root partitioning. This process erases the dual-root partitioning scheme from the system, so the benefits of dual-root partitioning will no longer be available.

#### Related Documentation

## Boot Loaders and Boot Devices

- [Installing Junos OS from the Boot Loader Using a USB Storage Device on an SRX Series Device on page 197](#)
- [Upgrading the Boot Loader on SRX Series Devices on page 198](#)

### Installing Junos OS from the Boot Loader Using a USB Storage Device on an SRX Series Device

To install Junos OS Release 10.0 or later from the boot loader using a USB storage device:

1. Format a USB storage device in MS-DOS format.
2. Copy the Junos OS image onto the USB storage device.
3. Plug the USB storage device into the SRX Series device.
4. Stop the device at the loader prompt and issue the following command:

```
loader> install file:///<image-path-on-usb>
```

An example of a command is as follows:

```
loader> install file:///junos-srxsme-10.0R2-domestic.tgz
```

This formats the internal media and installs the new Junos OS image on the media with dual-root partitioning.

5. Once the system boots up with Junos OS Release 10.0 or later, upgrade the U-boot and boot loader immediately.

## Upgrading the Boot Loader on SRX Series Devices

To upgrade the boot loader to the latest version:

1. Upgrade to Junos OS Release 10.0 or later (with or without dual-root support enabled).

The Junos OS 10.0 image contains the latest boot loader binaries in this path:  
**/boot/uboot, /boot/loader.**

2. Enter the shell prompt using the **start shell** command.
3. Run the following command from the shell prompt:

```
bootupgrade -u /boot/uboot -l /boot/loader
```

**NOTE:** For the new version to take effect, you should reboot the system after upgrading the boot loader.

To verify the boot loader version on the SRX Series device, enter the **show chassis routing-engine bios** command.

```
user@host> show chassis routing-engine bios  
Routing Engine BIOS Version: 1.5
```

The command output displays the boot loader version.

**NOTE:** You can use the following commands to upgrade U-Boot or perform cyclic redundancy check (CRC):

- **bootupgrade -s -u** – To upgrade the secondary boot loader.
- **bootupgrade -c u-boot** – To check CRC of the boot loader.
- **bootupgrade -s -c u-boot** – To check CRC for the secondary boot loader.
- **bootupgrade -c loader** – To check CRC for the loader on boot loader.

## Software Downgrade

---

- [Example: Downgrading Junos OS on SRX Series Devices on page 199](#)
- [Example: Downgrading Junos OS on J Series Devices on page 201](#)

### Example: Downgrading Junos OS on SRX Series Devices

This example shows how to downgrade Junos OS on the SRX Series devices.

- [Requirements on page 199](#)
- [Overview on page 199](#)
- [Configuration on page 199](#)
- [Verification on page 200](#)

---

#### Requirements

No special configuration beyond device initialization is required before configuring this feature.

---

#### Overview

When you upgrade your software, the device creates a backup image of the software that was previously installed in addition to installing the requested software upgrade.

To downgrade the software, you can revert to the previous image using the backup image. You can use this method to downgrade to only the software release that was installed on the device before the current release. To downgrade to an earlier version, follow the procedure for upgrading, using the software image labeled with the appropriate release. This example returns software to the previous Junos OS version.

---

#### Configuration

##### CLI Quick Configuration

To quickly downgrade Junos OS on SRX Series devices, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host>  
request system software rollback  
request system reboot
```

**GUI Step-by-Step Procedure**

To downgrade Junos OS on SRX Series devices:

1. In the J-Web user interface, select **Maintain>Software>Downgrade**. The image of the previous version (if any) appears on this page.

**NOTE:** After you perform this operation, you cannot undo it.

2. Select **Downgrade** to downgrade to the previous version of the software or **Cancel** to cancel the downgrade process.
3. Click **Maintain>Reboot** from the J-Web user interface to reboot the device.

**NOTE:** To downgrade to an earlier version, follow the procedure for upgrading, using the software image labeled with the appropriate release.

4. Click **OK** to check your configuration and save it as a candidate configuration.
5. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To downgrade Junos OS on SRX Series devices:

1. From operational mode, return to the previous Junos OS version.

```
user@host> request system software rollback
```

2. Reboot the device.

```
user@host> request system reboot
```

The device is now running the previous version of Junos OS. To downgrade to an earlier version, follow the procedure for upgrading, using the software image labeled with the appropriate release.

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

---

**Verification**

Confirm that the configuration is working properly.

**Verifying the Junos OS Downgrade Installation**

**Purpose** Verify that the Junos OS downgrade was installed.

**Action** From operational mode, enter the **show system** command.

## Example: Downgrading Junos OS on J Series Devices

This example shows how to downgrade Junos OS on J Series devices.

- [Requirements on page 201](#)
- [Overview on page 201](#)
- [Configuration on page 201](#)
- [Verification on page 202](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

**NOTE:** This procedure applies only to downgrading from one Junos OS software release to another or from one Junos OS services release to another.

When you upgrade your software, the device creates a backup image of the software that was previously installed in addition to installing the requested software upgrade.

To downgrade the software, you can revert to the previous image using the backup image. You can use this method to downgrade to only the software release that was installed on the device before the current release. To downgrade to an earlier version, follow the procedure for upgrading, using the software image labeled with the appropriate release.

### Configuration

**CLI Quick Configuration** To quickly downgrade Junos OS on J Series devices, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host>
request system software rollback
request system reboot
```

**GUI Step-by-Step Procedure**

To downgrade Junos OS on J Series devices:

1. In the J-Web user interface, select **Maintain>Software>Downgrade**. The image of the previous version (if any) appears on this page.

**NOTE:** After you perform this operation, you cannot undo it.

2. Select **Downgrade** to downgrade to the previous version of the software or **Cancel** to cancel the downgrade process.
3. Click **Maintain>Reboot** from the J-Web user interface to reboot the device.

**NOTE:** After you downgrade the software, the previous release is loaded, and you cannot reload the running version of software again. To downgrade to an earlier version, follow the procedure for upgrading, using the software image labeled with the appropriate release.

4. Click **OK** to check your configuration and save it as a candidate configuration.
5. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To downgrade Junos OS on J Series devices:

1. From operational mode, return to the previous Junos OS version.

```
user@host> request system software rollback
```

2. Reboot the device.

```
user@host> request system reboot
```

The device is now running the previous version of Junos OS. To downgrade to an earlier version, follow the procedure for upgrading, using the software image labeled with the appropriate release.

**Results**

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

---

**Verification**

Confirm that the configuration is working properly.

***Verifying the Junos OS Downgrade Installation***

**Purpose** Verify that the Junos OS downgrade was installed.

**Action** From operational mode, enter the **show system** command.

## CHAPTER 6

# Configuration

- [Autoinstallation on page 205](#)
- [Backup and Snapshot Configuration Files on page 208](#)
- [Boot Loaders and Boot Devices on page 210](#)
- [Configuration Statements on page 215](#)

### Autoinstallation

---

- [Example: Configuring Autoinstallation on page 205](#)

#### Example: Configuring Autoinstallation

This example shows how to configure a device for autoinstallation.

- [Requirements on page 205](#)
- [Overview on page 206](#)
- [Configuration on page 206](#)
- [Verification on page 207](#)

#### Requirements

---

Before you begin:

- Configure a DHCP server on your network to meet your network requirements. You can configure a device to operate as a DHCP server. See [“Example: Configuring the Device as a DHCP Server” on page 709](#).
- Create one of the following configuration files, and store it on a TFTP server in the network:
  - A host-specific file with the name **hostname.conf** for each device undergoing autoinstallation. Replace **hostname** with the name of a device. The **hostname.conf** file typically contains all the configuration information necessary for the device with this hostname.
  - A default configuration file named **router.conf** with the minimum configuration necessary to enable you to telnet into the new device for further configuration.
- Physically attach the device to the network using one or more of the following interface types:

- Fast Ethernet
- Gigabit Ethernet
- Serial with HDLC encapsulation

### Overview

No configuration is required on a device on which you are performing autoinstallation, because it is an automated process. However, to simplify the process, you can specify one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

The device uses these protocols to send a request for an IP address for the interface.

- BOOTP—Sends requests over all interfaces.
- RARP—Sends requests over Ethernet interfaces.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system autoinstallation configuration-servers tftp://tftpconfig.sp.com
set system autoinstallation interfaces ge-0/0/0 bootp rarp
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a device for autoinstallation:

1. Enable autoinstallation and specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@host# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
```

**NOTE:** You can also use an FTP address, for example, `ftp://user:password@sftpconfig.sp.com`.

2. Configure one or more Ethernet or serial interfaces to perform autoinstallation, and configure one or two procurement protocols for each interface.

```
[edit system]
user@host# set autoinstallation interfaces ge-0/0/0 bootp rarp
```

#### Results

From configuration mode, confirm your configuration by entering the **show system autoinstallation status** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system autoinstallation status

Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 10.25.100.1
Interface:
  Name: ge-0/0/0
  State: Configuration Acquisition
  Acquired:
    Address: 192.168.124.75
    Hostname: host-ge-000
    Hostname source: DNS
    Configuration filename: router-ge-000.conf
    Configuration filename server: 10.25.100.3
  Address acquisition:
    Protocol: BOOTP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** When there is a user-specified configuration for a particular interface, the factory default for that interface should be deleted. Having two configurations for the same device might lead to errors. For example, if PPP encapsulation is set on a T1 interface through user configuration while the factory default configuration configures CISCO HDLC on the same interface, then the interface might not come up and the following error will be logged in the message file: “DCD\_CONFIG\_WRITE\_FAILED failed.”

## Verification

Confirm that the configuration is working properly.

### Verifying Autoinstallation

<b>Purpose</b>	Verify that the device has been configured for autoinstallation.
<b>Action</b>	From operational mode, enter the <b>show system autoinstallation status</b> command. The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the device when it is deployed on the network.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoinstallation Overview on page 151</a></li> <li>• <i>Automatic Installation of Configuration Files (J Series Routers and SRX Services Gateway)</i></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>

## Backup and Snapshot Configuration Files

- [Configuring a Boot Device to Receive Junos OS Failure Memory Snapshots in J Series Devices on page 208](#)
- [Configuring External CompactFlash on SRX650 Devices on page 209](#)

### Configuring a Boot Device to Receive Junos OS Failure Memory Snapshots in J Series Devices

Use the **set system dump-device** command to specify the medium to use for the device to store system software failure memory snapshots. In this way, when the operating system fails, if you have specified a system dump device in the configuration, the operating system preserves a snapshot of the state of the device when it failed.

After you reboot the system, the dump device is checked for a snapshot as part of the operating system boot process. If a snapshot is found, it is written to the crash dump directory on the device (**/var/crash**). The customer support team can examine this memory snapshot to help determine the cause of the system software failure.

**NOTE:** If the swap partition on the dump device medium is not large enough for a system memory snapshot, either a partial snapshot or no snapshot is written into the crash dump directory.

From operational mode, enter the **set system dump-device** command with the following syntax:

```
user@host> set system dump-device boot-device | compact-flash |
removable-compact-flash | usb
```

[Table 33 on page 208](#) describes the **set system dump-device** command options.

**Table 33: CLI set system dump-device Command Options**

Option	Description
<b>boot-device</b>	Uses whatever device was booted from as the system software failure memory snapshot device.
<b>compact-flash</b>	Uses the internal CompactFlash (CF) card as the system software failure memory snapshot device.
<b>removable-compact-flash</b>	Uses the CF card on the rear of the device (J2320 and J2350 only) as the system software failure memory snapshot device.
<b>usb</b>	Uses the device attached to the USB port as the system software failure memory snapshot device.

## Configuring External CompactFlash on SRX650 Devices

The SRX650 Services Gateway includes the following 2 GB CompactFlash (CF) storage device:

- The Services and Routing Engine (SRE) contains a hot-pluggable external CF storage device used to upload and download files.
- The chassis contains an internal CF used to store the operating system.

By default, only the internal CF is enabled and an option to take a snapshot of the configuration from the internal CF to the external CF is not supported. This can be done only by using a USB storage device.

To take a snapshot of the configuration from the external CF:

1. Take a snapshot from the internal CF to a USB storage device using the **request system snapshot media usb** command.
2. Reboot the device from the USB storage device using the **request system reboot media usb** command.
3. Go to the U-boot prompt.
4. Stop at U-boot and set the following variables:
 

```
set ext.cf.pref 1
save
reset
```
5. Once the system is booted from the USB storage device, take a snapshot from the external CF using the **request system snapshot media external** command.

**NOTE:** Once the snapshot is taken on the external CF, we recommend that you set the `ext.cf.pref` to 0 at the U-boot prompt.

## Boot Loaders and Boot Devices

---

- [Example: Configuring Boot Devices for SRX Series Devices on page 210](#)
- [Example: Configuring Boot Devices for J Series Devices on page 213](#)

### Example: Configuring Boot Devices for SRX Series Devices

This example shows how to configure a boot device.

- [Requirements on page 210](#)
- [Overview on page 210](#)
- [Configuration on page 211](#)
- [Verification on page 212](#)

#### Requirements

---

Before you begin, ensure that the backup device has a storage capacity of at least 1 GB. See [“Preparing Your SRX Series Device for Junos OS Upgrades” on page 166](#).

#### Overview

---

You can configure a boot device to replace the primary boot device on your SRX Series device or to act as a backup boot device. Use either the J-Web user interface or the CLI to take a snapshot of the configuration currently running on the device, or of the original factory configuration and a rescue configuration, and save it to an alternate medium.

**NOTE:** For media redundancy, we recommend that you keep a secondary storage medium attached to the SRX Series device and updated at all times.

If the primary storage medium becomes corrupted and no backup medium is in place, you can recover the primary internal media from the TFTP installation.

You can also configure a boot device to store snapshots of software failures for use in troubleshooting.

**NOTE:** You cannot copy software to the active boot device.

**NOTE:** After a boot device is created with the default factory configuration, it can operate only in an internal media slot.

This example configures a boot device to back up the currently running and active file system partitions by rebooting from internal media and including only files shipped from the factory.

## Configuration

**CLI Quick Configuration** To quickly configure a boot device, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host> request system snapshot partition media internal factory
```

**GUI Step-by-Step Procedure** To configure a boot device:

1. In the J-Web user interface, select **Maintain>Snapshot**.
2. On the Snapshot page, specify the boot device to copy the snapshot to. From the Target Media list, select the **internal** boot device.
3. Select the Factory check box to copy only default files that were loaded on the internal media when it was shipped from the factory, plus the rescue configuration if one has been set.
4. Select the Partition check box to partition the medium that you are copying the snapshot to. This process is usually necessary for boot devices that do not already have software installed on them.
5. Click **Snapshot**.
6. Click **OK** to check your configuration and save it as a candidate configuration.
7. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a boot device:

From operational mode, create a boot device from the internal media including only files shipped from the factory that will be used to back up the currently running and active file system partitions.

```
user@host> request system snapshot partition media internal factory
```

**Results** From configuration mode, confirm your configuration by entering the **show system snapshot media internal** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host> show system snapshot media internal
```

```
Information for snapshot on      internal (/dev/ad0s1a) (backup)
Creation date: Oct 9 13:30:06 2009
JUNOS version on snapshot:
  junos : 10.0B3.10-domestic
Information for snapshot on      internal (/dev/ad0s2a) (primary)
Creation date: Jan 6 15:45:35 2010
JUNOS version on snapshot:
  junos : 10.2-20091229.2-domestic
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

---

Confirm that the configuration is working properly.

#### *Verifying the Snapshot Information*

**Purpose** Verify that the snapshot information for both root partitions on SRX Series devices were configured.

**Action** From operational mode, enter the **show system snapshot media** command.

The command output displays the snapshot creation time and Junos OS Release version on a media for both the primary and backup roots.

**NOTE:** With the dual-root partitioning scheme, performing a snapshot to a USB storage device that is less than 1 GB is not supported.

**NOTE:** You can use the **show system snapshot media internal** command to determine the partitioning scheme present on the internal media. Information for only one root is displayed for single-root partitioning, whereas information for both roots is displayed for dual-root partitioning.

**NOTE:** Any removable media that has been formatted with dual-root partitioning will not be recognized correctly by the **show system snapshot CLI** command on systems that have single-root partitioning. Intermixing dual-root and single-root formatted media on the same system is strongly discouraged.

#### **Related Documentation**

- [Upgrading the Boot Loader on SRX Series Devices on page 198](#)
- [Junos OS Upgrade Methods on the SRX Series Devices on page 138](#)

## Example: Configuring Boot Devices for J Series Devices

This example shows how to configure a boot device.

- [Requirements on page 213](#)
- [Overview on page 213](#)
- [Configuration on page 213](#)
- [Verification on page 214](#)

### Requirements

Before you begin, ensure that the backup device has a storage capacity of at least 256 MB. See “[Preparing Your J Series Services Router for Junos OS Upgrades](#)” on [page 167](#).

### Overview

You can configure a boot device to replace the primary boot device on your J Series device or to act as a backup boot device. Use either the J-Web user interface or the CLI to take a snapshot of the configuration currently running on the device, or of the original factory configuration and a rescue configuration, and save it to an alternate medium.

**NOTE:** For media redundancy, we recommend that you keep a secondary storage medium attached to the J Series device and updated at all times.

If the primary storage medium becomes corrupted and no backup medium is in place, you can recover the primary CF card from a special software image. You can also configure a boot device to store snapshots of software failures, for use in troubleshooting.

**NOTE:**

- You cannot copy software to the active boot device.
- After a boot device is created with the default factory configuration, it can operate only in an internal CF slot.
- After the boot device is created as an internal CF, it can operate only in an internal CF slot.

This example configures a boot device to copy the software snapshot to the device connected to the USB port.

### Configuration

#### CLI Quick Configuration

To quickly configure a boot device, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host>
request system snapshot media usb
```

**GUI Step-by-Step Procedure**

To configure a boot device:

1. In the J-Web user interface, select **Maintain>Snapshot**.
2. On the Snapshot page, in the Target Media field, specify **usb** as the boot device to copy the snapshot to.
3. Click **Snapshot**.
4. Click **OK** to check your configuration and save it as a candidate configuration.
5. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a boot device:

From operational mode, create a boot device on an alternate medium to replace the primary boot device or to serve as a backup.

```
user@host> request system snapshot media usb
```

**Results**

From configuration mode, confirm your configuration by entering the **show system snapshot media usb** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For USB:

```
user@host> show system snapshot media usb
```

```
Information for snapshot on      usb (/dev/dals1a) (primary)
  Creation date: Jul 24 16:16:01 2009
  JUNOS version on snapshot:
  junos   : 10.0I20090723_1017-domestic
Information for snapshot on      usb (/dev/dals2a) (backup)
  Creation date: Jul 24 16:17:13 2009
  JUNOS version on snapshot:
  junos   : 10.0I20090724_0719-domestic
```

If you are done configuring the device, enter **commit** from configuration mode.

---

**Verification**

Confirm that the configuration is working properly.

**Verifying the Snapshot Information****Purpose**

Verify that the snapshot information was configured.

**Action**

From operational mode, enter the **show system snapshot media** command.

## configuration-servers

<b>Syntax</b>	<pre>configuration-servers {     url {         password <i>password</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit system autoinstallation]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Configure the URL address of a server from which the configuration files must be obtained.</p> <p>You can download a configuration file automatically from an FTP, Hypertext Transfer Protocol (HTTP), or Trivial FTP (TFTP) servers. Examples of URLs:</p> <ul style="list-style-type: none"> <li>• tftp://hostname/path/filename</li> <li>• ftp://username:password@ftp.hostname.net</li> <li>• http://hostname/path/filename</li> <li>• http://username:password@httpconfig.sp.com</li> </ul>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>url</b>—Specify the URL address of the server containing the configuration files.</li> <li>• <b>password</b>—Specify the password for authentication with the configuration server. Specifying a password in URLs and in the <i>password</i> option might result in commit failure. We recommend you to use the <i>password</i> option for specifying the password.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>

## interfaces (Autoinstallation)

---

<b>Syntax</b>	<pre>interfaces {     <i>interface-name</i> {         bootp;         rarp;     } }</pre>
<b>Hierarchy Level</b>	[edit system autoinstallation]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the interface on which to perform autoinstallation. A request for an IP address is sent from the interface. Specify the IP address procurement protocol.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>bootp</b>—Enables BOOTP or DHCP during autoinstallation.</li><li>• <b>rarp</b>—Enables RARP during autoinstallation.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Autoinstallation on page 205</a></li><li>• <i>Installation and Upgrade Guide for Security Devices</i></li></ul>

## license

<b>Syntax</b>	<pre> license {   autoupdate {     url <i>url</i>;     password <i>password</i>;   }   renew {     before-expiration <i>number</i>;     interval <i>interval-hours</i>;   }   traceoptions {     file {       <i>filename</i> ;       files <i>number</i>;       match <i>regular-expression</i>;       size <i>maximum-file-size</i>;       (world-readable   no-world-readable);     }     flag <i>flag</i>;     no-remote-trace;   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify license information for the device.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>autoupdate</b>—Autoupdate license keys from license servers. <ul style="list-style-type: none"> <li>• <b>url</b>—URL of a license server.</li> </ul> </li> <li>• <b>renew</b>—License renewal lead time and checking interval. <ul style="list-style-type: none"> <li>• <b>before-expiration <i>number</i></b>—License renewal lead time before expiration in days. <b>Range</b> : 0 through 60 days</li> <li>• <b>interval <i>interval-hours</i></b>—License checking interval in hours. <b>Range</b> : 1 through 336 hours</li> </ul> </li> <li>• <b>traceoptions</b>—Set the trace options. <ul style="list-style-type: none"> <li>• <b>file</b>—Configure the trace file information. <ul style="list-style-type: none"> <li>• <b><i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, the name of the file is the name of the process being traced.</li> <li>• <b>files <i>number</i></b>— Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> </li> </ul> </li> </ul>

If you specify a maximum number of files, you also must specify a maximum file size with the **size *maximum file-size*** option.

**Range :** 2 through 1000 files

**Default :** 10 files

- **match *regular-expression***—Refine the output to include lines that contain the regular expression.
- **size *maximum-file-size***—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

**Range :** 10 KB through 1 GB

**Default :** 128 KB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files *number*** option.

- **(world-readable | no-world-readable)**— By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag *flag***—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags.
  - **all**—Trace all operations
  - **config**—Trace license configuration processing.
  - **events**—Trace licensing events and their processing.
  - **no-remote-trace**—Disable the remote tracing.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

# Administration

- [Auto BIOS on page 253](#)
- [Licenses on page 253](#)
- [Software Stop and Restart on page 261](#)
- [Operational Commands on page 271](#)

## Auto BIOS

---

- [Disabling Auto BIOS Upgrade on SRX Series Devices on page 253](#)

### Disabling Auto BIOS Upgrade on SRX Series Devices

The auto BIOS upgrade feature is enabled by default. You can disable the feature using the CLI in operational mode.

To disable the automatic upgrade of the BIOS on an SRX Series device, set the **chassis routing-engine bios** command.

```
user@host> set chassis routing-engine bios no-auto-upgrade
```

**NOTE:** The command disables automatic upgrade of the BIOS only during Junos OS upgrade or system boot-up. It does not disable automatic BIOS upgrade during loader installation.

- [Example: Deleting a License Key on page 260](#)

## Displaying License Keys

To display license keys installed on the device:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Display Keys** to display all the license keys installed on the device.

A screen displaying the license keys in text format appears. Multiple licenses are separated by a blank line.

## Generating a License Key

To generate a license key:

1. Gather the authorization code that you received when you purchased your license as well as your device serial number.
2. Go to the Juniper Networks licensing page at:  
<https://www.juniper.net/lcrs/generateLicense.do>
3. Enter the device serial number and authorization code in the webpage and click **Generate**. Depending on the type of license you purchased, you will receive one of the following responses:
  - License key—If you purchased a perpetual license, you will receive a license key from the licensing management system. You can enter this key directly into the system to activate the feature on your device.
  - License key entitlement—If you purchased a subscription-based license, you will receive a license key entitlement from the licensing management system. You can

use this entitlement to validate your license on the Juniper Networks licensing server and download the feature license from the server to your device.

  - [Example: Deleting a License Key on page 260](#)
  - *Installation and Upgrade Guide for Security Devices*

## Downloading License Keys

To download license keys installed on the device:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Download Keys** to download all the license keys installed on the device to a single file.
3. Select **Save it to disk** and specify the file to which the license keys are to be written.

- Related Documentation**

  - [Example: Adding a New License Key on page 257](#)
  - [Example: Deleting a License Key on page 260](#)
  - *Installation and Upgrade Guide for Security Devices*

## Saving License Keys

To save license keys installed on the device:

1. From operational mode, save the installed license keys to a file or URL.

```
user@host>request system license save filename | url
```

For example, the following command saves the installed license keys to a file named `license.config`:

```
request system license save ftp://user@host/license.conf
```

- [Installation and Upgrade Guide for Security Devices](#)

## Updating License Keys

To update a license key from the device:

1. From operational mode, do one of the following tasks:

- Update the license keys automatically.

```
user@host> request system license update
```

**NOTE:** The `request system license update` command will always use the default Juniper license server <https://ae1.juniper.net>

You can only use this command to update subscription-based licenses (such as UTM).

- Update the trial license keys automatically.

```
user@host> request system license update trial
```

## Example: Adding a New License Key

This example shows how to add a new license key.

- [Requirements on page 257](#)
- [Overview on page 257](#)
- [Configuration on page 257](#)
- [Verification on page 259](#)

### Requirements

Before you begin, confirm that your Junos OS feature requires you to purchase, install, and manage a separate software license.

### Overview

You can add a license key from a file or URL, from a terminal, or from the J-Web user interface. Use the **filename** option to activate a perpetual license directly on the device. (Most feature licenses are perpetual.) Use the **url** to send a subscription-based license key entitlement (such as UTM) to the Juniper Networks licensing server for authorization. If authorized, the server downloads the license to the device and activates it.

In this example, the file name is `bgp-reflection`.

### Configuration

#### CLI Quick Configuration

To quickly add a new license key, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, you can add a license key in either way:

- From a file or URL:  

```
user@hostname> request system license add bgp-reflection
```
- From the terminal:  

```
user@hostname> request system license add terminal
```

#### GUI Step-by-Step Procedure

To add a new license key:

1. In the J-Web user interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Add** to add a new license key.
3. Do one of the following, using a blank line to separate multiple license keys:
  - In the **License File URL** box, type the full URL to the destination file containing the license key to be added.
  - In the **License Key Text** box, paste the license key text, in plain-text format, for the license to be added.

4. Click **OK** to add the license key.

**NOTE:** If you added the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a high-memory device.

5. Click **OK** to check your configuration and save it as a candidate configuration.
6. If you are done configuring the device, click **Commit Options>Commit**.

### Step-by-Step Procedure

To add a new license key:

1. From operational mode, add a license key in either way:
  - From a file or URL:
 

```
user@host> request system license add bgp-reflection
```
  - From the terminal:
 

```
user@host>request system license add terminal
```
2. When prompted, enter the license key, separating multiple license keys with a blank line. If the license key you enter is invalid, an error is generated when you press Ctrl-D to exit license entry mode.

**NOTE:** If you added the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a high-memory device.

**Results** From operational mode, confirm your configuration by entering the **show system license** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@hostname> show system license
```

License usage:

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
bgp-reflection	0	1	0	permanent

Licenses installed:

```
License identifier: G03000002223
```

```
License version: 2
```

```
Valid for device: JN001875AB
```

Features:

```
  bgp-reflection  - Border Gateway Protocol route reflection
permanent
```

```
License identifier: G03000002225
```

```
License version: 2
```

```
Valid for device: JN001875AB
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying Installed Licenses on page 259](#)
- [Verifying License Usage on page 259](#)
- [Verifying Installed License Keys on page 259](#)

#### *Verifying Installed Licenses*

**Purpose** Verify that the expected licenses have been installed and are active on the device.

**Action** From operational mode, enter the **show system license** command.

The output shows a list of the licenses used and a list of the licenses installed on the device and when they expire.

#### *Verifying License Usage*

**Purpose** Verify that the licenses fully cover the feature configuration on the device.

**Action** From operational mode, enter the **show system license usage** command.

```
user@hostname> show system license usage
```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
bgp-reflection	1	1	0	permanent

The output shows a list of the licenses installed on the device and how they are used.

#### *Verifying Installed License Keys*

**Purpose** Verify that the license keys were installed on the device.

**Action** From operational mode, enter the **show system license keys** command.

```
user@hostname> show system license keys
```

```
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx
```

The output shows a list of the license keys installed on the device. Verify that each expected license key is present.

## Example: Deleting a License Key

This example shows how to delete a license key.

- [Requirements on page 260](#)
- [Overview on page 260](#)
- [Configuration on page 260](#)
- [Verification on page 261](#)

---

### Requirements

Before you delete a license key, confirm that it is no longer needed.

---

### Overview

You can delete a license key from the CLI or J-Web user interface. In this example, the license ID is G03000002223.

---

### Configuration

#### CLI Quick Configuration

To quickly delete a license key, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

```
user@host> request system license delete G03000002223
```

#### GUI Step-by-Step Procedure

To delete a license key:

1. In the J-Web user interface, select **Maintain>Licenses**.
2. Select the check box of the license or licenses you want to delete.
3. Click **Delete**.

**NOTE:** If you deleted the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a low-memory device.

---

4. Click **OK** to check your configuration and save it as a candidate configuration.
5. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

To delete a license key:

1. From operational mode, for each license, enter the following command and specify the license ID. You can delete only one license at a time.

```
user@host> request system license delete G03000002223
```

**NOTE:** If you deleted the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a low-memory device.

**Results**

From configuration mode, confirm your deletion by entering the **show system license** command. The license key you deleted will be removed. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

**Verifying Installed Licenses****Purpose**

Verify that the expected licenses have been removed from the device.

**Action**

From operational mode, enter the **show system license** command.

## Example: Rebooting SRX Series Devices

This example shows how to reboot a device.

- [Requirements on page 262](#)
- [Overview on page 262](#)
- [Configuration on page 262](#)
- [Verification on page 263](#)

---

### Requirements

Before rebooting the device, save and commit any Junos OS updates.

---

### Overview

This example shows how to reboot a device fifty minutes from when you set the time from the internal media while sending a text message of 'stop' to all system users before the device reboots.

---

### Configuration

#### CLI Quick Configuration

To quickly reboot a device, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host> request system reboot at 5 in 50 media internal message stop
```

#### GUI Step-by-Step Procedure

To reboot a device:

1. In the J-Web user interface, select **Maintain>Reboot**.
2. Select **Reboot in 50 minutes** to reboot the device fifty minutes from the current time.
3. Select the **internal** boot device from the Reboot From Media list.
4. In the Message box, type **stop** as the message to display to any user on the device before the reboot occurs.
5. Click **Schedule**. The J-Web user interface requests confirmation to perform the reboot.
6. Click **OK** to confirm the operation.
  - If the reboot is scheduled to occur immediately, the device reboots. You cannot access J-Web until the device has restarted and the boot sequence is complete. After the reboot is complete, refresh the browser window to display the J-Web login page.

- If the reboot is scheduled to occur in the future, the Reboot page displays the time until reboot. You have the option to cancel the request by clicking **Cancel Reboot** on the J-Web user interface Reboot page.
7. Click **OK** to check your configuration and save it as a candidate configuration.
  8. If you are done configuring the device, click **Commit Options>Commit**.

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To reboot a device:

From operational mode, schedule a reboot of the SRX Series device to occur fifty minutes from when you set the time from the internal media while sending a text message of 'stop' to all system users before the device reboots.

```
user@host> request system reboot at 5 in 50 media internal message stop
```

#### Results

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

#### Verification

Confirm that the configuration is working properly.

##### Verifying the Device Reboot

#### Purpose

Verify that the device rebooted.

#### Action

From operational mode, enter the **show system** command.

### Example: Rebooting J Series Devices

This example shows how to reboot a J Series device.

- [Requirements on page 264](#)
- [Overview on page 264](#)

- [Configuration on page 264](#)
- [Verification on page 265](#)

---

## Requirements

Before rebooting the device, save and commit any Junos OS updates.

---

## Overview

This example shows how to reboot a device fifty minutes from when you set the time from the USB media while sending a text message of 'stop' to all system users before the device reboots.

---

## Configuration

### CLI Quick Configuration

To quickly reboot a J Series device, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host> request system reboot at 5 in 50 media usb message stop
```

### GUI Step-by-Step Procedure

To reboot a J Series device:

1. In the J-Web user interface, select **Maintain>Reboot**.
2. Select **Reboot in 50 minutes** to reboot the device fifty minutes from the current time.
3. Select the **usb** boot device from the Reboot From Media list.
4. In the Message box, type **stop** as the message to display to any user on the device before the reboot occurs.
5. Click **Schedule**. The J-Web user interface requests confirmation to perform the reboot.
6. Click **OK** to confirm the operation.
  - If the reboot is scheduled to occur immediately, the device reboots. You cannot access J-Web until the device has restarted and the boot sequence is complete. After the reboot is complete, refresh the browser window to display the J-Web login page.
  - If the reboot is scheduled to occur in the future, the Reboot page displays the time until reboot. You have the option to cancel the request by clicking **Cancel Reboot** on the J-Web user interface Reboot page.
7. Click **OK** to check your configuration and save it as a candidate configuration.
8. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To reboot a J Series device:

From operational mode, schedule a reboot of the J Series device to occur fifty minutes from when you set the time from the USB media while sending a text message of 'stop' to all system users before the device reboots.

```
user@host> request system reboot at 5 in 50 media usb message stop
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Device Reboot

**Purpose** Verify that the device rebooted.

**Action** From operational mode, enter the **show system** command.

## Restarting the Chassis on SRX Series Devices

You can restart the chassis using the **restart chassis-control** command with the following options:

- To restart the process gracefully:

```
user@host> restart chassis-control gracefully
```

- To restart the process immediately:

```
user@host> restart chassis-control immediately
```

- To restart the process softly:

```
user@host> restart chassis-control soft
```

## Example: Halting SRX Series Devices

This example shows how to halt a device.

- [Requirements on page 266](#)
- [Overview on page 267](#)
- [Configuration on page 267](#)
- [Verification on page 268](#)

### Requirements

---

Before halting the device, save and commit any Junos OS updates.

## Overview

When the device is halted, all software processes stop and you can access the device through the console port only. Reboot the device by pressing any key on the keyboard.

**NOTE:** If you cannot connect to the device through the console port, shut down the device by pressing and holding the power button on the front panel until the **POWER LED** turns off. After the device has shut down, you can power on the device by pressing the power button again. The **POWER LED** turns on during startup and remains steadily green when the device is operating normally.

This example shows how to halt the system and stop software processes on the device immediately.

## Configuration

### CLI Quick Configuration

To quickly halt a device immediately, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, enter:

```
user@host>request system halt at now
```

### GUI Step-by-Step Procedure

To halt a device immediately:

1. In the J-Web user interface, select **Maintain>Reboot**.
2. Select **Halt Immediately**. After the software stops, you can access the device through the console port only.
3. Click **Schedule**. The J-Web user interface requests confirmation to halt.
4. Click **OK** to confirm the operation. If the device halts, all software processes stop and you can access the device through the console port only. Reboot the device by pressing any key on the keyboard.
5. Click **OK** to check your configuration and save it as a candidate configuration.
6. If you are done configuring the device, click **Commit Options>Commit**.

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To halt a device:

From operational mode, halt the SRX Series device immediately.

```
user@host>request system halt at now
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

#### *Verifying the Device Halt*

**Purpose** Verify that the device halted.

**Action** From operational mode, enter the **show system** command.

- Related Documentation**

**Bringing Chassis Components Online and Offline on SRX Series Devices**

You can use the **request** commands to bring chassis components online and offline.

To bring chassis components online and offline, enter these **request chassis** commands:

```
user@host> request chassis <fru> slot <slot#> pic <pic#> online
```

```
user@host> request chassis <fru> slot <slot#> pic <pic#> offline
```

Where **<fru>** in the request chassis command can be any of the following (for Branch SRX Series devices):

- **fpc**—Changes the Flexible PIC Concentrator (FPC) status.

Where **<fru>** in the request chassis command can be any of the following (for High-End SRX Series devices):

- **cb**—Changes the control board status.
- **fabric**—Changes the fabric status.
- **fpc**—Changes the Flexible PIC Concentrator (FPC) status.
- **fpm**—Changes the craft interface status.
- **pic**—Changes the physical interface card status.
- **routing-engine**—Changes the routing engine status.

**NOTE:** The **request chassis** command is not supported for bringing SPCs online and offline.

**NOTE:** On SRX3000 Series devices, the Network Processing I/O card (NP-IOC) is not hot-swappable and the **request chassis** command is not supported for bringing NP-IOC online and offline. You must power off the services gateway before removing or installing the cards.

Example:

To bring specific pic and the corresponding fpc slot online, from operational mode enter the following **request chassis** command:

```
user@host> request chassis pic pic-slot 1 fpc-slot 1 online
```

## Bringing Chassis Components Online and Offline on J Series Devices

You can use the **request** commands to bring all chassis components (except Power Entry Modules and fans) online and offline.

To bring chassis components online and offline, enter these **request chassis** commands:

```
user@host> request chassis <fru> slot <slot#> pic <pic#> offline
user@host> request chassis <fru> slot <slot#> pic <pic#> online
```

Where **<fru>** in the **request chassis** command can be any of the following:

- **cb**—Changes the control board status.
- **cluster**—Changes the chassis cluster status.
- **fabric**—Changes the fabric status.
- **fpc**—Changes the Flexible PIC Concentrator (FPC) status.
- **fpm**—Changes the craft interface status.
- **pic**—Changes the physical interface card status.
- **routing-engine**—Changes the routing engine status.

To bring specific pic and the corresponding fpc slot online, from operational mode enter the following **request chassis** command:

```
user@host> request chassis pic pic-slot 1 fpc-slot 1 online
```

## request system autorecovery state

<b>Syntax</b>	request system autorecovery state (save   recover   clear)
<b>Release Information</b>	Command introduced in Junos Release 11.2.
<b>Description</b>	Prepares the system for autorecovery of configuration, licenses, and disk information.
<b>Options</b>	<p><b>save</b>—Save the current state of the disk partitioning, configuration, and licenses for autorecovery.</p> <p>The active Junos OS configuration is saved as the Junos rescue configuration, after which the rescue configuration, licenses, and disk partitioning information is saved for autorecovery. Autorecovery information must be initially saved using this command for the autorecovery feature to verify integrity of data on every bootup.</p>
	<div>  <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>Any recovery performed at a later stage will restore the data to the same state as it was when the save command was executed.</li> <li>A fresh rescue configuration is generated when the command is executed. Any existing rescue configuration will be overwritten.</li> </ul> </div>
	<p><b>recover</b>—Recover the disk partitioning, configuration, and licenses.</p> <p>After autorecovery data has been saved, the integrity of saved items is always checked automatically on every bootup. The recovery command allows you to forcibly re-run the tests at any time if required.</p>
	<p><b>clear</b>—Clear all saved autorecovery information.</p> <p>Only the autorecovery information is deleted; the original copies of the data used by the router are not affected. Clearing the autorecovery information also disables all autorecovery integrity checks performed during bootup.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show system autorecovery state on page 292</a></li> <li><i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system autorecovery state save on page 274</a> <a href="#">request system autorecovery state recover on page 274</a> <a href="#">request system autorecovery state clear on page 274</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system autorecovery state save

```
user@host> request system autorecovery state save
Saving config recovery information
Saving license recovery information
Saving bsdlablel recovery information
```

## Sample Output

### request system autorecovery state recover

```
user@host> request system autorecovery state recover

Configuration:

```
user@host> request system autorecovery state clear
Clearing config recovery information
Clearing license recovery information
Clearing bsdlablel recovery information
```

## request system download abort

<b>Syntax</b>	<code>request system download abort &lt;download-id&gt;</code>
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Abort a download. The download instance is stopped and cannot be resumed. Any partially downloaded file is automatically deleted to free disk space. Information regarding the download is retained and can be displayed with the <b>show</b> command until a Clear operation is performed.
<div>  <b>NOTE:</b> Only downloads in the active, paused, and error states can be aborted. </div>	
<b>Options</b>	<b>download-id</b> —(Required) The ID number of the download to be paused.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download start on page 279</a></li> <li>• <a href="#">request system download pause on page 277</a></li> <li>• <a href="#">request system download resume on page 278</a></li> <li>• <a href="#">request system download clear on page 276</a></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download abort on page 275</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download abort

```
user@host> request system download abort 1
Aborted download #1
```

## request system download clear

---

<b>Syntax</b>	request system download clear
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Delete the history of completed and aborted downloads.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request system download start on page 279</a></li><li>• <a href="#">request system download pause on page 277</a></li><li>• <a href="#">request system download resume on page 278</a></li><li>• <a href="#">request system download abort on page 275</a></li><li>• <i>Installation and Upgrade Guide for Security Devices</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request system download clear on page 276</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system download clear

```
user@host> request system download clear
Cleared information on completed and aborted downloads
```

## request system download pause

<b>Syntax</b>	request system download pause <download-id>
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Suspend a particular download instance.
<div>  <b>NOTE:</b> Only downloads in the active state can be paused.         </div>	
<b>Options</b>	download-id—(Required) The ID number of the download to be paused.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download start on page 279</a></li> <li>• <a href="#">request system download resume on page 278</a></li> <li>• <a href="#">request system download abort on page 275</a></li> <li>• <a href="#">request system download clear on page 276</a></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download pause on page 277</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download pause

```
user@host> request system download pause 1
Paused download #1
```

## request system download resume

<b>Syntax</b>	<code>request system download resume <i>download-id</i> &lt;max-rate&gt;</code>
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Resume a download that has been paused. Download instances that are not in progress because of an error or that have been explicitly paused by the user can be resumed by the user. The file will continue downloading from the point where it paused. By default, the download resumes with the same bandwidth specified with the <b>request system download start</b> command. The user can optionally specify a new (maximum) bandwidth with the <b>request system download resume</b> command.
<div>  <b>NOTE:</b> Only downloads in the paused and error states can be resumed. </div>	
<b>Options</b>	<p><b>download-id</b>—(Required) The ID number of the download to be paused.</p> <p><b>max-rate</b>—(Optional) The maximum bandwidth for the download.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download start on page 279</a></li> <li>• <a href="#">request system download pause on page 277</a></li> <li>• <a href="#">request system download abort on page 275</a></li> <li>• <a href="#">request system download clear on page 276</a></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download resume on page 278</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system download resume

```
user@host> request system download resume 1
Resumed download #1
```

## request system download start

<b>Syntax</b>	<code>request system download start (url   max-rate   save as   login   delay)</code>
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Creates a new download instance and identifies it with a unique integer called the download ID.
<b>Options</b>	<p><b>url</b>—(Required) The FTP or HTTP URL location of the file to be downloaded.</p> <p><b>max-rate</b>—(Optional) The maximum average bandwidth for the download. Numbers with the suffix k or K, m or M, and g or G are interpreted as kbps, mbps, or gbps, respectively.</p> <p><b>save-as</b>—(Optional) The filename to be used for saving the file in the <code>/var/tmp</code> location.</p> <p><b>login</b>—(Optional) The username and password for the server in the format <code>username:password</code>.</p> <p><b>delay</b>—(Optional) The number of hours after which the download should start.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download pause on page 277</a></li> <li>• <a href="#">request system download resume on page 278</a></li> <li>• <a href="#">request system download abort on page 275</a></li> <li>• <a href="#">request system download clear on page 276</a></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download start on page 279</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download start

```
user@host> request system download start login user:passwd ftp://ftp-server/tftpboot/1m_file
max-rate 1k
Starting download #1
```

## request system firmware upgrade

<b>Syntax</b>	request system firmware upgrade
<b>Release Information</b>	Command introduced in Release 10.2 of Junos OS.
<b>Description</b>	Upgrade firmware on a system.
<b>Options</b>	<p><b>fpc</b>—Upgrade FPC ROM monitor.</p> <p><b>pic</b>—Upgrade PIC firmware.</p> <p><b>re</b>—Upgrade baseboard BIOS/FPGA. There is an active BIOS image and a backup BIOS image.</p> <p><b>vcpu</b>—Upgrade VCPU ROM monitor.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Installation and Upgrade Guide for Security Devices</i></li> <li><i>Administration Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system firmware upgrade on page 280</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system firmware upgrade

```

user@host> request system firmware upgrade re bios
Part          Type          Tag Current  Available Status
              version         version
Routing Engine 0 RE BIOS      0   1.5      1.9      OK
Routing Engine 0 RE BIOS Backup 1 1.7      1.9      OK
Perform indicated firmware upgrade ? [yes,no] (no) yes

user@host> request system firmware upgrade re bios backup
Part          Type          Tag Current  Available Status
              version         version
Routing Engine 0 RE BIOS      0   1.5      1.9      OK
Routing Engine 0 RE BIOS Backup 1 1.7      1.9      OK
Perform indicated firmware upgrade ? [yes,no] (no) yes

```

## request system license update

---

<b>Syntax</b>	request system license update
<b>Release Information</b>	Command introduced in Junos OS Release 9.5.
<b>Description</b>	Start autoupdating license keys from the LMS server.
<b>Options</b>	<b>trial</b> —Starts autoupdating trial license keys from the LMS server.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Administration Guide for Security Devices</i></li> <li>• <i>UTM Overview Feature Guide for Security Devices</i></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system license update on page 281</a> <a href="#">request system license update trial on page 281</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system license update

```
user@host> request system license update
```

```

## request system partition compact-flash

---

<b>Syntax</b>	request system partition compact-flash
<b>Release Information</b>	Command introduced in Release 9.2 of Junos OS.
<b>Description</b>	Reboots the device and repartitions the compact flash. The compact flash is repartitioned only if it is possible to restore all the data on the compact flash. Otherwise, the operation is aborted, and a message is displayed indicating that the current disk usage needs to be reduced.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Installing Junos OS on SRX Series Devices Using the Partition Option on page 193</a></li><li>• <i>Installation and Upgrade Guide for Security Devices</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request system partition compact-flash (If Yes) on page 282</a> <a href="#">request system partition compact-flash (If No) on page 282</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system partition compact-flash (If Yes)

```
user@host> request system partition compact-flash
Are you sure you want to reboot
and partition the compact-flash ? [yes,no] yes
Initiating repartition operation.
The operation may take several minutes to complete.
System will reboot now...
<System reboots>
<Repartition operation is performed>
<System reboots and starts up normally>
```

### Sample Output

#### request system partition compact-flash (If No)

```
user@host> request system partition compact-flash
Are you sure you want to reboot
and partition the compact-flash ? [yes,no] no
```

## request system power-off fpc

<b>Syntax</b>	<code>request system (halt   power-off   reboot) power-off fpc</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4.
<b>Description</b>	Bring Flexible PIC Concentrators (FPCs) offline before Routing Engines are shut down.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>halt</b>—Bring FPC offline and then halt the system.</li> <li>• <b>power-off</b>—Bring FPC offline and then power off the system.</li> <li>• <b>reboot</b>—Bring FPC offline and then reboot the system.</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system halt power-off fpc on page 283</a> <a href="#">request system power-off power-off fpc on page 283</a> <a href="#">request system reboot power-off fpc on page 283</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system halt power-off fpc

```
user@host> request system halt power-off fpc
Halt the system ? [yes,no] (no) yes

Offline fpc slot 0
```

### request system power-off power-off fpc

```
user@host> request system power-off power-off fpc
Power off the system ? [yes,no] (no) yes

Offline fpc slot 0
```

### request system reboot power-off fpc

```
user@host> request system reboot power-off fpc
Reboot the system ? [yes,no] (no) yes

Offline fpc slot 0
```

## request system snapshot (Maintenance)

---

**Syntax**    request system snapshot  
              <factory>  
              <media (compact-flash | hard-disk | internal | usb)>  
              <node (all | local | node-id | primary)>  
              <partition>  
              <slice (alternate) >

**Release Information**    Command introduced in Release 10.2 of Junos OS.

**Description**    Back up the currently running and active file system partitions on the device.

- Options**
- factory— (Optional) Specifies that only the files shipped from the factory are included in the snapshot.
  - media— (Optional) Specifies the media to be included in the snapshot:
    - compact-flash— Copies the snapshot to an external compact flash.
    - hard-disk— Copies the snapshot to a hard disk.
    - usb— Copies the snapshot to the USB storage device.
    - internal— Copies the snapshot to internal media. This is the default.

**NOTE:** USB option is available on all SRX series devices; hard disk and compact-flash options are available only on high-end SRX series devices; media internal option is available only on branch SRX series devices.

---

- node— (Optional) Specifies to archive the data and executable areas of a specific node.
  - node-id—Archive a specific node. The range of node ID is (0,1)
  - all—Archive all nodes.
  - local—Archive only local nodes.
  - primary—Archive only primary nodes.
- partition - (Default) Specifies that the target media should be repartitioned before the backup is saved to it.

**NOTE:**

- The target media is partitioned whether or not it is specified in the command, because this is a mandatory option.
- You cannot partition a hard-disk as it is mounted on /var directory.

- slice— (Optional) Takes a snapshot of the root partition the system has currently booted from to another slice in the same media.
- alternate— (Optional) Stores the snapshot on the other root partition in the system.

**NOTE:**

- The slice option cannot be used along with the other request system snapshot options, because the options are mutually exclusive. If you use the factory, media, or partition option, you cannot use the slice option; if you use the slice option, you cannot use any of the other options.
- The slice partition is supported only on branch SRX Series devices.

**Required Privilege Level** maintenance

**Related Documentation**

- [Example: Installing Junos OS on SRX Series Devices Using the Partition Option on page 193](#)
- *Installation and Upgrade Guide for Security Devices*

**List of Sample Output**

[request system snapshot media hard-disk on page 285](#)  
[request system snapshot media usb \(when usb device is missing on page 285](#)  
[request system snapshot media compact-flash on page 286](#)  
[request system snapshot media internal on page 286](#)  
[request system snapshot partition on page 286](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request system snapshot media hard-disk](#)

```
user@host> request system snapshot media hard-disk
Verifying compatibility of destination media partitions...
Running newfs (880MB) on hard-disk media / partition (ad2s1a)...
Running newfs (98MB) on hard-disk media /config partition (ad2s1e)...
Copying '/dev/ad0s1a' to '/dev/ad2s1a' .. (this may take a few minutes)
...
```

### [request system snapshot media usb \(when usb device is missing](#)

```
user@host> request system snapshot media usb
```

```
Verifying compatibility of destination media partitions...
Running newfs (254MB) on usb media / partition (da1s1a)...
Running newfs (47MB) on usb media /config partition (da1s1e)...
Copying '/dev/da0s2a' to '/dev/da1s1a' .. (this may take a few minutes)
Copying '/dev/da0s2e' to '/dev/da1s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

#### request system snapshot media compact-flash

```
user@host> request system snapshot media compact-flash
error: cannot snapshot to current boot device
```

#### request system snapshot media internal

```
user@host> request system snapshot media internal
error: cannot snapshot to current boot device
```

#### request system snapshot partition

```
user@host> request system snapshot partition
Verifying compatibility of destination media partitions...
Running newfs (439MB) on internal media / partition (da0s1a)...
Running newfs (46MB) on internal media /config partition (da0s1e)...
Copying '/dev/da1s1a' to '/dev/da0s1a' .. (this may take a few minutes)
Copying '/dev/da1s1e' to '/dev/da0s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

## request system software abort in-service-upgrade (ICU)

<b>Syntax</b>	request system software abort in-service-upgrade
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Abort an in-band cluster upgrade (ICU). This command must be issued from a router session other than the one on which you issued the <b>request system in-service-upgrade</b> command that launched the ICU. If an ICU is in progress, this command aborts it. If the node is being upgraded, this command will cancel the upgrade. The command is also helpful in recovering the node in case of a failed ICU.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>request system software in-service-upgrade (Maintenance)</i></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system software abort in-service-upgrade on page 287</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system software abort in-service-upgrade

```
user@host> request system software abort in-service-upgrade
In-Service-Upgrade aborted
```

## request system software add (Maintenance)

---

<b>Syntax</b>	<code>request system software add <i>package-name</i></code>
<b>Release Information</b>	Partition option introduced in the command in Release 10.1. of Junos OS.
<b>Description</b>	Installs the new software package on the device. For example: <b>request system software add junos-srxsme-10.0R2-domestic.tgz no-copy no-validate partition reboot.</b>
<b>Options</b>	<ul style="list-style-type: none"><li>• <code>delay-restart</code> — Installs the software package but does not restart the software process</li><li>• <code>best-effort-load</code> — Activate a partial load and treat parsing errors as warnings instead of errors</li><li>• <code>no-copy</code> — Installs the software package but does not saves the copies of package files</li><li>• <code>no-validate</code> — Does not check the compatibility with current configuration before installation starts</li><li>• <code>partition</code> — Formats and re-partitions the media before installation</li><li>• <code>reboot</code> — Reboots the device after installation is completed</li><li>• <code>unlink</code> — Removes the software package after successful installation</li><li>• <code>validate</code> — Checks the compatibility with current configuration before installation starts</li></ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Installation and Upgrade Guide for Security Devices</i></li><li>• <i>Administration Guide for Security Devices</i></li></ul>

## request system reboot

<b>Syntax</b>	<code>request system reboot &lt;at time&gt; &lt;in minutes&gt;&lt;media&gt;&lt;message 'text'&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	Reboots the software.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <i>at time</i>— Specifies the time at which to reboot the device . You can specify time in one of the following ways:             <ul style="list-style-type: none"> <li>• <i>now</i>— Reboots the device immediately. This is the default.</li> <li>• <i>+minutes</i>— Reboots the device in the number of minutes from now that you specify.</li> <li>• <i>yymmddhhmm</i>— Reboots the device at the absolute time on the date you specify. Enter the year, month, day, hour (in 24-hour format), and minute.</li> <li>• <i>hh:mm</i>— Reboots the device at the absolute time you specify, on the current day. Enter the time in 24-hour format, using a colon (:) to separate hours from minutes.</li> </ul> </li> <li>• <i>in minutes</i>— Specifies the number of minutes from now to reboot the device. This option is a synonym for the <i>at +minutes</i> option</li> <li>• <i>media type</i>— Specifies the boot device to boot the device from:             <ul style="list-style-type: none"> <li>• <i>disk/internal</i>— Reboots from the internal media. This is the default.</li> <li>• <i>usb</i>— Reboots from the USB storage device.</li> <li>• <i>compact flash</i>— Reboots from the external compact flash. This option is available on the SRX650 Services Gateway.</li> </ul> </li> <li>• <i>message text</i>— Provides a message to display to all system users before the device reboots.</li> </ul> <p>Example: <b>request system reboot at 5 in 50 media internal message stop</b></p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system software rollback (Maintenance) on page 290</a></li> </ul>

## request system software rollback (Maintenance)

---

<b>Syntax</b>	request system software rollback <node <i>node-id</i> >   <all>   <local>   <primary> <reboot>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	Revert to the software that was loaded at the last successful <b>request system software add</b> command. Example: <b>request system software rollback</b> .
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>node <i>node-id</i></b>—(High-end SRX Series devices only) Roll back the software to the previous set of packages on a specific node.</li><li>• <b>all</b>— Roll back the software on all the nodes.</li><li>• <b>local</b>— Roll back the software on the local node.</li><li>• <b>primary</b>— Roll back the software on the primary node.</li><li>• <b>reboot</b>— Reboot the system after a roll back.</li></ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Installation and Upgrade Guide for Security Devices</i></li><li>• <i>Administration Guide for Security Devices</i></li></ul>

## show chassis usb storage

<b>Syntax</b>	show chassis usb storage
<b>Release Information</b>	Command introduced in Junos OS Release 11.4 R2.
<b>Description</b>	Displays the current status of any USB mass storage device and whether the USB ports are enabled or disabled.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show chassis hardware detail on page 291</a> <a href="#">show chassis usb storage on page 291</a>

## Sample Output

### show chassis hardware detail

```

user@host> show chassis hardware detail
Hardware inventory:

## show system autorecovery state

<b>Syntax</b>	show system autorecovery state
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Performs checks and shows status of all autorecovered items.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system autorecovery state on page 273</a></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> <li>• <i>Administration Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system autorecovery state on page 292</a>
<b>Output Fields</b>	Table 34 on page 292 lists the output fields for the <b>show system autorecovery state</b> command. Output fields are listed in the approximate order in which they appear.

Table 34: show system autorecovery state Output Fields

Field Name	Field Description
File	The name of the file on which autorecovery checks are performed.
Slice	The disk partition on which autorecovery checks are performed.
Recovery Information	Indicates whether autorecovery information for the file or slice has been saved.
Integrity Check	Displays the status of the file's integrity check (passed or failed).
Action / Status	Displays the status of the item, or the action required to be taken for that item.

## Sample Output

### show system autorecovery state

```
user@host> show system autorecovery state
```

```

Configuration:
File          Recovery Information  Integrity Check  Action / Status
rescue.conf.gz Saved                Passed           None
Licenses:
File          Recovery Information  Integrity Check  Action / Status

## show system auto-snapshot

<b>Syntax</b>	show system auto-snapshot
<b>Release Information</b>	Command introduced in Junos OS Release 12.1X45-D10.
<b>Description</b>	<p>Display the status of the auto-snapshot information on SRX Series devices. When the automatic snapshot feature is enabled and the system reboots from the alternate root partition, the switch automatically takes a snapshot of the root file system in the alternate root partition and copies it to the primary root partition. This automatic snapshot procedure takes place whenever the system reboots from the alternate partition, regardless of whether the reboot from the alternate partition is due to a command or due to a corruption of the primary partition.</p> <p>When the automatic snapshot procedure is in progress, you cannot run the manual snapshot command, <b>request system snapshot</b>.</p>
<b>Required Privilege Level</b>	View
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system snapshot media on page 302</a></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system auto-snapshot on page 295</a>
<b>Output Fields</b>	<p><a href="#">Table 35 on page 294</a> lists the output fields for the <b>show system auto-snapshot</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 35: show system auto-snapshot Output Fields**

Field Name	Field Description
<b>Auto-snapshot Configuration</b>	<p>Displays the configuration status of auto-snapshot.</p> <p>Status of the configuration:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—If the system reboots from the alternate partition, the automatic snapshot feature automatically takes a snapshot of the alternate partition and copies it to the primary partition.</li> <li>• <b>Disabled</b>—The system does not automatically take a snapshot of the alternate partition. You must use the manual snapshot command, <b>request system snapshot</b>, to take a snapshot of one partition and copy it to the other.</li> </ul>
<b>Auto-snapshot State</b>	<p>Displays the current state of auto-snapshot.</p> <p>Status of the automatic snapshot procedure:</p> <ul style="list-style-type: none"> <li>• <b>Completed</b>—The automatic snapshot procedure has completed copying the alternate partition to the primary partition and the alarm has been cleared.</li> <li>• <b>Disabled</b>—The automatic snapshot procedure is inactive.</li> <li>• <b>In progress</b>—The automatic snapshot procedure is in progress. It takes about 10 to 15 minutes to complete, depending upon disk size.</li> </ul>

## Sample Output

### show system auto-snapshot

```
user@host> show system auto-snapshot
```

```
Auto-snapshot Configuration:  Enabled  
Auto-snapshot State: Completed
```

## show system download

<b>Syntax</b>	<code>show system download &lt;download-id&gt;</code>
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Display a brief summary of all the download instances along with their current state and extent of progress. If a <b>download-id</b> is provided, the command displays a detailed report of the particular download instance.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>download-id</b>—(Optional) The ID number of the download instance.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">request system download start on page 279</a></li> <li><i>Installation and Upgrade Guide for Security Devices</i></li> <li><i>Administration Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system download on page 296</a> <a href="#">show system download 1 on page 297</a>
<b>Output Fields</b>	Table 36 on page 296 lists the output fields for the <b>show system download</b> command. Output fields are listed in the approximate order in which they appear.

Table 36: show system download Output Fields

Field Name	Field Description
ID	Displays the download identification number.
Status	Displays the state of a particular download.
Start Time	Displays the start time of a particular download.
Progress	Displays the percentage of a download that has been completed.
URL	Displays the location of the downloaded file.

## Sample Output

### show system download

```

user@host> show system download
Download Status Information:
ID  Status    Start Time      Progress  URL
1   Active    May 4 06:28:36  5%       ftp://ftp-server//tftpboot/1m_file

## show system license (View)

<b>Syntax</b>	show system license <installed   keys   status   usage>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Logical system status option added in Junos OS Release 11.2.
<b>Description</b>	Display licenses and information about how licenses are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>status</b>—(Optional) Display license status for a specified logical system or for all logical systems.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Administration Guide for Security Devices</i></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show system license on page 299</a></p> <p><a href="#">show system license installed on page 299</a></p> <p><a href="#">show system license keys on page 300</a></p> <p><a href="#">show system license usage on page 300</a></p> <p><a href="#">show system license status logical-system all on page 300</a></p>
<b>Output Fields</b>	Table 18 on page 121 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

**Table 37: show system license Output Fields**

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
<b>Licenses used</b>	Number of licenses used by the device. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.

Table 37: show system license Output Fields (*continued*)

Field Name	Field Description
Licenses installed	Information about the installed license key: <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Features</b>—Feature associated with a license.</li> </ul>
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Time remaining in the grace period before a license is required for a feature being used.
Logical system license status	Displays whether a license is enabled for a logical system.

## Sample Output

### show system license

```
user@host> show system license

## show system login logout

<b>Syntax</b>	show system login logout
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Display the user names locked after unsuccessful login attempts.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Administration Guide for Security Devices</i></li> <li>• <i>Installation and Upgrade Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system login logout on page 301</a>
<b>Output Fields</b>	Table 38 on page 301 lists the output fields for the <b>show system login logout</b> command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the <b>detail</b> keyword is used.

Table 38: show system login logout

Field Name	Field Description	Level of Output
User	Username	All levels
Lockout start	Date and time the username was locked	All levels
Lockout end	Date and time the username was unlocked	All levels

## Sample Output

### show system login logout

```
user@host>show system login logout
```

```

User           Lockout start      Lockout end
root          2011-05-11 09:11:15 UTC 2011-05-11 09:13:15 UTC

```

## show system snapshot media

---

<b>Syntax</b>	show system snapshot media <i>media-type</i>
<b>Release Information</b>	Command introduced in Release 10.2 of Junos OS.
<b>Description</b>	Display the snapshot information for both root partitions on SRX Series devices
<b>Options</b>	<ul style="list-style-type: none"><li>• internal— Show snapshot information from internal media.</li><li>• usb— Show snapshot information from device connected to USB port.</li><li>• external— Show snapshot information from the external compact flash. This option is available on the SRX650 Services Gateway.</li></ul>
<b>Required Privilege Level</b>	View
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Installation and Upgrade Guide for Security Devices</i></li></ul>

### show system snapshot media internal

```
show system snapshot media internal
Information for snapshot on      internal (/dev/da0s1a) (primary)
Creation date: Jan 15 10:43:26 2010
JUNOS version on snapshot:
  junos   : 10.1B3-domestic
Information for snapshot on      internal (/dev/da0s2a) (backup)

```

## show system storage (View SRX Series)

**Syntax** show system storage  
 <detail>  
 <node *node-id* | all | local | primary>  
 <partitions>

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display the local storage data currently available on the SRX Series devices.

- Options**
- **none**—Display standard information about the amount of free disk space in the device file system.
  - **detail**—(Optional) Display detailed output about the amount of free disk space in the device file system.
  - **node**—(Optional) Display local storage data for a specific node.

**NOTE:** The **node** option is supported only on high-end SRX Series devices.

- **node-id**—Identification number of the node. It can be 0 or 1.
- **all**—(Optional) Display the local storage data for all nodes.
- **local**—(Optional) Display the local storage data for the local node.
- **primary**—(Optional) Display the local storage data for the primary node.
- **partitions**—(Optional) Display partitions information for the boot media.

**NOTE:** The **partitions** option is supported only on branch SRX Series devices.

**Required Privilege Level** View

**Output Fields** [Table 39 on page 303](#) describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

**Table 39: show system storage Output Fields**

Field Name	Field Description
<b>Filesystem</b>	Name of the file system.
<b>Size</b>	Size of the file system.
<b>Used</b>	Amount of space used in the file system.

Table 39: show system storage Output Fields (*continued*)

Field Name	Field Description
<b>Avail</b>	Amount of space available in the file system.
<b>Capacity</b>	Percentage of the file system space that is being used.
<b>Mounted on</b>	Directory in which the file system is mounted.

**show system storage**

```
user@host>show system storage
```

Filesystem	Size	Used	Avail	Capacity	Mounted on

## Introducing the Junos OS Command-Line Interface

The Junos OS command-line interface (CLI) is the software interface you use to access a device running Junos OS—whether from the console or through a network connection.

The Junos OS CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel. By leveraging industry-standard tools and utilities, the CLI provides a powerful set of commands that you can use to monitor and configure devices running Junos OS (see [Figure 8 on page 310](#)). The CLI is a straightforward command interface. You type commands on a single line, and the commands are executed when you press Enter.

**Figure 8: Monitoring and Configuring Routers**

Use the JUNOS CLI to monitor and configure Juniper Networks routers.

### Key Features of the CLI

The Junos OS CLI commands and statements follow a hierarchal organization and have a regular syntax. The Junos OS CLI provides the following features to simplify CLI use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with the Junos OS or with other routing software, you can use many of the CLI commands without referring to the documentation.
- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press the Tab key or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

If you have typed the mandatory arguments for executing a command in the operational or configuration mode the CLI displays **<[Enter]>** as one of the choices when you type a question mark (?). This indicates that you have entered the mandatory arguments and can execute the command at that level without specifying any further options. Likewise, the CLI also displays **<[Enter]>** when you have reached a specific hierarchy level in the configuration mode and do not have to enter any more mandatory arguments or statements.

- Industry-standard technology—With FreeBSD UNIX as the kernel, a variety of UNIX utilities are available on the Junos OS CLI. For example, you can:
  - Use regular expression matching to locate and replace values and identifiers in a configuration, filter command output, or examine log file entries.

- Use Emacs-based key sequences to move around on a command line and scroll through the recently executed commands and command output.
- Store and archive Junos OS device files on a UNIX-based file system.
  - Use standard UNIX conventions to specify filenames and paths.
- Exit from the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage router processes, and so on.

**Related Documentation**

- [Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies on page 311](#)
- [Getting Started with the Junos OS Command-Line Interface on page 368](#)
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 314](#)
- [Commands and Configuration Statements for Junos-FIPS on page 314](#)

## Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies

The Junos OS command-line interface (CLI) commands and statements are organized under two command modes and various hierarchies. The following sections provide you an overview of the Junos OS CLI command modes and commands and statements hierarchies:

- [Junos OS CLI Command Modes on page 311](#)
- [CLI Command Hierarchy on page 312](#)
- [Configuration Statement Hierarchy on page 312](#)
- [Moving Among Hierarchy Levels on page 313](#)

### Junos OS CLI Command Modes

The Junos OS CLI has two modes:

- **Operational mode**—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot the Junos OS, devices, and network connectivity.
- **Configuration mode**—A configuration for a device running on Junos OS is stored as a hierarchy of statements. In configuration mode, you enter these statements to define all properties of the Junos OS, including interfaces, general routing information, routing protocols, user access, and several system and hardware properties.

When you enter configuration mode, you are actually viewing and changing a file called the *candidate configuration*. The candidate configuration file enables you to make configuration changes without causing operational changes to the current operating configuration, called the *active configuration*. The router or switch does not implement the changes you added to the candidate configuration file until you commit them, which activates the configuration on the router or switch (see [Figure 9 on page 312](#)). Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

Figure 9: Committing a Configuration

### CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command.

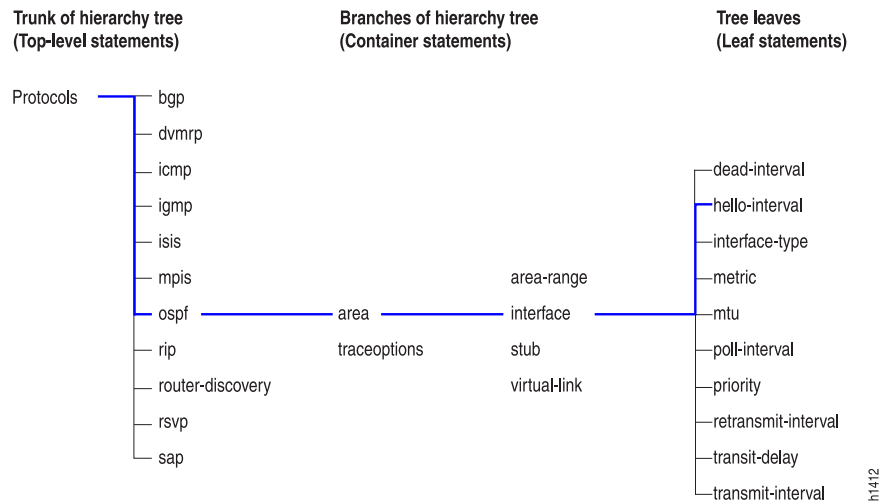

To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of the routes in the routing table, use the command **show route brief**.

### Configuration Statement Hierarchy

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

Figure 10 on page 313 illustrates a part of the hierarchy tree. The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

Figure 10: Configuration Statement Hierarchy Example

### Moving Among Hierarchy Levels

You can use the CLI commands in [Table 40 on page 313](#) to navigate the levels of the configuration statement hierarchy.

Table 40: CLI Configuration Mode Navigation Commands

Command	Description
<b>edit</b> <i>hierarchy-level</i>	Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
<b>exit</b>	Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the <b>edit</b> command. Alternatively, you can use the <b>quit</b> command. The <b>exit</b> and <b>quit</b> commands are interchangeable.
<b>up</b>	Moves up the hierarchy one level at a time.
<b>top</b>	Moves directly to the top level of the hierarchy.

## Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- J-Web graphical user interface (GUI)—Allows you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled. For more information, see the *J-Web Interface User Guide*.
- Junos XML management protocol—Application programmers can use the Junos XML management protocol to monitor and configure Juniper Networks routers. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring routers. For more information, see the *Junos XML Management Protocol Developer Guide*.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF XML management protocol to monitor and configure Juniper Networks routers. For more information, see the *NETCONF XML Management Protocol Developer Guide*.
- Junos OS commit scripts and self-diagnosis features—You can define scripts to enforce custom configuration rules, use commit script macros to provide simplified aliases for frequently used configuration statements, and configure diagnostic event policies and actions associated with each policy. For more information, see the *Junos OS Configuration and Operations Automation Library*.
- Management Information Bases (MIBs)—You can use enterprise-specific and standard MIBs to retrieve information about the hardware and software components on a Juniper Networks router. For more information about MIBs, see the *SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices*.

### Related Documentation

- [Getting Started with the Junos OS Command-Line Interface on page 368](#)
- [Commands and Configuration Statements for Junos-FIPS on page 314](#)

## Commands and Configuration Statements for Junos-FIPS

Junos-FIPS enables you to configure a network of Juniper Networks routers in a Federal Information Processing Standards (FIPS) 140-2 environment.

The Junos-FIPS software environment requires the installation of FIPS software by a crypto officer. In Junos-FIPS, some Junos OS commands and statements have restrictions and some additional configuration statements are available. For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

## CLI Online Help

- [Getting Online Help from the Junos OS Command-Line Interface on page 315](#)
- [Junos OS CLI Online Help Features on page 317](#)

### Getting Online Help from the Junos OS Command-Line Interface

The Junos OS command-line interface (CLI) has a context-sensitive online help feature that enables you to access information about commands and statements from the Junos OS CLI. This topic contains the following sections:

- [Getting Help About Commands on page 315](#)
- [Getting Help About a String in a Statement or Command on page 316](#)
- [Getting Help About Configuration Statements on page 316](#)
- [Getting Help About System Log Messages on page 317](#)

#### Getting Help About Commands

Information about commands is provided at each level of the CLI command hierarchy. You can type a question mark to get help about commands:

- If you type the question mark at the command-line prompt, the CLI lists the available commands and options. For example, to view a list of top-level operational mode commands, type a question mark (?) at the command-line prompt.

```
user@host> ?
Possible completions:
clear          Clear information in the system
configure      Manipulate software configuration information
file           Perform file operations
help           Provide help information
mtrace         Trace mtrace packets from source to receiver.
monitor        Real-time debugging
ping           Ping a remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart a software process
set            Set CLI properties, date, time, craft display text
show           Show information about the system
ssh            Open a secure shell to another host
start          Start a software process
telnet         Telnet to another host
test           Diagnostic debugging commands
traceroute     Trace the route to a remote host
user@host>
```

- If you type the question mark after entering the complete name of a command or command option, the CLI lists the available commands and options and then redisplay the command names and options that you typed.

```
user@host> clear ?
Possible completions:
arp            Clear address-resolution information
bgp            Clear BGP information
chassis        Clear chassis information
```

```
firewall    Clear firewall counters
igmp        Clear IGMP information
interfaces  Clear interface information
ilmi        Clear ILMI statistics information
isis        Clear IS-IS information
ldp         Clear LDP information
log         Clear contents of a log file
mpls        Clear MPLS information
msdp        Clear MSDP information
multicast   Clear Multicast information
ospf        Clear OSPF information
pim         Clear PIM information
rip         Clear RIP information
route       Clear routing table information
rsvp        Clear RSVP information
snmp        Clear SNMP information
system      Clear system status
vrrp        Clear VRRP statistics information
user@host> clear
```

- If you type the question mark in the middle of a command name, the CLI lists possible command completions that match the letters you have entered so far. It then redisplay the letters that you typed. For example, to list all operational mode commands that start with the letter *c*, type the following:

```
user@host> c?
Possible completions:
clear      Clear information in the system
configure  Manipulate software configuration information
user@host> c
```

- For introductory information on using the question mark or the help command, you can also type **help** and press Enter:

```
user@host> help
```

---

### Getting Help About a String in a Statement or Command

You can use the **help** command to display help about a text string contained in a statement or command name:

**help** *apropos string*

**string** is a text string about which you want to get help. This string is used to match statement or command names as well as to match the help strings that are displayed for the statements or commands.

If the string contains spaces, enclose it in quotation marks (" "). You can also specify a regular expression for the string, using standard UNIX-style regular expression syntax.

In configuration mode, this command displays statement names and help text that match the string specified. In operational mode, this command displays command names and help text that match the string specified.

---

### Getting Help About Configuration Statements

You can display help based on text contained in a statement name using the **help topic** and **help reference** commands:

**help** *topic word*  
**help** *reference statement-name*

The **help topic** command displays usage guidelines for the statement based on information that appears in the Junos OS feature guides. The **help reference** command displays summary information about the statement based on the summary descriptions that appear in the Junos OS feature guides.

### Getting Help About System Log Messages

You can display help based on a system log tag using the **help syslog** command:

**help** *syslog syslog-tag*

The **help syslog** command displays the contents of a system log message.

#### Related Documentation

- [Junos OS CLI Online Help Features on page 317](#)
- [Getting Started with the Junos OS Command-Line Interface on page 368](#)

## Junos OS CLI Online Help Features

The Junos OS CLI online help provides the following features for ease of use and error prevention:

- [Help for Omitted Statements on page 317](#)
- [Using CLI Command Completion on page 318](#)
- [Using Command Completion in Configuration Mode on page 318](#)
- [Displaying Tips About CLI Commands on page 318](#)

### Help for Omitted Statements

If you have omitted a required statement at a particular hierarchy level, when you attempt to move from that hierarchy level or when you issue the **show** command in configuration mode, a message indicates which statement is missing. For example:

```
[edit protocols pim interface so-0/0/0]
user@host# top
Warning: missing mandatory statement: 'mode'
[edit]
user@host# show
protocols {
  pim {
    interface so-0/0/0 {
      priority 4;
      version 2;
      # Warning: missing mandatory statement(s): 'mode'
    }
  }
}
```

## Using CLI Command Completion

---

The Junos OS CLI provides you a command completion option that enables Junos OS to recognize commands and options based on the initial few letters you typed. That is, you do not always have to remember or type the full command or option name for the CLI to recognize it.

- To display all possible command or option completions, type the partial command followed immediately by a question mark.
- To complete a command or option that you have partially typed, press Tab or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a prompt indicates that you have entered an ambiguous command, and the possible completions are displayed.

Command completion also applies to other strings, such as filenames, interface names, and usernames. To display all possible values, type a partial string followed immediately by a question mark. To complete a string, press Tab.

## Using Command Completion in Configuration Mode

---

The CLI command completion functions also apply to the commands in configuration mode and to configuration statements. Specifically, to display all possible commands or statements, type the partial string followed immediately by a question mark. To complete a command or statement that you have partially typed, press Tab or the Spacebar.

Command completion also applies to identifiers, with one slight difference. To display all possible identifiers, type a partial string followed immediately by a question mark. To complete an identifier, you must press Tab. This scheme allows you to enter identifiers with similar names; then press the Spacebar when you are done typing the identifier name.

## Displaying Tips About CLI Commands

---

To get tips about CLI commands, issue the **help tip cli** command. Each time you enter the command, a new tip appears. For example:

```
user@host> help tip cli
Junos tip:
Use 'request system software validate' to validate the incoming software
against the current configuration without impacting the running system.
user@host> help tip cli
Junos tip:
Use 'commit and-quit' to exit configuration mode after the commit has
succeeded. If the commit fails, you are left in configuration mode.
```

You can also enter **help tip cli *number*** to associate a tip with a number. This enables you to recall the tip at a later time. For example:

```
user@host> help tip cli 10
JUNOS tip:
Use '#' in the beginning of a line in command scripts to cause the
rest of the line to be ignored.
```

```

user@host> help tip cli
JUNOS tip:
Use the 'apply-groups' statement at any level of the configuration
hierarchy to inherit configuration statements from a configuration group.

user@host>

```

## Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 319](#)
- [Commonly Used Operational Mode Commands on page 320](#)

### CLI Command Categories

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see “[Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies](#)” on page 311.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in [CLI Explorer](#).
  - **clear**—Clear statistics and protocol database information.
  - **mtrace**—Trace mtrace packets from source to receiver.
  - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.

- **ping**—Determine the reachability of a remote network host.
- **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
- **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
- **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see [CLI Explorer](#).
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see [CLI Explorer](#).
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see [CLI Explorer](#).
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see [CLI Explorer](#).
- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see [CLI Explorer](#).
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see “[Understanding Junos OS CLI Configuration Mode](#)” on page 334.
- A command—**quit**—to exit the CLI. For information about this command, see [CLI Explorer](#).

### Commonly Used Operational Mode Commands

Table 41 on page 320 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

**Table 41: Commonly Used Operational Mode Commands**

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	<b>show version</b>

Table 41: Commonly Used Operational Mode Commands (*continued*)

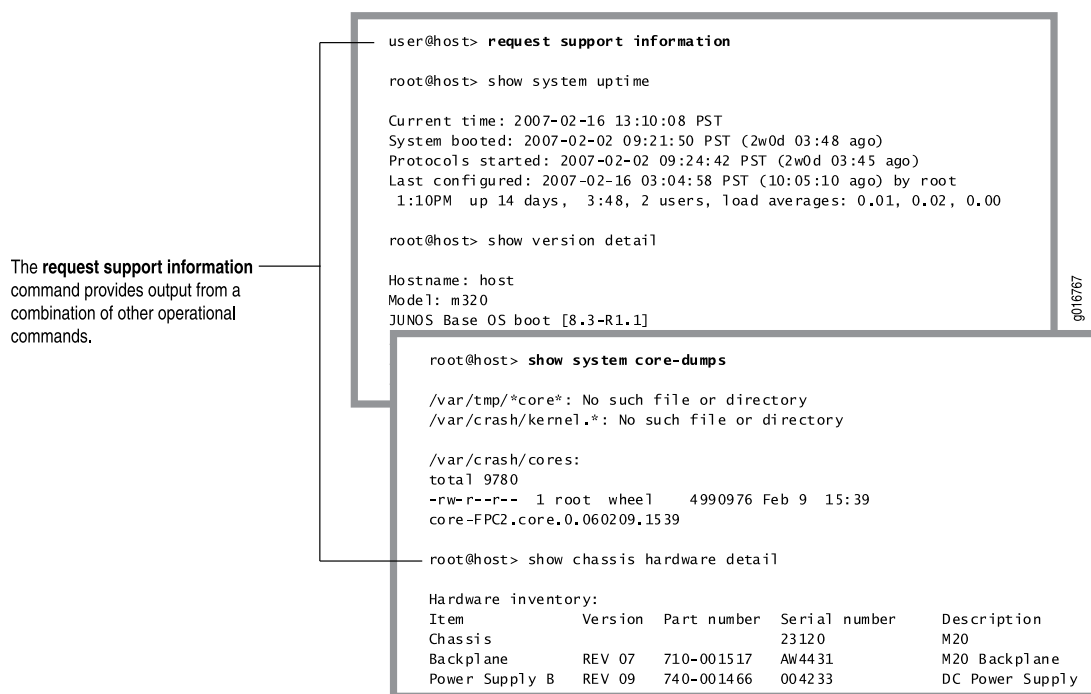

Items to Check	Description	Command
Log files	Contents of the log files	<b>monitor</b>
	Log files and their contents and recent user logins	<b>show log</b>
Remote systems	Host reachability and network connectivity	<b>ping</b>
	Route to a network system	<b>tracert</b>
Configuration	Current system configuration	<b>show configuration</b>
Manipulate files	List of files and directories on the router or switch	<b>file list</b>
	Contents of a file	<b>file show</b>
Interface information	Detailed information about interfaces	<b>show interfaces</b>
Chassis	Chassis alarm status	<b>show chassis alarms</b>
	Information currently on craft display	<b>show chassis craft-interface</b>
	Router or switch environment information	<b>show chassis environment</b>
	Hardware inventory	<b>show chassis hardware</b>
Routing table information	Information about entries in the routing tables	<b>show route</b>
Forwarding table information	Information about data in the kernel's forwarding table	<b>show route forwarding-table</b>
IS-IS	Adjacent routers or switches	<b>show isis adjacency</b>
OSPF	Display standard information about OSPF neighbors	<b>show ospf neighbor</b>
BGP	Display information about BGP neighbors	<b>show bgp neighbor</b>
MPLS	Status of interfaces on which MPLS is running	<b>show mpls interface</b>
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	<b>show mpls lsp</b>
	Routes that form a label-switched path	<b>show route label-switched-path</b>
RSVP	Status of interfaces on which RSVP is running	<b>show rsvp interface</b>
	Currently active RSVP sessions	<b>show rsvp session</b>
	RSVP packet and error counters	<b>show rsvp statistics</b>

## Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in [Figure 11 on page 322](#).

**Figure 11: Commands That Combine Other Commands**

- Related Documentation**
- [Overview of Junos OS CLI Operational Mode Commands on page 319](#)
  - [Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands on page 322](#)

## Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

1. Use the `?` prompt to list options available for the command. For example:

```

user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>           Execute this command
  
```

brief	Display brief output
descriptions	Display interface description strings
detail	Display detailed output
extensive	Display extensive output
media	Display media information
snmp-index	SNMP index of interface
statistics	Display statistics and detailed output
terse	Display terse output
	Pipe through a command

2. Choose the option you wish to use with the command. (See [Figure 12 on page 323](#).)

Figure 12: Command Output Options

Command output with the **brief** option.

```
user@host> show interfaces fe-1/1/1 brief
Physical interface: fe-1/1/1, Enabled, Physical link is Down
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
Disabled, Source filtering: Disabled,
Flow control: Enabled
Device flags : Present Running Down
Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
Link flags : None
```

Command output with the **terse** option.

```
user@host> show interfaces fe-1/1/1 terse
Interface      Admin Link Proto  Local    Remote
fe-1/1/1      up      down
```

Command output with the **extensive** option.

```
user@host> show interfaces fe-1/1/1 extensive
Physical interface: fe-1/1/1, Enabled, Physical link is Down
Interface index: 141, SNMP ifIndex: 33, Generation: 24
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
Disabled, Source filtering: Disabled,
Flow control: Enabled
Device flags : Present Running Down
Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
Link flags : None
CoS queues : 4 supported, 4 maximum usable queues
Hold-times : Up 0 ms, Down 0 ms
Current address: 00:90:69:d0:f8:9e, Hardware address: 00:90:69:d0:f8:9e
Last flapped : 2007-02-02 09:26:25 PST (2w0d 03:40 ago)
Statistics last cleared: Never
Traffic statistics:
Input bytes :                0                0 bps
Output bytes :                0                0 bps
Input packets:                0                0 pps
Output packets:                0                0 pps
---(more)---
```

#### Related Documentation

- [Overview of Junos OS CLI Operational Mode Commands on page 319](#)
- [Controlling the Scope of an Operational Mode Command on page 323](#)

## Controlling the Scope of an Operational Mode Command

The Junos OS CLI operational commands include options that you can use to identify specific components on a device running Junos OS. For example:

1. Type the **show interfaces** command to display information about all interfaces on the router.

```
user@host> show interfaces
Physical interface: so-0/0/0, Enabled, Physical link is Up
Interface index: 128, SNMP ifIndex: 23
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC3,
```

```

Loopback: None, FCS: 16, Payload scrambler: Enabled
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
Link flags     : Keepalives
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive: Input: 13861 (00:00:05 ago), Output: 13891 (00:00:01 ago)
LCP state: Opened
NCP state: inet: Opened, inet6: Not-configured, iso: Opened, mpIs:
Not-configured
CHAP state: Closed
PAP state: Closed
CoS queues   : 4 supported, 4 maximum usable queues
Last flapped  : 2008-06-02 17:16:14 PDT (1d 14:21 ago)
Input rate    : 40 bps (0 pps)
Output rate   : 48 bps (0 pps)

```

---(more)---

- To display information about a specific interface, type that interface as a command option:

```

user@host> show interfaces fe-0/1/3
Physical interface: fe-0/1/3, Enabled, Physical link is Up
  Interface index: 135, SNMP ifIndex: 30
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, MAC-REWRITE Error:
None,
  Loopback: Disabled, Source filtering: Disabled, Flow control: Enabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues     : 4 supported, 4 maximum usable queues
  Current address: 00:05:85:8f:c8:22, Hardware address: 00:05:85:8f:c8:22
  Last flapped   : 2008-06-02 17:16:15 PDT (1d 14:28 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)
  Active alarms  : None
  Active defects : None

user@host>

```

### Operational Mode Commands on a TX Matrix Router or TX Matrix Plus Router

When you issue operational mode commands on the TX Matrix router, CLI command options allow you to restrict the command output to show only a component of the routing matrix rather than the routing matrix as a whole.

These are the options shown in the CLI:

- **scc**—The TX Matrix router (or switch-card chassis)
- **sfc**—The TX Matrix Plus router (or switch-fabric chassis)
- **lcc *number***—A specific T640 router (in a routing matrix based on a TX Matrix router) or a TX Matrix Plus router (in a routing matrix based on a TX Matrix Plus router)
- **all-lcc**—All T640 routers (in a routing matrix based on a TX Matrix router) or all T1600 routers (in a routing matrix based on a TX Matrix Plus router)

If you specify none of these options, then the command applies by default to the whole routing matrix: the TX Matrix router and all connected T640 routers or the TX Matrix Plus router and all connected T1600 routers.

### Examples of Routing Matrix Command Options

The following output samples, using the **show version** command, demonstrate some different options for viewing information about the routing matrix.

```
user@host> show version ?
```

Possible completions:

<[Enter]>	Execute this command
all-lcc	Show software version on all LCC chassis
brief	Display brief output
detail	Display detailed output
lcc	Show software version on specific LCC (0..3)
scc	Show software version on the SCC
	Pipe through a command

### Sample Output: No Routing Matrix Options Specified

```
user@host> show version
```

```

**Related Documentation** • [Interface Naming Conventions Used in the Junos OS Operational Commands on page 493](#)

- [Using the Junos OS CLI Comment Character # for Operational Mode Commands on page 508](#)

## Using the Pipe ( | ) Symbol to Filter Junos Command Output

The Junos OS enables you to filter command output by adding the pipe ( | ) symbol when you enter a command.

For example:

```
user@host> show rip neighbor ?
```

Possible completions:

<[Enter]>	Execute this command
<name>	Name of RIP neighbor
instance	Name of RIP instance
logical-system	Name of logical system, or 'all'
	Pipe through a command

The following example lists the filters that can be used with the pipe symbol ( | ):

```
user@host> show rip neighbor | ?
```

Possible completions:

count	Count occurrences
display	Show additional kinds of information
except	Show only text that does not match a pattern
find	Search for first occurrence of pattern
hold	Hold text without exiting the --More-- prompt
last	Display end of output only
match	Show only text that matches a pattern
no-more	Don't paginate output
request	Make system-level requests
resolve	Resolve IP addresses
save	Save output text to file
trim	Trim specified number of columns from start of line

For the **show configuration** command only, an additional compare filter is available:

```
user@host> show configuration | ?
```

Possible completions:

compare	Compare configuration changes with prior version
...	

You can enter any of the pipe filters in conjunction. For example:

```
user@host> command | match regular-expression | save filename
```

### Related Documentation

- [Pipe \( | \) Filter Functions in the Junos OS command-line interface on page 328](#)
- [Using Regular Expressions with the Pipe \( | \) Symbol to Filter Junos Command Output on page 327](#)

## Using Regular Expressions with the Pipe ( | ) Symbol to Filter Junos Command Output

The **except**, **find**, and **match** filters used with the pipe symbol employ regular expressions to filter output. Juniper Networks uses the regular expressions as defined in POSIX 1003.2. If the regular expressions contain spaces, operators, or wildcard characters, enclose the expression in quotation marks.

**Table 42: Common Regular Expression Operators in Operational Mode Commands**

Operator	Function
	Indicates that a match can be one of the two terms on either side of the pipe.
^	Used at the beginning of an expression, denotes where a match should begin.
\$	Used at the end of an expression, denotes that a term must be matched exactly up to the point of the \$ character.
[ ]	Specifies a range of letters or digits to match. To separate the start and end of a range, use a hyphen ( - ).
( )	Specifies a group of terms to match.

For example, if a command produces the following output:

```
1 2
2 2
3 2 1
4
```

a pipe filter of **| match 2** displays the following output:

```
1 2
2 2
3 2 1
```

and a pipe filter of **| except 1** displays the following output:

```
2 2
4
```

- [Resolving IP Addresses on page 333](#)
- [Saving Output to a File on page 334](#)
- [Trimming Output by Specifying the Starting Column on page 334](#)

### Comparing Configurations

The **compare** filter compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, enter **compare** after the pipe ( | ) symbol:

```
[edit]
user@host# show | compare [filename] rollback n]
```

*filename* is the full path to a configuration file.

*n* is the index into the list of previously committed configurations. The most recently saved configuration is 0. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (–).
- Statements that are unchanged are prefixed with a single blank space ( ).

For example:

```
user@host> show configuration system | compare rollback 9
[edit system]
+ host-name nutmeg;
+ backup-router 192.168.71.254;
- ports {
-     console log-out-on-disconnect;
- }
[edit system name-server]
+ 172.17.28.11;
  172.17.28.101 { ... }
[edit system name-server]
  172.17.28.101 { ... }
+ 172.17.28.100;
+ 172.17.28.10;
[edit system]
- scripts {
-     commit {
-         allow-transients;
-     }
}
```

```
- }
+ services {
+     ftp;
+     rlogin;
+     rsh;
+     telnet;
+ }
```

Starting with Junos OS Release 8.3, output from the **show | compare** command has been enhanced to more accurately reflect configuration changes. This includes more intelligent handling of order changes in lists. For example, consider names in a group that are reordered as follows:

```
groups {      groups {
group_xmp;    group_xmp;
group_cmp;    group_grp;
group_grp;    group_cmp;
}             }
```

In previous releases, output from the **show | compare** command looked like the following:

```
[edit groups]
- group_xmp;
- group_cmp;
- group_grp;
+ group_xmp;
+ group_grp;
+ group_cmp;
```

Now, output from the **show | compare** command looks like the following:

```
[edit groups]
group_xmp {...}
! group_grp {...}
```

### Counting the Number of Lines of Output

To count the number of lines in the output from a command, enter **count** after the pipe symbol (|). For example:

```
user@host> show configuration | count
Count: 269 lines
```

### Displaying Output in XML Tag Format

To display command output in XML tag format, enter **display xml** after the pipe symbol (|).

The following example displays the **show cli directory** command output as XML tags:

```
user@host> show cli directory | display xml
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/7.5I0/junos">
  <cli>
    <working-directory>/var/tmp/</working-directory>
  </cli>
  <cli>
    <banner></banner>
  </cli>
</rpc-reply>
```

### Displaying the RPC tags for a Command

To display the remote procedure call (RPC) XML tags for an operational mode command, enter **display xml rpc** after the pipe symbol ( | ).

The following example displays the RPC tags for the **show route** command:

```
user@host> show route | display xml rpc
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/10.1I0/junos">
  <rpc>
    <get-route-information>
    </get-route-information>
  </rpc>
</cli>
  <banner></banner>
</cli>
</rpc-reply>
```

### Ignoring Output That Does Not Match a Regular Expression

To ignore text that matches a regular expression, specify the **except** command after the pipe symbol ( | ). If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks. For information on common regular expression operators, see [“Using Regular Expressions with the Pipe \( | \) Symbol to Filter Junos Command Output” on page 327](#).

The following example displays all users who are logged in to the router, except for the user **root**:

```
user@host> show system users | except root
 8:28PM up 1 day, 13:59, 2 users, load averages: 0.01, 0.01, 0.00
USER   TTY FROM          LOGIN@  IDLE WHAT
sheep  p0  baa.juniper.net  7:25PM   - cli
```

### Displaying Output from the First Match of a Regular Expression

To display output starting with the first occurrence of text matching a regular expression, enter **find** after the pipe symbol ( | ). If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks. For information on common regular expression operators, see [“Using Regular Expressions with the Pipe \( | \) Symbol to Filter Junos Command Output” on page 327](#).

The following example displays the routes in the routing table starting at IP address **208.197.169.0**:

```
user@host> show route | find 208.197.169.0
208.197.169.0/24    *[Static/5] 1d 13:22:11
                  > to 192.168.4.254 via so-3/0/0.0
224.0.0.5/32      *[OSPF/10] 1d 13:22:12, metric 1
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
47.0005.80ff.f800.0000.0108.0001.1921.6800.4015.00/160
                  *[Direct/0] 1d 13:22:12
                  > via lo0.0
```

The following example displays the first CCC entry in the forwarding table:

```
user@host> show route forwarding-table | find ccc
Routing table: ccc
MPLS:
Interface.Label    Type RtRef Nexthop          Type Index NhRef Netif
default           perm  0          10.0.16.2      rjct   3    1
0                 user  0          10.0.16.2      recv   5    2
1                 user  0          10.0.16.2      recv   5    2
32769             user  0          10.0.16.2      ucst   45   1 fe-0/0/0.534
fe-0/0/0. (CCC)   user  0          10.0.16.2      indr   44   2
                                     Push 32768, Push
```

### Retaining Output After the Last Screen

To not return immediately to the CLI prompt after viewing the last screen of output, enter **hold** after the pipe symbol ( | ). The following example prevents returning to the CLI prompt after you have viewed the last screen of output from the **show log log-file-1** command:

```
user@host> show log log-file-1 | hold
```

This filter is useful when you want to scroll or search through output.

### Displaying Output Beginning with the Last Entries

To display text starting from the end of the output, enter **last <lines>** after the pipe symbol ( | ).

The following example displays the last entries in **log-file-1** file:

```
user@host> show log log-file-1 | last
```

This filter is useful for viewing log files in which the end of the file contains the most recent entries.

**NOTE:** When the number of lines requested is less than the number of lines that the screen length setting permits you to display, Junos returns as many lines as permitted by the screen length setting. That is, if your screen length is set to 20 lines and you have requested only the last 10 lines, Junos returns the last 19 lines instead of the last 10 lines.

### Displaying Output That Matches a Regular Expression

To display output that matches a regular expression, enter **match *regular-expression*** after the pipe symbol ( | ). If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks. For information on common regular expression operators, see [“Using Regular Expressions with the Pipe \( | \) Symbol to Filter Junos Command Output”](#) on page 327.

The following example matches all the Asynchronous Transfer Mode (ATM) interfaces in the configuration:

```
user@host> show configuration | match at-
```

```

at-2/1/0 {
at-2/1/1 {
at-2/2/0 {
at-5/2/0 {
at-5/3/0 {

```

### Preventing Output from Being Paginated

By default, if output is longer than the length of the terminal screen, you are provided with a **---(more)---** message to display the remaining output. To display the remaining output, press the Spacebar.

To prevent the output from being paginated, enter **no-more** after the pipe symbol ( | ).

The following example displays output from the **show configuration** command all at once:

```
user@host> show configuration | no-more
```

This feature is useful, for example, if you want to copy the entire output and paste it into an e-mail.

### Sending Command Output to Other Users

To display command output on the terminal of a specific user logged in to your router, or on the terminals of all users logged in to your router, enter **request message (all | user account@terminal)** after the pipe symbol ( | ).

If you are troubleshooting your router and, for example, talking with a customer service representative on the phone, you can use the **request message** command to send your representative the command output you are currently viewing on your terminal.

The following example sends the output from the **show interfaces** command you enter on your terminal to the terminal of the user **root@tty1**:

```
user@host> show interfaces | request message user root@tty1
```

The user **root@tty1** sees the following output appear on the terminal screen:

```

Message from user@host on /dev/tty0 at 10:32 PST...
Physical interface: dsc, Enabled, Physical link is Up
  Interface index: 5, SNMP ifIndex: 5
  Type: Software-Pseudo, MTU: Unlimited...

```

### Resolving IP Addresses

If the output of a command displays an unresolved IP address, you can enter **| resolve** after the command to display the name associated with the IP address. The **resolve** filter enables the system to perform a reverse DNS lookup of the IP address. If DNS is not enabled, the lookup fails and no substitution is performed.

To perform a reverse DNS lookup of an unresolved IP address, enter **resolve <full-names>** after the pipe symbol ( | ). If you do not specify the **full-names** option, the name is truncated to fit whatever field width limitations apply to the IP address.

The following example performs a DNS lookup on any unresolved IP addresses in the output from the **show ospf neighbors** command:

```
user@host> show ospf neighbors | resolve
```

### [Saving Output to a File](#)

---

When command output is lengthy, when you need to store or analyze the output, or when you need to send the output in an e-mail or by FTP, you can save the output to a file. By default, the file is placed in your home directory on the router.

To save command output to a file, enter **save *filename*** after the pipe symbol ( | ).

The following example saves the output from the **request support information** command to a file named **my-support-info.txt**:

```
user@host> request support information | save my-support-info.txt
Wrote 1143 lines of output to 'my-support-info.txt'
user@host>
```

### [Trimming Output by Specifying the Starting Column](#)

---

Output appears on the terminal screen in terms of rows and columns. The first alphanumeric character starting at the left of the screen is in column 1, the second character is in column 2, and so on. To display output starting from a specific column (thus trimming the leftmost portion of the output), enter **trim *columns*** after the pipe symbol ( | ). The **trim** filter is useful for trimming the date and time from the beginning of system log messages

The following example displays output from the **show system storage** command, filtering out the first 10 columns:

```
user@host> show system storage | trim 11
```

- [Additional Details About Specifying Junos Statements and Identifiers on page 344](#)

### [Understanding Junos OS CLI Configuration Mode](#)

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in “[Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies](#)” on page 311, a router configuration is stored as a hierarchy of statements. In

configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- [Configuration Mode Commands on page 336](#)
- [Configuration Statements and Identifiers on page 337](#)
- [Configuration Statement Hierarchy on page 339](#)

## Configuration Mode Commands

Table 43 on page 336 summarizes each CLI configuration mode command. The commands are organized alphabetically.

**Table 43: Summary of Configuration Mode Commands**

Command	Description
<b>activate</b>	Remove the <b>inactive:</b> tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the <b>commit</b> command.
<b>annotate</b>	Add comments to a configuration. You can add comments only at the current hierarchy level.
<b>commit</b>	Commit the set of changes to the database and cause the changes to take operational effect.
<b>copy</b>	Make a copy of an existing statement in the configuration.
<b>deactivate</b>	Add the <b>inactive:</b> tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the <b>commit</b> command.
<b>delete</b>	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
<b>edit</b>	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
<b>exit</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>extension</b>	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
<b>help</b>	Display help about available configuration statements.
<b>insert</b>	Insert an identifier into an existing hierarchy.
<b>load</b>	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 43: Summary of Configuration Mode Commands (*continued*)

Command	Description
<b>quit</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>rename</b>	Rename an existing configuration statement or identifier.
<b>replace</b>	Replace identifiers or values in a configuration.
<b>rollback</b>	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit configuration</b> command.
<b>run</b>	Run a top-level CLI command without exiting from configuration mode.
<b>save</b>	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
<b>set</b>	Create a statement hierarchy and set identifier values. This is similar to <b>edit</b> except that your current level in the hierarchy does not change.
<b>show</b>	Display the current configuration.
<b>status</b>	Display the users currently editing the configuration.
<b>top</b>	Return to the top level of configuration command mode, which is indicated by the <b>[edit]</b> banner.
<b>up</b>	Move up one level in the statement hierarchy.
<b>update</b>	Update a private database.
<b>wildcard</b>	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

### Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 44 on page 338 describes top-level CLI configuration mode statements.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

**Table 44: Configuration Mode Top-Level Statements**

Statement	Description
<b>access</b>	Configure the Challenge Handshake Authentication Protocol (CHAP).
<b>accounting-options</b>	Configure accounting statistics data collection for interfaces and firewall filters. .
<b>chassis</b>	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. .
<b>class-of-service</b>	Configure class-of-service parameters. For information about the statements in this hierarchy, see the <i>Junos OS CoS Library for Security Devices</i> .
<b>firewall</b>	Define filters that select packets based on their contents. .
<b>forwarding-options</b>	Define forwarding options, including traffic sampling options. .
<b>groups</b>	Configure configuration groups. .
<b>interfaces</b>	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the <i>Junos OS Interfaces Library for Security Devices</i> .
<b>policy-options</b>	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. .
<b>protocols</b>	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the <i>Junos OS Routing Protocols Library for Security Devices</i> and the <i>MPLS Feature Guide for Security Devices</i> .
<b>routing-instances</b>	Configure multiple routing instances. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Security Devices</i> .
<b>routing-options</b>	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Security Devices</i> .
<b>security</b>	Configure IP Security (IPsec) services. .

Table 44: Configuration Mode Top-Level Statements (*continued*)

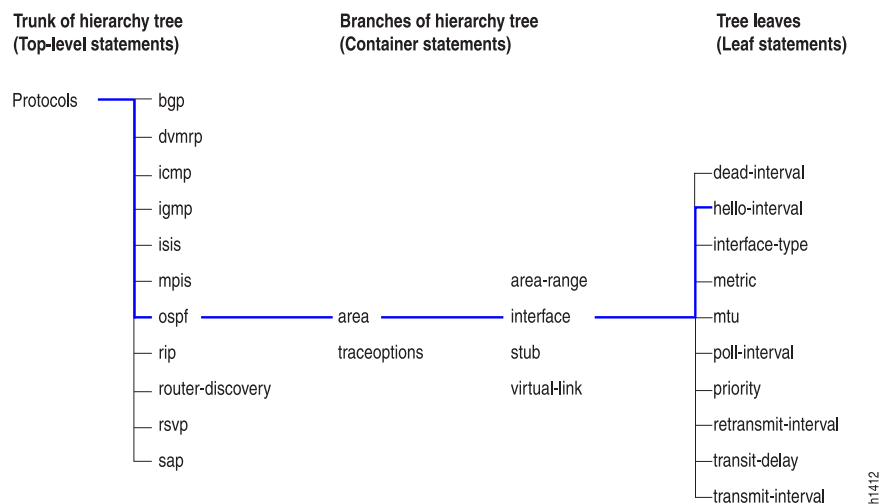

Statement	Description
<b>snmp</b>	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the <i>SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices</i> .
<b>system</b>	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. .

For specific information on configuration statements, see [CLI Explorer](#).

### Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see [Figure 13 on page 339](#)). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 13: Configuration Mode Hierarchy of Statements

Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. [Figure 13 on page 339](#) illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in [Figure 13 on page 339](#) as **[edit protocols ospf area *area-number* interface *interface-name*]** and displays the configuration as follows:

```
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
      interface so-0/0/1 {
        hello-interval 5;
      }
    }
  }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain “oneliners” at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric 10** is a oneliner because the **level** container statement with identifier **1**, its child statement **metric**, and its corresponding attribute **10** all appear on a single line in the hierarchy:

```
[edit protocols]
isis {
  interface ge-0/0/0.0 {
    level 1 metric 10;
  }
}
```

Likewise, in the following example, **dynamic-profile *dynamic-profile-name* aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier ***dynamic-profile-name***, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

#### Related Documentation

- [Entering and Exiting the Junos OS CLI Configuration Mode on page 358](#)

## Modifying the Junos OS Configuration

To configure a device running Junos OS or to modify an existing Junos configuration, you add statements to the configuration. For each statement hierarchy, you create the hierarchy starting with a statement at the top level and continuing with statements that move progressively lower in the hierarchy.

To modify the hierarchy, you use two configuration mode commands:

- **edit**—Moves to a particular hierarchy level. If that hierarchy level does not exist, the **edit** command creates it. The **edit** command has the following syntax:  
`edit <statement-path>`
- **set**—Creates a configuration statement and sets identifier values. After you issue a **set** command, you remain at the same level in the hierarchy. The **set** command has the following syntax:

`set <statement-path> statement <identifier>`

**statement-path** is the hierarchy to the configuration statement and the statement itself. If you have already moved to the statement's hierarchy level, you can omit the statement path. **statement** is the configuration statement itself. **identifier** is a string that identifies an instance of a statement.

You cannot use the **edit** command to change the value of identifiers. You must use the **set** command.

## Commit Operation When Multiple Users Configure the Software

Up to 32 users can be in configuration mode simultaneously, and they all can be making changes to the configuration. All changes made by all users are visible to everyone editing the configuration—the changes become visible as soon as the user presses the Enter key at the end of a command that changes the configuration, such as **set**, **edit**, or **delete**.

When any of the users editing the configuration issues a **commit** command, all changes made by all users are checked and activated.

If you enter configuration mode with the **configure private** command, each user has a private candidate configuration to edit somewhat independently of other users. When you commit the configuration, only your own changes get committed. To synchronize your copy of the configuration after other users have committed changes, you can run the **update** command in configuration mode. A commit operation also updates all of the private candidate configurations. For example, suppose user X and user Y are both in

**configure private** mode, and user X commits a configuration change. When user Y performs a subsequent commit operation and then views the new configuration, the new configuration seen by user Y includes the changes made by user X.

If you enter configuration mode with the **configure exclusive** command, you lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot commit the configuration. This is true even if the other users entered configuration mode before you enter the **configure exclusive** command. For example, suppose user X is already in the **configure private** or **configure** mode. Then suppose user Y enters the **configure exclusive** mode. User X cannot commit any changes to the configuration, even if those changes were entered before user Y logged in. If user Y exits **configure exclusive** mode, user X can then commit the changes made in **configure private** or **configure** mode.

**Related  
Documentation**

- [Committing a Junos OS Configuration on page 406](#)
- [Forms of the configure Command on page 342](#)
- [Displaying Users Currently Editing the Configuration on page 364](#)

## Forms of the configure Command

The Junos OS supports three forms of the **configure** command: **configure**, **configure private**, and **configure exclusive**. These forms control how users edit and commit configurations and can be useful when multiple users configure the software. See [Table 45 on page 343](#).

Table 45: Forms of the configure Command

Command	Edit Access	Commit Access
<b>configure</b>	<ul style="list-style-type: none"> <li>No one can lock the configuration. All users can make configuration changes.</li> </ul> <p>When you enter configuration mode, the CLI displays the following information:</p> <ul style="list-style-type: none"> <li>A list of other users editing the configuration.</li> <li>Hierarchy levels the users are viewing or editing.</li> <li>Whether the configuration has been changed, but not committed.</li> <li>When multiple users enter conflicting configurations, the most recent change to be entered takes precedence.</li> </ul>	<ul style="list-style-type: none"> <li>No one can lock the configuration. All users can commit all changes to the configuration.</li> <li>If you and another user make changes and the other user commits changes, your changes are committed as well.</li> </ul>
<b>configure exclusive</b>	<ul style="list-style-type: none"> <li>One user locks the configuration and makes changes without interference from other users.</li> <li>Other users can enter and exit configuration mode, but they cannot commit the configuration.</li> <li>If you enter configuration mode while another user has locked the configuration (with the <b>configure exclusive</b> command), the CLI displays the user and the hierarchy level the user is viewing or editing.</li> <li>If you enter configuration mode while another user has locked the configuration, you can forcibly log out that user with the <b>request system logout</b> operational mode command. For details, see <a href="#">CLI Explorer</a>.</li> </ul>	
<b>configure private</b>	<ul style="list-style-type: none"> <li>Multiple users can edit the configuration at the same time.</li> <li>Each user has a private candidate configuration to edit independently of other users.</li> <li>When multiple users enter conflicting configurations, the first commit operation takes precedence over subsequent commit operations.</li> </ul>	<ul style="list-style-type: none"> <li>When you commit the configuration, the router verifies that the operational (running) configuration has not been modified by another user before accepting your private candidate configuration as the new operational configuration.</li> <li>If the configuration has been modified by another user, you can merge the modifications into your private candidate configuration and attempt to commit again.</li> </ul>

## Additional Details About Specifying Junos Statements and Identifiers

This topic provides more detailed information about CLI container and leaf statements so that you can better understand how you must specify them when creating ASCII configuration files. It also describes how the CLI performs type checking to verify that the data you entered is in the correct format.

- [Specifying Statements on page 344](#)
- [Performing CLI Type-Checking on page 346](#)

### Specifying Statements

---

Statements are shown one of two ways, either with braces or without:

- Statement name and identifier, with one or more lower level statements enclosed in braces:

```
statement-name1 identifier-name {  
    statement-name2;  
    additional-statements;  
}
```

- Statement name, identifier, and a single identifier:

```
statement-name identifier-name1 identifier-name2;
```

The **statement-name** is the name of the statement.

The **identifier-name** is a name or other string that uniquely identifies an instance of a statement. An identifier is used when a statement can be specified more than once in a configuration.

When specifying a statement, you must specify either a statement name or an identifier name, or both, depending on the statement hierarchy.

You specify identifiers in one of the following ways:

- **identifier-name**—The **identifier-name** is a keyword used to uniquely identify a statement when a statement can be specified more than once in a statement.
- **identifier-name value**—The **identifier-name** is a keyword, and the **value** is a required option variable.

- **identifier-name** [*value1 value2 value3 ...*]  
—The **identifier-name** is a keyword that accepts multiple values. The brackets are required when you specify a set of values; however, they are optional when you specify only one value.

The following examples illustrate how statements and identifiers are specified in the configuration:

```
protocol {          # Top-level statement (statement-name).
  ospf {           # Statement under "protocol" (statement-name).
    area 0.0.0.0 {  # OSPF area "0.0.0.0" (statement-name identifier-name),
      interface so-0/0/0 { # which contains an interface named "so-0/0/0."
        hello-interval 25; # Identifier and value (identifier-name value).
        priority 2;        # Identifier and value (identifier-name value).
        disable;          # Flag identifier (identifier-name).
      }
      interface so-0/0/1; # Another instance of "interface," named so-0/0/1,
    }                   # this instance contains no data, so no braces
  }                   # are displayed.
}

policy-options {   # Top-level statement (statement-name).
  term term1 {     # Statement under "policy-options"
    # (statement-name value).
    from {         # Statement under "term" (statement-name).
      route-filter 10.0.0.0/8 orlonger reject; # One identifier ("route-filter")
    with
      route-filter 127.0.0.0/8 orlonger reject; # multiple values.
      route-filter 128.0.0.0/16 orlonger reject;
      route-filter 149.20.64.0/24 orlonger reject;
      route-filter 172.16.0.0/12 orlonger reject;
      route-filter 191.255.0.0/16 orlonger reject;
    }
    then {         # Statement under "term" (statement-name).
      next term;   # Identifier (identifier-name).
    }
  }
}
```

When you create an ASCII configuration file, you can specify statements and identifiers in one of the following ways. However, each statement has a preferred style, and the CLI uses that style when displaying the configuration in response to a configuration mode **show** command.

- Statement followed by identifiers:

**statement-name identifier-name [...]** **identifier-name value [...]**;

- Statement followed by identifiers enclosed in braces:

```
statement-name {
  identifier-name;
  [...];
  identifier-name value;
  [...];
}
```

- For some repeating identifiers, you can use one set of braces for all the statements:

```
statement-name {
  identifier-name value1;
  identifier-name value2;
```

}

### Performing CLI Type-Checking

When you specify identifiers and values, the CLI performs type checking to verify that the data you entered is in the correct format. For example, for a statement in which you must specify an IP address, the CLI requires you to enter an address in a valid format. If you have not, an error message indicates what you need to type. [Table 46 on page 346](#) lists the data types the CLI checks.

**Table 46: CLI Configuration Input Types**

Data Type	Format	Examples
Physical interface name (used in the <b>[edit interfaces]</b> hierarchy)	<i>type-fpc/pic/port</i>	Correct: so-0/0/1  Incorrect: so-0
Full interface name	<i>type-fpc/pic/port&lt;:channel&gt;.logical</i>	Correct: so-0/0/1.0  Incorrect: so-0/0/1
Full or abbreviated interface name (used in places other than the <b>[edit interfaces]</b> hierarchy)	<i>type-&lt;fpc&lt;/pic/port&gt;&gt;&lt;&lt;:channel&gt;.logical&gt;</i>	Correct: so, so-1, so-1/2/3:4.5
IP address	<i>0xhex-bytesoctet&lt;.octet&lt;.octet&lt;.octet&gt;&gt;&gt;</i>	Correct: 1.2.3.4, 0x01020304, 128.8.1, 128.8  Sample translations:  1.2.3 becomes 1.2.3.0 0x01020304 becomes 1.2.3.4 0x010203 becomes 0.1.2.3
IP address (destination prefix) and prefix length	<i>0xhex-bytes&lt;/length&gt;octet&lt;octet&lt;.octet&lt;.octet&gt;&gt;&gt;&lt;/length&gt;</i>	Correct: 10/8, 128.8/16, 1.2.3.4/32, 1.2.3.4  Sample translations:  1.2.3 becomes 1.2.3.0/32 0x01020304 becomes 1.2.3.4/32 0x010203 becomes 0.1.2.3/32 default becomes 0.0.0.0/0
International Organization for Standardization (ISO) address	<i>hex-nibble&lt;hex-nibble ...&gt;</i>	Correct: 47.1234.2345.3456.00, 47.123423453456.00, 47.12.34.23.45.34.56.00  Sample translations:  47123456 becomes 47.1234.56 47.12.34.56 becomes 47.1234.56 4712.3456 becomes 47.1234.56

Table 46: CLI Configuration Input Types *(continued)*

Data Type	Format	Examples
OSPF area identifier (ID)	<i>0xhex-bytesoctet&lt;.octet&lt;.octet.&lt; octet &gt;&gt;&gt; decimal-number</i>	<p><b>Correct:</b> 54, 0.0.0.54, 0x01020304, 1.2.3.4</p> <p><b>Sample translations:</b></p> <p>54 becomes 0.0.0.54</p> <p>257 becomes 0.0.1.1</p> <p>128.8 becomes 128.8.0.0</p> <p>0x010203 becomes 0.1.2.3</p>

- [Using Global Replace in a Junos Configuration on page 349](#)

### Using Keyboard Sequences to Move Around and Edit the Junos OS CLI

You can use keyboard sequences in the Junos OS command-line interface (CLI) to move around and edit the command line. You can also use keyboard sequences to scroll through a list of recently executed commands. [Table 47 on page 347](#) lists some of the CLI keyboard sequences. They are the same as those used in Emacs.

Table 47: CLI Keyboard Sequences

Category	Action	Keyboard Sequence
Move the Cursor	Move the cursor back one character.	Ctrl+b
	Move the cursor back one word.	Esc+b or Alt+b
	Move the cursor forward one character.	Ctrl+f
	Move the cursor forward one word.	Esc+f or Alt+f
	Move the cursor to the beginning of the command line.	Ctrl+a
	Move the cursor to the end of the command line.	Ctrl+e

Table 47: CLI Keyboard Sequences (*continued*)

Category	Action	Keyboard Sequence
Delete Characters	Delete the character before the cursor.	Ctrl+h, Delete, or Backspace
	Delete the character at the cursor.	Ctrl+d
	Delete all characters from the cursor to the end of the command line.	Ctrl+k
	Delete all characters on the command line.	Ctrl+u or Ctrl+x
	Delete the word before the cursor.	Ctrl+w, Esc+Backspace, or Alt+Backspace
	Delete the word after the cursor.	Esc+d or Alt+d
Insert Recently Deleted Text	Insert the most recently deleted text at the cursor.	Ctrl+y
Redraw the Screen	Redraw the current line.	Ctrl+l
Display Previous Command Lines	Scroll backward through the list of recently executed commands.	Ctrl+p
	Scroll forward through the list of recently executed commands.	Ctrl+n
	Search the CLI history in reverse order for lines matching the search string.	Ctrl+r
	Search the CLI history by typing some text at the prompt, followed by the keyboard sequence. The CLI attempts to expand the text into the most recent word in the history for which the text is a prefix.	Esc+/ sequence
Display Previous Command Words	Scroll backward through the list of recently entered words in a command line.	Esc+. or Alt+.
Repeat Keyboard Sequences	Specify the number of times to execute a keyboard sequence. <i>number</i> can be from 1 through 9 and <i>sequence</i> is the keyboard sequence that you want to execute.	Esc+ <i>number</i> <i>sequence</i> or Alt+ <i>number</i> <i>sequence</i>

**Related Documentation**

- [Using Wildcard Characters in Interface Names on page 349](#)

- [Using Global Replace in a Junos Configuration on page 349](#)

## Using Wildcard Characters in Interface Names

You can use wildcard characters in the Junos OS operational commands to specify groups of interface names without having to type each name individually. [Table 48 on page 349](#) lists the available wildcard characters. You must enclose all wildcard characters except the asterisk (\*) in quotation marks (" ").

**Table 48: Wildcard Characters for Specifying Interface Names**

Wildcard Character	Description
<b>* (asterisk)</b>	Match any string of characters in that position in the interface name. For example, <b>so*</b> matches all SONET/SDH interfaces.
<b>"[character&lt;character...&gt;]"</b>	Match one or more individual characters in that position in the interface name. For example, <b>so-"[03]"*</b> matches all SONET/SDH interfaces in slots 0 and 3.
<b>"[!character&lt;character...&gt;]"</b>	Match all characters except the ones included in the brackets. For example, <b>so-"[!03]"*</b> matches all SONET/SDH interfaces except those in slots 0 and 3.
<b>"[character1-character2]"</b>	Match a range of characters. For example, <b>so-"[0-3]"*</b> matches all SONET/SDH interfaces in slots 0, 1, 2, and 3.
<b>"[!character1-character2]"</b>	Match all characters that are not in the specified range of characters. For example, <b>so-"[!0-3]"*</b> matches all SONET/SDH interfaces in slots 4, 5, 6, and 7.

- [Using Global Replace in a Junos Configuration on page 349](#)

## Using Global Replace in a Junos Configuration

You can make global changes to variables and identifiers in a Junos configuration by using the **replace** configuration mode command. This command replaces a pattern in a configuration with another pattern. For example, you can use this command to find and replace all occurrences of an interface name when a PIC is moved to another slot in the router.

```
user@host# replacepattern pattern1 with pattern2 <upto n>
```

**pattern** *pattern1* is a text string or regular expression that defines the identifiers and values you want to replace in the configuration.

**pattern2** is a text string or regular expression that replaces the identifiers and values located with *pattern1*.

Juniper Networks uses standard UNIX-style regular expression syntax (as defined in POSIX 1003.2). If the regular expression contains spaces, operators, or wildcard characters, enclose the expression in quotation marks. Greedy qualifiers (match as much as possible) are supported. Lazy qualifiers (match as little as possible) are not.

The **upto *n*** option specifies the number of objects replaced. The value of *n* controls the total number of objects that are replaced in the configuration (not the total number of times the pattern occurs). Objects at the same hierarchy level (siblings) are replaced first. Multiple occurrences of a pattern within a given object are considered a single replacement. For example, if a configuration contains a **010101** text string, the command **replace pattern 01 with pattern 02 upto 2** replaces **010101** with **020202** (instead of **020201**). Replacement of **010101** with **020202** is considered a single replacement (*n* = 1), not three separate replacements (*n* = 3).

If you do not specify an **upto** option, all identifiers and values in the configuration that match *pattern1* are replaced.

The **replace** command is available in configuration mode at any hierarchy level. All matches are case-sensitive.

## CLI Commit Operations

- [Junos OS Commit Model for Router or Switch Configuration on page 350](#)
- [Commit Operation When Multiple Users Configure the Software on page 351](#)
- [Junos OS Batch Commits Overview on page 352](#)

### Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model: that is, a candidate configuration is modified as desired and then committed to the system. Once a configuration has been committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The former active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and all other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (1–49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (`juniper.conf.gz.1`, `juniper.conf.gz.2`, `juniper.conf.gz.3`) are located in the `/config` directory. If the file `rescue.conf.gz` is saved on the system, this file should also be saved in the `/config` directory. The factory default files are located in the `/etc/config` directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

## Commit Operation When Multiple Users Configure the Software

Up to 32 users can be in configuration mode simultaneously, and they all can be making changes to the configuration. All changes made by all users are visible to everyone editing the configuration—the changes become visible as soon as the user presses the Enter key at the end of a command that changes the configuration, such as **set**, **edit**, or **delete**.

When any of the users editing the configuration issues a **commit** command, all changes made by all users are checked and activated.

If you enter configuration mode with the **configure private** command, each user has a private candidate configuration to edit somewhat independently of other users. When you commit the configuration, only your own changes get committed. To synchronize your copy of the configuration after other users have committed changes, you can run the **update** command in configuration mode. A commit operation also updates all of the private candidate configurations. For example, suppose user X and user Y are both in **configure private** mode, and user X commits a configuration change. When user Y performs a subsequent commit operation and then views the new configuration, the new configuration seen by user Y includes the changes made by user X.

If you enter configuration mode with the **configure exclusive** command, you lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot commit the configuration. This is true even if the other users entered configuration mode before you enter the **configure exclusive** command. For example, suppose user X is already in the **configure private** or **configure** mode. Then suppose user Y enters the **configure exclusive** mode. User X cannot commit any changes to the configuration, even if those changes were entered before user Y logged in. If user Y exits **configure exclusive** mode, user X can then commit the changes made in **configure private** or **configure** mode.

## Junos OS Batch Commits Overview

Junos OS provides a batch commit feature that aggregates or merges multiple configuration edits from different CLI sessions or users and adds them to a batch commit queue. A batch commit server running on the device takes one or more jobs from the batch commit queue, applies the configuration changes to the shared configuration database, and then commits the configuration changes in a single commit operation.

Batches are prioritized by the commit server based on priority of the batch specified by the user or the time when the batch job is added. When one batch commit is complete, the next set of configuration changes are aggregated and loaded into the batch queue for the next session of the batch commit operation. Batches are created until there are no commit entries left in the queue directory.

When compared to the regular commit operation where all commits are independently committed sequentially, batch commits save time and system resources by committing multiple small configuration edits in a single commit operation.

Batch commits are performed from the **[edit batch]** configuration mode. The commit server properties can be configured at the **[edit system commit server]** hierarchy level.

### Aggregation and Error Handling

---

When there is a load-time error in one of the aggregated jobs, the commit job that encounters the error is discarded and the remaining jobs are aggregated and committed.

For example, if there are five commit jobs (**commit-1**, **commit-2**, **commit-3**, **commit-4**, and **commit-5**) being aggregated, and **commit-3** encounters an error while loading, **commit-3** is discarded and **commit-1**, **commit-2**, **commit-4**, and **commit-5** are aggregated and committed.

If there is an error during the commit operation when two or more jobs are aggregated and committed, the aggregation is discarded and each of those jobs is committed individually like a regular commit operation.

For example, if there are five commit jobs (**commit-1**, **commit-2**, **commit-3**, **commit-4**, and **commit-5**) that are aggregated and if there is a commit error caused because of **commit-3**, the aggregation is discarded, **commit-1**, **commit-2**, **commit-3**, **commit-4**, and **commit-5** are committed individually, and the CLI reports a commit error for **commit-3**.

## Configuration Groups

---

- [Understanding the Junos Configuration Groups on page 353](#)

### Understanding the Junos Configuration Groups

This topic provides you an overview of the configuration groups feature and the inheritance model in Junos OS, and contains the following sections:

- [Configuration Groups Overview on page 353](#)
- [Inheritance Model on page 354](#)
- [Configuring Configuration Groups on page 354](#)

#### Configuration Groups Overview

---

The configuration groups feature in Junos OS enables you to create a group containing configuration statements and to direct the inheritance of that group's statements in the rest of the configuration. The same group can be applied to different sections of the configuration, and different sections of one group's configuration statements can be inherited in different places in the configuration.

Configuration groups enable you to create smaller, more logically constructed configuration files, making it easier to configure and maintain Junos OS. For example, you can group statements that are repeated in many places in the configuration, such as when configuring interfaces, and thereby limit updates to just the group.

You can also use wildcards in a configuration group to allow configuration data to be inherited by any object that matches a wildcard expression.

The configuration group mechanism is separate from the grouping mechanisms used elsewhere in the configuration, such as BGP groups. Configuration groups provide a generic mechanism that can be used throughout the configuration but that are known only to Junos OS command-line interface (CLI). The individual software processes that perform the actions directed by the configuration receive the expanded form of the configuration; they have no knowledge of configuration groups.

## Inheritance Model

---

Configuration groups use true inheritance, which involves a dynamic, ongoing relationship between the source of the configuration data and the target of that data. Data values changed in the configuration group are automatically inherited by the target. The target need not contain the inherited information, although the inherited values can be overridden in the target without affecting the source from which they were inherited.

This inheritance model allows you to see only the instance-specific information without seeing the inherited details. A command pipe in configuration mode allows you to display the inherited data.

## Configuring Configuration Groups

---

For areas of your configuration to inherit configuration statements, you must first put the statements into a configuration group and then apply that group to the levels in the configuration hierarchy that require the statements.

To configure configuration groups and inheritance, you can include the **groups** statement at the **[edit]** hierarchy level:

```
[edit]
groups {
  group-name {
    configuration-data;
  }
}
```

Include the **apply-groups [ group-names ]** statement anywhere in the configuration that the configuration statements contained in a configuration group are needed.

**Related Documentation**

- [Creating a Junos Configuration Group on page 428](#)

## Configuration Management

---

- [Understanding How the Junos Configuration Is Stored on page 354](#)

### Understanding How the Junos Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently

committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

The currently operational Junos OS configuration is stored in the file **juniper.conf** and the last three committed configurations are stored in the files **juniper.conf.1**, **juniper.conf.2**, and **juniper.conf.3**. These four files are located in the directory **/config**, which is on the switch's hard disk. The remaining 46 previous versions of committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config** on the hard disk.

- [Example: Configuring a Routing Protocol on page 374](#)

## Entering and Exiting the Junos OS CLI Configuration Mode

You configure Junos OS by entering configuration mode and creating a hierarchy of configuration mode statements.

- To enter configuration mode, use the **configure** command.

When you enter configuration mode, the following configuration mode commands are available:

```
user@host>configure
entering configuration mode

[edit]
user@host#?
possible completions:
  <[Enter]>      Execute this command
  activate       Remove the inactive tag from a statement
  annotate       Annotate the statement with a comment
  commit         Commit current set of changes
  copy           Copy a statement
  deactivate     Add the inactive tag to a statement
  delete         Delete a data element
  edit           Edit a sub-element
  exit           Exit from this level
  help           Provide help information
  insert         Insert a new ordered data element
  load           Load configuration from ASCII file
  quit           Quit from this level
  rename         Rename a statement
  replace        Replace character string in configuration
  rollback       Roll back to previous committed configuration
  run            Run an operational-mode command
  save           Save configuration to ASCII file
  set            Set a parameter
  show           Show a parameter
  status         Show users currently editing configuration
  top            Exit to top level of configuration
  up             Exit one level of configuration
  wildcard       Wildcard operations
[edit]
user@host>
```

Users must have configure permission to view and use the **configure** command. When in configuration mode, a user can view and modify only those statements for which they have access privileges set. For more information, see the *Access Privilege Administration Guide*.

- If you enter configuration mode and another user is also in configuration mode, a message shows the user's name and what part of the configuration the user is viewing or editing:

```
user@host> configure
Entering configuration mode
Users currently editing the configuration:
  root terminal d0 (pid 4137) on since 2008-04-09 23:03:07 PDT, idle 7w6d 08:22

[edit]
The configuration has been changed but not committed
```

```
[edit]
user@host#
```

Up to 32 users can be in configuration mode simultaneously, and they all can make changes to the configuration at the same time.

- To exit configuration mode, use the **exit configuration-mode** configuration mode command from any level, or use the **exit** command from the top level. For example:

```
[edit protocols ospf area 0.0.0.0 interface so-0/0/0]
user@host# exit configuration-mode
exiting configuration mode
user@host>
```

```
[edit]
user@host# exit
exiting configuration mode
user@host>
```

If you try to exit from configuration mode using the **exit** command and the configuration contains changes that have not been committed, you see a message and prompt:

```
[edit]
user@host# exit
The configuration has been changed but not committed
Exit with uncommitted changes? [yes,no] (yes) <Enter>
Exiting configuration mode
user@host>
```

- To exit with uncommitted changes without having to respond to a prompt, use the **exit configuration-mode** command. This command is useful when you are using scripts to perform remote configuration.

```
[edit]
user@host# exit configuration-mode
The configuration has been changed but not committed
Exiting configuration mode
user@host>
```

## Displaying the Current Junos OS Configuration

To display the current configuration for a device running Junos OS, use the **show** configuration mode command. This command displays the configuration at the current hierarchy level or at the specified level.

```
user@host# show <statement-path>
```

The configuration statements appear in a fixed order, interfaces appear alphabetically by type, and then in numerical order by slot number, PIC number, and port number. Note that when you configure the router, you can enter statements in any order.

You also can use the CLI operational mode **show configuration** command to display the last committed current configuration, which is the configuration currently running on the router:

```
user@host> show configuration
```

When you show a configuration, a timestamp at the top of the configuration indicates when the configuration was last changed:

```
## Last commit: 2006-07-18 11:21:58 PDT by echen
version 8.3
```

If you have omitted a required statement at a particular hierarchy level, when you issue the **show** command in configuration mode, a message indicates which statement is missing. As long as a mandatory statement is missing, the CLI continues to display this message each time you issue a **show** command. For example:

```
[edit]
user@host# show
protocols {
  pim {
    interface so-0/0/0 {
      priority 4;
      version 2;
      # Warning: missing mandatory statement(s): 'mode'
    }
  }
}
```

### Related Documentation

- [Example: Displaying the Current Junos OS Configuration on page 360](#)
- [Displaying set Commands from the Junos OS Configuration on page 361](#)

## Example: Displaying the Current Junos OS Configuration

The following example shows how you can display the current Junos configuration. To display the entire configuration:

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface so-0/0/0 hello-interval 5
[edit]
user@host# show
protocols {
```

```
ospf {
  area 0.0.0.0 {
    interface so-0/0/0 {
      hello-interval 5;
    }
  }
}
```

Display a particular hierarchy in the configuration:

```
[edit]
user@host# show protocols ospf area 0.0.0.0
interface so-0/0/0 {
  hello-interval 5;
}
```

Move down a level and display the configuration at that level:

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
[edit protocols ospf area 0.0.0.0]
user@host# show
interface so-0/0/0 {
  hello-interval 5;
}
```

Display all of the last committed configuration:

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface so-0/0/0 hello-interval 5
[edit]
user@host# commit
commit complete
[edit]
user@host# quit
exiting configuration mode
user@host> show configuration
## Last commit: 2006-08-10 11:21:58 PDT by user
version 8.3
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
    }
  }
}
```

**Related Documentation** • [Displaying the Current Junos OS Configuration on page 360](#)

## Displaying set Commands from the Junos OS Configuration

In configuration mode, you can display the configuration as a series of configuration mode commands required to re-create the configuration. This is useful if you are not familiar

with how to use configuration mode commands or if you want to cut, paste, and edit the displayed configuration.

To display the configuration as a series of configuration mode commands, which are required to re-create the configuration from the top level of the hierarchy as **set** commands, issue the **show** configuration mode command with the **display set** option:

```
user@host# show | display set
```

This topic contains the following examples:

- [Example: Displaying set Commands from the Configuration on page 362](#)
- [Example: Displaying Required set Commands at the Current Hierarchy Level on page 362](#)
- [Example: Displaying set Commands with the match Option on page 363](#)

#### Example: Displaying set Commands from the Configuration

Display the **set** commands from the configuration at the **[edit interfaces]** hierarchy level:

```
[edit interfaces fe-0/0/0]
user@host# show
unit 0 {
  family inet {
    address 192.107.1.230/24;
  }
  family iso;
  family mpls;
}
inactive: unit 1 {
  family inet {
    address 10.0.0.1/8;
  }
}
user@host# show | display set
set interfaces fe-0/0/0 unit 0 family inet address 192.107.1.230/24
set interfaces fe-0/0/0 unit 0 family iso
set interfaces fe-0/0/0 unit 0 family mpls
set interfaces fe-0/0/0 unit 1 family inet address 10.0.0.1/8
deactivate interfaces fe-0/0/0 unit 1
```

To display the configuration as a series of configuration mode commands required to re-create the configuration from the current hierarchy level, issue the **show** configuration mode command with the **display set relative** option:

```
user@host# show | display set relative
```

#### Example: Displaying Required set Commands at the Current Hierarchy Level

Display the configuration as a series of configuration mode commands required to re-create the configuration from the current hierarchy level:

```
[edit interfaces fe-0/0/0]
user@host# show
unit 0 {
  family inet {
    address 192.107.1.230/24;
  }
}
```

```

    }
    family iso;
    family mpls;
  }
  inactive: unit 1 {
    family inet {
      address 10.0.0.1/8;
    }
  }
}
user@host# show | display set relative
set unit 0 family inet address 192.107.1.230/24
set unit 0 family iso
set unit 0 family mpls
set unit 1 family inet address 10.0.0.1/8
deactivate unit 1

```

To display the configuration as **set** commands and search for text matching a regular expression by filtering output, specify the **match** option after the pipe ( | ):

```
user@host# show | display set | match regular-expression
```

### Example: Displaying set Commands with the match Option

Display IP addresses associated with an interface:

```

xe-2/3/0 {
  unit 0 {
    family inet {
      address 192.107.9.106/30;
    }
  }
}
so-5/1/0 {
  unit 0 {
    family inet {
      address 192.107.9.15/32 {
        destination 192.107.9.192;
      }
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 127.0.0.1/32;
    }
  }
}
user@host# show interfaces | display set | match address
set interfaces xe-2/3/0 unit 0 family inet address 192.168.9.106/30
set interfaces so-5/1/0 unit 0 family inet address 192.168.9.15/32 destination 192.168.9.192
set interfaces lo0 unit 0 family inet address 127.0.0.1/32

```

#### Related Documentation

## Displaying Users Currently Editing the Configuration

To display the users currently editing the configuration, use the **status** configuration mode command:

```
user@host# status
Users currently editing the configuration:
rchen terminal p0 (pid 55691) on since 2006-03-01 13:17:25 PST
[edit interfaces]
```

The system displays who is editing the configuration (**rchen**), where the user is logged in (**terminal p0**), the date and time the user logged in (**2006-03-01 13:17:25 PST**), and what level of the hierarchy the user is editing (**[edit interfaces]**).

If you issue the **status** configuration mode command and a user has scheduled a candidate configuration to become active for a future time, the system displays who scheduled the commit (**root**), where the user is logged in (**terminal d0**), the date and time the user logged in (**2002-10-31 14:55:15 PST**), and that a commit is pending (**commit at**).

```
[edit]
user@host# status
Users currently editing the configuration:
root terminal d0 (pid 767) on since 2002-10-31 14:55:15 PST, idle 00:03:09
commit at
```

For information about how to schedule a commit, see [“Scheduling a Junos Commit Operation” on page 410](#).

If you issue the **status** configuration mode command and a user is editing the configuration in configure exclusive mode, the system displays who is editing the configuration (**root**), where the user is logged in (**terminal d0**), the date and time the user logged in (**2002-11-01 13:05:11 PST**), and that a user is editing the configuration in configure exclusive mode (**exclusive [edit]**).

```
[edit]
user@host# status
Users currently editing the configuration:
root terminal d0 (pid 2088) on since 2002-11-01 13:05:11 PST
exclusive [edit]
```

## Displaying Additional Information About the Configuration

In configuration mode only, to display additional information about the configuration, use the **display detail** command after the pipe ( **|** ) in conjunction with a **show** command. The additional information includes the help string that explains each configuration statement and the permission bits required to add and modify the configuration statement.

```
user@host# show <hierarchy-level> | display detail
```

For example:

```
[edit]
user@host# show | display detail
##
## version: Software version information
## require: system
##
version "3.4R1 [tlim]";
system {
  ##
  ## host-name: Host name for this router
  ## match: ^[:alnum:]._-]+$
  ## require: system
  ##
}
host-name router-name;
##
## domain-name: Domain name for this router
## match: ^[:alnum:]._-]+$
## require: system
##
domain-name isp.net;
##
## backup-router: Address of router to use while booting
##
backup-router 192.168.100.1;
root-authentication {
  ##
  ## encrypted-password: Encrypted password string
  ##
  encrypted-password "$ABC123"; # SECRET-DATA
}
##
## name-server: DNS name servers
## require: system
##
name-server {
  ##
  ## name-server: DNS name server address
  ##
  208.197.1.0;
}
login {
  ##
  ## class: User name (login)
  ## match: ^[:alnum:]._-]+$
  ##
  class super-user {
    ##
    ## permissions: Set of permitted operation categories
    ##
    permissions all;
  }
  ...
  ##

}
##
vci 0.128;
}
}
...

```

**Related Documentation** • [Displaying set Commands from the Junos OS Configuration on page 361](#)

## Using the `configure exclusive` Command

If you enter configuration mode with the **`configure exclusive`** command, you lock the candidate *global* configuration (also known as the *shared configuration* or *shared configuration database*) for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot commit the configuration.

If another user has locked the configuration, and you need to forcibly log the person out, enter the operational mode command **`request system logout pid pid_number`**.

If you enter configuration mode and another user is also in configuration mode and has locked the configuration, a message identifies the user and the portion of the configuration that the user is viewing or editing:

```

user@host> configure
Entering configuration mode
Users currently editing the configuration:
root terminal p3 (pid 1088) on since 2000-10-30 19:47:58 EDT, idle 00:00:44
exclusive [edit interfaces so-3/0/0 unit 0 family inet]

```

In `configure exclusive` mode, any uncommitted changes are discarded when you exit:

```

user@host> configure exclusive
warning: uncommitted changes will be discarded on exit
Entering configuration mode
[edit]
user@host# set system host-name cool
[edit]
user@host# quit
The configuration has been changed but not committed
warning: Auto rollback on exiting 'configure exclusive'
Discard uncommitted changes? [yes,no] (yes)
warning: discarding uncommitted changes
load complete
Exiting configuration mode

```

When you use the **yes** option to exit configure exclusive mode, Junos OS discards your uncommitted changes and rolls back your configuration. The **no** option allows you to continue editing or to commit your changes in configure exclusive mode.

When a user exits from configure exclusive mode while another user is in configure private mode, Junos OS will roll back any uncommitted changes.

**Related  
Documentation**

- [Forms of the configure Command on page 342](#)

## Updating the configure private Configuration

When you are in configure private mode, you must work with a copy of the most recently committed shared configuration. If the global configuration changes, you can issue the **update** command to update your private candidate configuration. When you do this, your private candidate configuration contains a copy of the most recently committed configuration with your private changes merged in. For example:

```
[edit]
user@host# update
[edit]
user@host#
```

**NOTE:** Merge conflicts can occur when you issue the **update** command.

You can also issue the **rollback** command to discard your private candidate configuration changes and obtain the most recently committed configuration:

```
[edit]
user@host# rollback
[edit]
user@host#
```

**Related  
Documentation**

## Getting Started with the Junos OS Command-Line Interface

As an introduction to the Junos OS command-line interface (CLI), this topic provides instructions for simple steps you take after installing Junos OS on the device. It shows you how to start the CLI, view the command hierarchy, and make small configuration changes. The related topics listed at the end of this topic provide you more detailed information about using the CLI.

**NOTE:**

- The instructions and examples in this topic are based on sample M Series and T Series routers. You can use them as a guideline for entering commands on your devices running Junos OS.
- Before you begin, make sure your device hardware is set up and Junos OS is installed. You must have a direct console connection to the device or network access using SSH or Telnet. If your device is not set up, follow the installation instructions provided with the device before proceeding.

To log in to a router and start the CLI:

1. Log in as **root**.

The root login account has superuser privileges, with access to all commands and statements.

2. Start the CLI:

```
root# cli
root@>
```

The > command prompt shows you are in operational mode. Later, when you enter configuration mode, the prompt will change to #.

**NOTE:** If you are using the root account for the first time on the device, remember that the device ships with no password required for root, but the first time you commit a configuration with Junos OS Release 7.6 or later, you must set a root password. Root access is not allowed over a telnet session. To enable root access over an SSH connection, you must configure the `system services ssh root-login allow` statement.

The CLI includes several ways to get help about commands. This section shows some examples of how to get help:

1. Type **?** to show the top-level commands available in operational mode.

```
root@> ?
Possible completions:
clear          Clear information in the system
configure      Manipulate software configuration information
diagnose       Invoke diagnose script
file           Perform file operations
help           Provide help information
monitor        Show real-time debugging information
mtrace         Trace multicast path from source to receiver
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
set            Set CLI properties, date/time, craft interface message
show           Show system information
ssh            Start secure shell on another host
```

start	Start shell
telnet	Telnet to another host
test	Perform diagnostic debugging
tracert	Trace route to remote host

2. Type **file ?** to show all possible completions for the **file** command.

```
root@> file ?
```

Possible completions:

<[Enter]>	Execute this command
archive	Archives files from the system
checksum	Calculate file checksum
compare	Compare files
copy	Copy files (local or remote)
delete	Delete files from the system
list	List file information
rename	Rename files
show	Show file contents
source-address	Local address to use in originating the connection
	Pipe through a command

3. Type **file archive ?** to show all possible completions for the **file archive** command.

```
root@> file archive ?
```

Possible completions:

compress	Compresses the archived file using GNU gzip (.tgz)
destination	Name of created archive (URL, local, remote, or floppy)
source	Path of directory to archive

## Switching Between Junos OS CLI Operational and Configuration Modes

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (>) and the configuration mode prompt is a pound sign (#).

To switch between operational mode and configuration mode:

1. When you log in to the router and type the **cli** command, you are automatically in operational mode:

```
--- JUNOS 9.2B1.8 built 2008-05-09 23:41:29 UTC
% cli
user@host>
```

2. To enter configuration mode, type the **configure** command or the **edit** command from the CLI operation mode. For example:

```
user@host> configure
Entering configuration mode
```

```
[edit]
user@host#
```

The CLI prompt changes from **user@host>** to **user@host#** and a banner appears to indicate the hierarchy level.

3. You can return to operational mode in one of the following ways:

- To commit the configuration and exit:

```
[edit]
user@host# commit and-quit
commit complete
Exiting configuration mode
user@host>
```

- To exit without committing:

```
[edit]
user@host# exit
Exiting configuration mode
user@host>
```

When you exit configuration mode, the CLI prompt changes from **user@host#** to **user@host>** and the banner no longer appears. You can enter or exit configuration mode as many times as you wish without committing your changes.

4. To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command:

```
[edit]
user@host# run operational-mode-command
```

For example, to display the currently set priority value of the Virtual Router Redundancy Protocol (VRRP) primary router while you are modifying the VRRP configuration for a backup router:

```
[edit interfaces xe-4/2/0 unit 0 family inet vrrp-group 27]
user@host# show
virtual-address [ 192.168.1.15 ];
[edit interfaces xe-4/2/0 unit 0 family inet vrrp-group 27]
user@host# run show vrrp detail
Physical interface: xe-5/2/0, Unit: 0, Address: 192.168.29.10/24
Interface state: up, Group: 10, State: backup
Priority: 190, Advertisement interval: 3, Authentication type: simple
Preempt: yes, VIP count: 1, VIP: 192.168.29.55
Dead timer: 8.326, Master priority: 201, Master router: 192.168.29.254
[edit interfaces xe-4/2/0 unit 0 family inet vrrp-group 27]
user@host# set priority ...
```

## Configuring a User Account on a Device Running Junos OS

This topic describes how to log on to a device running Junos OS using a root account and configure a new user account. You can configure an account for your own use or create a test account.

To configure a new user account on the device:

1. Log in as root and enter configuration mode:

```
root@host> configure
[edit]
root@host#
```

The prompt in brackets (**[edit]**), also known as a *banner*, shows that you are in configuration edit mode at the top of the hierarchy.

2. Change to the **[edit system login]** section of the configuration:

```
[edit]
root@host# edit system login
[edit system login]
root@host#
```

The prompt in brackets changes to **[edit system login]** to show that you are at a new level in the hierarchy.

3. Now add a new user account:

```
[edit system login]
root@host# edit user nchen
```

This example adds an account **nchen** (for Nathan Chen).

4. Configure a full name for the account. If the name includes spaces, enclose the entire name in quotation marks (" "):

```
[edit system login user nchen]
root@host# set full-name "Nathan Chen"
```

5. Configure an account class. The account class sets the user access privileges for the account:

```
[edit system login user nchen]
root@host# set class super-user
```

6. Configure an authentication method and password for the account:

```
[edit system login user nchen]
root@host# set authentication plain-text-password
New password:
Retype new password:
```

When the new password prompt appears, enter a clear-text password that the system can encrypt, and then confirm the new password.

7. Commit the configuration:

```
[edit system login user nchen]
root@host# commit
commit complete
```

Configuration changes are not activated until you commit the configuration. If the commit is successful, a **commit complete** message appears.

8. Return to the top level of the configuration, and then exit:

```
[edit system login user nchen]
root@host# top
[edit]
root@host# exit
Exiting configuration mode
```

9. Log out of the device:

```
root@host> exit
% logout Connection closed.
```

10. To test your changes, log back in with the user account and password you just configured:

```
login: nchen
Password: password
--- Junos 8.3-R1.1 built 2005-12-15 22:42:19 UTC
nchen@host>
```

When you log in, you should see the new username at the command prompt.

You have successfully used the CLI to view the device status and perform a simple configuration change. See the related topics listed in this section for more information about the Junos OS CLI features.

**NOTE:** For complete information about the commands to issue to configure your device, including examples, see the Junos OS feature guides.

#### Related Documentation

- [Getting Started with the Junos OS Command-Line Interface on page 368](#)
- [Getting Online Help from the Junos OS Command-Line Interface on page 315](#)
- [Displaying the Junos OS CLI Command and Word History on page 455](#)
- [Example: Configuring a Routing Protocol on page 374](#)

## Example: Configuring a Routing Protocol

This topic provides a sample configuration that describes how to configure an OSPF backbone area that has two SONET interfaces.

The final configuration looks like this:

```
[edit]
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
        dead-interval 20;
      }
      interface so-0/0/1 {
        hello-interval 5;
        dead-interval 20;
      }
    }
  }
}
```

This topic contains the following examples of configuring a routing protocol:

- [Shortcut on page 375](#)
- [Longer Configuration on page 375](#)
- [Making Changes to a Routing Protocol Configuration on page 377](#)

### Shortcut

You can create a shortcut for this entire configuration with the following two commands:

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface so-0/0/0 hello-interval 5
dead-interval 20
[edit]
user@host# set protocols ospf area 0.0.0.0 interface so-0/0/1 hello-interval 5
dead-interval 20
```

### Longer Configuration

This section provides a longer example of creating the previous OSPF configuration. In the process, it illustrates how to use the different features of the CLI.

1. Enter configuration mode by issuing the **configure** top-level command:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

Notice that the prompt has changed to a pound sign (#) to indicate configuration mode.

2. To create the above configuration, you start by editing the **protocols ospf** statements:

```
[edit]
user@host# edit protocols ospf
[edit protocols ospf]
user@host#
```

3. Now add the OSPF area:

```
[edit protocols ospf]
user@host# edit area 0.0.0.0
[edit protocols ospf area 0.0.0.0]
user@host#
```

4. Add the first interface:

```
[edit protocols ospf area 0.0.0.0]
user@host# edit interface so0
[edit protocols ospf area 0.0.0.0 interface so-0/0/0]
user@host#
```

You now have four nested statements.

5. Set the hello and dead intervals.

```
[edit protocols ospf area 0.0.0.0 interface so-0/0/0]
user@host#set ?
```

```

user@host# set hello-interval 5
user@host# set dead-interval 20
user@host#

```

6. You can see what is configured at the current level with the **show** command:

```

[edit protocols ospf area 0.0.0.0 interface so-0/0/0]
user@host# show
hello-interval 5;
dead-interval 20;
[edit protocols ospf area 0.0.0.0 interface so-0/0/0]
user@host#

```

7. You are finished at this level, so back up a level and take a look at what you have so far:

```

[edit protocols ospf area 0.0.0.0 interface so-0/0/0]
user@host# up
[edit protocols ospf area 0.0.0.0]
user@host# show
interface so-0/0/0 {
    hello-interval 5;
    dead-interval 20;
}
[edit protocols ospf area 0.0.0.0]
user@host#

```

The **interface** statement appears because you have moved to the **area** statement.

8. Add the second interface:

```

[edit protocols ospf area 0.0.0.0]
user@host# edit interface so-0/0/1
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# set hello-interval 5
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# set dead-interval 20
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# up
[edit protocols ospf area 0.0.0.0]
user@host# show
interface so-0/0/0 {
    hello-interval 5;
    dead-interval 20;
}
interface so-0/0/1 {
    hello-interval 5;
    dead-interval 20;
}
[edit protocols ospf area 0.0.0.0]
user@host#

```

9. Back up to the top level and see what you have:

```

[edit protocols ospf area 0.0.0.0]
user@host# top
[edit]
user@host# show
protocols {
    ospf {

```

```

    area 0.0.0.0 {
        interface so-0/0/0 {
            hello-interval 5;
            dead-interval 20;
        }
        interface so-0/0/1 {
            hello-interval 5;
            dead-interval 20;
        }
    }
}
[edit]
user@host#

```

This configuration now contains the statements you want.

10. Before committing the configuration (and thereby activating it), verify that the configuration is correct:

```

[edit]
user@host# commit check
configuration check succeeds
[edit]
user@host#

```

11. Commit the configuration to activate it on the router:

```

[edit]
user@host# commit
commit complete
[edit]
user@host#

```

### Making Changes to a Routing Protocol Configuration

Suppose you decide to use different dead and hello intervals on interface **so-0/0/1**. You can make changes to the configuration.

1. Go directly to the appropriate hierarchy level by typing the full hierarchy path to the statement you want to edit:

```

[edit]
user@host# edit protocols ospf area 0.0.0.0 interface so-0/0/1
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# show
hello-interval 5;
dead-interval 20;
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# set hello-interval 7
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# set dead-interval 28
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# top
[edit]
user@host# show
protocols {

```

```

ospf {
  area 0.0.0.0 {
    interface so-0/0/0 {
      hello-interval 5;
      dead-interval 20;
    }
    interface so-0/0/1 {
      hello-interval 7;
      dead-interval 28;
    }
  }
}
[edit]
user@host#

```

2. If you decide not to run OSPF on the first interface, delete the statement:

```

[edit]
user@host# edit protocols ospf area 0.0.0.0
[edit protocols ospf area 0.0.0.0]
user@host# delete interface so-0/0/0
[edit protocols ospf area 0.0.0.0]
user@host# top
[edit]
user@host# show
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/1 {
        hello-interval 7;
        dead-interval 28;
      }
    }
  }
}
[edit]
user@host#

```

Everything inside the statement you deleted was deleted with it. You can also eliminate the entire OSPF configuration by simply entering **delete protocols ospf** while at the top level.

3. If you decide to use the default values for the hello and dead intervals on your remaining interface but you want OSPF to run on that interface, delete the hello and dead interval timers:

```

[edit]
user@host# edit protocols ospf area 0.0.0.0 interface so-0/0/1
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# delete hello-interval
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# delete dead-interval
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# top
[edit]
user@host# show

```

```

protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/1;
    }
  }
}
[edit]
user@host#

```

You can set multiple statements at the same time as long as they are all part of the same hierarchy (the path of statements from the top inward, as well as one or more statements at the bottom of the hierarchy). This feature can reduce considerably the number of commands you must enter.

4. To go back to the original hello and dead interval timers on interface **so-0/0/1**, enter:

```

[edit]
user@host# edit protocols ospf area 0.0.0.0 interface so-0/0/1
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# set hello-interval 5 dead-interval 20
[edit protocols ospf area 0.0.0.0 interface so-0/0/1]
user@host# exit
[edit]
user@host# show
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/1 {
        hello-interval 5;
        dead-interval 20;
      }
    }
  }
}
[edit]
user@host#

```

5. You also can re-create the other interface, as you had it before, with only a single entry:

```

[edit]
user@host# set protocols ospf area 0.0.0.0 interface so-0/0/1 hello-interval 5
dead-interval 20
[edit]
user@host# show
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
        dead-interval 20;
      }
      interface so-0/0/1 {
        hello-interval 5;
        dead-interval 20;
      }
    }
  }
}

```

```
    }  
  }  
}  
[edit]  
user@host#
```

### Adding Junos Configuration Statements and Identifiers

All properties of a device running Junos OS are configured by including *statements* in the configuration. A statement consists of a keyword, which is fixed text, and, optionally, an *identifier*. An identifier is an identifying name which you define, such as the name of an interface or a username, and which allows you and the CLI to discriminate among a collection of statements.

For example, the following list shows the statements available at the top level of configuration mode:

```
user@host# set?
```

## Possible completions:

> accounting-options	Accounting data configuration
+ apply-groups	Groups from which to inherit configuration data
> chassis	Chassis configuration
> class-of-service	Class-of-service configuration
> firewall	Define a firewall configuration
> forwarding-options	Configure options to control packet sampling
> groups	Configuration groups
> interfaces	Interface configuration
> policy-options	Routing policy option configuration
> protocols	Routing protocol configuration
> routing-instances	Routing instance configuration
> routing-options	Protocol-independent routing option configuration
> snmp	Simple Network Management Protocol
> system	System parameters

An angle bracket ( > ) before the statement name indicates that it is a container statement and that you can define other statements at levels below it. If there is no angle bracket ( > ) before the statement name, the statement is a leaf statement; you cannot define other statements at hierarchy levels below it.

A plus sign (+) before the statement name indicates that it can contain a set of values. To specify a set, include the values in brackets. For example:

[edit]

```
user@host# set policy-options community my-as1-transit members [65535:10 65535:11]
```

In some statements, you can include an identifier. For some identifiers, such as interface names, you must specify the identifier in a precise format. For example, the interface name **so-0/0/0** refers to a SONET/SDH interface that is on the Flexible PIC Concentrator (FPC) in slot 0, in the first PIC location, and in the first port on the Physical Interface Card (PIC). For other identifiers, such as interface descriptive text and policy and firewall term names, you can specify any name, including special characters, spaces, and tabs.

You must enclose in quotation marks (double quotes) identifiers and any strings that include a space or tab character or any of the following characters:

```
( ) [ ] { } ! @ # $ % ^ & | ' = ?
```

If you do not type an option for a statement that requires one, a message indicates the type of information required. In this example, you need to type an area number to complete the command:

[edit]

```
user@host# set protocols ospf area<Enter>
```

```
^
syntax error, expecting <identifier>
```

## Deleting a Statement from a Junos Configuration

To delete a statement or identifier from a Junos configuration, use the **delete** configuration mode command. Deleting a statement or an identifier effectively "unconfigures" the functionality associated with that statement or identifier, returning that functionality to its default condition.

```
user@host# delete <statement-path> <identifier>
```

When you delete a statement, the statement and all its subordinate statements and identifiers are removed from the configuration.

For statements that can have more than one identifier, when you delete one identifier, only that identifier is deleted. The other identifiers in the statement remain.

To delete the entire hierarchy starting at the current hierarchy level, do not specify a statement or an identifier in the **delete** command. When you omit the statement or identifier, you are prompted to confirm the deletion:

```
[edit]
user@host# delete
Delete everything under this level? [yes, no] (no)
Possible completions:
no    Don't delete everything under this level
yes   Delete everything under this level
Delete everything under this level? [yes, no] (no)
```

**NOTE:** You cannot delete multiple statements or identifiers within a hierarchy using a single **delete** command. You must delete each statement or identifier individually using multiple **delete** commands. For example, consider the following configuration at the **[edit system]** hierarchy level:

```
system {
  host-name host-211;
  domain-name domain-122;
  backup-router 192.168.71.254;
  arp;
  authentication-order [ radius password tacplus ];
}
```

To delete the domain-name, host-name, and backup-router from the configuration, you cannot issue a single **delete** command:

```
user@host> delete system hostname host-211 domain-name domain-122 backup-router
192.168.71.254
```

You can only delete each statement individually:

```
user@host delete system host-name host-211
user@host delete system domain-name domain-122
user@host delete system backup-router 192.168.71.254
```

- Related Documentation**
- [Example: Deleting a Statement from the Junos Configuration on page 383](#)
  - [Adding Junos Configuration Statements and Identifiers on page 380](#)
  - [Copying a Junos Statement in the Configuration on page 384](#)

## Example: Deleting a Statement from the Junos Configuration

The following example shows how to delete the **ospf** statement, effectively unconfiguring OSPF on the router:

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface so-0/0/0 hello-interval 5
[edit]
user@host# show
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
    }
  }
}
[edit]
user@host# delete protocols ospf
[edit]
user@host# show
[edit]
user@host#
```

Delete all statements from the current level down:

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
[edit protocols ospf area 0.0.0.0]
user@host# set interface so-0/0/0 hello-interval 5
[edit protocols ospf area 0.0.0.0]
user@host# delete
Delete everything under this level? [yes, no] (no) yes
[edit protocols ospf area 0.0.0.0]
user@host# show
[edit]
user@host#
```

Unconfigure a particular property:

```
[edit]
user@host# set interfaces so-3/0/0 speed 100mb
[edit]
user@host# show
interfaces {
  so-3/0/0 {
    speed 100mb;
  }
}
```

```
[edit]
user@host# delete interfaces so-3/0/0 speed
[edit]
user@host# show
interfaces {
  so-3/0/0;
}
```

- [Example: Using Global Replace in a Junos Configuration—Using the upto Option on page 458](#)
- [Deleting a Statement from a Junos Configuration on page 382](#)

## Copying a Junos Statement in the Configuration

When you have many similar statements in a Junos configuration, you can add one statement and then make copies of that statement. Copying a statement duplicates that statement and the entire hierarchy of statements configured under that statement. Copying statements is useful when you are configuring many physical or logical interfaces of the same type.

To make a copy of an existing statement in the configuration, use the configuration mode **copy** command:

```
user@host# copy existing-statement to new-statement
```

Immediately after you have copied a portion of the configuration, the configuration might not be valid. You must check the validity of the new configuration, and if necessary, modify either the copied portion or the original portion for the configuration to be valid.

### Related Documentation

- [Example: Copying a Statement in the Junos Configuration on page 384](#)
- [Adding Junos Configuration Statements and Identifiers on page 380](#)

## Example: Copying a Statement in the Junos Configuration

The following example shows how you can create one virtual connection (VC) on an interface, and then copy its configuration to create a second VC:

```
[edit interfaces]
user@host# show
at-1/0/0 {
  description "PAIX to MAE West"
  encapsulation atm-pvc;
  unit 61 {
    point-to-point;
    vci 0.61;
    family inet {
      address 10.0.1.1/24;
    }
  }
}
[edit interfaces]
user@host# edit at-1/0/0
[edit interfaces at-1/0/0]
```

```

user@host# copy unit 61 to unit 62
[edit interfaces at-1/0/0]
user@host# show
description "PAIX to MAE West"
encapsulation atm-pvc;
unit 61 {
    point-to-point;
    vci 0.61;
    family inet {
        address 10.0.1.1/24;
    }
}
unit 62 {
    point-to-point;
    vci 0.61;
    family inet {
        address 10.0.1.1/24;
    }
}

```

**Related Documentation**

- [Copying a Junos Statement in the Configuration on page 384](#)

## Issuing Relative Junos Configuration Mode Commands

The **top** or **up** command followed by another configuration command, including **edit**, **insert**, **delete**, **deactivate**, **annotate**, or **show** enables you to quickly move to the top of the hierarchy or to a level above the area you are configuring.

To issue configuration mode commands from the top of the hierarchy, use the **top** command; then specify a configuration command. For example:

```

[edit interfaces fxp0 unit 0 family inet]
user@host# top edit system login
[edit system login]
user@host#

```

To issue configuration mode commands from a location higher up in the hierarchy, use the **up** configuration mode command; specify the number of levels you want to move up the hierarchy and then specify a configuration command. For example:

```

[edit protocols bgp]
user@host# up 2 activate system

```

**Related Documentation**

- [Displaying the Current Junos OS Configuration on page 360](#)

## Renaming an Identifier in a Junos Configuration

When modifying a Junos configuration, you can rename an identifier that is already in the configuration. You can do this either by deleting the identifier (using the **delete** command) and then adding the renamed identifier (using the **set** and **edit** commands), or you can rename the identifier using the **rename** configuration mode command:

```

user@host# rename <statement-path> identifier1 to identifier2

```

- Related Documentation**
- [Adding Junos Configuration Statements and Identifiers on page 380](#)
  - [Example: Renaming an Identifier in a Junos Configuration on page 386](#)
  - [Inserting a New Identifier in a Junos Configuration on page 386](#)

### Example: Renaming an Identifier in a Junos Configuration

This example shows how you can change the Network Time Protocol (NTP) server address to **10.0.0.6** using the **rename** configuration mode command:

```
[edit]
user@host# rename system network-time server 10.0.0.7 to server 10.0.0.6
```

- Related Documentation**
- [Renaming an Identifier in a Junos Configuration on page 385](#)

### Inserting a New Identifier in a Junos Configuration

When configuring a device running Junos OS, you can enter most statements and identifiers in any order. Regardless of the order in which you enter the configuration statements, the CLI always displays the configuration in a strict order. However, there are a few cases where the ordering of the statements matters because the configuration statements create a sequence that is analyzed in order.

For example, in a routing policy or firewall filter, you define terms that are analyzed sequentially. Also, when you create a named path in dynamic MPLS, you define an ordered list of the transit routers in the path, starting with the first transit router and ending with the last one.

To modify a portion of the configuration in which the statement order matters, use the **insert** configuration mode command:

```
user@host# insert <statement-path> identifier1 (before | after) identifier2
```

If you do not use the **insert** command, but instead simply configure the identifier, it is placed at the end of the list of similar identifiers.

- Related Documentation**
- [Renaming an Identifier in a Junos Configuration on page 385](#)
  - [Example: Renaming an Identifier in a Junos Configuration on page 386](#)
  - [Example: Inserting a New Identifier in a Junos Configuration on page 386](#)
  - [Deactivating and Reactivating Statements and Identifiers in a Junos Configuration on page 388](#)

### Example: Inserting a New Identifier in a Junos Configuration

Insert policy terms in a routing policy configuration. Note that if you do not use the **insert** command, but rather just configure another term, the added term is placed at the end of the existing list of terms. Also note that you must create the term, as shown in this example, before you can place it with the **insert** command.

```

[edit]
user@host# show
policy-options {
  policy-statement statics {
    term term1 {
      from {
        route-filter 192.168.0.0/16 orlonger;
        route-filter 224.0.0.0/3 orlonger;
      }
      then reject;
    }
    term term2 {
      from protocol direct;
      then reject;
    }
    term term3 {
      from protocol static;
      then reject;
    }
    term term4 {
      then accept;
    }
  }
}
[edit]
user@host# rename policy-options policy-statement statics term term4 to term term6
[edit]
user@host# set policy-options policy-statement statics term term4 from protocol local
[edit]
user@host# set policy-options policy-statement statics term term4 then reject
[edit]
user@host# set policy-options policy-statement statics term term5 from protocol
aggregate
[edit]
user@host# set policy-options policy-statement statics term term5 then reject
[edit]
user@host# insert policy-options policy-statement statics term term4 after term term3
[edit]
user@host# insert policy-options policy-statement statics term term5 after term term4
[edit]
user@host# show policy-options policy-statement statics
term term1 {
  from {
    route-filter 192.168.0.0/16 orlonger;
    route-filter 224.0.0.0/3 orlonger;
  }
  then reject;
}
term term2 {
  from protocol direct;
  then reject;
}
term term3 {
  from protocol static;
  then accept;
}

```

```

term term4 {
    from protocol local;
    then reject;
}
term term5 {
    from protocol aggregate;
    then reject;
}
term term6 {
    then accept;
}

```

Insert a transit router in a dynamic MPLS path:

```

[edit protocols mpls path ny-sf]
user@host# show
1.1.1.1;
2.2.2.2;
3.3.3.3 loose;
4.4.4.4 strict;
6.6.6.6;
[edit protocols mpls path ny-sf]
user@host# insert 5.5.5.5 before 6.6.6.6
[edit protocols mpls path ny-sf]
user@host# set 5.5.5.5 strict
[edit protocols mpls path ny-sf]
user@host# show
1.1.1.1;
2.2.2.2;
3.3.3.3 loose;
4.4.4.4 strict;
5.5.5.5 strict;
6.6.6.6;

```

## Deactivating and Reactivating Statements and Identifiers in a Junos Configuration

In a Junos configuration, you can deactivate statements and identifiers so that they do not take effect when you issue the **commit** command. Any deactivated statements and identifiers are marked with the **inactive** tag. They remain in the configuration, but are not activated when you issue a **commit** command.

To deactivate a statement or identifier, use the **deactivate** configuration mode command:

```
user@host# deactivate (statement identifier)
```

To reactivate a statement or identifier, use the **activate** configuration mode command:

```
user@host# activate (statement identifier)
```

In both commands, the **statement** and **identifier** you specify must be at the current hierarchy level.

**NOTE:** In Junos OS Release 10.3 and later, you can only deactivate identifiers or complete one-liner statements. You cannot deactivate just parts of a one-liner, such as only child or leaf statements. For example, in the following configuration:

```
[edit forwarding-options]
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

You can deactivate the complete one-liner **dynamic profile *dynamic-profile-name* aggregate-clients**. However, you cannot deactivate *only* the **aggregate-clients** statement from the one-liner statement.

In some portions of the configuration hierarchy, you can include a **disable** statement to disable functionality. One example is disabling an interface by including the **disable** statement at the **[edit interface *interface-name*]** hierarchy level. When you deactivate a statement, that specific object or property is completely ignored and is not applied at all when you issue a **commit** command. When you disable a functionality, it is activated when you issue a **commit** command but is treated as though it is down or administratively disabled.

#### Related Documentation

- [Adding Junos Configuration Statements and Identifiers on page 380](#)

## Examples: Deactivating and Reactivating Statements and Identifiers in a Junos Configuration

Deactivate an interface in the configuration:

```
[edit interfaces]
user@host# show
at-5/2/0 {
  traceoptions {
    traceflag all;
  }
  atm-options {
    vpi 0 maximum-vcs 256;
  }
  unit 0 {
    ...
  }
}

[edit interfaces]
user@host# deactivate at-5/2/0

[edit interfaces]
user@host# show
inactive: at-5/2/0 {
  traceoptions {
    traceflag all;
  }
  ...
}
```

```
}
}
```

Reactivate the interface:

```
[edit interfaces]
user@host# activate at-5/2/0
[edit interfaces]
user@host# show
at-5/2/0 {
  traceoptions {
    traceflag all;
  }
  ...
}
```

#### Related Documentation

- [Deactivating and Reactivating Statements and Identifiers in a Junos Configuration on page 388](#)

## Adding Comments in a Junos Configuration

You can include comments in a Junos configuration to describe any statement in the configuration. You can add comments interactively in the CLI and by editing the ASCII configuration file.

When you add comments in configuration mode, they are associated with a statement at the current level. Each statement can have one single-line comment associated with it. Before you can associate a comment with a statement, the statement must exist. The comment is placed on the line preceding the statement.

To add comments to a configuration, use the **annotate** configuration mode command:

```
user@host# annotate statement "comment-string"
```

***statement*** is the configuration statement to which you are attaching the comment; it must be at the current hierarchy level. If a comment for the specified ***statement*** already exists, it is deleted and replaced with the new comment.

***comment-string*** is the text of the comment. The comment text can be any length, and you must type it on a single line. If the comment contains spaces, you must enclose it in quotation marks. In the comment string, you can include the comment delimiters ***/\* \*/*** or ***#***. If you do not specify any, the comment string is enclosed with the ***/\* \*/*** comment delimiters.

To delete an existing comment, specify an empty comment string:

```
user@host# annotate statement ""
```

When you edit the ASCII configuration file and add comments, they can be one or more lines and must precede the statement they are associated with. If you place the comments in other places in the file, such as on the same line following a statement or on a separate line following a statement, they are removed when you use the **load** command to open the configuration into the CLI.

When you include comments in the configuration file directly, you can format comments in the following ways:

- Start the comment with a `/*` and end it with a `*/`. The comment text can be on a single line or can span multiple lines.
- Start the comment with a `#` and end it with a new line (carriage return).

If you add comments with the **annotate** command, you can view the comments within the configuration by entering the **show** configuration mode command or the **show configuration** operational mode command.

When configuring interfaces, you can add comments about the interface by including the **description** statement at the **[edit interfaces interface-name]** hierarchy level. Any comments you include appear in the output of the **show interfaces** commands. .

**NOTE:** The Junos OS supports annotation up to the last level in the configuration hierarchy, including oneliners. However, annotation of parts (the child statements or identifiers within the oneliner) of the oneliner is not supported. For example, in the following sample configuration hierarchy, annotation is supported up to the level 1 parent hierarchy, but not supported for the metric child statement:

```
[edit protocols]
  isis {
    interface ge-0/0/0.0 {
      level 1 metric 10;
    }
  }
}
```

- Related Documentation**
- [Adding Junos Configuration Statements and Identifiers on page 380](#)
  - [Example: Including Comments in a Junos Configuration on page 391](#)

## Example: Including Comments in a Junos Configuration

To add comments to a Junos configuration:

```
[edit]
user@host# show
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {

The following excerpt from a configuration example illustrates how to enter comments in a configuration file:

```

/* This comment goes with routing-options */
routing-options {
  /* This comment goes with routing-options traceoptions */
  traceoptions {
    /* This comment goes with routing-options traceoptions tracefile */
    tracefile rpd size 1m files 10;
    /* This comment goes with routing-options traceoptions traceflag task */
    traceflag task;
    /* This comment goes with routing-options traceoptions traceflag general */
    traceflag general;
  }
  autonomous-system 10458; /* This comment is dropped */
}
routing-options {
  rib-groups {
    ifrg {
      import-rib [ inet.0 inet.2 ];
      /* A comment here is dropped */
    }
    dvmrp-rib {
      import-rib inet.2;
      export-rib inet.2;
      /* A comment here is dropped */
    }
    /* A comment here is dropped */
  }
  /* A comment here is dropped */
}

```

## Using Regular Expressions to Delete Related Items from a Junos Configuration

The Junos OS command-line interface (CLI) enables you to delete related configuration items simultaneously, such as channelized interfaces or static routes, by using a single command and regular expressions. Deleting a statement or an identifier effectively “unconfigures” the functionality associated with that statement or identifier, returning that functionality to its default condition.

You can only delete certain parts of the configuration where you normally put multiple items, for example, interfaces. However, you cannot delete “groups” of different items; for example:

```
user@host# show system services
ftp;
rlogin;
rsh;
ssh {
    root-login allow;
}
telnet;
[edit]
user@host# wildcard delete system services *
syntax error.
```

When you delete a statement, the statement and all its subordinate statements and identifiers are removed from the configuration.

To delete related configuration items, issue the **wildcard** configuration mode command with the **delete** option and specify the statement path, the items to be summarized with a regular expression, and the regular expression.

```
user@host# wildcard delete <statement-path> <identifier> <regular-expression>
```

**NOTE:** When you use the **wildcard** command to delete related configuration items, the regular expression must be the final statement.

If the Junos OS matches more than eight related items, the CLI displays only the first eight items.

### Deleting Interfaces from the Configuration

Delete multiple T1 interfaces in the range from t1-0/0/0:0 through t1-0/0/0:23:

```
user@host# wildcard delete interfaces t1-0/0/0:.*
matched: t1-0/0/0:0
matched: t1-0/0/0:1
matched: t1-0/0/0:2
Delete 3 objects? [yes,no] (no) no
```

**Deleting Routes from the Configuration**

Delete static routes in the range from 172.0.0.0 to 172.255.0.0:

```
user@host# wildcard delete routing-options static route 172.*
matched: 172.16.0.0/12
matched: 172.16.14.0/24
matched: 172.16.100.0/24
matched: 172.16.128.0/19
matched: 172.16.160.0/24
matched: 172.17.12.0/23
matched: 172.17.24.0/23
matched: 172.17.28.0/23
...
Delete 13 objects? [yes,no] (no)
```

**Related Documentation**

- [Disabling Inheritance of a Junos OS Configuration Group on page 433](#)

**Example: Using the Wildcard Command with the Range Option**

- [Requirements on page 394](#)
- [Overview on page 394](#)
- [Configuration on page 395](#)
- [Verification on page 397](#)

---

**Requirements**

This example uses the following hardware and software components:

- M Series, MX Series, T Series or EX Series device
- Junos OS Release 12.1 or later running on the device

---

**Overview**

The **range** option with the **wildcard** command enables you to specify ranges in **activate**, **deactivate**, **delete**, **protect**, **set**, **show**, and **unprotect** commands. You can use ranges to specify a range of interfaces, logical units, VLANs, and other numbered elements. The **wildcard range** option expands the command you entered into multiple commands, each of which corresponds to one item in the range.

The **wildcard range** option enables you to configure multiple configuration statements using a single **set** command, instead of configuring each of them individually. For example, to configure 24 Gigabit Ethernet interfaces with different port numbers, you can use a single **wildcard range set** command instead of 24 individual **set interfaces** commands.

Similarly, to deactivate a group of 30 logical interfaces, you can use the **wildcard range deactivate** command instead of deactivating each logical interface individually.

You can use **wildcard range** with the **active**, **deactivate**, **delete**, **protect**, **set**, **show**, and **unprotect** configuration commands:

```
user@host# wildcard range ?
```

**Possible completions:**

activate	Remove the inactive tag from a statement
deactivate	Add the inactive tag to a statement
delete	Delete a data element
protect	Protect the statement
set	Set a parameter
show	Show a parameter
unprotect	Unprotect the statement

You can also specify all configuration hierarchy levels and their child configuration statements in the CLI by using **wildcard range** with the **set** option:

**Possible completions:**

> > access	Network access configuration
> > access-profile	Access profile for this instance
> > accounting-options	Accounting data configuration
> > applications	Define applications by protocol characteristics
...	

## Configuration

---

The following examples show how to configure multiple configuration statements in a single step by using the **range** option with the **wildcard** configuration command:

- [Using the Range Option for Configuring a Series of Named Identifiers for a Configuration Statement on page 395](#)
- [Specifying Multiple Ranges in the Syntax on page 396](#)
- [Specifying a Range and Unique Numbers In the Syntax on page 396](#)
- [Excluding Some Values from a Range on page 396](#)
- [Specifying a Range with a Step Number on page 397](#)

### *Using the Range Option for Configuring a Series of Named Identifiers for a Configuration Statement*

#### **Step-by-Step Procedure**

You can configure a series of identifiers for a configuration statement, by specifying a numerical range of values for the identifiers.

- To configure a series of the same type of interface with different port numbers (0 through 23), specify the range for the port numbers by using the following format:

**[edit]**

```
user@host# wildcard range set interfaces ge-0/0/[0-23] unit 0 family vpls
```

#### **Results**

Expands to 24 different **set** commands to configure interfaces with port numbers ranging from 0 through 23:

**[edit]**

```
user@host# set interfaces ge-0/0/0 unit 0 family vpls
user@host# set interfaces ge-0/0/1 unit 0 family vpls
user@host# set interfaces ge-0/0/2 unit 0 family vpls
...
user@host# set interfaces ge-0/0/23 unit 0 family vpls
```

### *Specifying Multiple Ranges in the Syntax*

**Step-by-Step Procedure** You can have multiple ranges specified in a **wildcard range** command. Each range must be separated by a comma. You can also have overlapping ranges.

- To specify more than one range in the syntax, include the minimum and maximum values for each range, separated by a comma.

[edit]

```
user@host# wildcard range protect event-options policy p[1-3,5-7,6-9]
```

**Results** Expands to the following **set** commands:

[edit]

```
user@host# set protect event-options policy p1
user@host# set protect event-options policy p2
user@host# set protect event-options policy p3
user@host# set protect event-options policy p5
user@host# set protect event-options policy p6
user@host# set protect event-options policy p7
user@host# set protect event-options policy p8
user@host# set protect event-options policy p9
```

### *Specifying a Range and Unique Numbers In the Syntax*

**Step-by-Step Procedure** You can also specify a combination of a range and unique numbers in the syntax of the **wildcard range** command.

- To specify a range and unique numbers, separate them with a comma.

[edit]

```
user@host# wildcard range protect event-options policy p[1-3,5,7,10]
```

**Results** Expands to the following **set** commands:

[edit]

```
user@host# set protect event-options policy p1
user@host# set protect event-options policy p2
user@host# set protect event-options policy p3
user@host# set protect event-options policy p5
user@host# set protect event-options policy p7
user@host# set protect event-options policy p10
```

### *Excluding Some Values from a Range*

**Step-by-Step Procedure** You can exclude certain values from a range by marking the numbers or the range of numbers to be excluded by using an exclamation mark.

- To exclude certain values from a range, include the portion to be excluded with ! in the syntax.

[edit]

```
user@host# wildcard range protect event-options policy p[1-5,!3-4]
```

**Results** Expands to the following **set** commands:

```
[edit]
user@host# set protect event-options policy p1
user@host# set protect event-options policy p2
user@host# set protect event-options policy p5
```

### *Specifying a Range with a Step Number*

- Step-by-Step Procedure** You can provide a step number for a range to have a constant interval in the range.
- To provide a step, include the step value in the syntax preceded by a forward slash (/).

```
[edit]
user@host# wildcard range protect event-options policy p[1-10/2]
```

**Results** Expands to the following **set** commands:

```
[edit]
user@host# set protect event-options policy p1
user@host# set protect event-options policy p3
user@host# set protect event-options policy p5
user@host# set protect event-options policy p7
user@host# set protect event-options policy p9
```

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Configuration on page 397](#)

### **Checking the Configuration**

**Purpose** Check the configuration created using the **wildcard range** option. The following sample shows output for the configuration described in [“Using the Range Option for Configuring a Series of Named Identifiers for a Configuration Statement” on page 395](#).

**Action** user@host> show configuration interfaces

```
ge-0/0/0 {  
  unit 0 {  
    family vpls;  
  }  
}  
ge-0/0/1 {  
  unit 0 {  
    family vpls;  
  }  
}  
ge-0/0/2 {  
  unit 0 {  
    family vpls;  
  }  
}  
ge-0/0/3 {  
  unit 0 {  
    family vpls;  
  }  
}  
...  
ge-0/0/23 {  
  unit 0 {  
    family vpls;  
  }  
}
```

**Meaning** The output indicates that 24 Gigabit Ethernet interfaces ranging from **ge-0/0/0** through **ge-0/0/23** are created.

- [Backing Up the Committed Configuration on the Alternate Boot Drive on page 413](#)
- [Example: Configuring Junos OS Batch Commits on page 414](#)

## Verifying a Junos Configuration

To verify that the syntax of a Junos configuration is correct, use the configuration mode **commit check** command:

```
[edit]
user@host# commit check
configuration check succeeds
[edit]
user@host#
```

If the **commit check** command finds an error, a message indicates the location of the error.

- [Protecting an Individual Member from a Homogenous List on page 402](#)
- [Unprotecting a Configuration on page 402](#)
- [Verification on page 402](#)

### Requirements

This example uses the following hardware and software components:

- A J Series, M Series, MX Series, or T Series device
- Junos OS 11.2 or later running on all devices

### Overview

The Junos OS enables you to protect the device configuration from being modified or deleted by other users. This can be accomplished by using the **protect** command in the configuration mode of the CLI. Likewise, you can also unprotect a protected configuration by using the **unprotect** command.

These commands can be used at any level of the configuration hierarchy—a top-level parent hierarchy or a configuration statement or an identifier within the lowest level of the hierarchy.

If a configuration hierarchy is protected, users cannot perform the following activities:

- Deleting or modifying a hierarchy or a statement or identifier within the protected hierarchy
- Inserting a new configuration statement or an identifier within the protected hierarchy
- Renaming a statement or identifier within the protected hierarchy
- Copying a configuration into a protected hierarchy
- Activating or deactivating statements within a protected hierarchy
- Annotating a protected hierarchy

---

### Protecting a Parent-Level Hierarchy

---

#### Step-by-Step Procedure

To protect a configuration at the top level of the hierarchy:

- Identify the hierarchy that you want to protect and issue the **protect** command for the hierarchy at the **[edit]** hierarchy level.

For example, if you want to protect the entire **[edit access]** hierarchy level, issue the following command:

```
[edit]
user@host# protect access
```

**Results** Protects all elements under the parent hierarchy.

#### NOTE:

- If you issue the **protect** command for a hierarchy that is not used in the configuration, the Junos OS CLI displays the following error message:

```
[edit]
user@host# protect access
warning: statement not found
```

---

---

### Protecting a Child Hierarchy

---

#### Step-by-Step Procedure

To protect a child hierarchy contained within a parent hierarchy:

- Navigate to the parent container hierarchy. Use the **protect** command for the hierarchy at the parent level.

For example, if you want to protect the **[edit system syslog console]** hierarchy level, use the following command at the **[edit system syslog]** hierarchy level.

```
[edit system syslog]
```

```
user@host# protect console
```

**Results** Protects all elements under the child hierarchy.

### Protecting a Configuration Statement Within a Hierarchy

**Step-by-Step Procedure** To protect a configuration statement within a hierarchy level:

- Navigate to the hierarchy level containing the statement that you want to protect and issue the **protect** command for the hierarchy.

For example, if you want to protect the **host-name** statement under the **[edit system]** hierarchy level, issue the following command:

```
[edit system]
user@host# protect host-name
```

### Protecting a List of Identifiers for a Configuration Statement

**Step-by-Step Procedure** Some configuration statements can take multiple values. For example, the **address** statement at the **[edit system login deny-sources]** hierarchy level can take a list of hostnames, IPv4 addresses, or IPv6 addresses. Suppose you have the following configuration:

```
[edit system login]
deny-sources {
  address [ 172.17.28.19 172.17.28.20 172.17.28.21 172.17.28.22];
}
```

- To protect all the addresses for the **address** statement, issue the following command at the **[edit]** level:

```
[edit]
user@host# protect system login deny-sources address
```

**Results** All the addresses ([172.17.28.19 172.17.28.20 172.17.28.21 172.17.28.22]) for the **address** statement are protected.

### Protecting an Individual Member from a Homogenous List

---

#### Step-by-Step Procedure

Suppose you have the following configuration:

```
[edit groups ]
test1 {
  system {
    name-server {
      10.1.2.1;
      10.1.2.2;
      10.1.2.3;
      10.1.2.4;
    }
  }
}
```

- To protect one or more individual addresses for the **name-server** statement, issue the following command at the **[edit]** level:

```
[edit]
user@host# protect groups test1 system name-server 10.1.2.1
user@host# protect groups test1 system name-server 10.1.2.4
```

**Results** Addresses 10.1.2.1 and 10.1.2.4 are protected.

### Unprotecting a Configuration

---

#### Step-by-Step Procedure

Suppose you have the following configuration at the **[edit system]** hierarchy level:

```
protect: system {
  host-name bigping;
  domain-search 10.1.2.1;
  login {
    deny-sources {
      protect: address [ 172.17.28.19 172.17.28.173 172.17.28.0 174.0.0.0 ];
    }
  }
}
```

- To unprotect the entire **[edit system]** hierarchy level, issue the following command at the **[edit]** level:

```
[edit]
user@host# unprotect system
```

**Results** The entire **system** hierarchy level is unprotected.

### Verification

---

#### *Verify That a Hierarchy Is Protected Using the show Command*

#### Purpose

To check that a configuration hierarchy is protected.

**Action** In the configuration mode, issue the **show** command at the **[edit]** hierarchy level to see all the configuration hierarchies and configuration statements that are protected.

**NOTE:** All protected hierarchies or statements are prefixed with a **protect:** string.

```
...
protect: system {
  host-name bigping;
  domain-search 10.1.2.1;
  login {
    deny-sources {
      protect: address [ 172.17.28.19 172.17.28.173 172.17.28.0 174.0.0.0 ];
    }
  }
}
...
```

#### *Verify That a Hierarchy Is Protected by Attempting to Modify a Configuration*

**Purpose** To verify that a configuration is protected by trying to modify the configuration using the **activate**, **copy**, **insert**, **rename**, and **delete** commands.

**Action** To verify that a configuration is protected:

1. Try using the **activate**, **copy**, **insert**, **rename**, and **delete** commands for a top-level hierarchy or a child-level hierarchy or a statement within the hierarchy.

For a protected hierarchy or statement, the Junos OS displays an appropriate warning that the command has not executed. For example:

```
protect: system {
  host-name a;
  inactive: domain-search [ a b ];
}
```

2. To verify that the hierarchy is protected, try issuing the **activate** command for the **domain-search** statement:

```
[edit system]
```

```
user@host# activate system domain-search
```

The Junos OS CLI displays an appropriate message:

```
warning: [system] is protected, 'system domain-search' cannot be activated
```

#### *Verify Usage of the protect Command*

**Purpose** To view the **protect** commands used for protecting a configuration.

**Action** 1. Navigate to the required hierarchy.

2. Issue the **show | display set relative** command.

```
user@host> show | display set relative
set system host-name bigping
set system domain-search 10.1.2.1
set system login deny-sources address 172.17.28.19
set system login deny-sources address 172.17.28.173
set system login deny-sources address 172.17.28.0
set system login deny-sources address 174.0.0.0
protect system login deny-sources address
protect system
```

#### *View the Configuration in XML*

**Purpose** To check if the protected hierarchies or statements are also displayed in the XML. Protected hierarchies, statements, or identifiers are displayed with the **protect="protect"** attribute in the XML.

**Action** To view the configuration in XML:

1. Navigate to the hierarchy you want to view and issue the **show** command with the pipe symbol and option **| display xml**:

[edit system]

```

user@host# show | display xml
[edit]
user@host# show system | display xml
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/11.2I0/junos">
  <configuration junos:changed-seconds="1291279234"
junos:changed-localtime="2010-12-02 00:40:34 PST">
    <system protect="protect">
      <host-name>bigping</host-name>
      <domain-search>10.1.2.1</domain-search>
      <login>
        <message>

          \jnpr

          \tUNAUTHORIZED USE OF THIS ROUTER
          \tIS STRICTLY PROHIBITED!

        </message>
        <class>
          <name>a</name>
          <allow-commands>commit-synchronize</allow-commands>
          <deny-commands>commit</deny-commands>
        </class>
        <deny-sources>
          <address protect="protect">172.17.28.19</address>
          <address protect="protect">172.17.28.173</address>
          <address protect="protect">172.17.28.0</address>
          <address protect="protect">174.0.0.0</address>
        </deny-sources>
      </login>
      <syslog>
        <archive>
        </archive>
      </syslog>
    </system>
  </configuration>
  <cli>
    <banner>[edit]</banner>
  </cli>
</rpc-reply>

```

**NOTE:** Loading an XML configuration with the `unprotect="unprotect"` tag unprotects an already protected hierarchy. For example, suppose you load the following XML hierarchy:

```
<protocols unprotect="unprotect">
  <ospf>
    <area>
      <name>0.0.0.0</name>
      <interface>
        <name>all</name>
      </interface>
    </area>
  </ospf>
</protocols>
```

The `[edit protocols]` hierarchy becomes unprotected if it is already protected.

## Committing a Junos OS Configuration

To save Junos OS configuration changes to the configuration database and to activate the configuration on the router, use the **commit** configuration mode command. You can issue the **commit** command from any hierarchy level:

```
[edit]
user@host# commit
commit complete
[edit]
user@host#
```

When you enter the **commit** command, the configuration is first checked for syntax errors (**commit check**). Then, if the syntax is correct, the configuration is activated and becomes the current, operational router configuration.

You can issue the **commit** command from any hierarchy level.

A configuration commit can fail for any of the following reasons:

- The configuration includes incorrect syntax, which causes the commit check to fail.
- The candidate configuration that you are trying to commit is larger than 700 MB.
- The configuration is locked by a user who entered the **configure exclusive** command.

If the configuration contains syntax errors, a message indicates the location of the error, and the configuration is not activated. The error message has the following format:

```
[edit edit-path]
'offending-statement;'
error-message
```

For example:

```
[edit firewall filter login-allowed term allowed from]
```

```
'icmp-type [ echo-request echo-reply ];'
keyword 'echo-reply' unrecognized
```

You must correct the error before recommitting the configuration. To return quickly to the hierarchy level where the error is located, copy the path from the first line of the error and paste it at the configuration mode prompt at the **[edit]** hierarchy level.

The uncommitted, candidate configuration file is `/var/run/db/juniper.db`. It is limited to 700 MB. If the commit fails with a message **configuration database size limit exceeded**, view the file size from configuration mode by entering the command `run file list /var/run/db detail`. You can simplify the configuration and reduce the file size by creating configuration groups with wildcards or defining less specific match policies in your firewall filters.

**NOTE:** CLI commit-time warnings displayed for configuration changes at the **[edit interfaces]** hierarchy level are removed and are logged as system log messages.

This is also applicable to VRRP configuration at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family (*inet* | *inet6*) address *address*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (*inet* | *inet6*) address *address*]**

When you commit a configuration, you commit the entire configuration in its current form. If more than one user is modifying the configuration, committing it saves and activates the changes of all the users.

**NOTE:**

- If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

load merge  
load replace  
load override  
load update

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

- We do not recommend performing a commit operation on the backup Routing Engine when graceful Routing Engine switchover is enabled on the router.

**NOTE:** If you configure the same IP address for a management interface or internal interface such as fxp0 and an external physical interface such as ge-0/0/1, when graceful Routing Engine switchover (GRES) is enabled, the CLI displays an appropriate commit error message that identical addresses have been found on the private and public interfaces. In such cases, you must assign unique IP addresses for the two interfaces that have duplicate addresses.

The management Ethernet interface used for the TX Matrix Plus router, T1600 routers in a routing matrix, and PTX Series Packet Transport Switches, is em0. Junos OS automatically creates the router's management Ethernet interface, em0.

## Committing a Junos Configuration and Exiting Configuration Mode

To save Junos OS configuration changes, activate the configuration on the device and exit configuration mode, using the **commit and-quit** configuration mode command. This command succeeds only if the configuration contains no errors.

```
[edit]
user@host# commit and-quit
commit complete
```

```

exiting configuration mode
user@host>

```

**NOTE:** We do not recommend performing a commit operation on the backup Routing Engine when graceful Routing Engine switchover is enabled on the router.

**Related  
Documentation**

- [Activating a Junos Configuration but Requiring Confirmation on page 409](#)

## Activating a Junos Configuration but Requiring Confirmation

When you commit the current candidate configuration, you can require an explicit confirmation for the commit to become permanent. This is useful if you want to verify that a configuration change works correctly and does not prevent access to the router. If the change prevents access or causes other errors, the router automatically returns to the previous configuration and restores access after the rollback confirmation timeout passes. This feature is called automatic rollback.

To commit the current candidate configuration but require an explicit confirmation for the commit to become permanent, use the **commit confirmed** configuration mode command:

```

[edit]
user@host# commit confirmed
commit confirmed will be automatically rolled back in 10 minutes unless confirmed
commit complete
#commit confirmed will be rolled back in 10 minutes
[edit]
user@host#

```

Once you have verified that the change works correctly, you can keep the new configuration active by entering a **commit** or **commit check** command within 10 minutes of the **commit confirmed** command. For example:

```

[edit]
user@host# commit check
commit confirmed will be automatically rolled back in 10 minutes unless confirmed
commit complete
#commit confirmed will be rolled back in 10 minutes
[edit]
user@host#

```

If the commit is not confirmed within a certain time (10 minutes by default), Junos OS automatically rolls back to the previous configuration and a broadcast message is sent to all logged-in users.

To show when a rollback is scheduled after a **commit confirmed** command, enter the **show system commit** command. For example:

```

user@host> show system commit
0 2005-01-05 15:00:37 PST by root via cli commit confirmed, rollback in 3mins

```

Like the **commit** command, the **commit confirmed** command verifies the configuration syntax and reports any errors. If there are no errors, the configuration is activated and begins running on the router.

Figure 14 on page 410 illustrates how the **commit confirmed** command works.

Figure 14: Confirm a Configuration

To change the amount of time before you have to confirm the new configuration, specify the number of minutes when you issue the command:

```
[edit]
user@host# commit confirmed minutes
commit complete
[edit]
user@host#
```

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

- Related Documentation**
- [Scheduling a Junos Commit Operation on page 410](#)
  - [Committing a Junos OS Configuration on page 406](#)

## Scheduling a Junos Commit Operation

You can schedule when you want your candidate configuration to become active. To save Junos OS configuration changes and activate the configuration on the router at a future time or upon reboot, use the **commit at** configuration mode command, specifying **reboot** or a future time at the **[edit]** hierarchy level:

```
[edit]
user@host # commit at string
```

Where **string** is **reboot** or the future time to activate the configuration changes. You can specify time in two formats:

- A time value in the form **hh:mm[:ss]** (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the **commit at** configuration mode command is issued. Use 24-hour time for the **hh** value; for example, **04:30:00** is 4:30:00 AM, and **20:00** is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.

- A date and time value in the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the **commit at** command is issued. Use 24-hour time for the **hh** value. For example, **2003-08-21 12:30:00** is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.

Enclose the **string** value in quotation marks (" "). For example, **commit at "18:00:00"**. For date and time, include both values in the same set of quotation marks. For example, **commit at "2005-03-10 14:00:00"**.

A commit check is performed immediately when you issue the **commit at** configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.

**NOTE:** If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at** configuration command after you issue the **request system reboot** command.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to cancel a scheduled configuration by means of the **clear** command, see [CLI Explorer](#).

**NOTE:** We do not recommend performing a commit operation on the backup Routing Engine when graceful Routing Engine switchover is enabled on the router.

#### Related Documentation

- [Committing a Junos OS Configuration on page 406](#)
- [Adding a Comment to Describe the Committed Configuration on page 412](#)

## Adding a Comment to Describe the Committed Configuration

You can include a comment that describes changes to the committed configuration. To do so, include the `commit comment` statement. The comment can be as long as 512 bytes and you must type it on a single line.

[edit]

user@host# `commit comment comment-string`

*comment-string* is the text of the comment.

**NOTE:** You cannot include a comment with the `commit check` command.

To add a comment to the `commit` command, include the `comment` statement after the `commit` command:

[edit]

```

user@host# commit comment "add user joe"
commit complete
[edit]
user@host#

```

To add a comment to the **commit confirmed** command, include the **comment** statement after the **commit confirmed** command:

```

[edit]
user@host# commit confirmed comment "add customer to port 27"
commit confirmed will be automatically rolled back in 10 minutes unless confirmed
commit complete
[edit]
user@host#

```

To view these commit comments, issue the **show system commit** operational mode command.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

#### Related Documentation

- [Committing a Junos OS Configuration on page 406](#)
- [Backing Up the Committed Configuration on the Alternate Boot Drive on page 413](#)

## Backing Up the Committed Configuration on the Alternate Boot Drive

After you commit the configuration and are satisfied that it is running successfully, you should issue the **request system snapshot** command to back up the new software onto the **/altconfig** file system. If you do not issue the **request system snapshot** command, the configuration on the alternate boot drive will be out of sync with the configuration on the primary boot drive.

The **request system snapshot** command backs up the root file system to **/altroot**, and **/config** to **/altconfig**. The root and **/config** file systems are on the router's flash drive, and the **/altroot** and **/altconfig** file systems are on the router's hard disk (if available).

**NOTE:** To back up the file system on a J Series Services Router, you must specify a media type (primary compact flash drive, removable compact flash drive, or USB storage device) for backup. For more information about the **request system snapshot** command, see [CLI Explorer](#).

After you issue the **request system snapshot** command, you cannot return to the previous version of the software because the running and backup copies of the software are identical.

## Example: Configuring Junos OS Batch Commits

- [Junos OS Batch Commits Overview on page 414](#)
- [Example: Configuring Batch Commit Server Properties on page 414](#)

### Junos OS Batch Commits Overview

---

Junos OS provides a batch commit feature that aggregates or merges multiple configuration edits from different CLI sessions or users and adds them to a batch commit queue. A batch commit server running on the device takes one or more jobs from the batch commit queue, applies the configuration changes to the shared configuration database, and then commits the configuration changes in a single commit operation.

Batches are prioritized by the commit server based on priority of the batch specified by the user or the time when the batch job is added. When one batch commit is complete, the next set of configuration changes are aggregated and loaded into the batch queue for the next session of the batch commit operation. Batches are created until there are no commit entries left in the queue directory.

When compared to the regular commit operation where all commits are independently committed sequentially, batch commits save time and system resources by committing multiple small configuration edits in a single commit operation.

Batch commits are performed from the **[edit batch]** configuration mode. The commit server properties can be configured at the **[edit system commit server]** hierarchy level.

#### **Aggregation and Error Handling**

When there is a load-time error in one of the aggregated jobs, the commit job that encounters the error is discarded and the remaining jobs are aggregated and committed.

For example, if there are five commit jobs (**commit-1**, **commit-2**, **commit-3**, **commit-4**, and **commit-5**) being aggregated, and **commit-3** encounters an error while loading, **commit-3** is discarded and **commit-1**, **commit-2**, **commit-4**, and **commit-5** are aggregated and committed.

If there is an error during the commit operation when two or more jobs are aggregated and committed, the aggregation is discarded and each of those jobs is committed individually like a regular commit operation.

For example, if there are five commit jobs (**commit-1**, **commit-2**, **commit-3**, **commit-4**, and **commit-5**) that are aggregated and if there is a commit error caused because of **commit-3**, the aggregation is discarded, **commit-1**, **commit-2**, **commit-3**, **commit-4**, and **commit-5** are committed individually, and the CLI reports a commit error for **commit-3**.

### Example: Configuring Batch Commit Server Properties

---

This example shows how to configure batch commit server properties to manage batch commit operations.

- [Requirements on page 415](#)
- [Overview on page 415](#)

- [Configuration on page 415](#)
- [Verification on page 417](#)

### Requirements

This example uses the following hardware and software components:

- MX Series 3D Universal Edge Router
- Junos OS Release 12.1 or later running on the device

### Overview

You can control how the batch commit queue is handled by the commit server by configuring the server properties at the **[edit system commit server]** hierarchy level. This enables you to control how many commit jobs are aggregated or merged into a single batch commit, the maximum number of jobs that can be added to the queue, days to keep batch commit error logs, interval between two batch commits, and tracing operations for batch commit operations.

### Configuration

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level. You can configure the commit server properties from either the regular **[edit]** mode or the **[edit batch]** mode.

Device R0

```
set system commit server maximum-aggregate-pool 4
set system commit server maximum-entries 500
set system commit server commit-interval 5
set system commit server days-to-keep-error-logs 30
set system commit server traceoptions commitd_nov
set system commit server traceoptions flag all
```

### Configuring the Commit Server Properties

#### Step-by-Step Procedure

1. (Optional) Configure the number of commit transactions to aggregate or merge in a single commit operation.

The default value for **maximum-aggregate-pool** is 5.

**NOTE:** Setting **maximum-aggregate-pool** to 1 commits each of the jobs individually.

In this example, the number of commit transactions is set to 4 indicating that four different commit jobs are aggregated into a single commit before the commit operation is initiated.

```
[edit system commit server]
user@R0# set maximum-aggregate-pool 4
```

2. (Optional) Configure the maximum number of jobs allowed in a batch.

This limits the number of commits jobs that are added to the queue.

```
[edit system commit server]
user@R0# set maximum-entries 500
```

**NOTE:** If you set **maximum-entries** to 1, the commit server cannot add more than one job to the queue, and the CLI displays an appropriate message when you try to commit more than one job.

3. (Optional) Configure the time (in seconds) to wait before starting the next batch commit operation.

```
[edit system commit server]
user@R0# set commit-interval 5
```

4. (Optional) Configure the number of days to keep error logs.

The default value is 30 days.

```
[edit system commit server]
user@R0# set days-to-keep-error-logs 30
```

5. (Optional) Configure tracing operations to log batch commit events.

In this example, the filename for logging batch commit events is **commitd\_nov**, and all traceoption flags are set.

```
[edit system commit server]
user@R0# set traceoptions commitd_nov
user@R0# set traceoptions flag all
```

**Results** From configuration mode, confirm your configuration by entering the **show system commit server** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show system commit server
maximum-aggregate-pool 4;
maximum-entries 500;
commit-interval 5;
days-to-keep-error-logs 30;
traceoptions {
  file commitd_nov;
  flag all;
}
```

#### *Committing the Configuration from Batch Configuration Mode*

**Step-by-Step Procedure** To commit the configuration from the **[edit batch]** mode, do one of the following:

- Log in to the device and enter **commit**.

```
[edit batch]
user@R0# commit
Added to commit queue request-id: 1000
```

- To assign a higher priority to a batch commit job, issue the **commit** command with the **priority** option.

```
[edit batch]
user@R0# commit priority
Added to commit queue request-id: 1001
```

- To commit a configuration without aggregating the configuration changes with other commit jobs in the queue, issue the **commit** command with the **atomic** option.

```
[edit batch]
user@R0# commit atomic
Added to commit queue request-id: 1002
```

- To commit a configuration without aggregating the configuration changes with other commit jobs in the queue, and issuing a higher priority to the commit job, issue the **commit** command with the **atomic priority** option.

```
[edit batch]
user@R0# commit atomic priority
Added to commit queue request-id: 1003
```

### Verification

Confirm that the configuration is working properly.

- [Checking the Batch Commit Server Status on page 417](#)
- [Checking the Batch Commit Status on page 417](#)
- [Viewing the Patch Files in a Batch Commit Job on page 418](#)
- [Viewing the Trace Files for Batch Commit Operations on page 420](#)

### Checking the Batch Commit Server Status

**Purpose** Check the status of the batch commit server.

**Action** user@R0> show system commit server  
Commit server status : Not running

By default, the status of the commit server is **Not running**. The commit server starts running only when a batch commit job is added to the queue.

When a batch commit job is added to the queue, the status of the commit server changes to **Running**.

```
user@R0> show system commit server
```

```
Commit server status : Running
Jobs in process:
 1003 1004 1005
```

**Meaning** The **Jobs in process** field lists the commit IDs of jobs that are in process.

### Checking the Batch Commit Status

**Purpose** Check the commit server queue for the status of the batch commits.

**Action** user@R0> show system commit server queue

Error commits:

Id: 1008

Last Modified: Wed Nov 2 01:08:18 2011

Status: Error while committing 1008

**Meaning** **Pending commits** displays commit jobs that are added to the commit queue but are not committed yet. **Completed commits** displays the list of commit jobs that are successful. **Error commits** are commits that failed because of an error.

#### *Viewing the Patch Files in a Batch Commit Job*

**Purpose** View the timestamps, patch files, and the status of each of the commit jobs. Patch files show the configuration changes that occur in each commit operation that is added to the batch commit queue.

**Action** 1. Issue the **show system commit server queue patch** command to view the patches for all commit operations.

user@R0> show system commit server queue patch

Pending commits:

none

## Completed commits:

```

Id: 1000
Last Modified: Tue Nov  1 22:46:43 2011

```

## Patch:

```

[edit system]
+ radius-server {
+   10.1.1.1 port 222;
+ }

```

The output shows the changes in configuration for each commit job ID.

- To view the patch for a specific commit job ID, issue the **show system commit server queue patch id <id-number>** command.

```
user@R0> show system commit server queue patch id 1000
```

```
Completed commits:
```

```
Id: 1000
```

```
Last Modified: Tue Nov 1 22:46:43 2011
```

```
Status: Successfully committed 1000
```

```
Patch:
```

```
[edit system]
```

```
+ radius-server {
```

```
+ 192.168.69.162 secret teH.bTc/RVbPM;
```

```
+ 192.168.64.10 secret teH.bTc/RVbPM;
```

```
+ 192.168.60.52 secret teH.bTc/RVbPM;
```

```
+ 192.168.60.55 secret teH.bTc/RVbPM;
```

```
+ 192.168.4.240 secret teH.bTc/RVbPM;
```

```
+ }
```

**Meaning** The output shows the patch created for a commit job. The + or - sign indicates the changes in the configuration for a specific commit job.

### *Viewing the Trace Files for Batch Commit Operations*

**Purpose** View the trace files for batch commit operations. You can use the trace files for troubleshooting purposes.

- Action** • Issue the **file show /var/log/<filename>** command to view all entries in the log file.

```
user@R0> file show/var/log/commitd_nov
```

The output shows commit server event logs and other logs for batch commits.

```
Nov 1 22:46:43 Successfully committed 1000
```

```
Nov 1 22:46:43 pausing after commit for 0 seconds
```

```
...
```

```
Nov 1 22:46:43 Done working on queue
```

```
...
```

```
Nov 1 22:47:17 maximum-aggregate-pool = 5
```

```
Nov 1 22:47:17 maximum-entries= 0
```

```
Nov 1 22:47:17 asynchronous-prompt = no
```

```
Nov 1 22:47:17 commit-interval = 0
```

```
Nov 1 22:47:17 days-to-keep-error-logs = -1
```

```
...
```

```
Nov 1 22:47:17 Added to commit queue request-id: 1001
```

```
Nov 1 22:47:17 Commit server status=running
```

```
Nov 1 22:47:17 No need to pause
```

```
...
```

```
Nov 1 22:47:18 Error while committing 1001
```

```
Nov 1 22:47:18 doing rollback
```

```
...
```

- To view log entries only for successful batch commit operations, issue the **file show /var/log/<filename>** command with the **| match committed** pipe option.

```
user@R0> file show/var/log/commitd_nov | match committed
```

The output shows batch commit job IDs for successful commit operations.

```
Nov 1 22:46:43 Successfully committed 1000
Nov 1 22:50:35 Successfully committed 1002
Nov 1 22:51:48 Successfully committed 1004
Nov 2 01:08:04 Successfully committed 1007
Nov 2 01:16:45 Successfully committed 1009
Nov 2 01:19:25 Successfully committed 1010
Nov 2 01:28:16 Successfully committed 1011
```

- To view log entries only for failed batch commit operations, issue the **file show** `/var/log/<filename>` command with the **| match "Error while"** pipe option.

```
user@R0> file show /var/log/commitd_nov | match "Error while"
```

The output shows commit job IDs for failed commit operations.

```
Nov 1 22:47:18 Error while committing 1001
Nov 1 22:51:10 Error while committing 1003
Nov 1 22:52:15 Error while committing 1005
...
```

- To view log entries only for commit server events, issue the **file show** `/var/log/<filename>` command with the **| match "commit server"** pipe option.

```
user@R0> file show /var/log/commitd_nov | match "commit server"
```

The output shows commit server event logs.

```
Nov 1 22:46:39 Commit server status=running

## Loading a Junos OS Configuration

- [Loading a Configuration from a File on page 421](#)
- [Examples: Loading a Configuration from a File on page 424](#)

### Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
           filename <relative>
```

For information about specifying the filename, see [“Specifying Filenames and URLs” on page 500](#).

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Type ^D to end input.

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
           terminal <relative>
```

To replace an entire configuration, specify the **override** option at any level of the hierarchy.

An override operation discards the current candidate configuration and loads the configuration in *filename* or the one that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. For an example, see [Figure 15 on page 424](#).

To replace portions of a configuration, specify the **replace** option. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see [Figure 16 on page 424](#).

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. An update operation compares the current configuration and the current candidate configuration, and loads only the changes between these configurations in *filename* or the one that you type at the terminal. When you use the update operation and commit the configuration, Junos OS attempts to notify the smallest set of system processes that are affected by the configuration change.

To combine the current configuration and the configuration in *filename* or the one that you type at the terminal, specify the **merge** option. A merge operation is useful when you are adding a new section to an existing configuration. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration. For an example, see [Figure 17 on page 424](#).

To change part of the configuration with a patch file and mark only those parts as changed, specify the **patch** option. For an example, see [Figure 18 on page 425](#).

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
  bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

If, in an override or merge operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see [Figure 19 on page 425](#).

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

## Synchronizing the Junos OS Configuration

- [Synchronizing Routing Engines on page 426](#)

### Synchronizing Routing Engines

If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the **commit synchronize** command. The Routing Engine on which you execute this command (requesting Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine will be terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

**NOTE:** We recommend that you use the **force** option only if you are unable to resolve the issues that caused the **commit synchronize** command to fail.

For example, if you are logged in to **re1** (requesting Routing Engine) and you want **re0** (responding Routing Engine) to have the same configuration as **re1**, issue the **commit synchronize** command on **re1**. **re1** copies and loads its candidate configuration to **re0**. Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, **re1**'s candidate configuration is activated and becomes the current operational configuration on both Routing Engines.

**NOTE:** When you issue the **commit synchronize** command, you must use the groups **re0** and **re1**. For information about how to use the **apply-groups** statement, see [“Applying a Junos Configuration Group” on page 429](#).

The responding Routing Engine must be running Junos OS Release 5.0 or later.

To synchronize a Routing Engine's current operational configuration file with the other, log in to the Routing Engine from which you want to synchronize and issue the **commit synchronize** command:

```
[edit]
user@host# commit synchronize
commit complete
[edit]
user@host#
```

**NOTE:** You can also add the `commit synchronize` statement at the `[edit system]` hierarchy level so that a `commit` command automatically invokes a `commit synchronize` command by default. .

To enforce a `commit synchronize` on the Routing Engines, log in to the Routing Engine from which you want to synchronize and issue the `commit synchronize` command with the `force` option:

```
[edit]
user@host# commit synchronize force
re0:
re1:
commit complete
re0:
commit complete
[edit]
user@host#
```

**NOTE:**

- If you have nonstop routing enabled on your router, you must enter the `commit synchronize` command from the master Routing Engine after you make any changes to the configuration. If you enter this command on the backup Routing Engine, the Junos OS displays a warning and commits the configuration.
- Starting with Junos OS Release 9.3, accounting of backup Routing Engine events or operations is not supported on accounting servers such as TACACS+ or RADIUS. Accounting is only supported for events or operations on a master Routing Engine.

- [Example: Viewing Default Statements That Have Been Applied to the Configuration on page 452](#)

## Creating a Junos Configuration Group

To create a configuration group, include the **groups** statement at the **[edit]** hierarchy level:

```
[edit]
groups {
  group-name {
    configuration-data;
  }
  lccn-re0 {
    configuration-data;
  }
  lccn-re1 {
    configuration-data;
  }
}
```

**group-name** is the name of a configuration group. You can configure more than one configuration group by specifying multiple **group-name** statements. However, you cannot use the prefix **junos-** in a group name because it is reserved for use by Junos OS. Similarly, the configuration group **juniper-ais** is reserved exclusively for Juniper Advanced Insight Solutions (AIS)-related configuration. For more information on the **juniper-ais** configuration group, see the *Juniper Networks Advanced Insight Solutions Guide*.

One reason for the naming restriction is a configuration group called **junos-defaults**. This preset configuration group is applied to the configuration automatically. You cannot modify or remove the **junos-defaults** configuration group. For more information about the Junos default configuration group, see [“Using Junos OS Defaults Groups” on page 450](#).

On routers that support multiple Routing Engines, you can also specify two special group names:

- **re0**—Configuration statements applied to the Routing Engine in slot 0.
- **re1**—Configuration statements applied to the Routing Engine in slot 1.

The configuration specified in group **re0** is only applied if the current Routing Engine is in slot 0; likewise, the configuration specified in group **re1** is only applied if the current Routing Engine is in slot 1. Therefore, both Routing Engines can use the same configuration file, each using only the configuration statements that apply to it. Each **re0** or **re1** group contains at a minimum the configuration for the hostname and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group also should contain the configuration for the backup router and static routes.

In addition, the TX Matrix router supports group names for the Routing Engines in each T640 router attached to the routing matrix. Providing special group names for all Routing Engines in the routing matrix allows you to configure the individual Routing Engines in each T640 router differently. Parameters that are not configured at the **[edit groups]** hierarchy level apply to all Routing Engines in the routing matrix.

**configuration-data** contains the configuration statements applied elsewhere in the configuration with the **apply-groups** statement. To have a configuration inherit the statements in a configuration group, include the **apply-groups** statement. For information about the **apply-groups** statement, see [“Applying a Junos Configuration Group” on page 429](#).

The group names for Routing Engines on the TX Matrix router have the following formats:

- **lccn-re0**—Configuration statements applied to the Routing Engine in slot 0 in a specified T640 router.
- **lccn-re1**—Configuration statements applied to the Routing Engine in slot 1 in a specified T640 router.

*n* identifies the T640 router and can be from 0 through 3. For example, to configure Routing Engine 1 properties for **lcc3**, you include statements at the **[edit groups lcc3-re1]** hierarchy level..

**NOTE:** The management Ethernet interface used for the TX Matrix Plus router, T1600 routers in a routing matrix, and PTX Series Packet Transport Switches, is **em0**. Junos OS automatically creates the router's management Ethernet interface, **em0**.

#### Related Documentation

- [Using Junos OS Defaults Groups on page 450](#)
- [Understanding the Junos Configuration Groups on page 353](#)
- [Disabling Inheritance of a Junos OS Configuration Group on page 433](#)
- [Using Wildcards with Configuration Groups on page 435](#)
- [Example : Configuring Sets of Statements with Configuration Groups on page 440](#)

## Applying a Junos Configuration Group

To have a Junos configuration inherit the statements from a configuration group, include the **apply-groups** statement:

```
apply-groups [ group-names ];
```

If you specify more than one group name, list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups.

For routers that support multiple Routing Engines, you can specify **re0** and **re1** group names. The configuration specified in group **re0** is only applied if the current Routing

Engine is in slot 0; likewise, the configuration specified in group **re1** is only applied if the current Routing Engine is in slot 1. Therefore, both Routing Engines can use the same configuration file, each using only the configuration statements that apply to it. Each **re0** or **re1** group contains at a minimum the configuration for the hostname and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group also should contain the configuration for the backup router and static routes.

**NOTE:** The management Ethernet interface used for the TX Matrix Plus router, T1600 routers in a routing matrix, and PTX Series Packet Transport Switches, is **em0**.

You can include only one **apply-groups** statement at each specific level of the configuration hierarchy. The **apply-groups** statement at a specific hierarchy level lists the configuration groups to be added to the containing statement's list of configuration groups.

Values specified at the specific hierarchy level override values inherited from the configuration group.

Groups listed in nested **apply-groups** statements take priority over groups in outer statements. In the following example, the BGP neighbor **10.0.0.1** inherits configuration data from group **one** first, then from groups **two** and **three**. Configuration data in group **one** overrides data in any other group. Data from group **ten** is used only if a statement is not contained in any other group.

```

apply-groups [ eight nine ten ];
protocols {
  apply-groups seven;
  bgp {
    apply-groups [ five six ];
    group some-bgp-group {
      apply-groups four;
      neighbor 10.0.0.1 {
        apply-groups [ one two three ];
      }
    }
  }
}

```

When you configure a group defined for the root level—that is, in the default logical system—you cannot successfully apply that group to a nondefault logical system under the **[edit logical-systems logical-system-name]** hierarchy level. Although the router accepts the commit if you apply the group, the configuration group does not take effect for the nondefault logical system. You can instead create an additional configuration group at the root level and apply it within the logical system. Alternatively, you can modify the original group so that it includes configuration for both the default and nondefault logical system hierarchy levels.

- [Example : Configuring Sets of Statements with Configuration Groups on page 440](#)

## Example: Configuring and Applying Junos Configuration Groups

In this example, the SNMP configuration is divided between the group **basic** and the normal configuration hierarchy.

There are a number of advantages to placing the system-specific configuration (SNMP contact) into a configuration group and thus separating it from the normal configuration hierarchy—the user can replace (using the **load replace** command) either section without discarding data from the other.

In addition, setting a contact for a specific box is now possible because the group data would be hidden by the router-specific data.

```
[edit]
groups {
  basic { # User-defined group name
    snmp { # This group contains some SNMP data
      contact "My Engineering Group";
      community BasicAccess {
        authorization read-only;
      }
    }
  }
}
apply-groups basic; # Enable inheritance from group "basic"
snmp { # Some normal (non-group) configuration
  location "West of Nowhere";
}
```

This configuration is equivalent to the following:

```
[edit]
snmp {
  location "West of Nowhere";
  contact "My Engineering Group";
  community BasicAccess {
    authorization read-only;
  }
}
```

For information about how to disable inheritance of a configuration group, see [“Disabling Inheritance of a Junos OS Configuration Group” on page 433](#).

## Example: Creating and Applying Configuration Groups on a TX Matrix Router

The following example shows how to configure and apply configuration groups on a TX Matrix Router:

```
[edit]
groups {
  re0 { # Routing Engine 0 on TX Matrix router
    system {
      host-name hostname;
      backup-router ip-address;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address ip-address;
          }
        }
      }
    }
  }
  re1 { # Routing Engine 1 on TX Matrix router
    system {
      host-name hostname;
      backup-router ip-address;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address ip-address;
          }
        }
      }
    }
  }
  lcc0-re0 { # Routing Engine 0 on T640 router numbered 0
    system {
      host-name hostname;
      backup-router ip-address;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
```

**Related Documentation**

- [Example: Configuring and Applying Junos Configuration Groups on page 431](#)
- [Creating a Junos Configuration Group on page 428](#)

To disable inheritance of a configuration group at any level except the top level of the hierarchy, include the **apply-groups-except** statement:

This statement is useful when you use the **apply-group** statement at a specific hierarchy level but also want to override the values inherited from the configuration group for a specific parameter.

```
[edit]
groups { # "groups" is a top-level statement
  global { # User-defined group name
    interfaces {
      <*> {
        hold-time down 640;
        link-mode full-duplex;
      }
    }
  }
}
apply-groups global;
interfaces {
```

```

so-1/1/0 {
  apply-groups-except global; # Disables inheritance from group "global"
  # so-1/1/0 uses default value for "hold-time"
  # and "link-mode"
}

```

For information about applying a configuration group, see [“Applying a Junos Configuration Group” on page 429](#).

Configuration groups can add some confusion regarding the actual values used by the router, because configuration data can be inherited from configuration groups. To view the actual values used by the router, use the **display inheritance** command after the pipe ( | ) in a **show** command. This command displays the inherited statements at the level at which they are inherited and the group from which they have been inherited.

```

[edit]
user@host# show | display inheritance
snmp {
  location "West of Nowhere";
  ##
  ## 'My Engineering Group' was inherited from group 'basic'
  ##
  contact "My Engineering Group";
  ##
  ## 'BasicAccess' was inherited from group 'basic'
  ##
  community BasicAccess {
    ##
    ## 'read-only' was inherited from group 'basic'
    ##
    authorization read-only;
  }
}

```

To display the expanded configuration (the configuration, including the inherited statements) without the ## lines, use the **except** command after the pipe in a **show** command:

```

[edit]
user@host# show | display inheritance | except ##
snmp {
  location "West of Nowhere";
  contact "My Engineering Group";
  community BasicAccess {
    authorization read-only;
  }
}

```

**NOTE:** Using the `display inheritance | except ##` option removes all the lines with `##`. Therefore, you might also not be able to view information about passwords and other important data where `##` is used. To view the complete configuration details with all the information without just the comments marked with `##`, use the `no-comments` option with the `display inheritance` command:

```
[edit]
user@host# show | display inheritance no-comments
snmp {
    location "West of Nowhere";
    contact "My Engineering Group";
    community BasicAccess {
        authorization read-only;
    }
}
```

#### Related Documentation

- [Applying a Junos Configuration Group on page 429](#)
- [Understanding the Junos Configuration Groups on page 353](#)

## Using Wildcards with Configuration Groups

You can use wildcards to identify names and allow one statement to provide data for a variety of statements. For example, grouping the configuration of the **sonet-options** statement over all SONET/SDH interfaces or the dead interval for OSPF over all Asynchronous Transfer Mode (ATM) interfaces simplifies configuration files and eases their maintenance.

Using wildcards in normal configuration data is done in a style that is consistent with that used with traditional UNIX shell wildcards. In this style, you can use the following metacharacters:

- Asterisk ( `*` )—Matches any string of characters.
- Question mark ( `?` )—Matches any single character.
- Open bracket ( `[` )—Introduces a character class.
- Close bracket ( `]` )—Indicates the end of a character class. If the close bracket is missing, the open bracket matches a `[` rather than introduce a character class.
- A character class matches any of the characters between the square brackets. Within a configuration group, an interface name that includes a character class must be enclosed in quotation marks.
- Hyphen ( `-` )—Specifies a range of characters.
- Exclamation point ( `!` )—The character class can be complemented by making an exclamation point the first character of the character class. To include a close bracket ( `]` ) in a character class, make it the first character listed (after the `!`, if any). To include a minus sign, make it the first or last character listed.

Wildcarding in configuration groups follows the same rules, but any term using a wildcard pattern must be enclosed in angle brackets *<pattern>* to differentiate it from other wildcarding in the configuration file.

```
[edit]
groups {
  sonet-default {
    interfaces {
      <so-*> {
        sonet-options {
          payload-scrambler;
          rfc-2615;
        }
      }
    }
  }
}
```

Wildcard expressions match (and provide configuration data for) existing statements in the configuration that match their expression only. In the previous example, the expression *<so-\*>* passes its **sonet-options** statement to any interface that matches the expression *so-\**.

The following example shows how to specify a range of interfaces:

```
[edit]
groups {
  gigabit-ethernet-interfaces {
    interfaces {
      "<ge-1/2/[5-8]>" {
        description "These interfaces reserved for Customer ABC";
      }
    }
  }
}
```

Angle brackets allow you to pass normal wildcarding through without modification. In any matching within the configuration, whether it is done with or without wildcards, the first item encountered in the configuration that matches is used. In the following example, data from the wildcarded BGP groups is inherited in the order in which the groups are listed. The preference value from *<\*a\*>* overrides the preference in *<\*b\*>*, just as the **p** value from *<\*c\*>* overrides the one from *<\*d\*>*. Data values from any of these groups override the data values from **abcd**.

```
[edit]
user@host# show
groups {
  one {
    protocols {
      bgp {
        group <*a*> {
          preference 1;
        }
        group <*b*> {
          preference 2;
        }
      }
    }
  }
}
```

```

    }
    group <*c*> {
        out-delay 3;
    }
    group <*d*> {
        out-delay 4;
    }
    group abcd {
        preference 10;
        hold-time 10;
        out-delay 10;
    }
}
}
}
}
protocols {
    bgp {
        group abcd {
            apply-groups one;
        }
    }
}
[edit]
user@host# show | display inheritance
protocols {
    bgp {
        group abcd {
            ##
            ## '1' was inherited from group 'one'
            ##
            preference 1;
            ##
            ## '10' was inherited from group 'one'
            ##
            hold-time 10;
            ##
            ## '3' was inherited from group 'one'
            ##
            out-delay 3;
        }
    }
}

```

## Example: Using Conditions to Apply Configuration Groups

- [Using Conditions to Apply Configuration Groups Overview on page 438](#)
- [Example: Configuring Conditions for Applying Configuration Groups on page 438](#)

### Using Conditions to Apply Configuration Groups Overview

---

You can use the **when** statement at the **[edit groups group-name]** hierarchy level to define conditions under which a configuration group should be applied.

You can configure a group to be applied based on the type of **chassis**, **model**, or **routing-engine**, virtual chassis **member**, cluster **node**, and start and optional end **time** of day or date.

For example, you could use the **when** statement to create a generic configuration group for each type of node and then apply the configuration based on certain node properties, such as chassis or model.

### Example: Configuring Conditions for Applying Configuration Groups

---

This example shows how to configure conditions under which a specified configuration group is to be applied.

- [Requirements on page 438](#)
- [Overview on page 438](#)
- [Configuration on page 439](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

You can configure your group configuration data at the **[edit groups group-name]** hierarchy level, then use the **when** statement to have the group applied based on conditions including: type of **chassis**, **model**, or **routing-engine**, virtual chassis **member**, cluster **node**, and start and optional end **time** of day or date.

If you specify multiple conditions in a single configuration group, all conditions must be met before the configuration group is applied.

You can specify the start time or the time duration for the configuration group to be applied. If only the start time is specified, the configuration group is applied at the specified time and it remains in effect until the time is changed. If the end time is specified, then on each day, the applied configuration group is started and stopped at the specified times.

This example sets conditions in a configuration group, **test1**, such that this group is applied only when all of the following conditions are met: the router is a model MX240 router with chassis type LCC0, with a Routing Engine operating as RE0, is member0 of the virtual chassis on node0, and the configuration group will only be in effect from 9:00 a.m. until

5:00 p.m. each day. The configuration data has not yet been added to the **test1** group in this example.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set groups test1 when model mx240
set groups test1 when chassis lcc0
set groups test1 when routing-engine re0
set groups test1 when member member0
set groups test1 when node node0
set groups test1 when time 9 to 5
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure conditions for configuration group **test1**:

1. Set the condition that identifies the model MX240 router.

```
[edit groups test1 when]
user@host# set model mx240
```

2. Set the condition that identifies the chassis type as **LCC0**.

```
[edit groups test1 when]
user@host# set chassis lcc0
```

3. Set the condition that identifies the Routing Engine operating as **RE0**.

```
[edit groups test1 when]
user@host# set routing-engine re0
```

4. Set the condition that identifies the virtual chassis **member0**.

```
[edit groups test1 when]
user@host# set member member0
```

5. Set the condition that identifies the cluster **node0**.

```
[edit groups test1 when]
user@host# set node node0
```

6. Set the condition that applies the group only between the hours of 9:00 a.m. and 5:00 p.m. daily.

```
[edit groups test1 when]
user@host# set time 9 to 5
```

**NOTE:** The syntax for specifying the time is: `time <start-time> [to <end-time>]` using the time format `yyyy-mm-dd.hh:mm`, `hh:mm`, or `hh`.

7. Commit the configuration.

**Results** From configuration mode, confirm your configuration by entering the **show groups** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show groups test1
when {
  time 9 to 5;
  chassis lcc0;
  model mx240;
  routing-engine re0;
  member member0;
  node node0;
}
```

#### **Verification**

Confirm that the configuration is working properly.

- [Checking Group Inheritance with Conditional Data on page 440](#)

#### **Checking Group Inheritance with Conditional Data**

**Purpose** Verify that conditional data from a configuration group is inherited when applied.

**Action** The **show | display inheritance** operational command can be issued with the **when** data to display the conditional inheritance. Using this example, you could issue one of these commands to determine that the conditional data was inherited:

```
user@host> show | display inheritance when model mx240
user@host> show | display inheritance when chassis lcc0
user@host> show | display inheritance when routing-engine re0
user@host> show | display inheritance when member member0
user@host> show | display inheritance when node node0
user@host> show | display inheritance when time 9 to 5
```

- Related Documentation**
- [Understanding the Junos Configuration Groups on page 353](#)
  - [Creating a Junos Configuration Group on page 428](#)
  - [Applying a Junos Configuration Group on page 429](#)

## **Example : Configuring Sets of Statements with Configuration Groups**

When sets of statements exist in configuration groups, all values are inherited. For example:

```

[edit]
user@host# show
groups {
  basic {
    snmp {
      interface so-1/1/1.0;
    }
  }
}
apply-groups basic;
snmp {
  interface so-0/0/0.0;
}
[edit]
user@host# show | display inheritance
snmp {
  ##
  ## 'so-1/1/1.0' was inherited from group 'basic'
  ##
  interface [ so-0/0/0.0 so-1/1/1.0 ];
}

```

For sets that are not displayed within brackets, all values are also inherited. For example:

```

[edit]
user@host# show
groups {
  worldwide {
    system {
      name-server {
        10.0.0.100;
        10.0.0.200;
      }
    }
  }
}
apply-groups worldwide;
system {
  name-server {
    10.0.0.1;
    10.0.0.2;
  }
}
[edit]
user@host# show | display inheritance
system {
  name-server {
    ##
    ## '10.0.0.100' was inherited from group 'worldwide'
    ##
    10.0.0.100;
    ##
    ## '10.0.0.200' was inherited from group 'worldwide'
    ##
    10.0.0.200;
    10.0.0.1;
  }
}

```

```

        10.0.0.2;
    }
}

```

### Example: Configuring Interfaces Using Junos OS Configuration Groups

You can use configuration groups to separate the common interface media parameters from the interface-specific addressing information. The following example places configuration data for ATM interfaces into a group called **atm-options**:

```

[edit]
user@host# show
groups {
  atm-options {
    interfaces {
      <at-*> {
        atm-options {
          vpi 0 maximum-vcs 1024;
        }
        unit <*> {
          encapsulation atm-snap;
          point-to-point;
          family iso;
        }
      }
    }
  }
}
apply-groups atm-options;
interfaces {
  at-0/0/0 {
    unit 100 {
      vci 0.100;
      family inet {
        address 10.0.0.100/30;
      }
    }
    unit 200 {
      vci 0.200;
      family inet {
        address 10.0.0.200/30;
      }
    }
  }
}
[edit]
user@host# show | display inheritance
interfaces {
  at-0/0/0 {

```

```

##
## "atm-options" was inherited from group "atm-options"
##
atm-options {
    ##
    ## "1024" was inherited from group "atm-options"
    ##
    vpi 0 maximum-vcs 1024;
}
unit 100 {
    ##
    ## "atm-snap" was inherited from group "atm-options"
    ##
    encapsulation atm-snap;
    ##
    ## "point-to-point" was inherited from group "atm-options"
    ##
    point-to-point;
    vci 0.100;
    family inet {
        address 10.0.0.100/30;
    }
    ##
    ## "iso" was inherited from group "atm-options"
    ##
    family iso;
}
unit 200 {
    ##
    ## "atm-snap" was inherited from group "atm-options"
    ##
    encapsulation atm-snap;
    ##
    ## "point-to-point" was inherited from group "atm-options"
    ##
    point-to-point;
    vci 0.200;
    family inet {
        address 10.0.0.200/30;
    }
    ##
    ## "iso" was inherited from group "atm-options"
    ##
    family iso;
}
}
}
[edit]
user@host# show | display inheritance | except ##
interfaces {
  at-0/0/0 {
    atm-options {
      vpi 0 maximum-vcs 1024;
    }
    unit 100 {
      encapsulation atm-snap;

```

```

    point-to-point;
    vci 0.100;
    family inet {
        address 10.0.0.100/30;
    }
    family iso;
}
unit 200 {
    encapsulation atm-snap;
    point-to-point;
    vci 0.200;
    family inet {
        address 10.0.0.200/30;
    }
    family iso;
}
}
}

```

#### Related Documentation

- [Interface Naming Conventions Used in the Junos OS Operational Commands on page 493](#)
- [Example: Configuring a Consistent IP Address for the Management Interface on page 444](#)

### Example: Configuring a Consistent IP Address for the Management Interface

On routers with multiple Routing Engines, each Routing Engine is configured with a separate IP address for the management interface (**fxp0**). To access the master Routing Engine, you must know which Routing Engine is active and use the appropriate IP address.

Optionally, for consistent access to the master Routing Engine, you can configure an additional IP address and use this address for the management interface regardless of which Routing Engine is active. This additional IP address is active only on the management interface for the master Routing Engine. During switchover, the address moves to the new master Routing Engine.

In the following example, address **10.17.40.131** is configured for both Routing Engines and includes a **master-only** statement. With this configuration, the **10.17.40.131** address is active only on the master Routing Engine. The address remains consistent regardless of which Routing Engine is active. Address **10.17.40.132** is assigned to **fxp0** on **re0**, and **10.17.40.133** is assigned to **fxp0** on **re1**.

```

[edit groups re0 interfaces fxp0]
unit 0 {
    family inet {
        address 10.17.40.131/25 {
            master-only;
        }
        address 10.17.40.132/25;
    }
}
[edit groups re1 interfaces fxp0]

```

```

unit 0 {
  family inet {
    address 10.17.40.131/25 {
      master-only;
    }
    address 10.17.40.133/25;
  }
}

```

This feature is available on all routers that include dual Routing Engines. On a routing matrix composed of the TX Matrix router, this feature is applicable to the switch-card chassis (SCC) only. Likewise, on a routing matrix composed of a TX Matrix Plus router, this feature is applicable to the switch-fabric chassis (SFC) only.

#### NOTE:

- If you configure the same IP address for a management interface or internal interface such as `fxp0` and an external physical interface such as `ge-0/0/1`, when graceful Routing Engine switchover (GRES) is enabled, the CLI displays an appropriate commit error message that identical addresses have been found on the private and public interfaces. In such cases, you must assign unique IP addresses for the two interfaces that have duplicate addresses.
- The management Ethernet interface used for the TX Matrix Plus router, T1600 routers in a routing matrix, and PTX Series Packet Transport Switches, is `em0`. Junos OS automatically creates the router's management Ethernet interface, `em0`.

- [Example: Configuring Interfaces Using Junos OS Configuration Groups on page 442](#)

## Example: Configuring Peer Entities

In this example, we create a group **some-isp** that contains configuration data relating to another Internet service provider (ISP). We can then insert **apply-group** statements at any point to allow any location in the configuration hierarchy to inherit this data.

```

[edit]
user@host# show
groups {
  some-isp {
    interfaces {
      <xe-*> {
        gigether-options {
          flow-control;
        }
      }
    }
  }
}

```

```

protocols {
  bgp {
    group <*> {
      neighbor <*> {
        remove-private;
      }
    }
  }
  pim {
    interface <*> {
      version 1;
    }
  }
}
}
interfaces {
  xe-0/0/0 {
    apply-groups some-isp;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
protocols {
  bgp {
    group main {
      neighbor 10.254.0.1 {
        apply-groups some-isp;
      }
    }
  }
  pim {
    interface xe-0/0/0.0 {
      apply-groups some-isp;
    }
  }
}
[edit]
user@host# show | display inheritance
interfaces {
  xe-0/0/0 {
    ##
    ## "gigether-options" was inherited from group "some-isp"
    ##
    gigether-options {
      ##
      ## "flow-control" was inherited from group "some-isp"
      ##
      flow-control;
    }
    unit 0 {
      family inet {
        address 10.0.0.1/24;

```

```

    }
  }
}
protocols {
  bgp {
    group main {
      neighbor 10.254.0.1 {
        ##
        ## "remove-private" was inherited from group "some-isp"
        ##
        remove-private;
      }
    }
  }
}
pim {
  interface xe-0/0/0.0 {
    ##
    ## "1" was inherited from group "some-isp"
    ##
    version 1;
  }
}
}

```

- Related Documentation**
- [Understanding the Junos Configuration Groups on page 353](#)
  - [Creating a Junos Configuration Group on page 428](#)
  - [Establishing Regional Configurations on page 447](#)

## Establishing Regional Configurations

In this example, one group is populated with configuration data that is standard throughout the company, while another group contains regional deviations from this standard:

```

[edit]
user@host# show
groups {
  standard {
    interfaces {
      <t3-*> {
        t3-options {
          compatibility-mode larscom subrate 10;
          idle-cycle-flag ones;
        }
      }
    }
  }
  northwest {
    interfaces {
      <t3-*> {
        t3-options {
          long-buildout;

```

```

        compatibility-mode kentrox;
    }
}
}
}
}
apply-groups standard;
interfaces {
    t3-0/0/0 {
        apply-groups northwest;
    }
}
[edit]
user@host# show | display inheritance
interfaces {
    t3-0/0/0 {
        ##
        ## "t3-options" was inherited from group "northwest"
        ##
        t3-options {
            ##
            ## "long-buildout" was inherited from group "northwest"
            ##
            long-buildout;
            ##
            ## "kentrox" was inherited from group "northwest"
            ##
            compatibility-mode kentrox;
            ##
            ## "ones" was inherited from group "standard"
            ##
            idle-cycle-flag ones;
        }
    }
}

```

- Related Documentation**
- [Understanding the Junos Configuration Groups on page 353](#)
  - [Example: Configuring Peer Entities on page 445](#)

## Selecting Wildcard Names

You can combine wildcarding and thoughtful use of names in statements to tailor statement values:

```

[edit]
user@host# show
groups {
    mpls-conf {
        protocols {
            mpls {
                label-switched-path <*-major> {
                    retry-timer 5;
                    bandwidth 155m;
                    optimize-timer 60;
                }
            }
        }
    }
}

```

**Related Documentation** • [Using Wildcards with Configuration Groups on page 435](#)

## Using Junos OS Defaults Groups

Junos OS provides a hidden and immutable configuration group called **junos-defaults** that is automatically applied to the configuration of your router. The **junos-defaults** group contains preconfigured statements that contain predefined values for common applications. Some of the statements must be referenced to take effect, such as definitions for applications (for example, FTP or telnet settings). Other statements are applied automatically, such as terminal settings.

**NOTE:** Many identifiers included in the **junos-defaults** configuration group begin with the name **junos-**. Because identifiers beginning with the name **junos-** are reserved for use by Juniper Networks, you cannot define any configuration objects using this name.

You cannot include **junos-defaults** as a configuration group name in an **apply-groups** statement.

To view the full set of available preset statements from the Junos defaults group, issue the **show groups junos-defaults** configuration mode command at the top level of the configuration. The following example displays a partial list of Junos defaults groups:

```
user@host# show groups junos-defaults
# Make vt100 the default for the console port
system {
  ports {
    console type vt100;
  }
}
applications {
  # File Transfer Protocol
  application junos-ftp {
    application-protocol ftp;
    protocol tcp;
    destination-port 21;
  }
  # Trivial File Transfer Protocol
  application junos-tftp {
    application-protocol tftp;
    protocol udp;
    destination-port 69;
  }
  # RPC port mapper on TCP
  application junos-rpc-portmap-tcp {
    application-protocol rpc-portmap;
    protocol tcp;
    destination-port 111;
  }
  # RPC port mapper on UDP
}
```

To reference statements available from the **junos-defaults** group, include the selected **junos-*default-name*** statement at the applicable hierarchy level.

- Related Documentation**
- [Creating a Junos Configuration Group on page 428](#)
  - [Example: Referencing the Preset Statement From the Junos defaults Group on page 451](#)
  - [Example: Viewing Default Statements That Have Been Applied to the Configuration on page 452](#)

### Example: Referencing the Preset Statement From the Junos defaults Group

The following example is a preset statement from the Junos defaults group that is available for FTP in a stateful firewall:

```
[edit]
groups {
  junos-defaults {
    applications {
      application junos-ftp {# Use FTP default configuration
        application-protocol ftp;
        protocol tcp;
        destination-port 21;
      }
    }
  }
}
```

To reference a preset Junos default statement from the Junos defaults group, include the **junos-*default-name*** statement at the applicable hierarchy level. For example, to reference the Junos default statement for FTP in a stateful firewall, include the **junos-ftp** statement at the **[edit services stateful-firewall rule my-rule term my-term from applications]** hierarchy level:

```
[edit]
services {
  stateful-firewall {
    rule my-rule {
      term my-term {
        from {
          applications junos-ftp; #Reference predefined statement, junos-ftp
        }
      }
    }
  }
}
```

- Related Documentation**
- [Example: Viewing Default Statements That Have Been Applied to the Configuration on page 452](#)
  - [Using Junos OS Defaults Groups on page 450](#)
  - [Understanding the Junos Configuration Groups on page 353](#)
  - [Creating a Junos Configuration Group on page 428](#)

## Example: Viewing Default Statements That Have Been Applied to the Configuration

To view the Junos defaults that have been applied to the configuration, issue the **show | display inheritance defaults** command. For example, to view the inherited Junos defaults at the **[edit system ports]** hierarchy level:

```
user@host# show system ports | display inheritance defaults
## ## 'console' was inherited from group 'junos-defaults'
## 'vt100' was inherited from group 'junos-defaults'
## console type vt100;
```

If you choose not to use existing Junos default statements, you can create your own configuration groups manually.

To view the complete configuration information without the comments marked with **##**, use the **no-comments** option with the **display inheritance** command.

## Examples: Using Command Completion in Configuration Mode

List the configuration mode commands:

```
[edit]
user@host# ?
<[Enter]>      Execute this command
activate      Remove the inactive tag from a statement
annotate      Annotate the statement with a comment
commit        Commit current set of changes
copy          Copy a statement
deactivate    Add the inactive tag to a statement
delete        Delete a data element
edit          Edit a sub-element
exit          Exit from this level
extension     Extension operations
help          Provide help information
insert        Insert a new ordered data element
load          Load configuration from ASCII file
quit          Quit from this level
rename        Rename a statement
replace       Replace character string in configuration
rollback      Roll back to previous committed configuration
run           Run an operational-mode command
save          Save configuration to ASCII file
set           Set a parameter
show          Show a parameter
status        Show users currently editing configuration
```

```

top                Exit to top level of configuration
up                Exit one level of configuration
wildcard          Wildcard operations
[edit]user@host#

```

List all the statements available at a particular hierarchy level:

```

[edit]
user@host# edit ?
Possible completions:

```

[edit]
user@host# edit protocols

```

List all commands that start with a particular letter or string:

```

user@host# edit routing-options a?
Possible completions:
> aggregate          Coalesced routes
> autonomous-system  Autonomous system number

```

```

[edit]
user@host# edit routing-options a

```

List all configured Asynchronous Transfer Mode (ATM) interfaces:

```

[edit]
user@host# edit interfaces at?
<interface_name>  Interface name
at-0/2/0           Interface name
at-0/2/1           Interface name

```

```
[edit]
user@host# edit interfaces at
```

Display a list of all configured policy statements:

```
[edit]
user@host# show policy-options policy-statement ?
<policy_name>      Name to identify a policy filter
  lo0only-v4        Name to identify a policy filter
  lo0only-v6        Name to identify a policy filter
  lo2bgp            Name to identify a policy filter
```

#### Related Documentation

- [Displaying the Junos OS CLI Command and Word History on page 455](#)

## Examples: Using the Junos OS CLI Command Completion

The following examples show how you can use the command completion feature in Junos OS. Issue the **show interfaces** command:

```
user@host> sh<Space>ow i<Space>
'i' is ambiguous.
Possible completions:
igmp          Show information about IGMP
interface     Show interface information
isis          Show information about IS-IS

user@host> show in<Space>terfaces
Physical interface: at-0/1/0, Enabled, Physical link is Up
Interface index: 11, SNMP ifIndex: 65
Link-level type: ATM-PVC, MTU: 4482, Clocking: Internal, SONET mode
Speed: OC12, Loopback: None, Payload scrambler: Enabled
Device flags: Present Running
Link flags: 0x01
...
```

```
user@host>
```

Display a list of all log files whose names start with the string “messages,” and then display the contents of one of the files:

```
user@myhost> show log mes?
Possible completions:
  <filename>Log file to display
messagesSize: 1417052, Last changed: Mar 3 00:33
messages.0.gzSize: 145575, Last changed: Mar 3 00:00
messages.1.gzSize: 134253, Last changed: Mar 2 23:00
messages.10.gzSize: 137022, Last changed: Mar 2 14:00
messages.2.grSize: 137112, Last changed: Mar 2 22:00
messages.3.gzSize: 121633, Last changed: Mar 2 21:00
messages.4.gzSize: 135715, Last changed: Mar 2 20:00
messages.5.gzSize: 137504, Last changed: Mar 2 19:00
messages.6.gzSize: 134591, Last changed: Mar 2 18:00
messages.7.gzSize: 132670, Last changed: Mar 2 17:00
messages.8.gzSize: 136596, Last changed: Mar 2 16:00
messages.9.gzSize: 136210, Last changed: Mar 2 15:00

user@myhost> show log mes<Tab>sages.4<Tab>.gz<Enter>
Jan 15 21:00:00 myhost newsyslog[1381]: logfile turned over
...
```

- Related Documentation**
- [Displaying the Junos OS CLI Command and Word History on page 455](#)

## Displaying the Junos OS CLI Command and Word History

To display a list of recent commands that you issued, use the **show cli history** command:

```
user@host> show cli history 3
01:01:44 -- show bgp next-hop-database
01:01:51 -- show cli history
01:02:51 -- show cli history 3
```

You can press Esc+. (period) or Alt+. (period) to insert the last word of the previous command. Repeat Esc+. or Alt+. to scroll backwards through the list of recently entered words. For example:

```
user@host> show interfaces terse fe-0/0/0
Interface      Admin    Link    Proto    Local    Remote
fe-0/0/0       up      up      inet     192.168.220.1/30
fe-0/0/0.0     up      up      inet     192.168.220.1/30

user@host> <Esc>
user@host> fe-0/0/0
```

If you scroll completely to the beginning of the list, pressing Esc+. or Alt+. again restarts scrolling from the last word entered.

## CLI Configuration Mode

- [Example: Using the configure Command on page 455](#)

### Example: Using the configure Command

If, when you enter configuration mode, another user is also in configuration mode, a message shows who the user is and what part of the configuration that user is viewing or editing:

```
user@host> configure
Entering configuration mode
Current configuration users:
root terminal p3 (pid 1088) on since 1999-05-13 01:03:27 EDT
[edit interfaces so-3/0/0 unit 0 family inet]
The configuration has been changed but not committed
[edit]
user@host#
```

If, when you enter configuration mode, the configuration contains changes that have not been committed, a message appears:

```
user@host> configure
Entering configuration mode
The configuration has been changed but not committed
[edit]
```

```
user@host#
```

- Related Documentation**

## Controlling the CLI Environment

- [Example: Controlling the CLI Environment on page 456](#)

### Example: Controlling the CLI Environment

The following example shows you how to change the default CLI environment:

```
user@host> set cli screen-length 66
Screen length set to 66
user@host> set cli screen-width 40
Screen width set to 40
user@host> set cli prompt "router1-san-jose > "
router1-san-jose > show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen length set to 66
CLI screen width set to 40
CLI terminal is 'xterm'
router1-san-jose >
```

## CLI Advanced Features

- [Example: Using Global Replace in a Junos Configuration—Using the \n Back Reference on page 456](#)
- [Example: Using Global Replace in a Junos Configuration—Replacing an Interface Name on page 457](#)
- [Example: Using Global Replace in a Junos Configuration—Using the upto Option on page 458](#)

### Example: Using Global Replace in a Junos Configuration—Using the \n Back Reference

The following example shows how you can use the `\n` back reference to replace a pattern:

```
[edit]
user@host# show interfaces
xe-0/0/0 {
    unit 0;
}
fe-3/0/1 {
    vlan-tagging;
    unit 0 {
        description "inet6 configuration. IP: 2000::c0a8::1bf5";
```

```

        vlan-id 100;
        family inet {
            address 17.10.1.1/24;
        }
        family inet6 {
            address 2000::c0a8:1bf5/3;
        }
    }
}
[edit]
user@host# replace pattern "(.):1bf5" with "\11bf5"
[edit]
user@host# show interfaces
xe-0/0/0 {
    unit 0;
}
fe-3/0/1 {
    vlan-tagging;
    unit 0 {
        description "inet6 configuration. IP: 2000::c0a8:1bf5";
        vlan-id 100;
        family inet {
            address 17.10.1.1/24;
        }
        family inet6 {
            address 2000::c0a8:1bf5/3;
        }
    }
}

```

The pattern `2000::c0a8:1bf5` is replaced with `2000::c0a8:1bf5`.

  - [Using Global Replace in a Junos Configuration on page 349](#)

## Example: Using Global Replace in a Junos Configuration—Replacing an Interface Name

The following example shows how you can replace an interface name in a configuration:

```

[edit]
user@host# show
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/0 {
                hello-interval 5;
            }
        }
    }
}
[edit]
user@host# replace so-0/0/0 with so-1/1/0
[edit]

```

```

user@host# show
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-1/1/0 {
        hello-interval 5;
      }
    }
  }
}

```

#### Related Documentation

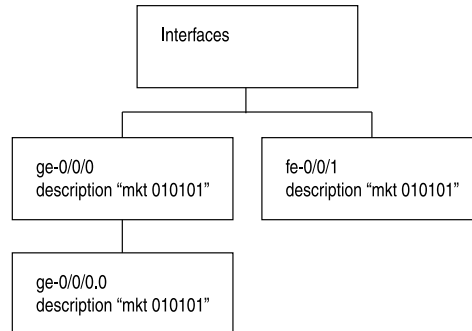

- [Example: Using Global Replace in a Junos Configuration—Using the upto Option on page 458](#)
- [Using Global Replace in a Junos Configuration on page 349](#)

### Example: Using Global Replace in a Junos Configuration—Using the upto Option

Consider the hierarchy shown in [Figure 20 on page 458](#). The text string **010101** appears in three places: the description sections of **ge-0/0/0**, **ge-0/0/0.0**, and **fe-0/0/1**. These three instances are three objects. The following example shows how you can use the **upto** option to perform replacements in a JUNOS configuration:

**Figure 20: Replacement by Object**

Current Configuration:

user@host > **replace pattern 01 with pattern 02 upto 2**

Resulting Configuration:

g017228

An **upto 2** option in the **replace** command converts **01** to **02** for two object instances. The objects under the main interfaces **ge-0/0/0** and **fe-0/0/1** will be replaced first (since these are siblings in the hierarchy level). Because of the **upto 2** restriction, the **replace** command replaces patterns in the first and second instance in the hierarchy (siblings), but not the third instance (child of the first instance).

```

user@host# show interfaces
ge-0/0/0 {
  description "mkt 010101"; #First instance in the hierarchy
  unit 0 {
    description "mkt 010101"; #Third instance in the hierarchy (child of the first
    instance)
  }
}
fe-0/0/1 {
  description "mkt 010101"; #second instance in the hierarchy (sibling of the first
  instance)
  unit 0 {
    family inet {
      address 200.200.20.2/24;
    }
  }
}
[edit]
user@host# replace pattern 01 with 02 upto 2
[edit]
user@host# commit
commit complete

[edit]
user@host# show interfaces
ge-0/0/0 {
  description "mkt 020202"; #First instance in the hierarchy
  unit 0 {
    description "mkt 010101"; #Third instance in the hierarchy (child of the first
    instance)
  }
}
fe-0/0/1 {
  description "mkt 020202"; #second instance in the hierarchy (sibling of the first
  instance)
  unit 0 {
    family inet {
      address 200.200.20.2/24;
    }
  }
}

```

## apply-groups

---

<b>Syntax</b>	<code>apply-groups [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	All hierarchy levels
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Apply a configuration group to a specific hierarchy level in a configuration, to have a configuration inherit the statements in the configuration group.</p> <p>You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups.</p>
<b>Options</b>	<i>group-names</i> —One or more names specified in the <b>groups</b> statement.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Applying a Junos Configuration Group on page 429</a></li> <li>• <a href="#">groups on page 463</a></li> </ul>

## apply-groups-except

---

<b>Syntax</b>	<code>apply-groups-except [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	All hierarchy levels except the top level
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Disable inheritance of a configuration group.
<b>Options</b>	<i>group-names</i> —One or more names specified in the <b>groups</b> statement.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">groups on page 463</a></li> <li>• <a href="#">Disabling Inheritance of a Junos OS Configuration Group on page 433</a></li> </ul>

## commit-interval (Batch Commits)

---

<b>Syntax</b>	commit-interval <i>number-of-seconds-between-commits</i> ;
<b>Hierarchy Level</b>	[edit system commit server]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	For Junos OS batch commits, specify the time interval (in seconds) between two commit operations.
<b>Options</b>	<i>number-of-seconds-between-commits</i> —Time interval (in seconds) between two commit operations. <b>Range:</b> 1 through 30 seconds. <b>Default:</b> 5 seconds.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Junos OS Batch Commits on page 414</a></li></ul>

## groups

```
Syntax  groups {
        group-name {
            configuration-data;
            when {
                chassis chassis-id;
                member member-id;
                model model-id;
                node node-id;
                routing-engine routing-engine-id;
                time <start-time> [to <end-time>];
            }
            conditional-data;
        }
        lccn-re0 {
            configuration-data;
        }
        lccn-re1 {
            configuration-data;
        }
    }
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 7.4.

Description Create a configuration group.

Options —

**group-name**—Name of the configuration group. To configure multiple groups, specify more than one **group-name**.

**configuration-data**—The configuration statements that are to be applied elsewhere in the configuration with the **apply-groups** statement, to have the target configuration inherit the statements in the group.

**when conditional-data**—Option introduced in Junos 11.3. The conditional statements that are to be applied when this configuration group is applied.

On routers that support multiple Routing Engines, you can also specify two special group names:

**re0**—Configuration statements that are to be applied to the Routing Engine in slot 0.

**re1**—Configuration statements that are to be applied to the Routing Engine in slot 1.

The configuration specified in group **re0** is applied only if the current Routing Engine is in slot 0; likewise, the configuration specified in group **re1** is applied only if the current Routing Engine is in slot 1. Therefore, both Routing Engines can use the same configuration file, each using only the configuration statements that apply to it. Each **re0** or **re1** group contains at a minimum the configuration for the hostname and the

management interface (**fxp0**). If each Routing Engine uses a different management interface, the group also should contain the configuration for the backup router and static routes.

(Routing matrix only) The TX Matrix router supports group names for the Routing Engines in each connected T640 router in the following formats:

**NOTE:** The management Ethernet interface used for the TX Matrix Plus router, T1600 routers in a routing matrix, and PTX Series Packet Transport Switches, is **em0**. Junos OS automatically creates the router's management Ethernet interface, **em0**.

---

- **lccn-re0**—Configuration statements applied to the Routing Engine in slot 0 of the specified T640 router that is connected to a TX Matrix router.
  - **lccn-re1**—Configuration statements applied to the specified to the Routing Engine in slot 1 of the specified T640 router that is connected to a TX Matrix router.
- n* identifies the T640 router and can be from 0 through 3.

The remaining statements are explained separately.

**Required Privilege Level**      **configure**—To enter configuration mode.

- Related Documentation**
- [Creating a Junos Configuration Group on page 428](#)
  - [apply-groups on page 461](#)
  - [apply-groups-except on page 461](#)

---

## days-to-keep-error-logs (Batch Commits)

---

<b>Syntax</b>	<code>days-to-keep-error-logs</code> <i>days-to-keep-error-log-entries</i> ;
<b>Hierarchy Level</b>	[edit system commit server]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	For Junos OS batch commits, specify the number of days to keep the error logs.
<b>Options</b>	<i>days-to-keep-error-log-entries</i> —Number of days to keep the error logs. <b>Range:</b> 1 through 366 days <b>Default:</b> 1 day
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Junos OS Batch Commits on page 414</a></li></ul>

## deactivate

---

<b>Syntax</b>	<code>deactivate (<i>statement</i>   <i>identifier</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Add the <b>inactive:</b> tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the <b>commit</b> command.
<b>Options</b>	<p><b><i>identifier</i></b>—Identifier to which you are adding the <b>inactive:</b> tag. It must be an identifier at the current hierarchy level.</p> <p><b><i>statement</i></b>—Statement to which you are adding the <b>inactive:</b> tag. It must be a statement at the current hierarchy level.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">activate on page 535</a></li><li>• <a href="#">delete on page 467</a></li><li>• <a href="#">Deactivating and Reactivating Statements and Identifiers in a Junos Configuration on page 388.</a></li></ul>

## delete

---

<b>Syntax</b>	<code>delete &lt;statement-path&gt; &lt;identifier&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.</p> <p>Deleting a statement or an identifier effectively “unconfigures” or disables the functionality associated with that statement or identifier.</p> <p>If you do not specify <i>statement-path</i> or <i>identifier</i>, the entire hierarchy, starting at the current hierarchy level, is removed.</p>
<b>Options</b>	<p><i>statement-path</i>—(Optional) Path to an existing statement or identifier. Include this if the statement or identifier to be deleted is not at the current hierarchy level.</p> <p><i>identifier</i>—(Optional) Name of the statement or identifier to delete.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">deactivate on page 466</a></li> <li>• <a href="#">Deleting a Statement from a Junos Configuration on page 382</a></li> </ul>

## edit

---

<b>Syntax</b>	<code>edit <i>statement-path</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Move inside the specified statement hierarchy. If the statement does not exist, it is created.</p> <p>You cannot use the <b>edit</b> command to change the value of identifiers. You must use the <b>set</b> command.</p>
<b>Options</b>	<i>statement-path</i> —Path to the statement.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">set on page 484</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

---

## exit

---

<b>Syntax</b>	exit <configuration-mode>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last <b>edit</b> command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>Options</b>	<p>none—Return to the previous edit level. If you are at the top of the statement hierarchy, exit configuration mode.</p> <p><b>configuration-mode</b>—(Optional) Exit from configuration mode.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">top on page 486</a></li><li>• <a href="#">up on page 489</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

## help

---

<b>Syntax</b>	<code>help &lt;(apropos <i>string</i>   reference &lt;<i>statement-name</i>&gt;   syslog &lt;<i>syslog-tag</i>&gt;   tip cli <i>number</i>   topic &lt;<i>word</i>&gt;)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display help about available configuration statements or general information about getting help.
<b>Options</b>	<p><b>apropos <i>string</i></b>—(Optional) Display statement names and help text that matches the string specified. If the string contains spaces, enclose it in quotation marks (" "). You can also specify a regular expression for the string, using standard UNIX-style regular expression syntax.</p> <p><b>reference &lt;<i>statement-name</i>&gt;</b>—(Optional) Display summary information for the statement. This information is based on summary descriptions that appear in the Junos feature guides.</p> <p><b>syslog &lt;<i>syslog-tag</i>&gt;</b>—(Optional) Display information about system log messages.</p> <p><b>tip cli <i>number</i></b>—(Optional) Display a tip about using the CLI. Specify the number of the tip you want to view.</p> <p><b>topic &lt;<i>word</i>&gt;</b>—(Optional) Display usage guidelines for a topic or configuration statement. This information is based on subjects that appear in the Junos feature guides.</p> <p>Entering the <b>help</b> command without an option provides introductory information about how to use the <b>help</b> command.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Getting Online Help from the Junos OS Command-Line Interface on page 315</a></li></ul>

---

## insert

---

<b>Syntax</b>	insert < <i>statement-path</i> > <i>identifier1</i> (before   after) <i>identifier2</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Insert an identifier in to an existing hierarchy.
<b>Options</b>	<p><b>after</b>—Place <i>identifier1</i> after <i>identifier2</i>.</p> <p><b>before</b>—Place <i>identifier1</i> before <i>identifier2</i>.</p> <p><i>identifier1</i>—Existing identifier.</p> <p><i>identifier2</i>—New identifier to insert.</p> <p><i>statement-path</i>—(Optional) Path to the existing identifier.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Inserting a New Identifier in a Junos Configuration on page 386</a></li></ul>

## load

---

<b>Syntax</b>	<code>load (factory-default   merge   override   patch   replace   set   update) load (<i>filename</i>   terminal) &lt;relative&gt;</code>
<b>QFX Series</b>	<code>load (dhcp-snooping <i>filename</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs.
<b>Options</b>	<p><b>dhcp-snooping</b>—(QFX Series switches) Loads DHCP snooping entries.</p> <p><b>factory-default</b>—Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on.</p> <p>On J Series Services Routers, pressing and holding down the Config button on the router for 15 seconds causes the factory configuration to be loaded and committed. However, this operation deletes all other configurations on the router; using the <b>load factory-default</b> command does not.</p> <p><b>filename</b>—Name of the file to load. For information about specifying the filename, see <a href="#">"Specifying Filenames and URLs" on page 500</a>.</p> <p><b>merge</b>—Combine the configuration that is currently shown in the CLI with the configuration.</p> <p><b>override</b>—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.</p> <p><b>patch</b>—Change part of the configuration and mark only those parts as changed.</p> <p><b>replace</b>—Look for a <b>replace</b> tag in <i>filename</i>, delete the existing statement of the same name, and replace it with the configuration.</p> <p><b>set</b>—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as <b>set</b>, <b>edit</b>, <b>exit</b>, and <b>top</b>.</p> <p><b>relative</b>—(Optional) Use the <b>merge</b> or <b>replace</b> option without specifying the full hierarchy level.</p> <p><b>terminal</b>—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.</p> <p><b>update</b>—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.</p>

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

**Required Privilege Level** configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

**Related Documentation**

- [Loading a Configuration from a File on page 421](#)

## maximum-aggregate-pool (Batch Commits)

**Syntax** maximum-aggregate-pool *maximum-number-of-commits-to-aggregate*;

**Hierarchy Level** [edit system commit server]

**Release Information** Statement introduced in Junos OS Release 12.1.

**Description** For Junos OS batch commits, specify the maximum number of individual commit operations that are aggregated or merged into a single commit operation.

**Options** *maximum-number-of-commits-to-aggregate*—Maximum number of individual commit operations that are aggregated or merged into a single commit operation.

**Range:** 1 through 4294967295

**Default:** 5

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- [Example: Configuring Junos OS Batch Commits on page 414](#)

## maximum-entries (Batch Commits)

---

<b>Syntax</b>	<code>maximum-entries <i>number-of-entries</i>;</code>
<b>Hierarchy Level</b>	[edit system commit server]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	For Junos OS batch commits, specify the maximum number of commit jobs that are included in the commit queue.
<b>Options</b>	<i>number-of-entries</i> —Maximum number of commit jobs that are included in the commit queue.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Junos OS Batch Commits on page 414</a></li></ul>

## protect

---

<b>Syntax</b>	<code>protect (hierarchy   statement   identifier)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Protect a hierarchy, statement, or identifier from modification or deletion.
<b>Options</b>	none
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Protecting the Junos OS Configuration from Modification or Deletion on page 399</a></li></ul>

## quit

---

<b>Syntax</b>	quit <configuration-mode>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last <b>edit</b> command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>Options</b>	<p>none—Return to the previous edit level. If you are at the top of the statement hierarchy, exit configuration mode.</p> <p><b>configuration-mode</b>—(Optional) Exit from configuration mode.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">top on page 486</a></li><li>• <a href="#">up on page 489</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

## rename

**Syntax** `rename <statement-path> identifier1 to identifier2`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Rename an existing configuration statement or identifier.

**Options** *identifier1*—Existing identifier to rename.

*identifier2*—New name of identifier.

*statement-path*—(Optional) Path to an existing statement or identifier.

**NOTE:** For example, to rename interface `ge-0/0/0.0` to `ge-0/0/10.0` at the following hierarchy level:

```
logical-systems {
  logical-system-abc {
    (...)
    protocols {
      ospf {
        area 0.0.0.0 {
          interface ge-0/1/0.0;
```

Issue the following command:

```
rename logical-systems logical-system-abc protocols ospf area 0.0.0.0 interface
ge-0/1/0.0.0 to interface ge-0/1/10.0
```

**Required Privilege Level** `configure`—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

**Related Documentation**

- [Renaming an Identifier in a Junos Configuration on page 385](#)

## rename

**Syntax** `rename <statement-path> identifier1 to identifier2`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Rename an existing configuration statement or identifier.

**Options** *identifier1*—Existing identifier to rename.

*identifier2*—New name of identifier.

*statement-path*—(Optional) Path to an existing statement or identifier.

**NOTE:** For example, to rename interface `ge-0/0/0.0` to `ge-0/0/10.0` at the following hierarchy level:

```
logical-systems {
  logical-system-abc {
    (...)
    protocols {
      ospf {
        area 0.0.0.0 {
          interface ge-0/1/0.0;
```

Issue the following command:

```
rename logical-systems logical-system-abc protocols ospf area 0.0.0.0 interface
ge-0/1/0.0.0 to interface ge-0/1/10.0
```

**Required Privilege Level** `configure`—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

**Related Documentation**

- [Renaming an Identifier in a Junos Configuration on page 385](#)

## replace

---

<b>Syntax</b>	replace pattern <i>pattern1</i> with <i>pattern2</i> <upto <i>n</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 7.6.
<b>Description</b>	Replace identifiers or values in a configuration.
<b>Options</b>	<p><i>pattern1</i>—Text string or regular expression that defines the identifiers or values you want to match.</p> <p><i>pattern2</i>—Text string or regular expression that replaces the identifiers and values located with <i>pattern1</i>.</p> <p>Juniper Networks uses standard UNIX-style regular expression syntax (as defined in POSIX 1003.2). If the regular expression contains spaces, operators, or wildcard characters, enclose the expression in quotation marks. Greedy qualifiers (match as much as possible) are supported. Lazy qualifiers (match as little as possible) are not.</p> <p><b>upto <i>n</i></b>—Number of objects replaced. The value of <i>n</i> controls the total number of objects that are replaced in the configuration (not the total number of times the pattern occurs). Objects at the same hierarchy level (siblings) are replaced first. Multiple occurrences of a pattern within a given object are considered a single replacement. If you do not specify an <b>upto</b> option, all identifiers and values in the configuration that match <i>pattern1</i> are replaced.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using Global Replace in a Junos Configuration on page 349</a></li> </ul>

## rollback

---

<b>Syntax</b>	<code>rollback &lt;number   rescue&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Return to a previously committed configuration. The software saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit</b> configuration command.</p> <p>The currently operational Junos OS configuration is stored in the file <b>juniper.conf</b>, and the last three committed configurations are stored in the files <b>juniper.conf.1</b>, <b>juniper.conf.2</b>, and <b>juniper.conf.3</b>. These four files are located in the directory <b>/config</b>, which is on the router's flash drive. The remaining 46 previous committed configurations, the files <b>juniper.conf.4</b> through <b>juniper.conf.49</b>, are stored in the directory <b>/var/db/config</b>, which is on the router's hard disk.</p> <p>During rollback, the configuration you specify is loaded from the associated file. Only objects in the rollback configuration that differ from the previously loaded configuration are marked as changed (equivalent to <b>load update</b>).</p>
<b>Options</b>	<p>none (Optional)—Return to the most recently saved configuration.</p> <p><b>number</b>—(Optional) Configuration to return to. The range of values is from <b>0</b> through <b>49</b>. The most recently saved configuration is number <b>0</b>, and the oldest saved configuration is number <b>49</b>. The default is <b>0</b>.</p> <p><b>rescue</b>—(Optional) Return to the rescue configuration.</p>
<b>Required Privilege Level</b>	rollback—To roll back to configurations other than the one most recently committed.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Returning to a Previously Committed Junos OS Configuration on page 569</a></li><li>• <a href="#">Creating and Returning to a Rescue Configuration on page 573</a></li></ul>

## run

---

<b>Syntax</b>	<code>run <i>command</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Run a top-level CLI command without exiting from configuration mode.
<b>Options</b>	<i>command</i> —CLI top-level command.
<b>Required Privilege Level</b>	configure—To enter configuration mode.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Junos OS CLI Configuration Mode on page 334</a></li></ul>

## save

<b>Syntax</b>	<code>save <i>filename</i></code>
<b>QFX Series</b>	<code>save (dhcp-snooping <i>filename</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.</p> <p>When saving a file to a remote system, the software uses the <b>scp/ssh</b> protocol.</p>
<b>Options</b>	<p><b><i>filename</i></b>—Name of the saved file. You can specify a filename in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b><i>filename</i></b>—File in the user's home directory (the current directory) on the local flash drive.</li> <li>• <b><i>path/filename</i></b>—File on the local flash drive.</li> <li>• <b><i>/var/filename</i></b> or <b><i>/var/path/filename</i></b>—File on the local hard disk.</li> <li>• <b><i>a:filename</i></b> or <b><i>a:path/filename</i></b>—File on the local drive. The default path is <b>/</b> (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.</li> <li>• <b><i>hostname:/path/filename</i></b>, <b><i>hostname:filename</i></b>, <b><i>hostname:path/filename</i></b>, or <b><i>scp://hostname/path/filename</i></b>—File on an <b>scp/ssh</b> client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify <b><i>hostname</i></b> as <b><i>username@hostname</i></b>.</li> <li>• <b><i>ftp://hostname/path/filename</i></b>—File on an FTP server. You can also specify <b><i>hostname</i></b> as <b><i>username @hostname</i></b> or <b><i>username:password @hostname</i></b>. The default path is the user's home directory. To specify an absolute path, the path must start with the string <b>%2F</b>; for example, <b><i>ftp://hostname/%2Fpath/filename</i></b>. To have the system prompt you for the password, specify <b><i>prompt</i></b> in place of the password. If a password is required, and you do not specify the password or <b><i>prompt</i></b>, an error message is displayed:           <pre>user@host&gt; file copy ftp://username@ftp.hostname.net//filename file copy ftp.hostname.net: Not logged in. user@host&gt; file copy ftp://username:prompt@ftphostname.net//filename</pre> <p>Password for <b><i>username@ftp.hostname.net</i></b>:</p> </li> <li>• <b><i>http://hostname/path/filename</i></b>—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify <b><i>hostname</i></b> as <b><i>username@hostname</i></b> or <b><i>username:password@hostname</i></b>. If a password is required and you omit it, you are prompted for it.</li> <li>• <b><i>re0:/path/filename</i></b> or <b><i>re1:/path/filename</i></b>—File on a local Routing Engine.</li> </ul>

**Required Privilege Level** configure—To enter configuration mode.

**Related Documentation** • [Deactivating and Reactivating Statements and Identifiers in a Junos Configuration on page 388](#)

## server (Batch Commits)

**Syntax**

```
server {
  commit-interval <number-of-seconds-between-commits>;
  days-to-keep-error-logs <days-to-keep-error-log-entries>;
  maximum-aggregate-pool <maximum-number-of-commits-to-aggregate>;
  maximum-entries <number-of-entries>;
  traceoptions {
    file filename;
    files number;
    flag (all | batch | commit-server | configuration);
    size maximum-file-size;
    (world-readable | no-world-readable);
  }
}
```

**Hierarchy Level** [edit system commit]

**Release Information** Statement introduced in Junos OS Release 12.1.

**Description** For Junos OS batch commits, configure the batch commit server properties.  
  
The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation** • [Example: Configuring Junos OS Batch Commits on page 414](#)

## set

---

<b>Syntax</b>	set < <i>statement-path</i> > <i>identifier</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Create a statement hierarchy and set identifier values. This is similar to <b>edit</b> except that your current level in the hierarchy does not change.
<b>Options</b>	<p><i>identifier</i>—Name of the statement or identifier to set.</p> <p><i>statement-path</i>—(Optional) Path to an existing statement hierarchy level. If that hierarchy level does not exist, it is created.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">edit on page 468</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

status

---

<b>Syntax</b>	status
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display the users currently editing the configuration.
<b>Required Privilege Level</b>	configure—To enter configuration mode. <ul style="list-style-type: none"><li>• <a href="#">“Displaying Users Currently Editing the Configuration” on page 364.</a></li></ul>

## top

---

<b>Syntax</b>	<code>top &lt;configuration-command&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Return to the top level of configuration command mode, which is indicated by the <b>[edit]</b> banner.
<b>Options</b>	<i>configuration-command</i> —(Optional) Issue configuration mode commands from the top of the hierarchy.
<b>Required Privilege Level</b>	configure—To enter configuration mode.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li><li>• <a href="#">exit on page 469</a></li><li>• <a href="#">up on page 489</a></li></ul>

## traceoptions (Batch Commits)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i>;     files <i>number</i>;     flag (all   batch   commit-server   configuration);     size <i>maximum-file-size</i>;     (world-readable   no-world-readable); } </pre>
<b>Hierarchy Level</b>	[edit system commit server]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	For Junos OS batch commits, configure tracing operations.
<b>Options</b>	<b>file <i>name</i></b> —Name of the file to receive the output of the tracing operation.

**NOTE:** If you configure traceoptions and do not explicitly specify a filename for logging the events, the batch commit events are logged in the commitd file (var/log/commitd) by default.

**files *number***—Maximum number of trace files.

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—All tracing operations flags.
- **batch**—Tracing operations for batch events.
- **commit-server**—Tracing operations for commit server events.
- **configuration**—Tracing operations for the reading of configuration.

**size**—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

**world-readable | no-world-readable**—**readable**—Grant all users permission to read archived log files, or restrict the permission only to the root user and users who have the Junos OS maintenance permission.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Junos OS Batch Commits on page 414</a></li> </ul>

## unprotect

---

<b>Syntax</b>	<code>unprotect (<i>hierarchy</i>   <i>statement</i>   <i>identifier</i>)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Unprotect a protected hierarchy, configuration statement, or an identifier.
<b>Options</b>	none
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">top on page 486</a></li><li>• <a href="#">up on page 489</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

---

## up

---

<b>Syntax</b>	<code>up &lt;number&gt; &lt;configuration-command&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Move up one level in the statement hierarchy.
<b>Options</b>	<p>none—Move up one level in the configuration hierarchy.</p> <p><i>configuration-command</i>—(Optional) Issue configuration mode commands from a location higher in the hierarchy.</p> <p><i>number</i>—(Optional) Move up the specified number of levels in the configuration hierarchy.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li><li>• <a href="#">exit on page 469</a></li><li>• <a href="#">top on page 486</a></li></ul>

## update

---

**Syntax**    update

**Release Information**    Command introduced in Junos OS Release 7.5.

**Description**    Update private candidate configuration with a copy of the most recently committed configuration, including your private changes.

**NOTE:** The `update` command is available only when you are in configure private mode.

---

**Required Privilege Level**    configure—To enter configuration mode.

**Related Documentation**

- [Updating the configure private Configuration on page 368.](#)

## when

<b>Syntax</b>	<pre> when {   chassis <i>chassis-id</i>;   member <i>member-id</i>;   model <i>model-id</i>;   node <i>node-id</i>;   routing-engine <i>routing-engine-id</i>;   time &lt;<i>start-time</i>&gt; [to &lt;<i>end-time</i>&gt;]; } </pre>
<b>Hierarchy Level</b>	[edit groups <i>group-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3.
<b>Description</b>	<p>Define conditions under which the configuration group should be applied. Conditions include the type of chassis, model, or Routing Engine, virtual chassis member, cluster node, and start and optional end time of day. If you specify multiple conditions in a single configuration group, all conditions must be met before the configuration group is applied.</p>
<b>Options</b>	<p><b>chassis</b> <i>chassis-id</i>—Specify the chassis type of the router. Valid types include SCC0, SCC1, LCC0, LCC1 ... LCC3.</p> <p><b>member</b> <i>member-id</i>—Specify the name of the member of the virtual chassis.</p> <p><b>model</b> <i>model-id</i>—Specify the model name of the router, such as m7i or tx100.</p> <p><b>node</b> <i>node-id</i>—Specify the cluster node.</p> <p><b>routing-engine</b> <i>routing-engine-id</i>—Specify the type of Routing Engine, re0 or re1.</p> <p><b>time</b> &lt;<i>start-time</i>&gt; [to &lt;<i>end-time</i>&gt;]—Specify the start time or time duration for this configuration group to be applied. If only the start time is specified, the configuration group is applied at the specified time and remains in effect until the time is changed. If the end time is specified, then on each day, the applied configuration group is started and stopped at the specified times. The syntax for specifying the time is: <b>time</b> &lt;<i>start-time</i>&gt; [to &lt;<i>end-time</i>&gt;] using the time format yyyy-mm-dd.hh:mm, hh:mm, or hh.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating a Junos Configuration Group on page 428</a></li> <li>• <a href="#">apply-groups on page 461</a></li> <li>• <a href="#">apply-groups-except on page 461</a></li> <li>• <a href="#">groups on page 463</a></li> </ul>

## wildcard delete

---

<b>Syntax</b>	<code>wildcard delete &lt;statement-path&gt; &lt;identifier&gt; &lt;regular-expression&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.</p> <p>Deleting a statement or an identifier effectively “unconfigures” or disables the functionality associated with that statement or identifier.</p> <p>If you do not specify <i>statement-path</i> or <i>identifier</i>, the entire hierarchy starting at the current hierarchy level is removed.</p>
<b>Options</b>	<p><i>identifier</i>—(Optional) Name of the statement or identifier to delete.</p> <p><i>regular-expression</i>—(Optional) The pattern based on which you want to delete multiple items. When you use the <b>wildcard</b> command to delete related configuration items, the <i>regular-expression</i> must be the final statement.</p> <p><i>statement-path</i>—(Optional) Path to an existing statement or identifier. Include this if the statement or identifier to be deleted is not at the current hierarchy level.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode. Other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Using Global Replace in a Junos Configuration—Using the upto Option on page 458.</a></li></ul>

## CHAPTER 10

# Administration

- [CLI Operational Mode on page 493](#)
- [Routine Monitoring on page 495](#)
- [Managing the CLI Environment on page 509](#)
- [CLI Advanced Features on page 515](#)
- [Junos OS CLI Environment Commands on page 517](#)
- [Operational Commands on page 532](#)

### CLI Operational Mode

---

- [Interface Naming Conventions Used in the Junos OS Operational Commands on page 493](#)

### Interface Naming Conventions Used in the Junos OS Operational Commands

This topic explains the interface naming conventions used in the Junos OS operational commands, and contains the following sections:

- [Physical Part of an Interface Name on page 493](#)
- [Logical Part of an Interface Name on page 494](#)
- [Channel Identifier Part of an Interface Name on page 494](#)

#### Physical Part of an Interface Name

---

The M Series Multiservices Edge Routers and the T Series Core Routers use one convention for interface naming, whereas the J Series Services Routers and the SRX Series Services Gateways use another.

- **M Series and T Series interface names**—On the M Series and T Series routers, when you display information about an interface, you specify the interface type, the slot in which the Flexible PIC Concentrator (FPC) is installed, the slot on the FPC in which the PIC is located, and the configured port number.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

*type-fpc/pic/port*

**NOTE:** Exceptions to the *type-fpc/pic/port* physical description include the aggregated Ethernet and aggregated SONET/SDH interfaces, which use the syntax *aenumber* and *asnumber*, respectively.

- J Series and SRX interface names—On J Series and SRX devices, the unique name of each network interface has the following format to identify the physical device that corresponds to a single physical network connector:

*type-slot/pim-or-ioc/port*

For more information about J Series and SRX interface naming conventions, see the *Junos OS Interfaces Library for Security Devices*.

### Logical Part of an Interface Name

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16,384. In the virtual part of the name, a period (.) separates the port and logical unit numbers:

- M Series and T Series routers:

*type-fpc/pic/port.logical*

- J Series and SRX devices:

*type-slot/pim-or-ioc/port:channel.unit*

### Channel Identifier Part of an Interface Name

The channel identifier part of the interface name is required only on channelized interfaces. For channelized interfaces, channel 0 identifies the first channelized interface. For channelized intelligent queuing (IQ) interfaces, channel 1 identifies the first channelized interface.

**NOTE:** Depending on the type of channelized interface, up to three levels of channelization can be specified. For more information, see the *Junos OS Interfaces Library for Security Devices*.

A colon (:) separates the physical and virtual parts of the interface name:

- M Series and T Series routers:

*type-fpc/pic/port:channel*

*type-fpc//pic/port:channel:channel*

*type-fpc/pic/port:channel:channel:channel*

- J Series and SRX devices:

*type-slot/pim-or-ioc/port:channel*

*type-slot/pim-or-ioc/port:channel:channel*

*type-slot/pim-or-ioc/port:channel:channel:channel*

## Checking the Status of a Device Running Junos OS

You can use **show** commands to check the status of the device and monitor the activities on the device.

To help you become familiar with **show** commands:

- Type **show ?** to display the list of **show** commands you can use to monitor the router:

```
root@> show ?
Possible completions:
accounting      Show accounting profiles and records
aps             Show Automatic Protection Switching information
arp            Show system Address Resolution Protocol table entries
as-path        Show table of known autonomous system paths
bfd            Show Bidirectional Forwarding Detection information
bgp            Show Border Gateway Protocol information
chassis        Show chassis information
class-of-service Show class-of-service (CoS) information
cli            Show command-line interface settings
configuration   Show current configuration
connections    Show circuit cross-connect connections
dvmrp          Show Distance Vector Multicast Routing Protocol
info
dynamic-tunnels Show dynamic tunnel information information
esis           Show end system-to-intermediate system information
firewall       Show firewall information
helper         Show port-forwarding helper information
host           Show hostname information from domain name server
igmp           Show Internet Group Management Protocol information
ike            Show Internet Key Exchange information
ilmi           Show interim local management interface information
interfaces     Show interface information
ipsec          Show IP Security information
ipv6           Show IP version 6 information
isis           Show Intermediate System-to-Intermediate System info
l2circuit      Show Layer 2 circuit information
l2vpn          Show Layer 2 VPN information
lacp           Show Link Aggregation Control Protocol information
ldp            Show Label Distribution Protocol information
```

link-management	Show link management information
llc2	Show LLC2 protocol related information
log	Show contents of log file
mld	Show multicast listener discovery information
mpls	Show Multiprotocol Label Switching information
msdp	Show Multicast Source Discovery Protocol information
multicast	Show multicast information
ntp	Show Network Time Protocol information
ospf	Show Open Shortest Path First information
ospf3	Show Open Shortest Path First version 3 information
passive-monitoring	Show information about passive monitoring
pfe	Show Packet Forwarding Engine information
pgm	Show Pragmatic Generalized Multicast information
pim	Show Protocol Independent Multicast information
policer	Show interface policer counters and information
policy	Show policy information
ppp	Show PPP process information
rip	Show Routing Information Protocol information
ripng	Show Routing Information Protocol for IPv6 info
route	Show routing table information
rsvp	Show Resource Reservation Protocol information
sap	Show Session Announcement Protocol information
security	Show security information
services	Show services information
snmp	Show Simple Network Management Protocol information
system	Show system information
task	Show routing protocol per-task information
ted	Show Traffic Engineering Database information
version	Show software process revision levels
vpls	Show VPLS information
vrrp	Show Virtual Router Redundancy Protocol information

- Use the **show chassis routing-engine** command to view the Routing Engine status:

```

root@> show chassis routing-engine
Routing Engine status:
Slot 0:
  Current state           Master
  Election priority       Master (default)
  Temperature             31 degrees C / 87 degrees F
  CPU temperature         32 degrees C / 89 degrees F
  DRAM                    768 MB
  Memory utilization      84 percent
  CPU utilization:
    User                  0 percent
    Background            0 percent
    Kernel                1 percent
    Interrupt             0 percent
    Idle                  99 percent
  Model                   RE-2.0
  Serial ID               b10000078c10d701
  Start time              2005-12-28 13:52:00 PST
  Uptime                  12 days, 3 hours, 44 minutes, 19 seconds
  Load averages:         1 minute   5 minute   15 minute
                        0.02         0.01         0.00

```

- Use the **show system storage** command to view available storage on the device:

```

root@> show system storage

Filesystem      Size      Used      Avail  Capacity  Mounted on
/dev/ad0s1a    865M      127M      669M      16%      /

```

devfs	1.0K	1.0K	0B	100%	/dev
devfs	1.0K	1.0K	0B	100%	/dev/

## Monitoring Who Uses the Junos OS CLI

Depending upon how you configure Junos OS, multiple users can log in to the router, use the CLI, and configure or modify the software configuration.

If, when you enter configuration mode, another user is also in configuration mode, a notification message is displayed that indicates who the user is and what portion of the configuration the person is viewing or editing:

```
user@host> configure
Entering configuration mode
Users currently editing the configuration:
  root terminal d0 (pid 4137) on since 2008-04-09 23:03:07 PDT, idle 7w6d 08:22
    [edit]
The configuration has been changed but not committed

[edit]
user@host#
```

## Viewing Files and Directories on a Device Running Junos OS

Junos OS stores information in files on the device, including configuration files, log files, and router software files. This topic shows some examples of operational commands that you can use to view files and directories on a device running Junos OS.

Sections include:

- [Directories on the Router or Switch on page 498](#)
- [Listing Files and Directories on page 498](#)
- [Specifying Filenames and URLs on page 500](#)

## Directories on the Router or Switch

Table 49 on page 498 lists some standard directories on a device running Junos OS.

**Table 49: Directories on the Router**

Directory	Description
<code>/config</code>	This directory is located on the device's router's internal flash drive. It contains the active configuration ( <b>juniper.conf</b> ) and rollback files 1, 2, and 3.
<code>/var/db/config</code>	This directory is located on the router's device's hard drive and contains rollback files 4 through 49.
<code>/var/tmp</code>	This directory is located on the device's hard drive. It holds core files from the various processes on the Routing Engines. Core files are generated when a particular process crashes and are used by Juniper Networks engineers to diagnose the reason for failure.
<code>/var/log</code>	This directory is located on the device's hard drive. It contains files generated by both the device's logging function as well as the <b>traceoptions</b> command.
<code>/var/home</code>	This directory is located on the device's hard drive. It contains a subdirectory for each configured user on the device. These individual user directories are the default file location for many Junos OS commands.
<code>/altroot</code>	This directory is located on the device's hard drive and contains a copy of the root file structure from the internal flash drive. This directory is used in certain disaster recovery modes where the internal flash drive is not operational.
<code>/altconfig</code>	This directory is located on the device's hard drive and contains a copy of the <b>/config</b> file structure from the internal flash drive. This directory is also used in certain disaster recovery modes when the internal flash drive is not operational.

## Listing Files and Directories

You can view the device's directory structure as well as individual files by issuing the **file** command in operational mode.

1. To get help about the **file** command, type the following:

```
user@host> file ?
Possible completions:
  <[Enter]>          Execute this command
```

archive	Archives files from the system
checksum	Calculate file checksum
compare	Compare files
copy	Copy files (local or remote)
delete	Delete files from the system
list	List file information
rename	Rename files
show	Show file contents
source-address	Local address to use in originating the connection
	Pipe through a command

user@host> file

Help shows that the **file** command includes several options for manipulating files.

2. Use the **list** option to see the directory structure of the device. For example, to show the files located in your home directory on the device:

```
user@host> file list
.ssh/
common
```

The default directory for the **file list** command is the home directory of the user logged in to the device. In fact, the user's home directory is the default directory for most of Junos OS commands requiring a filename.

3. To view the contents of other file directories, specify the directory location. For example:

```
user@host> file list /config
juniper.conf
juniper.conf.1.gz
juniper.conf.2.gz
juniper.conf.3.gz
```

4. You can also use the device's context-sensitive help system to locate a directory. For example:

```
user@host> file list /?
Possible completions:
<[Enter]>      Execute this command

Jul  9 23:19:03 SSRAM bank 1 - part number 710-001385, serial number 410608
...

```

## Specifying Filenames and URLs

In some CLI commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication *load-key-file***, and **request system software add**—you can include a filename. On a routing matrix, you can include chassis information as part of the filename (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**).

You can specify a filename or URL in one of the following ways:

- **filename**—File in the user's current directory on the local flash drive. You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in Hypertext Transfer Protocol (HTTP) or FTP.

**NOTE:** Wildcards are supported only by the **file** (**compare** | **copy** | **delete** | **list** | **rename** | **show**) commands. When you issue the **file show** command with a wildcard, it must resolve to one filename.

- **path/filename**—File on the local flash disk.
- **/var/filename** or **/var/path/filename**—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router on a routing matrix:  

```
user@host> file delete lcc0-re0:/var/tmp/junk
```
- **a:filename** or **a:path/filename**—File on the local drive. The default path is / (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- **hostname:/path/filename**, **hostname:filename**, **hostname:path/filename**, or **scp://hostname/path/filename**—File on an **scp/ssh** client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify **hostname** as **username@hostname**.
- **ftp://hostname/path/filename**—File on an FTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. The default path is the user's home directory. To specify an absolute path, the path must start with **%2F**; for example, **ftp://hostname/%2Fpath/filename**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed:  

```
user@host> file copy ftp://username@ftp.hostname.net//filename
file copy ftp.hostname.net: Not logged in.

user@host> file copy ftp://username:prompt@ftp.hostname.net//filename
Password for username@ftp.hostname.net:
```
- **http://hostname/path/filename**—File on an HTTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. If a password is required and you omit it, you are prompted for it.
- **re0:/path/filename** or **re1:/path/filename**—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router on a routing matrix:  

```
user@host> show log lcc0-re1:chassisd
```

## Displaying Junos OS Information

You can display Junos OS version information and other status to determine if the version of Junos OS that you are running supports particular features or hardware.

To display Junos OS information:

1. Make sure you are in operational mode.
2. To display brief information and status for the kernel and Packet Forwarding Engine, enter the **show version brief** command. This command shows version information for Junos OS packages installed on the router. For example:

```
user@host> show version brief
Hostname: host
Model: m7i
JUNOS Base OS boot [9.1R1.8]
JUNOS Base OS Software Suite [9.1R1.8]
JUNOS Kernel Software Suite [9.1R1.8]
JUNOS Crypto Software Suite [9.1R1.8]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1R1.8]
JUNOS Packet Forwarding Engine Support (M7i/M10i) [9.1R1.8]
JUNOS Online Documentation [9.1R1.8]
JUNOS Routing Software Suite [9.1R1.8]
```

```
user@host>
```

If the **Junos Crypto Software Suite** is listed, the router has Canada and USA encrypted Junos OS. If the **Junos Crypto Software Suite** is not listed, the router is running worldwide nonencrypted Junos OS.

3. To display detailed version information, enter the **show version detail** command. This command display shows the hostname and version information for Junos OS packages installed on your router. It also includes the version information for each software process. For example:

```
user@host> show version detail

Hostname: host
Model: m20
JUNOS Base OS boot [8.4R1.13]
JUNOS Base OS Software Suite [8.4R1.13]
JUNOS Kernel Software Suite [8.4R1.13]
JUNOS Crypto Software Suite [8.4R1.13]
JUNOS Packet Forwarding Engine Support (M/T Common) [8.4R1.13]
JUNOS Packet Forwarding Engine Support (M20/M40) [8.4R1.13]
JUNOS Online Documentation [8.4R1.13]

## Managing Programs and Processes Using Junos OS Operational Mode Commands

This topic shows some examples of Junos operational commands that you can use to manage programs and processes on a device running Junos OS.

Sections include:

- [Showing Software Processes on page 504](#)
- [Restarting a Junos OS Process on page 505](#)
- [Stopping the Junos OS on page 506](#)
- [Rebooting the Junos OS on page 507](#)

## Showing Software Processes

To verify system operation or to begin diagnosing an error condition, you may need to display information about software processes running on the device.

To show software processes:

1. Make sure you are in operational mode.
2. Type the **show system processes extensive** command. This command shows the CPU utilization on the device and lists the processes in order of CPU utilization. For example:

```
user@host> show system processes extensive
```

```
last pid: 28689; load averages: 0.01, 0.00, 0.00 up 56+06:16:13 04:52:04
73 processes: 1 running, 72 sleeping
```

```
Mem: 101M Active, 101M Inact, 98M Wired, 159M Cache, 69M Buf, 286M Free
Swap: 1536M Total, 1536M Free
```

PID	USERNAME	PRI	NICE	SIZE	RES	STATE	TIME	WCPU	CPU	COMMAND
3365	root	2	0	21408K	4464K	select	511:23	0.00%	0.00%	chassisd
3508	root	2	0	3352K	1168K	select	32:45	0.00%	0.00%	l2ald
3525	root	2	0	3904K	1620K	select	13:40	0.00%	0.00%	dcd
5532	root	2	0	11660K	2856K	kqread	10:36	0.00%	0.00%	rpd
3366	root	2	0	2080K	828K	select	8:33	0.00%	0.00%	alarmd
3529	root	2	0	2040K	428K	select	7:32	0.00%	0.00%	irsd
3375	root	2	0	2900K	1600K	select	6:01	0.00%	0.00%	ppmd
3506	root	2	0	5176K	2568K	select	5:38	0.00%	0.00%	mib2d
4957	root	2	0	1284K	624K	select	5:16	0.00%	0.00%	ntpd
6	root	18	0	0K	0K	syncer	4:49	0.00%	0.00%	syncer
3521	root	2	0	2312K	928K	select	2:14	0.00%	0.00%	lfmd
3526	root	2	0	5192K	1988K	select	2:04	0.00%	0.00%	snmpd
3543	root	2	0	0K	0K	peer_s	1:46	0.00%	0.00%	peer proxy
3512	root	2	0	3472K	1044K	select	1:44	0.00%	0.00%	rmopd
3537	root	2	0	0K	0K	peer_s	1:30	0.00%	0.00%	peer proxy
3527	root	2	0	3100K	1176K	select	1:14	0.00%	0.00%	pfed
3380	root	2	0	3208K	1052K	select	1:11	0.00%	0.00%	bfdd
4136	root	2	0	11252K	3668K	select	0:54	0.00%	0.00%	cli
3280	root	2	0	2248K	1420K	select	0:28	0.00%	0.00%	eventd
3528	root	2	0	2708K	672K	select	0:28	0.00%	0.00%	dfwd
7	root	-2	0	0K	0K	vluwt	0:26	0.00%	0.00%	vntru
3371	root	2	0	1024K	216K	sbwait	0:25	0.00%	0.00%	tnp.sntpd
13	root	-18	0	0K	0K	psleep	0:24	0.00%	0.00%	vmuncacheda
3376	root	2	0	1228K	672K	select	0:22	0.00%	0.00%	smartd
5	root	-18	0	0K	0K	psleep	0:17	0.00%	0.00%	bufdaemon
3368	root	2	0	15648K	9428K	select	0:17	0.00%	0.00%	mgd
3362	root	2	0	1020K	204K	select	0:15	0.00%	0.00%	watchdog
3381	root	2	0	2124K	808K	select	0:15	0.00%	0.00%	l2cpd
3524	root	2	0	6276K	1492K	select	0:14	0.00%	0.00%	kmd
3343	root	10	0	1156K	404K	nanslp	0:14	0.00%	0.00%	cron

---(more)---

Table 50 on page 505 lists and describes the output fields included in this example. The fields are listed in alphabetical order.

**Table 50: show system process extensive Command Output Fields**

Field	Description
COMMAND	Command that is running.
CPU	Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.
last pid	Last process identifier assigned to the process.
load averages	Three load averages, followed by the current time.
Mem	Information about physical and virtual memory allocation.
NICE	UNIX “nice” value. The nice value allows a process to change its final scheduling priority.
PID	Process identifier.
PRI	Current kernel scheduling priority of the process. A lower number indicates a higher priority.
processes	Number of existing processes and the number of processes in each state ( <b>sleeping</b> , <b>running</b> , <b>starting</b> , <b>zombies</b> , and <b>stopped</b> ).
RES	Current amount of resident memory, in KB.
SIZE	Total size of the process ( <b>text</b> , <b>data</b> , and <b>stack</b> ), in KB.
STATE	Current state of the process ( <b>sleep</b> , <b>wait</b> , <b>run</b> , <b>idle</b> , <b>zombi</b> , or <b>stop</b> ).
Swap	Information about physical and virtual memory allocation.
USERNAME	Owner of the process.
WCPU	Weighted CPU usage.

### Restarting a Junos OS Process

To correct an error condition, you might need to restart a software process running on the device. You can use the **restart** command to force a restart of a software process.

**CAUTION:** Do not restart a software process unless specifically asked to do so by your Juniper Networks customer support representative. Restarting a software process during normal operation of a device could cause interruption of packet forwarding and loss of data.

To restart a software process:

1. Make sure you are in operational mode.
2. Type the following command:

```
user@host> restart process-name < (immediately | gracefully | soft) >
```

- **process-name** is the name of the process that you want to restart. For example, **routing** or **class-of-service**. You can use the command completion feature of Junos OS to see a list of software processes that you can restart using this command.
- **gracefully** restarts the software process after performing clean-up tasks.
- **immediately** restarts the software process without performing any clean-up tasks.
- **soft** rereads and reactivates the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant.

The following example shows how to restart the routing process:

```
user@host> restart routing
Routing protocol daemon started, pid 751
```

When a process restarts, the process identifier (PID) is updated. (See [Figure 21 on page 506.](#))

Figure 21: Restarting a Process

PID	USERNAME	PRI	NICE	SIZE	RES	STATE	TIME	WCPU	CPU	COMMAND
546	root	10	0	9096K	1720K	nanslp	0:21	0.00%	0.00%	chassisd
685	root	2	0	12716K	3840K	kqread	0:01	0.00%	0.00%	rpdp
553	root	2	0	8792K	1544K	select	0:01	0.00%	0.00%	mib2d

PID before restart

547	root	2	0	7732K	888K	select	0:00	0.00%	0.00%	alarmd
545	root	2	0	10292K	2268K	select	0:00	0.00%	0.00%	dcd
1	root	10	0	816K	520K	wait	0:00	0.00%	0.00%	init
550	root	2	-12	1308K	692K	select	0:00	0.00%	0.00%	ntpd
758	root	32	0	21716K	832K	RUN	0:00	0.00%	0.00%	top
560	root	2	0	8208K	1088K	select	0:00	0.00%	0.00%	rmopd
561	root	2	0	8188K	1156K	select	0:00	0.00%	0.00%	cosd
559	root	2	0	1632K	840K	select	0:00	0.00%	0.00%	ilmid
573	lab	2	0	7480K	2580K	select	0:00	0.00%	0.00%	cli
751	root	2	0	12716K	3944K	kqread	0:00	0.00%	0.00%	rpdp
558	root	2	20	8708K	1880K	select	0:00	0.00%	0.00%	sampd
555	root	2	0	1856K	932K	select	0:00	0.00%	0.00%	vrpd
686	root	2	0	7808K	940K	select	0:00	0.00%	0.00%	apd

PID after restart

## Stopping the Junos OS

To avoid damage to the file system and to prevent loss of data, you must always gracefully shut down Junos OS before powering off the device.

**NOTE:** SRX Series Services Gateway devices for the branch and EX Series Ethernet Switches support resilient dual-root partitioning.

If you are unable to shut down a device gracefully because of unexpected circumstances such as a power outage or a device failure, resilient dual-root partitioning prevents file corruption and enables a device to remain operational. In addition, it enables a device to boot transparently from the second root partition if the system fails to boot from the primary root partition.

Resilient dual-root partitioning serves as a backup mechanism for providing additional resiliency to a device when there is an abnormal shutdown. However, it is not an alternative to performing a graceful shutdown under normal circumstances.

To stop Junos OS:

1. Make sure you are in operational mode.
2. Enter the **request system halt** command. This command stops all system processes and halts the operating system. For example:

```
user@host> request system halt
Halt the system? [yes,no] (no) yes
shutdown: [pid 3110]
Shutdown NOW!
*** FINAL System shutdown message from root@host ***
System going down IMMEDIATELY
user@host> Dec 17 17:28:40 init: syslogd (PID 2514) exited with status=0 Normal
Exit
Waiting (max 60 seconds) for system process `bufdaemon' to stop...stopped
Waiting (max 60 seconds) for system process `syncer' to stop...stopped
syncing disks... 4
done
Uptime: 3h31m41s
ata0: resetting devices.. done
The operating system has halted.
Please press any key to reboot.
```

## Rebooting the Junos OS

After a software upgrade or to recover (occasionally) from an error condition, you must reboot Junos OS.

To reboot the Junos OS:

1. Make sure you are in operational mode.
2. Enter the **request system reboot** command. This command displays the final stages of the system shutdown and executes the reboot. Reboot requests are recorded to the system log files, which you can view with the **show log messages** command. For example:

```
user@host> request system reboot
Reboot the system? [yes,no] (no)yes
```

```

shutdown: [pid 845]
Shutdown NOW!
*** FINAL System shutdown message from root@host ***
System going down IMMEDIATELY
user@host> Dec 17 17:34:20 init: syslogd (PID 409) exited with status=0 Normal
Exit
Waiting (max 60 seconds) for system process `bufdaemon' to stop...stopped
Waiting (max 60 seconds) for system process `syncer' to stop...stopped
syncing disks... 10 6
done
Uptime: 2m45s
ata0: resetting devices.. done
Rebooting...

```

## Using the Junos OS CLI Comment Character # for Operational Mode Commands

The comment character in Junos OS enables you to copy operational mode commands that include comments from a file and paste them into the CLI. A pound sign (#) at the beginning of the command-line indicates a comment line. This is useful for describing frequently used operational mode commands; for example, a user's work instructions on how to monitor the network. To add a comment to a command file, the first character of the line must be #. When you start a command with #, the rest of the line is disregarded by Junos OS.

To add comments in operational mode, start with a # and end with a new line (carriage return):

```
user@host> # comment-string
```

*comment-string* is the text of the comment. The comment text can be any length, but each comment line must begin with a #.

- Related Documentation**
- [Example: Using Comments in Junos OS Operational Mode Commands on page 508](#)

### Example: Using Comments in Junos OS Operational Mode Commands

The following example shows how to use comments in a file:

```

#Command 1: Show the router version
show version
#Command 2: Show all router interfaces
show interfaces terse

```

The following example shows how to copy and paste contents of a file into the CLI:

```

user@host> #Command 1: Show the router version
user@host> show version
Hostname: myhost
Model: m5
Junos Base OS boot [6.4-20040511.0]
Junos Base OS Software Suite [6.4-20040511.0]

```

```

Junos Kernel Software Suite [6.4-20040511.0]
Junos Packet Forwarding Engine Support (M5/M10) [6.4-20040511.0] Junos Routing
  Software Suite [6.4-20040511.0] Junos Online Documentation [6.4-20040511.0] Junos
  Crypto Software Suite [6.4-20040511.0]

## Managing the CLI Environment

- [Controlling the Junos OS CLI Environment on page 509](#)
- [Overview of Junos OS CLI Operational Mode Commands on page 512](#)
- [Setting the Junos OS CLI Screen Length and Width on page 514](#)

### Controlling the Junos OS CLI Environment

In operational mode, you can control the Junos OS command-line interface (CLI) environment. For example, you can specify the number of lines that are displayed on the screen or your terminal type. The following output lists the options that you can use to control the CLI environment:

```

user@host>set cli ?
Possible completions:
complete-on-space  Set whether typing space completes current word
directory          Set working directory
idle-timeout       Set maximum idle time before login session ends
logical-system     Set default logical system
prompt            Set CLI command prompt string
restart-on-upgrade Set whether CLI prompts to restart after software upgrade

screen-length      Set number of lines on screen
screen-width       Set number of characters on a line
terminal          Set terminal type
timestamp          Timestamp CLI output

```

**NOTE:** When you use SSH to log in to the router or log in from the console when its terminal type is already configured, your terminal type, screen length, and screen width are already set.

This chapter discusses the following topics:

- [Setting the Terminal Type on page 510](#)
- [Setting the CLI Prompt on page 510](#)
- [Setting the CLI Directory on page 510](#)
- [Setting the CLI Timestamp on page 510](#)
- [Setting the Idle Timeout on page 511](#)
- [Setting the CLI to Prompt After a Software Upgrade on page 511](#)
- [Setting Command Completion on page 511](#)
- [Displaying CLI Settings on page 511](#)

---

### Setting the Terminal Type

To set the terminal type, use the **set cli terminal** command:

```
user@host> set cli terminal terminal-type
```

The terminal type can be one of the following: **ansi**, **vt100**, **small-xterm**, or **xterm**.

---

### Setting the CLI Prompt

The default CLI prompt is **user@host>**. To change this prompt, use the **set cli prompt** command. If the prompt string contains spaces, enclose the string in quotation marks ( " ").

```
user@host> set cli prompt string
```

---

### Setting the CLI Directory

To set the current working directory, use the **set cli directory** command:

```
user@host> set cli directory directory
```

**directory** is the pathname of working directory.

---

### Setting the CLI Timestamp

By default, CLI output does not include a timestamp. To include a timestamp in CLI output, use the **set cli timestamp** command:

```
user@host> set cli timestamp [format time-date-format | disable]
```

If you do not specify a timestamp format, the default format is **Mmm dd hh:mm:ss** (for example, Feb 08 17:20:49). Enclose the format in single quotation marks ( ' ).

### Setting the Idle Timeout

By default, an individual CLI session never times out after extended times, unless the **idle-timeout** statement has been included in the user's login class configuration. To set the maximum time an individual session can be idle before the user is logged off the router, use the **set cli idle-timeout** command:

```
user@host> set cli idle-timeout timeout
```

*timeout* can be 0 through 100,000 minutes. Setting *timeout* to 0 disables the timeout.

### Setting the CLI to Prompt After a Software Upgrade

By default, the CLI prompts you to restart after a software upgrade. To disable the prompt for an individual session, use the **set cli restart-on-upgrade off** command:

```
user@host> set cli restart-on-upgrade off
```

To reenable the prompt, use the **set cli restart-on-upgrade on** command:

```
user@host> set cli restart-on-upgrade on
```

### Setting Command Completion

By default, you can press Tab or the Spacebar to have the CLI complete a command.

To have the CLI allow only a tab to complete a command, use the **set cli complete-on-space off** command:

```
user@host> set cli complete-on-space off
Disabling complete-on-space
user@host>
```

To reenable the use of both spaces and tabs for command completion, use the **set cli complete-on-space on** command:

```
user@host> set cli complete-on-space on
Enabling complete-on-space
user@host>
```

### Displaying CLI Settings

To display the current CLI settings, use the **show cli** command:

```
user@host> show cli
CLI screen length set to 24
CLI screen width set to 80
CLI complete-on-space set to on
```

## Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 512](#)
- [Commonly Used Operational Mode Commands on page 513](#)

### CLI Command Categories

---

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see [“Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies” on page 311](#).
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in [CLI Explorer](#).
  - **clear**—Clear statistics and protocol database information.
  - **mtrace**—Trace mtrace packets from source to receiver.
  - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
  - **ping**—Determine the reachability of a remote network host.
  - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
  - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
  - **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see [CLI Explorer](#).
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see [CLI Explorer](#).
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see [CLI Explorer](#).
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see [CLI Explorer](#).

- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see [CLI Explorer](#).
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see “[Understanding Junos OS CLI Configuration Mode](#)” on page 334.
- A command—**quit**—to exit the CLI. For information about this command, see [CLI Explorer](#).

### Commonly Used Operational Mode Commands

Table 41 on page 320 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

**Table 51: Commonly Used Operational Mode Commands**

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	<b>show version</b>
Log files	Contents of the log files	<b>monitor</b>
	Log files and their contents and recent user logins	<b>show log</b>
Remote systems	Host reachability and network connectivity	<b>ping</b>
	Route to a network system	<b>traceroute</b>
Configuration	Current system configuration	<b>show configuration</b>
Manipulate files	List of files and directories on the router or switch	<b>file list</b>
	Contents of a file	<b>file show</b>
Interface information	Detailed information about interfaces	<b>show interfaces</b>
Chassis	Chassis alarm status	<b>show chassis alarms</b>
	Information currently on craft display	<b>show chassis craft-interface</b>
	Router or switch environment information	<b>show chassis environment</b>
	Hardware inventory	<b>show chassis hardware</b>
Routing table information	Information about entries in the routing tables	<b>show route</b>

Table 51: Commonly Used Operational Mode Commands (*continued*)

Items to Check	Description	Command
Forwarding table information	Information about data in the kernel's forwarding table	<b>show route forwarding-table</b>
IS-IS	Adjacent routers or switches	<b>show isis adjacency</b>
OSPF	Display standard information about OSPF neighbors	<b>show ospf neighbor</b>
BGP	Display information about BGP neighbors	<b>show bgp neighbor</b>
MPLS	Status of interfaces on which MPLS is running	<b>show mpls interface</b>
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	<b>show mpls lsp</b>
	Routes that form a label-switched path	<b>show route label-switched-path</b>
RSVP	Status of interfaces on which RSVP is running	<b>show rsvp interface</b>
	Currently active RSVP sessions	<b>show rsvp session</b>
	RSVP packet and error counters	<b>show rsvp statistics</b>

## Setting the Junos OS CLI Screen Length and Width

You can set the Junos OS command-line interface (CLI) screen length and width according to your specific requirements. This topic contains the following sections:

- [Setting the Screen Length on page 514](#)
- [Setting the Screen Width on page 515](#)
- [Understanding the Screen Length and Width Settings on page 515](#)

### Setting the Screen Length

The default CLI screen length is 24 lines. To change the length, use the **set cli screen-length** command:

```
user@host> set cli screen-length length
```

Setting the screen length to 0 lines disables the display of output one screen at a time. Disabling this UNIX **more**-type interface can be useful when you are issuing CLI commands from scripts.

## Setting the Screen Width

The default CLI screen width is 80 characters. To change the width, use the **set cli screen-width** command:

```
user@host> set cli screen-width width
```

## Understanding the Screen Length and Width Settings

The **cli screen-length** and **cli screen-width** settings in combination with each other and the size of the telnet or console window determine the extent of output displayed before each **--more--** prompt appears.

The following examples explain how the **cli screen-length** and **cli screen-width** values determine the appearance of the output:

- When the CLI screen width is set to the default value (80 characters) and the cli screen length to 10 lines, the **--more--** prompt appears on the tenth line of the output.
- When the CLI screen width is set to 20 characters and the CLI screen length is set to 6 lines in a telnet or console window that is wide enough to contain 40 characters, the **--more--** prompt appears on the fourth line of the output. Here each one of the first two lines has more than 20 characters and is counted as two lines. The third line contains the fifth line of output, and the fourth line contains the **--more--** prompt, which has to appear in the sixth line as per the setting.

**NOTE:** If you have inadvertently set the CLI screen width to a lower value that does not allow you to see the commands that you are typing, reset the CLI screen width with a higher value by entering the **set cli screen-width** command.

**TIP:** If you are not able to see the command that you are entering, type the command in a text editor and copy it at the command prompt.

## CLI Advanced Features

- [Common Regular Expressions to Use with the replace Command on page 516](#)

## Common Regular Expressions to Use with the replace Command

**Table 52: Common Regular Expressions to Use with the replace Command**

Operator	Function
	Indicates that a match can be one of the two terms on either side of the pipe.
^	Used at the beginning of an expression, denotes where a match should begin.
\$	Used at the end of an expression, denotes that a term must be matched exactly up to the point of the \$ character.
[ ]	Specifies a range of letters or digits to match. To separate the start and end of a range, use a hyphen ( - ).
( )	Specifies a group of terms to match. Stored as numbered variables. Use for back references as \1 \2 .... \9.
*	0 or more terms.
+	One or more terms.
.	Any character except for a space ( " ").
\	A backslash escapes special characters to suppress their special meaning. For example, \. matches . (period symbol).
\n	Back reference. Matches the <i>n</i> th group.
&	Back reference. Matches the entire match.

Table 53 on page 516 lists some replacement examples.

**Table 53: Replacement Examples**

Command	Result
replace pattern myrouter with router1	Match: myrouter Result: router1
replace pattern "192.168\.(*)/24" with "10.2.\1/28"	Match: 192.168.3.4/24 Result: 10.2.3.4/28
replace pattern "1.\1" with "abc&def"	Match: 1.1 Result: abc1.1def

Table 53: Replacement Examples (*continued*)

Command	Result
<code>replace pattern 1.1 with " abc\&amp;def"</code>	Match: 1#1 Result: <code>abc&amp;def</code>

## Junos OS CLI Environment Commands

- `set cli complete-on-space`
- `set cli directory`
- `set cli idle-timeout`
- `set cli prompt`
- `set cli restart-on-upgrade`
- `set cli screen-length`
- `set cli screen-width`
- `set cli terminal`
- `set cli timestamp`
- `set date`
- `show cli`
- `show cli authorization`
- `show cli directory`
- `show cli history`

## set cli complete-on-space

---

<b>Syntax</b>	set cli complete-on-space (off   on)
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the command-line interface (CLI) to complete a partial command entry when you type a space or a tab. This is the default behavior of the CLI.
<b>Options</b>	<b>off</b> —Turn off command completion.  <b>on</b> —Allow either a space or a tab to be used for command completion.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show cli on page 528</a></li></ul>
<b>List of Sample Output</b>	<a href="#">set cli complete-on-space on page 518</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### set cli complete-on-space

In the following example, pressing the Spacebar changes the partial command entry from **com** to **complete-on-space**. The example shows how adding the keyword **off** at the end of the command disables command completion.

```
user@host> set cli com<Space>
user@host>set cli complete-on-space off
Disabling complete-on-space
```

## set cli directory

---

<b>Syntax</b>	set cli directory <i>directory</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the current working directory.
<b>Options</b>	<i>directory</i> —Pathname of the working directory.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">set cli directory on page 519</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### set cli directory

```
user@host> set cli directory /var/tmp
Current directory: /var/tmp
```

## set cli idle-timeout

---

<b>Syntax</b>	set cli idle-timeout < <i>minutes</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the maximum time that an individual session can be idle before the user is logged off the router or switch.
<b>Options</b>	<i>minutes</i> —(Optional) Maximum idle time. The range of values, in minutes, is 0 through 100,000. If you do not issue this command, and the user's login class does not specify this value, the user is never forced off the system after extended idle times. Setting the value to 0 disables the timeout.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">set cli idle-timeout on page 520</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### set cli idle-timeout

```
user@host> set cli idle-timeout 60
Idle timeout set to 60 minutes
```

## set cli prompt

---

<b>Syntax</b>	set cli prompt <i>string</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Set the prompt so that it is displayed within the CLI.</p> <pre>user@host&gt; set cli prompt lab1-router&gt;</pre>
<b>Options</b>	<i>string</i> —CLI prompt string. To include spaces in the prompt, enclose the string in quotation marks. By default, the string is <i>username@hostname</i> .
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting the CLI Prompt on page 510</a></li></ul>

## set cli restart-on-upgrade

---

<b>Syntax</b>	set cli restart-on-upgrade string (off   on)
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>For an individual session, set the CLI to prompt you to restart the router after upgrading the software.</p> <pre>user@host&gt; set cli restart-on-upgrade on Enabling restart-on-upgrade</pre>
<b>Options</b>	<p><b>off</b>—Disables the prompt.</p> <p><b>on</b>—Enables the prompt.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting the CLI to Prompt After a Software Upgrade on page 511</a></li></ul>

---

## set cli screen-length

---

<b>Syntax</b>	set cli screen-length <i>length</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Set terminal screen length.</p> <pre>user@host&gt; set cli screen-length 75 Screen Length set to 75</pre>
<b>Options</b>	<p><i>length</i>—Number of lines of text that the terminal screen displays. The range of values, in number of lines, is 24 through 100,000. The default is 24.</p> <p>The point at which the ---(<b>more</b>)--- prompt appears on the screen is a function of this setting and the settings for the <b>set cli screen-width</b> and <b>set cli terminal</b> commands.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting the Screen Length on page 514</a></li><li>• <a href="#">Understanding the Screen Length and Width Settings on page 515</a></li><li>• <a href="#">set cli screen-width on page 524</a></li><li>• <a href="#">set cli terminal on page 525</a></li><li>• <a href="#">show cli</a></li></ul>

## set cli screen-width

---

<b>Syntax</b>	set cli screen-width <width>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Set the terminal screen width.</p> <pre>user@host&gt; set cli screen-width 132 Screen width set to 132</pre>
<b>Options</b>	<p><b>width</b>—Number of characters in a line. The value is 0 or in the range of 0 through 1024. The default value is 80.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting the Screen Width on page 515</a></li><li>• <a href="#">set cli screen-length on page 523</a></li><li>• <a href="#">set cli terminal on page 525</a></li><li>• <a href="#">show cli</a></li></ul>

## set cli terminal

---

<b>Syntax</b>	set cli terminal <i>terminal-type</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Set the terminal type.</p> <pre>user@host&gt; set cli terminal xterm</pre>
<b>Options</b>	<p><i>terminal-type</i>—Type of terminal that is connected to the Ethernet management port:</p> <ul style="list-style-type: none"><li>• <b>ansi</b>—ANSI-compatible terminal (80 characters by 24 lines)</li><li>• <b>small-xterm</b>—Small xterm window (80 characters by 24 lines)</li><li>• <b>vt100</b>—VT100-compatible terminal (80 characters by 24 lines)</li><li>• <b>xterm</b>—Large xterm window (80 characters by 65 lines)</li></ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting the Terminal Type on page 510</a></li></ul>

## set cli timestamp

---

<b>Syntax</b>	set cli timestamp (format <i>timestamp-format</i>   disable)
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Set a timestamp for CLI output.</p> <pre>user@host&gt; set cli timestamp format '%m-%d-%T' '04-21-17:39:13' CLI timestamp set to: '%m-%d-%T'</pre>
<b>Options</b>	<p><b>format <i>timestamp-format</i></b>—Set the data and time format for the timestamp. The timestamp format you specify can include the following placeholders in any order:</p> <ul style="list-style-type: none"><li>• <b>%m</b>—Two-digit month</li><li>• <b>%d</b>—Two-digit date</li><li>• <b>%T</b>—Six-digit hour, minute, and seconds</li></ul> <p>Enclose the format in single quotation marks ( ' ). Do not use spaces. Use a hyphen ( - ) or similar character to separate placeholders.</p> <p><b>disable</b>—Remove the timestamp from the CLI.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting the CLI Timestamp on page 510</a></li></ul>

## set date

---

**Syntax** set date (*date-time* | ntp <*ntp-server*> <source-address *source-address*>)

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Set the date and time.

```
user@host> set date ntp
21 Apr 17:22:02 ntpdate[3867]: step time server 172.17.27.46 offset 8.759252 sec
```

- Options**
- ***date-time***—Specify date and time in one of the following formats:
    - *YYYYMMDDHHMM.SS*
    - “*month DD, YYYY HH:MM(am | pm)*”
  - **ntp**—Configure the router to synchronize the current date and time setting with a Network Time Protocol (NTP) server.
  - ***ntp-server***—(Optional) Specify the IP address of one or more NTP servers.
  - ***source-address source-address***—(Optional) Specify the source address that is used by the router to contact the remote NTP server.

**Required Privilege Level** view

## show cli

<b>Syntax</b>	show cli
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display configured CLI settings.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli on page 528</a>
<b>Output Fields</b>	<a href="#">Table 54 on page 528</a> lists the output fields for the <b>show cli</b> command. Output fields are listed in the approximate order in which they appear.

**Table 54: show cli Output Fields**

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: <b>on</b> or <b>off</b> .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is <b>disabled</b> .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: <b>on</b> or <b>off</b> .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: <b>enhanced</b> .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is <b>disabled</b> .
CLI working directory	Pathname of the working directory.

## Sample Output

### show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
```

```
CLI terminal is 'vt100'  
CLI is operating in enhanced mode  
CLI timestamp disabled  
CLI working directory is '/var/tmp'
```

## show cli authorization

**Syntax** show cli authorization

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display the permissions for the current user.

```
user@host> show cli authorization
Current user: 'root' login: 'boojum' class '(root)'
Permissions:
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network info
  configure  -- Can enter configuration mode
  control    -- Can modify any config
  edit       -- Can edit full files
  field      -- Can use field debug commands
  floppy     -- Can read and write the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons

## | (pipe)

<b>Syntax</b>	(compare   count   display (changed   commit-scripts   detail   display set   inheritance   omit   xml)   except <i>pattern</i>   find <i>pattern</i>   hold   last <i>lines</i>   match <i>pattern</i>   no-more   request message (all   <i>account@terminal</i> ) resolve <full-names>   save <i>filename</i>   trim <i>columns</i> )
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. display commit-scripts option added in Junos OS Release 7.4.
<b>Description</b>	Filter the output of an operational mode or a configuration mode command.
<b>Options</b>	<p><b>compare (filename   rollback <i>n</i> )</b>—(Configuration mode only, and only with the <b>show</b> command) Compare configuration changes with another configuration file.</p> <p><b>count</b>—Display the number of lines in the output.</p> <p><b>display</b>—Display additional information about the configuration contents.</p> <ul style="list-style-type: none"> <li><b>changed</b>—Tag changes with <b>junos:changed attribute</b> (XML only).</li> <li><b>commit-scripts</b>—(Configuration mode only) Display all statements that are in a configuration, including statements that were generated by transient changes. For more information, see the <i>Junos OS Configuration and Operations Automation Library</i>.</li> <li><b>detail</b>—(Configuration mode only) Display configuration data detail.</li> <li><b>inheritance &lt;brief   default   no-comments   groups   terse&gt;</b>—(Configuration mode only) Display inherited configuration data and source group.</li> <li><b>omit</b>—(Configuration mode only) Display configuration statements omitted by the <b>apply-flags omit</b> configuration statement.</li> <li><b>set</b>—Display the configuration as a series of configuration mode commands required to re-create the configuration.</li> <li><b>xml</b>—(Operational mode only) Display the command output as Junos XML protocol (Extensible Markup Language [XML]) tags.</li> </ul> <p><b>except <i>pattern</i></b>—Ignore text matching a regular expression when searching the output. If the regular expression contains spaces, operators, or wildcard characters, enclose it in quotation marks.</p> <p><b>find <i>pattern</i></b>—Display the output starting at the first occurrence of text matching a regular expression. If the regular expression contains spaces, operators, or wildcard characters, enclose it in quotation marks (" ").</p> <p><b>last <i>lines</i></b>—Display the last number of lines you want to view from the end of the configuration. However, when the number of lines requested is less than the number of lines that the screen length setting permits you to display, Junos returns as many lines</p>

as permitted by the screen length setting. For more information on using the **last lines** option, see [“Displaying Output Beginning with the Last Entries” on page 332](#).

**hold**—Hold text without exiting the **--More--** prompt.

**match *pattern***—Search for text matching a regular expression. If the regular expression contains spaces, operators, or wildcard characters, enclose it in quotation marks.

**no-more**—Display output all at once rather than one screen at a time.

**resolve**—Convert IP addresses into Domain Name System (DNS) names. Truncates to fit original size unless **full-names** is specified. To prevent the names from being truncated, use the **full-names** option.

**request message (all | *account@terminal*)**—Display command output on the terminal of a specific user logged in to your router, or on the terminals of all users logged in to your router.

**save *filename***—Save the output to a file or URL. For information about specifying the filename, see [“Specifying Filenames and URLs” on page 500](#).

**trim *columns***—Trim specified number of columns from the start line.

---

## activate

---

<b>Syntax</b>	<code>activate (<i>statement</i>   <i>identifier</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Remove the <b>inactive:</b> tag from a statement, effectively adding the statement or identifier back to the configuration. Statements or identifiers that have been activated take effect when you next issue the <b>commit</b> command.
<b>Options</b>	<p><b><i>identifier</i></b>—Identifier from which you are removing the <b>inactive</b> tag. It must be an identifier at the current hierarchy level.</p> <p><b><i>statement</i></b>—Statement from which you are removing the <b>inactive</b> tag. It must be a statement at the current hierarchy level.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">deactivate on page 466</a></li><li>• <a href="#">Deactivating and Reactivating Statements and Identifiers in a Junos Configuration on page 388</a></li></ul>

## annotate

**Syntax** `annotate statement "comment-string"`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Add comments to a configuration. You can add comments only at the current hierarchy level.

Any comments you add appear only when you view the configuration by entering the [show](#) command in configuration mode or the **show configuration** command in operational mode.

**NOTE:** The Junos OS supports annotation up to the last level in the configuration hierarchy, including onliners. However, annotation of parts (child statements or identifiers within a oneliner) of the onliner is not supported. For example, in the following sample configuration hierarchy, annotation is supported up to the onliner level 1, but not supported for the metric child statement and its attribute *10*:

```
[edit protocols]
  isis {
    interface ge-0/0/0.0 {
      level 1 metric 10;
    }
  }
}
```

**Options** *comment-string*—Text of the comment. You must enclose it in quotation marks. In the comment string, you can include the comment delimiters `/* */` or `#`. If you do not specify any, the comment string is enclosed with the `/* */` comment delimiters. If a comment for the specified *statement* already exists, it is deleted and replaced with the new comment.

*statement*—Statement to which you are attaching the comment.

**Required Privilege Level** `configure`—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

**Related Documentation**

- [Adding Comments in a Junos Configuration on page 390](#)

## commit

**Syntax** `commit <<at <"string">> <and-quit> <check> <comment <"comment-string">>  
<confirmed> <display detail> <minutes> <synchronize><force>>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Commit the set of changes to the database and cause the changes to take operational effect.

**Options** `at <"string">`—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.

**string** is **reboot** or the future time to activate the configuration changes. Enclose the **string** value (including **reboot**) in quotation marks (" "). You can specify time in two formats:

- A time value in the form **hh:mm[:ss]** (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the **commit at** configuration command is issued. Use 24-hour time for the **hh** value; for example, **04:30:00** is 4:30:00 AM, and **20:00** is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.
- A date and time value in the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the **commit at** command is issued. Use 24-hour time for the **hh** value. For example, **2003-08-21 12:30:00** is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.

For example, **commit at "18:00:00"**. For date and time, include both values in the same set of quotation marks. For example, **commit at "2005-03-10 14:00:00"**.

A *commit check* is performed when you issue the **commit at** configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.

**NOTE:** If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at** configuration command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see [CLI Explorer](#).

**and-quit**—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

**check**—(Optional) Verify the syntax of the configuration, but do not activate it.

**comment** <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab"**.

**confirmed** <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is 1 through 65,535 minutes, and the default is 10 minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

**display detail**—(Optional) Monitors the commit process.

**NOTE:** In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the **more** pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

---

**synchronize** <*force*>—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the **commit synchronize** command. The Routing Engine on which you execute this command (request Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine is terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

**NOTE:** When you issue the `commit synchronize` command, you must use the `apply-groups re0` and `re1` commands. For information about how to use groups, see [“Disabling Inheritance of a Junos OS Configuration Group” on page 433](#).

The responding Routing Engine must use Junos OS Release 5.0 or later.

**Required Privilege Level**

`configure`—To enter configuration mode.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*

## configure

<b>Syntax</b>	configure <dynamic> <exclusive> <private>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Enter configuration mode. When this command is entered without any optional keywords, everyone can make configuration changes and commit all changes made to the configuration.
<b>Options</b>	<p><b>none</b>—Enter configuration mode.</p> <p><b>dynamic</b>—(Optional) Configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database. As a result, the time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can then reference these policies and policy objects in routing policies you configure in the standard database.</p> <p><b>exclusive</b>—(Optional) Lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot change the configuration.</p> <p><b>private</b>—(Optional) Allow multiple users to edit different parts of the configuration at the same time and to commit only their own changes, or to roll back without interfering with one another's changes. You cannot commit changes in configure private mode when another user is in configure exclusive mode.</p>
<b>Required Privilege Level</b>	configure
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show configuration on page 559</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">configure on page 540</a>
<b>Output Fields</b>	When you enter this command, you are placed in configuration mode and the system prompt changes from <i>hostname&gt;</i> to <i>hostname#</i> .

## Sample Output

### configure

```
user@host> configure
Entering configuration mode
[edit]
user@host#
```

## copy

---

<b>Syntax</b>	<code>copy <i>existing-statement</i> to <i>new-statement</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Make a copy of an existing statement in the configuration.
<b>Options</b>	<i>existing-statement</i> —Statement to copy. <i>new-statement</i> —Copy of the statement.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Copying a Junos Statement in the Configuration on page 384</a></li></ul>

## file

<b>Syntax</b>	<code>file &lt;archive   checksum   compare   copy   delete   list   rename   show   source address   archive&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive files from the device, copy files to and from the router or switch, calculate the file checksum, compare files, delete a file from the device, list files on the device, rename a file, show file contents, or show the local address to initiate a connection.
<b>Options</b>	<p><b>archive (Optional)</b> —Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.</p> <p><b>checksum (Optional)</b> —Calculate the Message Digest 5 (MD5) checksum of a file.</p> <p><b>compare (Optional)</b> —Compare two local files and describe the differences between them in default, context, or unified output styles.</p> <p><b>copy (Optional)</b> —Copy files from one place to another on the local switch or between the local switch and a remote system.</p> <p><b>delete (Optional)</b> —Delete a file on the local switch.</p> <p><b>list (Optional)</b> —Display a list of files on the local switch.</p> <p><b>rename (Optional)</b> —Rename a file on the local switch.</p> <p><b>show (Optional)</b> —Display the contents of a file.</p> <p><b>source address (Optional)</b> —Specify the source address of the local file.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Viewing Files and Directories on a Device Running Junos OS on page 497</a></li> </ul>

## help

---

<b>Syntax</b>	<code>help &lt; (apropos <i>string</i>   reference &lt;<i>statement-name</i>&gt;   syslog &lt;<i>syslog-tag</i>&gt;   tip cli <i>number</i>   topic &lt;<i>word</i>&gt; )&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>apropos</b> option added in Junos OS Release 8.0.
<b>Description</b>	Display help about available operational commands, configuration statements, or general information about getting help. Entering the <b>help</b> command without an option provides introductory information about how to use the <b>help</b> and <b>?</b> commands.
<b>Options</b>	<p><b>apropos <i>string</i></b>—(Optional) Display command names and help text that matches the string specified. If the string contains spaces, enclose it in quotation marks (" "). You can also specify a regular expression for the string, using standard UNIX-style regular expression syntax.</p> <p><b>reference &lt;<i>statement-name</i>&gt;</b>—(Optional) Display summary information for a configuration statement. This information is based on summary descriptions that appear in the Junos feature guides.</p> <p><b>syslog &lt;<i>syslog-tag</i>&gt;</b>—(Optional) Display information about system log messages.</p> <p><b>tip cli <i>number</i></b>—(Optional) Display a tip about using the CLI. Specify the number of the tip you want to view.</p> <p><b>topic &lt;<i>word</i>&gt;</b>—(Optional) Display usage guidelines for a topic or configuration statement. This information is based on subjects that appear in the Junos feature guides.</p>
<b>Required Privilege Level</b>	None
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Getting Online Help from the Junos OS Command-Line Interface on page 315</a></li></ul>

## request

**Syntax** request <chassis | ipsec switch | message | mpls | routing-engine | security | services | system | flow-collector | support information>

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Stop or reboot router components, switch between primary and backup components, display messages, and display system information.

**CAUTION:** Halt the backup Routing Engine before you remove it or shut off the power to the router; otherwise, you might need to reinstall the Junos OS.

**NOTE:** If your router contains two Routing Engines and you want to shut the power off to the router or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded) and then the master Routing Engine. To halt a Routing Engine, enter the `request system halt` command. You can also halt both Routing Engines at the same time by issuing the `request system halt both-routing-engines` command.

If you want to reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) and then the master Routing Engine.

**NOTE:** If you reboot the TX Matrix router, all the T640 master Routing Engines connected to the TX Matrix router reboot. If you halt both Routing Engines on a TX Matrix router, all the T640 Routing Engines connected to the TX Matrix router are also halted. Likewise, if you reboot the TX Matrix Plus router, all the T1600 master Routing Engines connected to the TX Matrix Plus router reboot. If you halt both Routing Engines on a TX Matrix Plus router, all the T1600 Routing Engines connected to the TX Matrix Plus router are also halted.

**NOTE:** If you insert a Flexible PIC Concentrator (FPC) into your router, you may need to issue the `request chassis fpc` command (or press the online button) to bring the FPC online. This applies to FPCs in M20, M40, M40e, M160, M320, and T Series routers. For command usage, see the `request chassis fpc` command description in [CLI Explorer](#).

**Additional Information** Most `request` commands are described in [CLI Explorer](#).

**Required Privilege Level** maintenance

Syntax (J Series Routers)	<pre>restart &lt;adaptive-services   audit-process   chassis-control   class-of-service   dhcp   dhcp-service   dialer-services   diameter-service   event-processing   firewall   interface-control   ipsec-key-management   isdn-signaling   l2ald   l2-learning   l2tp-service   mib-process   network-access-service   pgm   ppp   pppoe   remote-operations   routing &lt;logical-system <i>logical-system-name</i>&gt;   sampling   service-deployment   snmp   usb-control   web-management&gt; &lt;gracefully   immediately   soft&gt;</pre>
Syntax (QFX Series)	<pre>restart &lt;adaptive-services   audit-process   chassis-control   class-of-service   dialer-services   diameter-service   dlsd   ethernet-connectivity   event-processing   fibre-channel   firewall   general-authentication-service   igmp-host-services   interface-control   ipsec-key-management   isdn-signaling   l2ald   l2-learning   l2tp-service   mib-process   named-service   network-access-service   nstrace-process   pgm   ppp   pppoe   redundancy-interface-process   remote-operations   <i>logical-system-name</i>&gt;   routing   sampling   secure-neighbor-discovery   service-deployment   snmp   usb-control   web-management&gt; &lt;gracefully   immediately   soft&gt;</pre>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options** **none**—Same as **gracefully**.

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing and tracking usage patterns, for billing a user based upon the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**— (M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**license-service**—(EX Series switches) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member member-id**—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series router) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway gateway-name**—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers) (Optional) Restart the USB control process.

**vrrp**—(EX Series switches and MX Series routers) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers) (Optional) Restart the Web management process.

**Required Privilege Level**    reset

**Related Documentation**    • [Overview of Junos OS CLI Operational Mode Commands on page 319](#)

**List of Sample Output**    [restart interfaces on page 556](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

---

## set

---

<b>Syntax</b>	set < <i>statement-path</i> > <i>identifier</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Create a statement hierarchy and set identifier values. This is similar to <b>edit</b> except that your current level in the hierarchy does not change.
<b>Options</b>	<p><i>identifier</i>—Name of the statement or identifier to set.</p> <p><i>statement-path</i>—(Optional) Path to an existing statement hierarchy level. If that hierarchy level does not exist, it is created.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">edit on page 468</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

## show

---

<b>Syntax</b>	<code>show &lt;statement-path&gt; &lt;identifier&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display the current configuration.
<b>Options</b>	<p><code>none</code>—Display the entire configuration at the current hierarchy level.</p> <p><code>identifier</code>—(Optional) Display the configuration for the specified identifier.</p> <p><code>statement-path</code>—(Optional) Display the configuration for the specified statement hierarchy path.</p>
<b>Required Privilege Level</b>	<code>configure</code> —To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show   display inheritance on page 562</a></li><li>• <a href="#">show   display omit on page 563</a></li><li>• <a href="#">show   display set on page 564</a></li><li>• <a href="#">show   display set relative on page 565</a></li><li>• <a href="#">show groups junos-defaults on page 566</a></li><li>• <a href="#">Displaying the Current Junos OS Configuration on page 360</a></li></ul>

## show configuration

---

<b>Syntax</b>	show configuration < <i>statement-path</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display the configuration that currently is running on the router or switch, which is the last committed configuration.
<b>Options</b>	<p><b>none</b>—Display the entire configuration.</p> <p><b><i>statement-path</i></b>—(Optional) Display one of the following hierarchies in a configuration. (Each <b><i>statement-path</i></b> option has additional suboptions not described here. See the appropriate feature guide or EX Series switch documentation for more information.)</p> <ul style="list-style-type: none"> <li>• <b>access</b>—Network access configuration.</li> <li>• <b>access-profile</b>—Access profile configuration.</li> <li>• <b>accounting-options</b>—Accounting data configuration.</li> <li>• <b>applications</b>—Applications defined by protocol characteristics.</li> <li>• <b>apply-groups</b>—Groups from which configuration data is inherited.</li> <li>• <b>chassis</b>—Chassis configuration.</li> <li>• <b>chassis network-services</b>—Current running mode.</li> <li>• <b>class-of-service</b>—Class-of-service configuration.</li> <li>• <b>diameter</b>—Diameter base protocol layer configuration.</li> <li>• <b>ethernet-switching-options</b>—(EX Series switch only) Ethernet switching configuration.</li> <li>• <b>event-options</b>—Event processing configuration.</li> <li>• <b>firewall</b>—Firewall configuration.</li> <li>• <b>forwarding-options</b>—Options that control packet sampling.</li> <li>• <b>groups</b>—Configuration groups.</li> <li>• <b>interfaces</b>—Interface configuration.</li> <li>• <b>jsrc</b>—JSRC partition configuration.</li> <li>• <b>jsrc-partition</b>—JSRC partition configuration.</li> <li>• <b>logical-systems</b>—Logical system configuration.</li> <li>• <b>poe</b>—(EX Series switch only) Power over Ethernet configuration.</li> <li>• <b>policy-options</b>—Routing policy option configuration.</li> <li>• <b>protocols</b>—Routing protocol configuration.</li> </ul>

- **routing-instances**—Routing instance configuration.
- **routing-options**—Protocol-independent routing option configuration.
- **security**—Security configuration.
- **services**—Service PIC applications configuration.
- **snmp**—Simple Network Management Protocol configuration.
- **system**—System parameters configuration.
- **virtual-chassis**—(EX Series switch only) Virtual Chassis configuration.
- **vlan**—(EX Series switch only) VLAN configuration.

<b>Additional Information</b>	The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text <b>ACCESS-DENIED</b> is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the <b>secret</b> permission bit is not set for your user account, the text <b>SECRET-DATA</b> is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

## show | display inheritance

**Syntax** show | display inheritance <brief | defaults | no-comments | terse>

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Show the inherited configuration data and information about the source group from which the configuration has been inherited. Show interface ranges configuration data in expanded format and information about the source interface-range from which the configuration has been expanded

```
user@host# show system ports | display inheritance defaults
## 'console' was inherited from group 'junos-defaults'
## 'vt100' was inherited from group 'junos-defaults'
## console type vt100;
```

```
user@host# show system login class readonly | display inheritance
## 'interface' was inherited from group global'
## 'network' was inherited from group global'
## 'routing' was inherited from group global'
## 'system' was inherited from group global'
## 'trace' was inherited from group global'
## 'view' was inherited from group global'
##
permissions [ interface network routing system trace view ];
```

```
user@host# show system login class readonly | display inheritance no-comments
permissions [ interface network routing system trace view ];
```

- Options**
- **brief**—Display brief output for the command.
  - **defaults**—Display the Junos OS defaults that have been applied to the configuration.
  - **no-comments**—Display configuration information without inline comments marked with ##.
  - **terse**—Display terse output with inheritance details as inline comment.

**Required Privilege Level** view

## show | display set

---

**Syntax**    show | display set

**Release Information**    Command introduced before Junos OS Release 7.4.

**Description**    Display the configuration as a series of configuration mode commands required to re-create the configuration from the top level of the hierarchy as **set** commands

```
user@host# show | display set
set interfaces fe-0/0/0 unit 0 family inet address 192.168.1.230/24
set interfaces fe-0/0/0 unit 0 family iso
set interfaces fe-0/0/0 unit 0 family mpls
set interfaces fe-0/0/0 unit 1 family inet address 10.0.0.1/8
deactivate interfaces fe-0/0/0 unit 1
```

## show groups junos-defaults

---

**Syntax**    show groups junos-defaults

**Release Information**    Command introduced before Junos OS Release 7.4.

**Description**    Display the full set of available preset statements from the Junos OS defaults group.

```
user@host# show groups junos-defaults
groups {
  junos-defaults {
    applications {
      # File Transfer Protocol
      application junos-ftp {
        application-protocol ftp;
        protocol tcp;
        destination-port 21;
      }
      # Trivial File Transfer Protocol
      application junos-tftp {
        application-protocol tftp;
        protocol udp;
        destination-port 69;
      }
      # RPC port mapper on TCP
      application junos-rpc-portmap-tcp {
        application-protocol rpc-portmap;
        protocol tcp;
        destination-port 111;
      }
      # RPC port mapper on UDP
    }
  }
}
```

## show system commit

<b>Syntax</b>	show system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the pending commit operation (if any) and the commit history.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>clear system commit</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system commit on page 568</a> <a href="#">show system commit (At a Particular Time) on page 568</a> <a href="#">show system commit (At the Next Reboot) on page 568</a> <a href="#">show system commit (Rollback Pending) on page 568</a> <a href="#">show system commit (QFX Series) on page 568</a>
<b>Output Fields</b>	Table 55 on page 567 describes the output fields for the <b>show system commit</b> command. Output fields are listed in the approximate order in which they appear.

**Table 55: show system commit Output Fields**

Field Name	Field Description
<b>Commit history</b>	Displays the last 50 commit operations listed, most recent to first. The identifier <b>rescue</b> designates a configuration created for recovery using the <b>request system configuration rescue save</b> command.
<b>Timestamp</b>	Date and time of the commit operation.
<b>Username</b>	User who executed the commit operation.
<b>Commit method</b>	Method used to execute the commit operation: <ul style="list-style-type: none"> <li>• <b>cli</b>—CLI interactive user performed the commit operation.</li> <li>• <b>Junos XML protocol</b>—Junos XML protocol client performed the commit operation.</li> <li>• <b>synchronize</b>—The <b>commit synchronize</b> command was performed on the other Routing Engine.</li> <li>• <b>snmp</b>—An SNMP <b>set</b> request caused the commit operation.</li> <li>• <b>button</b>—A button on the router or switch was pressed to commit a rescue configuration for recovery.</li> <li>• <b>autoinstall</b>—A configuration obtained through autoinstallation was committed.</li> <li>• <b>other</b>—A method other than those identified was used to perform the commit operation.</li> </ul>

## Sample Output

### show system commit

```
user@host> show system commit
0   2003-07-28 19:14:04 PDT by root via other
1   2003-07-25 22:01:36 PDT by user via cli
2   2003-07-25 22:01:32 PDT by user via cli
3   2003-07-25 21:30:13 PDT by root via button
4   2003-07-25 13:46:48 PDT by user via cli

```

# Troubleshooting

- [Troubleshooting Procedures on page 569](#)

## Troubleshooting Procedures

---

- [Returning to the Most Recently Committed Junos Configuration on page 569](#)
- [Returning to a Previously Committed Junos OS Configuration on page 569](#)
- [Creating and Returning to a Rescue Configuration on page 574](#)
- [Rolling Back Junos OS Configuration Changes on page 575](#)

### Returning to the Most Recently Committed Junos Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback

load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

#### Related Documentation

- [Rolling Back Junos OS Configuration Changes on page 575](#)
- [Returning to a Previously Committed Junos OS Configuration on page 569](#)
- [Understanding How the Junos Configuration Is Stored on page 354](#)

### Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- [Returning to a Configuration Prior to the One Most Recently Committed on page 570](#)
- [Displaying Previous Configurations on page 570](#)

- [Comparing Configuration Changes with a Prior Version on page 571](#)
- [Creating and Returning to a Rescue Configuration on page 573](#)
- [Saving a Configuration to a File on page 573](#)

---

### Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

---

### Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

```

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```

[edit]
user@host# show | compare (filename| rollback n)

```

**filename** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

**n** is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (**/config/juniper.conf**).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 60;
  advertise-inactive;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  peer-as 33333;
  allow 2.2.2.2/32;
}
group test-peers {
  type external;
  allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
- hold-time 60;
+ hold-time 90;
- advertise-inactive;
[edit protocols bgp group fred]
+ advertise-inactive;
[edit protocols bgp]
- group test-peers {
  - type external;
  - allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 90;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  advertise-inactive;
  peer-as 33333;
```

```
allow 2.2.2.2/32;
}
```

### Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the rollback command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see [CLI Explorer](#).

### Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
  ospf {
    traffic-engineering;
    reference-bandwidth 4g;
    ...
  }
}
```

## Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

2. Show the current configuration (if any) for SNMP:

```
[edit]
user@host# show snmp
```

No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

```
[edit]
user@host# set snmp health-monitor
```

4. Show the new configuration:

```
[edit]
user@host# show snmp
health-monitor;
```

The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

```
[edit]
user@host# rollback
load complete
```

6. Show the configuration again to make sure your change is no longer present:

```
[edit]
user@host# show snmp
```

No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

```
[edit]
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

### J-Web Overview

The J-Web interface allows you to monitor, configure, troubleshoot, and manage the routing platform by means of a Web browser enabled with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS). J-Web provides access to all the configuration statements supported by the routing platform, so you can fully configure it without using the Junos OS CLI.

You can perform the following tasks with the J-Web interface:

- **Monitoring**—Display the current configuration and information about the system, interfaces, chassis, routing protocols, routing tables, routing policy filters, and other features.
- **Configuring**—View the current configurations at a glance, configure the routing platform, and manage configuration files. The J-Web interface provides the following different configuration methods:
  - Configure the routing platform quickly and easily without configuring each statement individually.
  - Edit a graphical version of the Junos OS CLI configuration statements and hierarchy.

- Edit the configuration in a text file.
- Upload a configuration file.

The J-Web interface also allows you to manage configuration history and set a rescue configuration.

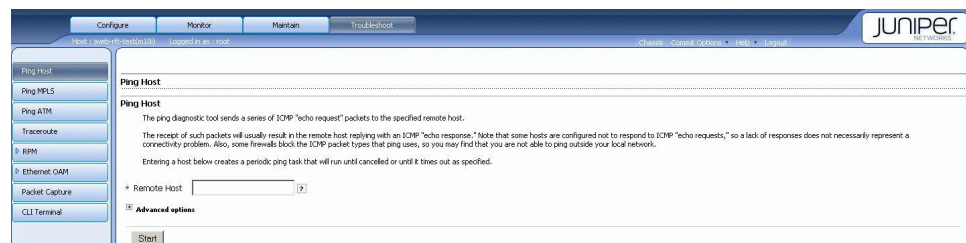

- Troubleshooting—Troubleshoot routing problems by running the ping or traceroute diagnostic tool. The diagnostic tools also allow you to capture and analyze routing platform control traffic.
- Maintaining—Manage log, temporary, and core (crash) files and schedule reboots on the routing platforms. On J Series routers, you can also manage software packages and licenses and copy a snapshot of the system software to a backup device.
- Configuring and monitoring events—Filter and view system log messages that record events occurring on the router. You can configure files to log system log messages and also assign attributes, such as severity levels, to messages.
- Configuring and monitoring alarms—On J Series routers only, monitor and diagnose the router by monitoring active alarms that alert you to the conditions on a network interface. You can also set the conditions that trigger alarms on an interface.

## J-Web Layout

Each page of the J-Web interface is divided into the following panes, as shown in [Figure 22 on page 580](#).

- Top pane—Displays identifying information and links.
- Main pane—Location where you monitor, configure, troubleshoot, and manage the routing platform by entering information in text boxes, making selections, and clicking buttons.
- Side pane—Displays subtasks of the Configure, Monitor, Maintain, or Troubleshoot task currently displayed in the main pane. For the configuration editor, this pane displays the hierarchy of configuration statements committed on the router. Click an item to access it in the main pane.

**Figure 22: J-Web Layout**

## Top Pane Elements

The top pane comprises the elements shown in [Figure 23 on page 581](#).

Figure 23: Top Pane Elements

- *hostname – model*—Hostname and model of the routing platform.
- Logged in as: *username*—Username you used to log in to the routing platform.
- Commit Options
  - Commit—Commits the candidate configuration. Changes made by other users as well as changes made in other J-Web sessions will be committed.
  - Compare—Displays the differences between the committed and uncommitted configuration on the device.
  - Discard—Discards the candidate configuration. Changes made by other users as well as changes made in other J-Web sessions will be discarded.
  - Preference—Enables you to select preferences for committing configuration. **Commit Check** only validates the configuration and reports errors. **Commit** validates and commits the configuration specified on every J-Web page.
- Help
  - Help Contents—Link to context-sensitive help information.
  - About—Link to information about the J-Web interface, such as the version number.
- Logout—Ends your current login session with the routing platform and returns you to the login page.
- Taskbar—Menu of J-Web tasks. Click a J-Web task to access it.
  - **Configure**—Configure the routing platform by using Configuration pages or the configuration editor, and view configuration history.
  - **Monitor**—View information about configuration and hardware on the routing platform.
  - **Maintain**—Manage files and licenses, upgrade software, and reboot the routing platform.
  - **Troubleshoot**—Troubleshoot network connectivity problems.

## Main Pane Elements

The main pane comprises the elements shown in [Figure 24 on page 582](#).

Figure 24: Main Pane Elements

The screenshot shows the 'Configure' window for 'SNMP'. The 'Traps' section is active. It features a 'Trap Group Name' input field with a red asterisk indicating it is required. Below this is a 'Categories' section with a list of checkboxes: Authentication, Chassis, Configuration, Link, Remote operations, RMON alarm, Routing, Startup, and VRRP events. A 'Targets' section contains a list box and an 'Add' button. A help tooltip is displayed over a question mark icon, providing information about the 'Targets' field: 'Targets: The value should be: A host name or IP Address'. At the bottom of the window are 'OK' and 'Cancel' buttons.

- Help (?) icon—Displays useful information when you move the cursor over the question mark. This help displays field-specific information, such as the definition, format, and valid range of the field.
- Red asterisk (\*)—Indicates a required field.
- Icon Legend— For the Edit Configuration subtask (J-Web configuration editor) only, explains icons that appear in the user interface to provide information about configuration statements:
  - C—Comment. Move your cursor over the icon to view a comment about the configuration statement.
  - I—Inactive. The configuration statement does not affect the routing platform.
  - M—Modified. The configuration statement is added or modified.
  - \*—Mandatory. The configuration statement must have a value.

## Side Pane Elements

The side pane comprises the elements shown in [Figure 25 on page 583](#).

Figure 25: Side Pane Elements

- Subtask—Displays options related to the selected task in the J-Web taskbar.
- Configuration hierarchy—For the J-Web configuration editor, displays the hierarchy of committed statements in the routing platform configuration.
  - Click **Expand all** to display the entire hierarchy.
  - Click **Hide all** to display only the statements at the top level.
  - Click plus signs (+) to expand individual items.
  - Click minus signs (–) to hide individual items.

## Navigating the J-Web Interface

The layout of the panes allows you to quickly navigate through the interface. You navigate the J-Web interface, move forward and backward, scroll pages, and expand and collapse elements as you do in a typical Web browser interface.

From the taskbar, select the J-Web task that you want to perform. Selecting the task displays related subtasks in the side pane. When you select a subtask, related fields are displayed in the main pane. By default, the system selects the first subtask and displays its related fields in the main pane. The side pane and taskbar are available from all pages, allowing you to skip from one task or subtask to the other from any page in the interface.

You can easily navigate to most subtasks by selecting them from the side pane. On pages where you are required to take an action, buttons and links allow you to move to the next or previous page as you perform certain actions. For more information, see [“Navigating the J-Web Configuration Editor” on page 584](#).

## Navigating the J-Web Configuration Editor

When you select **Configure>CLI Tools>Point and Click CLI** (J-Web configuration editor), the side pane displays the top level of the configured hierarchy committed on the routing platform. The main pane displays the configuration hierarchy options.

You can click a statement or identifier displayed in the main pane, or in the hierarchy in the left pane, to display the corresponding configuration options in the main pane. For more information, see [“Point and Click CLI \(J-Web Configuration Editor\)” on page 595](#).

After typing or selecting your configuration edits, click a button in the main pane (described in [Table 56 on page 584](#)) to move to the previous page after applying or committing the configuration. An updated configuration does not take effect until you commit it.

**Table 56: Key J-Web Edit Configuration Buttons**

Function	Button
Apply edits to the candidate configuration, and return one level up (previous page) in the configuration hierarchy.	<b>OK</b>
Clear the entries you have not yet applied to the candidate configuration, and return one level up (previous page) in the configuration hierarchy.	<b>Cancel</b>
Verify edits and apply them to the current configuration file running on the routing platform. For more details, see <a href="#">“Committing a Configuration” on page 607</a> .	<b>Commit</b>
Discard changes or delete configuration.	<b>Discard</b>

## Getting J-Web Help

The J-Web interface provides two ways to display Help for the Monitor, Configure Troubleshoot, and Maintain tasks.

To get Help in the J-Web interface:

- **Field-sensitive Help**—Move the cursor over the question mark (?) next to the field for which you want more information. The system displays useful information about the field. Typically, this Help includes one line of information about what this field does or what you must enter in a given text box. For example, Help for the Peer Autonomous System Number field states, “the value should be a number between 1 and 65535.”
- **Context-sensitive Help**—Click **Help** in the taskbar to open a separate page displaying the summary of all the fields on that page. To exit Help, close the page. You can navigate Help pages using hypertext links connecting related topics, or click the following options (if available) at the top and bottom of each page. [Figure 26 on page 585](#) shows Help for the CoS Configuration page.
  - **Prev**—Access the previous page.
  - **Next**—Access the next page.
  - **Report an Error**—Access a form for providing feedback.

Figure 26: CoS Help Page

## Installation and Setup

- [J-Web Software Requirements on page 585](#)
- [Installing the J-Web Software on page 585](#)
- [Starting the J-Web Interface on page 586](#)
- [Configuring Basic Settings on page 588](#)

### J-Web Software Requirements

To access the J-Web interface for all platforms, your management device requires the following software:

- Supported browsers— Microsoft Internet Explorer version 7.0 or Mozilla Firefox version 3.0
- Language support— English—version browsers
- Supported OS— Microsoft Windows XP Service Pack 3

Other browser versions might not provide access to the J-Web interface.

### Installing the J-Web Software

Your routing platform comes with the Junos OS installed on it. When you power on the routing platform, all software starts automatically. On J Series routers, the J-Web software is part of the Junos OS available by default. However, on M Series and T Series routers, you need to install the J-Web software because it is not shipped on the routing platform.

If your routing platform is not shipped with the J-Web software on it, you must download the J-Web software package from the Juniper Networks webpage and install it on your routing platform. After the installation, you must enable Web management of the routing platform with the CLI.

**NOTE:** M Series or T Series routers must be running Junos OS version 7.3 or later to support the J-Web interface.

To install and enable the J-Web software:

1. Using a Web browser, navigate to the Juniper Networks Customer Support Center at <https://www.juniper.net/customers/csc/software/>.
2. Log in to the Juniper Networks authentication system with the username (generally your e-mail address) and password supplied by Juniper Networks representatives.
3. Download the J-Web software to your local host. Select the version that is the same as the Junos OS version running on the routing platform.
4. Copy the software package to the routing platform. We recommend that you copy it to the `/var/tmp` directory.
5. If you have previously installed the J-Web software on the routing platform, you must delete it before installing the new version. To do so, from operational mode in the CLI, enter the following command:

```
user@host> request system software delete jweb
```

6. Install the new package on the routing platform. From operational mode in the CLI, enter the following command:

```
user@host> request system software add path/filename
```

Replace **path** with the full pathname to the J-Web software package. Replace **filename** with the filename of the J-Web software package.

7. Enable Web management of the routing platform. From configuration mode in the CLI, enter the following command:

```
user@host# system services web-management http
```

## Starting the J-Web Interface

Before you start the user interface, you must perform the initial routing platform configuration described in the routing platform hardware guide. After the initial configuration, you use your username and password and the hostname or IP address of the router to start the user interface.

To start the J-Web interface:

1. Launch a Web browser that has Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled.

The HTTPS protocol, which uses 128-bit encryption, is available only in domestic versions of the Junos OS. To use HTTPS, you must have installed a certificate on the routing platform and enabled HTTPS.

**NOTE:** If the routing platform is running the worldwide version of the Junos OS and you are using the Microsoft Internet Explorer Web browser, you must disable the Use SSL 3.0 option in the Web browser to access the routing platform.

2. After **http://** or **https://** in your Web browser, type the hostname or IP address of the routing platform, and press Enter.

The J-Web login page appears.

3. On the login page, type your username and password, and click **Log In**.

To correct or change the username or password you typed, click **Reset**, type the new entry or entries, and click **Log In**.

**NOTE:** The default username is **root** with no password. You must change this during initial configuration or the system does not accept the configuration.

The J-Web **Initial Configuration Set Up** page appears.

To explicitly terminate a J-Web session at any time, click **Logout** in the top pane.

## Configuring Basic Settings

Before you begin initial configuration, complete the following tasks:

- Install the routing platform in its permanent location, as described in the hardware installation guide or the Getting Started Guide for your routing platform.
- Gather the following information:
  - Hostname for the router on the network
  - Domain that the router belongs to on the network
  - Password for the root user
  - Time zone where the router is located
  - IP address of a Network Time Protocol (NTP) server (if NTP is used to set the time on the router)
  - IP address of a Domain Name System (DNS) server
  - List of domains that can be appended to hostnames for DNS resolution
  - IP address of the default gateway
  - IP address to be used for the loopback interface
  - IP address of the built-in Ethernet interface that you will use for management purposes
- Collect the following equipment:
  - A management device, such as a laptop, with an Ethernet port
  - An Ethernet cable

To configure basic settings with J-Web Initial Configuration:

1. Enter information into the Initial Configuration Set Up page (see [Figure 27 on page 589](#)), as described in [Table 57 on page 589](#).
2. Click **Apply** to apply the configuration.

Management Access

The following access methods are considered insecure as any information sent over them will be sent without encryption and could possibly be intercepted during transmission.

Allow Telnet Access

☒

Allow JUNOScript over Clear-Text Access

☐

The following access method is considered secure as any information sent over it will be encrypted before transmission.

Allow SSH Access

☒

In order to enable HTTPS or JUNOScript over SSL, you will need to visit the SSL configuration page to configure certificates and associations.

Apply

**NOTE:** For J Series routers only, after initial configuration is complete, the routing platform stops functioning as a Dynamic Host Configuration Protocol (DHCP) server. If you change the IP address of the management interface and have the management device configured to use DHCP, you lose your DHCP lease and your connection to the routing platform through the J-Web interface. To reestablish a connection, either set the IP address on the management device manually, or connect the management interface to the management network and access the routing platform another way—for example, through the console port.

Table 57: Initial Configuration Set Up Summary

Field	Function	Your Action
Identification		
Host Name (required)	Defines the hostname of the router.	Type the hostname.
Domain Name	Defines the network or subnetwork that the machine belongs to.	Type the domain name.
Root Password (required)	Sets the root password that the user “root” can use to log in to the router.	Type a plain-text password that the system encrypts.  <b>NOTE:</b> After a root password has been defined, it is required when you log in to the J-Web user interface or the CLI.

Table 57: Initial Configuration Set Up Summary (*continued*)

Field	Function	Your Action
Verify Root Password (required)	Verifies that the root password has been typed correctly.	Retype the password.
<b>Time</b>		
Time Zone	Identifies the time zone that the router is located in.	From the list, select the appropriate time zone.
NTP Servers	Specify an NTP server that the router can reach to synchronize the system time.	<p>To add an IP address, type it in the box to the left of the Add button, then click <b>Add</b>.</p> <p>To delete an IP address, click it in the box above the Add button, then click <b>Delete</b>.</p>
Current System Time	Synchronizes the system time with the NTP server, or manually sets the system time and date.	<ul style="list-style-type: none"> <li>To immediately set the time using the NTP server, click <b>Set Time via NTP</b>. The router sends a request to the NTP server and synchronizes the system time.</li> </ul> <p><b>NOTE:</b> If you are configuring other settings on this page, the router also synchronizes the system time using the NTP server when you click <b>Apply</b>.</p> <ul style="list-style-type: none"> <li>To set the time manually, click <b>Set Time Manually</b>. A pop-up window allows you to select the current date and time from lists.</li> </ul>
<b>Network</b>		
DNS Name Servers	Specify a DNS server that the router can use to resolve hostnames into addresses.	<p>To add an IP address, type it in the box to the left of the Add button, then click <b>Add</b>.</p> <p>To delete an IP address, click it in the box above the Add button, then click <b>Delete</b>.</p>
Domain Search	Adds each domain name that the router is included in to the configuration so that they are included in a DNS search.	<p>To add a domain name, type it in the box to the left of the Add button, then click <b>Add</b>.</p> <p>To delete a domain name, click it in the box above the Add button, then click <b>Delete</b>.</p>
Default Gateway	Defines a default gateway through which to direct packets addressed to networks not explicitly listed in the routing table.	Type a 32-bit IP address, in dotted decimal notation.
Loopback Address	Defines a reserved IP address that is always available on the router. If no address is entered, this address is set to 127.0.0.1/32.	Type a 32-bit IP address and prefix length, in dotted decimal notation.

Table 57: Initial Configuration Set Up Summary (*continued*)

Field	Function	Your Action
<b>fe-0/0/0</b> Address (on J2300, J4300, and J6300 routers)	Defines the IP address and prefix length of the management interface. The management interface is used for accessing the router. The DHCP client sets this address to <b>192.168.1.1/24</b> if no DHCP server is found.	Type a 32-bit IP address and prefix length, in dotted decimal notation.
<b>ge-0/0/0</b> Address (on J4350 and J6350 routers)		<b>NOTE:</b> You must enter the address for the management interface on the Quick Configuration Set Up page before you click <b>Apply</b> . If you do not manually configure this address, you will lose your connection to the J-Web interface when you click <b>Apply</b> .
<b>fxp0</b> Address (on M Series routers)		
<b>Management Access</b>		
Allow Telnet Access	Allows remote access to the router by using Telnet.	To enable Telnet access, select the check box.
Allow JUNOScript protocol over Clear-Text Access	Allows JUNOScript to access the router by using a protocol for sending unencrypted text over a TCP connection.	To enable JUNOScript access over clear text, select the check box.
Allow SSH Access	Allows remote access to the router by using SSH.	To enable SSH access, select the check box.

## Secure Web Access

- [Secure Web Access Overview on page 591](#)
- [Generating SSL Certificates on page 592](#)

### Secure Web Access Overview

A routing platform uses the Secure Sockets Layer (SSL) protocol to provide secure management of routing platforms through the Web interface. SSL uses public-private key technology that requires a paired private key and an authentication certificate for the SSL service. SSL encrypts communication between your routing platform and the Web browser with a session key negotiated by the SSL server certificate.

An SSL certificate includes identifying information such as a public key and a signature made by a certificate authority (CA). When you access the routing platform through HTTPS, an SSL handshake authenticates the server and the client and begins a secure session. If the information does not match or the certificate has expired, you are not able to access the routing platform through HTTPS.

Without SSL encryption, communication between your routing platform and the browser is sent in the open and can be intercepted. We recommend that you enable HTTPS access on your WAN interfaces.

On J Series routers, HTTP access is enabled by default on the built-in management interfaces. By default, HTTPS access is supported on any interface with an SSL server certificate.

## Generating SSL Certificates

To enable secure Web access, you must first generate a digital SSL certificate, and then enable HTTPS access on the routing platform.

To generate an SSL certificate:

1. Enter the following **openssl** command in your Secure Shell command-line interface. The **openssl** command generates a self-signed SSL certificate in the Privacy-Enhanced Mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

```
%openssl req -x509 -nodes -newkey rsa:1024 -keyout filename.pem -out filename.pem
```

Replace **filename** with the name of a file in which you want the SSL certificate to be written—for example, **new.pem**.

2. When prompted, type the appropriate information in the identification form. For example, type **US** for the country name.
3. Display the contents of the **new.pem** file.

```
cat new.pem
```

Copy the contents of this file for installing the SSL certificate.

Go on to [“Configuring Secure Web Access” on page 612](#) to install the SSL certificate and enable HTTPS.

## CHAPTER 13

# Configuration

- [Configuration Tools on page 593](#)
- [Configuration Tasks on page 603](#)

### Configuration Tools

---

- [Configuration Task Overview on page 593](#)
- [Point and Click CLI \(J-Web Configuration Editor\) on page 595](#)
- [CLI Viewer \(View Configuration Text\) on page 597](#)
- [CLI Editor \(Edit Configuration Text\) on page 599](#)
- [CLI Terminal Requirements on page 600](#)
- [Starting the CLI Terminal on page 600](#)
- [Using the CLI Terminal on page 601](#)

### Configuration Task Overview

The J-Web user interface provides different methods for configuring your routing platform with the Junos OS. Choose a configuration method appropriate to your needs and familiarity with the interface.

Use the J-Web user interface to configure the services supported on a routing platform, including system settings, routing protocols, interfaces, network management, and user access.

Alternatively, you can configure the routing platform services with the Junos OS command-line interface (CLI) from a console connection to the routing platform or a remote network connection. You can also access the CLI from the J-Web interface. For more information, see [“Using the CLI Terminal” on page 601](#). For complete information about using the CLI, see the *CLI User Guide*.

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible through the user interface immediately, but do not take effect on the routing platform until you *commit* the changes.

You can set your preference by selecting **Commit** or **Commit Check**. This preference is applicable across sessions and users. **Commit Check** only validates the configuration and

reports errors. **Commit** validates and commits the configuration specified on every J-Web page.

When you commit the configuration, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration when you commit the candidate configuration, all changes made by all the users take effect. If you are editing the configuration with the CLI, you can edit an *exclusive* or *private* candidate configuration. For more information, see the *CLI User Guide*.

When you commit a configuration, the routing platform saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0 (the current operational version), and the oldest saved configuration is version 49. You can roll back the configuration to any saved version.

**NOTE:** You must assign a root password before committing a configuration and can do so on the J-Web Set Up page.

To better understand the Junos OS configuration process, become familiar with the terms defined in [Table 58 on page 594](#).

**Table 58: Junos OS Configuration Terms**

Term	Definition
<b>candidate configuration</b>	A working copy of the configuration that can be edited without affecting the routing platform until it is committed.
<b>configuration group</b>	Group of configuration statements that can be inherited by the rest of the configuration.
<b>commit a configuration</b>	Have the candidate configuration checked for proper syntax, activated, and marked as the current configuration file running on the routing platform.
<b>configuration hierarchy</b>	Set of hierarchically organized configuration statements that make up the Junos <sup>®</sup> OS configuration on a routing platform. There are two types of statements: <i>container statements</i> , which contain other statements, and <i>leaf statements</i> , which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
<b>rescue configuration</b>	On J Series routers only, a configuration that recovers a routing platform from a configuration that denies management access. You set a current committed configuration through the J-Web interface or CLI for emergency use. To load and commit the rescue configuration, you press and release the <b>CONFIG</b> or <b>RESET CONFIG</b> button.
<b>roll back a configuration</b>	Return to a previously committed configuration.

## Point and Click CLI (J-Web Configuration Editor)

Using Point and Click CLI, you can configure all properties of the Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

The configuration is stored as a hierarchy of statements. You create the specific hierarchy of configuration statements that you want to use. After you finish entering the configuration statements, you commit them to activate the configuration on the routing platform.

You can create the hierarchy interactively, or you can create an ASCII text file that is loaded onto the routing platform and then committed. Edit Configuration (J-Web configuration editor) allows you to create the hierarchy interactively, and Edit Configuration Text allows you to create and commit statements as an ASCII text file.

To access Edit Configuration, also called the J-Web configuration editor, select **Configure>CLI Tools>Point and Click**. This page allows you to configure all routing platform services that you can configure from the Junos OS CLI. Each field in the J-Web configuration editor has the same name as the corresponding configuration statement at the same hierarchy level in the CLI. For example, the Policy Options field corresponds to the **policy-options** statement in the CLI. As a result, you can easily switch from one interface to the other or follow a CLI configuration example using the J-Web configuration editor.

Table 59 on page 595 lists key J-Web configuration editor tasks and their functions.

**Table 59: J-Web Configuration Editor Tasks Summary**

J-Web Configuration Editor Task	Function
<b>Access</b>	Configure network access. For example, you can configure the Point-to-Point Protocol (PPP), the tracing access processes, the Layer 2 Tunneling Protocol (L2TP), RADIUS authentication for L2TP, and Internet Key Exchange (IKE) access profiles.
<b>Accounting options</b>	Configure accounting profiles. An accounting profile represents common characteristics of collected accounting data, including collection interval, accounting data files, and counter names on which to collect statistics. On the Accounting options pages, you can configure multiple accounting profiles, such as the interface, filter, MIB, routing engine, and class usage profiles.
<b>Applications</b>	Define applications by protocol characteristics and group the applications you have defined into a set. On the Applications pages, you can configure application properties, such as Internet Control Message Protocol (ICMP) code and type. You can also specify application protocols—also known as application-level gateways (ALGs)—to be included in an application set for service processing, or specify network protocols to match in an application definition.
<b>Chassis</b>	Configure routing platform chassis properties. On the Chassis pages, you can configure different properties of the routing platform chassis, including conditions that activate the red and yellow alarm LEDs on the routing platforms and SONET/SDH framing and concatenation properties for individual Physical Interface Cards (PICs).

Table 59: J-Web Configuration Editor Tasks Summary (*continued*)

J-Web Configuration Editor Task	Function
<b>Class of service</b>	Define class-of-service (CoS) components, such as CoS value aliases, classifiers, forwarding classes, rewrite rules, schedulers, and virtual channel groups. The Class of service pages also allow you to assign CoS components to interfaces. For more information, see the <i>Class of Service Library for Security Devices</i> .
<b>Diameter</b>	Configure Diameter base protocol. For example, you can specify the remote peers, the endpoint origin attributes, and network elements that associate routes with peers. .
<b>Event options</b>	Configure event policies. An event policy is an if-then-else construct that defines actions to be executed by the software on receipt of a system log message. For each policy, you can configure multiple actions, as follows—ignore the event, upload a file to a specified destination, execute Junos OS operational mode commands, or execute Junos OS event scripts (op scripts). For more information, see the <i>Junos OS Configuration and Operations Automation Library</i> .
<b>Firewall</b>	Configure stateless firewall filters. With stateless firewall filters—also known as ACLs—you can control packets transiting the routing platform to a network destination and packets destined for and sent by the routing platform. On the Firewall pages, you can create filters and add terms to them. For each term, you can set the match conditions and associate actions to be performed on packets matching these conditions.
<b>Forwarding options</b>	<p>Configure traffic forwarding and traffic sampling options. You can sample IP traffic based on particular input interfaces and various fields in the packet header. You can also use traffic sampling to monitor any combination of specific logical interfaces, specific protocols on one or more interfaces, a range of addresses on a logical interface, or individual IP addresses.</p> <p>Traffic forwarding policies allow you to control the per-flow load balancing, port mirroring, and Domain Name System (DNS) or Trivial File Transfer Protocol (TFTP) forwarding.</p>
<b>Interfaces</b>	Configure physical and logical interface properties. For the physical interface on the routing platform, you can modify default values for general interface properties, such as the interface's maximum transmission unit (MTU) size, link operational mode, and clock source. For each logical interface, you can specify the protocol family and other logical interface properties. For more information, see the <i>Junos OS Interfaces Library for Security Devices</i> .
<b>Jsrc</b>	Configure Jsrc. For example, you can configure the JSRC partition, associate a Diameter instance, SAE hostname, and the SAE realm with the partition.
<b>Policy options</b>	Configure policies by specifying match conditions and associating actions with the conditions. On the Policy options page, you can create a named community and define autonomous system (AS) paths, damping parameters, and routing policies. You can also create a named prefix list and include it in a routing policy.
<b>Protocols</b>	Configure routing protocols such as Border Gateway Protocol (BGP), Distance Vector Multicast Routing Protocol (DVMRP), Intermediate System-to-Intermediate System (IS-IS), Multiprotocol Label Switching (MPLS), Open Shortest Path First (OSPF), Resource Reservation Protocol (RSVP) and Routing Information Protocol (RIP). For more information, see the <i>Junos OS Routing Protocols Library for Security Devices</i> and the <i>MPLS Feature Guide for Security Devices</i> .
<b>Routing instances</b>	Configure routing instances. A routing instance is a collection of routing tables, interfaces, and routing protocol parameters. On the Routing instances pages, you can configure the following types of routing instances: forwarding, Layer 2 virtual private network (VPN), nonforwarding, VPN routing and forwarding (VRF), virtual router, and virtual private LAN service (VPLS). For more information, see the <i>Junos OS Routing Protocols Library for Security Devices</i> .

Table 59: J-Web Configuration Editor Tasks Summary (*continued*)

J-Web Configuration Editor Task	Function
<b>Routing options</b>	<p>Configure protocol-independent routing options that affect systemwide routing operations. On the Routing options pages, you can perform the following tasks:</p> <ul style="list-style-type: none"> <li>• Add routing table entries, including static routes, aggregated (coalesced) routes, generated routes (routes of last resort), and martian routes (routes to ignore).</li> <li>• Create additional routing tables and routing table groups.</li> <li>• Set the AS number of the routing platform for use by BGP.</li> <li>• Set the router ID, which is used by BGP and OSPF to identify the routing platform from which a packet originated.</li> <li>• Define BGP confederation members for use by BGP.</li> <li>• Configure how much system logging information to log for the routing protocol process.</li> <li>• Configure systemwide tracing (debugging) to track standard and unusual routing operations and record this information in a log file.</li> </ul> <p>For more information, see the <i>Junos OS Routing Protocols Library for Security Devices</i>.</p>
<b>Security</b>	<p>Configure Internet Protocol Security (IPsec) for authentication of origin, data integrity, confidentiality, replay protection, and nonrepudiation of source. In addition to IPsec, you can configure the Internet Key Exchange (IKE), which defines mechanisms for key generation and exchange, and manages security associations (SAs). You can also configure the SSH known host list, and the trace options for IPsec key management. For more information, see the <i>Junos OS VPN Library for Security Devices</i>.</p>
<b>Services</b>	<p>Configure application settings for services interfaces, such as dynamic flow capture parameters, the intrusion detection service (IDS), IPsec VPN service, RPM, stateful firewalls, and Network Address Translation (NAT).</p>
<b>Snmp</b>	<p>Configure SNMP to monitor network devices from a central location. You can specify an administrative contact and location and add a description for each system being managed by SNMP. You can also configure SNMP community strings, trap options, and interfaces on which SNMP requests can be accepted. For more information, see the <i>SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices</i>.</p>
<b>System</b>	<p>Configure system management functions, including the router's hostname, address, and domain name; the addresses of Domain Name System (DNS) servers; user login accounts, including user authentication and the root-level user account; time zones and Network Time Protocol (NTP) properties; and properties of the router's auxiliary and console ports.</p>

### CLI Viewer (View Configuration Text)

To view the entire configuration in text format, select **Configure>CLI Tools>CLI Viewer**. The main pane displays the configuration in text format (see [Figure 28 on page 598](#)). The displayed configuration is the same as the configuration displayed when you enter the Junos OS CLI command **show configuration**.

**Figure 28: View Configuration Text Page****CLI Viewer**

The CLI Viewer page shows the current configuration running on the device.

The current configuration running on the device is

```
## Last commit: 2010-01-11 03:52:56 PST by user.
version 10.1B3.4;
groups {
  re0 {
    system {
      host-name tp5;
      backup-router 192.168.71.254 destination 0.0.0.0/0;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 192.168.70.147/21;
          }
        }
      }
    }
  }
  re1 {
    system {
      backup-router 192.168.71.254 destination 0.0.0.0/0;
    }
  }
  global {
    system {
      domain-name device12.example.com;
    }
  }
}
```

The configuration statements appear in a fixed order, irrespective of the order in which you configured the routing platform. The top of the configuration displays a timestamp indicating when the configuration was last changed and the current version.

[Figure 28 on page 598](#) shows that the user committed the last configuration on 11 January 2010, and the software version running on the routing platform is Junos OS Release 10.1.

Each level in the hierarchy is indented to indicate each statement's relative position in the hierarchy. Each level is generally set off with braces, using an open brace ( { ) at the beginning of each hierarchy level and a closing brace ( } ) at the end. If the statement at a hierarchy level is empty, the braces are not displayed. Each leaf statement ends with a semicolon ( ; ), as does the last statement in the hierarchy.

This indented representation is used when the configuration is displayed or saved as an ASCII file. However, when you load an ASCII configuration file, the format of the file is not so strict. The braces and semicolons are required, but the indentation and use of new lines are not required in ASCII configuration files.

## CLI Editor (Edit Configuration Text)

Using View and Edit, you can configure all properties of the Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

The configuration is stored as a hierarchy of statements. You create the specific hierarchy of configuration statements that you want to use. After you finish entering the configuration statements, you commit them to activate the configuration on the routing platform.

You can create the hierarchy interactively, or you can create an ASCII text file that is loaded onto the routing platform and then committed. Edit Configuration (J-Web configuration editor) allows you to create the hierarchy interactively, and Edit Configuration Text allows you to create and commit statements as an ASCII text file.

To edit the entire configuration in text format, select **Configure>CLI Tools>CLI Editor**. The main pane displays the configuration in a text editor (see [Figure 29 on page 599](#)).

**Figure 29: Edit Configuration Text Page**

### CLIEditor

Edit the configuration. When you click "Commit", the edited configuration replaces the existing configuration and takes effect. If any errors occur when the configuration is loading or committed, they are displayed and the previous configuration is restored.

### Configuration:

```
## Last commit: 2010-01-11 03:52:56 PST by regress
version 10.1B3.4;
groups {
  re0 {
    system {
      host-name tp5;
      backup-router 192.168.71.254 destination 0.0.0.0/0;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 192.168.70.147/21;
          }
        }
      }
    }
  }
  re1 {
    system {
      backup-router 192.168.71.254 destination 0.0.0.0/0;
    }
  }
  global {
    system {
      domain-name englab.juniper.net;
    }
  }
}
```

For more information about the format of an ASCII configuration file, see [“CLI Viewer \(View Configuration Text\)” on page 597](#).

**CAUTION:** We recommend that you use this method to edit and commit the configuration only if you have experience editing configurations through the CLI.

To edit the entire configuration in text format:

1. Navigate to the hierarchy level you want to edit.
2. Edit the candidate configuration using standard text editor operations—insert lines (with the Enter key), delete lines, and modify, copy, and paste text.
3. Click **Commit** to load and commit the configuration.

The routing platform checks the configuration for the correct syntax before committing it.

When you edit the ASCII configuration file, you can add comments of one or more lines. Comments must precede the statement they are associated with. If you place the comments in other places in the file, such as on the same line after a statement or on a separate line following a statement, they are removed when you click Commit. Comments must begin and end with special characters. For more information, see the *CLI User Guide*.

## CLI Terminal Requirements

To access the CLI through the J-Web interface, your management device requires the following features:

- SSH access—Enable SSH on your system. SSH provides a secured method of logging in to the routing platform, to encrypt traffic so that it is not intercepted. If SSH is not enabled on the system, the CLI terminal page displays an error and provides a link to the Set Up Quick Configuration page that allows you to enable SSH. For more information, see “[Configuring Basic Settings](#)” on page 588.
- Java applet support—Make sure that your Web browser supports Java applets.
- JRE installed on the client—Install Java Runtime Environment (JRE) version 1.4 or later on your system. JRE is a software package that must be installed on a system to run Java applications. Download the latest JRE version from the Java Software website <http://www.java.com/>. Installing JRE installs Java plug-ins, which once installed, load automatically and transparently to render Java applets.

**NOTE:** The CLI terminal is supported on JRE version 1.4 and later only.

---

## Starting the CLI Terminal

To get started on the CLI terminal:

1. Make sure that your system meets the requirements mentioned in “[CLI Terminal Requirements](#)” on page 600.
2. In the J-Web interface, select **Troubleshoot > CLI Terminal**. A Java applet is downloaded into the J-Web interface allowing SSH access to the routing platform.
3. Log in to the CLI by typing your Junos OS password. This is the same password that you use to log in to the J-Web interface.

After you log in, a percentage sign (%) prompt appears to indicate that you are in the UNIX shell (see [Figure 30 on page 601](#)).

4. To start the CLI, type **cli**.

The presence of the angle bracket (>) prompt indicates that the CLI has started. By default, the prompt is preceded by a string that contains your username and the hostname of the routing platform. The angle bracket also indicates that you are in operational mode.

5. To enter configuration mode, type **configure**. The **[edit]** prompt indicates the current configuration mode.
6. Type **exit** or **quit** to return to the previous level of the configuration—for example, to return to operational mode from configuration mode.

For security purposes, each time you log out of the routing platform or leave the CLI terminal page, the CLI terminal session ends and you are required to reenter your password. When you select **Troubleshoot>CLI Terminal** again, retype your Junos OS password to access the CLI.

**Figure 30: Starting the CLI Terminal**

#### CLI Terminal

A Java applet will be loaded below that will provide an SSH connection between your browser and '10.209.8.129'. You will be asked to enter your password again as a security measure before the CLI console connection is made. If the connection cannot be made, there may be a firewall between your web client and the device blocking SSH traffic, or you may be using a web proxy server which will allow web traffic to the device, but will not forward SSH traffic.

```
root@betsy% cli
root@betsy> configure
Entering configuration mode

[edit]
root@betsy# exit
Exiting configuration mode

root@betsy> quit
root@betsy% █
```

## Using the CLI Terminal

The Junos OS CLI uses industry-standard tools and utilities to provide a set of commands for monitoring and configuring a routing platform. You type commands on a line and press Enter to execute them. The CLI provides command help, command completion, and Emacs-style keyboard sequences for moving around on the command line and scrolling through a buffer of recently executed commands.

The J-Web CLI terminal provides access to the Junos OS CLI through the J-Web interface. The functionality and behavior of the CLI available through the CLI terminal page is the same as the Junos OS CLI available through the routing platform console. The CLI terminal supports all CLI commands and other features such as CLI help and autocompletion. Using the CLI terminal page, you can fully configure, monitor, and manage your routing platform.

The commands in the CLI are organized hierarchically, with commands that perform a similar function grouped together under the same level. For example, all commands that display information about the routing platform system and system software are grouped under the **show** command, and all commands that display information about the routing table are grouped under the **show route** command. The hierarchical organization results in commands that have a regular syntax and provides the following features that simplify CLI use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software they are operating on. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command.
- Command completion—Command completion for command names (keywords) and command options is also available at each level of the hierarchy. In the CLI terminal, you can do one of the following for command completions:
  - Type a partial command name followed immediately by a question mark (with no intervening space) to see a list of commands that match the partial name you typed.
  - Press the Spacebar to complete a command or option that you have partially typed. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a prompt indicates that you have entered an ambiguous command, and the possible completions are displayed.

The Tab key option is currently not available on the CLI terminal.

The CLI has two modes:

- Operational mode—Complete set of commands to control the CLI environment, monitor and troubleshoot network connectivity, manage the routing platform, and enter configuration mode.
- Configuration mode—Complete set of commands to configure the routing platform.

For more information about the Junos OS CLI, see the *CLI User Guide*. For information about configuring and monitoring Junos OS features with the CLI, see <http://www.juniper.net/books>.

Figure 31 on page 603 shows the CLI terminal displaying all the options that you can configure in CLI configuration mode.

Figure 31: J-Web CLI Terminal

**CLI Terminal**

A Java applet will be loaded below that will provide an SSH connection between your browser and '10.209.8.129'. You will be asked to enter your password again as a security measure before the CLI console connection is made. If the connection cannot be made, there may be a firewall between your web client and the device blocking SSH traffic, or you may be using a web proxy server which will allow web traffic to the device, but will not forward SSH traffic.

```

root@betsy# set ?
Possible completions:
> access                Network access configuration
> access-profile        Access profile for this instance
> accounting-options    Accounting data configuration
> applications          Define applications by protocol characteristics

## Configuration Tasks

- [Editing and Committing a Junos OS Configuration on page 603](#)
- [J-Web Configuration Tasks on page 604](#)
- [Editing a Configuration on page 604](#)
- [Committing a Configuration on page 607](#)
- [Discarding Parts of a Candidate Configuration on page 607](#)
- [Accounting Options on page 608](#)

### Editing and Committing a Junos OS Configuration

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible through the user interface immediately, but do not take effect on the routing platform until you *commit* the changes.

When you commit the configuration, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration when you commit the candidate configuration, all changes made by all the users take effect. If you are editing the configuration with the CLI, you can edit an *exclusive* or *private* candidate configuration. For more information, see the *CLI User Guide*.

When you commit a configuration, the routing platform saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0 (the current operational version), and the oldest saved configuration is version 49. You can roll back the configuration to any saved version.

**NOTE:** You must assign a root password before committing a configuration and can do so on the [J-Web Set Up](#) page.

## J-Web Configuration Tasks

J-Web configuration pages offer you several different ways to configure your routing platform. Configuration pages provide access to all the configuration statements supported by the routing platform, so you can fully configure it without using the CLI. You can also manage the configuration, monitor user access, and set a rescue configuration.

[Table 60 on page 604](#) provides a summary of the J-Web configuration tasks.

**Table 60: J-Web Configuration Tasks Summary**

J-Web Configuration Task	Description	More Information
Edit the configuration using a clickable interface	Expand the entire configuration hierarchy in the side pane and click a configuration statement to view or edit. The main pane displays all the options for the statement, with a text box for each option.	<a href="#">“Point and Click CLI (J-Web Configuration Editor)” on page 595</a>
Edit the configuration in text format	Paste a complete configuration hierarchy into a scrollable text box, or edit individual lines in the configuration text.	<a href="#">“CLI Editor (Edit Configuration Text)” on page 599</a>
Upload a configuration file	Upload a complete configuration.	<a href="#">“Upload Configuration File” on page 647</a>
View the configuration in text format	View the entire configuration on the routing platform in text format.	<a href="#">“CLI Viewer (View Configuration Text)” on page 597</a>

## Editing a Configuration

To edit the configuration on a series of pages of clickable options that step you through the hierarchy, select **Configure>CLI Tools>Point and Click**. The side pane displays the top level of the configuration hierarchy, and the main pane displays configured hierarchy options and the Icon Legend (see [Figure 32 on page 605](#)).

Figure 32: Edit Configuration Page

Refresh Commit... Discard...

**Icon Legend**

- Comment**  
The configuration statement has been annotated with a comment. To display the comment, place the cursor over the statement icon.
- Inactive**  
The configuration statement is not active and does not affect the device.
- Modified**  
The configuration statement has been changed or added.
- Mandatory**  
The configuration statement must have a value.

To expand or hide the hierarchy of all the statements in the side pane, click **Expand all** or **Hide all**. To expand or hide an individual statement in the hierarchy, click the expand (+) or collapse (–) icon to the left of the statement.

**NOTE:** Only those statements included in the committed configuration are displayed in the side pane hierarchy.

The configuration information in the main pane consists of configuration options that correspond to configuration statements. Configuration options that contain subordinate statements are identified by the term *nested configuration*.

To include, edit, or delete statements in the candidate configuration, click one of the links described in [Table 61 on page 606](#) in the main pane. Then specify configuration information by typing into a field, selecting a value from a list, or clicking a check box (toggle).

Table 61: J-Web Edit Configuration Links

Link	Function
<b>Add new entry</b>	Displays fields and lists for a statement identifier, allowing you to add a new identifier to a statement.
<b>Configure</b>	Displays information for a configuration option that has not been configured, allowing you to include a statement.
<b>Delete</b>	Deletes the corresponding statement or identifier from the configuration. All subordinate statements and identifiers contained within a deleted statement are also discarded.
<b>Edit</b>	Displays information for a configuration option that has already been configured, allowing you to edit a statement.
<i>identifier</i>	Displays fields and lists for an existing statement identifier, allowing you to edit the identifier.

As you navigate through the configuration, the hierarchy level is displayed at the upper right of the main pane. You can click a statement or identifier in the hierarchy to return to the corresponding configuration options in the main pane.

The main pane includes icons that display information about statements and identifiers when you place your cursor over them. [Table 62 on page 606](#) describes the meaning of these icons.

Table 62: J-Web Edit Configuration Icons

Icon	Meaning
<b>C</b>	Displays a comment about a statement.
<b>I</b>	Indicates that a statement is inactive.
<b>M</b>	Indicates that a statement has been added or modified, but has not been committed.
<b>*</b>	Indicates that the statement or identifier is required in the configuration.
<b>?</b>	Provides help information.

**NOTE:** You can annotate statements with comments or make them inactive only through the CLI. For more information, see the *CLI User Guide*.

After typing or selecting your configuration edits, click a button in the main pane (described in [Table 63 on page 607](#)) to apply your changes or refresh the display, or discard parts of the candidate configuration. An updated configuration does not take effect until you commit it.

Table 63: J-Web Edit Configuration Buttons

Button	Function
<b>OK</b>	Applies edits to the candidate configuration, and returns you to the previous level in the configuration hierarchy.
<b>Cancel</b>	Clears the entries you have not yet applied to the candidate configuration, and returns you to the previous level in the configuration hierarchy.
<b>Refresh</b>	Updates the display with any changes to the configuration made by other users. .
<b>Commit</b>	Verifies edits and applies them to the current configuration file running on the routing platform. For details, see <a href="#">“Committing a Configuration” on page 607</a> .
<b>Discard</b>	Removes edits applied to, or deletes existing statements or identifiers from, the candidate configuration. For details, see <a href="#">“Discarding Parts of a Candidate Configuration” on page 607</a> .

## Committing a Configuration

When you finish making changes to a candidate configuration with the J-Web configuration editor, you must commit the changes to use them in the current operational software running on the routing platform.

If another user is editing an exclusive candidate configuration with the CLI, you cannot commit a configuration until the user has committed the configuration. To display a list of users, see [“Displaying Users Editing the Configuration” on page 644](#). For more information about editing an exclusive candidate configuration, see the *CLI User Guide*.

To commit a candidate configuration:

1. In the J-Web configuration editor, click **Commit**.

The main pane displays a summary of your changes in statement form.

2. To confirm the commit operation, click **OK**.

If multiple users are editing the configuration when you commit the candidate configuration, all changes made by all users take effect.

3. To display all the edits applied to the running configuration, click **Refresh**.

## Discarding Parts of a Candidate Configuration

Before committing a candidate configuration, you can discard changes you applied or delete existing statements or identifiers.

To discard parts of a candidate configuration:

1. Navigate to the level of the hierarchy you want to edit, and click **Discard**.

The main pane displays a list of target statements based on the hierarchy level and the changes you have made.

2. Select an option button to specify the appropriate discard operation or deletion. (Not all buttons appear in all situations.)
  - **Discard Changes Below This Point**—Discards changes made to the candidate configuration at the displayed hierarchy level and below. All subordinate statements and identifiers contained within a discarded statement are also discarded.
  - **Discard All Changes**—Discards all changes made to the candidate configuration.
  - **Delete Configuration Below This Point**—Deletes all changes and statements in the candidate configuration at the displayed hierarchy level and below. All subordinate statements and identifiers contained within a deleted statement are also deleted.
3. To confirm the discard operation or deletion, click **Discard**.

The updated candidate configuration does not take effect on the routing platform until you commit it.

## Accounting Options

[Figure 33 on page 609](#) shows the Accounting options configuration page. This page displays the different settings that you can configure at the accounting options hierarchy level.

On the Accounting options page, click any option to view and configure related options.

Figure 33: Accounting Options Configuration Editor Page

**Configuration**

```

## CHAPTER 14

# Administration

- [Session and User Management on page 611](#)
- [Secure Web Access on page 612](#)
- [Alarms on page 615](#)
- [Events on page 617](#)
- [Device Management on page 623](#)
- [Monitoring in J-Web on page 627](#)
- [Configuration and File Management on page 642](#)

### Session and User Management

---

- [Setting J-Web Session Limits on page 611](#)
- [Terminating J-Web Sessions on page 612](#)
- [Viewing Current Users on page 612](#)

#### Setting J-Web Session Limits

By default, an unlimited number of users can log in to the J-Web interface on a routing platform, and each session remains open for 24 hours (1440 minutes). Using CLI commands, you can limit the maximum number of simultaneous J-Web user sessions and set a default session timeout for all users.

- To limit the number of simultaneous J-Web user sessions, enter the following commands:

```
user@host# edit system services web-management session
user@host# set session-limit session-limit
```

Range: 1 through 1024. Default: Unlimited

- To change the J-Web session idle time limit, enter the following commands:

```
user@host# edit system services web-management session
user@host# set idle-timeout minutes
```

Range: 1 through 1440. Default: 1440

You can also configure the maximum number of simultaneous subordinate HTTP processes that the routing platform creates in response to user requests.

To configure the maximum number of subordinate httpd processes, enter the following commands:

```
user@host# edit system services web-management limits
```

```
user@host# active-child-process process-limit
```

The default is **5**, and the range is **0** through **32**.

## Terminating J-Web Sessions

To explicitly terminate a J-Web session at any time, click **Logout** in the top pane. You must log in again to begin a new session.

By default, if the routing platform does not detect any activity through the J-Web interface for 24 hours, the session times out and is terminated. For information about changing the idle time limit, see [“Setting J-Web Session Limits” on page 611](#).

## Viewing Current Users

To view a list of users logged in to the routing platform, select **Monitor>System View>System Information** in J-Web and scroll down to the Logged-in User Details section, or enter the **show system users** command in the CLI. The J-Web page and CLI output show all users logged in to the routing platform from either J-Web or the CLI.

## Secure Web Access

---

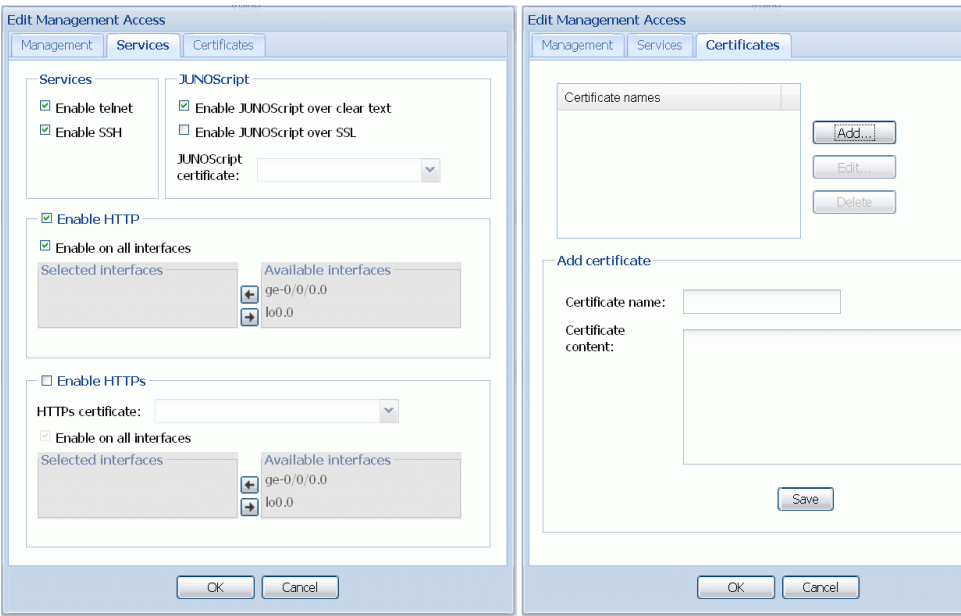

- [Configuring Secure Web Access on page 612](#)

## Configuring Secure Web Access

Navigate to the Management Access Configuration page by selecting **Configure>System Properties>Management Access**. Click **Edit** from the main pane to open the Edit Management Access page. On this page, you can enable HTTP and HTTPS access on interfaces for managing Services Routers through the Web interface. You can also install SSL certificates and enable JUNOScript over SSL with the Secure Access page.

[Figure 34 on page 613](#) shows the Edit Management Access page.

Figure 34: Edit Management Access Page

To configure Web access settings in the J-Web interface:

1. Enter information into the Edit Management Access page, as described in [Table 64 on page 613](#).
2. Click **OK** to apply the configuration.
3. To verify that Web access is enabled correctly, connect to the router using one of the following methods:
  - For HTTP access—In your Web browser, type **http://URL** or **http://IP address**.
  - For HTTPS access—In your Web browser, type **https://URL** or **https://IP address**.
  - For SSL JUNOScript access—A JUNOScript client such as Junos Scope is required. For information about how to log in to Junos Scope, see the *Junos Scope Software User Guide*.

Table 64: Secure Access Configuration Summary

Field	Function	Your Action
Adding Certificates		
Certificate names	Displays digital certificates required for SSL access to the routing platform.  Allows you to add and delete SSL certificates.  For information about how to generate an SSL certificate, see <a href="#">“Generating SSL Certificates” on page 592</a> .	To add a certificate:  <ol style="list-style-type: none"><li>1. Click <b>Add</b> on the Certificates tab to display the Add certificate box.</li><li>2. Type a name in the Certificate name box—for example, <b>new</b>.</li><li>3. Paste the generated certificate and RSA private key in the Certificate content box.</li></ol>

Table 64: Secure Access Configuration Summary (*continued*)

Field	Function	Your Action
To delete a certificate, select it from the list and click <b>Delete</b> .		
<b>Enabling HTTP Web Access</b>		
Enable HTTP	Enables HTTP access on interfaces.	To enable HTTP access, select the <b>Enable HTTP access</b> check box on the Services tab.
Enable HTTP on all interfaces	Enables HTTP access on all interfaces at one time.	To enable HTTP access on all interfaces, select the <b>Enable on all interfaces</b> check box on the Services tab.
Selected interfaces	Lists the interfaces for which you want to enable HTTP access.	<p>Clear the <b>Enable on all interfaces</b> check box on the Services tab, select the interface, and move it to the appropriate list by clicking the direction arrows:</p> <ul style="list-style-type: none"> <li>To enable HTTP access on an interface, move the interface to the <b>Selected interfaces</b> list.</li> <li>To disable HTTP access on an interface, move the interface to the <b>Available interfaces</b> list.</li> </ul>
<b>Enabling HTTPS Web Access</b>		
Enable HTTPS	Enables HTTPS access on interfaces.	To enable HTTPS access, select the <b>Enable HTTPS access</b> check box on the Services tab.
HTTPS certificate	<p>Specifies SSL certificates to be used for encryption.</p> <p>This field is available only after you have created an SSL certificate.</p>	To specify the HTTPS certificate, select a certificate from the HTTPS certificate list on the Services tab—for example, <b>new</b> .
Enable on all interfaces	Enables HTTPS on all interfaces at one time.	To enable HTTPS on all interfaces, select the <b>Enable HTTPS on all interfaces</b> check box on the Services tab.
Selected interfaces	Lists interfaces for which you want to enable HTTPS access.	<p>Clear the <b>Enable on all interfaces</b> check box on the Services tab, select the interface, and move it to the appropriate list by clicking the direction arrows:</p> <ul style="list-style-type: none"> <li>To enable HTTPS access on an interface, move the interface to the <b>Selected interfaces</b> list.</li> <li>To disable HTTPS access on an interface, move the interface to the <b>Available interfaces</b> list.</li> </ul>
<b>Enabling JUNOScript over SSL</b>		
Enable JUNOScript over SSL	Enables secured SSL access to the JUNOScript XML scripting API.	To enable SSL access, select the <b>Enable JUNOScript over SSL</b> check box on the Services tab.
JUNOScript certificate	<p>Specifies SSL certificates to be used for encryption.</p> <p>This field is available only after you create at least one SSL certificate.</p>	To enable an SSL certificate, select a certificate from the JUNOScript certificate list on the Services tab—for example, <b>new</b> .

---

## Alarms

---

- [Using Alarms on page 615](#)
- [View Alarms on page 615](#)
- [Active Alarms Information on page 616](#)
- [Alarm Severity on page 616](#)
- [Displaying Alarm Descriptions on page 616](#)
- [Sample Task—Viewing and Filtering Alarms on page 616](#)

### Using Alarms

You can monitor active alarms on the J-Web interface. The View Alarms page alerts you about conditions that might prevent the routing platform from operating normally. The page displays information about active alarms, the severity of the alarms, the time at which the alarm began, and a brief description for each active alarm. Alternatively, you can use the CLI to view alarms on all routing platforms. An alarm indicates that you are running the routing platform in a manner that is not recommended. When you see an alarm, you must check its cause and remedy it.

Alternatively, you can display alarm information by entering the following commands at the J-Web CLI terminal:

- **show chassis alarms**
- **show system alarms**

For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the commands, see [CLI Explorer](#).

### View Alarms

On J Series routers only, you can monitor active alarms on the J-Web interface. To view the alarms page, click **Monitor > Events and Alarms > Alarms**. The View Alarms page alerts you about conditions that might prevent the routing platform from operating normally. The page displays information about active alarms, the severity of the alarms, the time at which the alarm began and a brief description for each active alarm. Alternatively, you can use the CLI to view alarms on all routers. An alarm indicates that you are running the routing platform in a manner that is not recommended. When you see an alarm, you must check its cause and remedy it.

Alternatively, you can display alarm information by entering the following commands at the J-Web CLI terminal:

- **show chassis alarms**
- **show system alarms**

The View Alarms page displays all the active alarms along with detailed descriptions. Each description provides more information about the probable cause or solution for the

condition that caused the alarm (see [“Sample Task—Viewing and Filtering Alarms” on page 616](#)). The description also provides the date and time when the failure was detected.

## Active Alarms Information

The View Alarms page displays the following types of alarms. You can set the conditions that trigger alarms on an interface. Chassis and system alarm conditions are preset.

- Interface alarms—Indicate a problem in the state of the physical links on a fixed or installed Physical Interface Module (PIM), such as a link failure or a missing signal. To enable interface alarms, you must configure them.
- Chassis alarms—Indicate a failure on the routing platform or one of its components, such as a power supply failure, excessive component temperature, or media failure. Chassis alarms are preset and cannot be modified.
- System alarms—Indicate a missing rescue configuration or software license, where valid. System alarms are preset and cannot be modified.

## Alarm Severity

Alarms displayed on the View Alarms page can have the following two severity levels:

- Major (red)—Indicates a critical situation on the routing platform that has resulted from one of the following conditions. A red alarm condition requires immediate action.
  - One or more hardware components have failed.
  - One or more hardware components have exceeded temperature thresholds.
  - An alarm condition configured on an interface has triggered a critical warning.
- Minor (yellow)—Indicates a noncritical condition on the routing platform that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

A missing rescue configuration or software license generates a yellow system alarm.

## Displaying Alarm Descriptions

All active alarms are displayed on the View Alarms page with detailed description of the alarm. This description provides more information about the probable cause or solution for the condition that caused the alarm (see [“Sample Task—Viewing and Filtering Alarms” on page 616](#)). The description also provides the date and time when the failure was detected. Note the date and time of an alarm so that you can correlate it with error messages on the View Events page or in the messages system log file.

## Sample Task—Viewing and Filtering Alarms

[Figure 35 on page 617](#) shows the View Alarms page displaying one system alarm that is currently active. The yellow color indicates that the alarm is noncritical. You can also see the time at which the system received the alarm. You can also filter alarms based on alarm type, severity, description, and date.

Figure 35: View Alarms Page

**View Alarms**

## Events

- [Using View Events on page 617](#)
- [Viewing Events on page 618](#)
- [View Events on page 618](#)
- [Understanding Severity Levels on page 619](#)
- [Using Filters on page 619](#)
- [Using Regular Expressions on page 621](#)
- [Sample Task—Filtering and Viewing Events on page 622](#)

## Using View Events

The Events task on the J-Web interface enables you to filter and view system log messages that record events occurring on your routing platform.

[Figure 36 on page 618](#) shows the View Events page. This page provides an easy method to view the events recorded in the system log (also known as system log messages). By default, the View Events page displays a summary of the most recent 25 events, with severity levels highlighted in different colors.

The events summary includes information about the time the event occurred, the name of the process that generated the message, the event ID, and a short description of the event. You can move the cursor over the question mark (?) next to an event ID to display a useful description of the event.

You can filter events by system log filename, event ID, text from the event description, name of the process that generated the event, or time period, to display only the events you want. You can also generate and save an HTML report of the system alarms.

Alternatively, enter the following command in the J-Web CLI terminal to display the list of messages and a brief description of each message. For more information about the CLI terminal, see [“Using the CLI Terminal” on page 601](#).

```
user@host> help syslog ?
```

**Figure 36: View Events page**

checklogin	notice	WEB_AUTH_SUCC	Authenticated httpd client (username root)	2009-07-17 04:09:54 PDT

## Viewing Events

The View Events page displays system log messages that record events occurring on the routing platform. Events recorded include those of the following types:

- Routine operations, such as creation of an Open Shortest Path First (OSPF) protocol adjacency or a user login into the configuration database
- Failure and error conditions, such as failure to access a configuration file or unexpected closure of a connection to a child or peer process
- Emergency or critical conditions, such as routing platform power-off due to excessive temperature

For more information about system log messages, see the [System Log Explorer](#).

## View Events

To view system log messages that record events occurring on your routing platform, click **Monitor>Events and Alarms>View Events**. The View Events page is displayed. This page provides an easy method to view the events recorded in the system log (also known as system log messages). By default, the View Events page displays a summary of the most recent 25 events, with severity levels highlighted in different colors.

The View Events page displays system log messages that record events occurring on the routing platform. Events recorded include those of the following types:

- Routine operations, such as creation of an OSPF protocol adjacency or a user login into the configuration database

- Failure and error conditions, such as failure to access a configuration file or unexpected closure of a connection to a child or peer process
- Emergency or critical conditions, such as routing platform power-off due to excessive temperature

On the View Events page, you can also use filters to display relevant events. [Table 66 on page 620](#) lists the different filters, their functions, and the associated actions. You can apply any or a combination of the described filters to view the messages that you want to view. After specifying the filter or filters you want, click **Search** to display the filtered events.

## Understanding Severity Levels

On the View Events page, the severity level of a message is indicated by different colors. The severity level indicates how seriously the triggering event affects routing platform functions.

[Table 65 on page 619](#) lists the system log severity levels, the corresponding colors, and a description of what the severity level indicates.

**Table 65: Severity Levels**

Color	Severity Level (from Highest to Lowest Severity)	Description
Red	<b>emergency</b>	System panic or other conditions that cause the routing platform to stop functioning.
Orange	<b>alert</b>	Conditions that must be corrected immediately, such as a corrupted system database.
Pink	<b>critical</b>	Critical conditions, such as hard drive errors.
Blue	<b>error</b>	Standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.
Yellow	<b>warning</b>	Conditions that warrant monitoring.
Green	<b>notice</b>	Conditions that are not error conditions but are of interest or might warrant special handling.
	<b>info</b>	Informational messages. This is the default.
	<b>debug</b>	Software debugging messages.
Gray	<b>unknown</b>	No severity level is specified.

## Using Filters

On the View Events page, you can use filters to display relevant events.

[Table 66 on page 620](#) lists the different filters, their functions, and the associated actions.

You can apply any or a combination of the described filters to view the messages that you want to view. After specifying the filter or filters you want, click **Search** to display the filtered events. Click **Reset** to clear the existing search criteria and enter new values.

**Table 66: Summary of Event Filters**

Event Filter	Function	Your Action
<b>System Log File</b>	<p>Specifies the name of a system log file for which you want to display the recorded events.</p> <p>The list includes the names of all the system log files that you configure.</p> <p>By default, a log file, <b>messages</b>, is included in the <b>/var/log/</b> directory.</p> <p>For information about how to configure system log files, see the <a href="#">System Log Explorer</a>.</p>	To specify events recorded in a particular file, select the system log filename from the list—for example, <b>messages</b> .
<b>Event ID</b>	<p>Specifies the event ID for which you want to display the messages.</p> <p>If you type part of the ID, the system completes the remaining ID automatically.</p> <p>An event ID, also known as a system log message code, uniquely identifies a system log message. It begins with a prefix that indicates the generating software process or library.</p>	To specify events with a specific ID, type its partial or complete ID—for example, <b>TFTPD_AF_ERR</b> .
<b>Description</b>	<p>Specifies text from the description of events that you want to display.</p> <p>You can use a regular expression to match text from the event description.</p> <p><b>NOTE:</b> The regular expression matching is case-sensitive.</p> <p>For more information about using regular expressions, see <a href="#">“Using Regular Expressions” on page 621</a>.</p>	<p>To specify events with a specific description, type a text string from the description. You can include a regular expression.</p> <p>For example, type <b>^Initial*</b> to display all messages with lines beginning with the term <i>Initial</i>.</p>
<b>Process</b>	<p>Specifies the name of the process generating the events you want to display.</p> <p>To view all the processes running on your system, enter the CLI command <b>show system processes</b> in the J-Web CLI terminal.</p> <p>For more information about processes, see the <i>Installation and Upgrade Guide for Security Devices</i>.</p>	<p>To specify events generated by a process, type the name of the process.</p> <p>For example, type <b>mgd</b> to list all messages generated by the management process.</p>
<b>Include archived files</b>	Includes the archived log files in the search. Files are archived when the active log file reaches its maximum size limit.	Select the check box to include archived files in the search.

Table 66: Summary of Event Filters (*continued*)

Event Filter	Function	Your Action
<b>Date From</b>	Specifies the time period in which the events you want displayed are generated.	To specify the time period:
<b>To</b>	<p>A calendar allows you to select the year, month, day, and time. It also allows you to select the local time.</p> <p>By default, the messages generated in the last one hour are displayed. <b>To</b> shows the current date and time, and <b>Date From</b> shows the time one hour before end time.</p>	<ul style="list-style-type: none"> <li>Click the button next to <b>Date From</b> and select the year, month, date, and time—for example, <b>02/10/2006 11:32</b>.</li> <li>Click the button next to <b>To</b> and select the year, month, date, and time—for example, <b>02/10/2006 3:32</b>.</li> </ul> <p>To select the current time as the start time, select <b>Local Time</b>.</p>

## Using Regular Expressions

On the View Events page, you can filter the events displayed by the text in the event description. In the **Description** box, you can use regular expressions to filter and display a set of messages for viewing. Junos OS supports POSIX Standard 1003.2 for extended (modern) UNIX regular expressions.

Table 67 on page 621 specifies some of the commonly used regular expression operators and the terms matched by them. A term can match either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

**NOTE:** On the View Events page, the regular expression matching is case-sensitive.

Table 67: Common Regular Expression Operators and the Terms They Match

Regular Expression Operator	Matching Terms
. (period)	<p>One instance of any character except the space.</p> <p>For example, <code>.in</code> matches messages with <i>win</i> or <i>windows</i>.</p>
* (asterisk)	<p>Zero or more instances of the immediately preceding term.</p> <p>For example, <code>tre*</code> matches messages with <i>tree</i>, <i>tread</i>, or <i>trough</i>.</p>
+ (plus sign)	<p>One or more instances of the immediately preceding term.</p> <p>For example, <code>tre+</code> matches messages with <i>tree</i> or <i>tread</i> but not <i>trough</i>.</p>
? (question mark)	<p>Zero or one instance of the immediately preceding term.</p> <p>For example, <code>colou?r</code> matches messages with <i>or color</i> or <i>colour</i>.</p>
(pipe)	<p>One of the terms that appear on either side of the pipe operator.</p> <p>For example, <code>gre ay</code> matches messages with either <i>grey</i> or <i>gray</i>.</p>

Table 67: Common Regular Expression Operators and the Terms They Match (*continued*)

Regular Expression Operator	Matching Terms
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is specific to Junos OS.
^ (caret)	The start of a line, when the caret appears outside square brackets.  For example, <code>^T</code> matches messages with <i>This line</i> and not with <i>On this line</i> .
\$ (dollar sign)	Strings at the end of a line.  For example, <code>:\$</code> matches messages with <i>the following:</i> and not with <i>2:00</i> .
[] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range.  For example, <code>[0-9]</code> matches messages with any number.
() (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.  For example, <code>dev(/ ice)</code> matches messages with <i>dev/</i> or <i>device</i> .

### Sample Task—Filtering and Viewing Events

Figure 37 on page 623 shows the View Events page displaying filtered events. In this example, you are typing **UI\_CHILD\_EXITED** in the Event ID box and clicking **Search**. The Event Summary displays messages with the **UI\_CHILD\_EXITED** event ID only. You can view the following information about the events:

- Messages displayed are green. The green color and context-sensitive help indicate that the message severity level is **notice** and the event type is **error**. This information means that the condition causing the message is an error or failure and might require corrective action.
- The events were generated by the management process (mgd).
- The Event Description column displays a brief description of the event, and the help description provides information about the cause of the event.

## Device Management

- [Using Software \(J Series Routing Platforms Only\) on page 623](#)
- [Using Licenses \(J Series Routing Platform Only\) on page 624](#)
- [Using Snapshot \(J Series Routing Platforms Only\) on page 625](#)
- [Sample Task—Manage Snapshots on page 626](#)
- [Using Reboot on page 627](#)

### Using Software (J Series Routing Platforms Only)

On J Series routers only, you can upgrade and manage Junos OS packages from the J-Web interface. A Junos OS package is a collection of files that make up the software components of the routing platform.

Typically, you upgrade the Junos OS on a routing platform by downloading a set of images onto your routing platform or onto another system on your local network, such as a PC. You then uncompress the package and install the uncompressed software using the Maintain>Software page. Finally, you boot your system with this upgraded device.

As new features and software fixes become available, you must upgrade your software to use them. Before an upgrade, we recommend that you back up your primary boot device in case it becomes corrupted or fails during the upgrade. Creating a backup also stores your active configuration files and log files and ensures that you recover to a known, stable environment in case of an unsuccessful upgrade. For more information about creating a system backup, see [“Sample Task—Manage Snapshots” on page 626](#).

During a successful upgrade, the upgrade package completely reinstalls the existing software. The upgrade process rebuilds the file system but retains configuration files, log files, and similar information from the previous version.

[Table 68 on page 624](#) lists the different tasks that you can perform from the Maintain>Software pages.

Table 68: Manage Software Tasks Summary

Manage Software Task	Function
<b>Upload Package</b>	<p>Install software packages uploaded from your computer to the routing platform.</p> <ul style="list-style-type: none"> <li>File to Upload (required)—Specifies the location of the software package. Type the location of the software package, or click <b>Browse</b> to navigate to the location.</li> <li>Reboot If Required—If this check box is selected, the router is automatically rebooted when the upgrade is complete. Select the check box if you want the router to reboot automatically when the upgrade is complete.</li> </ul> <p>Click <b>Upload Package</b> to begin, and click <b>Cancel</b> to clear the entries and return to the previous page.</p>
<b>Install Package</b>	<p>Install software packages on the routing platform that are retrieved with FTP or HTTP from the location specified.</p> <ul style="list-style-type: none"> <li>Package Location—Specifies the FTP or HTTP server, file path, and software package name. The software is activated after the router has rebooted.</li> <li>User—Specifies the username, if the server requires one.</li> <li>Password—Specifies the password, if the server requires one.</li> <li>Reboot If Required—If this check box is selected, the router is automatically rebooted when the upgrade is complete.</li> </ul> <p>Click <b>Fetch and Install Package</b> to begin.</p>
<b>Downgrade</b>	<p>Downgrade the Junos OS on the routing platform.</p> <p>When you downgrade the software to a previous version, the software version that is saved in <b>junos.old</b> is the version of Junos OS that your router is downgraded to. For your changes to take effect, you must reboot the router.</p> <p><b>CAUTION:</b> After you perform this operation, you cannot undo it.</p>

Alternatively, you can install software packages on your routing platform by entering the **request system software add** command at the J-Web CLI terminal.

### Using Licenses (J Series Routing Platform Only)

The Maintain>Licenses page displays a summary of the licenses needed and used for each feature that requires a license on a J Series routing platform. This page also allows you to add licenses.

To enable some Junos OS features on a J Series routing platform, you must purchase, install, and manage separate software licenses. The presence on the router of the appropriate software license keys (passwords) determines the features you can configure and use. Each feature license is tied to exactly one software feature, and that license is valid for exactly one J Series routing platform.

Using the Maintain>Licenses page, you can perform the following tasks:

- Add licenses—Add license keys for the following features:
  - Flow monitoring traffic analysis support

- Advanced Border Gateway Protocol (BGP) features that enable route reflectors for readvertising BGP routes to internal peers.
- Delete licenses—Delete one or more license keys from a J Series routing platform with the J-Web license manager.
- Display license keys—Display the license keys in text format. Multiple licenses are separated by a blank line.

Alternatively, you can run the following commands at the J-Web CLI terminal. For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the commands, see [CLI Explorer](#).

- **show system license**—Display license information.
- **request system license add**—Add licenses on J Series routers.

For more information about licenses, see the Getting Started Guide for your J Series router.

### Using Snapshot (J Series Routing Platforms Only)

The Maintain>Snapshot page allows you to configure storage devices to replace the primary boot device on your router or to act as a backup boot device. To do so, you create a snapshot of the system software running on your router, saving the snapshot to an alternative storage device.

The Manage Snapshot page allows you to perform the following tasks:

- Copy the current system software, along with the current and rescue configurations, to an alternative storage device.

**CAUTION:** We recommend that you keep your secondary storage medium updated at all times. If the internal compact flash fails at startup, the J Series routing platform automatically boots itself from this secondary storage medium. The secondary storage medium can be either an external compact flash or a USB storage device. When a secondary storage medium is not available, the routing platform is unable to boot and does not come back online. This situation can occur if the power fails during a Junos OS upgrade and the physical or logical storage media on the routing platform are corrupted. The backup device must have a storage capacity of at least 256 MB.

- Copy only default files that were loaded on the internal compact flash when it was shipped from the factory, plus the rescue configuration, if one has been set.
- Configure a boot device to store snapshots of software failures, for use in troubleshooting.
- Partition the storage medium. This process is usually necessary for storage devices that do not already have software installed on them.

- Create a snapshot for use as the primary boot device to replace the device in the internal compact flash slot or to replicate it for use in another J Series routing platform. You can perform this action only on a removable storage device.
- Specify the size of the following partitions in kilobytes:
  - **data**—Data partition is not used by the routing platform, and can be used for extra storage.
  - **swap**—Swap partition is used for swap files and software failure memory snapshots. Software failure memory snapshots are saved to the boot medium only if it is specified as the dump device.
  - **config**—Config partition is used for storing configuration files.
  - **root**—Root partition does not include configuration files.

Click **Snapshot** to begin.

Alternatively, you can use the **request system snapshot** command in the J-Web CLI terminal to take a snapshot of the routing platform. For information about installing boot devices, see the Getting Started Guide for your J Series router.

## Sample Task—Manage Snapshots

Figure 38 on page 627 shows a Maintain>Snapshot page that allows you to back up the currently running and active file system on a standby storage device that is not running. In this example, you are taking the snapshot to replace the current primary boot device on the routing platform. A compact flash is connected to the USB port on the J Series routing platform with a USB adapter.

To take the snapshot:

1. Select **Maintain>Snapshot** from the task bar.
2. Next to Advanced options, click the expand icon (see Figure 38 on page 627).
3. Select **compact-flash** from the Target Media list to specify the storage device to copy the snapshot to.
4. Next to As Primary Media, select the check box to create a storage medium to be used in the internal compact flash slot only.
5. Click **Snapshot**.

Figure 38: Manage Snapshots Page

Snapshot

System Snapshot

You can configure boot devices to replace the primary boot device or to act as a backup boot device. To do this, you create a snapshot of the running system software, saving the snapshot to an alternate media.

The snapshot process copies the current system software, along with the current and rescue configurations, to alternate media. Optionally, you can copy only the factory and rescue configurations.

Target Media: Snapshots the system software to specified media:

- compact-flash: Internal compact flash
- removable-compact-flash: External compact flash

Target Media  ?

Partition ☐ ?

**Advanced options**

As Primary Media ☒ ?

Data Size  ?

Swap Size  ?

Config Size  ?

Root Size  ?

## Using Reboot

The Maintain>Reboot page allows you to reboot the routing platform at a specified time. Using the Maintain>Reboot page, you can perform the following tasks:

- Reboot the router immediately, after a specified number of minutes or at the absolute time that you specify, on the current day.
- Stop (halt) the router software immediately. After the router software has stopped, you can access the router through the console port only.
- Type a message to be displayed to any users on the router before the reboot occurs.

Click **Schedule** to begin.

If the reboot is scheduled to occur immediately, the router reboots. You cannot access the J-Web interface until the router has restarted and the boot sequence is complete. After the reboot is complete, refresh the browser window to display the J-Web interface login page.

Alternatively, you can reboot the routing platform by running the **request system reboot** command at the J-Web CLI terminal. For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the **request system reboot** command, see [CLI Explorer](#).

## Monitoring in J-Web

- [Monitor Task Overview on page 628](#)
- [Chassis Viewer \(M7i, M10i, M20, M120, and M320 Routing Platforms Only\) on page 628](#)
- [Class of Service on page 629](#)
- [Interfaces on page 630](#)
- [MPLS on page 631](#)

- [PPPoE \(J Series Routing Platforms Only\) on page 632](#)
- [RPM on page 632](#)
- [Routing on page 633](#)
- [Security on page 634](#)
- [Service Sets on page 636](#)
- [Services on page 636](#)
- [System View on page 636](#)
- [Sample Task—Monitoring Interfaces on page 638](#)
- [Sample Task—Monitoring Route Information on page 640](#)

## Monitor Task Overview

Use the J-Web Monitor tasks to monitor your routing platform. The J-Web interface displays diagnostic information about the routing platform in the browser.

You can also monitor the routing platform with command-line interface (CLI) operational mode commands that you type into a CLI emulator in the J-Web interface. The monitoring pages display the same information displayed in the output of **show** commands entered in the CLI terminal. For more information about the J-Web CLI terminal, see [“Using the CLI Terminal” on page 601](#). For more information about the **show** commands, see the Junos OS command references.

J-Web monitoring pages appear when you select **Monitor** in the taskbar. The monitoring pages display the current configuration on your system and the status of your system, chassis, interfaces, and routing and security operations. The monitoring pages have plus signs (+) that you can expand to view details. On some pages, such as the Routing Information page, you can specify search criteria to view selective information.

## Chassis Viewer (M7i, M10i, M20, M120, and M320 Routing Platforms Only)

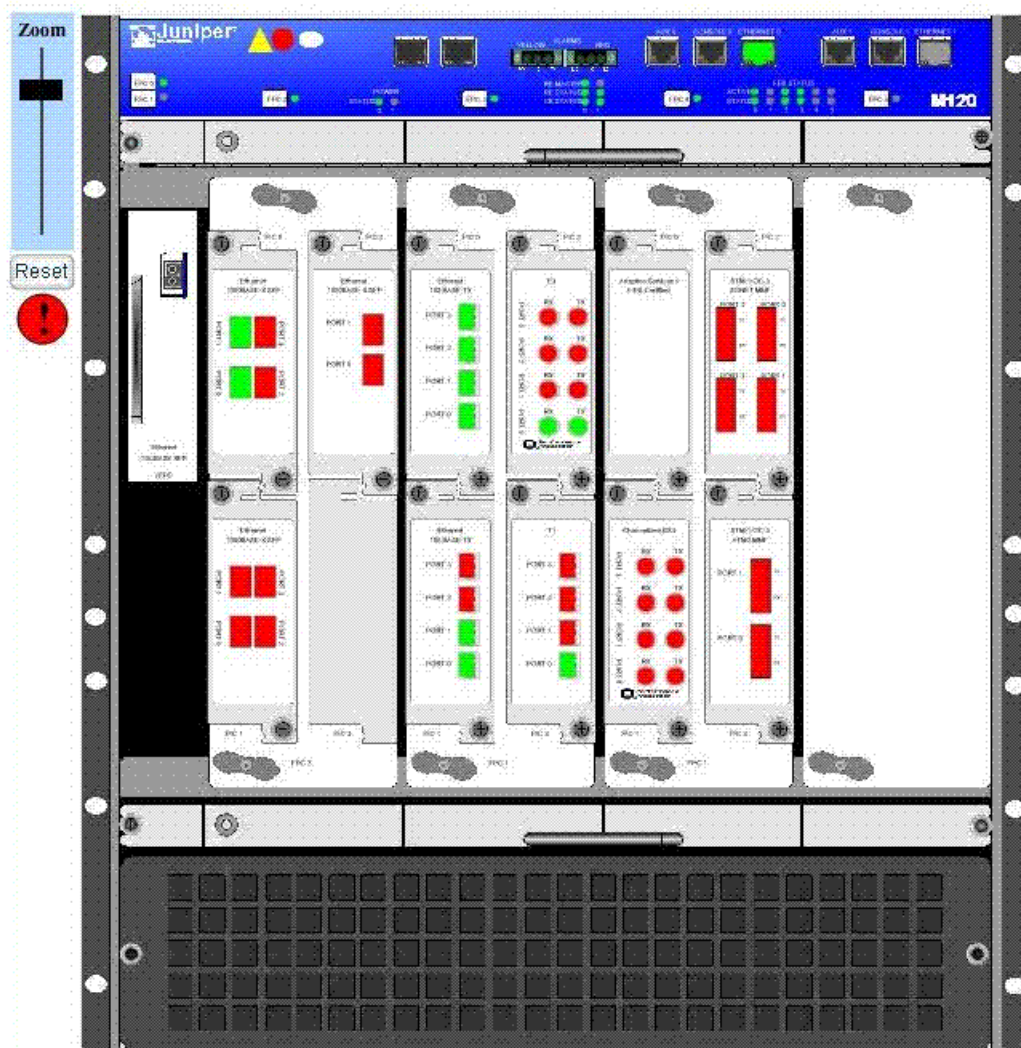

On M7i, M10i, M20, M120, and M320 routers, you can use the chassis viewer feature to view images of the chassis and access information about each component similar to what you can obtain using the **show chassis alarms** and **show chassis hardware** commands.

To access the chassis viewer, click **Chassis** in the upper-right corner of any J-Web page for an M7i, M10i, M20, M120, or M320 routing platform. A separate page appears to display the image of the chassis and its component parts, including power supplies, individual Physical Interface Cards (PICs), and ports. Major or minor alarm indicators appear in red.

[Figure 39 on page 629](#) shows the chassis and components of an M120 routing platform. It also shows the status of each port in red or green, and the zoom bar selections.

Figure 39: Chassis Viewer Page

Click and drag the chassis to pan the image. Hover over a FRU for status information(serial number, description, etc.). Right click on the chassis for more options such as configuration and monitoring. Router status lights are updated every 1 minute.

## Class of Service

To display details about the performance of class of service (CoS) on a routing platform, select **Monitor > Class of Service** in the J-Web interface.

Table 69 on page 630 shows a summary of the information displayed on the Class of Service pages and the corresponding CLI **show** commands that you can enter at the J-Web CLI terminal.

**Table 69: Class of Service Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
<b>Interfaces</b>	
Information about the physical and logical interfaces in the system and details about the CoS components assigned to these interfaces.	<b>show class-of-service interface</b>
<b>Classifiers</b>	
Forwarding classes and loss priorities that incoming packets are assigned to based on the packet's CoS values.	<b>show class-of-service classifier</b>
<b>CoS Value Aliases</b>	
CoS value aliases that the system is using to represent DiffServ code point (DSCP), DSCP IPv6, MPLS experimental (EXP), and IPv4 precedence bits.	<b>show class-of-service code-point-aliases</b>
<b>RED Drop Profiles</b>	
Detailed information about the drop profiles used by the system. Also, displays a graph of the random early detection (RED) curve that the system uses to determine the queue fullness and drop probability.	<b>show class-of-service drop-profile</b>
<b>Forwarding Classes</b>	
Assignment of forwarding classes to queue numbers.	<b>show class-of-service forwarding-class</b>
<b>Rewrite Rules</b>	
Packet CoS value rewrite rules based on the forwarding classes and loss priorities.	<b>show class-of-service rewrite-rule</b>
<b>Scheduler Maps</b>	
Assignment of forwarding classes to schedulers. Schedulers include transmit rate, rate limit, and buffer size.	<b>show class-of-service scheduler-map</b>

## Interfaces

The J-Web interface hierarchically displays all routing platform physical and logical interfaces, including state and configuration information. This information is divided into multiple parts. To view general interface information such as available interfaces, operation states of the interfaces, and descriptions of the configured interfaces, select **Monitor>Interfaces** in the J-Web interface. To view interface-specific properties such as administrative state or traffic statistics in the J-Web interface, select the interface name on the Port Monitoring page and click **Details**. (See [“Sample Task—Monitoring Interfaces”](#) on page 638.)

[Table 70 on page 631](#) shows a summary of the information displayed on the Interfaces pages and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

Table 70: Interfaces Information and the Corresponding CLI show Commands

Information Displayed	Corresponding CLI Command
Status information about the specified Protocol Independent Multicast (PIM).	<b>show interfaces terse</b>
Detailed information about all interfaces configured on the routing platform.	<b>show interfaces detail</b>
Current state of the interface you specify.	<b>show interfaces <i>interface-name</i></b>

## MPLS

To view information about MPLS label-switched paths (LSPs) and virtual private networks (VPNs), select **Monitor>MPLS**.

[Table 71 on page 631](#) shows a summary of the information displayed on the MPLS pages and the corresponding CLI **show** commands that you can enter at the J-Web CLI terminal.

Table 71: MPLS Information and the Corresponding CLI show Commands

Information Displayed	Corresponding CLI Command
<b>Interfaces</b>	
Interfaces on which MPLS is enabled, plus the operational state and any administrative groups applied to an interface.	<b>show mpls interface</b>
<b>LSP Information</b>	
LSP sessions currently active on the routing platform, including inbound (ingress) and outbound (egress) addresses, LSP state, and LSP name.	<b>show mpls lsp</b>
<b>LSP Statistics</b>	
Statistics for LSP sessions currently active on the routing platform, including the total number of packets and bytes forwarded through an LSP.	<b>show mpls lsp statistics</b>
<b>RSVP Sessions</b>	
RSVP-signaled LSP sessions currently active on the routing platform, including inbound (ingress) and outbound (egress) addresses, LSP state, and LSP name.	<b>show rsvp session</b>
<b>RSVP Interfaces</b>	
Interfaces on which RSVP is enabled, including the interface name, total bandwidth through the interface, and total current reserved and reservable (available) bandwidth on the interface.	<b>show rsvp interface</b>

## PPPoE (J Series Routing Platforms Only)

The Point-to-Point Protocol over Ethernet (PPPoE) monitoring information is displayed in multiple parts. To display the session status for PPPoE interfaces, cumulative statistics for all PPPoE interfaces on the routing platform, and the PPPoE version configured on the routing platform, select **Monitor>PPPoE** in the J-Web interface.

To view interface-specific properties in the J-Web interface, select the interface name on the PPPoE page.

[Table 72 on page 632](#) shows a summary of the information displayed on the PPPoE page and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 72: PPPoE Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
Session-specific information about the interfaces on which PPPoE is enabled.	<b>show pppoe interfaces</b>
Statistics for PPPoE sessions currently active.	<b>show pppoe statistics</b>
PPPoE protocol currently configured on the routing platform.	<b>show pppoe version</b>

## RPM

The real-time performance monitoring (RPM) information includes the round-trip time, jitter, and standard deviation values for each configured RPM test on the routing platform. To view these RPM properties, select **Troubleshoot > RPM** in the J-Web interface.

[Table 73 on page 632](#) shows a summary of the information displayed on the RPM page and the corresponding CLI **show** command you can enter at the J-Web CLI terminal.

**Table 73: RPM Information and the Corresponding CLI show Command**

Information Displayed	Corresponding CLI Command
Results of the most recent RPM probes.	<b>show services rpm probe-results</b>

In addition to the RPM statistics for each RPM test, the J-Web interface displays the round-trip times and cumulative jitter graphically. [Figure 40 on page 633](#) shows sample graphs for an RPM test.

Figure 40: Sample RPM Graphs

In [Figure 40 on page 633](#), the round-trip time and jitter values are plotted as a function of the system time. Large spikes in round-trip time or jitter indicate a slower outbound (egress) or inbound (ingress) time for the probe sent at that particular time.

## Routing

To view information about routes in a routing table or for information about OSPF, BGP, or RIP, select **Monitor>Routing** in the J-Web interface.

The routing information includes information about the route's destination, protocol, state, and parameters. To view selective information, type or select information in one or more of the Narrow Search boxes, and click **Search**.

[Table 74 on page 633](#) shows a summary of the information displayed on the Routing pages and the corresponding CLI **show** commands that you can enter at the J-Web CLI terminal.

**Table 74: Routing Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
<b>Route Information</b>	
A high-level summary of the routes in the routing table.	<b>show route terse</b>
Detailed information about the active entries in the routing tables.	<b>show route detail</b>

**Table 74: Routing Information and the Corresponding CLI show Commands** (*continued*)

Information Displayed	Corresponding CLI Command
<b>BGP Information</b>	
Summary about Border Gateway Protocol (BGP).	<b>show bgp summary</b>
BGP peers.	<b>show bgp neighbor</b>
<b>OSPF Information</b>	
Information about OSPF neighbors.	<b>show ospf neighbors</b>
OSPF interfaces.	<b>show ospf interfaces</b>
OSPF statistics.	<b>show ospf statistics</b>
<b>RIP Information</b>	
Routing Information Protocol (RIP) statistics about messages sent and received on an interface, as well as information received from advertisements from other routers.	<b>show rip statistics</b>
RIP neighbors.	<b>show rip neighbors</b>

## Security

- [Firewall on page 634](#)
- [IPsec on page 635](#)
- [NAT on page 635](#)

### Firewall

To view stateful firewall filter information in the J-Web interface, select **Monitor>Security>Firewall>Stateful Firewall**. To display stateful firewall filter information for a particular address prefix, port, or other characteristic, type information in or select information from one or more of the Narrow Search boxes, and click **OK**.

[Table 75 on page 634](#) shows a summary of the information displayed on Firewall pages and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 75: Firewall Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
<b>Statistics Summary</b>	
Stateful firewall filter statistics.	<b>show services stateful-firewall statistics</b>
<b>Stateful Firewall</b>	
Stateful firewall filter conversations.	<b>show services stateful-firewall conversations</b>

**Table 75: Firewall Information and the Corresponding CLI show Commands** (*continued*)

Information Displayed	Corresponding CLI Command
Flow table entries for stateful firewall filters.	<b>show services stateful-firewall flows</b>
<b>IDS Information</b>	
Information about an address under possible attack.	<b>show services ids destination-table</b>
Information about an address that is a suspected attacker.	<b>show services ids source-table</b>
Information about a particular suspected attack source-and-destination address pair.	<b>show services ids pair-table</b>

### IPsec

To view information about configured IP Security (IPsec) tunnels and statistics, and Internet Key Exchange (IKE) security associations for adaptive services interfaces, select **Monitor>Security>IPsec** in the J-Web interface.

[Table 76 on page 635](#) shows a summary of the information displayed on the IPsec page and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 76: IPsec Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
(Adaptive services interface only) IPsec statistics for the selected service set.	<b>show services ipsec-vpn ipsec statistics</b>
(Adaptive services interface only) IPsec security associations for the selected service set.	<b>show services ipsec-vpn ipsec security-associations</b>
(Adaptive services interface only) Internet Key Exchange (IKE) security associations.	<b>show services ipsec-vpn ike security-associations</b>

### NAT

NAT pool information includes information about the address ranges configured within the pool on the routing platform. To view NAT pool information, select **Monitor>Security>NAT** in the J-Web interface.

[Table 77 on page 635](#) shows a summary of the information displayed on the NAT page and the corresponding CLI **show** command you can enter at the J-Web CLI terminal.

**Table 77: NAT Information and the Corresponding CLI show Command**

Information Displayed	Corresponding CLI Command
Information about Network Address Translation (NAT) pools.	<b>show services nat pool</b>

## Service Sets

Service set information includes the services interfaces on the routing platform, the number of services sets configured on the interfaces, and the total CPU used by the service sets. To view these service set properties, select **Monitor>Service Sets** in the J-Web interface.

A service set is a group of rules from a stateful firewall filter, Network Address Translation (NAT), intrusion detection service (IDS), or IP Security (IPsec) that you apply to a services interface. IDS, NAT, and stateful firewall filter service rules can be configured within the same service set. However, IPsec services are configured in a separate service set.

[Table 78 on page 636](#) shows a summary of the information displayed on Service Sets pages and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 78: Service Sets Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
Service set summary information.	<b>show services service-sets summary</b>
Service set memory usage.	<b>show services service-sets memory-usage</b>

## Services

A J Series routing platform can operate as a Dynamic Host Configuration Protocol (DHCP) server. To view information about dynamic and static DHCP leases, conflicts, pools, and statistics, select **Monitor>Services>DHCP** in the J-Web interface.

[Table 79 on page 636](#) shows a summary of the information displayed on the DHCP page and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 79: DHCP Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
DHCP server client binding information.	<b>show system services dhcp binding</b>
DHCP client-detected conflicts for IP addresses.	<b>show system services dhcp conflict</b>
DHCP server IP address pools.	<b>show system services dhcp pool</b>
DHCP server statistics.	<b>show system services dhcp statistics</b>

## System View

- [System Information on page 637](#)

- [FEB Redundancy \(M120 Routing Platforms Only\) on page 638](#)

### System Information

To view information about system properties such as the name and IP address of the routing platform or the resource usage on the Routing Engine, select **Monitor>System View** in the J-Web interface.

Table 80 on page 637 shows a summary of the information displayed on System pages and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 80: System Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
Current time and information about how long the routing platform, routing platform software, and routing protocols have been running.	<b>show system uptime</b>
Information about users who are currently logged in to the routing platform.	<b>show system users</b>
Statistics about the amount of free disk space in the routing platform's file systems.	<b>show system storage</b>
Software processes running on the routing platform.	<b>show system processes</b>

### Chassis Information

To view chassis properties on the routing platform, select **Monitor>System View>Chassis Information** in the J-Web interface.

Table 81 on page 637 shows a summary of the information displayed on the Chassis Information page and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 81: Chassis Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
Conditions that have been configured to trigger alarms.	<b>show chassis alarms</b>
Environmental information about the routing platform chassis, including the temperature and information about the fans, power supplies, and Routing Engine.	<b>show chassis environment</b>
Status information about the installed FPCs and PICs.	<b>show chassis fpc</b>
List of all FPCs and PICs installed in the routing platform chassis, including the hardware version level and serial number.	<b>show chassis hardware</b>

### Process Details

To view process details like process ID, CPU load, or memory utilization, select **Monitor>System View>Process Details** in the J-Web interface.

[Table 82 on page 638](#) shows a summary of the information displayed on the Process Details page and the corresponding CLI **show** commands you can enter at the J-Web CLI terminal.

**Table 82: Process Details Information and the Corresponding CLI show Commands**

Information Displayed	Corresponding CLI Command
Software processes running on the router	<b>show processes extensive</b>

#### **FEB Redundancy (M120 Routing Platforms Only)**

On M120 routers, Forwarding Engine Boards (FEBs) provide route lookup and forwarding functions from Flexible PIC Concentrators (FPCs) and compact Flexible PIC Concentrators (cFPCs). You can configure FEB redundancy groups to provide high availability for FEBs.

To view the status of FEBs and FEB redundancy groups, or connectivity between FPCs and FEBs, select **Monitor>System View>FEB Redundancy** in the J-Web interface.

[Table 83 on page 638](#) shows a summary of the information displayed on the FEB Redundancy page and the corresponding CLI **show** command you can enter at the J-Web CLI terminal.

**Table 83: FEB Redundancy Information and the Corresponding CLI show Command**

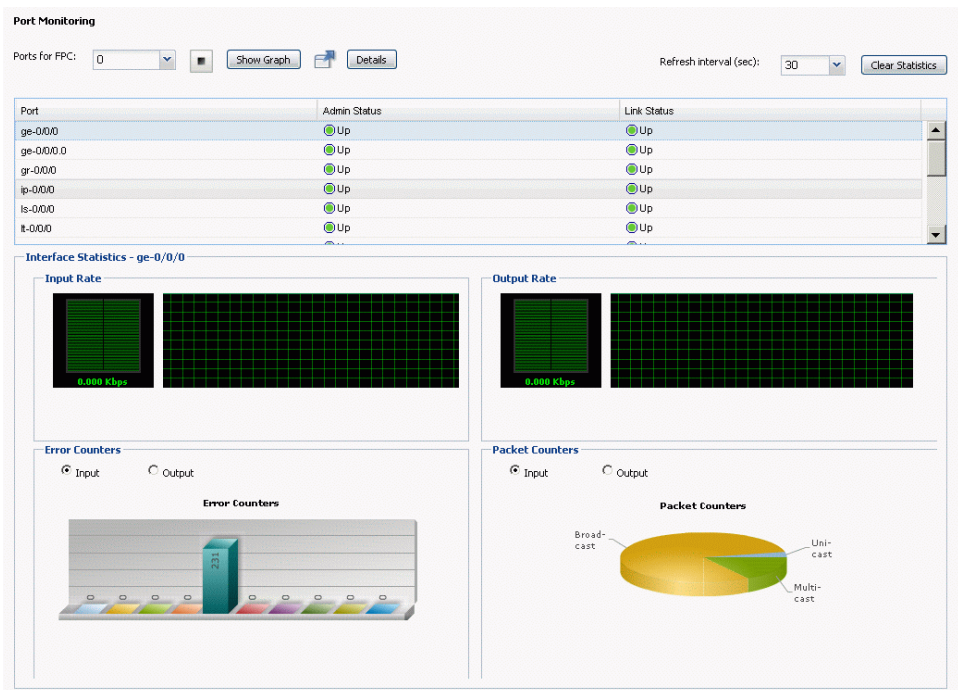

Information Displayed	Corresponding CLI Command
Forwarding Engine Board (FEB) status information.	<b>show chassis feb</b>

### **Sample Task—Monitoring Interfaces**

[Figure 41 on page 639](#) shows the Port Monitoring page that displays the interfaces installed on your routing platform. At a glance, you can monitor the status of all the configured physical and logical interfaces.

Figure 41: Port Monitoring Page

You can select any interface and click **Details** to view details about its status. For example, selecting **ge-0/0/0** and clicking **Details**, displays detailed information about the interface (see [Figure 42 on page 640](#)).

Figure 42: Details of Interface ge-0/0/0 Page

Name	Value
name	ge-0/0/0
local-index	129
snmp-index	160
generation	132
link type	Ethernet
mtu	1514
source-filtering	disabled

### Sample Task—Monitoring Route Information

Figure 43 on page 641 shows the Route Information monitoring page that displays information about all 9 routes in the routing table. All routing platforms are active, and there are no hidden routes.

Figure 43: Monitoring Route Information Page with Complete Information

**Routing**

**Route Information**

9 destinations, 9 routes (8 active, 0 hold down, 1 hidden) Showing 8 of 9 routes

**inet.0**

Destination	Protocol/Preference	Next-Hop	Age
+ 0.0.0.0/0	*Static/5	Router	2w2d 19:46:24
+ 10.10.0.0/16	*Static/5	Router	2w2d 19:46:24
+ 10.209.0.0/18	*Direct/0	Interface	2w2d 19:46:24
+ 10.209.8.129/32	*Local/0	Local	2w2d 19:46:26
+ 172.16.0.0/12	*Static/5	Router	2w2d 19:46:24

Next Hop Address  Receive Protocol

Best Route ☐ Inactive Routes ☐

Exact Route ☐ Hidden Routes ☐

Number of Routes to Display

By default, information about all routes in the routing table (up to a maximum of 25 routes on one page) is displayed. To view information about selective routes, type or select information in one or more of the Narrow Search boxes, and click **OK**. For example, typing **direct** in the box next to Protocol, displays the only 1 route. This is the only route that has **0** preference from a directly connected network. (see [Figure 44 on page 641](#)).

## Configuration and File Management

---

- [Displaying Configuration History on page 642](#)
- [Displaying Users Editing the Configuration on page 644](#)
- [Loading a Previous Configuration File on page 645](#)
- [Downloading a Configuration File on page 646](#)
- [Comparing Configuration Files on page 646](#)
- [Upload Configuration File on page 647](#)
- [Using Rescue \(J Series Routing Platforms Only\) on page 648](#)
- [Using Files on page 648](#)

### Displaying Configuration History

When you commit a configuration, the routing platform saves the current operational version and the previous 49 versions of committed configurations. To manage these configuration files with the J-Web interface, select **Maintain>Config Management>History**. The main pane displays Database Information and Configuration History (see [Figure 45 on page 643](#)).

[Table 84 on page 643](#) summarizes the contents of the display.

The configuration history display allows you to perform the following operations:

- View a configuration.
- Compare two configurations.
- Download a configuration file to your local system.
- Roll back the configuration to any of the previous versions stored on the routing platform.

Figure 45: Configuration Database and History Page

History

Database Information

No users are editing the configuration database.

Configuration History

The following table shows the device's commit history.

To view a configuration, click the revision number.

To compare configurations, select two and click "Compare".

Action	Action to perform with the configuration file. The action can be <b>Download</b> or <b>Rollback</b> . For more information, see <a href="#">“Downloading a Configuration File” on page 646</a> and <a href="#">“Loading a Previous Configuration File” on page 645</a> .

For more information about saved versions of configuration files, see [“Editing and Committing a Junos OS Configuration” on page 603](#).

## Displaying Users Editing the Configuration

To display a list of users editing the routing platform configuration, select **Maintain>Config Management>History**. The list is displayed as Database Information in the main pane (see [Figure 46 on page 645](#)). [Table 85 on page 645](#) summarizes the Database Information display.

Figure 46: Database Information Page

<b>History</b>						
<b>Database Information</b>						
The following users are editing the configuration:						
User Name	Start Time	Idle Time	Terminal	PID	Edit Flags	Edit Path
rob	2007-01-31 19:18:37 PST	16:16:14	p1	3423	None	[edit]
joe	2007-02-22 02:58:45 PST	13:56:25	p0	2962	None	[edit]
<b>Configuration History</b>						
The following table shows the router's commit history.						
To view a configuration, click the revision number.						

Table 85: J-Web Configuration Database Information Summary

Field	Description
User Name	Name of user editing the configuration.
Start Time	Time of day the user logged in to the routing platform.
Idle Time	Elapsed time since the user issued a configuration command from the CLI.
Terminal	Terminal on which the user is logged in.
PID	Process identifier assigned to the user by the routing platform.
Edit Flags	Designates a private or exclusive edit.
Edit Path	Level of the configuration hierarchy that the user is editing.

### Loading a Previous Configuration File

To load (roll back) and commit a previous configuration file stored on the routing platform:

1. In the Action column, click **Rollback** for the version of the configuration you want to load.

The main pane displays the results of the rollback operation.

**NOTE:** When you click **Rollback**, the routing platform loads and commits the selected configuration. This behavior is different from entering the **rollback configuration mode** command from the CLI, where the configuration is loaded, but not committed.

## Downloading a Configuration File

To download a configuration file from the routing platform to your local system:

1. In the Action column, click **Download** for the version of the configuration you want to download.
2. Select the options your Web browser provides that allow you to save the configuration file to a target directory on your local system.

The file is saved as an ASCII file.

## Comparing Configuration Files

To compare any two of the past 50 committed configuration files:

1. Click two of the check boxes to the left of the configuration versions you want to compare.
2. Click **Compare**.

The main pane displays the differences between the two configuration files at each hierarchy level as follows (see [Figure 47 on page 647](#)):

- Lines that have changed are highlighted side by side in green.
- Lines that exist only in the more recent configuration file are displayed in red on the left.
- Lines that exist only in the least recent configuration file are displayed in blue on the right.

Figure 47: J-Web Configuration File Comparison Results

Added in Rollback 2 Configuration

Upload Configuration File

- To upload a configuration file from your local system:
1. Select **Maintain>Config Management>Upload**.  
The main pane displays the File to Upload box (see Figure 48 on page 648).
  2. Specify the name of the file to upload using one of the following methods:
    - Type the absolute path and filename in the File to Upload box.
    - Click **Browse** to navigate to the file.
  3. Click **Upload and Commit** to upload and commit the configuration.  
The routing platform checks the configuration for the correct syntax before committing it.

Figure 48: J-Web Upload Configuration File Page

**Config Management**

**Upload**

Type the name of a configuration file on the local hard drive. When you click "Upload and Commit", the configuration in the file replaces the existing configuration and takes effect. If any errors occur when the file is loaded, configuration is restored.

• File to Upload   ?

## Using Rescue (J Series Routing Platforms Only)

If someone inadvertently commits a configuration that denies management access to a routing platform, you can delete the invalid configuration and replace it with a rescue configuration. You must have previously set the rescue configuration through the J-Web interface or the CLI. The rescue configuration is a previously committed, valid configuration.

To view, set, or delete the rescue configuration, select **Maintain>Rescue**. On the Rescue page (see [Figure 49 on page 648](#)), you can perform the following tasks:

- View the current rescue configuration (if one exists)—Click **View rescue configuration**.
- Set the current running configuration as the rescue configuration—Click **Set rescue configuration**. On a J Series routing platform, you can also press the **CONFIG** or **RESET CONFIG** button.
- Delete the current rescue configuration—Click **Delete rescue configuration**.

Figure 49: Rescue Configuration Page

**Rescue**

If you inadvertently commit a configuration that denies management access, the only recourse may be to connect the console. The rescue configuration gives you another alternative. The rescue configuration is a configuration you know will allow management access to the router.

Press and immediately release the Config button on the chassis to cause the router to load and commit the rescue configuration. This will put the router back into a manageable state. You must have set the rescue configuration for this feature to function properly.

**View Rescue Configuration**

The rescue configuration for the router has been set. To view the rescue configuration, click the link below.

[View rescue configuration](#)

**Set or Delete Rescue Configuration**

Clicking 'Set rescue configuration' will set the rescue configuration to the current running configuration of the router. Clicking 'Delete rescue configuration' will delete the rescue configuration.

[Set rescue configuration](#)

[Delete rescue configuration](#)

## Using Files

Select **Maintain>Files** in the J-Web interface to manage log, temporary, and core files on the routing platform.

[Table 86 on page 649](#) lists the different tasks that you can perform from the **Maintain > Files** page.

**Table 86: Manage Files Tasks Summary**

Manage Files Task	Functions
<b>Clean Up Files</b>	<p>Rotate log files and delete unnecessary files on the routing platform. If you are running low on storage space, the file cleanup procedure quickly identifies files that can be deleted.</p> <p>The file cleanup procedure performs the following tasks. Click <b>Clean Up Files</b> to begin.</p> <ul style="list-style-type: none"> <li>Rotates log files—All information in the current log files is archived, and fresh log files are created.</li> <li>Deletes log files in <b>/cf/var/log</b>—Any files that are not currently being written to are deleted.</li> <li>Deletes temporary files in <b>/cf/var/tmp</b>—Any files that have not been accessed within two days are deleted.</li> <li>Deletes all crash files in <b>/cf/var/crash</b>—Any core files that the router has written during an error are deleted.</li> </ul> <p>Alternatively, you can rotate log files and display the files that you can delete by entering the <b>request system storage cleanup</b> command at the J-Web CLI terminal. For more information, see <a href="#">“Using the CLI Terminal” on page 601</a>. For more information about the <b>request system storage cleanup</b> command, see <a href="#">CLI Explorer</a>.</p>
<b>Download and Delete Files</b>	<p>Download a copy of an individual file or delete it from the routing platform. When you download a file, it is not deleted from the file system. When you delete the file, it is permanently removed.</p> <p>Click one of the following file types, and then select whether to download or delete a file:</p> <ul style="list-style-type: none"> <li><b>Log Files</b>—Lists the log files located in the <b>/cf/var/log</b> directory on the router.</li> <li><b>Temporary Files</b>—Lists the temporary files located in the <b>/cf/var/tmp</b> directory on the router.</li> <li><b>Old Junos OS</b>—Lists the existing Junos OS packages in the <b>/cf/var/sw</b> directory on the router.</li> <li><b>Crash (Core) Files</b>—Lists the core files located in the <b>/cf/var/crash</b> directory on the router.</li> </ul> <p><b>CAUTION:</b> If you are unsure whether to delete a file from the router, we recommend using the <b>Clean Up Files</b> task, which determines the files that can be safely deleted from the file system.</p>
<b>Delete Backup Junos Package</b>	<p>Delete a backup copy of the previous software installation from the routing platform. When you delete the file, it is permanently removed from the file system.</p> <p>Click <b>Delete backup Junos Package</b> to begin.</p>

## CHAPTER 15

# Troubleshooting

- [J-Web User Interface on page 651](#)
- [Events on page 652](#)
- [Network on page 653](#)

### J-Web User Interface

---

- [Lost Router Connectivity on page 651](#)
- [Unpredictable J-Web Behavior on page 651](#)
- [No J-Web Access on page 652](#)

#### Lost Router Connectivity

- Problem**    **Description:** After completing initial configuration, I lost connectivity to the routing platform through J-Web.
- Cause**      For J Series routers only, after initial configuration is complete, the routing platform stops functioning as a Dynamic Host Configuration Protocol (DHCP) server. If you change the IP address of the management interface and have the management device configured to use DHCP, you lose your DHCP lease and your connection to the routing platform through the J-Web interface.
- Solution**    To reestablish a connection, either set the IP address on the management device manually, or connect the management interface to the management network and access the routing platform another way—for example, through the console port.

#### Unpredictable J-Web Behavior

- Problem**    **Description:** I have multiple J-Web windows open and am experiencing unpredictable results.
- Solution**    Close the extra windows. The routing platform can support multiple J-Web sessions for a single user who logs in to each session. However, if a single user attempts to launch multiple J-Web windows—for example, by right-clicking a link to launch another instance of a Web browser—the session can have unpredictable results.

## No J-Web Access

**Problem**    **Description:** I cannot access J-Web from my browser.

**Solution**    **Solution 1**—On an M Series or T Series router, verify that you have successfully installed the J-Web software package and enabled Web management on the platform, as described in [“Installing the J-Web Software” on page 585](#).

**Solution 2**—If the routing platform is running the worldwide version of the Junos OS and you are using the Microsoft Internet Explorer Web browser, you must disable the **Use SSL 3.0** option in the Web browser to access J-Web on the routing platform.

## Events

- [Troubleshooting Events on page 652](#)

### Troubleshooting Events

**Problem**    **Description:** My View Events page does not display any events. (See [Figure 50 on page 652](#).)

**Figure 50: View Events Page Displaying Error**

The screenshot shows the 'View Events' interface. The 'Events Filter' section includes a 'System Log File' dropdown set to 'messages', an unchecked 'Include archived files' checkbox, 'Date From' and 'To' date pickers both set to '2009-07-17,03:54', and empty 'Event ID' and 'Description' input fields. There are 'Search' and 'Reset' buttons. Below the filter is the 'Events Detail' section, which contains a table with columns: Process, Severity, Event ID, Event Description, and Time. The table is currently empty, displaying the message 'No events match filter condition'. A 'Generate Report' button is located to the right of the table.

**Cause**    Typically, events are not displayed when logging of messages is not enabled. You can enable system log messages at a number of different levels using the J-Web configuration editor or the CLI terminal. The choice of level depends on how specific you want the event logging to be and what options you want to include. For details about the configuration options, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.

**Solution**    To enable system log messages with the J-Web configuration editor:

1. Navigate to **Configuration>View and Edit>Edit Configuration**.
2. Next to System, click **Configure** or **Edit** to navigate to the system level in the configuration hierarchy.
3. Next to Syslog, click **Configure** or **Edit** to navigate to the system log level in the configuration hierarchy.

4. Next to File, click **Add new entry** to create a log file.
5. In the File name box, type **messages** to name the log file.
6. Next to Contents, click **Add new entry** to select a facility that you want to configure—for example, **authorization**, **change-log**, **conflict-log**, or **user**.
7. In the Facility list, select **authorization** to configure the authorization facility.
8. In the Level list, select **info** to set the severity level to informational messages.
9. Repeat Steps 4 and 5 to configure different facilities and their levels.
10. To verify the configuration, at the CLI terminal, enter the **show syslog** command in configuration mode. (See [Figure 51 on page 653](#).)

**Figure 51: Verifying System Log Messages Configuration**

```

CLI Terminal
-----
A Java applet will be loaded below that will provide an SSH connection between your browser and '10.204.92.13'. You will be asked to enter your password again as a security
measure before the CLI console connection is made. If the connection cannot be made, there may be a firewall between your web client and the device blocking SSH traffic, or
you may be using a web proxy server which will allow web traffic to the device, but will not forward SSH traffic.

## Network

- [Using Ping Host on page 653](#)
- [Using Ping MPLS on page 654](#)
- [Using Ping ATM \(M Series, MX Series, and T Series Routing Platforms Only\) on page 656](#)
- [Using Traceroute on page 656](#)
- [Using Packet Capture on page 656](#)
- [Sample Task—Ping Host on page 657](#)

## Using Ping Host

Use the Ping Host page to verify that the host can be reached over the network. The output is useful for diagnosing host and network connectivity problems. The routing

platform sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host to determine:

- Whether a remote host is active or inactive
- The round-trip delay in communicating with the host
- Packet loss

Entering a hostname or address on the Ping Host page creates a periodic ping task that runs until canceled or until it times out as specified. When you use the ping host tool, the routing platform first sends an echo request packet to an address, then waits for a reply. The ping is successful if it has the following results:

- The echo request gets to the destination host.
- The destination host is able to get an echo reply back to the source within a predetermined time called the round-trip time.

Alternatively, you can enter the **ping** command at the J-Web CLI terminal. For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the **ping** command, see [CLI Explorer](#).

Because some hosts are configured not to respond to ICMP echo requests, a lack of responses does not necessarily represent a connectivity problem. Also, some firewalls block the ICMP packet types that ping uses, so you might find that you are not able to ping outside your local network.

## Using Ping MPLS

Use the Ping MPLS page to diagnose the state of label-switched paths (LSPs), Layer 2 and Layer 3 virtual private networks (VPNs), and Layer 2 circuits. You can ping an MPLS endpoint using various options. You can send variations of ICMP echo request packets to the specified MPLS endpoint.

When you use the ping MPLS task from a Junos OS operating as the inbound (ingress) node at the entry point of an LSP or VPN, the routing platform sends probe packets into the LSP or VPN. Based on how the LSP or VPN outbound (egress) node at the remote endpoint of the connection replies to the probes, you can determine the connectivity of the LSP or VPN.

Each probe is an echo request sent to the LSP or VPN exit point as an MPLS packet with a UDP payload. If the outbound node receives the echo request, it checks the contents of the probe and returns a value in the UDP payload of the response packet. If the Junos OS receives the response packet, it reports a successful ping response.

Responses that take longer than 2 seconds are identified as failed probes.

[Table 87 on page 655](#) lists the ping MPLS tasks, summarizes their functions, and identifies corresponding CLI **show** commands you can enter at the J-Web CLI terminal. For more information, see [“Using the CLI Terminal” on page 601](#).

Table 87: Ping MPLS Tasks Summary and the Corresponding CLI show Commands

Ping MPLS Task	Corresponding CLI Command	Function	Additional Information
<b>Ping RSVP-signaled LSP</b>	<b>ping mpls rsvp</b>	Checks the operability of an LSP that has been set up by the Resource Reservation Protocol (RSVP). The Junos OS pings a particular LSP using the configured LSP name.	When an RSVP-signaled LSP has several paths, the Junos OS sends the ping requests on the path that is currently active.
<b>Ping LDP-signaled LSP</b>	<b>ping mpls ldp</b>	Checks the operability of an LSP that has been set up by the Label Distribution Protocol (LDP). The Junos OS pings a particular LSP using the forwarding equivalence class (FEC) prefix and length.	When an LDP-signaled LSP has several gateways, the Junos OS sends the ping requests through the first gateway.  Ping requests sent to LDP-signaled LSPs use only the master routing instance.
<b>Ping LSP to Layer 3 VPN prefix</b>	<b>ping mpls l3vpn</b>	Checks the operability of the connections related to a Layer 3 VPN. The Junos OS tests whether a prefix is present in a provider edge (PE) router's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix.	The Junos OS does not test the connection between a PE router and a customer edge (CE) router.
<b>Ping LSP for a Layer 2 VPN connection by interface</b>	<b>ping mpls l2vpn interface</b>	Checks the operability of the connections related to a Layer 2 VPN. The Junos OS directs outgoing request probes out the specified interface.	For information about interface names, see the <i>Junos OS Interfaces Library for Security Devices</i> .
<b>Ping LSP for a Layer 2 VPN connection by instance</b>	<b>ping mpls l2vpn instance</b>	Checks the operability of the connections related to a Layer 2 VPN. The Junos OS pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, to test the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound and outbound PE routers.	
<b>Ping LSP to a Layer 2 circuit remote site by interface</b>	<b>ping mpls l2circuit interface</b>	Checks the operability of the Layer 2 circuit connections. The Junos OS directs outgoing request probes out the specified interface.	
<b>Ping LSP to a Layer 2 circuit remote site by VCI</b>	<b>ping mpls l2circuit virtual-circuit</b>	Checks the operability of the Layer 2 circuit connections. The Junos OS pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE router, testing the integrity of the Layer 2 circuit between the inbound and outbound PE routers.	

Table 87: Ping MPLS Tasks Summary and the Corresponding CLI show Commands (*continued*)

Ping MPLS Task	Corresponding CLI Command	Function	Additional Information
Ping end point of LSP	<code>ping mpls lsp-end-point</code>	Checks the operability of an LSP endpoint. The Junos OS pings an LSP endpoint using either an LDP FEC prefix or an RSVP LSP endpoint address.	

### Using Ping ATM (M Series, MX Series, and T Series Routing Platforms Only)

On M Series, MX Series, and T Series routers, use the Ping ATM pages to ping an Asynchronous Transfer Mode (ATM) node on an ATM virtual circuit (VC) pathway to verify that the node can be reached over the network. The output is useful for diagnosing ATM node and network connectivity problems. The routing platform sends a series of echo requests to a specified ATM node and receives echo responses.

Alternatively, you can enter the `ping atm` command at the J-Web CLI terminal. For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the `ping atm` command, see [CLI Explorer](#).

### Using Traceroute

Use the Traceroute page to trace a route between the routing platform and a remote host. You can use the traceroute task to display a list of routers between the routing platform and a specified destination host. The output is useful for diagnosing a point of failure in the path from the routing platform to the destination host, and addressing network traffic latency and throughput problems.

The routing platform generates the list of routers by sending a series of ICMP traceroute packets in which the time-to-live (TTL) value in the messages sent to each successive router is incremented by 1. (The TTL value of the first traceroute packet is set to 1.) In this manner, each router along the path to the destination host replies with a Time Exceeded packet from which the source IP address can be obtained.

The routing platform sends a total of three traceroute packets to each router along the path and displays the round-trip time for each traceroute operation. If the routing platform times out before receiving a **Time Exceeded** message, an asterisk (\*) is displayed for that round-trip time.

Alternatively, you can enter the `traceroute` command at the J-Web CLI terminal. For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the `traceroute` command, see [CLI Explorer](#).

### Using Packet Capture

Use the Packet Capture page when you need to quickly capture and analyze router control traffic on a routing platform. The Packet Capture page allows you to capture traffic destined for or originating from the Routing Engine. You can use the packet capture task to compose expressions with various matching criteria to specify the packets that you

want to capture. You can either choose to decode and view the captured packets in the J-Web interface as they are captured, or save the captured packets to a file and analyze them offline with packet analyzers such as Ethereal. The packet capture task does not capture transient traffic.

Alternatively, you can use the CLI **monitor traffic** command at the J-Web CLI terminal to capture and display packets matching a specific criteria. For more information, see [“Using the CLI Terminal” on page 601](#). For more information about the **monitor traffic** command, see [CLI Explorer](#).

To capture transient traffic and entire IPv4 data packets for offline analysis, you must configure packet capture with the J-Web or CLI configuration editor. For details, see the *J-series Services Router Administration Guide*.

## Sample Task—Ping Host

[Figure 52 on page 658](#) shows a sample Ping Host page. In this example, you are sending ping requests to two destination hosts—**10.10.2.2** and **10.10.10.10**. The echo requests reaches **10.10.2.2** and does not reach **10.10.10.10**.

To ping the host:

1. Select **Troubleshoot>Ping Host** from the task bar.
2. Next to Advanced options, click the expand icon (see [Figure 52 on page 658](#)).
3. Next to Remote Host, type **10.10.2.2** to specify the host's IP address.
4. Retain the default values in the following fields:
  - Interface—**any**—Ping requests to be sent on all interfaces.
  - Count—**10**—Number of ping requests to send.
  - Type-of-Service—**0**—TOS value in the IP header of the ping request packet.
  - Routing Instance—**default**—Routing instance name for the ping attempt.
  - Interval—**1**—Interval, in seconds, between the transmission of each ping request.
  - Packet Size—**56**—Size of the ping request packet in bytes. The routing platform adds 8 bytes of ICMP header to this size before sending it.
  - Time-to-Live—**32**—TTL hop count for the ping request packet.
5. Click **Start**.
6. Repeat Steps [2](#) through [5](#) to ping destination host **10.10.10.10**.

Figure 52: Ping Host Troubleshoot Page

**Ping Host**

The ping diagnostic tool sends a series of ICMP "echo request" packets to the specified remote host.

The receipt of such packets will usually result in the remote host replying with an ICMP "echo response." Note that some hosts are configured not to respond to ICMP "echo requests," so a lack of responses does not necessarily represent a connectivity problem. Also, some firewalls block the ICMP packet types that ping uses, so you may find that you are not able to ping outside your local network.

Entering a host below creates a periodic ping task that will run until cancelled or until it times out as specified.

Figure 53 on page 658 displays the results of a successful ping in the main pane, and Table 88 on page 658 provides a summary of the ping host results and output.

Figure 53: Successful Ping Host Results Page

**Ping Host**

**Ping 10.10.2.2**

```

PING 10.10.2.2 (10.10.2.2): 56 data bytes
64 bytes from 10.10.2.2: icmp_seq=0 ttl=58 time=259.730 ms
64 bytes from 10.10.2.2: icmp_seq=1 ttl=58 time=259.555 ms
64 bytes from 10.10.2.2: icmp_seq=2 ttl=58 time=258.501 ms
64 bytes from 10.10.2.2: icmp_seq=3 ttl=58 time=258.516 ms
64 bytes from 10.10.2.2: icmp_seq=4 ttl=58 time=258.547 ms
64 bytes from 10.10.2.2: icmp_seq=5 ttl=58 time=365.037 ms
64 bytes from 10.10.2.2: icmp_seq=6 ttl=58 time=261.953 ms
64 bytes from 10.10.2.2: icmp_seq=7 ttl=58 time=257.491 ms
64 bytes from 10.10.2.2: icmp_seq=8 ttl=58 time=257.492 ms
64 bytes from 10.10.2.2: icmp_seq=9 ttl=58 time=258.303 ms
--- 10.10.2.2 ping statistics ---
10 packets transmitted, 10 packets received, 0% packet loss
round-trip min/avg/max/stddev = 257.491/269.512/365.037/31.865 ms

```

Table 88: J-Web Ping Host Results and Output Summary

Ping Host Result	Description
64 bytes from	Size of ping response packet, which is equal to the default value in the Packet Size box (56), plus 8.
10.10.2.2	IP address of the destination host that sent the ping response packet.

Table 88: J-Web Ping Host Results and Output Summary (continued)

Ping Host Result	Description
icmp_seq=number	Sequence numbers of packets from 0 through 9. You can use this value to match the ping response to the corresponding ping request.
ttl=58	Time-to-live hop-count value of the ping response packet.
259.730 ms	Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
10 packets transmitted, 10 packets received, 0% packet loss	Ping packets transmitted, received, and lost. 10 ping requests (probes) were sent to the host, and 10 ping responses were received from the host. No packets were lost.
257.491/269.512/365.037/31.865 ms	<ul style="list-style-type: none"><li>• 257.491—Minimum round-trip time</li><li>• 269.512—Average round-trip time</li><li>• 365.037—Maximum round-trip time</li><li>• 31.865—Standard deviation of the round-trip times</li><li>• ms—milliseconds</li></ul>

Figure 54 on page 659 shows the output of an unsuccessful ping. There can be different reasons for an unsuccessful ping. This result shows that the local router did not have a route to the host 10.10.10.10 and thus could not reach it.

Figure 54: Unsuccessful Ping Host Results Page

### Secure Web Access Overview

---

You can manage a Juniper Networks device remotely through the J-Web interface. To communicate with the device, the J-Web interface uses the Hypertext Transfer Protocol (HTTP). HTTP allows easy Web access but no encryption. The data that is transmitted between the Web browser and the device by means of HTTP is vulnerable to interception and attack. To enable secure Web access, the Juniper Networks devices support HTTP over Secure Sockets Layer (HTTPS). You can enable HTTP or HTTPS access on specific interfaces and ports as needed.

The Juniper Networks device uses the Secure Sockets Layer (SSL) protocol to provide secure device management through the Web interface. SSL uses public-private key technology that requires a paired private key and an authentication certificate for providing

the SSL service. SSL encrypts communication between your device and the Web browser with a session key negotiated by the SSL server certificate.

An SSL certificate includes identifying information such as a public key and a signature made by a certificate authority (CA). When you access the device through HTTPS, an SSL handshake authenticates the server and the client and begins a secure session. If the information does not match or the certificate has expired, you cannot access the device through HTTPS.

Without SSL encryption, communication between your device and the browser is sent in the open and can be intercepted. We recommend that you enable HTTPS access on your WAN interfaces.

HTTP access is enabled by default on the built-in management interfaces. By default, HTTPS access is supported on any interface with an SSL server certificate.

- [Establishing J-Web Sessions on page 671](#)

### Understanding the User Interfaces

---

You can use two user interfaces to configure, monitor, manage, and troubleshoot your device—the J-Web user interface and the command-line interface (CLI) for Junos OS.

**NOTE:** Other user interfaces facilitate the configuration of one or, in some cases, many devices on the network through a common API. Among the supported interfaces are the Junos Scope and Session and Resource Control (SRC) applications.

You can operate the device either in secure or router context. With the J-Web user interface and the CLI, you configure the routing protocols that run on the device and the device security features, including stateful firewall policies, Network Address Translation (NAT) attack prevention screens, Application Layer Gateways (ALGs), and IPsec VPNs. You

also set the properties of its network interfaces. After activating a software configuration, you can use either user interface to monitor the system and the protocol traffic passing through the device, manage operations, and diagnose protocol and network connectivity problems.

This section contains the following topics:

- [J-Web User Interface on page 665](#)
- [CLI on page 666](#)

### ***J-Web User Interface***

The J-Web user interface allows you to monitor, configure, troubleshoot, and manage your device by means of a Web browser enabled with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS). J-Web provides access to all the configuration statements supported by the device, so you can fully configure it without using the CLI editor.

You can perform the following tasks with the J-Web user interface:

- **Dashboard (SRX Series devices only)**—Views high-level details of Chassis View, system identification, resource utilization, security resources, system alarms, file usage, login sessions, chassis status, threats activity, and storage usage.
- **Configuring**—View the current configurations at a glance, configure the device, and manage configuration files. The J-Web user interface provides the following configuration methods:
  - Edit a graphical version of the Junos OS CLI configuration statements and hierarchy.
  - Edit the configuration in a text file.
  - Upload a configuration file.
  - Use wizards to configure basic setup, firewall, VPN, and NAT settings on SRX100, SRX210, SRX220, SRX240, and SRX650 devices.

The J-Web user interface also allows you to manage configuration history and set a rescue configuration.

- **Monitoring**—Display the current configuration and information about the system, interfaces, chassis, routing protocols, routing tables, routing policy filters, and other features.
- **Managing**—Manage log, temporary, and core (crash) files and schedule reboots on your devices. You can also manage software packages and licenses, and copy a snapshot of the system software to a backup device.
- **Diagnosing**—Diagnose routing problems by running the ping or traceroute diagnostic tool. The diagnostic tools also allow you to capture and analyze control traffic on the devices.

- Configuring and monitoring events—Filter and view system log messages that record events occurring on the device. You can configure files to log system log messages and also assign attributes, such as severity levels, to messages.
- Configuring and monitoring alarms—Monitor and diagnose the device by monitoring active alarms that alert you to the conditions on a network interface. You can also set the conditions that trigger alarms on an interface.

**CLI**

The CLI is a straightforward command-line interface in which you type commands on a line and press Enter to execute them. The CLI provides command Help, command completion, and Emacs-style keyboard sequences for moving around on the command line and scrolling through a buffer of recently executed commands.

The CLI has two modes:

- Operational mode—Complete set of commands to control the CLI environment, monitor and troubleshoot network connectivity, manage the device, and enter configuration mode.
- Configuration mode—Complete set of commands to configure the device. This topic refers to configuration mode as the *CLI configuration editor*.

**Related Documentation**

- [Understanding the J-Web Interface Layout on page 667](#)
- [Getting Help in the J-Web User Interface on page 670](#)
- *CLI User Guide*
- *Administration Guide for Security Devices*

**Starting the J-Web User Interface**

Before you start the user interface, you must perform the initial device configuration described in the Getting Started Guide for your device. After the initial configuration, you use your username and password, and the hostname or IP address of the device, to start the user interface.

[Table 89 on page 666](#) shows the maximum number of concurrent Web sessions on SRX100, SRX210, SRX220, SRX240, and SRX650 devices.

**Table 89: Concurrent Web Sessions on SRX Series Devices**

SRX100	SRX210	SRX220	SRX240	SRX650
3	3	3	5	5

To start the J-Web user interface:

1. Launch your HTTP-enabled or HTTPS-enabled Web browser.

To use HTTPS, you must have installed the certificate provided by the device.

**NOTE:** If the device is running the worldwide version of the Junos OS and you are using the Microsoft Internet Explorer Web browser, you must disable the Use SSL 3.0 option in the Web browser to access the device.

2. Type **http://** or **https://** in your Web browser followed by the hostname or IP address of the device, and press Enter.

The J-Web login page appears.

3. Type your username and password, and click **Log In**.

To correct or change the username or password you typed, click **Reset**, type the new entry or entries, and click **Log In**.

**NOTE:** The default username is **root** with no password. You must change this during initial configuration or the system does not accept the configuration.

To explicitly terminate a J-Web session at any time, click **Logout** in the top pane.

- [Establishing J-Web Sessions on page 671](#)
- [Administration Guide for Security Devices](#)

### Understanding the J-Web Interface Layout

The top pane of the J-Web user interface comprises the following elements:

- *hostname—model*—The hostname and model of the device are displayed in the upper-left corner.
- Logged in as: *username*—The username you used to log in to the device is displayed in the upper-left corner.
- Chassis—The chassis view of the device.
- Commit Options—A set of global options that allow you to commit multiple changes at the same time.

- **Commit**—Commits the candidate configuration of the current user session, along with changes from other user sessions.
- **Compare**—Displays the XML log of pending uncommitted configurations on the device.
- **Discard**—Discards the candidate configuration of the current user session, along with changes from other user sessions.
- **Preference**—Indicates your choice of committing all global configurations together or committing each configuration change immediately. The two behavior modes to which you can set your commit options are:
  - **Validate and commit configuration changes**—Sets the system to force an immediate commit on every screen after every configuration change.
  - **Validate configuration changes**—Loads all the configuration changes for an accumulated single commit. If there are errors in loading the configuration, the errors are logged. This is the default mode.
- **Help**—Links to information on Help and the J-Web user interface.
  - **Help Contents**—Displays context-sensitive Help topics.
  - **About**—Displays information about the J-Web user interface, such as the version number.
- **Logout**—The Logout link, which ends your current login session and returns you to the login page, is available in the upper-right corner.
- **Taskbar**—A menu of J-Web tasks is displayed as tabs across the top of the J-Web user interface. Select a tab to access a task.
  - **Dashboard**—Displayd current activity on the system.
  - **Configure**—Configures the device and views configuration history.
  - **Monitor**—Displays information about configuration and hardware on the device.
  - **Maintain**—Manages files and licenses, upgrades software, and reboots the device.
  - **Troubleshoot**—Troubleshoots network connectivity problems.

The main pane of the J-Web user interface includes the following elements to help you configure the device:

- **Red asterisk (\*)**—Appears next to all required fields.
- **Help (?) icon**—Displays useful information when you move the cursor over the question mark. This Help displays field-specific information, such as the definition, format, and valid range of the field.

The left pane of the J-Web user interface displays subtasks related to the selected task in the J-Web taskbar.

## Related Documentation

- [Establishing J-Web Sessions on page 671](#)
- *Administration Guide for Security Devices*

### J-Web Commit Options Guidelines

Using the J-Web Commit Preference, you can configure the commit options either to commit all global configurations together or to commit each configuration change immediately. Do one of the following to commit a configuration:

- Set Commit Preference to **Validate and commit configuration changes**, and then click **OK**.
- Set Commit Preference to **Validate configuration changes**, click **OK** to check your configuration and save it as a candidate configuration, and then click **Commit Options>Commit**.

For example, suppose you want to delete a firewall and add a new one.

- If Commit Preference is set to **Validate and commit configuration changes**, then you would need to commit your changes twice for each action.
- If Commit Preference is set to **Validate configuration changes**, then you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible through the user interface immediately, allowing other users to edit those configurations, but the changes do not take effect on the device platform until you commit them. When you commit the configuration, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration when you commit the candidate configuration, changes made by all the users take effect.

You use the single commit feature to commit all your configurations in J-Web simultaneously. This helps to reduce the time J-Web takes to commit configurations because when changes are committed at every step, rollback configurations pile up quickly.

**NOTE:** If you end a session with a particular Commit Preference, the subsequent sessions for that particular browser will automatically come up with the preference you previously selected. If you start the subsequent session on a different browser, the session will come up with the default commit preference.

**NOTE:** There are some pages whose configurations would need to be committed immediately. For such pages, even if you configure the commit options to perform a single global commit for them, the system displays appropriate information notification windows to remind you to commit your changes immediately. Examples of such pages are Switching, Interfaces, and Class of Service.

---

### Getting Help in the J-Web User Interface

To get Help in the J-Web user interface, use the following methods:

- **Field-sensitive Help**—Move the cursor over the question mark (?) next to the field for which you want more information. Typically, this Help includes one line of information about what this field does or what you must enter in a given text box. For example, Help for the Peer Autonomous System Number text box states, “The value should be a number between 1 and 65535.”
- **Context-sensitive Help**—Click **Help** in the taskbar to open a separate page displaying the summary of all the fields on that page. To exit Help, close the page. You can navigate Help pages using hypertext links connecting related topics, or click the following options (if available) at the top and bottom of each page.
  - **Prev**—Access the previous page.
  - **Next**—Access the next page.
  - **Report an Error**—Access a form for providing feedback.
- **Wizard Help** (SRX100, SRX210, SRX220, SRX240, and SRX650)—Use the Firewall Policy, VPN, and NAT wizards to perform basic configurations. Click a field in a wizard page to display information about that field in the lower left corner of the wizard page.

- *Administration Guide for Security Devices*

### Establishing J-Web Sessions

---

You establish a J-Web session through an HTTP-enabled or HTTPS-enabled Web browser. The HTTPS protocol, which uses 128-bit encryption, is available only in domestic versions of the Junos OS. To use HTTPS, you must have installed the certificate provided by the device.

When you attempt to log in through the J-Web interface, the system authenticates your username with the same methods used for Telnet and SSH.

The device can support multiple J-Web sessions for a single user who logs in to each session. However, if a single user attempts to launch multiple J-Web *windows*—for example, by right-clicking a link to launch another instance of a Web browser—the session can have unpredictable results.

If the device does not detect any activity through the J-Web user interface for 15 minutes, the session times out and is terminated. You must log in again to begin a new session.

To explicitly terminate a J-Web session at any time, click **Logout** in the top pane.

## User Authentication and Access

- [Understanding User Authentication Methods on page 671](#)
- [Understanding User Accounts on page 672](#)
- [Understanding Login Classes on page 673](#)
- [Understanding Template Accounts on page 676](#)

### Understanding User Authentication Methods

---

Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log into the device.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the device using Telnet. Both are distributed client/server systems—the RADIUS and TACACS+ clients run on the device, and the server runs on a remote network system.

You can configure the device to use RADIUS or TACACS+ authentication, or both, to validate users who attempt to access the device. If you set up both authentication methods, you also can configure which method the device will try first.

**Related  
Documentation**

- [Understanding User Accounts on page 672](#)
- [Understanding Login Classes on page 673](#)
- [Understanding Template Accounts on page 676](#)
- *Administration Guide for Security Devices*

---

### Understanding User Accounts

User accounts provide one way for users to access the device. Users can access the device without accounts if you configured RADIUS or TACACS+ servers. After you have created an account, the device creates a home directory for the user. An account for the user **root** is always present in the configuration. For each user account, you can define the following:

- Username—Name that identifies the user. It must be unique within the device. Do not include spaces, colons, or commas in the username.
- User's full name—If the full name contains spaces, enclose it in quotation marks (" "). Do not include colons or commas.
- User identifier (UID)—Numeric identifier that is associated with the user account name. The identifier range from 100 through 64,000 and must be unique within the device. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.
- User's access privilege—You can create login classes with specific permission bits or use one of the predefined classes.
- Authentication method or methods and passwords that the user can use to access the device—You can use SSH or an MD5 password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. If you configure the plain-text-password option, you are prompted to enter and confirm the password.

- [Example: Configuring Authentication Order on page 900](#)
- *Administration Guide for Security Devices*

### Understanding Login Classes

All users who log into the device must be in a login class. You can define any number of login classes. You then apply one login class to an individual user account. With login classes, you define the following:

- Access privileges users have when they are logged into the device.
- Commands and statements that users can and cannot specify.
- How long a login session can be idle before it times out and the user is logged off.

[Table 90 on page 673](#) contains a few predefined login classes. The predefined login classes cannot be modified.

**Table 90: Predefined Login Classes**

Login Class	Permission Bits Set
operator	clear, network, reset, trace, view
read-only	view
super-user and superuser	all
unauthorized	None

This section contains the following topics:

- [Permission Bits on page 673](#)
- [Denying or Allowing Individual Commands on page 675](#)

#### **Permission Bits**

Each top-level command-line interface (CLI) command and each configuration statement has an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more permission bits (see [Table 91 on page 674](#)).

Two forms for the permissions control the individual parts of the configuration:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

Table 91: Permission Bits for Login Classes

Permission Bit	Access
<b>admin</b>	Can view user account information in configuration mode and with the <b>show configuration</b> command.
<b>admin-control</b>	Can view user accounts and configure them (at the <b>[edit system login]</b> hierarchy level).
<b>access</b>	Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>access-control</b>	Can view and configure access information (at the <b>[edit access]</b> hierarchy level).
<b>all</b>	Has all permissions.
<b>clear</b>	Can clear (delete) information learned from the network that is stored in various network databases (using the <b>clear</b> commands).
<b>configure</b>	Can enter configuration mode (using the <b>configure</b> command) and commit configurations (using the <b>commit</b> command).
<b>control</b>	Can perform all control-level operations (all operations configured with the <b>-control</b> permission bits).
<b>field</b>	Reserved for field (debugging) support.
<b>firewall</b>	Can view the firewall filter configuration in configuration mode.
<b>firewall-control</b>	Can view and configure firewall filter information (at the <b>[edit firewall]</b> hierarchy level).
<b>floppy</b>	Can read from and write to the removable media.
<b>interface</b>	Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>interface-control</b>	Can view chassis, class of service, groups, forwarding options, and interfaces configuration information. Can configure chassis, class of service, groups, forwarding options, and interfaces (at the <b>[edit]</b> hierarchy).
<b>maintenance</b>	Can perform system maintenance, including starting a local shell on the device and becoming the superuser in the shell (by issuing the <b>su root</b> command), and can halt and reboot the device (using the <b>request system</b> commands).
<b>network</b>	Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>reset</b>	Can restart software processes using the <b>restart</b> command and can configure whether software processes are enabled or disabled (at the <b>[edit system processes]</b> hierarchy level).
<b>rollback</b>	Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.

Table 91: Permission Bits for Login Classes (*continued*)

Permission Bit	Access
<b>routing</b>	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
<b>routing-control</b>	Can view general routing, routing protocol, and routing policy configuration information and configure general routing (at the <b>[edit routing-options]</b> hierarchy level), routing protocols (at the <b>[edit protocols]</b> hierarchy level), and routing policy (at the <b>[edit policy-options]</b> hierarchy level).
<b>secret</b>	Can view passwords and other authentication keys in the configuration.
<b>secret-control</b>	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
<b>security</b>	Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>security-control</b>	Can view and configure security information (at the <b>[edit security]</b> hierarchy level).
<b>shell</b>	Can start a local shell on the device by entering the <b>start shell</b> command.
<b>snmp</b>	Can view SNMP configuration information in configuration and operational modes.
<b>snmp-control</b>	Can view SNMP configuration information and configure SNMP (at the <b>[edit snmp]</b> hierarchy level).
<b>system</b>	Can view system-level information in configuration and operational modes.
<b>system-control</b>	Can view system-level configuration information and configure it (at the <b>[edit system]</b> hierarchy level).
<b>trace</b>	Can view trace file settings in configuration and operational modes.
<b>trace-control</b>	Can view trace file settings and configure trace file properties.
<b>view</b>	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics.

***Denying or Allowing Individual Commands***

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that are otherwise permitted or not allowed by a permission bit.

- [Understanding User Accounts on page 672](#)

- [Understanding Template Accounts on page 676](#)
- [Example: Configuring New Users on page 902](#)
- *Administration Guide for Security Devices*

---

### Understanding Template Accounts

You use local user template accounts when you need different types of templates. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the device and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is authenticated, the server returns the local username to the device, which then determines whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, the device selects the appropriate local user template locally configured on the device. If a local user template does not exist for the authenticated user, the device defaults to the **remote** template.

## USB Modems for Remote Management Setup

- [USB Modem Interface Overview on page 676](#)
- [USB Modem Configuration Overview on page 679](#)

---

### USB Modem Interface Overview

Juniper Networks devices support the use of USB modems for remote management. You can use Telnet or SSH to connect to the device from a remote location through two modems over a telephone network. The USB modem is connected to the USB port on the device, and a second modem is connected to a remote management device such as a PC or laptop computer.

You can configure your device to fail over to a USB modem connection when the primary Internet connection experiences interruption.

A USB modem connects to a device through modem interfaces that you configure. The device applies its own modem AT commands to initialize the attached modem. Modem setup requires that you connect and configure the USB modem at the device and the modem at the user end of the network.

You use either the J-Web configuration editor or CLI configuration editor to configure the USB modem and its supporting dialer interfaces.

**NOTE:** Low-latency traffic such as VoIP traffic is not supported over USB modem connections.

**NOTE:** We recommend using a US Robotics USB 56k V.92 Modem, model number USR Model 5637.

### **USB Modem Interfaces**

You configure two types of interfaces for USB modem connectivity:

- A physical interface which uses the naming convention **umd0**. The device creates this interface when a USB modem is connected to the USB port.
- A logical interface called the dialer interface. You use the dialer interface, **dln**, to configure dialing properties for USB modem connections. The dialer interface can be configured using Point-to-Point Protocol (PPP) encapsulation. You can also configure the dialer interface to support authentication protocols—PPP Challenge Handshake (CHAP) or Password Authentication Protocol (PAP). You can configure multiple dialer interfaces for different functions on the device. After configuring the dialer interface, you must configure a backup method such as a dialer backup, a dialer filter, or a dialer watch.

The USB modem provides a dial-in remote management interface, and supports dialer interface features by sharing the same dial pool as a dialer interface. The dial pool allows the logical dialer interface and the physical interface to be bound together dynamically on a per-call basis. You can configure the USB modem to operate either as a dial-in console for management or as a dial-in WAN backup interface. Dialer pool priority has a range from 1 to 255, with 1 designating the lowest priority interfaces and 255 designating the highest priority interfaces.

### **Dialer Interface Rules**

The following rules apply when you configure dialer interfaces for USB modem connections:

- The dialer interface must be configured to use PPP encapsulation. You cannot configure Cisco High-Level Data Link Control (HDLC) or Multilink PPP (MLPPP) encapsulation on dialer interfaces.
- The dialer interface cannot be configured as a constituent link in a multilink bundle.
- The dialer interface can perform backup, dialer filter, and dialer watch functions, but these operations are mutually exclusive. You can configure a single dialer interface to operate in only one of the following ways:
  - As a backup interface—for one primary interface
  - As a dialer filter

- As a dialer watch interface

The backup dialer interfaces are activated only when the primary interface fails. USB modem backup connectivity is supported on all interfaces except `lsq-0/0/0`.

The dial-on-demand routing backup method allows a USB modem connection to be activated only when network traffic configured as an “interesting packet” arrives on the network. Once the network traffic is sent, an inactivity timer is triggered and the connection is closed. You define an interesting packet using the dialer filter feature of the device. To configure dial-on-demand routing backup using a dialer filter, you first configure the dialer filter and then apply the filter to the dialer interface.

Dialer watch is a backup method that integrates backup dialing with routing capabilities and provides reliable connectivity without relying on a dialer filter to trigger outgoing USB modem connections. With dialer watch, the device monitors the existence of a specified route. If the route disappears, the dialer interface initiates the USB modem connection as a backup connection.

#### ***How the Device Initializes USB Modems***

When you connect the USB modem to the USB port on the device, the device applies the modem AT commands configured in the `init-command-string` command to the initialization commands on the modem.

If you do not configure modem AT commands for the `init-command-string` command, the device applies the following default sequence of initialization commands to the modem: `AT S7=45 S0=0 V1 X4 &C1 E0 Q0 &Q8 %C0`. [Table 92 on page 678](#) describes the commands. For more information about these commands, see the documentation for your modem.

**Table 92: Default Modem Initialization Commands**

Modem Command	Description
<code>AT</code>	Attention. Informs the modem that a command follows.
<code>S7=45</code>	Instructs the modem to wait 45 seconds for a telecommunications service provider (carrier) signal before terminating the call.
<code>S0=0</code>	Disables the auto answer feature, whereby the modem automatically answers calls.
<code>V1</code>	Displays result codes as words.
<code>&amp;C1</code>	Disables reset of the modem when it loses the carrier signal.
<code>E0</code>	Disables the display on the local terminal of commands issued to the modem from the local terminal.
<code>Q0</code>	Enables the display of result codes.
<code>&amp;Q8</code>	Enables Microcom Networking Protocol (MNP) error control mode.

Table 92: Default Modem Initialization Commands (*continued*)

Modem Command	Description
%C0	Disables data compression.

When the device applies the modem AT commands in the **init-command-string** command or the default sequence of initialization commands to the modem, it compares them to the initialization commands already configured on the modem and makes the following changes:

- If the commands are the same, the device overrides existing modem values that do not match. For example, if the initialization commands on the modem include **S0=0** and the device's **init-command-string** command includes **S0=2**, the device applies **S0=2**.
- If the initialization commands on the modem do not include a command in the device's **init-command-string** command, the device adds it. For example, if the **init-command-string** command includes the command **L2**, but the modem commands do not include it, the device adds **L2** to the initialization commands configured on the modem.

#### Related Documentation

- [USB Modem Configuration Overview on page 679](#)
- [Example: Configuring a USB Modem Interface on page 699](#)
- [Example: Configuring a Dialer Interface for USB Modem Dial-In on page 705](#)
- *Administration Guide for Security Devices*
- *Modem Interfaces Feature Guide for Security Devices*

#### USB Modem Configuration Overview

Before you begin:

1. Install device hardware. For more information, see the Getting Started Guide for your device.
2. Establish basic connectivity. For more information, see the Getting Started Guide for your device.
3. Order a US Robotics USB 56k V.92 Modem, model number USR Model 5637 from US Robotics (<http://www.usr.com/>).
4. Order a public switched telephone network (PSTN) line from your telecommunications service provider. Contact your service provider for more information.
5. Connect the USB modem to the device's USB port.

**NOTE:** J Series devices have two USB ports. However, you can connect only one USB modem to the USB ports on these devices. If you connect USB modems to both ports, the device detects only the first modem connected.

**NOTE:** When you connect the USB modem to the USB port on the device, the USB modem is initialized with the modem initialization string configured for the USB modem interface on the device.

- a. Plug the modem into the USB port.
- b. Connect the modem to your telephone network.

Suppose you have a branch office router and a head office router each with a USB modem interface and a dialer interface. This example shows you how to establish a backup connection between the branch office and head office routers. See [Table 93 on page 680](#) for a summarized description of the procedure.

**Table 93: Configuring Branch Office and Head Office Routers for USB Modem Backup Connectivity**

Router Location	Configuration Requirement	Procedure
Branch Office	Configure the logical dialer interface on the branch office router for USB modem dial backup.	To configure the logical dialer interface, see <a href="#">"Example: Configuring a USB Modem Interface"</a> on page 699.
	Configure the dialer interface <b>dl0</b> on the branch office router using one of the following backup methods: <ul style="list-style-type: none"> <li>Configure the dialer interface <b>dl0</b> as the backup interface on the branch office router's primary T1 interface <b>t1-1/0/0</b>.</li> <li>Configure a dialer filter on the branch office router's dialer interface.</li> <li>Configure a dialer watch on the branch office router's dialer interface.</li> </ul>	Configure the dialer interface using one of the following backup methods: <ul style="list-style-type: none"> <li>To configure <b>dl0</b> as a backup for <b>t1-1/0/0</b> see <a href="#">Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup</a>.</li> <li>To configure a dialer filter on <b>dl0</b>, see <a href="#">Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup</a>.</li> <li>To configure a dialer watch on <b>dl0</b>, see <a href="#">Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup</a>.</li> </ul>
Head Office	Configure dial-in on the dialer interface <b>dl0</b> on the head office router.	To configure dial-in on the head office router, see <a href="#">"Example: Configuring a Dialer Interface for USB Modem Dial-In"</a> on page 705.

If the dialer interface is configured to accept only calls from a specific caller ID, the device matches the incoming call's caller ID against the caller IDs configured on its dialer

interfaces. If an exact match is not found and the incoming call's caller ID has more digits than the configured caller IDs, the device performs a right-to-left match of the incoming call's caller ID with the configured caller IDs and accepts the incoming call if a match is found. For example, if the incoming call's caller ID is 4085321091 and the caller ID configured on a dialer interface is 5321091, the incoming call is accepted. Each dialer interface accepts calls from only callers whose caller IDs are configured on it.

See [Table 94 on page 681](#) for a list of available incoming map options.

**Table 94: Incoming Map Options**

Option	Description
<b>accept-all</b>	<p>Dialer interface accepts all incoming calls.</p> <p>You can configure the <b>accept-all</b> option for only one of the dialer interfaces associated with a USB modem physical interface. The dialer interface with the <b>accept-all</b> option configured is used only if the incoming call's caller ID does not match the caller IDs configured on other dialer interfaces.</p>
<b>caller</b>	<p>Dialer interface accepts calls from a specific caller ID. You can configure a maximum of 15 caller IDs per dialer interface.</p> <p>The same caller ID must not be configured on different dialer interfaces. However, you can configure caller IDs with more or fewer digits on different dialer interfaces. For example, you can configure the caller IDs 14085551515, 4085551515, and 5551515 on different dialer interfaces.</p>

You configure dialer interfaces to support PAP. PAP allows a simple method for a peer to establish its identity using a two-way handshake during initial link establishment. After the link is established, an ID and password pair are repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

## Telnet and SSH Device Control

- [Securing the Console Port Configuration Overview on page 681](#)
- [Reverse Telnet Overview on page 683](#)

### Securing the Console Port Configuration Overview

You can use the console port on the device to connect to the device through an RJ-45 serial cable. From the console port, you can use the CLI to configure the device. By default, the console port is enabled. To secure the console port, you can configure the device to take the following actions:

- Log out of the console session when you unplug the serial cable connected to the console port.
- Disable root login connections to the console. This action prevents a non-root user from performing password recovery operation using the console.
- Disable the console port. We recommend disabling the console port to prevent unauthorized access to the device, especially when the device is used as customer premises equipment (CPE) and is forwarding sensitive traffic.

**NOTE:** It is not always possible to disable the console port, because console access is important during operations such as software upgrades.

To secure the console port:

1. Do one of the following:

- Disable the console port. Enter

```
[edit system ports console]
user@host# set disable
```

- Disable root login connections to the console. Enter

```
[edit system ports console]
user@host# set insecure
```

**NOTE:** After configuring the console port as insecure, if a user tries to perform password recovery operation by booting in single-user mode, the device will prompt for the root password. This way, the user will be unable to log into single-user mode for password recovery unless the root password is known.

- Log out of the console session when the serial cable connected to the console port is unplugged. Enter

```
[edit system ports console]
user@host# set log-out-on-disconnect
```

2. If you are done configuring the device, enter **commit** from configuration mode.

#### Related Documentation

- [Configuring Password Retry Limits for Telnet and SSH Access on page 923](#)
- [Reverse Telnet Overview on page 683](#)
- [Configuring Reverse Telnet and Reverse SSH on page 924](#)
- [Administration Guide for Security Devices](#)

## Reverse Telnet Overview

Reverse telnet allows you to configure a device to listen on a specific port for Telnet and SSH services. When you connect to that port, the device provides an interface to the auxiliary port on the device. You use a rollover cable to connect the auxiliary port from the device on which reverse telnet is enabled to the console port of the device you want to manage.

**NOTE:** Reverse telnet is supported only on J Series devices.

To use reverse telnet, you must have the following devices:

- A device with an auxiliary port running the appropriate version of Junos OS.
- A device with a console port for remote management if network connectivity fails and you want to use console access.

This section contains the following topics:

- [Reverse Telnet Options on page 683](#)
- [Reverse Telnet Restrictions on page 683](#)

### Reverse Telnet Options

When you enable reverse telnet, you can control the port that is used, and you can optionally turn on reverse ssh to encrypt the reverse telnet communication between the device and the client. By default, reverse telnet uses port 2900 and reverse ssh uses port 2901.

**NOTE:** Enabling reverse ssh requires an additional command. By default, when you enable reverse telnet, the connection is not encrypted.

### Reverse Telnet Restrictions

Keep the following restrictions in mind when you attempt to use reverse telnet or reverse ssh:

- Multiple connections to the serial port are not allowed. If there is an existing connection to the serial port, any other connections are denied.
- If the auxiliary port is enabled (through the **system services port auxiliary** configuration statement), you cannot use reverse telnet or reverse ssh because another service is already using the auxiliary port.

#### Related Documentation

## DHCP for IP Address Device

- [DHCP Server, Client, and Relay Agent Overview on page 684](#)
- [DHCP Configuration Overview on page 685](#)
- [Understanding DHCP Server Operation on page 686](#)
- [Understanding DHCP Client Operation on page 687](#)
- [Understanding DHCP Relay Agent Operation on page 687](#)
- [DHCP Settings and Restrictions Overview on page 688](#)
- [Understanding DHCP Services in a Routing Instance on page 689](#)

### DHCP Server, Client, and Relay Agent Overview

---

A Dynamic Host Configuration Protocol (DHCP) server can automatically allocate IP addresses and also deliver configuration settings to client hosts on a subnet. DHCP lets network administrators centrally manage a pool of IP addresses among hosts and automate the assignment of IP addresses in a network. An IP address can be leased to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses among a group of hosts that do not need permanent IP addresses.

The Juniper Networks device acts as the DHCP server, providing IP addresses and settings to hosts, such as PCs, that are connected to device interfaces. The DHCP server is compatible with the DHCP servers of other vendors on the network.

The device can also operate as a DHCP client and DHCP relay agent.

DHCP is based on BOOTP, a bootstrap protocol that allows a client to discover its own IP address, the IP address of a server host, and the name of a bootstrap file. DHCP servers can handle requests from BOOTP clients, but provide additional capabilities beyond BOOTP, such as the automatic allocation of reusable IP addresses and additional configuration options.

**NOTE:** Although a Juniper Networks device can act as a DHCP server, a DHCP client, or DHCP relay agent at the same time, you cannot configure more than one DHCP role on a single interface.

---

DHCP provides two primary functions:

- Allocate temporary or permanent IP addresses to clients.
- Store, manage, and provide client configuration parameters.

#### Related Documentation

- [DHCP Configuration Overview on page 685](#)
- [Understanding DHCP Server Operation on page 686](#)

- *Administration Guide for Security Devices*

### DHCP Configuration Overview

A typical DHCP server configuration provides the following configuration settings for a particular subnet on a device interface:

- An IP address pool, with one address excluded from the pool.
- Default and maximum lease times.
- Domain search suffixes. These suffixes specify the domain search list used by a client when resolving hostnames with DNS.
- A DNS name server.
- Device solicitation address option (option 32). The IP address excluded from the IP address pool is reserved for this option.

In addition, the DHCP server might assign a static address to at least one client on the subnet. [Table 95 on page 685](#) provides the settings and values for the sample DHCP server configuration.

**Table 95: Sample DHCP Configuration Settings**

Setting	Sample Value
<b>DHCP Subnet Configuration</b>	
Address pool subnet address	192.168.2.0/24
High address in the pool range	192.168.2.254
Low address in the pool range	192.168.2.2
Address pool default lease time, in seconds	1,209,600 (14 days)
Address pool maximum lease time, in seconds	2,419,200 (28 days)
Domain search suffixes	mycompany.net mylab.net
Address to exclude from the pool	192.168.2.33
DNS server address	192.168.10.2
Identifier code for router solicitation address option	32
Type choice for router solicitation address option	Ip address

**Table 95: Sample DHCP Configuration Settings (*continued*)**

Setting	Sample Value
IP address for router solicitation address option	192.168.2.33
<b>DHCP MAC Address Configuration</b>	
Static binding MAC address	01:03:05:07:09:0B
Fixed address	192.168.2.50

**Related Documentation**

- [DHCP Server, Client, and Relay Agent Overview on page 684](#)
- [Understanding DHCP Server Operation on page 686](#)
- [Understanding DHCP Client Operation on page 687](#)
- [Understanding DHCP Relay Agent Operation on page 687](#)
- [RFC 3397, Dynamic Host Configuration Protocol \(DHCP\) Domain Search Option](#)
- [Administration Guide for Security Devices](#)

**Understanding DHCP Server Operation**

As a DHCP server, a Juniper Networks device can provide temporary IP addresses from an IP address pool to all clients on a specified subnet, a process known as dynamic binding. Juniper Networks devices can also perform static binding, assigning permanent IP addresses to specific clients based on their media access control (MAC) addresses. Static bindings take precedence over dynamic bindings.

**NOTE:** The DHCP requests received on an interface are associated to a DHCP pool that is in the same subnet as the primary IP address/subnet on an interface. If an interface is associated with multiple IP addresses/subnets, the device uses the lowest numerically assigned IP address as the primary IP address/subnet for the interface. To change the IP address/subnet that is listed as the primary address on an interface, use the `set interfaces < interface name > unit 0 family inet xxx.xxx.xxx.xxx/yy primary` command and commit the change.

This section contains the following topics:

- [DHCP Options on page 686](#)
- [Compatibility with Autoinstallation on page 687](#)

**DHCP Options**

In addition to its primary DHCP server functions, you can also configure the device to send configuration settings like the following to clients through DHCP:

- IP address of the DHCP server (Juniper Networks device)
- List of Domain Name System (DNS) and NetBIOS servers
- List of gateway routers
- IP address of the boot server and the filename of the boot file to use
- DHCP options defined in RFC 2132, *DHCP Options and BOOTP Vendor Extensions*

### **Compatibility with Autoinstallation**

The functions of a Juniper Networks device acting as a DHCP server are compatible with the autoinstallation feature. The DHCP server automatically checks any autoinstallation settings for conflicts and gives the autoinstallation settings priority over corresponding DHCP settings. For example, an IP address set by autoinstallation takes precedence over an IP address set by the DHCP server.

#### **Related Documentation**

- [DHCP Server, Client, and Relay Agent Overview on page 684](#)
- [Example: Configuring the Device as a DHCP Server on page 709](#)
- [Understanding DHCP Client Operation on page 687](#)
- [Understanding DHCP Relay Agent Operation on page 687](#)
- *Administration Guide for Security Devices*

### **Understanding DHCP Client Operation**

---

A Juniper Networks device can act as a DHCP client, receiving its TCP/IP settings and the IP address for any physical interface in any security zone from an external DHCP server. The device can also act as a DHCP server, providing TCP/IP settings and IP addresses to clients in any zone. When the device operates as a DHCP client and a DHCP server simultaneously, it can transfer the TCP/IP settings learned through its DHCP client module to its default DHCP server module. For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP server in the network. You set the vendor class ID, lease time, DHCP server address, retransmission attempts, and retry interval. You can renew DHCP client releases.

#### **Related Documentation**

- [DHCP Server, Client, and Relay Agent Overview on page 684](#)
- [Example: Configuring the Device as a DHCP Client on page 714](#)
- [Understanding DHCP Relay Agent Operation on page 687](#)
- [DHCP Settings and Restrictions Overview on page 688](#)
- *Administration Guide for Security Devices*

### **Understanding DHCP Relay Agent Operation**

---

A Juniper Networks device operating as a DHCP relay agent forwards incoming requests from BOOTP and DHCP clients to a specified BOOTP or DHCP server. Client requests can pass through virtual private network (VPN) tunnels.

Although a Juniper Networks device can act as a DHCP server, a DHCP client, or DHCP relay agent at the same time, you cannot configure more than one DHCP role on a single interface.

DHCP relay operations are supported on all SRX Series devices in chassis cluster mode.

### DHCP Settings and Restrictions Overview

This section contains the following topics:

- [Propagation of TCP/IP Settings for DHCP on page 688](#)
- [DHCP Conflict Detection and Resolution on page 688](#)
- [DHCP Interface Restrictions on page 689](#)

#### ***Propagation of TCP/IP Settings for DHCP***

The Juniper Networks device can operate simultaneously as a client of the DHCP server in the untrust zone and a DHCP server to the clients in the trust zone. The device takes the TCP/IP settings that it receives as a DHCP client and forwards them as a DHCP server to the clients in the trust zone. The device interface in the untrust zone operates as the DHCP client, receiving IP addresses dynamically from an Internet service provider (ISP) on the external network.

During the DHCP protocol exchange, the device receives TCP/IP settings from the external network on its DHCP client interface. Settings include the address of the ISP's DHCP name server and other server addresses. These settings are propagated to the DHCP server pools configured on the device to fulfill host requests for IP addresses on the device's internal network.

#### ***DHCP Conflict Detection and Resolution***

A client that receives an IP address from the device operating as a DHCP server performs a series of Address Resolution Protocol (ARP) tests to verify that the address is available and no conflicts exist. If the client detects an address conflict, it informs the DHCP server about the conflict and can request another IP address from the DHCP server.

The device maintains a log of all client-detected conflicts and removes addresses with conflicts from the DHCP address pool. To display the conflicts list, you use the **show system services dhcp conflict** command. The addresses in the conflicts list remain excluded until you use the **clear system services dhcp conflict** command to manually clear the list.

**DHCP Interface Restrictions**

The device supports DHCP client requests received on any Ethernet interface. DHCP requests received from a relay agent are supported on all interface types.

DHCP is not supported on interfaces that are part of a virtual private network (VPN).

**Related Documentation**

- [DHCP Server, Client, and Relay Agent Overview on page 684](#)
- [Understanding DHCP Server Operation on page 686](#)
- [Understanding DHCP Client Operation on page 687](#)
- [Understanding DHCP Relay Agent Operation on page 687](#)
- [Administration Guide for Security Devices](#)

**Understanding DHCP Services in a Routing Instance**

The Dynamic Host Configuration Protocol (DHCP) can serve as a DHCP local server, a DHCP client, or a DHCP relay agent.

**DHCP Local Server**

You can enable an SRX Series device to function as a DHCP local server, and then configure its options on the device. The DHCP local server provides an IP address and other configuration information in response to a client request.

To configure the DHCP local server on the device, include the **dhcp-local-server** statement at the **[edit system services]** hierarchy level.

**NOTE:** You cannot configure the DHCP local server and the DHCP relay agent on the same interface.

**DHCP Client, DHCP Local Server, and Address-Assignment Pool Interaction**

In a typical branch network configuration, the DHCP client is on the subscriber's computer, and the DHCP local server is configured on the device. The following steps provide a high-level description of the interaction among the DHCP client, DHCP local server, and address-assignment pools.

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber.
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.

3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server and client installs the host route and ARP entry, and then monitors the lease state.

### ***DHCP Local Server and Address-Assignment Pools***

In a DHCP local server operation, the client address and configuration information reside in centralized address-assignment pools, that are managed independently from the DHCP local server and they can be shared by different client applications.

Configuring a DHCP environment that includes a DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the DHCP local server on the device and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients.

**NOTE:** The DHCP local server and the address-assignment pools used by the server must be configured in the same routing instance.

---

### ***DHCP Client***

DHCP configuration consists of configuring DHCP clients and a DHCP local server. A client configuration determines how clients send a message requesting an IP address, while a server configuration enables the server to send an IP address back to the client.

For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP local server in the network. You set the vendor class ID, lease time, DHCP server address, retransmission attempts, and retry interval.

### ***DHCP Relay Agent***

You can configure DHCP relay options on the device and enable the device to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP local server.

To configure the DHCP relay agent on the router, include the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level.

You can also include the **dhcp-relay** statement at the following hierarchy level:

**[edit routing-instances routing-instance-name forwarding-options]**

### ***DHCP Client, DHCP Relay Agent, and DHCP Local Servers***

In a typical branch network configuration, the DHCP client is on the subscriber's computer, and the DHCP relay agent is configured on the device between the DHCP client and one or more DHCP local servers.

The following steps describe, at a high level, how the DHCP client, DHCP relay agent, and DHCP local server interact in a configuration that includes two DHCP local servers.

1. The DHCP client sends a discover packet to find a DHCP local server in the network from which to obtain configuration parameters for the subscriber, including an IP address.
2. The DHCP relay agent receives the discover packet and forwards copies to each of the two DHCP local servers. The DHCP relay agent then creates an entry in its internal client table to keep track of the client's state.
3. In response to receiving the discover packet, each DHCP local server sends an offer packet to the client. The DHCP relay agent receives the offer packets and forwards them to the DHCP client.
4. On receipt of the offer packets, the DHCP client selects the DHCP local server from which to obtain configuration information. Typically, the client selects the server that offers the longest lease time on the IP address.
5. The DHCP client sends a request packet that specifies the DHCP local server from which to obtain configuration information.
6. The DHCP local server requested by the client sends an acknowledgement (ACK) packet that contains the client's configuration parameters.
7. The DHCP relay agent receives the ACK packet and forwards it to the client.
8. The DHCP client receives the ACK packet and stores the configuration information.
9. If configured to do so, the DHCP relay agent installs a host route and Address Resolution Protocol (ARP) entry for this client.
10. After establishing the initial lease on the IP address, the DHCP client and the DHCP local server use unicast transmission to negotiate lease renewal or release.

### ***Considerations***

The following considerations apply when you enable a DHCP local server, DHCP relay agent, or DHCP client in a routing instance:

- The DHCP local server, DHCP relay agent, and DHCP client can be configured in one routing instance, but the functionality is mutually exclusive on one interface. If the DHCP client is enabled on one interface, the DHCP local server or the DHCP relay agent cannot be enabled on that interface.
- The DHCP client, DHCP relay agent and DHCP local server services act independently in their respective routing instance. The following features can function simultaneously on a device:
  - DHCP client and DHCP local server

- DHCP client and DHCP relay agent
- Multiple routing instances. Each instance can have a DHCP local server, DHCP relay agent, or DHCP client, or each routing instance can have a DHCP client and DHCP local server or a DHCP client and DHCP relay agent.
- In Junos Release 12.1X46, autoinstallation is not compatible with jDHCPd:

```
version 12.1X46-D40.2;
system {
  /* not compatible with jDHCPd */  <<<<<<
  autoinstallation {
    usb {
      disable;
    }
  }
}
```

**NOTE:** Before you enable DHCP services in a routing instance, you must remove all the configuration related to DHCP services that does not include routing instance support. If you do not do this, the old default routing instance configuration will override the new routing instance configuration.

## DHCPv6 Client

- [DHCPv6 Client Overview on page 693](#)
- [Understanding DHCPv6 Client and Server Identification on page 693](#)

## DHCPv6 Client Overview

A Juniper Networks device can act as a Dynamic Host Configuration Protocol version 6 (DHCPv6) client, receiving its TCP/IP settings and the IPv6 address for any physical interface in any security zone from an external DHCPv6 server. When the device operates as a DHCPv6 client and a DHCPv6 server simultaneously, it can transfer the TCP/IP settings learned through its DHCPv6 client module to its default DHCPv6 server module. For the device to operate as a DHCPv6 client, you configure a logical interface on the device to obtain an IPv6 address from the DHCPv6 server in the network.

DHCPv6 client support for Juniper Networks devices includes the following features:

- Identity association for nontemporary addresses (IA\_NA)
- Identity association for prefix delegation (IA\_PD)
- Rapid commit
- TCP/IP propagation
- Auto-prefix delegation
- Autoconfig mode (stateful and stateless)

To configure the DHCPv6 client on the device, include the **dhcpv6-client** statement at the **[edit interfaces]** hierarchy level.

**NOTE:** To configure a DHCPv6 client in a routing instance, add the interface in a routing instance using the **[edit routing-instances]** hierarchy.

- [Minimum DHCPv6 Client Configuration on page 736](#)

## Understanding DHCPv6 Client and Server Identification

Each DHCPv6 client and server is identified by a DHCP unique identifier (DUID). The DUID is unique across all DHCPv6 clients and servers, and it is stable for any specific client or server. DHCPv6 clients use DUIDs to identify a server in messages where a server needs to be identified. DHCPv6 servers use DUIDs to determine the configuration parameters to be used for clients and in the association of addresses with clients.

The DUID is a 2-octet type code represented in network byte order, followed by a variable number of octets that make up the actual identifier; for example, 00:02:00:01:02:03:04:05:07:a0. A DUID can be up to 128 octets in length (excluding the type code). The following types are currently defined for the DUID parameter:

- Type 1—Link Layer address plus time (duid-llt)
- Type 2—Vendor-assigned unique ID based on enterprise number (vendor)
- Type 3—Link Layer address (duid-ll)

The duid-llt DUID consists of a 2-octet type field that contains the value 1, a 2-octet hardware type code, 4 octets that signify a time value, followed by the Link Layer address of any one network interface that is connected to the DHCP device at the time that the DUID is generated.

The vendor DUID is assigned by the vendor to the device and contains the vendor's registered private enterprise number as maintained by the identity association for nontemporary addresses (IA\_NA) assignment, followed by a unique identifier assigned by the vendor.

The duid-ll DUID contains a 2-octet type field that stores the value 3, and a 2-octet network hardware type code, followed by the Link Layer address of any one network interface that is permanently connected to the client or server device.

### DHCPv6 Local Server

- [DHCPv6 Server Overview on page 694](#)

---

#### DHCPv6 Server Overview

A Dynamic Host Configuration Protocol version 6 (DHCPv6) server can automatically allocate IP addresses to IP version 6 (IPv6) clients and deliver configuration settings to client hosts on a subnet or to requesting devices that need an IPv6 prefix. A DHCPv6 server lets network administrators centrally manage a pool of IP addresses among hosts and automate the assignment of IP addresses in a network.

**NOTE:** SRX Series and J Series devices do not support DHCP client authentication. In a DHCPv6 deployment, security policies control access through the device for any DHCP client that has received an address and other attributes from the DHCPv6 server.

---

Some features include:

- Configuration for a specific interface or a group of interfaces
- Stateless address autoconfiguration (SLAAC)
- Prefix delegation, including access-internal route installation
- DHCPv6 server groups

The DHCPv6 server configuration usually consists of DHCPv6 options for clients, an IPv6 prefix, an address pool that contains IPv6 address ranges and options, and a security policy to allow DHCPv6 traffic. In a typical setup the provider Juniper Networks device is configured as an IPv6 prefix delegation server that assigns addresses to the customer edge device. The customer's edge router then provides addresses to internal devices.

To configure DHCPv6 local server on a device, you include the DHCPv6 statement at the `[edit system services dhcp-local-server]` hierarchy level. You then create an address

assignment pool for DHCPv6 that is configured in the **[edit access address-assignment pool]** hierarchy level using the **family inet6** statement.

You can also include the **dhcpv6** statement at the **[edit routing-instances routing-instance-name system services dhcp-local-server]** hierarchy.

**NOTE:** Existing DHCPv4 configurations in the **[edit system services dhcp]** hierarchy are not affected when you upgrade to Junos OS Release 10.4 from an earlier version or enable DHCPv6 server.

## File Management

- [File Management Overview on page 695](#)

### File Management Overview

You can use the J-Web user interface and the CLI to perform routine file management operations such as archiving log files and deleting unused log files, cleaning up temporary files and crash files, and downloading log files from the routing platform to your computer. You can also encrypt the configuration files with the CLI to prevent unauthorized users from viewing sensitive configuration information.

Before you perform any file management tasks, you must perform the initial device configuration described in the Getting Started Guide for your device.

## Licenses

- [Junos OS License Overview on page 696](#)
- [Junos OS Feature License Model Number for J Series Services Routers and SRX Series Services Gateways on page 698](#)

## Junos OS License Overview

---

To enable some Junos OS features, you must purchase, install, and manage separate software licenses. For those features that require a license, the presence on the device of the appropriate software license keys (passwords) determines whether you can use the feature.

For information about how to purchase software licenses for your device, contact your Juniper Networks sales representative.

Certain Junos OS features require licenses. Each license is valid for only a single device. To manage the licenses, you must understand license enforcement and the components of a license key.

This section contains the following topics:

- [License Enforcement on page 696](#)
- [License Key Components on page 696](#)
- [License Management Fields Summary on page 697](#)

### ***License Enforcement***

For features that require a license, you must install and properly configure the license to use the feature. Although the device allows you to commit a configuration that specifies a feature requiring a license when the license is not present, you are prohibited from actually using the feature.

Successful commitment of a configuration does not imply that the required licenses are installed. If a required license is not present, the system provides a warning message after it commits the configuration rather than failing to commit it because of a license violation.

### ***License Key Components***

A license key consists of two parts:

- License ID—Alphanumeric string that uniquely identifies the license key. When a license is generated, it is given a license ID.
- License data—Block of binary data that defines and stores all license key objects.

For example, in the following typical license key, the string **XXXXXXXXXX** is the license ID, and the trailing block of data is the license data:

```
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx  
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx  
          xxxxxx xxxxxx xxx
```

The license data defines the device ID for which the license is valid and the version of the license.

### License Management Fields Summary

The Licenses page displays a summary of licensed features that are configured on the device and a list of licenses that are installed on the device. The information on the license management page is summarized in [Table 26 on page 157](#).

**Table 96: Summary of License Management Fields**

Field Name	Definition
<b>Feature Summary</b>	
Feature	Name of the licensed feature: <ul style="list-style-type: none"> <li>• <b>Features</b>—Software feature licenses.</li> <li>• <b>All features</b>—All-inclusive licenses</li> </ul>
Licenses Used	Number of licenses currently being used on the device. Usage is determined by the configuration on the device. If a feature license exists and that feature is configured, the license is considered used.
Licenses Installed	Number of licenses installed on the device for the particular feature.
Licenses Needed	Number of licenses required for legal use of the feature. Usage is determined by the configuration on the device: If a feature is configured and the license for that feature is not installed, a single license is needed.
<b>Installed Licenses</b>	
ID	Unique alphanumeric ID of the license.
State	<b>Valid</b> —The installed license key is valid.  <b>Invalid</b> —The installed license key is not valid.
Version	Numeric version number of the license key.
Group	If the license defines a group license, this field displays the group definition.  If the license requires a group license, this field displays the required group definition.  <b>NOTE:</b> Because group licenses are currently unsupported, this field is always blank.
Enabled Features	Name of the feature that is enabled with the particular license.
Expiry	Verify that the expiration information for the license is correct.  For Junos OS, only permanent licenses are supported. If a license has expired, it is shown as invalid.

- [Configuring a Dial-Up Modem Connection Remotely on page 707](#)

#### Example: Configuring a USB Modem Interface

This example shows how to configure a USB modem interface for dial backup.

- [Requirements on page 700](#)
- [Overview on page 700](#)

- [Configuration on page 700](#)
- [Verification on page 701](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you create an interface called as `umd0` for USB modem connectivity and set the dialer pool priority to 25. You also configure a modem initialization string to autoanswer after a specified number of rings. The default modem initialization string is `AT S7=45 S0=0 V1 X4 &C1 E0 Q0 &Q8 %C0`. The modem command `S0=0` disables the modem from autoanswering the calls. Finally, you set the modem to act as a dial-in WAN backup interface.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces umd0 dialer-options pool usb-modem-dialer-pool priority 25
set modem-options init-command-string "ATS0=2 \n" dialin routable
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a USB modem interface for dial backup:

1. Create an interface.

```
[edit]
user@host# edit interfaces umd0
```

2. Set the dialer options and priority.

```
[edit interfaces umd0]
user@host# set dialer-options pool usb-modem-dialer-pool priority 25
```

3. Specify the modem options.

```
[edit interfaces umd0]
user@host# set modem-options init-command-string "ATS0=2 \n"
```

4. Set the modem to act as a dial-in WAN backup interface.

```
[edit interfaces umd0]
user@host# set modem-options dialin routable
```

**Results** From configuration mode, confirm your configuration by entering the **show interface umd0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interface umd0
modem-options {
init-command-string "ATSO=2 \n";
dialin routable;
}
dialer-options {
pool usb-modem-dialer-pool priority 25;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Verifying the Configuration

**Purpose** Verify a USB modem interface for dial backup.

**Action** From configuration mode, enter the **show interfaces umd0 extensive** command. The output shows a summary of interface information and displays the modem status.

```

**Related  
Documentation**

- [USB Modem Configuration Overview on page 679](#)
- [USB Modem Interface Overview on page 676](#)
- [Example: Configuring a Dialer Interface for USB Modem Dial-In on page 705](#)
- *Administration Guide for Security Devices*
- *Modem Interfaces Feature Guide for Security Devices*

---

### Example: Configuring a Dialer Interface

This example shows how to configure a logical dialer interface for the device.

- [Requirements on page 702](#)
- [Overview on page 702](#)
- [Configuration on page 703](#)
- [Verification on page 704](#)

#### **Requirements**

Before you begin:

- Install device hardware and establish basic connectivity. See the Getting Started Guide for your device.
- Order a US Robotics USB 56k V.92 Modem, model number USR Model 5637, from US Robotics (<http://www.usr.com/>).
- Order a dial-up modem for the PC or laptop computer at the remote location from where you want to connect to the device.
- Order a PSTN line from your telecommunications service provider. Contact your service provider.

#### **Overview**

In this example, you configure a logical dialer interface called dl0 to establish USB connectivity. You can configure multiple dialer interfaces for different functions on the device. You add a description to differentiate among different dialer interfaces. For example, this modem is called USB-modem-remote-management. Configure PPP encapsulation and set the logical unit as 0. You then specify the name of the dialer pool as usb-modem-dialer-pool and set the source and destination IP addresses as 172.20.10.2, and 172.20.10.1, respectively.

**NOTE:** You cannot configure Cisco High-Level Data Link Control (HDLC) or Multilink PPP (MLPPP) encapsulation on dialer interfaces used in USB modem connections.

---

**NOTE:** If you configure multiple dialer interfaces, ensure that the same IP subnet address is not configured on different dialer interfaces. Configuring the same IP subnet address on multiple dialer interfaces can result in inconsistency in the route and packet loss. The device might route packets through another dialer interface with the IP subnet address instead of through the dialer interface to which the USB modem call is mapped.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces dl0 description USB-modem-remote-management encapsulation ppp
set interfaces dl0 unit 0 dialer-options pool usb-modem-dialer-pool
set interfaces dl0 unit 0 family inet address 172.20.10.2 destination 172.20.10.1
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a logical dialer interface for the device:

1. Create an interface.

```
[edit]
user@host# set interfaces dl0
```

2. Add a description and configure PPP encapsulation.

```
[edit interfaces dl0]
user@host# set description USB-modem-remote-management
user@host# set encapsulation ppp
```

3. Create the logical unit.

**NOTE:** The logical unit number must be 0.

```
[edit interfaces dl0]
user@host# set unit 0
```

4. Configure the name of the dialer pool to use for USB modem connectivity.

```
[edit interfaces dl0 unit 0]
user@host# set dialer-options pool usb-modem-dialer-pool
```

5. Configure source and destination IP addresses for the dialer interface.

```
[edit interfaces dl0 unit 0]
user@host# set family inet address 172.20.10.2 destination 172.20.10.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces dl0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces dl0
description USB-modem-remote-management;
encapsulation ppp;
unit 0 {
family inet {
address 172.20.10.2/32 {
destination 172.20.10.1;
}
}
dialer-options {
pool usb-modem-dialer-pool;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Verifying a Dialer Interface

**Purpose** Verify that the dialer interface has been configured.

**Action** From configuration mode, enter the **show interfaces dl0 extensive** command. The output shows a summary of dialer interface information.

```
Physical interface: dl0, Enabled, Physical link is Up

#### Example: Configuring a Dialer Interface for USB Modem Dial-In

This example shows how to configure a dialer interface for USB modem dial-in.

- [Requirements on page 706](#)
- [Overview on page 706](#)
- [Configuration on page 706](#)
- [Verification on page 707](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

To enable connections to the USB modem from a remote location, you must configure the dialer interfaces set up for USB modem use to accept incoming calls. You can configure a dialer interface to accept all incoming calls or accept only calls from one or more caller IDs.

If the dialer interface is configured to accept only calls from a specific caller ID, the system matches the incoming call's caller ID against the caller IDs configured on its dialer interfaces. If an exact match is not found and the incoming call's caller ID has more digits than the configured caller IDs, the system performs a right-to-left match of the incoming call's caller ID with the configured caller IDs and accepts the incoming call if a match is found. For example, if the incoming call's caller ID is 4085550115 and the caller ID configured on a dialer interface is 5550115, the incoming call is accepted. Each dialer interface accepts calls from only callers whose caller IDs are configured on it.

You can configure the following incoming map options for the dialer interface:

- **accept-all**—Dialer interface accepts all incoming calls.

You can configure the **accept-all** option for only one of the dialer interfaces associated with a USB modem physical interface. The device uses the dialer interface with the **accept-all** option configured only if the incoming call's caller ID does not match the caller IDs configured on other dialer interfaces.

- **caller**—Dialer interface accepts calls from a specific caller ID—for example, **4085550115**. You can configure a maximum of 15 caller IDs per dialer interface.

The same caller ID must not be configured on different dialer interfaces. However, you can configure caller IDs with more or fewer digits on different dialer interfaces. For example, you can configure the caller IDs 14085550115, 4085550115, and 5550115 on different dialer interfaces.

In this example, you configure the incoming map option as caller 4085550115 for dialer interface dl0.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the **[edit]** hierarchy level.

```
set interfaces dl0 unit 0 dialer-options incoming-map caller 4085550115
```

#### Step-by-Step Procedure

To configure a dialer interface for USB modem dial-in:

1. Select a dialer interface.

```
[edit]  
user@host# edit interfaces dl0
```

2. Configure the incoming map options.

```
[edit]  
user@host# edit unit 0 dialer-options incoming-map caller 4085551515
```

3. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

### **Verification**

To verify the configuration is working properly, enter the **show interface dlo** command.

### **Configuring a Dial-Up Modem Connection Remotely**

To remotely connect to the USB modem connected to the USB port on the device, you must configure a dial-up modem connection on the PC or laptop computer at your remote location. Configure the dial-up modem connection properties to disable IP header compression.

To configure a dial-up modem connection remotely:

1. At your remote location, connect a modem to a management device such as a PC or laptop computer.
2. Connect the modem to your telephone network.
3. On the PC or laptop computer, select **Start>Settings>Control Panel>Network Connections**. The Network Connections page appears.
4. Click **Create a new connection**. The New Connection Wizard appears.
5. Click **Next**. The New Connection Wizard: Network Connection Type page appears.
6. Select **Connect to the network at my workplace**, and then click **Next**.  
The New Connection Wizard: Network Connection page appears.
7. Select **Dial-up connection**, and then click **Next**. The New Connection Wizard: Connection Name page appears.
8. In the Company Name box, type the dial-up connection name, for example **USB-modem-connect**. Then, click **Next**. The New Connection Wizard: Phone Number to Dial page appears.
9. In the Phone number box, type the telephone number of the PSTN line connected to the USB modem at the device end.

10. Click **Next** twice, and then click **Finish**. The Connect USB-modem-connect page appears.
11. If CHAP is configured on the dialer interface used for the USB modem interface at the device end, type the username and password configured in the CHAP configuration in the User name and Password boxes.
12. Click **Properties**. The USB-modem-connect Properties page appears.
13. In the Networking tab, select **Internet Protocol (TCP/IP)**, and then click **Properties**. The Internet Protocol (TCP/IP) Properties page appears.
14. Click **Advanced**. The Advanced TCP/IP Settings page appears.
15. Clear the **Use IP header compression** check box.

### Example: Configuring the Device as a DHCP Server

This example shows how to configure the device as a DHCP server.

- [Requirements on page 709](#)
- [Overview on page 709](#)
- [Configuration on page 709](#)
- [Verification on page 712](#)

#### Requirements

Before you begin:

- Determine the IP address pools and the lease durations to use for each subnet.
- Obtain the MAC addresses of the clients that require permanent IP addresses. Determine the IP addresses to use for these clients.
- List the IP addresses that are available for the servers and devices on your network; for example, DNS, NetBIOS servers, boot servers, and gateway devices. See the *Understanding Management Predefined Policy Applications*.
- Determine the DHCP options required by the subnets and clients in your network.

#### Overview

In this example, you configure the device as a DHCP server. You specify the IP address pool as 192.168.2.0/24 and from a low range of 192.168.2.2 to a high range of 192.168.2.254. You set the default-lease-time to 1,209,600 and the maximum-lease-time to 2,419,200. You then set the domain search suffixes as mycompany.net and mylab.net. These suffixes specify the domain search list used by a client when resolving hostnames with DNS.

Then you specify the DNS server IP address as 192.168.10.2. You set the IP address for the device solicitation address option (option 32) as 192.168.2.33. The IP address excluded from the IP address pool is reserved for this option. Finally, you assign a fixed IP address as 192.168.2.50 with the MAC address of the client, 01:03:05:07:09:0B.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system services dhcp pool 192.168.2.0/24 address-range low 192.168.2.2
high 192.168.2.254
set system services dhcp pool 192.168.2.0/24 default-lease-time 1209600
maximum-lease-time 2419200
set system services dhcp pool 192.168.2.0/24 domain-search mycompany.net
set system services dhcp pool 192.168.2.0/24 domain-search mylab.net
set system services dhcp pool 192.168.2.0/24 name-server 192.168.10.2
set system services dhcp pool 192.168.2.0/24 option 32 ip-address 192.168.2.33
set system services dhcp static-binding 01:03:05:07:09:0B fixed-address 192.168.2.50
```

**GUI Step-by-Step  
Procedure**

To configure the device as a DHCP server:

1. In the J-Web interface, select **Configure>Services>DHCP>Boot DHCP Relay**.
2. Next to System, click **Configure**.
3. Next to Services, make sure the check box is selected, and click **Configure**.
4. Next to Dhcp, click **Configure**.
5. Define the IP address pool. Next to Pool, click **Add new entry**.
6. In the Subnet address box, type **192.168.2.0/24**.
7. Next to Address range, select the check box.
8. In the High box, type **192.168.2.254**.
9. In the Low box, type **192.168.2.2**.
10. Click **OK**.
11. Define the default and maximum lease times, in seconds. From the Default lease time list, select **Enter Specific Value**.
12. In the Length box, type **1209600**.
13. From the Maximum lease time list, select **Enter Specific Value**.
14. Next to Maximum lease time, type **2419200**.
15. Define the domain search suffixes to be used by the clients. Next to Domain search, click **Add new entry**.
16. In the Suffix box, type **mycompany.net**.
17. Click **OK**.
18. Next to Domain search, click **Add new entry**.
19. In the Suffix box, type **mylab.net**.
20. Click **OK**.
21. Define a DNS server. Next to Name server, click **Add new entry**.
22. In the Address box, type **192.168.10.2**.
23. Click **OK**.
24. Define DHCP option 32, the device solicitation address option. Next to Option, click **Add new entry**.
25. In the Option identifier code box, type **32**.
26. From the Option type choice list, select **Ip address**.
27. In the Ip address box, type **192.168.2.33**.
28. Click **OK** twice.
29. Assign a static IP address to a MAC address. Next to Static binding, click **Add new entry**.
30. In the Mac address box, type **01:03:05:07:09:0B**.

31. Next to Fixed address, click **Add new entry**.
32. In the Address box, type **192.168.2.50**.
33. Click **OK** until you return to the Configuration page.
34. Click **OK** to check your configuration and save it as a candidate configuration.
35. If you are done configuring the device, click **Commit Options>Commit**.

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the device as a DHCP server:

1. Configure the DHCP server.  

```
[edit]
user@host# edit system services dhcp
```
2. Specify the IP address pool range.  

```
[edit system services dhcp]
user@host# set pool 192.168.2.0/24 address-range low 192.168.2.2 high 192.168.2.254
```
3. Define the default and maximum lease times, in seconds.  

```
[edit system services dhcp]
user@host# set pool 192.168.2.0/24 default-lease-time 1209600
maximum-lease-time 2419200
```
4. Define the domain search suffixes to be used by the clients.  

```
[edit system services dhcp]
user@host# set pool 192.168.2.0/24 domain-search mycompany.net
user@host# set pool 192.168.2.0/24 domain-search mylab.net
```
5. Specify the DNS server IP address.  

```
[edit system services dhcp]
user@host# set pool 192.168.2.0/24 name-server 192.168.10.2
```
6. Set the device solicitation IP address.  

```
[edit system services dhcp]
user@host# set pool 192.168.2.0/24 option 32 ip-address 192.168.2.33
```
7. Assign a fixed IP address with the MAC address of the client.  

```
[edit system services dhcp]
user@host# set static-binding 01:03:05:07:09:0B fixed-address 192.168.2.50
```

**Results** From configuration mode, confirm your configuration by entering the **show system services dhcp** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system services dhcp
pool 192.168.2.0/24 {
```

```
address-range low 192.168.2.2 high 192.168.2.254;
maximum-lease-time 2419200;
default-lease-time 1209600;
name-server {
    192.168.10.2;
}
domain-search {
    mycompany.net;
    mylab.net;
}
option 32 ip-address 192.168.2.33;
}
static-binding 01:03:05:07:09:0B {
    fixed-address {
        192.168.2.50;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Global DHCP Information on page 712](#)
- [Verifying the DHCP Binding Database on page 712](#)
- [Verifying DHCP Server Operation on page 713](#)

### **Verifying Global DHCP Information**

**Purpose** Verify that the global DHCP Information has been configured for the device.

**Action** From operational mode, enter the **show system services dhcp global** command.

Global settings:

BOOTP lease length	infinite
DHCP lease times:	
Default lease time	1 day
Minimum lease time	1 minute
Maximum lease time	infinite

DHCP options:

Name: domain-name, Value: mylablab.example.net
Name: name-server, Value: [ 192.168.5.68, 172.17.28.101, 172.17.28.100 ]

### **Verifying the DHCP Binding Database**

**Purpose** Verify that the DHCP binding database reflects the DHCP server configuration.

**Action** From operational mode, enter these commands:

- **show system services dhcp binding** command to display all active bindings in the database.
- **show system services dhcp binding *address* detail** command (where *address* is the IP address of the client) to display more information about a client.

- **show system services dhcp conflict command** to show any potential conflicts with the bindings.

These commands produce following sample output:

```

user@host> show system services dhcp binding

IP Address   Hardware Address   Type           Lease expires at
30.1.1.20    00:12:1e:a9:7b:81  dynamic       2007-05-11 11:14:43 PDT

user@host> show system services dhcp binding 3.3.3.2 detail

IP address           3.3.3.2
Hardware address      00:a0:12:00:13:02
Pool                  3.3.3.0/24
Interface fe-0/0/0, relayed by 3.3.3.200

Lease information:
Type                  DHCP
Obtained at           2004-05-02 13:01:42 PDT
Expires at            2004-05-03 13:01:42 PDT
State                 active

DHCP options:
Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
Name: domain-name, Value: mydomain.tld
Code: 32, Type: ip-address, Value: 3.3.3.33

user@host> show system services dhcp conflict

Detection time Detection method Address
2004-08-03 19:04:00 PDT ARP 3.3.3.5
2004-08-04 04:23:12 PDT Ping 4.4.4.8
2004-08-05 21:06:44 PDT Client 3.3.3.10

```

### **Verifying DHCP Server Operation**

**Purpose** Verify that the DHCP server operation has been configured.

**Action** From operational mode, enter these commands:

- **ping** command to verify that a client responds to ping packets containing the destination IP address assigned by the device.
- **ipconfig /all** command to display the IP configuration on the client. For example, on a PC running Microsoft Windows, enter **ipconfig /all** at the command prompt to display the PC's IP configuration.

```

user@host> ping 192.168.2.2

PING 192.168.2.2 (192.168.2.2): 56 data bytes
64 bytes from 192.168.2.2: icmp_seq=0 ttl=255 time=8.856 ms

**Example: Configuring the Device as a DHCP Client**

---

This example shows how to configure the device as a DHCP client.

- [Requirements on page 714](#)
- [Overview on page 715](#)
- [Configuration on page 715](#)
- [Verification on page 717](#)

**Requirements**

Before you begin:

- Determine the IP address pools and the lease durations to use for each subnet.
- Obtain the MAC addresses of the clients that require permanent IP addresses. Determine the IP addresses to use for these clients.

- List the IP addresses that are available for the servers and devices on your network; for example, DNS, NetBIOS servers, boot servers, and gateway devices. See the *Understanding Management Predefined Policy Applications*.
- Determine the DHCP options required by the subnets and clients in your network.

### Overview

In this example, you configure the device as a DHCP client. You specify the interface as ge-0/0/1, set the logical unit as 0, and create a DHCP inet family. You then specify the DHCP client identifier as 00:0a:12:00:12:12 in hexadecimal. You use hexadecimal if the client identifier is a MAC address. You set the DHCP lease time as 86,400 seconds. The range is from 60 through 2,147,483,647 seconds.

Then you set the number of retransmission attempts to 6. The range is from 0 through 6, and the default is 4. You set the retransmission interval to 5 seconds. The range is from 4 through 64, and the default is 4 seconds. Finally, you set the IPv4 address of the preferred DHCP server to 10.1.1.1 and the vendor class ID to ether.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-0/0/1 unit 0 family inet dhcp
set interfaces ge-0/0/1 unit 0 family inet dhcp client-identifier 00:0a:12:00:12:12
set interfaces ge-0/0/1 unit 0 family inet dhcp lease-time 86400
set interfaces ge-0/0/1 unit 0 family inet dhcp retransmission-attempt 6
set interfaces ge-0/0/1 unit 0 family inet dhcp retransmission-interval 5
set interfaces ge-0/0/1 unit 0 family inet dhcp server-address 10.1.1.1
set interfaces ge-0/0/1 unit 0 family inet dhcp vendor-id ether
```

#### GUI Step-by-Step Procedure

To configure the device as a DHCP client:

1. In the J-Web user interface, select **Configure>Services>DHCP>Boot DHCP Relay**.
2. Under Interfaces, click **ge-0/0/1**.
3. Under Unit, next to the unit number, click **Edit**.
4. Under Family, select the **Inet** check box and click **Edit**.
5. Next to Dhcp, click **Yes** and click **Configure**.
6. Configure the DHCP client identifier as either an ASCII or hexadecimal value. Next to Client identifier, click **Configure**.
7. From the Client identifier choice list, select **hexadecimal**.
8. In the Hexadecimal box, type the client identifier—**00:0a:12:00:12:12**.
9. Click **OK**.
10. Set the DHCP lease time in seconds. From the Lease time list, select **Enter Specific Value**.

11. In the Length box, type **86400**.
12. Set the retransmission number of attempts. In the Retransmission attempt box, type **6**.
13. Set the retransmission interval in seconds. In the Retransmission interval box, type **5**.
14. Set the IPv4 address of the preferred DHCP server. In the Server address box, type **10.1.1.1**.
15. Set the vendor class ID. In the Vendor id box, type **ether**.
16. Click **OK**.
17. Click **OK** to check your configuration and save it as a candidate configuration.
18. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the device as a DHCP client:

1. Specify the DHCP client interface.  

```
[edit]  
user@host# edit interfaces ge-0/0/1 unit 0 family inet dhcp
```
2. Configure the DHCP client identifier as a hexadecimal value.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp]  
user@host# set client-identifier 00:0a:12:00:12:12
```
3. Set the DHCP lease time.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp]  
user@host# set lease-time 86400
```
4. Set the number of attempts allowed to retransmit a DHCP packet.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp]  
user@host# set retransmission-attempt 6
```
5. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp]  
user@host# set retransmission-interval 5
```
6. Set the IPv4 address of the preferred DHCP server.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp]  
user@host# set server-address 10.1.1.1
```
7. Set the vendor class ID for the DHCP client.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp]  
user@host# set vendor-id ether
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces ge-0/0/1 unit 0 family inet** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-0/0/1 unit 0 family inet
dhcp {
  client-identifier hexadecimal 00:0a:12:00:12:12;
  lease-time 86400;
  retransmission-attempt 6;
  retransmission-interval 5;
  server-address 10.1.1.1;
  update-server;
  vendor-id ether;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the DHCP Client on page 717](#)

### **Verifying the DHCP Client**

**Purpose** Verify that the DHCP client information has been configured.

**Action** From operational mode, enter these commands:

- **show system services dhcp client** command to display DHCP client information.
- **show system services dhcp client interface-name** command to display more information about a specific interface.
- **show system services dhcp client statistics command** to show client statistics.

These commands produce the following sample output:

```
user@host> show system services dhcp client

Logical Interface Name  ge-0/0/1.0
Hardware address       00:0a:12:00:12:12
Client Status          bound
Vendor Identifier       ether
Server Address          10.1.1.1
Address obtained        10.1.1.89
update server           enables
Lease Obtained at      2006-08-24 18:13:04 PST
Lease Expires at       2006-08-25 18:13:04 PST

DHCP Options:

### Example: Configuring the Device as a BOOTP or DHCP Relay Agent

This example shows how to configure the device as a BOOTP or DHCP relay agent.

- [Requirements on page 719](#)
- [Overview on page 719](#)
- [Configuration on page 719](#)
- [Verification on page 722](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you enable the DHCP relay agent to relay BOOTP or DHCP messages to a BOOTP server. You enable VPN encryption to allow client requests to pass through the VPN tunnel. You specify the IP time-to-live value to be set in responses to the client as 20. The range is from 1 through 255. You then set the maximum number of hops allowed per packet to 10. The range is from 4 through 16.

Then you specify the minimum number of seconds before requests are forwarded as 300. The range is from 0 through 30,000 seconds. You set the description of the server (the value is a string), and you specify a valid server name or address to the server to forward (the value is an IPv4 address). You define the routing instance, whose value is a nonreserved text string of 128 or fewer characters. You then specify the incoming BOOTP or DHCP request forwarding interface as ge-0/0/0. You enable the broadcast option if the Layer 2 interface is unknown.

You then specify the IP time-to-live value to be set in responses to the client as 30. The range is from 1 through 255. You set the description of the server as text and the DHCP option as 82. You set the maximum number of hops allowed per packet to 20 and specify the minimum number of seconds as 400 before requests are forwarded. You enable the no listen option. Finally, you enable VPN encryption to allow client requests to pass through the VPN tunnel.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set forwarding-options helpers bootp relay agent-option
set forwarding-options helpers bootp vpn
set forwarding-options helpers bootp client-response-ttl 20
set forwarding-options helpers bootp maximum-hop-count 10
set forwarding-options helpers bootp minimum-wait-time 300
set forwarding-options helpers bootp description text
set forwarding-options helpers bootp server 2.2.2.2
set forwarding-options helpers bootp server 2.2.2.2 routing instance rt-i-1
set forwarding-options helpers bootp interface ge-0/0/0
set forwarding-options helpers bootp interface ge-0/0/0 broadcast
set forwarding-options helpers bootp interface ge-0/0/0 client-response-ttl 30
set forwarding-options helpers bootp interface ge-0/0/0 description text
set forwarding-options helpers bootp interface ge-0/0/0 dhcp-option82
set forwarding-options helpers bootp interface ge-0/0/0 maximum-hop-count 20
set forwarding-options helpers bootp interface ge-0/0/0 minimum-wait-time 400
set forwarding-options helpers bootp interface ge-0/0/0 no-listen
set forwarding-options helpers bootp interface ge-0/0/0 vpn
```

**GUI Step-by-Step Procedure**

To configure the device as a BOOTP/DHCP relay agent:

1. In the J-Web user interface, select **Configure>Services>DHCP>Boot DHCP Relay**.
2. Select the DHCP relay agent check box to enable the BOOTP/DHCP relay agent.
3. Select the VPN encryption check box.
4. In the Client response TTL box, type **20**.
5. In the Maximum hop count box, type **10**.
6. In the Minimum wait time box, type **300**.
7. In the Description box, type the description of the server.
8. Add a new server. Next to Server, click **Add new Entry**.
9. Next to the Name box, type **2.2.2.2**.
10. Define the routing instance. Next to Routing instance, click **Add new entry**.
11. In the Name box, type **rt-i-1** and click **OK**. A routing instance is optional.
12. Add a new interface. Next to Interface, click **Add new entry**.
13. In the Interface name box, type the interface name. For example, type **ge-0/0/0**.
14. In the Client response TTL box, type **30**.
15. In the Description box, type the description of the server.
16. Select the **Dhcp option 82** check box.
17. In the Maximum hop count box, type **20**.
18. In the Minimum wait time box, type **400**.
19. Select the **No listen** check box.
20. Select the **VPN encryption** check box.
21. Click **OK** until you return to the Configuration page.
22. Click **OK** to check your configuration and save it as a candidate configuration.
23. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the device as a BOOTP or DHCP relay agent:

1. Set the DHCP relay agent.  

```
[edit]  
user@host# edit forwarding-options helpers bootp  
user@host# set relay agent-option
```
2. Enable VPN encryption to allow client requests to pass through VPN tunnel.  

```
[edit forwarding-options helpers bootp]
```

- ```

user@host# set vpn

```
3. Set the IP time-to-live value. .
 

```

[edit forwarding-options helpers bootp]
user@host# set client-response-ttl 20

```
  4. Set the maximum number of hops allowed per packet.
 

```

[edit forwarding-options helpers bootp]
user@host# set maximum-hop-count 10

```
  5. Set the minimum wait time in seconds.
 

```

[edit forwarding-options helpers bootp]
user@host# set minimum-wait-time 300

```
  6. Specify the description of the server.
 

```

[edit forwarding-options helpers bootp]
user@host# set description text

```
  7. Add a new server.
 

```

[edit forwarding-options helpers bootp]
user@host# set server 2.2.2.2

```
  8. Define the routing instance.
 

```

[edit forwarding-options helpers bootp]
user@host# set server 2.2.2.2 routing-instance rt-i-1

```
  9. Define the incoming BootP request forwarding interface.
 

```

[edit forwarding-options helpers bootp]
user@host# set interface ge-0/0/0

```
  10. Enable broadcast option.
 

```

[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set broadcast

```
  11. Define the IP time-to-live value.
 

```

[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set client-response-ttl 30

```
  12. Specify the description of the server.
 

```

[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set description text

```
  13. Set the DHCP option 82.
 

```

[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set dhcp-option82

```
  14. Specify the maximum number of hops allowed per packet.
 

```

[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set forwarding-options helpers bootp interface ge-0/0/0
maximum-hop-count 20

```
  15. Set the minimum wait time.
 

```

[edit forwarding-options helpers bootp interface ge-0/0/0]

```

```
user@host# set minimum-wait-time 400
```

16. Set the no listen option.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set no-listen
```

17. Enable VPN encryption to allow client requests to pass through the VPN tunnel.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set vpn
```

**Results** From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show forwarding-options
helpers {
  bootp {
    relay-agent-option;
    description text;
    server 2.2.2.2 routing-instance rt-i-1;
    maximum-hop-count 10;
    minimum-wait-time 300;
    client-response-ttl 20;
    vpn;
  }
  interface {
    ge-0/0/0 {
      no-listen;
      broadcast;
      description text;
      maximum-hop-count 20;
      minimum-wait-time 400;
      client-response-ttl 30;
      vpn;
      dhcp-option82;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

#### **Verifying DHCP Relay Statistics**

**Purpose** Verify that the DHCP Relay statistics have been configured.

**Action** From operational mode, enter the **show system services dhcp relay-statistics** command.

```
user@host> show system services dhcp relay-statistics
```

```
Received Packets:    4 Forwarded Packets    4 Dropped Packets
      4    Due to missing interface in relay database: 4    Due to missing
matching routing instance: 0    Due to an error during packet read: 0    Due
to an error during packet send: 0    Due to invalid server address: 0    Due
to missing valid local address: 0    Due to missing route to server/client: 0
```

### Configuring a DHCP Local Server

- [Minimum DHCP Local Server Configuration on page 723](#)
- [Configuring Address-Assignment Pools on page 724](#)
- [Configuring an Address-Assignment Pool Name and Addresses on page 724](#)
- [Configuring a Named Address Range for Dynamic Address Assignment on page 725](#)
- [Configuring Static Address Assignments on page 725](#)
- [Configuring DHCP Client-Specific Attributes on page 726](#)
- [Verifying and Managing DHCP Local Server Configuration on page 726](#)

#### Minimum DHCP Local Server Configuration

This following sample output shows the minimum configuration you must use to configure an SRX Series device as a DHCP local server. In this output, the server group is named bob, and the DHCP local server is enabled on interface ge-1/0/1.0 within the group.

```
[edit access]
address-assignment {
  pool verizon family inet {
    network 192.168.1.0/24;
  }
}

edit system services
dhcp-local-server {
  group bob {
    interface ge-1/0/1.0
  }
}

edit interfaces ge-1/0/1 unit 0
family {
  inet {
    address 192.168.1.1/24
  }
}
```

**NOTE:** You can configure the DHCP local server in a routing instance by using the `dhcp-local server`, `interface`, and `address-assignment` statements in the `[edit routing-instances]` hierarchy level.

### **Configuring Address-Assignment Pools**

The address-assignment pool feature enables you to create address pools that can be shared by different client applications.

To configure an address-assignment pool:

1. Configure the address-assignment pool name and specify the addresses for the pool.  
See [“Configuring an Address-Assignment Pool Name and Addresses” on page 724.](#)
2. (Optional) Configure named ranges (subsets) of addresses.  
See [“Configuring a Named Address Range for Dynamic Address Assignment” on page 725.](#)
3. (Optional; IPv4 only) Create static address bindings.  
See [“Configuring Static Address Assignments” on page 725.](#)
4. (Optional) Configure attributes for DHCP clients.  
See [“Configuring DHCP Client-Specific Attributes” on page 726.](#)

### **Configuring an Address-Assignment Pool Name and Addresses**

When configuring an address-assignment pool, you must specify the name of the pool and its addresses.

To configure an IPv4 address-assignment pool:

1. Configure the name of the pool and specify the IPv4 family.  
[edit access]  
user@host# **edit address-assignment pool blr-pool family inet**
2. Configure the network address and the prefix length of the addresses in the pool.  
[edit access address-assignment pool blr-pool family inet]  
user@host# **set network 192.168.0.0/16**

**NOTE:** You can configure an IPv4 address-assignment pool in a routing instance by configuring the address-assignment statements in the `[edit routing-instances]` hierarchy level.

### *Configuring a Named Address Range for Dynamic Address Assignment*

You can optionally configure multiple named ranges, or subsets, of addresses within an address-assignment pool. During a dynamic address assignment, a client can be assigned an address from a specific named range. To create a named range, you specify a name for the range and define the address range.

To create a named range within an IPv4 address-assignment pool:

1. Specify the name of the address-assignment pool.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure the name of the range and the lower and upper boundaries of the addresses in the range.

```
[edit access address-assignment pool isp_1 family inet]
user@host# set range southeast low 192.168.102.2 high 192.168.102.254
```

**NOTE:** To configure named address ranges in a routing instance, configure the address-assignment statements in the `[edit routing-instances]` hierarchy level.

### *Configuring Static Address Assignments*

You can optionally create a static IPv4 address binding by reserving a specific address for a particular client. The address is removed from the address-assignment pool so that it is not assigned to another client. When you reserve an address, you identify the client host and create a binding between the client MAC address and the assigned IP address.

To configure a static IPv4 address binding:

1. Specify the name of the IPv4 address-assignment pool containing the IP address you want to reserve for the client.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Specify the name of the client for the static binding, the client MAC address, and the IP address to reserve for the client. This configuration specifies that the client with MAC address 01:03:05:07:09:0b is always assigned IP address 192.168.10.2.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set host svale6_boston_net hardware-address 01:03:05:07:09:0b
ip-address 192.168.10.2
```

**NOTE:** To configure static binding for an IPv4 address in a routing instance, configure the address-assignment statements in the `[edit routing-instances]` hierarchy.

### Configuring DHCP Client-Specific Attributes

You use the address-assignment pool feature to include application-specific attributes when clients obtain an address. The client application, such as DHCP, uses the attributes to determine how addresses are assigned and to provide optional application-specific characteristics to the client. For example, the DHCP application might specify that a client that matches certain prerequisite information is dynamically assigned an address from a particular named range. Based on which named range is used, DHCP specifies additional DHCP attributes such as the boot file that the client uses, the DNS server, and the maximum lease time.

You use the **dhcp-attributes** statement to configure DHCP client-specific attributes for address-assignment pools.

To configure address-assignment pool attributes for DHCP clients:

1. Specify the name of the address-assignment pool.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure optional DHCP client attributes.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set dhcp-attributes maximum-lease-time 2419200
user@host# set dhcp-attributes name-server 192.168.10.2
user@host# set dhcp-attributes boot-file boot-file.txt
user@host# set dhcp-attributes boot-file boot-server example.net
```

**NOTE:** To configure DHCP client-specific attributes in a routing instance, configure the **dhcp-attributes** statements in the **[edit routing-instances]** hierarchy.

### Verifying and Managing DHCP Local Server Configuration

**Purpose** View or clear information about client address bindings and statistics for the DHCP local server.

- Action**
- To display the address bindings in the client table on the DHCP local server:
 

```
user@host> show dhcp server binding
```
  - To display DHCP local server statistics:
 

```
user@host> show dhcp server statistics
```
  - To clear the binding state of a DHCP client from the client table on the DHCP local server:
 

```
user@host> clear dhcp server binding
```
  - To clear all DHCP local server statistics:
 

```
user@host> clear dhcp server statistics
```

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp server binding routing instance <routing-instance name>`
- `show dhcp server statistics routing instance <routing-instance name>`
- `clear dhcp server binding routing instance <routing-instance name>`
- `clear dhcp server statistics routing instance <routing-instance name>`

### Configuring a DHCP Client

- [Minimum DHCP Client Configuration on page 727](#)
- [Configuring Optional DHCP Client Attributes on page 727](#)
- [Verifying and Managing DHCP Client Configuration on page 728](#)

#### Minimum DHCP Client Configuration

The following sample output shows the minimum configuration you must use to configure an SRX Series device as a DHCP client. In this output, the interface is ge-0/0/0 and the logical unit is 0.

```
[edit interfaces]
ge-0/0/0 {
  unit 0 {
    family inet {
      dhcp-client
    }
  }
}
```

**NOTE:** To configure a DHCP client in a routing instance, add the interface in a routing instance using the `[edit routing-instances]` hierarchy.

#### Configuring Optional DHCP Client Attributes

For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP local server in the network. You can then set the client-identifier, lease time, retransmission attempts, retry interval, preferred DHCP local server address, and vendor class ID.

To configure optional DHCP client attributes:

1. Configure the DHCP client identifier prefix as the routing instance name.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set client-identifier prefix host
```

2. Set the DHCP lease time.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set lease-time 86400
```

3. Set the number of attempts allowed to retransmit a DHCP packet.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set retransmission-attempt 6
```

4. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set retransmission-interval 5
```

5. Set the IPv4 address of the preferred DHCP local server.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set server-address 10.1.1.1
```

6. Set the vendor class ID for the DHCP client.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set vendor-id ether
```

**NOTE:** To configure the DHCP client in a routing instance, configure the interface in the [edit routing-instances] hierarchy.

### *Verifying and Managing DHCP Client Configuration*

**Purpose** View or clear information about client address bindings and statistics for the DHCP client.

**Action** • To display the address bindings in the client table on the DHCP client:

```
user@host> show dhcp client binding
```

• To display DHCP client statistics:

```
user@host> show dhcp client statistics
```

• To clear the binding state of a DHCP client from the client table on the DHCP client:

```
user@host> clear dhcp client binding
```

• To clear all DHCP client statistics:

```
user@host> clear dhcp client statistics
```

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp client binding routing instance <routing-instance name>`
- `show dhcp client statistics routing instance <routing-instance name>`
- `clear dhcp client binding routing instance <routing-instance name>`
- `clear dhcp client statistics routing instance <routing-instance name>`

## Configuring a DHCP Relay Agent

- [Minimum DHCP Relay Agent Configuration on page 729](#)
- [Verifying and Managing DHCP Relay Configuration on page 729](#)

### Minimum DHCP Relay Agent Configuration

The following sample output shows the minimum configuration you must use to configure an SRX Series device as a DHCP relay agent. In this output, the active server group is named server-1 and its IP address is 1.1.1.1/24. The DHCP relay agent configuration is applied to a group named bob. Within this group, the DHCP relay agent is enabled on interface ge-1/0/1.0.

```
[edit forwarding-options]
dhcp-relay {
  group bob {
    interface ge-1/0/1.0
  }
  server-group server-1 {
    address 1.1.1.1/24
  }
  active-server-group server-1
}
```

**NOTE:** To configure the DHCP relay agent in a routing instance, configure the `dhcp-relay` statements in the `[edit routing-instances]` hierarchy level .

### Verifying and Managing DHCP Relay Configuration

**Purpose** View or clear address bindings or statistics for DHCP relay agent clients.

**Action** • To display the address bindings for DHCP relay agent clients:

```
user@host> show dhcp relay binding
```

• To display DHCP relay agent statistics:

```
user@host> show dhcp relay statistics
```

• To clear the binding state of DHCP relay agent clients:

```
user@host> clear dhcp relay binding
```

• To clear all DHCP relay agent statistics:

```
user@host> clear dhcp relay statistics
```

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp relay binding routing instance <routing-instance name>`
- `show dhcp relay statistics routing instance <routing-instance name>`
- `clear dhcp relay binding routing instance <routing-instance name>`
- `clear dhcp relay statistics routing instance <routing-instance name>`

### Minimum DHCP Local Server Configuration

This following sample output shows the minimum configuration you must use to configure an SRX Series device as a DHCP local server. In this output, the server group is named bob, and the DHCP local server is enabled on interface ge-1/0/1.0 within the group.

```
[edit access]
address-assignment {
  pool verizon family inet {
    network 192.168.1.0/24;
  }
}

edit system services
dhcp-local-server {
  group bob {
    interface ge-1/0/1.0
  }
}

edit interfaces ge-1/0/1 unit 0
family {
  inet {
    address 192.168.1.1/24
  }
}
```

**NOTE:** You can configure the DHCP local server in a routing instance by using the `dhcp-local-server`, `interface`, and `address-assignment` statements in the `[edit routing-instances]` hierarchy level.

#### Related Documentation

- *Administration Guide for Security Devices*

## Configuring Address-Assignment Pools

The address-assignment pool feature enables you to create address pools that can be shared by different client applications.

To configure an address-assignment pool:

1. Configure the address-assignment pool name and specify the addresses for the pool.  
See [“Configuring an Address-Assignment Pool Name and Addresses” on page 724](#).
2. (Optional) Configure named ranges (subsets) of addresses.  
See [“Configuring a Named Address Range for Dynamic Address Assignment” on page 725](#).
3. (Optional;IPv4 only) Create static address bindings.  
See [“Configuring Static Address Assignments” on page 725](#).
4. (Optional) Configure attributes for DHCP clients.  
See [“Configuring DHCP Client-Specific Attributes” on page 726](#).

### Related Documentation

- *Administration Guide for Security Devices*

## Configuring an Address-Assignment Pool Name and Addresses

When configuring an address-assignment pool, you must specify the name of the pool and its addresses.

To configure an IPv4 address-assignment pool:

1. Configure the name of the pool and specify the IPv4 family.  
[edit access]  
user@host# **edit address-assignment pool blr-pool family inet**
2. Configure the network address and the prefix length of the addresses in the pool.  
[edit access address-assignment pool blr-pool family inet]  
user@host# **set network 192.168.0.0/16**

**NOTE:** You can configure an IPv4 address-assignment pool in a routing instance by configuring the address-assignment statements in the [edit routing-instances] hierarchy level.

### Related Documentation

- [Configuring Address-Assignment Pools on page 724](#)
- *Administration Guide for Security Devices*

## Configuring DHCP Client-Specific Attributes

You use the address-assignment pool feature to include application-specific attributes when clients obtain an address. The client application, such as DHCP, uses the attributes to determine how addresses are assigned and to provide optional application-specific characteristics to the client. For example, the DHCP application might specify that a client that matches certain prerequisite information is dynamically assigned an address from a particular named range. Based on which named range is used, DHCP specifies additional DHCP attributes such as the boot file that the client uses, the DNS server, and the maximum lease time.

You use the **dhcp-attributes** statement to configure DHCP client-specific attributes for address-assignment pools.

To configure address-assignment pool attributes for DHCP clients:

1. Specify the name of the address-assignment pool.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure optional DHCP client attributes.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set dhcp-attributes maximum-lease-time 2419200
user@host# set dhcp-attributes name-server 192.168.10.2
user@host# set dhcp-attributes boot-file boot-file.txt
user@host# set dhcp-attributes boot-file boot-server example.net
```

**NOTE:** To configure DHCP client-specific attributes in a routing instance, configure the **dhcp-attributes** statements in the **[edit routing-instances]** hierarchy.

### Related Documentation

- [Configuring Address-Assignment Pools on page 724](#)
- *Administration Guide for Security Devices*

## Configuring a Named Address Range for Dynamic Address Assignment

You can optionally configure multiple named ranges, or subsets, of addresses within an address-assignment pool. During a dynamic address assignment, a client can be assigned an address from a specific named range. To create a named range, you specify a name for the range and define the address range.

To create a named range within an IPv4 address-assignment pool:

1. Specify the name of the address-assignment pool.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure the name of the range and the lower and upper boundaries of the addresses in the range.

```
[edit access address-assignment pool isp_1 family inet]
user@host# set range southeast low 192.168.102.2 high 192.168.102.254
```

**NOTE:** To configure named address ranges in a routing instance, configure the address-assignment statements in the [edit routing-instances] hierarchy level.

#### Related Documentation

- [Configuring Address-Assignment Pools on page 724](#)
- *Administration Guide for Security Devices*

### Configuring Static Address Assignments

You can optionally create a static IPv4 address binding by reserving a specific address for a particular client. The address is removed from the address-assignment pool so that it is not assigned to another client. When you reserve an address, you identify the client host and create a binding between the client MAC address and the assigned IP address.

To configure a static IPv4 address binding:

1. Specify the name of the IPv4 address-assignment pool containing the IP address you want to reserve for the client.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Specify the name of the client for the static binding, the client MAC address, and the IP address to reserve for the client. This configuration specifies that the client with MAC address 01:03:05:07:09:0b is always assigned IP address 192.168.10.2.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set host svale6_boston_net hardware-address 01:03:05:07:09:0b
ip-address 192.168.10.2
```

**NOTE:** To configure static binding for an IPv4 address in a routing instance, configure the address-assignment statements in the [edit routing-instances] hierarchy.

#### Related Documentation

## Enabling TCP/IP Propagation on a DHCP Local Server

This topic describes how to configure TCP/IP settings on a DHCP local server, which includes a DHCP client and a DHCP local server.

To enable TCP/IP setting propagation on a DHCP local server:

1. Configure the **update-server** option on the DHCP client.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
dhcp-client {
  update-server;
}
```

2. Configure the address pool to specify the interface (where **update-server** is configured) from which TCP/IP settings can be propagated.

```
[edit access]
address-assignment {
  pool sprint family inet {
    network 192.168.2.0/24;
    dhcp-attributes {
      propagate-settings ge-0/0/1.0;
    }
  }
}
```

3. Configure the DHCP local server.

```
edit system services
dhcp-local-server {
  group bob {
    interface ge-1/0/1.0
  }
}
```

**Related Documentation**

- *Administration Guide for Security Devices*

## Minimum DHCP Client Configuration

The following sample output shows the minimum configuration you must use to configure an SRX Series device as a DHCP client. In this output, the interface is ge-0/0/0 and the logical unit is 0.

```
[edit interfaces]
ge-0/0/0 {
  unit 0 {
    family inet {
      dhcp-client
    }
  }
}
```

**NOTE:** To configure a DHCP client in a routing instance, add the interface in a routing instance using the [edit routing-instances] hierarchy.

#### Related Documentation

- [Configuring Optional DHCP Client Attributes on page 727](#)
- *Administration Guide for Security Devices*

### Configuring Optional DHCP Client Attributes

For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP local server in the network. You can then set the client-identifier, lease time, retransmission attempts, retry interval, preferred DHCP local server address, and vendor class ID.

To configure optional DHCP client attributes:

1. Configure the DHCP client identifier prefix as the routing instance name.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set client-identifier prefix host
```
2. Set the DHCP lease time.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set lease-time 86400
```
3. Set the number of attempts allowed to retransmit a DHCP packet.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set retransmission-attempt 6
```
4. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set retransmission-interval 5
```
5. Set the IPv4 address of the preferred DHCP local server.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set server-address 10.1.1.1
```
6. Set the vendor class ID for the DHCP client.  

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set vendor-id ether
```

**NOTE:** To configure the DHCP client in a routing instance, configure the interface in the [edit routing-instances] hierarchy.

### Minimum DHCP Relay Agent Configuration

The following sample output shows the minimum configuration you must use to configure an SRX Series device as a DHCP relay agent. In this output, the active server group is named server-1 and its IP address is 1.1.1.1/24. The DHCP relay agent configuration is applied to a group named bob. Within this group, the DHCP relay agent is enabled on interface ge-1/0/1.0.

```
[edit forwarding-options]
dhcp-relay {
  group bob {
    interface ge-1/0/1.0
  }
  server-group server-1 {
    address 1.1.1.1/24
  }
  active-server-group server-1
}
```

**NOTE:** To configure the DHCP relay agent in a routing instance, configure the `dhcp-relay` statements in the `[edit routing-instances]` hierarchy level.

### DHCPv6 Client

- [Minimum DHCPv6 Client Configuration on page 736](#)
- [Configuring Optional DHCPv6 Client Attributes on page 737](#)
- [Configuring Nontemporary Address Assignment on page 738](#)
- [Configuring Identity Associations for Nontemporary Addresses and Prefix Delegation on page 739](#)
- [Configuring Auto-Prefix Delegation on page 739](#)
- [Configuring the DHCPv6 Client Rapid Commit Option on page 740](#)
- [Configuring a DHCPv6 Client in Autoconfig Mode on page 741](#)
- [Configuring TCP/IP Propagation on a DHCPv6 Client on page 741](#)

### Minimum DHCPv6 Client Configuration

This topic describes the minimum configuration you must use to configure an SRX Series device as a DHCPv6 client.

To configure the device as a DHCPv6 client:

1. Specify the DHCPv6 client interface.

```
[edit]
```

```
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the DHCPv6 client type. The client type can be `autoconfig` or `statefull`.

- To enable DHCPv6 auto configuration mode, configure the client type as **autoconfig**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type autoconfig
```

- For stateful address assignment, configure the client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

3. Specify the identity association type.

- To configure identity association for nontemporary address (IA\_NA) assignment, specify the **client-ia type** as **ia-na**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

- To configure identity association for prefix delegation (IA\_PD), specify the **client-ia-type** as **ia-pd**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-pd
```

4. Configure the DHCPv6 client identifier by specifying the DHCP unique identifier (DUID) type. The following DUID types are supported:

- Link Layer address (`duid-ll`)
- Link Layer address plus time (`duid-llt`)
- Vendor-assigned unique ID based on enterprise number (`vendor`)

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-identifier duid-type duid-ll
```

**NOTE:** To configure a DHCPv6 client in a routing instance, add the interface to a routing instance using the `[edit routing-instances]` hierarchy.

#### Related Documentation

- [DHCPv6 Client Overview on page 693](#)

### Configuring Optional DHCPv6 Client Attributes

To enable a device to operate as a DHCPv6 client, you configure a logical interface on the device to obtain an IPv6 address from the DHCPv6 local server in the network. You can then specify the retransmission attempts, client requested configuration options, interface used to delegate prefixes, rapid commit, and update server options.

To configure optional DHCPv6 client attributes:

1. Specify one of the following DHCPv6 client requested configuration options:

- dns-server
- domain
- ntp-server
- sip-domain
- sip-server

For example, to specify the DHCPv6 client requested option as **dns-server**:

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set req-option dns-server
```

2. Set the number of attempts allowed to retransmit a DHCPv6 client protocol packet.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set retransmission-attempt 6
```

3. Configure the **update-server** option on the DHCPv6 client.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-server
```

4. Specify the interface used to delegate prefixes.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-router-advertisement interface ge-0/0/0
```

5. Configure the two-message (rapid commit) exchange option for address assignment.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set rapid-commit
```

**NOTE:** To configure a DHCPv6 client in a routing instance, add the interface to a routing instance using the [edit routing-instances] hierarchy.

#### Related Documentation

- [Minimum DHCPv6 Client Configuration on page 736](#)

### Configuring Nontemporary Address Assignment

Nontemporary address assignment is also known as stateful address assignment. In the stateful address assignment mode, the DHCPv6 client requests global addresses from the DHCPv6 server. Based on the DHCPv6 server's response, the DHCPv6 client assigns the global addresses to interfaces and sets a lease time for all valid responses. When the lease time expires, the DHCPv6 client renews the lease from the DHCPv6 server.

To configure nontemporary (stateful) address assignment:

1. Specify the DHCPv6 client interface.

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

3. Specify the IA\_NA assignment.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

#### Related Documentation

- [Minimum DHCPv6 Client Configuration on page 736](#)

### Configuring Identity Associations for Nontemporary Addresses and Prefix Delegation

The DHCPv6 client requests IPv6 addresses and prefixes from the DHCPv6 server. Based on the DHCPv6 server's response, the DHCPv6 client assigns the IPv6 addresses to interfaces and sets a lease time for all valid responses. When the lease time expires, the DHCPv6 client renews the lease from the DHCPv6 server.

To configure identity association for nontemporary addresses (IA\_NA) and identity association for prefix delegation (IA\_PD):

1. Specify the DHCPv6 client interface.

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

3. Specify the IA\_NA.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

4. Specify the IA\_PD.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-pd
```

#### Related Documentation

- [Minimum DHCPv6 Client Configuration on page 736](#)

### Configuring Auto-Prefix Delegation

You can use DHCPv6 client prefix delegation to automate the delegation of IPv6 prefixes to the customer premises equipment (CPE). With prefix delegation, a delegating router delegates IPv6 prefixes to a requesting router. The requesting router then uses the prefixes to assign global IPv6 addresses to the devices on the subscriber LAN. The requesting router can also assign subnet addresses to subnets on the LAN.

To configure auto-prefix delegation:

1. Configure the DHCPv6 client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set client-type statefull
```

2. Specify the identity association type as **ia-na** for nontemporary addresses.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set client-ia-type ia-na
```

3. Specify the identity association type as **ia-pd** for prefix delegation.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set client-ia-type ia-pd
```

4. Configure the DHCPv6 client identifier by specifying the DUID type.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set client-identifier duid-type duid-ll
```

5. Specify the interface used to delegate prefixes.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set update-router-advertisement interface ge-0/0/0
```

**Related  
Documentation**

- [Configuring Optional DHCPv6 Client Attributes on page 737](#)

---

### Configuring the DHCPv6 Client Rapid Commit Option

The DHCPv6 client can obtain configuration parameters from a DHCPv6 server through a rapid two-message exchange (solicit and reply). When the rapid commit option is enabled by both the DHCPv6 client and the DHCPv6 server, the two-message exchange is used, rather than the default four-method exchange (solicit, advertise, request, and reply). The two-message exchange provides faster client configuration and is beneficial in environments in which networks are under a heavy load.

To configure the DHCPv6 client to support the DHCPv6 rapid commit option:

1. Specify the DHCPv6 client interface.

```
[edit]
```

```
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the two-message exchange option for address assignment.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set rapid-commit
```

**Related  
Documentation**

- [DHCPv6 Client Overview on page 693](#)

### Configuring a DHCPv6 Client in Autoconfig Mode

A DHCPv6 client configured in autoconfig mode acts as a stateful client, a stateless client (DHCPv6 server is required for TCP/IP configuration), and stateless–no DHCP client, based on the managed (M) and other configuration (O) bits in the received router advertisement messages.

If the managed bit is 1 and the other configuration bit is 0, the DHCPv6 client acts as a stateful client. In stateful mode, the client receives IPv6 addresses from the DHCPv6 server, based on the identity association for nontemporary addresses (IA\_NA) assignment.

If the managed bit is 0 and the other configuration bit is 1, the DHCPv6 client acts as a stateless client. In stateless mode, the addresses are automatically configured, based on the prefixes in the router advertisement messages received from the router. The stateless client receives configuration parameters from the DHCPv6 server.

If the managed bit is 0 and the other configuration bit is also 0, the DHCPv6 client acts as a stateless–no DHCP client. In the stateless–no DHCP mode, the client receives IPv6 addresses from the router advertisement messages.

To configure DHCPv6 client in autoconfig mode:

1. Configure the DHCPv6 client type as **autoconfig**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type autoconfig
```

2. Specify the identity association type as **ia-na** for nontemporary addresses.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

3. Specify the interface on which to configure router advertisement.

```
[edit protocols router-advertisement]
user@host# set interface ge-0/0/1.0
```

### Configuring TCP/IP Propagation on a DHCPv6 Client

You can enable or disable the propagation of TCP/IP settings received on the device acting as a DHCPv6 client. The settings can be propagated to the server pool running on the device. This topic describes how to configure TCP/IP settings on a DHCPv6 client, where both the DHCPv6 client and DHCPv6 server are on the same device.

To configure TCP/IP setting propagation on a DHCPv6 client:

1. Configure the **update-server** option on the DHCPv6 client.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-server
```

2. Configure the address pool to specify the interface (where **update-server** is configured) from which TCP/IP settings can be propagated.

[edit access]

```
user@host# set address-assignment pool 2 family inet6 dhcp-attributes  
propagate-settings ge-0/0/0
```

### Creating a Security Policy for DHCPv6

---

For the DHCPv6 server to allow DHCPv6 requests, you must create a security policy to enable DHCPv6 traffic. In this example, the zone `my-zone` allows DHCPv6 traffic from the zone `untrust`, and the `ge-0/0/3.0` interface is configured with the IPv6 address `3000::1`.

To create a security zone policy to allow DHCPv6:

1. Create the zone and add an interface to that zone.

[edit security zones]

```
user@host# edit security-zone my-zone interfaces ge-0/0/3.0
```

2. Configure host inbound traffic system services to allow DHCPv6.

[edit security zones security-zone my-zone interfaces ge-0/0/3.0]

```
user@host# set host-inbound-traffic system-services dhcpv6
```

3. If you are done configuring the device, enter **commit** from configuration mode.

**Related  
Documentation**

- [DHCPv6 Server Overview on page 694](#)
- [Example: Configuring DHCPv6 Server Options on page 743](#)
- [Example: Configuring an Address-Assignment Pool on page 745](#)
- *Administration Guide for Security Devices*

### Example: Configuring DHCPv6 Server Options

This example shows how to configure DHCPv6 server options.

- [Requirements on page 743](#)
- [Overview on page 743](#)
- [Configuration on page 743](#)
- [Verification on page 745](#)

#### Requirements

Before you begin:

- Determine the IPv6 address pool range.
- Determine the IPv6 prefix. See the *Understanding Address Books*.
- Determine the grace period, maximum lease time, or any custom options that should be applied to clients.
- List the IP addresses that are available for the devices on your network; for example, DNS and SIP servers.

#### Overview

In this example, you set a default client limit as 100 for all DHCPv6 groups. You then create a group called my-group that contains at least one interface. In this case, the interface is ge-0/0/3.0. You set a range of interfaces using the upto command and set a custom client limit as 200 for group my-group that overrides the default limit. Finally, you configure interface ge-0/0/3.0 with IPv6 address 3000::1/64 and set router advertisement for interface ge-0/0/3.0.

**NOTE:** A DHCPv6 group must contain at least one interface.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system services dhcp-local-server dhcpv6 overrides interface-client-limit 100
set system services dhcp-local-server dhcpv6 group my-group interface ge-0/0/3.0
set system services dhcp-local-server dhcpv6 group my-group interface ge-0/0/3.0 upto
  ge-0/0/6.0
set system services dhcp-local-server dhcpv6 group my-group overrides
  interface-client-limit 200
set interfaces ge-0/0/3 unit 0 family inet6 address 3000::1/64
set protocols router-advertisement interface ge-0/0/3.0 prefix 3000::/64
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure DHCPv6 server options:

1. Configure a DHCP local server.  

```
[edit]  
user@host# edit system services dhcp-local-server dhcpv6
```
2. Set a default limit for all DHCPv6 groups.  

```
[edit system services dhcp-local-server dhcpv6]  
user@host# set overrides interface-client-limit 100
```
3. Specify a group name and interface.  

```
[edit system services dhcp-local-server dhcpv6]  
user@host# set group my-group interface ge-0/0/3.0
```
4. Set a range of interfaces.  

```
[edit system services dhcp-local-server dhcpv6]  
user@host# set group my-group interface ge-0/0/3.0 upto ge-0/0/6.0
```
5. Set a custom client limit for the group.  

```
[edit system services dhcp-local-server dhcpv6]  
user@host# set group my-group overrides interface-client-limit 200
```
6. Configure an interface with an IPv6 address.  

```
[edit interfaces]  
user@host# set ge-0/0/3 unit 0 family inet6 address 3000::1/64
```
7. Set router advertisement for the interface.  

```
[edit protocols]  
user@host# set router-advertisement interface ge-0/0/3.0 prefix 3000::/64
```

**Results** From configuration mode, confirm your configuration by entering the **show system services dhcp-local-server**, **show interfaces ge-0/0/3**, and **show protocols** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]  
user@host# show system services dhcp-local-server  
dhcpv6 {  
  overrides {  
    interface-client-limit 100;  
  }  
  group my-group {  
    overrides {  
      interface-client-limit 200;  
    }  
    interface ge-0/0/3.0 {  
      upto ge-0/0/6.0;  
    }  
  }  
}
```

```

}
[edit]
user@host# show interfaces ge-0/0/3
unit 0 {
family inet6 {

### Example: Configuring an Address-Assignment Pool

This example shows how to configure an address-assignment pool.

- [Requirements on page 746](#)
- [Overview on page 746](#)

- [Configuration on page 746](#)
- [Verification on page 747](#)

### Requirements

Before you begin:

- Specify the name of the address-assignment pool and configure addresses for the pool.
- Set DHCPv6 attributes for the address-assignment pool.

### Overview

In this example, you configure an address-pool called my-pool and specify the IPv6 family as inet6. You configure the IPv6 prefix as 3000:0000::/10, the range name as range1, and the IPv6 range for DHCPv6 clients from a low of 3000:0000::/32 to a high of 3000:1000::/32. You can define the range based on the lower and upper boundaries of the prefixes in the range or based on the length of the prefixes in the range. Finally, you specify the DHCPv6 attribute for the DNS server as 3001::1, the grace period as 3600, and the maximum lease time as 120.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set access address-assignment pool my-pool family inet6 prefix 3000:0000::/10
set access address-assignment pool my-pool family inet6 range range1 low
  3000:0000::/32 high 3000:1000::/32
set access address-assignment pool my-pool family inet6 dhcp-attributes dns-server
  3001::1
set access address-assignment pool my-pool family inet6 dhcp-attributes grace-period
  3600
set access address-assignment pool my-pool family inet6 dhcp-attributes
  maximum-lease-time 120
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure an IPv6 address-assignment pool:

1. Configure an address-pool and specify the IPv6 family.  

```
[edit access]
user@host# edit address-assignment pool my-pool family inet6
```
2. Configure the IPv6 prefix, the range name, and IPv6 range for DHCPv6 clients.  

```
[edit access address-assignment pool my-pool family inet6]
user@host# set prefix 3000:0000::/10
user@host# set range range1 low 3000:0000::/32 high 3000:1000::/32
```
3. Configure the DHCPv6 attribute for the DNS server for the address pool.

```
[edit access address-assignment pool my-pool family inet6]
user@host# set dhcp-attributes dns-server 3001::1
```

4. Configure the DHCPv6 attribute for the grace period.

```
[edit access address-assignment pool my-pool family inet6]
user@host# set dhcp-attributes grace-period 3600
```

5. Configure the DHCPv6 attribute for the maximum lease time.

```
[edit access address-assignment pool my-pool family inet6]
user@host# set dhcp-attributes maximum-lease-time 120
```

**Results** From configuration mode, confirm your configuration by entering the **show access address-assignment** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show access address-assignment
pool my-pool {
  family inet6 {
    prefix 3000:0000::/10;
    range range1 {
      low 3000:0000::/32;
      high 3000:1000::/32;
    }
    dhcp-attributes {
      maximum-lease-time 120;
      grace-period 3600;
      dns-server {
        3001::1;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Verifying Configuration

**Purpose** Verify that the address-assignment pool has been configured.

**Action** From operational mode, enter the **show access address-assignment** command.

- [Administration Guide for Security Devices](#)

### Configuring a Named Address Range for Dynamic Address Assignment

---

You can optionally configure multiple named ranges, or subsets of addresses, within an address-assignment pool. During dynamic address assignment, a client can be assigned an address from a specific named range. To create a named range, you specify a name for the range and define the address range and DHCPv6 attributes.

To configure a named address range for dynamic address assignment:

1. Specify the name of the address-assignment pool and the IPv6 family.

```
[edit access]
user@host# edit address-assignment pool my-pool2 family inet6
```

2. Configure the IPv6 prefix and then define the range name and IPv6 range for DHCPv6 clients. You can define the range based on the lower and upper boundaries of the prefixes in the range, or based on the length of the prefixes in the range.

```
[edit access address-assignment pool my-pool2 family inet6]
user@host# set prefix 3000:5000::/10
user@host# set range range2 low 3000:2000::/32 high 3000:3000::/32
```

3. Configure DHCPv6 attributes for the address pool.

```
[edit access address-assignment pool my-pool2 family inet6]
user@host# set dhcp-attributes dns-server 2001:db8:18:: grace-period 3600
maximum-lease-time 120
```

4. If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Address-Assignment Pool Linking

---

Address-assignment pool linking enables you to specify a secondary address pool for the device to use when the primary address-assignment pool is fully allocated. When the primary pool has no available addresses remaining, the device automatically switches over to the linked secondary pool and begins allocating addresses from that pool. The device uses a secondary pool only when the primary address-assignment pool is fully allocated.

You can create a chain of multiple linked pools. For example, you can link pool A to pool B, and link pool B to pool C. When pool A has no available addresses, the device switches to pool B for addresses. When pool B is exhausted, the device switches to pool C. There is no limit to the number of linked pools in a chain. However, you cannot create multiple links to or from the same pool—a pool can be linked to only one secondary pool, and a secondary pool can be linked from only one primary pool.

To link a primary address-assignment pool named pool1 to a secondary pool named pool2:

```
[edit access address-assignment]
user@host# set pool pool1 link pool2
```

Documentation**

- *Administration Guide for Security Devices*

### Configuring DHCP Client-Specific Attributes

You use the address-assignment pool feature to include application-specific attributes when clients obtain an address. A client application, such as DHCPv6, uses the attributes to determine how addresses are assigned and to provide optional application-specific characteristics to the client. For example, the DHCPv6 application might specify that a client that matches certain prerequisite information is dynamically assigned an address from a particular named range. Based on which named range is used, DHCPv6 specifies additional DHCPv6 attributes such as the DNS server or the maximum lease time for clients.

You use the **dhcp-attributes** statement to configure DHCPv6 client-specific attributes for address-assignment pools at the **[edit access address-assignment pool *pool-name* family inet6]** hierarchy.

Table 98 on page 749 describes the DHCPv6 client attributes for configuring IPv6 address-assignment pools.

**Table 98: DHCPv6 Attributes**

| Attribute                     | Description                                                      | DHCPv6 Option |
|-------------------------------|------------------------------------------------------------------|---------------|
| <b>dns-server</b>             | IPv6 address of DNS server to which clients can send DNS queries | 23            |
| <b>grace-period</b>           | Grace period offered with the lease                              | —             |
| <b>maximum-lease-time</b>     | Maximum lease time allowed by the DHCPv6 server                  | —             |
| <b>option</b>                 | User-defined options                                             | —             |
| <b>sip-server-address</b>     | IPv6 address of SIP outbound proxy server                        | 22            |
| <b>sip-server-domain-name</b> | Domain name of the SIP outbound proxy server                     | 21            |

### Configuring an Address-Assignment Pool for Router Advertisement

You can create an address-assignment pool that is explicitly used for router advertisement address assignment. You populate the address-assignment pool using the standard procedure, but you additionally specify that the pool is used for router advertisement.

To configure an address-assignment pool that is used for router advertisement:

1. Create the IPv6 address-assignment pool.
2. Specify that the address-assignment pool is used for router advertisement.

```
[edit access address-assignment]
user@host# set neighbor-discovery-router-advertisement router1
```

3. If you are done configuring the device, enter **commit** from configuration mode.

### Groups Configuration Statement Hierarchy

Use the statements in the **groups** configuration hierarchy to configure information that can be dynamically updated in various parts of the device configuration.

```

groups {
    group-name {
        configuration-data ;
    }
}

```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** The address-assignment pool feature enables you to create IPv4 and IPv6 address pools that different client applications can share. For example, multiple client applications, such as DHCPv4 or DHCPv6, can use an address-assignment pool to provide addresses for their particular clients.

**Required Privilege Level** access—To view this statement in the configuration.  
access-control—To add this statement to the configuration.

## address-pool (Access)

---

**Syntax**    address-pool *pool-name* {  
                  (address *address-or-address-prefix* ) {  
                    address-range {  
                      high *upper-limit*;  
                      low *lower-limit*;  
                      mask *network-mask*;  
                    }  
                  primary-dns *name*;  
                  primary-wins *name*;  
                  secondary-dns *name*;  
                  secondary-wins *name*;  
                }

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Release 10.4 of Junos OS.

**Description**    Create an address-pool for L2TP clients.

- Options**
- **pool-name**—Name assigned to the address-pool.
  - **address**—Configure subnet information for the address-pool.
  - **address-range**—Defines the address range available for clients.
  - **primary-dns**—Specify the primary-dns IP address.
  - **secondary-dns**—Specify the secondary-dns IP address.
  - **primary-wins**—Specify the primary-wins IP address.
  - **secondary-wins**—Specify the secondary-wins IP address.

**Required Privilege Level**    access—To view this statement in the configuration.  
                                  access-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.                                                                                                                                                                                                                                             |
| <b>Default</b>                  | If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <b><i>authentication-methods</i></b> —One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following: <ul style="list-style-type: none"><li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the [edit <b>system login user</b>] hierarchy level.</li><li>• <b>radius</b>—Use RADIUS authentication services.</li><li>• <b>tacplus</b>—Use TACACS+ authentication services.</li></ul> |
| <b>Required Privilege Level</b> | <b>system</b> —To view this statement in the configuration.<br><b>system-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                  |

## boot-server (NTP)

| <b>Description</b>              | <p>Configure the server that NTP queries when the SRX Series device boots to determine the local date and time.</p> <p>When you boot the SRX Series device, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the SRX Series device uses to determine the time when the SRX Series device boots. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the SRX Series device boots up.</p> <p>If you configure an NTP boot server, then when the SRX Series device boots, it immediately synchronizes with the boot server even if the NTP process is explicitly disabled or if the time difference between the client and the boot server exceeds the threshold value of 1000 seconds.</p> |

| <b>Description</b>              | Configure the SRX Series device to operate in broadcast mode with the remote system at the specified address. In this mode, the SRX Series device sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the SRX Series device is operating as a transmitter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b>address</b>—The broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be <b>224.0.1.1</b>.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>routing-instance-name routing-instance-name</b>—(Optional) The routing instance name in which the interface has an address in the broadcast subnet.</p> <p><b>Default:</b> The default routing instance is used to broadcast packets.</p> <p><b>ttl value</b>—(Optional) Time-to-live (TTL) value to use.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 1</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

    }
```

**Hierarchy Level** [edit access address-assignment pool *pool-name* family inet6]

**Release Information** Statement introduced in Release 10.4 of Junos OS.

**Description** Configure attributes for address pools that can be used by different clients.

**Options**

- **dns-server *IPv6-address***—Specify a DNS server to which clients can send DNS queries.

- **grace-period *seconds***—Specify the grace period offered with the lease.

**Range:** 0 through 4,294,967,295 seconds

**Default:** 0 (no grace period)

- **maximum-lease-time *seconds***—Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.

**Range:** 30 through 4,294,967,295 seconds

**Default:** 86,400 seconds (24 hours)

- **option *dhcp-option-identifier-code***—Specify the DHCP option identifier code.

- **propagate-ppp-settings [*interface-name*]**—Specify PPP interface name for propagating DNS or WINS settings.

- **sip-server-address** *IPv6-address*—Specify the IPv6 address of the SIP outbound proxy server.
- **sip-server-domain-name** *domain-name*—Specify the domain name of the SIP outbound proxy server.

**Required Privilege Level** access—To view this statement in the configuration.  
access-control—To add this statement to the configuration.

**Related Documentation** • *Administration Guide for Security Devices*

## dhcp-client

**Syntax**

```
dhcp-client {
  client-identifier {
    prefix {
      host-name;
      logical-system-name;
      routing-instance-name;
    }
    use-interface-description (device | logical);
    user-id (ascii string | hexadecimal string);
  }
  lease-time (length | infinite);
  retransmission-attempt value;
  retransmission-interval seconds;
  server-address server-address;
  update-server;
  vendor-id vendor-id;
}
```

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family*]

**Release Information** Statement introduced in Junos OS Release 12.1X44-D10.

**Description** Configure the Dynamic Host Configuration Protocol (DHCP) client.

**Options** The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation** • *Administration Guide for Security Devices*

## dhcpv6-client

---

**Syntax**    dhcpv6-client {  
              client-ia-type (ia-na | ia-pd);  
              client-identifier duid-type (duid-ll | duid-llt | vendor);  
              client-type (autoconfig | statefull);  
              rapid-commit;  
              req-option (dns-server | domain | fqdn | nis-domain | nis-server | ntp-server | sip-domain  
                          | sip-server | time-zone | vendor-spec);  
              retransmission-attempt *number*;  
              update-router-advertisement {  
                  interface *interface-name*;  
              }  
              update-server;  
          }

**Hierarchy Level**    [edit interfaces *interface-name* unit *logical-unit-number* family *family*]

**Release Information**    Statement introduced in Junos OS Release 12.1X45-D10.

**Description**    Configure the Dynamic Host Configuration Protocol version 6 (DHCPv6) client.

**Options**    The remaining options are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**    • *Administration Guide for Security Devices*

## dhcp-local-server (System Services)

```
Syntax  dhcp-local-server {
        dhcpv6 {
            authentication {

## family (Security Forwarding Options)

**Syntax**

```
family {
  inet6 {
    mode (drop | flow-based | packet-based);
  }
  iso {
    mode packet-based;
  }
  mpls {
    mode packet-based;
  }
}
```

**Hierarchy Level** [edit security forwarding-options]

**Release Information** Statement introduced in Release 8.5 of Junos OS.

**Description** Determine the protocol family to be used for packet forwarding.

**NOTE:** Packet-based processing is not supported on the following SRX Series devices: SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800.

**Options** The remaining statements are explained separately.

**Required Privilege Level**

|                                                              |
|--------------------------------------------------------------|
| security—To view this statement in the configuration.        |
| security-control—To add this statement to the configuration. |

## forwarding-options (Security)

**Syntax**

```
forwarding-options {
  family {
    inet6 {
      mode (drop | flow-based | packet-based);
    }
    iso {
      mode packet-based;
    }
    mpls {
      mode packet-based;
    }
  }
}
```

**Hierarchy Level** [edit security]

**Release Information** Statement introduced in Release 8.5 of Junos OS.

**Description** Determine how the **inet6**, **iso**, and **mpls** protocol families manage security forwarding options.

### NOTE:

- Packet-based processing is not supported on the following SRX Series devices: SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.
- On SRX Series devices, the default mode for processing traffic is flow mode. To configure an SRX Series device as a border router, you must change the mode from flow-based processing to packet-based processing. Use the **set security forwarding-options family mpls mode packet-based** statement to configure the SRX device to packet mode. You must reboot the device for the configuration to take effect.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

| <b>Description</b>              | Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the interface <i>interface-name</i> statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group.                                                                                                                                                                           |
| <b>Options</b>                  | <ul style="list-style-type: none"><li>• <i>interface-name</i>—Name of the interface.</li><li>• <b>trace</b>—Enable tracing of the interface specified by the <i>interface-name</i> argument.</li><li>• <b>upto</b> <i>upto-interface-name</i>—The upper end of the range of interfaces; the lower end of the range is the <i>interface-name</i> entry. The interface device name of the <i>upto-interface-name</i> must be the same as the device name of the <i>interface-name</i>.</li></ul> |

| <b>Release Information</b> | Statement introduced in Release 10.4 of Junos OS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Configure extended DHCP local server tracing operations that can be enabled on a specific interface or group of interfaces. You use the <b>interface <i>interface-name</i> trace</b> statement at the [edit system services group <i>group-name</i> ] hierarchy level to enable the tracing operation on the specific interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>file-name</b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>jdhcpd</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events</li> <li>• <b>dhcpv6-packet</b>—Trace DHCPv6 packet decoding operations.</li> <li>• <b>dhcpv6-packet-option</b>—Trace DHCPv6 option decoding operations.</li> <li>• <b>dhcpv6-state</b>—Trace changes in state for DHCPv6 operations.</li> <li>• <b>packet</b>—Trace packet decoding operations</li> <li>• <b>packet-option</b>—Trace DHCP option decoding operations</li> <li>• <b>state</b>—Trace changes in state</li> </ul> |

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## internet-options

**Syntax**

```

internet-options {
    icmpv4-rate-limit {
        bucket size seconds;
        packet-rate packet-rate;
    }
    icmpv6-rate-limit {
        bucket size seconds;
        packet-rate packet-rate;
    }
    ipv6-duplicate-addr-detection-transmits number;
    no-path-mtu-discovery;
    no-source-quench;
    no-tcp-reset;
    no-tcp-rfc1323;
    no-tcp-rfc1323-paws;
    path-mtu-discovery;
    source-port {
        upper-limit range;
    }
    source-quench;
    tcp-drop-synfin-set;
}

```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1.

**Description** Configure tunable options for Internet operations.

- Options**
- **icmpv4-rate-limit**—Configure rate-limiting parameters for Internet Control Message Protocol version 4 (ICMPv4) messages.
    - **bucket-size *seconds***—Set ICMP rate-limiting maximum bucket size in seconds.
    - **packet-rate *packet-rate***— Set ICMP rate-limiting packets earned per second.
  - **icmpv6-rate-limit**—Configure rate-limiting parameters for Internet Control Message Protocol version 6 (ICMPv6) messages.
    - **bucket-size *seconds***—Set ICMP rate-limiting maximum bucket size in seconds.
    - **packet-rate *packet-rate***— Set ICMP rate-limiting packets earned per second.
  - **ipv6-duplicate-addr-detection-transmits *number***—Control the number of attempts for IPv6 duplicate address detection.
  - **no-path-mtu-discovery**—Do not enable path maximum transmission unit (MTU) discovery on TCP connections.
  - **no-source-quench**—Do not react to incoming ICMP source quench messages.
  - **no-tcp-reset**—Do not send RST TCP packets for packets sent to non-listening ports.
  - **no-tcp-rfc1323**—Disable RFC 1323 TCP extensions.

- **no-tcp-rfc1323-paws**—Disable RFC 1323 Protection Against Wrapped Sequence Number extension.
- **path-mtu-discovery**—Enable path MTU discovery on TCP connections.
- **source-port**—Configure source port selection parameters.
  - **upper-limit *range***—Specify upper limit of source port selection range.
- **source-quench**—React to incoming ICMP source quench messages.
- **tcp-drop-synfin-set**—Drop TCP packets that have both SYN and FIN flags.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

---

## lease-time (dhcp-client)

---

**Syntax** lease-time *seconds*;

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family* dhcp-client]

**Release Information** Statement introduced in Junos OS Release 12.1X44-D10.

**Description** Specify the time to negotiate and exchange Dynamic Host Configuration Protocol (DHCP) information.

**Options** **seconds**— Request time to negotiate and exchange information.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | For NTP, configure the SRX Series device to operate in symmetric active mode with the remote system at the specified address. In this mode, the SRX Series device and the remote system can synchronize with each other. This configuration is useful in a network in which either the SRX Series device or the remote system might be a better source of time.                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Release 9.6 of Junos OS.                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Reverse SSH allows you to configure a device to listen on a specific port for telnet and SSH (secure shell) services. When you connect to that port, the device provides an interface to the auxiliary port on the device. You can control the port that is used. By default, port 2901 is used. |

| <b>Release Information</b>      | Statement introduced in Release 9.6 of Junos OS.                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Reverse Telnet allows you to configure a device to listen on a specific port for telnet and SSH (secure shell) services. When you connect to that port, the device provides an interface to the auxiliary port on the device. You can control the port that is used. By default, port 2900 is used. |

| <b>Release Information</b> | Statement introduced in Release 10.4 of Junos OS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | Enable dynamic reconfiguration triggered by the DHCP local server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>attempts <i>number</i></b>—Configure maximum number of attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>Range:</b> 1 through 10 attempts</p> <p><b>Default:</b> 8 attempts</p> <p><b>clear-on-abort</b>—Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>strict</b>—Configure the system to only allow packets that contain the reconfigure accept option.</p> <p><b>timeout <i>seconds</i></b>—Configure the initial value in seconds between attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. Each successive attempts doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>Range:</b> 1 through 10 seconds</p> <p><b>Default:</b> 2 seconds</p> <p><b>token <i>token-name</i></b>—Configure a plain-text token for all DHCP clients or only the clients specified by the specified group of interfaces. The default is null (empty string).</p> |

**trigger** — Specify DHCP reconfigure trigger.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## req-option

**Syntax** req-option (dns-server | domain | fqdn | nis-domain | nis-server | ntp-server | sip-domain | sip-server | time-zone | vendor-spec);

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family* dhcpv6-client]

**Release Information** Statement introduced in Junos OS Release 12.1X45-D10.

**Description** The configuration options requested by the DHCPv6 client.

**Options** **dns-server**—Specify a DNS server.

**domain**—Specify a domain name.

**fqdn**—Specify a fully qualified domain name.

**nis-domain**—Specify a Network Information Service (NIS) domain.

**nis-server**—Specify a Network Information Service (NIS) server.

**ntp-server**—Specify a Network Time Protocol (NTP) server.

**sip-domain**—Specify a Session Initiation Protocol (SIP) domain.

**sip-server**—Specify a Session Initiation Protocol (SIP) server.

**time-zone**—Specify a time zone.

**vendor-spec**—Specify vendor specification.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Release 9.6 of Junos OS.                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Reverse Telnet allows you to configure a device to listen on a specific port for telnet and SSH (secure shell) services. When you connect to that port, the device provides an interface to the auxiliary port on the device. Use reverse SSH to encrypt the reverse telnet communication between the device and the client. |

| <b>Description</b>              | <p>For NTP, configure the SRX Series device to operate in client mode with the remote system at the specified address. In this mode, the SRX Series device can be synchronized with the remote system, but the remote system can never be synchronized with the SRX Series device.</p> <p>If the NTP client time drifts so that the difference in time from the NTP server exceeds 128 milliseconds, the client is automatically stepped back into synchronization. If the offset between the NTP client and server exceeds the 1000-second threshold, the client still synchronizes with the server, but it also generates a system log message noting that the threshold was exceeded.</p>     |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure the router or switch so that users on remote systems can access the local router or switch through the DHCP server, finger, rlogin, SSH, telnet, Web management, Junos XML protocol clear-text, Junos XML protocol SSL, and network utilities or enable Junos OS to work with the Session and Resource Control (SRC) software.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring clear-text or SSL Service for Junos XML Protocol Client Applications*
- *Configuring the Junos OS to Work with SRC Software*

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Specify a source address for each configured TACACS+ server, RADIUS server, or NTP server, or the source address to record in system log messages that are directed to a remote machine.                                                                                                                                                                                 |
| <b>Options</b>                  | <i>source-address</i> —A valid IP address configured on one of the SRX Series devices. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all <b>host <i>hostname</i></b> statements at the [edit system <b>syslog</b> ] hierarchy level, but not for messages directed to the other Routing Engine. |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                        |

| <b>Description</b>         | Configure extended DHCP local server tracing operations for DHCP processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <ul style="list-style-type: none"> <li>• <b>file-name</b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>jdhcpd</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</li> <li>• <b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</li> </ul> <p><b>Range:</b> 2 through 1000<br/> <b>Default:</b> 3 files</p> <ul style="list-style-type: none"> <li>• <b>match regular-expression</b>—(Optional) Refine the output to include lines that contain the regular expression.</li> <li>• <b>size maximum-file-size</b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</li> </ul> <p><b>Syntax:</b> <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB<br/> <b>Range:</b> 10 KB through 1 GB<br/> <b>Default:</b> 128 KB</p> <ul style="list-style-type: none"> <li>• <b>world-readable</b>—(Optional) Enable unrestricted file access.</li> <li>• <b>no-world-readable</b>—(Optional) Disable unrestricted file access.</li> <li>• <b>flag flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags: <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events.</li> </ul> </li> </ul> |

- **database**—Trace database operations.
- **dhcpv6-general**—Trace operations for DHCPv6.
- **dhcpv6-io**—Trace input/output operations for DHCPv6.
- **dhcpv6-packet**—Trace DHCPv6 packet decoding operations.
- **dhcpv6-packet-option**—Trace DHCPv6 option decoding operations.
- **dhcpv6-rpd**—Trace routing protocol process operations.
- **dhcpv6-session-db**—Trace session database operations for DHCPv6.
- **dhcpv6-state**—Trace changes in state for DHCPv6 operations.
- **fwd**—Trace firewall process operations.
- **general**—Trace miscellaneous general operations.
- **ha**—Trace high-availability related operations.
- **interface**—Trace interface operations.
- **io**—Trace input/output operations.
- **packet**—Trace packet decoding operations.
- **packet- option**—Trace DHCP option decoding operations.
- **performance**—Trace DHCP performance measurement operations.
- **profile**—Trace DHCP profile operations.
- **rpd**—Trace routing protocol process operations.
- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database operations.
- **state**—Trace changes in state.
- **statistics**—Trace changes in statistics.
- **ui**—Trace changes in user interface operations.
- **no remote-trace**—Disable remote tracing.

**Required Privilege Level**    trace—To view this statement in the configuration.  
                                  trace-control—To add this statement to the configuration.

## System Configuration Statement Hierarchy

Use the statements in the **system** configuration hierarchy to configure system management functions including addresses of the Domain Name System (DNS) servers; device's hostname, address, and domain name; health monitoring; interface filtering; properties of the device's auxiliary and console ports; security profiles for logical systems; time zones and Network Time Protocol (NTP) properties; trace options; and user login accounts, including user authentication and the root-level user account. Statement descriptions that are exclusive to the J Series and SRX Series devices running Junos OS are described in this section.

```
system {
  accounting {
    destination {
      radius {
        server server-address {
          accounting-port port-number;
          max-outstanding-requests number;
          port number;
          retry number;
          secret password;
          source-address address;
          timeout seconds;
        }
      }
    }
    tacplus {
      server server-address {
        port port-number;
        secret password;
        single-connection;
        source-address source-address;
        timeout seconds;
      }
    }
  }
  events [change-log interactive-commands login];
  traceoptions {

| <b>Release Information</b> | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | <p>Configure RADIUS server address for subscriber access management, Layer 2 Tunnelling Protocol (L2TP), or (Point-to-Point Protocol (PPP).</p> <p>To configure multiple RADIUS servers, include multiple <b>radius-server</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <ul style="list-style-type: none"> <li><b>server-address</b>—Address of the RADIUS server.</li> <li><b>accounting-port <i>port-number</i></b>—RADIUS server accounting port number.<br/> <b>Range:</b> 1 through 65,335 files<br/> <b>Default:</b> 1813</li> <li><b>port <i>port-number</i></b>—RADIUS server authentication port number.<br/> <b>Range:</b> 1 through 65,335 files<br/> <b>Default:</b> 1812</li> <li><b>retry <i>value</i></b>—Number of times that the router is allowed to attempt to contact a RADIUS server.<br/> <b>Range:</b> 1 through 10<br/> <b>Default:</b> 3</li> <li><b>secret <i>password</i></b>—Password to use; it can include spaces if the character string is enclosed in quotation marks.</li> <li><b>max-outstanding-requests <i>value</i></b>—Maximum number of outstanding requests in flight to server.<br/> <b>Range:</b> 1 through 65,335 files</li> <li><b>source-address <i>source-address</i></b>—Valid IPv4 or IPv6 address configured on one of the router or switch interfaces.</li> <li><b>timeout <i>seconds</i></b>—Amount of time to wait.</li> </ul> |

**Range:** 1 through 90 seconds

**Default:** 3 seconds

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

---

## root-authentication

---

**Syntax** root-authentication {  
    encrypted-password *password*;  
    load-key-file *URL*;  
    plain-text-password;  
    ssh-dsa *public-key* {  
        <from *pattern-list*>;  
    }  
    ssh-rsa *public-key* {  
        <from *pattern-list*>;  
    }  
}

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Specify authentication information for the root login.

- Options**
- **encrypted-password *password***—Specify the encrypted authentication password. You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.
  - **plain-text-password**—The CLI prompts you for a password encrypts it, and stores the encrypted version in its user database.
  - **load-key-file *URL***—File URL containing one or more SSH keys.
  - **ssh-dsa *public-key***—SSH DSA public key string.
    - **from *pattern-list***—Pattern list of allowed hosts.
  - **ssh-rsa *public-key***—SSH RSA public key string.
    - **from *pattern-list***—Pattern list of allowed hosts.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## web-management (System Services)

```
Syntax  web-management {
        http {
            interfaces interface-names ;
            port port;
        }
        https {
            interfaces interface-names;
            system-generated-certificate name;
            port port;
        }
        management url management url;
        session {
            idle-timeout minutes;
            session-limit number;
        }
        traceoptions {
            file {
                filename;
                files number;
                match regular-expression;
                size maximum-file-size;
                (no-world-readable | world-readable);
            }
            flag flag;
            level level;
            no-remote-trace;
        }
    }
```

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Junos OS Release 9.0.

**Description** Configure settings for HTTP or HTTPS access. HTTP access allows management of the device using the J-Web interface. HTTPS access allows secure management of the device using the J-Web interface. With HTTPS access, communication is encrypted between your browser and the webserver for your device.

**Options** **control**—Disable the SBC process.

- **max-threads**—Maximum simultaneous threads to handle requests.

**Range:** 0 through 16

**http**—Configure HTTP.

- **interface [value]**—Interface value that accept HTTP access.
- **port number**—TCP port for incoming HTTP connections.

**Range:** 1 through 65,535

**https**—Configure HTTPS.

- **interface** *[value]*—Interface value that accept HTTP access.
- **port** *number*—TCP port for incoming HTTP connections.  
**Range:** 1 through 65,535
- **local-certificate**—X.509 certificate to use from configuration.
- **pki-local-certificate**—X.509 certificate to use from PKI local store.
- **system-generated-certificate**—X.509 certificate generated automatically by system.

**management url** *management url*—URL Path for Web management access.

**session**—Configure web management session.

- **idle-timeout** *minutes*—Default timeout of web-management sessions in minutes.
- **session-limit** *number*—Maximum number of web-management sessions to allow.

**traceoptions**—Set the trace options.

- **file**—Configure the trace file information.
  - *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.
  - **files number**—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size maximum file-size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

- **match regular-expression**—Refine the output to include lines that contain the regular expression.
- **size maximum-file-size**—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

**Range:** 10 KB through 1 GB

**Default:** 128 KB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files number** option.

- **(world-readable | no-world-readable)**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag flag**—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags.
  - **all**—Trace all areas.
  - **configuration**—Trace configuration.
  - **dynamic-vpn**—Trace dynamic-vpn events.
  - **init**—Trace daemon init process.
  - **mgd**—Trace MGD requests.
  - **webauth**—Trace webauth requests.
- **level level**—Specify the level of debugging output.
  - **all**—Match all levels.
  - **error**—Match error conditions.

- **info**—Match informational messages.
- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.
- **no-remote-trace**—Disable the remote tracing.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

### Generating an SSL Certificate Using the openssl Command

---

To generate an SSL certificate using the **openssl** command:

1. Enter **openssl** in the CLI. The **openssl** command generates a self-signed SSL certificate in privacy-enhanced mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

**NOTE:** Run this command on a LINUX or UNIX device because Juniper Networks Services Gateways do not support the **openssl** command.

```
% openssl req -x509 -nodes -newkey rsa:1024 -keyout filename.pem -out
filename.pem
```

Replace **filename** with the name of a file in which you want the SSL certificate to be written—for example, **new.pem**.

2. When prompted, type the appropriate information in the identification form. For example, type **US** for the country name.
3. Display the contents of the file **new.pem**.

```
cat new.pem
```

Copy the contents of this file for installing the SSL certificate.

### Generating a Self-Signed SSL Certificate

To generate a self-signed SSL certificate on Juniper Networks devices:

1. Establish basic connectivity.
2. Reboot the system. The self-signed certificate is automatically generated at bootup time.

```
user@host> request system reboot
Reboot the system ? [yes,no] yes
```

3. Specify **system-generated-certificate** under HTTPS Web management.

```
[edit]
user@host# show system services web-management https
system-generated-certificate
```

### Manually Generating Self-Signed SSL Certificates

To manually generate a self-signed SSL certificate on Juniper Networks devices:

1. Establish basic connectivity.
2. If you have root login access, you can manually generate the self-signed certificate by using the following commands:

```
root@host> request security pki generate-size 512 certificate-id certname
```

Generated key pair sslcert, key size 512 bits

```
root@host> request security pki local-certificate generate-self-signed certificate-id  
cert-name email email domain-name domain-name ip-address ip-address subject  
"DC= Domain name, CN= Common-Name, OU= Organizational-Unit-name, O=  
Organization-Name, ST= state, C= Country"
```

Self-signed certificate generated and loaded successfully

**NOTE:** When generating the certificate, you must specify the subject, e-mail address, and either domain-name or ip-address.

3. Specify **local-certificate** under HTTPS Web management.

[edit]

```
root@host# show system services web-management https local-certificate certname
```

### Configuring Device Addresses

You can use the Management tab to configure IPv4 and loopback addresses on the device.

To configure IPv4 and loopback addresses:

1. In the J-Web user interface, select **Configure>System Properties>Management Access**.
2. Click **Edit**. The Edit Management Access dialog box appears.
3. Select the **Management** tab.
4. If you want to enable a loopback address for the device, enter an address and corresponding subnet mask in the **Loopback address** section.
5. If you want to enable an IPv4 address for the device, select **IPv4 address** and enter a corresponding management port, subnet mask, and default gateway.
6. Click **OK** to save the configuration or **Cancel** to clear it.

**Related  
Documentation**

- *Administration Guide for Security Devices*

## Enabling Access Services

You can use the Services tab to specify the type of connections that users can make to the device. For instance, you can enable secure HTTPS sessions to the device or enable access to the Junos XML protocol XML scripting API.

To enable access services:

1. In the J-Web user interface, select **Configure>System Properties>Management Access**.
2. Click **Edit**. The Edit Management Access dialog box appears.
3. Select the **Services** tab.
4. If you want to enable users to create secure Telnet or secure SSH connections to the device, select **Enable Telnet** or **Enable SSH**.
5. If you want to enable access to the Junos XML protocol XML scripting API, select **Enable Junos XML protocol over clear text** or **Enable Junos XML protocol over SSL**. If you enable Junos XML protocol over SSL, select the certificate you want to use for encryption from the **Junos XML protocol certificate** drop-down list.
6. Select **Enable HTTP** if you want users to connect to device interfaces over an HTTP connection. Then specify the interfaces that should use the HTTP connection:
  - **Enable on all interfaces**—Select this option if you want to enable HTTP on all device interfaces.
  - **Selected interfaces**—Use the arrow buttons to populate this list with individual interfaces if you want to enable HTTP on only some of the device interfaces.
7. If you want users to connect to device interfaces over a secure HTTPS connection, select **Enable HTTPS**. Then select which certificate you want to use to secure the connection from the **HTTPS certificates** list and specify the interfaces that should use the HTTPS connection:
  - **Enable on all interfaces**—Select this option if you want to enable HTTPS on all device interfaces.
  - **Selected interfaces**—Use the arrow buttons to populate this list with individual interfaces if you want to enable HTTPS on only some of the device interfaces.
8. Click **OK** to save the configuration or **Cancel** to clear it.

To verify that Web access is enabled correctly, connect to the device using one of the following methods:

- For HTTP access—In your Web browser, type **http://URL** or **http://IP address**.
- For HTTPS access—In your Web browser, type **https://URL** or **https://IP address**.
- For SSL Junos XML protocol access—A Junos XML protocol client such as Junos Scope is required.

## Example: Configuring Secure Web Access

This example shows how to configure secure Web access on your device.

- [Requirements on page 892](#)
- [Overview on page 892](#)
- [Configuration on page 892](#)
- [Verification on page 893](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

**NOTE:** You can enable HTTPS access on specified interfaces. If you enable HTTPS without specifying an interface, HTTPS is enabled on all interfaces.

### Overview

In this example, you import the SSL certificate that you have generated as a new and private key in PEM format. You then enable HTTPS access and specify the SSL certificate to be used for authentication. Finally, you specify the port as 8443 on which HTTPS access is to be enabled.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set security certificates local new load-key-file /var/tmp/new.pem
set system services web-management https local-certificate new port 8443
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure secure Web access on your device:

1. Import the SSL certificate and private key.  

```
[edit security]
user@host# set certificates local new load-key-file /var/tmp/new.pem
```
2. Enable HTTPS access and specify the SSL certificate and port.  

```
[edit system]
user@host# set services web-management https local-certificate new port 8443
```

**Results** From configuration mode, confirm your configuration by entering the **show security** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security
certificates {
  local {
    new {
      "-----BEGIN RSA PRIVATE KEY-----\nMIICXQIBAAKBgQC/C5UI4frNqbi
      qPwbTiOkJvqoDw2YgYseOZ5zzVJyErgSg954T\nEuHM67Ck8hAOrcnb0YO+SY
      Y5rCXLf4+2s8k9EypLtYRw/Ts66DZoXI4viqE7HSsK\n5sQw/UDBlw7/MJ+OpA
      ... KYiFf4CbBBbjlMQJOHFudW6ISVBslONkzX+FT\ni95ddka6ilRnArEb4VFCRh+
      eIQBdp1UjziYf7NuzDx4Z\n -----END RSA PRIVATE KEY-----\n-----BEGIN
      CERTIFICATE----- \nMIIDjDCCAvWgAwIBAgIBADANBgkqhkiG9w0BAQQ ...

      HBIYnMxDTALBgNVBAMTBGpucHlxJDAiBgkqhkiG\n9w0BCQEWFW5iaGFyZ2F2YUB
      fLUYAnBYmsYWOH\n -----END CERTIFICATE-----\n"; ## SECRET-DATA
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying an SSL Certificate Configuration on page 893](#)
- [Verifying a Secure Access Configuration on page 893](#)

### Verifying an SSL Certificate Configuration

**Purpose** Verify the SSL certificate configuration.

**Action** From operational mode, enter the **show security** command.

### Verifying a Secure Access Configuration

**Purpose** Verify the secure access configuration.

**Action** From operational mode, enter the **show system services** command. The following sample output displays the sample values for secure Web access:

```
[edit]
user@host# show system services
web-management {
  http;
  https {
    port 8443;
    local-certificate new;
  }
}
```

---

**Adding, Editing, and Deleting Certificates on the Device**

---

You can use the Certificates tab to upload SSL certificates to the device, edit existing certificates on the device, or delete certificates from the device. You can use the certificates to secure HTTPS and Junos XML protocol sessions.

To add, edit, or delete a certificate:

1. In the J-Web user interface, select **Configure>System Properties>Management Access**.
2. Click **Edit**. The Edit Management Access dialog box appears.
3. Select the **Certificates** tab.
4. Choose one of the following options:
  - If you want to add a new certificate, click **Add**. The Add Certificate section is expanded.
  - If you want to edit the information for an existing certificate, select it and click **Edit**. The Edit Certificate section is expanded.
  - If you want to delete an existing certificate, select it and click **Delete**. (You can skip the remaining steps in this section.)
5. In the **Certificate Name** box, type a name—for example, **new**.
6. In the **Certificate content** box, paste the generated certificate and RSA private key.
7. Click **Save**.
8. Click **OK** to save the configuration or **Cancel** to clear it.

### Example: Configuring a RADIUS Server for System Authentication

This example shows how to configure a RADIUS server for system authentication.

- [Requirements on page 895](#)
- [Overview on page 895](#)
- [Configuration on page 895](#)
- [Verification on page 897](#)

#### Requirements

Before you begin:

- Perform the initial device configuration. See the Getting Started Guide for your device.
- Configure at least one RADIUS server. For more details, see [RADIUS Authentication and Accounting Servers Configuration Overview](#).

#### Overview

In this example, you add a new RADIUS server with an IP address of 172.16.98.1 and specify the shared secret password of the RADIUS server as Radiussecret1. The secret is stored as an encrypted value in the configuration database. Finally, you specify the source address to be included in the RADIUS server requests by the device. In most cases you can use the loopback address of the device, which in this example is 10.0.0.1.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system radius-server address 172.16.98.1
set system radius-server 172.16.98.1 secret Radiussecret1
set system radius-server 172.16.98.1 source-address 10.0.0.1
```

##### GUI Step-by-Step Procedure

To configure a RADIUS server for system authentication:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Authentication Method and Order** tab.
4. In the RADIUS section, click **Add**. The Add Radius Server dialog box appears.
5. In the IP Address box, type the server's 32-bit IP address.
6. In the Password and Confirm Password boxes, type the secret password for the server and verify your entry.
7. In the Server Port box, type the appropriate port.

8. In the Source Address box, type the source IP address of the server.
9. In the Retry Attempts box, specify the number of times that the server should try to verify the user's credentials.
10. In the Time Out box, specify the amount of time (in seconds) the device should wait for a response from the server.
11. Click **OK** to check your configuration and save it as a candidate configuration.
12. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a RADIUS server for system authentication:

1. Add a new RADIUS server and set its IP address.  

```
[edit system]
user@host# set radius-server address 172.16.98.1
```
2. Specify the shared secret (password) of the RADIUS server.  

```
[edit system]
user@host# set radius-server 172.16.98.1 secret Radiussecret1
```
3. Specify the device's loopback address source address.  

```
[edit system]
user@host# set radius-server 172.16.98.1 source-address 10.0.0.1
```

**Results** From configuration mode, confirm your configuration by entering the **show system radius-server** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system radius-server
radius-server 172.16.98.1 {
  secret Radiussecret1;
  source-address 10.0.0.1;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS authentication, you must create user template accounts and specify a system authentication order. Do one of the following tasks:

- Configure a system authentication order. See [“Example: Configuring Authentication Order” on page 900](#).
- Configure a user. See [“Example: Configuring New Users” on page 902](#).
- Configure local user template accounts. See [“Example: Creating Template Accounts” on page 908](#).

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the RADIUS Server System Authentication Configuration**

**Purpose** Verify that the RADIUS server has been configured for system authentication.

**Action** From operational mode, enter the **show system radius-server** command.

### **Related Documentation**

- [Understanding User Authentication Methods on page 671](#)
- [Understanding User Accounts on page 672](#)
- [Example: Configuring a TACACS+ Server for System Authentication on page 897](#)
- [Understanding Login Classes on page 673](#)
- *Administration Guide for Security Devices*

### **Example: Configuring a TACACS+ Server for System Authentication**

This example shows how to configure a TACACS+ server for system authentication.

- [Requirements on page 897](#)
- [Overview on page 898](#)
- [Configuration on page 898](#)
- [Verification on page 899](#)

### **Requirements**

Before you begin:

- Perform the initial device configuration. See the Getting Started Guide for your device.
- Configure at least one TACACS+ server.

### Overview

In this example, you set the IP address to 172.16.98.24 and the shared secret password of the TACACS+ server to Tacacssecret1. The secret password is stored as an encrypted value in the configuration database. You then set the loopback source address as 10.0.0.1

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system tacplus-server address 172.16.98.24
set system tacplus-server 172.16.98.24 secret Tacacssecret1
set system tacplus-server 172.16.98.24 source-address 10.0.0.1
```

#### GUI Step-by-Step Procedure

To configure a TACACS+ server for system authentication:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Authentication Method and Order** tab.
4. In the TACACS section, click **Add**. The Add TACACS Server dialog box appears.
5. In the IP Address box, type the server's 32-bit IP address.
6. In the Password and Confirm Password boxes, type the secret password for the server and verify your entry.
7. In the Server Port box, type the appropriate port.
8. In the Source Address box, type the source IP address of the server.
9. In the Retry Attempts box, specify the number of times that the server should try to verify the user's credentials.
10. In the Time Out box, specify the amount of time (in seconds) the device should wait for a response from the server.
11. Click **OK** to check your configuration and save it as a candidate configuration.
12. If you are done configuring the device, click **Commit Options>Commit**.

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a TACACS+ server for system authentication:

1. Add a new TACACS+ server and set its IP address.  

```
[edit system]
user@host# set tacplus-server address 172.16.98.24
```
2. Specify the shared secret (password) of the TACACS+ server.

```
[edit system]
user@host# set tacplus-server 172.16.98.24 secret Tacacssecret1
```

3. Specify the device's loopback address as the source address.

```
[edit system]
user@host# set tacplus-server 172.16.98.24 source-address 10.0.0.1
```

**Results** From configuration mode, confirm your configuration by entering the **show system tacplus-server** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system tacplus-server
tacplus-server 172.16.98.24 {
  secret Tacacssecret1;
  source-address 10.0.0.1;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up TACACS+ authentication, you must create user template accounts and specify a system authentication order. Do one of the following tasks:

- Configure a system authentication order. See [“Example: Configuring Authentication Order” on page 900](#).
- Configure a user. See [“Example: Configuring New Users” on page 902](#).
- Configure local user template accounts. See [“Example: Creating Template Accounts” on page 908](#).

### Verification

Confirm that the configuration is working properly.

#### Verifying the TACACS+ Server System Authentication Configuration

**Purpose** Verify that the TACACS+ server has been configured for system authentication.

**Action** From operational mode, enter the **show system tacplus-server** command.

**Related Documentation**

- [Understanding User Authentication Methods on page 671](#)
- [Understanding User Accounts on page 672](#)
- [Example: Configuring a RADIUS Server for System Authentication on page 895](#)
- [Understanding Login Classes on page 673](#)
- [Administration Guide for Security Devices](#)

## Example: Configuring Authentication Order

---

This example shows how to configure authentication order.

- [Requirements on page 900](#)
- [Overview on page 900](#)
- [Configuration on page 900](#)
- [Verification on page 901](#)

### Requirements

Before you begin, perform the initial device configuration. See the Getting Started Guide for your device.

### Overview

You can configure the authentication methods that the device uses to verify that a user can gain access. For each login attempt, the device tries the authentication methods in order, starting with the first one, until the password matches. If you do not configure system authentication, users are verified based on their configured local passwords.

This example configures the device to attempt user authentication with the local password first, then with the RADIUS server, and finally with the TACACS+ server.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
insert system authentication-order radius after password
insert system authentication-order tacplus after radius
```

#### GUI Step-by-Step Procedure

To configure authentication order:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Authentication Method and Order** tab.
4. Under Available Methods, select the authentication method the device should use to authenticate users, and use the arrow button to move the item to the Selected Methods list. Available methods include:
  - RADIUS
  - TACACS+
  - Local Password

If you want to use multiple methods to authenticate users, repeat this step to add the additional methods to the Selected Methods list.

5. Under Selected Methods, use the Up Arrow and Down Arrow to specify the order in which the device should execute the authentication methods.
6. Click **OK** to check your configuration and save it as a candidate configuration.
7. If you are done configuring the device, click **Commit Options>Commit**.

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure authentication order:

1. Add RADIUS authentication to the authentication order.  

```
[edit]
user@host# insert system authentication-order radius after password
```
2. Add TACACS+ authentication to the authentication order.  

```
[edit]
user@host# insert system authentication-order tacplus after radius
```

**Results** From configuration mode, confirm your configuration by entering the **show system authentication-order** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system authentication-order
authentication-order [password, radius, tacplus];
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS or TACACS+ authentication, you must configure at least one RADIUS or TACACS+ server and create user template accounts. Do one of the following tasks:

- Configure a RADIUS server. See [“Example: Configuring a RADIUS Server for System Authentication”](#) on page 895.
- Configure a TACACS+ server. See [“Example: Configuring a TACACS+ Server for System Authentication”](#) on page 897.
- Configure a user. See [“Example: Configuring New Users”](#) on page 902.
- Configure template accounts. See [“Example: Creating Template Accounts”](#) on page 908.

#### Verification

Confirm that the configuration is working properly.

***Verifying the Authentication Order Configuration***

**Purpose** Verify that the authentication order has been configured.

**Action** From operational mode, enter the **show system authentication-order** command.

- Related Documentation**
- [Understanding User Authentication Methods on page 671](#)
  - [Understanding User Accounts on page 672](#)
  - [Understanding Login Classes on page 673](#)
  - *Administration Guide for Security Devices*

---

**Example: Configuring New Users**

---

This example shows how to configure new users.

- [Requirements on page 902](#)
- [Overview on page 902](#)
- [Configuration on page 903](#)
- [Verification on page 904](#)

***Requirements***

No special configuration beyond device initialization is required before configuring this feature.

***Overview***

You can add new users to the device's local database. For each account, you define a login name and password for the user and specify a login class for access privileges. The login password must meet the following criteria:

- The password must be at least six characters long.
- You can include most character classes in a password (alphabetic, numeric, and special characters), but not control characters.
- The password must contain at least one change of case or character class.

In this example, you create a login class named operator-and-boot and allow it to reboot the device. You can define any number of login classes. You then allow the operator-and-boot login class to use commands defined in the clear, network, reset, trace, and view permission bits.

Then you create user accounts. User accounts provide enable you to access the device. (You can access the device without accounts if you configured RADIUS or TACACS+ servers.) You set the username as cmartin and the login class as superuser. Finally, you define the encrypted password for the user.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login class operator-and-boot allow-commands "request system reboot"
set system login class operator-and-boot permissions [clear network reset trace view]
set system login user cmartin class superuser authentication encrypted-password
$1$ABC123
```

#### GUI Step-by-Step Procedure

To configure new users:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Users** tab.

4. Click **Add** to add a new user. The Add User dialog box appears.

5. In the User name box, type a unique name for the user.

Do not include spaces, colons, or commas in the username.

6. In the User ID box, type a unique ID for the user.

7. In the Full Name box, type the user's full name.

If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.

8. In the Password and Confirm Password boxes, enter a login password for the user and verify your entry.

9. From the Login Class list, select the user's access privilege:

- **operator**
- **read-only**
- **unauthorized**

This list also includes any user-defined login classes.

10. Click **OK** in the Add User dialog box and Edit User Management dialog box.

11. Click **OK** to check your configuration and save it as a candidate configuration.

12. If you are done configuring the device, click **Commit Options>Commit**.

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure new users:

1. Set the name of the login class and allow the use of the reboot command.

```
[edit system login]
user@host# set class operator-and-boot allow-commands "request system reboot"
```

2. Set the permission bits for the login class.

```
[edit system login]
user@host# set class operator-and-boot permissions [clear network reset trace
view]
```

3. Set the username, login class, and encrypted password for the user.

```
[edit system login]
user@host# set user cmartin class superuser authentication encrypted-password
$1$ABC123
```

**Results** From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login
class operator-and-boot {
permissions [ clear network reset trace view ];
allow-commands "request system reboot";
}
user cmartin {
class superuser;
authentication {
encrypted-password "$1$ABC123";
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS or TACACS+ authentication, you must configure at least one RADIUS or TACACS+ server and specify a user template account. Do one of the following tasks:

- Configure a RADIUS server. See [“Example: Configuring a RADIUS Server for System Authentication” on page 895](#).
- Configure a TACACS+ server. See [“Example: Configuring a TACACS+ Server for System Authentication” on page 897](#).
- Configure a user. See [“Example: Configuring New Users” on page 902](#).
- Configure template accounts. See [“Example: Creating Template Accounts” on page 908](#).

### Verification

Confirm that the configuration is working properly.

### *Verifying the New Users Configuration*

**Purpose** Verify that the new users have been configured.

**Action** From operational mode, enter the **show system login** command.

- Related Documentation**
- [Understanding User Authentication Methods on page 671](#)
  - [Understanding User Accounts on page 672](#)
  - [Understanding Template Accounts on page 676](#)

  - *Administration Guide for Security Devices*

---

### **Example: Configuring System Retry Options**

This example shows how to configure system retry options to protect the device from malicious users.

- [Requirements on page 905](#)
- [Overview on page 905](#)
- [Configuration on page 907](#)
- [Verification on page 908](#)

#### **Requirements**

Before you begin, you should understand “[Handling Authorization Failure](#)” on page 911.

No special configuration beyond device initialization is required before configuring this feature.

#### **Overview**

Malicious users sometimes try to log in to a secure device by guessing an authorized user account’s password. Locking out a user account after a number of failed authentication attempts helps protect the device from malicious users.

Device lockout allows you to configure the number of failed attempts before the user account is locked out of the device and configure the amount of time before the user can attempt to log in to the device again. You can configure the amount of time in-between failed login attempts of a user account and can manually lock and unlock user accounts.

---

**NOTE:**

This example includes the following settings:

- **backoff-factor** — Sets the length of delay in seconds after each failed login attempt. When a user incorrectly logs in to the device, the user must wait the configured amount of time before attempting to log in to the device again. The length of delay increases by this value for each subsequent login attempt after the value specified in the **backoff-threshold** statement. The default value for this statement is five seconds, with a range of five to ten seconds.
- **backoff-threshold** — Sets the threshold for the number of failed login attempts on the device before the user experiences a delay when attempting to reenter a password. When a user incorrectly logs in to the device and hits the threshold of failed login attempts, the user experiences a delay that is set in the **backoff-factor** statement before attempting to log in to the device again. The default value for this statement is two, with a range of one through three.
- **lockout-period** — Sets the amount of time in minutes before the user can attempt to log in to the device after being locked out due to the number of failed login attempts specified in the **tries-before-disconnect** statement. When a user fails to correctly login after the number of allowed attempts specified by the **tries-before-disconnect** statement, the user must wait the configured amount of minutes before attempting to log in to the device again. The lockout-period must be greater than zero. The range at which you can configure the lockout-period is one through 43,200 minutes.
- **tries-before-disconnect** — Sets the maximum number of times the user is allowed to enter a password to attempt to log in to the device through SSH or Telnet. When the user reaches the maximum number of failed login attempts, the user is locked out of the device. The user must wait the configured amount of minutes in the **lockout-period** statement before attempting to log back in to the device. The **tries-before-disconnect** statement must be set when the **lockout-period** statement is set; otherwise, the **lockout-period** statement is meaningless. The default number of attempts is ten, with a range of one through ten attempts.

Once a user is locked out of the device, if you are the security administrator, you can manually remove the user from this state using the `clear system login lockout <username>` command. You can also use the `show system login lockout` command to view which users are currently locked out, when the lockout period began for each user, and when the lockout period ends for each user.

If the security administrator is locked out of the device, he can log in to the device from the console port, which ignores any user locks. This provides a way for the administrator to remove the user lock on their own user account.

---

In this example the user waits for the **backoff-threshold** multiplied by the **backoff-factor** interval, in seconds, to get the login prompt. In this example, the user must wait 5 seconds after the first failed login attempt and 10 seconds after the second failed login attempt to get the login prompt. The user gets disconnected after 15 seconds after the third failed attempt because the **tries-before-disconnect** option is configured as 3.

The user cannot attempt another login until 120 minutes has elapsed, unless a security administrator manually clears the lock sooner.

### Configuration

**CLI Quick Configuration** To quickly configure the lockout-period, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

```
[edit]
set system login retry-options backoff-factor 5
set system login retry-options backoff-threshold 1
set system login retry-options lockout-period 120
set system login retry-options tries-before-disconnect 3
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure system retry-options:

1. Configure the backoff factor.

```
[edit ]
user@host# set system login retry-options backoff-factor 5
```

2. Configure the backoff threshold.

```
[edit]
user@host# set system login retry-options backoff-threshold 1
```

3. Configure the amount of time the device gets locked after failed attempts.

```
[edit]
user@host# set system login retry-options lockout-period 5
```

4. Configure the number of unsuccessful attempts during which, the device can remain unlocked.

```
[edit]
user@host# set system login retry-options tries-before-disconnect 3
```

**Results** From configuration mode, confirm your configuration by entering the **show system login retry-options** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login retry-options
backoff-factor 5;
backoff-threshold 1;
lockout-period 5;
tries-before-disconnect 3;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

#### **Displaying the Locked User Logins**

|                              |                                                                                                                                                                                                                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>               | Verify that the login lockout configuration is enabled                                                                                                                                                                                                                                                             |
| <b>Action</b>                | Attempt 3 unsuccessful logins for a particular username. The device gets locked for the user and then login to the device with a different user name. From operational mode, enter the <b>show system login lockout</b> command.                                                                                   |
| <b>Meaning</b>               | When you perform 3 unsuccessful login attempts with a particular username, the device is locked for that user for 5 minutes as configured in the example. You can verify that the user is, locked by logging in to the device with a different username and entering the <b>show system login lockout</b> command. |

### **Example: Creating Template Accounts**

This example shows how to create template accounts.

- [Requirements on page 908](#)
- [Overview on page 908](#)
- [Configuration on page 909](#)
- [Verification on page 910](#)

#### **Requirements**

No special configuration beyond device initialization is required before configuring this feature.

#### **Overview**

You can create template accounts that are shared by a set of users when you are using RADIUS or TACACS+ authentication. When a user is authenticated by a template account, the CLI username is the login name, and the privileges, file ownership, and effective user ID are inherited from the template account.

By default, Junos OS uses the **remote** template account when:

- The authenticated user does not exist locally on the device.
- The authenticated user's record in the RADIUS or TACACS+ server specifies local user, or the specified local user does not exist locally on the device.

In this example, you create a remote template account and set the username to remote and the login class for the user as operator. You create a remote template that is applied

to users authenticated by RADIUS or TACACS+ that do not belong to a local template account.

You then create a local template account and set the username as admin and the login class as superuser. You use local template accounts when you need different types of templates. Each template can define a different set of permissions appropriate for the group of users who use that template.

### **Configuration**

- [Creating a Remote Template Account on page 909](#)
- [Creating a Local Template Account on page 909](#)

#### **Creating a Remote Template Account**

#### **CLI Quick Configuration**

To quickly configure this section of the example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the **[edit]** hierarchy level.

```
set system login user remote class operator
```

#### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To create a remote template account:

1. Set the username and the login class for the user.

```
[edit system login]
user@host# set user remote class operator
```

#### **Results**

From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login
user remote {
  class operator;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

#### **Creating a Local Template Account**

#### **CLI Quick Configuration**

To quickly configure this section of the example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the **[edit]** hierarchy level.

```
set system login user admin class superuser
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To create a local template account:

1. Set the username and the login class for the user.

```
[edit system login]
user@host# set user admin class superuser
```

**Results** From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login
user admin {
  class super-user;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS or TACACS+ authentication, you must configure at least one RADIUS or TACACS+ server and specify a system authentication order. Do one of the following tasks:

- Configure a RADIUS server. See [“Example: Configuring a RADIUS Server for System Authentication” on page 895](#).
- Configure a TACACS+ server. See [“Example: Configuring a TACACS+ Server for System Authentication” on page 897](#).
- Configure system authentication order. See [“Example: Configuring Authentication Order” on page 900](#).

### Verification

Confirm that the configuration is working properly.

### Verifying the Template Accounts Creation

**Purpose** Verify that the template accounts have been created.

**Action** From operational mode, enter the **show system login** command.

- ## Handling Authorization Failure

The number of reattempts the device allows is defined by the **tries-before-disconnect** option. The device allows 3 unsuccessful attempts by default or as configured by the administrator. The device prevents the locked users to perform activities that require authentication, until a security administrator manually clears the lock or the defined time period for the device to remain locked has elapsed. However, the existing locks are ignored when the user attempts to log in from the local console.

### Understanding Administrative Roles

A system user can be a member of a class that allows the user to act as a particular kind of administrator for the system. Requiring a specific role to view or modify an item restricts the extent of information a user can obtain from the system. It also limits how much of the system is open to intentional or unintentional modification or observation by a user. We recommend that you use the following guidelines when you are designing administrative roles:

- Do not allow any user to log in to the system as **root**.
- Restrict each user to the smallest set of privileges needed to perform the user's duties.
- Do not allow any user to belong to a login class containing the **shell** permission flag. The **shell** permission flag allows users to run the **start shell** command from the CLI.
- Allow users to have rollback permissions. Rollback permissions allow users to undo an action performed by an administrator but does not allow them to commit the changes.

You can assign an administrative role to a user by configuring a login class to have the privileges required for that role. You can configure each class to allow or deny access to configuration statements and commands by name. These specific restrictions override and take precedence over any permission flags also configured in the class. You can assign one of the following role attributes to an administrative user.

- **Crypto-administrator**—Allows the user to configure and monitor cryptographic data.
- **Security-administrator**—Allows the user to configure and monitor security data.
- **Audit-administrator**—Allows the user to configure and monitor audit data.
- **IDS-administrator**—Allows the user to monitor and clear the intrusion detection service (IDS) security logs.

Each role can perform the following specific management functions:

- **Cryptographic Administrator**
  - Configures the cryptographic self-test.
  - Modifies the cryptographic security data parameters.
- **Audit Administrator**
  - Configures and deletes the audit review search and sort feature.
  - Searches and sorts audit records.
  - Configures search and sort parameters.
  - Manually deletes audit logs.

- **Security Administrator**

- Invokes, determines, and modifies the cryptographic self-test behavior.
  - Enables, disables, determines, and modifies the audit analysis and audit selection functions and configures the device to automatically delete audit logs.
  - Enables or disables security alarms.
  - Specifies limits for quotas on Transport Layer connections.
  - Specifies the limits, network identifiers, and time periods for quotas on controlled connection-oriented resources.
  - Specifies the network addresses permitted to use Internet Control Message Protocol (ICMP) or Address Resolution Protocol (ARP).
  - Configures the time and date used in time stamps.
  - Queries, modifies, deletes, and creates the information flow or access control rules and attributes for the unauthenticated information flow security function policy (SFP), the authenticated information flow SFP, the unauthenticated device services, and the discretionary access control policy.
  - Specifies initial values that override default values when object information is created under unauthenticated information flow SFP, the authenticated information flow SFP, the unauthenticated target of evaluation (TOE) services, and the discretionary access control policy.
  - Creates, deletes, or modifies the rules that control the address from which management sessions can be established.
  - Specifies and revokes security attributes associated with the users, subjects, and objects.
  - Specifies the percentage of audit storage capacity at which the device alerts administrators.
  - Handles authentication failures and modifies the number of failed authentication attempts through SSH or from the CLI that can occur before progressive throttling is enforced for further authentication attempts and before the connection is dropped.
  - Manages basic network configuration of the device.
- **IDS Administrator**—Specifies IDS security alarms, intrusion alarms, audit selections, and audit data.

You need to set the security-role attribute in the classes created for these administrative roles. This attribute restricts which users can show and clear the security logs, actions that cannot be performed through configuration alone.

For example, you need to set the security-role attribute in the **ids-admin** class created for the IDS administrator role if you want to restrict clearing and showing IDS logs to the IDS administrator role. Likewise, you need to set the security-role to one of the other admin values to restrict that class from being able to clear and show non-IDS logs only.

**NOTE:** When a user deletes an existing configuration, the configuration statements under the hierarchy level of the deleted configuration (that is, the child objects that the user does not have permission to modify), now remain in the device.

#### Related Documentation

- [Example: Configuring Administrative Roles on page 914](#)

### Example: Configuring Administrative Roles

This example shows how to configure individual administrative roles for a distinct, unique set of privileges apart from all other administrative roles.

- [Requirements on page 914](#)
- [Overview on page 914](#)
- [Configuration on page 914](#)
- [Verification on page 919](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this feature.

#### Overview

This example configures four users:

- **audit-officer** of the class **audit-admin**
- **crypto-officer** of the class **crypto-admin**
- **security-officer** of the class **security-admin**
- **ids-officer** of the class **ids-admin**

When a **security-admin** class is configured, the privileges for creating administrators are revoked from the user who created the **security-admin** class. Creation of new users and logins is at the discretion of the **security-officer**.

In this example, you create audit admin, crypto admin, security admin, and ids admin with permission flags pertaining to this role. Then you allow or deny access to configuration statements and commands by name for each administrative role. These specific restrictions take precedence over the permission flags also configured in the class. For example, only the **crypto-admin** can run the **request system set-encryption-key** command, which requires having the **security** permission flag to access it. Only the **security-admin** can include the **system time-zone** statement in the configuration, which requires having the **system-control** permission flag.

#### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set system login class audit-admin permissions security
set system login class audit-admin permissions trace
set system login class audit-admin permissions maintenance
set system login class audit-admin allow-commands "^clear (log|security log)"
set system login class audit-admin deny-commands "^clear (security alarms|system
login lockout)|^file (copy|delete|rename)|^request (security|system
set-encryption-key)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell";
set system login class audit-admin security-role audit-administrator
set system login class crypto-admin permissions admin-control
set system login class crypto-admin permissions configure
set system login class crypto-admin permissions maintenance
set system login class crypto-admin permissions security-control
set system login class crypto-admin permissions system-control
set system login class crypto-admin permissions trace
set system login class crypto-admin allow-commands "^request system
set-encryption-key"
set system login class crypto-admin deny-commands "^clear (log|security alarms|security
log|system login lockout)|^file (copy|delete|rename)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell"
set system login class crypto-admin allow-configuration-regexps "security (ike|ipsec)
(policy|proposal)" "security ipsec ^vpn$ .* manual
(authentication|encryption|protocol|spi)" "system fips self-test after-key-generation"
set system login class crypto-admin security-role crypto-administrator
set system login class security-admin permissions all
set system login class security-admin deny-commands "^clear (log|security
log)|^(clear|show) security alarms alarm-type idp|^request (security|system
set-encryption-key)|^rollback|^start shell"
set system login class security-admin deny-configuration-regexps "security alarms
potential-violation idp" "security (ike|ipsec) (policy|proposal)" "security ipsec ^vpn$
.* manual (authentication|encryption|protocol|spi)" "security log cache" "security log
exclude .* event-id IDP_.*" "system fips self-test after-key-generation"
set system login class security-admin security-role security-administrator
set system login class ids-admin permissions configure
set system login class ids-admin permissions security-control
set system login class ids-admin permissions trace
set system login class ids-admin permissions maintenance
set system login class ids-admin allow-configuration-regexps "security alarms
potential-violation idp" "security log exclude .* event-id IDP_.*"
set system login class ids-admin deny-commands "^clear log|^(clear|show) security
alarms (alarm-id|all|newer-than|older-than|process|severity)|^(clear|show) security
alarms alarm-type
(authentication|cryptographic-self-test|decryption-failures|encryption-failures|
ike-phase1-failures|ike-phase2-failures|key-generation-self-test|
non-cryptographic-self-test|policy|replay-attacks)|^file (copy|delete|rename)|^request
(security|system set-encryption-key)|^rollback|
^set date|^show security (dynamic-policies|match-policies|policies)|^start shell"
set system login class ids-admin deny-configuration-regexps "security alarms
potential-violation (authentication|cryptographic-self-test|decryption-
failures|encryption-failures|ike-phase1-failures|ike-phase2-failures|
key-generation-self-test|non-cryptographic-self-test|policy|replay-attacks)"
set system login class ids-admin security-role ids-admin

```

```

set system login user audit-officer class audit-admin
set system login user crypto-officer class crypto-admin
set system login user security-officer class security-admin
set system login user ids-officer class ids-admin
set system login user audit-officer authentication plain-text-password
set system login user crypto-officer authentication plain-text-password
set system login user security-officer authentication plain-text-password
set system login user ids-officer authentication plain-text-password

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the Junos OS CLI guide.

To configure users in administrative roles:

1. Create the **audit-admin** login class.

```

[edit]
user@host# set system login class audit-admin
[edit system login class audit-admin]
user@host# set permissions security
user@host# set permissions trace
user@host# set permissions maintenance

```

2. Configure the **audit-admin** login class restrictions.

```

[edit system login class audit-admin]
user@host# set allow-commands "^clear (log|security log)"
user@host# set deny-commands "^clear (security alarms|system login lockout)|^file
(copy|delete|rename)|^request (security|system
set-encryption-key)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell"
user@host# set security-role audit-administrator

```

3. Create the **crypto-admin** login class.

```

[edit]
user@host# set system login class crypto-admin

```

```

[edit system login class crypto-admin]
user@host# set permissions admin-control
user@host# set permissions configure
user@host# set permissions maintenance
user@host# set permissions security-control
user@host# set permissions system-control
user@host# set permissions trace

```

4. Configure the **crypto-admin** login class restrictions.

```

[edit system login class crypto-admin]
user@host# set allow-commands "^request system set-encryption-key"
user@host# set deny-commands "^clear (log|security alarms|security log|system
login lockout)|^file (copy|delete|rename)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell"
user@host# set allow-configuration-regexps "security (ike|ipsec) (policy|proposal)"
"security ipsec ^vpn$.* manual (authentication|encryption|protocol|spi)" "system
fips self-test after-key-generation"

```

```
user@host# set security-role crypto-administrator
```

5. Create the **security-admin** login class.

```
[edit]
user@host# set system login class security-admin
```

```
[edit system login class security-admin]
user@host# set permissions all
```

6. Configure the **security-admin** login class restrictions.

```
[edit system login class security-admin]
user@host# set deny-commands "^clear (log|security log)|^(clear|show) security
alarms alarm-type idp|^request (security|system
set-encryption-key)|^rollback|^start shell"
user@host# set deny-configuration-regexps "security alarms potential-violation
idp" "security (ike|ipsec) (policy|proposal)" "security ipsec ^vpn$ .* manual
(authentication| encryption|protocol|spi)" "security log cache" "security log
exclude .* event-id IDP_.*" "system fips self-test after-key- generation"
user@host# set security-role security-administrator
```

7. Create the **ids-admin** login class.

```
[edit]
user@host# set system login class ids-admin
```

```
[edit system login class ids-admin]
user@host# set permissions configure
user@host# set permissions maintenance
user@host# set permissions security-control
user@host# set permissions trace
```

8. Configure the **ids-admin** login class restrictions.

```
[edit system login class ids-admin]
user@host# set allow-configuration-regexps "security alarms potential-violation
idp" "security log exclude .* event-id IDP_.*"
set system login class ids-admin deny-commands "^clear log|^(clear|show) security
alarms (alarm-id|all|newer-than|older- than|process|severity)|^(clear|show)
security alarms alarm-type
(authentication|cryptographic-self-test|decryption-failures|encryption-failures|
ike-phase1-failures|ike-phase2-failures|key-generation-self-test|
non-cryptographic-self-test|policy|replay-attacks)|^file
(copy|delete|rename)|^request (security|system set-encryption-key)|
^rollback|^set date|^show security (dynamic-policies|match-policies|policies)|^start
shell"
set system login class ids-admin deny-configuration-regexps "security alarms
potential-violation (authentication|cryptographic-self-test|decryption-
failures|encryption-failures|ike-phase1-failures|ike-phase2-failures|
key-generation-self-test|non-cryptographic-self-test|policy|replay-attacks)"
user@host# set security-role ids-administrator
```

9. Assign users to the roles.

```
[edit]
user@host# set system login
```

```
[edit system login]
user@host# set user audit-officer class audit-admin
user@host# set user crypto-officer class crypto-admin
user@host# set user security-officer class security-admin
user@host# set user ids-officer class ids-admin
```

10. Configure passwords for the users.

```
[edit system login]
user@host# set user audit-officer authentication plain-text-password
user@host# set user crypto-officer authentication plain-text-password
user@host# set user security-officer authentication plain-text-password
user@host# set user ids-officer authentication plain-text-password
```

### Results

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show system
system {
  login {
    class audit-admin {
      permissions [ maintenance security trace ];
      allow-commands "^clear (log|security log)";
      deny-commands "^clear (security alarms|system login logout)|^file
        (copy|delete|rename)|^request (security|system
          set-encryption-key)|^rollback|^set date|^show security
          (alarms|dynamic-policies|match-policies|policies)|^start shell";
      security-role audit-administrator;
    }
    class crypto-admin {
      permissions [ admin-control configure maintenance security-control system-control
        trace ];
      allow-commands "^request (system set-encryption-key)";
      deny-commands "^clear (log|security alarms|security log|system login logout)|^file
        (copy|delete|rename)|^rollback|^set date|^show security
        (alarms|dynamic-policies|match-policies|policies)|^start shell";
      allow-configuration-regexps "security (ike|ipsec) (policy|proposal)" "security ipsec
        ^vpn$ .* manual (authentication|encryption|protocol|spi)" "system fips self-test
        after-key-generation" ;
      security-role crypto-administrator;
    }
    class security-admin {
      permissions [ all];
      deny-commands "^clear (log|security log)|^(clear|show) security alarms alarm-type
        idp|^request (security|system set-encryption-key)|^rollback|^start shell";
      deny-configuration-regexps "security alarms potential-violation idp" "security
        (ike|ipsec) (policy|proposal)" "security ipsec ^vpn$ .* manual

## USB Modems for Remote Management Setup

- [Connecting to the Device Remotely on page 921](#)
- [Modifying USB Modem Initialization Commands on page 921](#)
- [Resetting USB Modems on page 922](#)

### Connecting to the Device Remotely

To remotely connect to the device through a USB modem connected to the USB port on the device:

1. On the PC or laptop computer at your remote location, select **Start>Settings>Control Panel>Network Connections**. The Network Connections page appears.
2. Double-click the **USB-modem-connect** dial-up connection. The Connect USB-modem-connect page appears.
3. Click **Dial** to connect to the Juniper Networks device.

When the connection is complete, you can use Telnet or SSH to connect to the device.

#### Related Documentation

- [USB Modem Configuration Overview on page 679](#)
- [Configuring a Dial-Up Modem Connection Remotely on page 707](#)
- *Administration Guide for Security Devices*

### Modifying USB Modem Initialization Commands

**NOTE:** These instructions use Hayes-compatible modem commands to configure the modem. If your modem is not Hayes-compatible, see the documentation for your modem and enter equivalent modem commands.

You can use the CLI configuration editor to override the value of an initialization command configured on the USB modem or configure additional commands for initializing USB modems.

**NOTE:** If you modify modem initialization commands when a call is in progress, the new initialization sequence is applied on the modem only when the call ends.

You can configure the following modem AT commands to initialize the USB modem:

- The command **S0=2** configures the modem to automatically answer calls on the second ring.
- The command **L2** configures medium speaker volume on the modem.

You can insert spaces between commands.

When you configure modem commands in the CLI configuration editor, you must follow these conventions:

- Use the newline character `\n` to indicate the end of a command sequence.
- Enclose the command string in double quotation marks.

You can override the value of the **S0=0** command in the initialization sequence configured on the modem and add the **L2** command.

To modify the initialization commands on a USB modem:

1. Configure the modem AT commands to initialize the USB modem.

```
[edit interfaces umd0]  
user@host# set modem-options init-command-string "AT S0=2 L2 \n"
```

2. If you are done configuring the device, enter **commit** from configuration mode.

---

### Resetting USB Modems

If the USB modem does not respond, you can reset the modem.

**CAUTION:** If you reset the modem when a call is in progress, the call is terminated.

To reset the USB modem, in operational mode, enter the following command:

```
user@host> request interface modem reset umd0
```

## Telnet and SSH Device Control

- [Configuring Password Retry Limits for Telnet and SSH Access on page 923](#)
- [Configuring Reverse Telnet and Reverse SSH on page 924](#)

- [Example: Controlling Management Access on SRX and J-Series Devices on page 925](#)
- [The telnet Command on page 928](#)
- [The ssh Command on page 929](#)

### Configuring Password Retry Limits for Telnet and SSH Access

To prevent brute force and dictionary attacks, the device performs the following actions for Telnet or SSH sessions by default:

- Disconnects a session after a maximum of 10 consecutive password retries.
- After the second password retry, introduces a delay in multiples of 5 seconds between subsequent password retries.

For example, the device introduces a delay of 5 seconds between the third and fourth password retry, a delay of 10 seconds between the fourth and fifth password retry, and so on.

- Enforces a minimum session time of 20 seconds during which a session cannot be disconnected. Configuring the minimum session time prevents malicious users from disconnecting sessions before the password retry delay goes into effect, and attempting brute force and dictionary attacks with multiple logins.

You can configure the password retry limits for Telnet and SSH access. In this example, you configure the device to take the following actions for Telnet and SSH sessions:

- Allow a maximum of four consecutive password retries before disconnecting a session.
- Introduce a delay in multiples of 5 seconds between password retries that occur after the second password retry.
- Enforce a minimum session time of 40 seconds during which a session cannot be disconnected.

To configure password retry limits for Telnet and SSH access:

1. Set the maximum number of consecutive password retries before a Telnet or SSH or telnet session is disconnected. The default number is **10**, but you can set a number from 1 through **10**.

```
[edit system login retry-options]
user@host# set tries-before-disconnect 4
```

2. Set the threshold number of password retries after which a delay is introduced between two consecutive password retries. The default number is **2**, but you can specify a value from 1 through **3**.

```
[edit system login retry-options]
user@host# set backoff-threshold 2
```

3. Set the delay (in seconds) between consecutive password retries after the threshold number of password retries. The default delay is in multiples of **5** seconds, but you can specify a value from **5** through **10** seconds.

```
[edit system login retry-options]
user@host# set backoff-factor 5
```

4. Set the minimum length of time (in seconds) during which a Telnet or SSH session cannot be disconnected. The default is **20** seconds, but you can specify an interval from **20** through **60** seconds.

```
[edit system login retry-options]  
user@host# set minimum-time 40
```

5. If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Reverse Telnet and Reverse SSH

To configure reverse telnet and reverse ssh:

1. Enable reverse telnet.

```
[edit]  
user@host# set system services reverse telnet
```

2. Specify the port to be used for reverse telnet. If you do not specify a port, 2900 is the default port that is used.

```
[edit]  
user@host# set system services reverse telnet port 5000
```

3. Enable reverse ssh to encrypt the connection between the device and the client.

```
[edit]  
user@host# set system services reverse ssh
```

4. Specify the port for reverse ssh. If you do not specify a port, 2901 is the default port that is used.

```
[edit]  
user@host# set system services reverse ssh port 6000
```

5. If you are done configuring the device, enter **commit** from configuration mode.

### Example: Controlling Management Access on SRX and J-Series Devices

This example shows how to control management access on SRX Series devices.

- [Requirements on page 925](#)
- [Overview on page 925](#)
- [Configuration on page 925](#)
- [Verification on page 927](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this feature.

#### Overview

By default, any host on the trusted interface can manage a security device. To limit the IP addresses that can manage a device, you can configure a firewall filter to deny all, with the exception of the IP address or addresses to which you want to grant management access. This example shows how to limit management access to a specific IP addresses to allow it to manage SRX Series and J Series devices.

#### Configuration

- [Configuring an IP Address List to Restrict Management Access to a Device on page 925](#)

#### Configuring an IP Address List to Restrict Management Access to a Device

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options prefix-list manager-ip 192.168.4.254/32
set policy-options prefix-list manager-ip 10.0.0.0/8
set firewall filter manager-ip term block_non_manager from source-address 0.0.0.0/0
set firewall filter manager-ip term block_non_manager from source-prefix-list manager-ip
except
set firewall filter manager-ip term block_non_manager from protocol tcp
set firewall filter manager-ip term block_non_manager from destination-port ssh
set firewall filter manager-ip term block_non_manager from destination-port https
set firewall filter manager-ip term block_non_manager from destination-port telnet
set firewall filter manager-ip term block_non_manager from destination-port http
set firewall filter manager-ip term block_non_manager then discard
set firewall filter manager-ip term accept_everything_else then accept
set interfaces lo0 unit 0 family inet filter input manager-ip
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

1. Define a set of host addresses, called "manager-ip", that are allowed to manage the device.

[edit policy-options]

```
user@host# set prefix-list manager-ip 192.168.4.254/32
user@host# set prefix-list manager-ip 10.0.0.0/8
```

**NOTE:** The configured list is referenced in the actual filter, where you can change your defined set of addresses.

2. Configure a firewall filter to deny traffic from all IP addresses except the IP addresses defined in the "manager-ip" list. Management traffic that uses any of the listed destination ports is rejected when the traffic comes from an address in the list.

[edit firewall filter]

```
user@host# set manager-ip term block_non_manager from source-address 0.0.0.0/0
user@host# set manager-ip term block_non_manager from source-prefix-list
manager-ip except
user@host# set manager-ip term block_non_manager from protocol tcp
user@host# set manager-ip term block_non_manager from destination-port ssh
user@host# set manager-ip term block_non_manager from destination-port https
user@host# set manager-ip term block_non_manager from destination-port telnet
user@host# set manager-ip term block_non_manager from destination-port http
user@host# set manager-ip term block_non_manager then discard
user@host# set manager-ip term accept_everything_else then accept
```

3. Apply stateless firewall filters to the loopback interface to filter the packets originating from the hosts to which you are granting management access.

[edit interfaces lo0 unit 0 ]

```
user@host# set family inet filter input manager-ip
```

**NOTE:** This configuration applies to traffic that terminates at the device. For traffic that terminates at the device interface (such as IPsec, OSPF, RIP, or BGP), you must also include the management IP addresses in the manager-ip prefix-list.

**Results** From configuration mode, confirm your configuration by entering **show configuration** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show configuration policy-options
prefix-list manager-ip {
  10.0.0.0/8;
  192.168.4.254/32;
}

user@host# show configuration firewall
filter manager-ip {
  term block_non_manager {
    from {
      source-address {
        0.0.0.0/0;
      }
    }
  }
}
```

```

        source-prefix-list {
            manager-ip except;
        }
        protocol tcp;
        destination-port [ ssh https telnet http ];
    }
    then {
        discard;
    }
}
term accept_everything_else {
    then accept;
}
}

user@host# show configuration interfaces
lo0 {
    unit 0 {
        family inet {
            filter {
                input manager-ip;
            }
        }
    }
}

user@host# show configuration interfaces lo0
unit 0 {
    family inet {
        filter {
            input manager-ip;
        }
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying Interfaces**

**Purpose** Verify if the interfaces are configured correctly.

**Action** From operational mode, enter the following commands:

- show policy-options
- show firewall
- show interfaces

**Related Documentation**

- *Administration Guide for Security Devices*

## The telnet Command

You can use the CLI **telnet** command to open a Telnet session to a remote device:

```
user@host> telnet host <8bit> <bypass-routing> <inet> <interface interface-name>
<no-resolve> <port port> <routing-instance routing-instance-name> <source address>
```

**NOTE:** On SRX100, SRX210, SRX220, SRX240, and SRX650 devices, the maximum number of concurrent Telnet sessions is as follows:

| SRX100 | SRX210 | SRX220 | SRX240 | SRX650 |
|--------|--------|--------|--------|--------|
| 3      | 3      | 3      | 5      | 5      |

To exit the Telnet session and return to the Telnet command prompt, press Ctrl-].

To exit the Telnet session and return to the CLI command prompt, enter **quit**.

Table 99 on page 928 describes the **telnet** command options.

**Table 99: CLI telnet Command Options**

| Option                                        | Description                                                                                                                                                                           |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8bit</b>                                   | Use an 8-bit data path.                                                                                                                                                               |
| <b>bypass-routing</b>                         | Bypass the routing tables and open a Telnet session only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. |
| <b>host</b>                                   | Open a Telnet session to the specified hostname or IP address.                                                                                                                        |
| <b>inet</b>                                   | Force the Telnet session to an IPv4 destination.                                                                                                                                      |
| <b>interface source-interface</b>             | Open a Telnet session to a host on the specified interface. If you do not include this option, all interfaces are used.                                                               |
| <b>no-resolve</b>                             | Suppress the display of symbolic names.                                                                                                                                               |
| <b>port port</b>                              | Specify the port number or service name on the host.                                                                                                                                  |
| <b>routing-instance routing-instance-name</b> | Use the specified routing instance for the Telnet session.                                                                                                                            |
| <b>source address</b>                         | Use the specified source address for the Telnet session.                                                                                                                              |

### The ssh Command

You can use the CLI **ssh** command to use the secure shell (SSH) program to open a connection to a remote device:

```
user@host> ssh host <bypass-routing> <inet> <interface interface-name>
<routing-instance routing-instance-name> <source address> <v1> <v2>
```

**NOTE:** On SRX100, SRX210, SRX220, SRX240, and SRX650 devices, the maximum number of concurrent SSH sessions is as follows:

| SRX100 | SRX210 | SRX220 | SRX240 | SRX650 |
|--------|--------|--------|--------|--------|
| 3      | 3      | 3      | 5      | 5      |

Table 100 on page 929 describes the **ssh** command options.

**Table 100: CLI ssh Command Options**

| Option                                        | Description                                                                                                                                                                            |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bypass-routing</b>                         | Bypass the routing tables and open an SSH connection only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. |
| <b>host</b>                                   | Open an SSH connection to the specified hostname or IP address.                                                                                                                        |
| <b>inet</b>                                   | Force the SSH connection to an IPv4 destination.                                                                                                                                       |
| <b>interface source-interface</b>             | Open an SSH connection to a host on the specified interface. If you do not include this option, all interfaces are used.                                                               |
| <b>routing-instance routing-instance-name</b> | Use the specified routing instance for the SSH connection.                                                                                                                             |
| <b>source address</b>                         | Use the specified source address for the SSH connection.                                                                                                                               |
| <b>v1</b>                                     | Force SSH to use version 1 for the connection.                                                                                                                                         |
| <b>v2</b>                                     | Force SSH to use version 2 for the connection.                                                                                                                                         |

## DHCP for IP Address Device

- [Verifying and Managing DHCP Local Server Configuration on page 930](#)
- [Verifying and Managing DHCP Client Configuration on page 930](#)
- [Verifying and Managing DHCP Relay Configuration on page 931](#)

### Verifying and Managing DHCP Local Server Configuration

**Purpose** View or clear information about client address bindings and statistics for the DHCP local server.

- Action**
- To display the address bindings in the client table on the DHCP local server:  
`user@host> show dhcp server binding`
  - To display DHCP local server statistics:  
`user@host> show dhcp server statistics`
  - To clear the binding state of a DHCP client from the client table on the DHCP local server:  
`user@host> clear dhcp server binding`
  - To clear all DHCP local server statistics:  
`user@host> clear dhcp server statistics`

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp server binding routing instance <routing-instance name>`
  - `show dhcp server statistics routing instance <routing-instance name>`
  - `clear dhcp server binding routing instance <routing-instance name>`
  - `clear dhcp server statistics routing instance <routing-instance name>`
- 

**Related Documentation**

- *Administration Guide for Security Devices*

### Verifying and Managing DHCP Client Configuration

**Purpose** View or clear information about client address bindings and statistics for the DHCP client.

- Action**
- To display the address bindings in the client table on the DHCP client:  
`user@host> show dhcp client binding`
  - To display DHCP client statistics:

```
user@host> show dhcp client statistics
```

- To clear the binding state of a DHCP client from the client table on the DHCP client:

```
user@host> clear dhcp client binding
```

- To clear all DHCP client statistics:

```
user@host> clear dhcp client statistics
```

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp client binding routing instance <routing-instance name>`
- `show dhcp client statistics routing instance <routing-instance name>`
- `clear dhcp client binding routing instance <routing-instance name>`
- `clear dhcp client statistics routing instance <routing-instance name>`

#### Related Documentation

- *Administration Guide for Security Devices*

### Verifying and Managing DHCP Relay Configuration

**Purpose** View or clear address bindings or statistics for DHCP relay agent clients.

#### Action

- To display the address bindings for DHCP relay agent clients:

```
user@host> show dhcp relay binding
```

- To display DHCP relay agent statistics:

```
user@host> show dhcp relay statistics
```

- To clear the binding state of DHCP relay agent clients:

```
user@host> clear dhcp relay binding
```

- To clear all DHCP relay agent statistics:

```
user@host> clear dhcp relay statistics
```

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp relay binding routing instance <routing-instance name>`
- `show dhcp relay statistics routing instance <routing-instance name>`
- `clear dhcp relay binding routing instance <routing-instance name>`
- `clear dhcp relay statistics routing instance <routing-instance name>`

---

**Decrypting Configuration Files**

---

To disable the encryption of configuration files on a device and make them readable to all:

1. Enter operational mode in the CLI.
2. Verify your permission to decrypt configuration files on this device by entering the encryption key for the device.

```
user@host> request system set-encryption-key
Enter EEPROM stored encryption key:
Verifying EEPROM stored encryption key:
```

3. At the second prompt, reenter the encryption key.
4. Enter configuration mode in the CLI.
5. Enable configuration file decryption.

```
[edit]
user@host# edit system
user@host# set no-encrypt-configuration-files
```

6. Begin the decryption process by committing the configuration.

```
[edit]
user@host# commit
commit complete
```

**Related  
Documentation**

---

**Encrypting Configuration Files**

---

To configure an encryption key in EEPROM and determine the encryption process, enter one of the **request system set-encryption-key** commands in operational mode described in [Table 101 on page 933](#).

Table 101: request system set-encryption-key Commands

| CLI Command                                            | Description                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>request system set-encryption-key</b>               | Sets the encryption key and enables default configuration file encryption: <ul style="list-style-type: none"> <li>• AES encryption for the Canada and U.S. version of Junos OS</li> <li>• DES encryption for the international version of Junos OS</li> </ul>                                                                                    |
| <b>request system set-encryption-key algorithm des</b> | Sets the encryption key and specifies configuration file encryption by DES.                                                                                                                                                                                                                                                                      |
| <b>request system set-encryption-key unique</b>        | Sets the encryption key and enables default configuration file encryption with a unique encryption key that includes the chassis serial number of the device. <p>Configuration files encrypted with the unique key can be decrypted only on the current device. You cannot copy such configuration files to another device and decrypt them.</p> |
| <b>request system set-encryption-key des unique</b>    | Sets the encryption key and specifies configuration file encryption by DES with a unique encryption key.                                                                                                                                                                                                                                         |

To encrypt configuration files on a device:

1. Enter operational mode in the CLI.
2. Configure an encryption key in EEPROM and determine the encryption process; for example, enter the **request system set-encryption-key** command.

```
user@host> request system set-encryption-key
Enter EEPROM stored encryption key:
```

3. At the prompt, enter the encryption key. The encryption key must have at least six characters.

```
Enter EEPROM stored encryption key:example1
Verifying EEPROM stored encryption key:
```

4. At the second prompt, reenter the encryption key.
5. Enter configuration mode in the CLI.
6. Enable configuration file encryption to take place.

```
[edit]
user@host# edit system
user@host# set encrypt-configuration-files
```

7. Begin the encryption process by committing the configuration.

```
[edit]
user@host# commit
commit complete
```

### Modifying the Encryption Key

---

When you modify the encryption key, the configuration files are decrypted and then reencrypted with the new encryption key.

To modify the encryption key:

1. Enter operational mode in the CLI.
2. Configure a new encryption key in EEPROM and determine the encryption process; for example, enter the **request system set-encryption-key** command.

```
user@host> request system set-encryption-key
Enter EEPROM stored encryption key:
```

3. At the prompt, enter the new encryption key. The encryption key must have at least six characters.

```
Enter EEPROM stored encryption key:exampleone
Verifying EEPROM stored encryption key:
```

4. At the second prompt, reenter the new encryption key.

### Cleaning Up Files

---

You can use the J-Web user interface to rotate log files and delete unnecessary files on the device. If you are running low on storage space, the file cleanup procedure quickly identifies files that can be deleted.

The file cleanup procedure performs the following tasks:

- Rotates log files—Archives all information in the current log files and creates fresh log files.
- Deletes log files in **/var/log**—Deletes any files that are not currently being written to.
- Deletes temporary files in **/var/tmp**—Deletes any files that have not been accessed within two days.
- Deletes all crash files in **/var/crash**—Deletes any core files that the device has written during an error.
- Deletes all software images (**\*.tgz** files) in **/var/sw/pkg**—Deletes any software images copied to this directory during software upgrades.

To rotate log files and delete unnecessary files with the J-Web user interface:

1. In the J-Web user interface, select **Maintain>Files**.
2. In the Clean Up Files section, click **Clean Up Files**. The device rotates log files and identifies the files that can be safely deleted.

The J-Web user interface displays the files that you can delete and the amount of space that will be freed on the file system.

3. Click one of the following buttons on the confirmation page:
  - To delete the files and return to the Files page, click **OK**.
  - To cancel your entries and return to the list of files in the directory, click **Cancel**.

**Related  
Documentation**

- *Network Monitoring and Troubleshooting Guide for Security Devices*

### Cleaning Up Files with the CLI

You can use the CLI **request system storage cleanup** command to rotate log files and delete unnecessary files on the device. If you are running low on storage space, the file cleanup procedure quickly identifies files that can be deleted.

The file cleanup procedure performs the following tasks:

- Rotates log files—Archives all information in the current log files, deletes old archives, and creates fresh log files.
- Deletes log files in **/var/log**—Deletes any files that are not currently being written to.
- Deletes temporary files in **/var/tmp**—Deletes any files that have not been accessed within two days.
- Deletes all crash files in **/var/crash**—Deletes any core files that the device has written during an error.
- Deletes all software images (\*.tgz files) in **/var/sw/pkg**—Deletes any software images copied to this directory during software upgrades.

To rotate log files and delete unnecessary files with the CLI:

1. Enter operational mode in the CLI.
2. Rotate log files and identify the files that can be safely deleted.

```
user@host> request system storage cleanup
```

The device rotates log files and displays the files that you can delete.

3. Enter **yes** at the prompt to delete the files.

**NOTE:** You can issue the **request system storage cleanup dry-run** command to review the list of files that can be deleted with the **request system storage cleanup** command, without actually deleting the files.

**NOTE:**

On SRX Series devices, the `/var` hierarchy is hosted in a separate partition (instead of the root partition). If Junos OS installation fails as a result of insufficient space:

- Use the `request system storage cleanup` command to delete temporary files.
- Delete any user-created files in both the root partition and under the `/var` hierarchy.

**Related Documentation**

- *Network Monitoring and Troubleshooting Guide for Security Devices*

### Deleting Files

You can use the J-Web user interface to delete an individual file from the device. When you delete the file, it is permanently removed from the file system.

**CAUTION:** If you are unsure whether to delete a file from the device, we recommend using the Cleanup Files tool. This tool determines which files can be safely deleted from the file system.

To delete files with the J-Web user interface:

1. In the J-Web user interface, select **Maintain>Files**.
2. In the Download and Delete Files section, click one of the following file types:
  - **Log Files**—Lists the log files located in the `/var/log` directory on the device.
  - **Temporary Files**—Lists the temporary files located in the `/var/tmp` directory on the device.
  - **Old Junos OS**—Lists the software images in the (`*.tgz` files) in the `/var/sw/pkg` directory on the device.
  - **Crash (Core) Files**—Lists the core files located in the `/var/crash` directory on the device.

The J-Web user interface displays the files located in the directory.

3. Check the box next to each file you plan to delete.
4. Click **Delete**.

The J-Web user interface displays the files you can delete and the amount of space that will be freed on the file system.

5. Click one of the following buttons on the confirmation page:
  - To delete the files and return to the Files page, click **OK**.
  - To cancel your entries and return to the list of files in the directory, click **Cancel**.

**Related Documentation**

- *Network Monitoring and Troubleshooting Guide for Security Devices*

---

**Deleting the Backup Software Image**

---

Junos OS keeps a backup image of the software that was previously installed so that you can downgrade to that version of the software if necessary. You can use the J-Web user interface to delete this backup image. If you delete this image, you cannot downgrade to this particular version of the software.

To delete the backup software image:

1. In the J-Web user interface, select **Maintain>Files**.
2. Review the backup image information listed in the Delete Backup Junos Package section.
3. Click the **Delete backup Junos package** link to delete the backup image.
4. Click one of the following buttons on the confirmation page:
  - To delete the backup image and return to the Files page, click **OK**.
  - To cancel the deletion of the backup image and return to the Files page, click **Cancel**.

**Related Documentation**

- *Network Monitoring and Troubleshooting Guide for Security Devices*

---

**Downloading Files**

---

You can use the J-Web user interface to download a copy of an individual file from the device. When you download a file, it is not deleted from the file system.

To download files with the J-Web user interface:

1. In the J-Web user interface, select **Maintain>Files**.
2. In the Download and Delete Files section, click one of the following file types:
  - **Log Files**—Lists the log files located in the **/var/log** directory on the device.
  - **Temporary Files**—Lists the temporary files located in the **/var/tmp** directory on the device.
  - **Old Junos OS**—Lists the software images located in the (**\*.tgz** files) in the **/var/sw/pkg** directory on the device.
  - **Crash (Core) Files**—Lists the core files located in the **/var/crash** directory on the device.

The J-Web user interface displays the files located in the directory.

3. Click **Download** to download an individual file.
4. Choose a location for the browser to save the file.

The file is downloaded.

**Related Documentation**

- *Network Monitoring and Troubleshooting Guide for Security Devices*

### Managing Accounting Files

---

If you configure your system to capture accounting data in log files, set the location for your accounting files to the DRAM.

The default location for accounting files is the **cfs/var/log** directory on the CompactFlash (CF) card. The **nonpersistent** option minimizes the read/write traffic to your CF card. We recommend that you use the **nonpersistent** option for all accounting files configured on your system.

To store accounting log files in DRAM instead of the CF card:

1. Enter configuration mode in the CLI.
2. Create an accounting data log file in DRAM and replace *filename* with the name of the file.

```
[edit]  
user@host# edit accounting-options file filename
```

3. Store accounting log files in the DRAM file.

```
[edit]  
user@host# set file filename nonpersistent
```

**CAUTION:** If log files for accounting data are stored on DRAM, these files are lost when the device reboots. Therefore, we recommend that you back up these files periodically.

---

- [Example: Adding a New License Key on page 941](#)
- [Example: Deleting a License Key on page 945](#)

### Displaying License Keys

---

To display license keys installed on the device:

1. In the J-Web interface, select **Maintain>Licenses**.

2. Under Installed Licenses, click **Display Keys** to display all the license keys installed on the device.

A screen displaying the license keys in text format appears. Multiple licenses are separated by a blank line.

**Related Documentation**

- *Installation and Upgrade Guide for Security Devices*
- *Administration Guide for Security Devices*

---

### Downloading License Keys

To download license keys installed on the device:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Download Keys** to download all the license keys installed on the device to a single file.
3. Select **Save it to disk** and specify the file to which the license keys are to be written.

**Related Documentation**

---

### Generating a License Key

To generate a license key:

1. Gather the authorization code that you received when you purchased your license as well as your device serial number.
2. Go to the Juniper Networks licensing page at:  
<https://www.juniper.net/lcrs/generateLicense.do>
3. Enter the device serial number and authorization code in the webpage and click **Generate**. Depending on the type of license you purchased, you will receive one of the following responses:
  - License key—If you purchased a perpetual license, you will receive a license key from the licensing management system. You can enter this key directly into the system to activate the feature on your device.
  - License key entitlement—If you purchased a subscription-based license, you will receive a license key entitlement from the licensing management system. You can use this entitlement to validate your license on the Juniper Networks licensing server and download the feature license from the server to your device.

**Related Documentation**

- [Example: Deleting a License Key on page 260](#)
- *Installation and Upgrade Guide for Security Devices*

---

### Saving License Keys

To save license keys installed on the device:

1. From operational mode, save the installed license keys to a file or URL.

```
user@host>request system license save filename | url
```

For example, the following command saves the installed license keys to a file named `license.config`:

```
request system license save ftp://user@host/license.conf
```

**Related Documentation**

- [Downloading License Keys on page 255](#)
- [Example: Adding a New License Key on page 257](#)
- [Example: Deleting a License Key on page 260](#)
- *Installation and Upgrade Guide for Security Devices*

### Updating License Keys

To update a license key from the device:

1. From operational mode, do one of the following tasks:

- Update the license keys automatically.

```
user@host> request system license update
```

**NOTE:** The `request system license update` command will always use the default Juniper license server <https://ae1.juniper.net>

You can only use this command to update subscription-based licenses (such as UTM).

- Update the trial license keys automatically.

```
user@host> request system license update trial
```

#### Related Documentation

- [Junos OS Feature License Model Number for J Series Services Routers and SRX Series Services Gateways on page 159](#)

### Example: Adding a New License Key

This example shows how to add a new license key.

- [Requirements on page 942](#)
- [Overview on page 942](#)
- [Configuration on page 942](#)
- [Verification on page 943](#)

### Requirements

Before you begin, confirm that your Junos OS feature requires you to purchase, install, and manage a separate software license.

### Overview

You can add a license key from a file or URL, from a terminal, or from the J-Web user interface. Use the **filename** option to activate a perpetual license directly on the device. (Most feature licenses are perpetual.) Use the **url** to send a subscription-based license key entitlement (such as UTM) to the Juniper Networks licensing server for authorization. If authorized, the server downloads the license to the device and activates it.

In this example, the file name is `bgp-reflection`.

### Configuration

**CLI Quick Configuration** To quickly add a new license key, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

From operational mode, you can add a license key in either way:

- From a file or URL:

```
user@hostname> request system license add bgp-reflection
```

- From the terminal:

```
user@hostname> request system license add terminal
```

### GUI Step-by-Step Procedure

To add a new license key:

1. In the J-Web user interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Add** to add a new license key.
3. Do one of the following, using a blank line to separate multiple license keys:
  - In the **License File URL** box, type the full URL to the destination file containing the license key to be added.
  - In the **License Key Text** box, paste the license key text, in plain-text format, for the license to be added.
4. Click **OK** to add the license key.

**NOTE:** If you added the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a high-memory device.

---

5. Click **OK** to check your configuration and save it as a candidate configuration.
6. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure**

To add a new license key:

1. From operational mode, add a license key in either way:

- From a file or URL:

```
user@host> request system license add bgp-reflection
```

- From the terminal:

```
user@host>request system license add terminal
```

2. When prompted, enter the license key, separating multiple license keys with a blank line. If the license key you enter is invalid, an error is generated when you press Ctrl-D to exit license entry mode.

**NOTE:** If you added the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a high-memory device.

**Results**

From operational mode, confirm your configuration by entering the **show system license** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@hostname> show system license
```

License usage:

| Feature name   | Licenses used | Licenses installed | Licenses needed | Expiry    |
|----------------|---------------|--------------------|-----------------|-----------|
| bgp-reflection | 0             | 1                  | 0               | permanent |

Licenses installed:

License identifier: G03000002223

License version: 2

Valid for device: JN001875AB

Features:

bgp-reflection - Border Gateway Protocol route reflection  
permanent

License identifier: G03000002225

License version: 2

Valid for device: JN001875AB

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Verifying Installed Licenses on page 944](#)
- [Verifying License Usage on page 944](#)
- [Verifying Installed License Keys on page 944](#)

**Verifying Installed Licenses**

**Purpose** Verify that the expected licenses have been installed and are active on the device.

**Action** From operational mode, enter the **show system license** command.

The output shows a list of the licenses used and a list of the licenses installed on the device and when they expire.

**Verifying License Usage**

**Purpose** Verify that the licenses fully cover the feature configuration on the device.

**Action** From operational mode, enter the **show system license usage** command.

```
user@hostname> show system license usage
```

| Feature name   | Licenses used | Licenses installed | Licenses needed | Expiry    |
|----------------|---------------|--------------------|-----------------|-----------|
| bgp-reflection | 1             | 1                  | 0               | permanent |

The output shows a list of the licenses installed on the device and how they are used.

**Verifying Installed License Keys**

**Purpose** Verify that the license keys were installed on the device.

**Action** From operational mode, enter the **show system license keys** command.

```
user@hostname> show system license keys
```

```
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx
```

The output shows a list of the license keys installed on the device. Verify that each expected license key is present.

### Example: Deleting a License Key

This example shows how to delete a license key.

- [Requirements on page 945](#)
- [Overview on page 945](#)
- [Configuration on page 945](#)
- [Verification on page 946](#)

#### Requirements

Before you delete a license key, confirm that it is no longer needed.

#### Overview

You can delete a license key from the CLI or J-Web user interface. In this example, the license ID is G03000002223.

#### Configuration

##### CLI Quick Configuration

To quickly delete a license key, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

```
user@host> request system license delete G03000002223
```

##### GUI Step-by-Step Procedure

To delete a license key:

1. In the J-Web user interface, select **Maintain>Licenses**.
2. Select the check box of the license or licenses you want to delete.
3. Click **Delete**.

**NOTE:** If you deleted the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a low-memory device.

4. Click **OK** to check your configuration and save it as a candidate configuration.
5. If you are done configuring the device, click **Commit Options>Commit**.

##### Step-by-Step Procedure

To delete a license key:

1. From operational mode, for each license, enter the following command and specify the license ID. You can delete only one license at a time.

```
user@host> request system license delete G03000002223
```

**NOTE:** If you deleted the SRX100 Memory Upgrade license, the device reboots immediately and comes back up as a low-memory device.

**Results** From configuration mode, confirm your deletion by entering the **show system license** command. The license key you deleted will be removed. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

#### **Verification**

Confirm that the configuration is working properly.

#### **Verifying Installed Licenses**

**Purpose** Verify that the expected licenses have been removed from the device.

**Action** From operational mode, enter the **show system license** command.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive compress source /var/log/messages* destination  
/var/log/messages-archive.tgz  
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

| <b>Description</b>              | <p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul> |
| <b>Options</b>                  | <p><b>files <i>from-file</i></b>—Names of files to compare.</p> <p><b>files <i>to-file</i></b>—Names of files to compare against.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
