## file copy

|                            |                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>file copy <i>source destination</i></code><br><code>&lt;source-address <i>source- address</i>&gt;</code>                                  |
| <b>Release Information</b> | Command introduced before Junos OS Release 7.4.                                                                                                 |
| <b>Description</b>         | Copy files from one location to another location on the local device or to a location on a remote device that is reachable by the local device. |

**WARNING:** The `sslv3-support` option is not available for configuration with the `set system services xnm-ssl` and `file copy` commands. SSLv3 is no longer supported or available.

You can use the `set system services xnm-ssl sslv3-support` command to enable SSLv3 for a Junos XML protocol client application to use as the protocol to connect to the Junos XML protocol server on a device, and you can use the `file copy source destination sslv3-support` command to enable the copying of files from an SSLv3 URL.

Using SSLv3 presents a potential security vulnerability, and we recommend that you not use SSLv3. For more details about this security vulnerability, go to <http://kb.juniper.net/InfoCenter/index?page=content&id=JSA10656>.

## Sample Output

The following are examples of a variety of file copy scenarios.

### Copy a File from the Local Device to a Personal Computer

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/exampleo/tmp
```

```
...transferring.file..... | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
```

### Copy a Configuration File Between Routing Engines

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/example.conf re1:/var/tmp/copied-example.conf
```

### Copy a Log File Between Routing Engines

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

### Copy a File Using FTP

To use anonymous FTP to copy a local file to a remote system:

```
user@host> file copy filename ftp://hostname/filename
```

In the following example, `/config/example.conf` is the local file and `hostname` is the FTP server:

```
user@host> file copy /config/example.conf ftp://hostname/example.conf
Receiving ftp: //hostname/example.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using FTP and Requiring a Password

To use FTP where you require more privacy and are prompted for a password:

```
root@host> file copy filename ftp://user@hostname/filename
```

In the following example, `/config/example.conf` is the local file and `hostname` is the FTP server:

```
root@host> file copy /config/example.conf ftp://user@hostname/example.conf
Password for user@hostname: *****
Receiving ftp: //user@hostname/example.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using Secure Copy

To use scp to copy a local file to a remote system:

```
root@host> file copy filename scp://user@hostname/path/filename
```

In the following example, `/config/example.conf` is the local file, `user` is the username, and `ssh-host` is the scp server:

```
root@host> file copy /config/example.conf scp://user@ssh-host/tmp/example.conf
user@ssh-host's password: *****
example.conf          100%
| ***** |
2198          00:00
```

## file delete

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

## file show

## request system autorecovery state

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | request system autorecovery state (save   recover   clear)                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Release Information</b>      | Command introduced in Junos Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Prepares the system for autorecovery of configuration, licenses, and disk information.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>save</b>—Save the current state of the disk partitioning, configuration, and licenses for autorecovery.</p> <p>The active Junos OS configuration is saved as the Junos rescue configuration, after which the rescue configuration, licenses, and disk partitioning information is saved for autorecovery. Autorecovery information must be initially saved using this command for the autorecovery feature to verify integrity of data on every bootup.</p> |
|                                 | <div>  <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>Any recovery performed at a later stage will restore the data to the same state as it was when the save command was executed.</li> <li>A fresh rescue configuration is generated when the command is executed. Any existing rescue configuration will be overwritten.</li> </ul> </div>                        |
|                                 | <p><b>recover</b>—Recover the disk partitioning, configuration, and licenses.</p> <p>After autorecovery data has been saved, the integrity of saved items is always checked automatically on every bootup. The recovery command allows you to forcibly re-run the tests at any time if required.</p>                                                                                                                                                              |
|                                 | <p><b>clear</b>—Clear all saved autorecovery information.</p> <p>Only the autorecovery information is deleted; the original copies of the data used by the router are not affected. Clearing the autorecovery information also disables all autorecovery integrity checks performed during bootup.</p>                                                                                                                                                            |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                                                                                                                                                                      |

### Sample Output

#### request system partition compact-flash (If Yes)

```

user@host> request system partition compact-flash
Are you sure you want to reboot
and partition the compact-flash ? [yes,no] yes
Initiating repartition operation.
The operation may take several minutes to complete.
System will reboot now...
<System reboots>
<Repartition operation is performed>
<System reboots and starts up normally>

```

### Sample Output

#### request system partition compact-flash (If No)

```

user@host> request system partition compact-flash
Are you sure you want to reboot
and partition the compact-flash ? [yes,no] no

```

## request system power-off fpc

---

### Sample Output

`request system services dhcp client renew ge-1/0/1`

```
user@host> request system services dhcp client renew ge-1/0/1
```

## request system snapshot (Maintenance)

---

**Syntax**    request system snapshot  
              <factory>  
              <media (compact-flash | hard-disk | internal | usb)>  
              <node (all | local | node-id | primary)>  
              <partition>  
              <slice (alternate) >

**Release Information**    Command introduced in Release 10.2 of Junos OS.

**Description**    Back up the currently running and active file system partitions on the device.

- Options**
- factory— (Optional) Specifies that only the files shipped from the factory are included in the snapshot.
  - media— (Optional) Specifies the media to be included in the snapshot:
    - compact-flash— Copies the snapshot to an external compact flash.
    - hard-disk— Copies the snapshot to a hard disk.
    - usb— Copies the snapshot to the USB storage device.
    - internal— Copies the snapshot to internal media. This is the default.

**NOTE:** USB option is available on all SRX series devices; hard disk and compact-flash options are available only on high-end SRX series devices; media internal option is available only on branch SRX series devices.

---

- node— (Optional) Specifies to archive the data and executable areas of a specific node.
  - node-id—Archive a specific node. The range of node ID is (0,1)
  - all—Archive all nodes.
  - local—Archive only local nodes.
  - primary—Archive only primary nodes.
- partition - (Default) Specifies that the target media should be repartitioned before the backup is saved to it.

**NOTE:**

- The target media is partitioned whether or not it is specified in the command, because this is a mandatory option.
- You cannot partition a hard-disk as it is mounted on /var directory.

- slice— (Optional) Takes a snapshot of the root partition the system has currently booted from to another slice in the same media.
- alternate— (Optional) Stores the snapshot on the other root partition in the system.

**NOTE:**

- The slice option cannot be used along with the other request system snapshot options, because the options are mutually exclusive. If you use the factory, media, or partition option, you cannot use the slice option; if you use the slice option, you cannot use any of the other options.
- The slice partition is supported only on branch SRX Series devices.

**Required Privilege Level** maintenance

**Related Documentation**

**List of Sample Output**

[request system snapshot media hard-disk on page 989](#)  
[request system snapshot media usb \(when usb device is missing on page 989](#)  
[request system snapshot media compact-flash on page 990](#)  
[request system snapshot media internal on page 990](#)  
[request system snapshot partition on page 990](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request system snapshot media hard-disk](#)

```
user@host> request system snapshot media hard-disk
Verifying compatibility of destination media partitions...
Running newfs (880MB) on hard-disk media / partition (ad2s1a)...
Running newfs (98MB) on hard-disk media /config partition (ad2s1e)...
Copying '/dev/ad0s1a' to '/dev/ad2s1a' .. (this may take a few minutes)
...
```

### [request system snapshot media usb \(when usb device is missing](#)

```
user@host> request system snapshot media usb
```

```
Verifying compatibility of destination media partitions...
Running newfs (254MB) on usb media / partition (da1s1a)...
Running newfs (47MB) on usb media /config partition (da1s1e)...
Copying '/dev/da0s2a' to '/dev/da1s1a' .. (this may take a few minutes)
Copying '/dev/da0s2e' to '/dev/da1s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

#### request system snapshot media compact-flash

```
user@host> request system snapshot media compact-flash
error: cannot snapshot to current boot device
```

#### request system snapshot media internal

```
user@host> request system snapshot media internal
error: cannot snapshot to current boot device
```

#### request system snapshot partition

```
user@host> request system snapshot partition
Verifying compatibility of destination media partitions...
Running newfs (439MB) on internal media / partition (da0s1a)...
Running newfs (46MB) on internal media /config partition (da0s1e)...
Copying '/dev/da1s1a' to '/dev/da0s1a' .. (this may take a few minutes)
Copying '/dev/da1s1e' to '/dev/da0s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

## request system software abort in-service-upgrade (ICU)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Command introduced in Release 11.2 of Junos OS.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Abort an in-band cluster upgrade (ICU). This command must be issued from a router session other than the one on which you issued the <b>request system in-service-upgrade</b> command that launched the ICU. If an ICU is in progress, this command aborts it. If the node is being upgraded, this command will cancel the upgrade. The command is also helpful in recovering the node in case of a failed ICU. |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>                                    | Display information about the system. Issue this command before contacting customer support, and then include the command output in your support request. Output from this command varies somewhat, depending on which platform you issue the command from. However, the command always executes a series of <b>show</b> commands, with the appropriate information for your device automatically included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                                        | <p><b>node</b><i>node-id</i>—(SRX Series) (Optional) Display system information for the specified node. On SRX Series, replace <i>node-id</i> with a value of 0 or 1. This option is applicable only the device with HA environment.</p> <p><b>all</b>—(SRX Series) (Optional) Display system information for all nodes.</p> <p><b>local</b>—(SRX Series) (Optional) Display system information for local node.</p> <p><b>primary</b>—(SRX Series) (Optional) Display system information for primary node.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers) (Optional) Display system information for all chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system information for all chassis for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> |

**all-members**—(EX Series switches and MX Series routers) (Optional) Display system information for all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX Series switches and MX Series routers) (Optional) Display system information for the local Virtual Chassis member.

**member *member-id***—(EX Series switches and MX Series routers) (Optional) Display system information for the specified member of the Virtual Chassis configuration. On EX Series switches, replace ***member-id*** with a value appropriate for that Virtual Chassis configuration. On MX Series routers, replace ***member-id*** with a value of 0 or 1.

**scc**—(TX Matrix routers) (Optional) Display system information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers) (Optional) Display system information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** The **show** commands issued as a result of this command vary depending on which platform you issue the command from. Output is always appropriate for the device. For example, [Table 102 on page 996](#) lists the **show** commands that are called when you issue **request support information** on an MX Series router.

**Table 102: Sample show Commands Called by the request information support command on an MX Series Router**

Table 102: Sample show Commands Called by the request information support command on an MX Series Router (*continued*)

|                           |                                          |
|---------------------------|------------------------------------------|
| show krt state            | show system virtual-memory no-forwarding |
| show pfe statistics error | show version detail no-forwarding        |

The **no-forwarding** option ensures that all mgd processes associated with the **show** command are properly halted if you break into the output (Ctrl+C) while the command is still running.

**Required Privilege Level** maintenance

## request system zeroize

**Syntax** `request system zeroize <media>`

**Description** Erases all configuration information and resets all key values. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories.

The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as root and start the Junos OS command-line interface (CLI) by typing `cli` at the prompt.

**Options** **media**—(Optional) In addition to removing all configuration and log files, the media option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the request system zeroize media operation can take considerably more time than the request system zeroize operation. However, the critical security parameters are all removed at the beginning of the process.

**NOTE:** The media option is not supported on SRX5000 line devices.

**Required Privilege Level** Not applicable.

| <b>Description</b>                  | Restart a Junos OS process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router to drop calls and interrupt transmission, resulting in possible loss of data.

- Options**
- 802.1x-protocol-daemon—(Branch SRX Series only) (Optional) Restart the 802.1x protocol process (daemon).
  - application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
  - application-security—(Optional) Restart the application security process.
  - audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, for analyzing and tracking usage patterns, and for billing a user based upon the amount of time used or the type of services accessed.
  - autoinstallation—(Branch SRX Series only) (Optional) Restart the autoinstallation process.
  - chassis-control—(Optional) Restart the chassis management process.
  - class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
  - database-replication—(Optional) Restart the database replication process.
  - datapath-trace-service—(High-end SRX Series only) (Optional) Restart the packet path tracing process.
  - ddns—(Optional) Restart the dynamic domain name system, which dynamically updates IP addresses for registered domain names.
  - dhcp—(Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.
  - dhcp-services—(Branch SRX Series only) (Optional) Restart the Dynamic Host Configuration Protocol process.
  - dialer-services—(Branch SRX Series only) (Optional) Restart the ISDN dial-out process.
  - disk-monitoring—(High-end SRX Series only) (Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.
  - dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on PIC3 monitoring services cards.
  - ethernet-connectivity-fault-management—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.
  - ethernet-link-fault-management—(Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.
  - ethernet-switching—(Branch SRX Series only) (Optional) Restart the Ethernet switching process.
  - event-processing—(Optional) Restart the event process (eventd).
  - fipsd—(High-end SRX Series only) (Optional) Restart the fipsd services.

- **firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and accepts or rejects packets that are transiting an interface on a router or switch.
- **firewall-authentication-service**—(Optional) Restart the firewall authentication service process.
- **forwarding**—(Branch SRX Series only) (Optional) Restart the security forwarding options process.
- **general-authentication-service**—(Optional) Restart the general authentication process.
- **gprs-process**—(High-end SRX Series only) (Optional) Restart the General Packet Radio Service (GPRS) process.
- **gracefully**—(Optional) Restart the software process.
- **group-key-member**—(Branch SRX Series only) (Optional) Restart the group key member process.
- **group-key-server**—(Branch SRX Series only) (Optional) Restart the group VPN server process. The group VPN server loses all its data, including TEK and KEK keys, when it restarts. New keys are generated, but the keys are not available to group members until they reregister.
- **idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.
- **immediately**—(Optional) Immediately restart the software process.
- **interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.
- **ipmi**—(Optional) Restart the intelligent platform management interface process.
- **ipsec-key-management**—(Optional) Restart the IPsec key management process.
- **jnx-wmi-service**—(High-end SRX Series only) (Optional) Restart the jnx Windows Management Instrumentation (WMI) service process.
- **jsrp-service**—(Optional) Restart the Juniper Services Redundancy Protocol (jsrdp) process, which controls chassis clustering.
- **kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.
- **lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link. The LACP process allows link aggregation control instances to reach agreement on the identity of the LAG to which a link belongs, moves the link to that LAG, and enables the transmission and reception processes for the link to function in an orderly manner.
- **l2cpd-service**—(High-end SRX Series only) (Optional) Restart the Layer 2 Control Protocol (L2CP) process, which enables features such as L2 protocol tunneling and nonstop bridging.

- l2-learning—(Optional) Restart the Layer 2 (L2) address flooding and learning process.
- license-service—(Optional) Restart the feature license management process.
- lldpd-service—(Branch SRX Series only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.
- logical-system-service—(High-end SRX Series only) (Optional) Restart the logical system service process.
- mib-process—(Optional) Restart the MIB version II process, which provides the router's MIB II agent.
- mountd-service—(Optional) Restart the service for Network File System (NFS) mount requests.
- mpls-traceroute—(Branch SRX Series only) (Optional) Restart the MPLS periodic traceroute process.
- multicast-snooping—(Branch SRX Series only) (Optional) Restart the multicast snooping process, which makes L2 devices, such as VLAN switches, aware of L3 information, such as the media access control (MAC) addresses of members of a multicast group.
- named-service—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.
- network-security—(Optional) Restart the network security process.
- network-security-trace—(Optional) Restart the network security trace process.
- nfsd-service—(Optional) Restart the remote NFS server process, which provides remote file access for applications that need NFS-based transport.
- ntpd-service—(High-end SRX Series only) (Optional) Restart the Network Time Protocol (NTP) process.
- peer-selection-service—(Branch SRX Series only) (Optional) Restart the peer selection service process.
- pgm—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.
- pic-services-logging—(High-end SRX Series only) (Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.
- pki-service—(Optional) Restart the public key infrastructure (PKI) service process.
- ppp—(Branch SRX Series only) (Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.
- pppoe—(Branch SRX Series only) (Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

- `profillerd`—(Optional) Restart the profiler process.
- `r2cp`—(Branch SRX Series only) (Optional) Restart the Radio-to-Router Control Protocol process.
- `remote-operations`—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.
- `routing`—(Optional) Restart the routing protocol process (`rpd`).
- `sampling`—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.
- `sdk-service`—(Branch SRX Series only) (Optional) Restart the software development kit (SDK) service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK service process is present on the router, it is turned off by default.
- `secure-neighbor-discovery`—(Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.
- `security-intelligence`—(Optional) Restart security intelligence process.
- `security-log`—(Optional) Restart the security log process.
- `service-deployment`—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.
- `services`—(Branch SRX Series only) (Optional) Restart a service.
- `simple-mail-client-service`—(Optional) Restart the simple mail client service process.
- `snmp`—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.
- `soft`—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.
- `statistics-service`—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.
- `subscriber-management`—(Optional) Restart the subscriber management process.
- `subscriber-management-helper`—(Optional) Restart the subscriber management helper process.
- `system-health-management`—(Branch SRX Series only) (Optional) Restart the system health management process.
- `tunnel-oamd`—(High-end SRX Series only) (Optional) Restart the tunnel OAM process for L2 tunneled networks.
- `uac-service`—(Optional) Restart the Unified Access Control (UAC) process.
- `usb-control`—(Branch SRX Series only) (Optional) Restart the USB control process.
- `vrrp`—(Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that

LAN without requiring more than the static configuration of a single default route on the hosts.

- web-management—(Optional) Restart the Web management process.
- wireless-lan-service—(Branch SRX Series only) (Optional) Restart the wireless LAN service process.
- wireless-wan-service—(Branch SRX Series only) (Optional) Restart the wireless WAN service process.

**Required Privilege Level**

reset

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

---

### Restart Commands Overview

Use the **restart** operational commands to restart software processes on the device. Operational commands are organized alphabetically.

| <b>Output Fields</b>            | Table 103 on page 1012 lists the output fields for the <b>show chassis routing-engine</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 103: show chassis routing-engine Output Fields**

| Field Name           | Field Description                                                             |
|----------------------|-------------------------------------------------------------------------------|
| Temperature          | Routing Engine temperature.                                                   |
| CPU temperature      | CPU temperature.                                                              |
| Total memory         | Total memory available on the system.                                         |
| Control plane memory | Memory available for the control plane.                                       |
| Data plane memory    | Memory reserved for data plane processing.                                    |
| CPU utilization      | Current CPU utilization statistics on the control plane core.                 |
| User                 | Current CPU utilization in user mode on the control plane core.               |
| Background           | Current CPU utilization in nice mode on the control plane core.               |
| Kernel               | Current CPU utilization in kernel mode on the control plane core.             |
| Interrupt            | Current CPU utilization in interrupt mode on the control plane core.          |
| Idle                 | Current CPU utilization in idle mode on the control plane core.               |
| Model                | Routing Engine model.                                                         |
| Start time           | Routing Engine start time.                                                    |
| Uptime               | Length of time the Routing Engine has been up (running) since the last start. |

Table 103: show chassis routing-engine Output Fields (*continued*)

| Field Name         | Field Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| Last reboot reason | Reason for the last reboot of the Routing Engine.                                                                 |
| Load averages      | The average number of threads waiting in the run queue or currently executing over 1-, 5-, and 15-minute periods. |

## Sample Output

### show chassis routing-engine

```

user@host> show chassis routing-engine (Sample 1)
Routing Engine status:
  Temperature          38 degrees C / 100 degrees F
  CPU temperature      36 degrees C / 96 degrees F
  Total memory         512 MB Max   435 MB used ( 85 percent)
    Control plane memory 344 MB Max   296 MB used ( 86 percent)
    Data plane memory   168 MB Max   138 MB used ( 82 percent)
  CPU utilization:
    User                8 percent
    Background          0 percent
    Kernel              4 percent
    Interrupt           0 percent
    Idle                88 percent
  Model                RE-SRX240-LOWMEM
  Serial ID            AAP8652
  Start time           2009-09-21 00:04:54 PDT
  Uptime               52 minutes, 47 seconds
  Last reboot reason   0x200:chassis control reset
  Load averages:       1 minute   5 minute   15 minute
                      0.12       0.15       0.10

```

## Sample Output

### show chassis routing-engine

```

user@host> show chassis routing-engine (Sample 2)
Routing Engine status:
  Temperature          46 degrees C / 114 degrees F
  CPU temperature      46 degrees C / 114 degrees F
  Total memory         1024 MB Max   737 MB used ( 72 percent)
    Control plane memory 600 MB Max   426 MB used ( 71 percent)
    Data plane memory   424 MB Max   314 MB used ( 74 percent)
  CPU utilization:
    User                40 percent
    Background          0 percent
    Kernel              11 percent
    Interrupt           0 percent
    Idle                49 percent
  Model                RE-SRXSME-SRE6
  Start time           2009-09-19 20:04:18 PDT
  Uptime               1 day, 4 hours, 51 minutes, 11 seconds
  Last reboot reason   0x200:chassis control reset
  Load averages:       1 minute   5 minute   15 minute
                      0.27       0.53       0.78

```

## show dhcp client binding

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Output Fields</b>            | Table 104 on page 1014 lists the output fields for the <b>show dhcp client binding</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 104: show dhcp client binding Output Fields

| Field Name       | Field Description                    |
|------------------|--------------------------------------|
| IP address       | IP address of the DHCP client.       |
| Hardware address | Hardware address of the DHCP client. |
| Server           | IP address of the DHCP server.       |

Table 104: show dhcp client binding Output Fields (*continued*)

| Field Name        | Field Description                                             |
|-------------------|---------------------------------------------------------------|
| Expires           | Number of seconds in which the lease expires.                 |
| State             | State of the address binding table on the DHCP local server.  |
| Interface         | Interface on which the request was received.                  |
| Lease Expires     | Date and time at which the client's IP address lease expires. |
| Lease Expires in  | Number of seconds in which the lease expires.                 |
| Lease Start       | Date and time at which the client's IP address lease started. |
| Vendor Identifier | Vendor identifier.                                            |
| Server Identifier | IP address of the DHCP server.                                |
| Client IP Address | IP address of the DHCP client.                                |

## Sample Output

### show dhcp client binding

```

user@host> show dhcp client binding
2 clients, (2 bound, 0 init, 0 discover, 0 renew, 0 rebind)

Table 105: show dhcpv6 client binding Output Fields

| Field Name       | Field Description                                              |
|------------------|----------------------------------------------------------------|
| Hardware Address | Hardware address of the DHCPv6 client.                         |
| State            | State of the address-binding table on the DHCPv6 local server. |
| Lease Expires    | Date and time at which the client's IP address lease expires.  |
| Lease Expires in | Number of seconds until the lease expires.                     |
| Lease Start      | Date and time at which the client's IP address lease started.  |
| Client DUID      | The DHCPv6 client's unique identifier.                         |
| Bind type        | The bind type.                                                 |

Table 105: show dhcpv6 client binding Output Fields (*continued*)

| Field Name        | Field Description                                                          |
|-------------------|----------------------------------------------------------------------------|
| Client Type       | The type of DHCPv6 client. The client type can be autoconfig or statefull. |
| Rapid Commit      | Two-message exchange option for address assignment.                        |
| Server IP Address | IP address of the DHCPv6 server.                                           |
| Client IP Address | IP address of the DHCPv6 client.                                           |

## Sample Output

|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dhcpv6 Packets dropped | Number of packets discarded by the DHCPv6 local server because of errors. Only nonzero statistics appear in the DHCPv6 Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Output Fields</b>            | Table 108 on page 1023 lists the output fields for the <b>show dhcp relay binding</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 108: show dhcp relay binding Output Fields

| Field Name          | Field Description                            |
|---------------------|----------------------------------------------|
| IP address          | IP address of the DHCP client.               |
| Hardware address    | Hardware address of the DHCP client.         |
| Request received on | Interface on which the request was received. |

Table 108: show dhcp relay binding Output Fields (*continued*)

| Field Name  | Field Description                                             |
|-------------|---------------------------------------------------------------|
| Type        | Type of DHCP packet processing performed on the device.       |
| Obtained at | Date and time at which the client's IP address lease started. |
| Expires at  | Date and time at which the client's IP address lease expires. |
| State       | State of the address binding table on the DHCP local server.  |

## Sample Output

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 110: show dhcp server binding Output Fields

| Field Name          | Field Description                            |
|---------------------|----------------------------------------------|
| IP address          | IP address of the DHCP client.               |
| Hardware address    | Hardware address of the DHCP client.         |
| Request received on | Interface on which the request was received. |

Table 110: show dhcp server binding Output Fields (*continued*)

| Field Name  | Field Description                                             |
|-------------|---------------------------------------------------------------|
| Type        | Type of DHCP packet processing performed on the device.       |
| Obtained at | Date and time at which the client's IP address lease started. |
| Expires at  | Date and time at which the client's IP address lease expires. |
| State       | State of the address binding table on the DHCP local server.  |

## Sample Output

### show dhcp server binding

```
user@host> show dhcp server binding 100.20.32.1 detail
Active binding information:
    IP address          100.20.32.1
    Hardware address    90:00:00:01:00:01
    Request received on fe-0/0/2.0, relayed by 100.20.32.2

Lease information:
    Type                DHCP
    Obtained at         2007-01-17 11:28:47 PST
    Expires at          2007-01-17 11:38:47 PST
    State                rebind
```

## show dhcp server statistics

## show system directory-usage

**Syntax** show system directory-usage  
 <depth *number*>  
 <node *node-id* | all | local | primary>  
 <path>

**Release Information** Command introduced before Junos OS Release 9.0.

**Description** Display directory usage information.

- Options**
- **none**—Display all directory usage information.
  - **depth *number***—(Optional) Specify the depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.
  - **node**—(Optional) Display the directory information for a specific node.

**NOTE:** The **node** option is supported only on high-end SRX Series devices.

- **node-id**—Identification number of the node. It can be 0 or 1.
- **all**—(Optional) Display the directory information for all nodes.
- **local**—(Optional) Display the directory information for the local node.
- **primary**—(Optional) Display the directory information for the primary node.
- **path**—(Optional) Specify the path of the root directory to traverse.

**Required Privilege Level** view

**List of Sample Output** [show system directory-usage on page 1043](#)

**Output Fields** [Table 116 on page 1042](#) describes the output fields for the **show system directory-usage** command. Output fields are listed in the approximate order in which they appear.

**Table 116: show system directory-usage Output Fields**

| Field Name            | Field Description                             |
|-----------------------|-----------------------------------------------|
| <i>bytes</i>          | Number of bytes used by files in a directory. |
| <i>directory-name</i> | Name of the directory.                        |

## Sample Output

### show system directory-usage

```
user@host> show system directory-usage
node0:
```

```
-----
          /var/tmp
2.0K      /var/tmp/.ssh
```

## show system download

| <b>Output Fields</b>            | Table 18 on page 121 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                         |

**Table 118: show system license Output Fields**

| Field Name           | Field Description                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature name</b>  | Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.                                                                |
| <b>Licenses used</b> | Number of licenses used by the device. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used. |

Table 118: show system license Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Licenses installed            | Information about the installed license key: <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Features</b>—Feature associated with a license.</li> </ul> |
| Licenses needed               | Number of licenses required for features being used but not yet properly licensed.                                                                                                                                                                                                                                                                                                                                                                                             |
| Expiry                        | Time remaining in the grace period before a license is required for a feature being used.                                                                                                                                                                                                                                                                                                                                                                                      |
| Logical system license status | Displays whether a license is enabled for a logical system.                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:
```

| Feature name                            | Licenses used | Licenses installed | Licenses needed | Expiry     |
|-----------------------------------------|---------------|--------------------|-----------------|------------|
| av_key_kaspersky_engine<br>01:00:00 IST | 1             | 1                  | 0               | 2012-03-30 |
| wf_key_surfcontrol_cpa<br>01:00:00 IST  | 0             | 1                  | 0               | 2012-03-30 |
| dynamic-vpn                             | 0             | 1                  | 0               | permanent  |
| ax411-wlan-ap                           | 0             | 2                  | 0               | permanent  |

```
Licenses installed:
```

```
License identifier: JUNOS301998
```

```
License version: 2
```

```
Valid for device: AG4909AA0080
```

```
Features:
```

```
av_key_kaspersky_engine - Kaspersky AV
```

```
date-based, 2011-03-30 01:00:00 IST - 2012-03-30 01:00:00 IST
```

```
License identifier: JUNOS302000
```

```
License version: 2
```

```
Valid for device: AG4909AA0080
```

```
Features:
```

```
wf_key_surfcontrol_cpa - Web Filtering
```

```
date-based, 2011-03-30 01:00:00 IST - 2012-03-30 01:00:00 IST
```

### show system license installed

```
user@host> show system license installed
```

```
License identifier: JUNOS301998
```

```
License version: 2
```

```
Valid for device: AG4909AA0080
```

```
Features:
```

```
av_key_kaspersky_engine - Kaspersky AV
date-based, 2011-03-30 01:00:00 IST - 2012-03-30 01:00:00 IST
```

| <b>List of Sample Output</b>    | <a href="#">show system login logout on page 1049</a>                                                                                                                                                                                                                                                            |
| <b>Output Fields</b>            | Table 38 on page 301 lists the output fields for the <b>show system login logout</b> command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the <b>detail</b> keyword is used. |

Table 119: show system login logout

| Field Name    | Field Description                       | Level of Output |
|---------------|-----------------------------------------|-----------------|
| User          | Username                                | All levels      |
| Lockout start | Date and time the username was locked   | All levels      |
| Lockout end   | Date and time the username was unlocked | All levels      |

## Sample Output

### show system login logout

```
user@host>show system login logout
```

```

User           Lockout start      Lockout end
root           2011-05-11 09:11:15 UTC 2011-05-11 09:13:15 UTC

```

## show system storage (View SRX Series)

**Syntax** show system storage  
 <detail>  
 <node *node-id* | all | local | primary>  
 <partitions>

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display the local storage data currently available on the SRX Series devices.

- Options**
- **none**—Display standard information about the amount of free disk space in the device file system.
  - **detail**—(Optional) Display detailed output about the amount of free disk space in the device file system.
  - **node**—(Optional) Display local storage data for a specific node.

**NOTE:** The **node** option is supported only on high-end SRX Series devices.

- **node-id**—Identification number of the node. It can be 0 or 1.
- **all**—(Optional) Display the local storage data for all nodes.
- **local**—(Optional) Display the local storage data for the local node.
- **primary**—(Optional) Display the local storage data for the primary node.
- **partitions**—(Optional) Display partitions information for the boot media.

**NOTE:** The **partitions** option is supported only on branch SRX Series devices.

**Required Privilege Level** View

**Output Fields** [Table 39 on page 303](#) describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

**Table 122: show system storage Output Fields**

| Field Name | Field Description                        |
|------------|------------------------------------------|
| Filesystem | Name of the file system.                 |
| Size       | Size of the file system.                 |
| Used       | Amount of space used in the file system. |

Table 122: show system storage Output Fields (*continued*)

| Field Name        | Field Description                                       |
|-------------------|---------------------------------------------------------|
| <b>Avail</b>      | Amount of space available in the file system.           |
| <b>Capacity</b>   | Percentage of the file system space that is being used. |
| <b>Mounted on</b> | Directory in which the file system is mounted.          |

**show system storage**

# Access Privilege Administration Guide

- [Overview on page 1059](#)
- [Configuration on page 1067](#)
- [Administration on page 1226](#)

## Overview

---

- [Introduction to Access Privileges on page 1059](#)

## Introduction to Access Privileges

- [Understanding Junos OS Access Privilege Levels on page 1059](#)
- [Junos OS Login Classes Overview on page 1063](#)
- [Access Privilege User Permission Flags Overview on page 1064](#)
- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1066](#)

### Understanding Junos OS Access Privilege Levels

---

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 1059](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 1062](#)

### *Junos OS Login Class Permission Flags*

The **permissions** statement specifies one or more of the permission flags listed in [Table 123 on page 1060](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure**

to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

[Table 123 on page 1060](#) lists the Junos OS login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.

**Table 123: Login Class Permission Flags**

| Permission Flag         | Description                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access</b>           | Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.                      |
| <b>access-control</b>   | Can view and configure access information at the <b>[edit access]</b> hierarchy level.                                                        |
| <b>admin</b>            | Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.                      |
| <b>admin-control</b>    | Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.                                                  |
| <b>all-control</b>      | Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels. |
| <b>clear</b>            | Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.       |
| <b>configure</b>        | Can enter configuration mode by using the <b>configure</b> command.                                                                           |
| <b>control</b>          | Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.                                 |
| <b>field</b>            | Can view field debug commands. Reserved for debugging support.                                                                                |
| <b>firewall</b>         | Can view the firewall filter configuration in configuration mode.                                                                             |
| <b>firewall-control</b> | Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.                                             |
| <b>floppy</b>           | Can read from and write to the removable media.                                                                                               |
| <b>flow-tap</b>         | Can view the flow-tap configuration in configuration mode.                                                                                    |

Table 123: Login Class Permission Flags (*continued*)

| Permission Flag                       | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>flow-tap-control</b>               | Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.                                                                                                                                                                                                                                               |
| <b>flow-tap-operation</b>             | <p>Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have <b>flow-tap-operation</b> permission.</p> <p><b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.</p>                                       |
| <b>idp-profiler-operation</b>         | Can view profiler data.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interface</b>                      | Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.                                                                                                                                                                                                                                                                                          |
| <b>interface-control</b>              | <p>Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul> |
| <b>maintenance</b>                    | Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router by using the <b>request system</b> commands.                                                                                                                                                                          |
| <b>network</b>                        | Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.                                                                                                                                                                                                                                                                                                       |
| <b>pgcp-session-mirroring</b>         | Can view the <b>pgcp</b> session mirroring configuration.                                                                                                                                                                                                                                                                                                                                                            |
| <b>pgcp-session-mirroring-control</b> | Can modify the <b>pgcp</b> session mirroring configuration.                                                                                                                                                                                                                                                                                                                                                          |
| <b>reset</b>                          | Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.                                                                                                                                                                                                                       |
| <b>rollback</b>                       | Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.                                                                                                                                                                                                                                                                                    |
| <b>routing</b>                        | Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.                                                                                                                                                                                                                                                                                     |

Table 123: Login Class Permission Flags (*continued*)

| Permission Flag           | Description                                                                                                                                                                                                                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>routing-control</b>    | Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level. |
| <b>secret</b>             | Can view passwords and other authentication keys in the configuration.                                                                                                                                                                                                                                                     |
| <b>secret-control</b>     | Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.                                                                                                                                                                                                           |
| <b>security</b>           | Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.                                                                                                                                                                                                     |
| <b>security-control</b>   | Can view and configure security information at the <b>[edit security]</b> hierarchy level.                                                                                                                                                                                                                                 |
| <b>shell</b>              | Can start a local shell on the router or switch by using the <b>start shell</b> command.                                                                                                                                                                                                                                   |
| <b>snmp</b>               | Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.                                                                                                                                                                                                       |
| <b>snmp-control</b>       | Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.                                                                                                                                                                                                       |
| <b>system</b>             | Can view system-level information in configuration and operational modes.                                                                                                                                                                                                                                                  |
| <b>system-control</b>     | Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.                                                                                                                                                                                                              |
| <b>trace</b>              | Can view trace file settings and configure trace file properties.                                                                                                                                                                                                                                                          |
| <b>trace-control</b>      | Can modify trace file settings and configure trace file properties.                                                                                                                                                                                                                                                        |
| <b>view</b>               | Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.                                                                                                                                                                 |
| <b>view-configuration</b> | Can view all of the configuration (excluding secrets).                                                                                                                                                                                                                                                                     |

***Allowing or Denying Individual Commands for Junos OS Login Classes***

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of

operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration-regexps** and **deny-configuration-regexps**, **allow-commands** and **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

#### Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify

- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos OS contains a few predefined login classes, which are listed in [Table 124 on page 1064](#). The predefined login classes cannot be modified.

**Table 124: Predefined System Login Classes**

| Login Class             | Permission Flag Set                    |
|-------------------------|----------------------------------------|
| operator                | clear, network, reset, trace, and view |
| read-only               | view                                   |
| superuser or super-user | all                                    |
| unauthorized            | None                                   |

**NOTE:**

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:

warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'

- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:

error: target '<class-name>' is a predefined class

### Access Privilege User Permission Flags Overview

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all** permissions flag.

For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

The permission flags listed in "Related Documentation" grant a specific set of access privileges. Each permission flag is listed with the operational mode commands and configuration hierarchy levels and statements for which that flag grants access.

**NOTE:** Each command listed represents that command and all subcommands with that command as a prefix. Each configuration statement listed represents the top of the configuration hierarchy to which that flag grants access.

### Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

The **allow/deny-configuration** and **allow/deny-configuration-regexps** statements let you explicitly allow or deny users access privileges to portions of the configuration hierarchy. Each of these statements is added to named login classes and configured with one or more regular expressions to be allowed or denied. Each login class is assigned to specific users or user IDs.

The search and match methods differ in the two forms of these statements. You must select which form to use within a login class—you cannot configure **allow-configuration** and **allow-configuration-regexps** together in the same login class. You must select just one. If you have existing configurations using the **allow/deny-configuration** form of the statements, using the same configuration options with the **allow/deny-configuration-regexps** form of the statements might not produce the same results.

- **Allow/deny-configuration** statements perform slower matching, with more flexibility, especially in wildcard matching. However, it can take a very long time to evaluate all of the possible statements if a great number of full path regular expressions or wildcard expressions are configured, possibly impacting performance. These statements were introduced before Junos OS Release 7.4.
- **Allow/deny-configuration-regexps** statements perform faster matching, with less flexibility. You configure a set of strings in which each string is a regular expression, with spaces between the terms of the string. This provides very fast matching. However, it is more tedious to use wildcard expressions in this form of the statement, because you must set up wildcards for each token (term) of the space-delimited string you want to match. These statements were introduced in Junos OS Release 11.2.

#### Configuring Access Privilege Levels

---

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
permissions [ permissions ];
```

#### Specifying Access Privileges for Junos OS Operational Mode Commands

---

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)"**. Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

### Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

The **allow/deny-configuration** and **allow/deny-configuration-regexps** statements let you explicitly allow or deny users access privileges to portions of the configuration hierarchy. Each of these statements is added to named login classes and configured with one or more regular expressions to be allowed or denied. Each login class is assigned to specific users or user IDs.

The search and match methods differ in the two forms of these statements. You must select which form to use within a login class—you cannot configure **allow-configuration** and **allow-configuration-regexps** together in the same login class. You must select just one. If you have existing configurations using the **allow/deny-configuration** form of the statements, using the same configuration options with the **allow/deny-configuration-regexps** form of the statements might not produce the same results.

- **Allow/deny-configuration** statements perform slower matching, with more flexibility, especially in wildcard matching. However, it can take a very long time to evaluate all of the possible statements if a great number of full path regular expressions or wildcard expressions are configured, possibly impacting performance. These statements were introduced before Junos OS Release 7.4.
- **Allow/deny-configuration-regexps** statements perform faster matching, with less flexibility. You configure a set of strings in which each string is a regular expression, with spaces between the terms of the string. This provides very fast matching. However, it is more tedious to use wildcard expressions in this form of the statement, because you must set up wildcards for each token (term) of the space-delimited string you want to match. These statements were introduced in Junos OS Release 11.2.

### Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```
[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}
```

### Example: Specifying Access Privileges Using allow/deny-configuration-regexps Statements

This example shows how to set up configuration access privileges using the **allow-configuration-regexps** and **deny-configuration-regexps** statements.

- [Requirements on page 1070](#)
- [Overview on page 1070](#)
- [Configuration on page 1071](#)
- [Examples Using Allow or Deny Configurations with Regular Expressions on page 1071](#)

#### Requirements

This example uses the following hardware and software components:

- One Juniper Networks J Series, M Series, MX Series, or T Series device
- Junos OS Release 11.2 or later
  - There must be at least one user assigned to a login class.
  - There can be more than one login class, each with varying permission configurations, and more than one user on the device.

#### Overview

The **allow-configuration-regexps** and **deny-configuration-regexps** statements let you explicitly allow or deny users assigned to named user classes access privileges to portions of the configuration hierarchy, giving the system administrator precision control over who can change specific configurations in the system.

**NOTE:** The statements `allow-configuration-regexps` and `deny-configuration-regexps` perform similar functions as the statements `allow-configuration` and `deny-configuration`, except you can configure sets of strings in which the strings include spaces when using the first set of statements. You cannot use the two kinds of statements together.

### Configuration

To set up configuration access privileges:

1. To explicitly allow one or more individual configuration mode hierarchies that would otherwise be denied, include the `allow-configuration-regexps` statement at the `[edit system login class class-name]` hierarchy level, configured with the regular expressions to be allowed.

```
[edit system login class class-name]
user@host# set allow-configuration-regexps "regular expression 1" "regular expression
2" "regular expression 3" "regular expression 4" ...
```

2. To explicitly deny one or more individual configuration hierarchies that would otherwise be allowed, include the `deny-configuration-regexps` statement at the `[edit system login class class-name]` hierarchy level, configured with the regular expressions to be denied.

```
[edit system login class class-name]
user@host# set deny-configuration-regexps "regular expression 1" "regular-expression
2" "regular expression 3" "regular expression 4"...
```

3. Assign the login class to one or more users.

```
[edit system login]
user@host# set user username class class-name
```

4. Commit your changes.

Users assigned this login class have the permissions you have set for the class.

### Examples Using Allow or Deny Configurations with Regular Expressions

**Purpose** This section provides examples of access privilege configurations to give you ideas for creating configurations appropriate for your system. You can use combinations of privilege statements for configuration access and for operational mode commands to give precise control over classes of access privileges.

**Allow Configuration Changes** The following example login class lets the user make changes at the `[edit system services]` hierarchy level and issue configuration mode commands (such as `commit`), in addition to the permissions specified by the `configure` permissions flag, which allows the user to enter configuration mode using the `configure` command.

```
[edit system login class class-name]
user@host# set permissions configure view view-configuration
user@host# set allow-configuration-regexps "system services"
```

**Deny Configuration Changes**

The following example login class lets the user perform all operations allowed by the **all** permissions flag. However, it denies modifying the configuration at the **[edit system services]** hierarchy level.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set deny-configuration-regexps "system services"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@host# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@host# set deny-configuration "system login class m ."
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit the configuration or issue commands (such as **commit**) at the **[edit system login class]** or the **[edit system services]** hierarchy levels:

```
[edit system login class class-name]
user@host# set deny-configuration "system login class" "system services"
```

**Allow and Deny Configuration Changes**

The following example login class lets the user perform all operations allowed by the **all** permissions flag, and explicitly grants configuration access to **[system "interfaces .\* unit .\* family inet address .\*" protocols]**. However, the user is denied configuration access to the SNMP hierarchy level.

**NOTE:** You can use the \* wildcard character when denoting regular expressions. However, it must be used as a portion of a regular expression. You cannot use [ \* ] or [ .\* ] alone.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set allow-configuration-regexps system "interfaces .* unit .* family inet
address .*" protocols
user@host# set deny-configuration-regexps snmp
```

### Allow and Deny Multiple Configuration Changes

The following example login class lets the user perform all operations allowed by the **all** permissions flag, and explicitly grants configuration access to multiple hierarchy levels for interfaces. It denies configuration access to the **[edit system]** and **[edit protocols]** hierarchy levels.

**NOTE:** You can configure as many regular expressions as needed to be allowed or denied. Regular expressions to be denied take precedence over configurations to be allowed.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set allow-configuration-regexps "interfaces .* description .*" "interfaces .*
unit .* description .*" "interfaces .* unit .* family inet address .*" "interfaces .* disable"
user@host# set deny-configuration-regexps "system" "protocols"
```

### Allow Configuration Changes and Deny Operations Commands

You can combine allow and deny configuration statements with allow and deny operational commands statements to fine-tune access privileges. The following example login class uses a combination of the **deny-commands** operational permissions statement and the **allow-configuration-regexps** configuration permissions statement to let the user configure and commit changes to the OSPF and BGP protocols. However, this class of user cannot issue the **show system statistics** or the **show bgp summary** commands.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set deny-commands "(show system statistics)|(show bgp summary)"
user@host# set allow-configuration-regexps "protocols ospf|bgp"
```

The following shows permissions set for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

**Verification** To verify that you have set the access privileges correctly:

1. Configure a login class and commit the changes.
2. Assign the login class to a *username*.
3. Log in as the *username* assigned with the new login class.
4. Attempt to perform the configurations that have been allowed or denied.
  - You should be able to perform configuration changes to hierarchy levels and regular expressions that have been allowed.
  - You should not be able to perform configuration changes to hierarchy levels and regular expressions that have been denied.
  - Denied expressions should take precedence over allowed expressions.
  - Any allowed or denied expressions should take precedence over any permissions granted with the **permissions** statement.

### Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```
[edit]
system {
  # This login class has operator privileges and the additional ability
  # to reboot the router.
  login {
    # This login class has operator privileges and the additional ability to reboot the
    # router or switch.
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
    # This login class has operator privileges but can't use any commands beginning
    # with "set".
    # This login class has operator privileges
    # but cannot use any commands beginning with "set"
    class operator-no-set {
      permissions [ clear network reset trace view ];
      deny-commands "^set";
    }
    # This login class has operator privileges and can install software but not view
    # BGP information, and can issue the show route command, without specifying
    # commands or arguments under it.
    class operator-and-install-but-no-bgp {
      permissions [ clear network reset trace view ];
      allow-commands "(request system software add)|(show route$)";
      deny-commands "show bgp";
    }
  }
}
```

```

    }
  }
}

```

### Example: Specifying Access Privileges Using `allow/deny-configuration-regexps` Statements

This example shows how to set up configuration access privileges using the `allow-configuration-regexps` and `deny-configuration-regexps` statements.

- [Requirements on page 1075](#)
- [Overview on page 1075](#)
- [Configuration on page 1075](#)
- [Examples Using Allow or Deny Configurations with Regular Expressions on page 1076](#)

#### Requirements

This example uses the following hardware and software components:

- One Juniper Networks J Series, M Series, MX Series, or T Series device
- Junos OS Release 11.2 or later
  - There must be at least one user assigned to a login class.
  - There can be more than one login class, each with varying permission configurations, and more than one user on the device.

#### Overview

The `allow-configuration-regexps` and `deny-configuration-regexps` statements let you explicitly allow or deny users assigned to named user classes access privileges to portions of the configuration hierarchy, giving the system administrator precision control over who can change specific configurations in the system.

**NOTE:** The statements `allow-configuration-regexps` and `deny-configuration-regexps` perform similar functions as the statements `allow-configuration` and `deny-configuration`, except you can configure sets of strings in which the strings include spaces when using the first set of statements. You cannot use the two kinds of statements together.

#### Configuration

To set up configuration access privileges:

1. To explicitly allow one or more individual configuration mode hierarchies that would otherwise be denied, include the `allow-configuration-regexps` statement at the `[edit system login class class-name]` hierarchy level, configured with the regular expressions to be allowed.

```
[edit system login class class-name]
user@host# set allow-configuration-regexps "regular expression 1" "regular expression
2" "regular expression 3" "regular expression 4" ...
```

2. To explicitly deny one or more individual configuration hierarchies that would otherwise be allowed, include the **deny-configuration-regexps** statement at the **[edit system login class class-name]** hierarchy level, configured with the regular expressions to be denied.

```
[edit system login class class-name]
user@host# set deny-configuration-regexps "regular expression 1" "regular-expression
2" "regular expression 3" "regular expression 4"...
```

3. Assign the login class to one or more users.

```
[edit system login]
user@host# set user username class class-name
```

4. Commit your changes.

Users assigned this login class have the permissions you have set for the class.

### *Examples Using Allow or Deny Configurations with Regular Expressions*

**Purpose** This section provides examples of access privilege configurations to give you ideas for creating configurations appropriate for your system. You can use combinations of privilege statements for configuration access and for operational mode commands to give precise control over classes of access privileges.

**Allow Configuration Changes** The following example login class lets the user make changes at the **[edit system services]** hierarchy level and issue configuration mode commands (such as **commit**), in addition to the permissions specified by the **configure** permissions flag, which allows the user to enter configuration mode using the **configure** command.

```
[edit system login class class-name]
user@host# set permissions configure view view-configuration
user@host# set allow-configuration-regexps "system services"
```

**Deny Configuration Changes** The following example login class lets the user perform all operations allowed by the **all** permissions flag. However, it denies modifying the configuration at the **[edit system services]** hierarchy level.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set deny-configuration-regexps "system services"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@host# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@host# set deny-configuration "system login class m .*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit the configuration or issue commands (such as **commit**) at the **[edit system login class]** or the **[edit system services]** hierarchy levels:

```
[edit system login class class-name]
user@host# set deny-configuration "system login class" "system services"
```

#### Allow and Deny Configuration Changes

The following example login class lets the user perform all operations allowed by the **all** permissions flag, and explicitly grants configuration access to **[system "interfaces .\* unit .\* family inet address .\*" protocols]**. However, the user is denied configuration access to the SNMP hierarchy level.

**NOTE:** You can use the \* wildcard character when denoting regular expressions. However, it must be used as a portion of a regular expression. You cannot use [ \* ] or [ .\* ] alone.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set allow-configuration-regexps system "interfaces .* unit .* family inet
address .*" protocols
user@host# set deny-configuration-regexps snmp
```

#### Allow and Deny Multiple Configuration Changes

The following example login class lets the user perform all operations allowed by the **all** permissions flag, and explicitly grants configuration access to multiple hierarchy levels for interfaces. It denies configuration access to the **[edit system]** and **[edit protocols]** hierarchy levels.

**NOTE:** You can configure as many regular expressions as needed to be allowed or denied. Regular expressions to be denied take precedence over configurations to be allowed.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set allow-configuration-regexps "interfaces .* description .*" "interfaces .*
unit .* description .*" "interfaces .* unit .* family inet address .*" "interfaces .* disable"
user@host# set deny-configuration-regexps "system" "protocols"
```

#### Allow Configuration Changes and Deny Operations Commands

You can combine allow and deny configuration statements with allow and deny operational commands statements to fine-tune access privileges. The following example login class uses a combination of the **deny-commands** operational permissions statement and the **allow-configuration-regexps** configuration permissions statement to let the user configure and commit changes to the OSPF and BGP protocols. However, this class of user cannot issue the **show system statistics** or the **show bgp summary** commands.

```
[edit system login class class-name]
user@host# set permissions all configure view view-configuration
user@host# set deny-commands "(show system statistics)|(show bgp summary)"
user@host# set allow-configuration-regexps "protocols ospf|bgp"
```

The following shows permissions set for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

**Verification** To verify that you have set the access privileges correctly:

1. Configure a login class and commit the changes.
2. Assign the login class to a *username*.
3. Log in as the *username* assigned with the new login class.
4. Attempt to perform the configurations that have been allowed or denied.
  - You should be able to perform configuration changes to hierarchy levels and regular expressions that have been allowed.
  - You should not be able to perform configuration changes to hierarchy levels and regular expressions that have been denied.
  - Denied expressions should take precedence over allowed expressions.
  - Any allowed or denied expressions should take precedence over any permissions granted with the **permissions** statement.

---

### admin-control

---

Can view user account information and configure it at the **[edit system]** hierarchy level.

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### all-control

---

Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

---

## configure

Can enter configuration mode.

### Commands

```
configure
request snmp
request-snmp-utility-mib-clear
request-snmp-utility-mib-set
```

**Configuration Hierarchy Levels** No associated CLI configuration hierarchy levels and statements.

- Related Documentation**
- [Access Privilege User Permission Flags Overview on page 1064](#)

---

## control

Can perform all control-level operations; can modify any configuration.

### Commands

```
test configuration
```

**Configuration Hierarchy Levels** No associated CLI configuration hierarchy levels and statements.

- Related Documentation**
- [Access Privilege User Permission Flags Overview on page 1064](#)

  - [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1066](#)

### firewall

---

Can view the firewall filter configuration in configuration mode.

**Commands**

```
show firewall
  <get-firewall-information>

show firewall counter
  <get-firewall-counter-information>

show firewall filter
  <get-firewall-filter-information>

show firewall filter version
  <get-filter-version>

show firewall log
  <get-firewall-log-information>

show firewall prefix-action-stats
  <get-firewall-prefix-action-information>

show policer
  <get-policer-information>
```

**Configuration  
Hierarchy Levels**      [\[edit dynamic-profiles firewall\]](#)

  - [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1066](#)
  - [firewall-control on page 1118](#)

### [firewall-control](#)

---

Can view and configure firewall filter information at the [\[edit dynamic-profiles firewall\]](#), [\[edit firewall\]](#), and [\[edit logical-systems firewall\]](#) hierarchy levels.

**Commands**

show firewall  
    <get-firewall-information>

show firewall counter  
    <get-firewall-counter-information>

show firewall filter  
    <get-firewall-filter-information>

show firewall filter version  
    <get-filter-version>

show firewall log  
    <get-firewall-log-information>

show firewall prefix-action-stats  
    <get-firewall-prefix-action-information>

show policer

---

### idp-profiler-operation

---

Can view profiler data.

**Commands** No associated CLI commands.

**CLI Configuration Hierarchy Levels** No associated CLI configuration hierarchy levels and statements.

---

### interface

---

Can view the interface configuration in configuration mode.

**Commands** No associated CLI commands.

**Configuration Hierarchy Levels**

- [edit accounting-options]

## network

Can access the network by using the **ping**, **ssh**, **telnet**, and **traceroute** commands.

### Commands

```
mtrace
mtrace from-source
mtrace monitor
mtrace to-gateway
ping
  <ping>

ping atm
ping clns
ping ethernet

## reset

Can restart software processes by using the **restart** command and can configure whether software processes configured at the **[edit system processes]** hierarchy level are enabled or disabled.

**Commands**

```
request chassis cfeb master switch
request chassis cfeb master switch no-confirm
request chassis routing-engine master acquire
request chassis routing-engine master acquire force
request chassis routing-engine master acquire force no-confirm
request chassis routing-engine master acquire no-confirm
request chassis routing-engine master release
request chassis routing-engine master release no-confirm
request chassis routing-engine master switch
request chassis routing-engine master switch no-confirm
request chassis sfm master switch
request chassis sfm master switch no-confirm
request chassis ssb master switch
request chassis ssb master switch no-confirm
restart
restart kernel-replication
  <restart-kernel-replication>
restart-named-service
restart routing
  <routing-restart>
restart services
restart services border-signaling-gateway
  <restart-border-signaling-gateway-service>
restart services pgcp
  <restart-pgcp-service>
restart web-management
  <restart-web-management>
```

**Configuration Hierarchy Levels** No associated CLI configuration hierarchy levels and statements.

## routing-control

Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the **[edit routing-options]** hierarchy level, routing protocols at the **[edit protocols]** hierarchy level, and routing policy at the **[edit policy-options]** hierarchy level.

**Commands** No associated CLI commands.

<b>Configuration Hierarchy Levels</b>	[edit bridge-domains] [edit bridge-domains domain multicast-snooping-options] [edit bridge-domains domain multicast-snooping-options traceoptions] [edit dynamic-profiles protocols igmp traceoptions] [edit dynamic-profiles protocols mld traceoptions] [edit dynamic-profiles protocols router-advertisement traceoptions] [edit dynamic-profiles routing-instances] [edit dynamic-profiles routing-instances instance bridge-domains] [edit dynamic-profiles routing-instances instance bridge-domains domain multicast-snooping-options] [edit dynamic-profiles routing-instances instance bridge-domains domain multicast-snooping-options traceoptions] [edit dynamic-profiles routing-instances instance multicast-snooping-options] [edit dynamic-profiles routing-instances instance multicast-snooping-options traceoptions] [edit dynamic-profiles routing-instances instance pbb-options] [edit dynamic-profiles routing-instances instance protocols] [edit dynamic-profiles routing-instances instance protocols bgp group neighbor traceoptions] [edit dynamic-profiles routing-instances instance protocols bgp group traceoptions] [edit dynamic-profiles routing-instances instance protocols bgp traceoptions] [edit dynamic-profiles routing-instances instance protocols esis traceoptions] [edit dynamic-profiles routing-instances instance protocols isis traceoptions] [edit dynamic-profiles routing-instances instance protocols l2vpn traceoptions] [edit dynamic-profiles routing-instances instance protocols ldp traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp group peer traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp group traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp peer traceoptions] [edit dynamic-profiles routing-instances instance protocols msdp traceoptions] [edit dynamic-profiles routing-instances instance protocols mvpn traceoptions] [edit dynamic-profiles routing-instances instance protocols ospf traceoptions] [edit dynamic-profiles routing-instances instance protocols pim traceoptions] [edit dynamic-profiles routing-instances instance protocols rip traceoptions] [edit dynamic-profiles routing-instances instance protocols ripng traceoptions] [edit dynamic-profiles routing-instances instance protocols router-discovery traceoptions] [edit dynamic-profiles routing-instances instance protocols vpls traceoptions] [edit dynamic-profiles routing-instances instance routing-options] [edit dynamic-profiles routing-instances instance routing-options multicast traceoptions] [edit dynamic-profiles routing-instances instance routing-options traceoptions] [edit dynamic-profiles routing-instances instance service-groups] [edit dynamic-profiles routing-instances instance switch-options] [edit dynamic-profiles routing-instances instance switch-options multicast traceoptions]

## view

Can view current system-wide, routing table, and protocol-specific values and statistics.

### Commands

```
clear ipv6 router-advertisement
<clear-ipv6-router-advertisement-information>
show
show accounting

show accounting profile
<get-accounting-profile-information>

show accounting records
<get-accounting-record-information>

show amt
show amt statistics
<get-amt-statistics>
show amt summary
<get-amt-summary>
show amt tunnel
<get-amt-tunnel-information>
show amt tunnel gateway-address
<get-amt-tunnel-gateway-address>
show amt tunnel tunnel-interface
<get-amt-tunnel-interface>
show ancp
show ancp cos
<get-ancp-cos-information>

show ancp cos last-update
<get-ancp-cos-last-update-information>

show ancp cos pending-update
<get-ancp-cos-pending-information>

show ancp neighbor
<get-ancp-neighbor-information>

show ancp subscriber
<get-ancp-subscriber-information>

show ancp subscriber identifier
<get-ancp-subscriber-identifier-information>
show ancp subscriber neighbor
show aps
<get-aps-information>

show aps group
<get-aps-group-information>
show aps interface
<get-aps-interface-information>
```

```
show arp
  <get-arp-table-information>

show as-path
  <get-as-path>
show as-path domain
  <get-as-path-domain>
show auto-configuration
show auto-configuration interfaces
show bfd
show bfd session
  <get-bfd-session-information>

show bfd session address
  <get-bfd-session-address>
show bfd session discriminator
  <get-bfd-session-discriminator>
show bfd session prefix
  <get-bfd-session-prefix>
show bgp
show bgp bmp

### Operational Mode Commands

- [show cli authorization](#)

## show cli authorization

**Syntax** show cli authorization

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display the permissions for the current user.

```
user@host> show cli authorization
Current user: 'root' login: 'boojum' class '(root)'
Permissions:
Permissions:
  admin          -- Can view user accounts
  admin-control-- Can modify user accounts
  clear          -- Can clear learned network info
  configure      -- Can enter configuration mode
  control        -- Can modify any config
  edit          -- Can edit full files
  field          -- Can use field debug commands
  floppy         -- Can read and write the floppy
  interface      -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network        -- Can access the network
  reset          -- Can reset/restart interfaces and daemons
  routing        -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell          -- Can start a local shell
  snmp           -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system         -- Can view system configuration
  system-control-- Can modify system configuration
  trace          -- Can view trace file settings

### Monitoring Overview

---

Junos OS supports a suite of J-Web tools and CLI operational mode commands for monitoring the system health and performance of your device. Monitoring tools and commands display the current state of the device. To use the J-Web user interface and CLI operational tools, you must have the appropriate access privileges.

You can use the J-Web Monitor option to monitor a device. J-Web results appear in the browser.

You can also monitor the device with CLI operational mode commands. CLI command output appears on the screen of your console or management device, or you can filter the output to a file. For operational commands that display output, such as the **show**

commands, you can redirect the output into a filter or a file. When you display help about these commands, one of the options listed is `|`, called a *pipe*, which allows you to filter the command output.

For example, if you enter the **show configuration** command, the complete device configuration appears on the screen. To limit the display to only those lines of the configuration that contain **address**, enter the **show configuration** command using a pipe into the **match** filter:

```
user@host> show configuration | match address
address-range low 192.168.3.2 high 192.168.3.254;
address-range low 192.168.71.71 high 192.168.71.254;
address 192.168.71.70/21;
address 192.168.2.1/24;
address 127.0.0.1/32;
```

For a complete list of the filters, type a command, followed by the pipe, followed by a question mark (?):

```
user@host> show configuration | ?
Possible completions:
compare          Compare configuration changes with prior version
count            Count occurrences
display          Show additional kinds of information
except           Show only text that does not match a pattern
find             Search for first occurrence of pattern
hold             Hold text without exiting the prompt
last             Display end of output only
match            Show only text that matches a pattern
no-more          Don't paginate output
request          Make system-level requests
resolve          Resolve IP addresses
save             Save output text to file
trim             Trim specified number of columns from start of line
```

You can specify complex expressions as an option for the **match** and **except** filters.

**NOTE:** To filter the output of configuration mode commands, use the filter commands provided for the operational mode commands. In configuration mode, an additional filter is supported.

### Diagnostic Tools Overview

Juniper Networks devices support a suite of J-Web tools and CLI operational mode commands for evaluating system health and performance. Diagnostic tools and commands test the connectivity and reachability of hosts in the network.

- Use the J-Web Diagnose options to diagnose a device. J-Web results appear in the browser.

- Use CLI operational mode commands to diagnose a device. CLI command output appears on the screen of your console or management device, or you can filter the output to a file.

To use the J-Web user interface and CLI operational tools, you must have the appropriate access privileges.

This section contains the following topics:

- [J-Web Diagnostic Tools on page 1233](#)
- [CLI Diagnostic Commands on page 1233](#)

### *J-Web Diagnostic Tools*

The J-Web diagnostic tools consist of the options that appear when you select **Troubleshoot** and **Maintain** in the task bar. [Table 125 on page 1233](#) describes the functions of the Troubleshoot options.

**Table 125: J-Web Interface Troubleshoot Options**

Option	Function
<b>Troubleshoot Options</b>	
<b>Ping Host</b>	Allows you to ping a remote host. You can configure advanced options for the ping operation.
<b>Ping MPLS</b>	Allows you to ping an MPLS endpoint using various options.
<b>Traceroute</b>	Allows you to trace a route between the device and a remote host. You can configure advanced options for the traceroute operation.
<b>Packet Capture</b>	Allows you to capture and analyze router control traffic.
<b>Maintain Options</b>	
<b>Files</b>	Allows you to manage log, temporary, and core files on the device.
<b>Upgrade</b>	Allows you to upgrade and manage Junos OS packages.
<b>Licenses</b>	Displays a summary of the licenses needed and used for each feature that requires a license. Allows you to add licenses.
<b>Reboot</b>	Allows you to reboot the device at a specified time.

### *CLI Diagnostic Commands*

The CLI commands available in operational mode allow you to perform the same monitoring, troubleshooting, and management tasks you can perform with the J-Web user interface. Instead of invoking the tools through a graphical interface, you use operational mode commands to perform the tasks.

You can perform certain tasks only through the CLI. For example, you can use the **mtrace** command to display trace information about a multicast path from a source to a receiver, which is a feature available only through the CLI.

To view a list of top-level operational mode commands, type a question mark (?) at the command-line prompt.

At the top level of operational mode are the broad groups of CLI diagnostic commands listed in [Table 126 on page 1234](#).

**Table 126: CLI Diagnostic Command Summary**

Command	Function
<b>Controlling the CLI Environment</b>	
<b>set option</b>	Configures the CLI display.
<b>Diagnosis and Troubleshooting</b>	
<b>clear</b>	Clears statistics and protocol database information.
<b>mtrace</b>	Traces information about multicast paths from source to receiver.
<b>monitor</b>	Performs real-time debugging of various Junos OS components, including the routing protocols and interfaces.
<b>ping</b>	Determines the reachability of a remote network host.
<b>ping mpls</b>	Determines the reachability of an MPLS endpoint using various options.
<b>test</b>	Tests the configuration and application of policy filters and AS path regular expressions.
<b>traceroute</b>	Traces the route to a remote network host.
<b>Connecting to Other Network Systems</b>	
<b>ssh</b>	Opens secure shell connections.
<b>telnet</b>	Opens Telnet sessions to other hosts on the network.
<b>Management</b>	
<b>copy</b>	Copies files from one location on the device to another, from the device to a remote system, or from a remote system to the device.
<b>restart option</b>	Restarts the various system processes, including the routing protocol, interface, and SNMP processes.
<b>request</b>	Performs system-level operations, including stopping and rebooting the device and loading Junos OS images.
<b>start</b>	Exits the CLI and starts a UNIX shell.
<b>configuration</b>	Enters configuration mode.
<b>quit</b>	Exits the CLI and returns to the UNIX shell.

## Accounting, Source Class Usage, and Destination Class Usage Options

- [Accounting Options Overview on page 1235](#)
- [Understanding Source Class Usage and Destination Class Usage Options on page 1236](#)

### Accounting Options Overview

An accounting profile represents common characteristics of collected accounting data, including the following:

- Collection interval
- File to contain accounting data
- Specific fields and counter names on which to collect statistics

You can configure multiple accounting profiles, as described in [Table 127 on page 1235](#).

**Table 127: Types of Accounting Profiles**

Type of Profile	Description
Interface profile	Collects the specified error and statistic information.
Filter profile	Collects the byte and packet counts for the counter names specified in the filter profile.
MIB profile	Collects selected MIB statistics and logs them to a specified file.
Routing Engine profile	Collects selected Routing Engine statistics and logs them to a specified file.
Class usage profile	Collects class usage statistics and logs them to a specified file.

## Understanding Source Class Usage and Destination Class Usage Options

You can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into disjoint sets defined as source classes and destination classes. You can define classes based on a variety of parameters, such as routing neighbors, autonomous systems, and route filters.

Source class usage (SCU) counts packets sent to customers by performing lookups on the IP source address and the IP destination address. SCU makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. You must enable SCU accounting on both the inbound and outbound physical interfaces.

Destination class usage (DCU) counts packets from customers by performing lookups of the IP destination address. DCU makes it possible to track traffic originating from the customer edge and destined for specific prefixes on the provider core router.

On T Series Core Routers and M320 Multiservice Edge Routers, the source class and destination classes are not carried across the platform fabric. The implications of this are as follows:

- On T Series and M320 routers, SCU and DCU accounting is performed before the packet enters the fabric.
- On T Series and M320 routers, DCU is performed before output filters are evaluated. On M Series platforms, DCU is performed after output filters are evaluated.
- If an output filter drops traffic on M Series devices, the dropped packets are excluded from DCU statistics. If an output filter drops traffic on T Series and M320 routers, the dropped packets are included in DCU statistics.

On Enhanced Scaling FPCs (T640-FPC1-ES, T640-FPC2-ES, T640-FPC3-ES, T640-FPC4-1P-ES, and T1600-FPC4-ES), the source class accounting is performed at ingress. On a T4000 Type 5 FPC, the source class accounting is performed at egress. The implications of this are as follows:

- SCU accounting is *not* performed when packets traverse from T4000 Type 5 FPC (ingress FPC) to Enhanced Scaling FPCs (egress FPC).
- SCU accounting is performed when packets traverse from Enhanced Scaling FPCs (ingress FPC) to T4000 Type 5 FPC (egress FPC).

Class-based filter match conditions are not supported on J Series Services Routers.

## Alarms

- [Alarm Overview on page 1237](#)

### Alarm Overview

Alarms alert you to conditions on a network interface, on the device chassis, or in the system software that might prevent the device from operating normally. You can set the conditions that trigger alarms on an interface. Chassis and system alarm conditions are preset.

An active alarm lights the **ALARM** LED on the front panel of the device. You can monitor active alarms from the J-Web user interface or the CLI. When an alarm condition triggers an alarm, the device lights the yellow (amber) **ALARM** LED on the front panel. When the condition is corrected, the light turns off.

**NOTE:** The **ALARM** LED on J Series devices light yellow whether the alarm condition is major (red) or minor (yellow).

This section contains the following topics:

- [Alarm Types on page 1237](#)
- [Alarm Severity on page 1237](#)
- [Alarm Conditions on page 1238](#)

### Alarm Types

The device supports three types of alarms:

- Interface alarms indicate a problem in the state of the physical links on fixed or installed Physical Interface Modules (PIMs). To enable interface alarms, you must configure them.
- Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.
- System alarms indicate a missing rescue configuration or software license, where valid. System alarms are preset and cannot be modified, although you can configure them to appear automatically in the J-Web user interface or CLI.

### Alarm Severity

Alarms have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action.
  - One or more hardware components have failed.
  - One or more hardware components have exceeded temperature thresholds.
  - An alarm condition configured on an interface has triggered a critical warning.

- **Minor (yellow)**—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

A missing rescue configuration or software license generates a yellow system alarm.

### Alarm Conditions

To enable alarms on a device interface, you must select an alarm condition and an alarm severity. In contrast, alarm conditions and severity are preconfigured for chassis alarms and system alarms.

**NOTE:** For information about chassis alarms for your device, see the *Hardware Guide* for your device.

This section contains the following topics:

- [Interface Alarm Conditions on page 1238](#)
- [System Alarm Conditions on page 1241](#)

### Interface Alarm Conditions

[Table 128 on page 1238](#) lists the interface conditions, sorted by interface type, that you can configure for an alarm. You can configure each alarm condition to trigger either a major (red) alarm or minor a (yellow) alarm. The corresponding configuration option is included.

For the services stateful firewall filters (NAT, IDP, and IPsec), which operate on an internal adaptive services module within a device, you can configure alarm conditions on the integrated services and services interfaces.

**Table 128: Interface Alarm Conditions**

Interface	Alarm Condition	Description	Configuration Option
DS1 (T1)	Alarm indication signal (AIS)	The normal T1 traffic signal contained a defect condition and has been replaced by the AIS. A transmission interruption occurred at the remote endpoint or upstream of the remote endpoint. This all-ones signal is transmitted to prevent consequential downstream failures or alarms.	<b>ais</b>
	Yellow alarm	The remote endpoint is in yellow alarm failure. This condition is also known as a far-end alarm failure.	<b>ylw</b>
Ethernet	Link is down	The physical link is unavailable.	<b>link-down</b>
Integrated services	Hardware or software failure	On the adaptive services module, either the hardware associated with the module or the software that drives the module has failed.	<b>failure</b>

Table 128: Interface Alarm Conditions (*continued*)

Interface	Alarm Condition	Description	Configuration Option
Serial	Clear-to-send (CTS) signal absent	The remote endpoint of the serial link is not transmitting a CTS signal. The CTS signal must be present before data can be transmitted across a serial link.	<b>cts-absent</b>
	Data carrier detect (DCD) signal absent	The remote endpoint of the serial link is not transmitting a DCD signal. Because the DCD signal transmits the state of the device, no signal probably indicates that the remote endpoint of the serial link is unavailable.	<b>dcd-absent</b>
	Data set ready (DSR) signal absent	The remote endpoint of the serial link is not transmitting a DSR signal. The DSR signal indicates that the remote endpoint is ready to receive and transmit data across the serial link.	<b>dsr-absent</b>
	Loss of receive clock	The clock signal from the remote endpoint is not present. Serial connections require clock signals to be transmitted from one endpoint and received by the other endpoint of the link.	<b>loss-of-rx-clock</b>
	Loss of transmit clock	The local clock signal is not present. Serial connections require clock signals to be transmitted from one endpoint and received by the other endpoint of the link.	<b>loss-of-tx-clock</b>
Services	Services module hardware down	A hardware problem has occurred on the device's services module. This error typically means that one or more of the CPUs on the module has failed.	<b>hw-down</b>
	Services link down	The link between the device and its services module is unavailable.	<b>linkdown</b>
	Services module held in reset	The device's services module is stuck in reset mode. If the services module fails to start up five or more times in a row, the services module is held in reset mode. Startup fails when the amount of time from CPU release to CPU halt is less than 300 seconds.	<b>pic-hold-reset</b>
	Services module reset	The device's services module is resetting. The module resets after it crashes or is reset from the CLI, or when it takes longer than 60 seconds to start up.	<b>pic-reset</b>
	Services module software down	A software problem has occurred on the device's services module.	<b>sw-down</b>

Table 128: Interface Alarm Conditions (*continued*)

Interface	Alarm Condition	Description	Configuration Option
E3	Alarm indication signal (AIS)	The normal E3 traffic signal contained a defect condition and has been replaced by the AIS. A transmission interruption occurred at the remote endpoint or upstream of the remote endpoint. This all-ones signal is transmitted to prevent consequential downstream failures or alarms.	<b>ais</b>
	Loss of signal (LOS)	No remote E3 signal is being received at the E3 interface.	<b>los</b>
	Out of frame (OOF)	An OOF condition has existed for 10 seconds. This alarm applies only to E3 interfaces configured in frame mode. The OOF failure is cleared when no OOF or LOS defects have occurred for 20 seconds.	<b>oof</b>
	Remote defect indication	An AIS, LOS, or OOF condition exists. This alarm applies only to E3 interfaces configured in frame mode.	<b>rdi</b>

Table 128: Interface Alarm Conditions (*continued*)

Interface	Alarm Condition	Description	Configuration Option
T3 (DS3)	Alarm indication signal	The normal T3 traffic signal contained a defect condition and has been replaced by the AIS. A transmission interruption occurred at the remote endpoint or upstream of the remote endpoint. This all-ones signal is transmitted to prevent consequential downstream failures or alarms.	<b>ais</b>
	Excessive number of zeros	The bit stream received from the upstream host has more consecutive zeros than are allowed in a T3 frame.	<b>exz</b>
	Far-end receive failure (FERF)	The remote endpoint of the connection has failed. A FERF differs from a yellow alarm, because the failure can be any failure, not just an OOF or LOS failure.	<b>ferf</b>
	Idle alarm	The Idle signal is being received from the remote endpoint.	<b>idle</b>
	Line code violation	Either the line encoding along the T3 link is corrupted or a mismatch between the encoding at the local and remote endpoints of a T3 connection occurred.	<b>lcv</b>
	Loss of frame (LOF)	An OOF or loss-of-signal LOS condition has existed for 10 seconds. The LOF failure is cleared when no OOF or LOS defects have occurred for 20 seconds. A LOF failure is also called a red failure.	<b>lof</b>
	Loss of signal (LOS)	No remote T3 signal is being received at the T3 interface.	<b>los</b>
	Phase-locked loop out of lock	The clocking signals for the local and remote endpoints no longer operate in lock-step.	<b>pll</b>
	Yellow alarm	The remote endpoint is in yellow alarm failure. This condition is also known as a far-end alarm failure.	<b>ylw</b>

**System Alarm Conditions**

[Table 129 on page 1241](#) lists the two preset system alarms, the condition that triggers each alarm, and the action you take to correct the condition.

Table 129: System Alarm Conditions and Corrective Actions

Alarm Type	Alarm Condition	Corrective Action
Configuration	The rescue configuration is not set.	Set the rescue configuration.

Table 129: System Alarm Conditions and Corrective Actions (*continued*)

Alarm Type	Alarm Condition	Corrective Action
License	<p>You have configured at least one software feature that requires a feature license, but no valid license for the feature is currently installed.</p> <p><b>NOTE:</b> This alarm indicates that you are in violation of the software license agreement. You must install a valid license key to be in compliance with all agreements.</p>	Install a valid license key.

## Data Path Debugging and Trace Options

- [Understanding Data Path Debugging for SRX Series Devices on page 1242](#)
- [Understanding Security Debugging Using Trace Options on page 1243](#)
- [Understanding Flow Debugging Using Trace Options on page 1243](#)

### Understanding Data Path Debugging for SRX Series Devices

With the data path debugging feature, you can trace and debug (capture packets) at different data points along the processing path. The events available in the packet-processing path are: NP ingress, load-balancing thread (LBT), jexec, packet-ordering thread (POT), and NP egress. You can also enable flow module trace if the security flow trace flag for a certain module is set.

At each event, you can specify any of the four actions (count, packet dump, packet summary, and trace). Data path debugging provides filters to define what packets to capture, and only the matched packets are traced. The packet filter can filter out packets based on logical interface, protocol, source IP address prefix, source port, destination IP address prefix, and destination port.

To enable end-to-end debugging, you must perform the following steps:

1. Define the capture file and specify the maximum capture size.
2. Define the packet filter to trace only a certain type of traffic based on the requirement.
3. Define the action profile specifying the location on the processing path from where to capture the packets (for example, LBT or NP ingress).
4. Enable the data path debugging.
5. Capture traffic.

6. Disable data path debugging.
7. View or analyze the report.

**NOTE:**

The packet-filtering behavior for the port and interface options is as follows:

- The packet filter traces both IPv4 and IPv6 traffic if only **port** is specified.
- The packet filter traces IPv4, IPV6, and non-IP traffic if only **interface** is specified.

**Related Documentation**

- [Understanding Security Debugging Using Trace Options on page 1243](#)
- [Understanding Flow Debugging Using Trace Options on page 1243](#)
- [Debugging the Data Path \(CLI Procedure\) on page 1279](#)

### Understanding Security Debugging Using Trace Options

---

The Junos OS trace function allows applications to write security debugging information to a file. The information that appears in this file is based on criteria you set. You can use this information to analyze security application issues.

The trace function operates in a distributed manner, with each thread writing to its own trace buffer. These trace buffers are then collected at one point, sorted, and written to trace files. Trace messages are delivered using the InterProcess Communications (IPC) protocol. A trace message has a lower priority than that of control protocol packets such as BGP, OSPF, and IKE, and therefore delivery is not considered to be as reliable.

**Related Documentation**

- [Understanding Data Path Debugging for SRX Series Devices on page 1242](#)
- [Understanding Flow Debugging Using Trace Options on page 1243](#)
- [Setting Security Trace Options \(CLI Procedure\) on page 1279](#)
- [Debugging the Data Path \(CLI Procedure\) on page 1279](#)
- [Displaying Output for Security Trace Options on page 1481](#)

### Understanding Flow Debugging Using Trace Options

---

For flow trace options, you can define a packet filter using combinations of **destination-port**, **destination-prefix**, **interface**, **protocol**, **source-port**, and **source-prefix**. If the security flow trace flag for a certain module is set, the packet matching the specific packet filter triggers flow tracing and writes debugging information to the trace file.

- [Debugging the Data Path \(CLI Procedure\) on page 1279](#)

## MPLS

- [MPLS Connection Checking Overview on page 1244](#)

### MPLS Connection Checking Overview

Use either the J-Web ping MPLS diagnostic tool or the CLI commands **ping mpls**, **ping mpls l2circuit**, **ping mpls l2vpn**, and **ping mpls l3vpn** to diagnose the state of label-switched paths (LSPs), Layer 2 and Layer 3 virtual private networks (VPNs), and Layer 2 circuits.

When you use the ping MPLS feature from a J Series device operating as the inbound (ingress) node at the entry point of an LSP or VPN, the router sends probe packets into the LSP or VPN. Based on how the LSP or VPN outbound (egress) node at the remote endpoint of the connection replies to the probes, you can determine the connectivity of the LSP or VPN.

Each probe is an echo request sent to the LSP or VPN exit point as an MPLS packet with a UDP payload. If the outbound node receives the echo request, it checks the contents of the probe and returns a value in the UDP payload of the response packet. If the J Series device receives the response packet, it reports a successful ping response.

Responses that take longer than 2 seconds are identified as failed probes.

[Table 87 on page 655](#) summarizes the options for using either the J-Web ping MPLS diagnostic tool or the CLI **ping mpls** command to display information about MPLS connections in VPNs and LSPs.

**Table 130: Options for Checking MPLS Connections**

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
<b>Ping RSVP-signaled LSP</b>	<b>ping mpls rsvp</b>	Checks the operability of an LSP that has been set up by the Resource Reservation Protocol (RSVP). The J Series device pings a particular LSP using the configured LSP name.	When an RSVP-signaled LSP has several paths, the J Series device sends the ping requests on the path that is currently active.
<b>Ping LDP-signaled LSP</b>	<b>ping mpls ldp</b>	Checks the operability of an LSP that has been set up by the Label Distribution Protocol (LDP). The J Series device pings a particular LSP using the forwarding equivalence class (FEC) prefix and length.	When an LDP-signaled LSP has several gateways, the J Series device sends the ping requests through the first gateway.  Ping requests sent to LDP-signaled LSPs use only the master routing instance.

Table 130: Options for Checking MPLS Connections (*continued*)

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
Ping LSP to Layer 3 VPN prefix	ping mpls l3vpn	Checks the operability of the connections related to a Layer 3 VPN. The J Series device tests whether a prefix is present in a provider edge (PE) device's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix.	The J Series device does not test the connection between a PE device and a customer edge (CE) router.
Locate LSP using interface name	ping mpls l2vpn interface	Checks the operability of the connections related to a Layer 2 VPN. The J Series device directs outgoing request probes out the specified interface.	—
Instance to which this connection belongs	ping mpls l2vpn instance	Checks the operability of the connections related to a Layer 2 VPN. The J series device pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, to test the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound and outbound PE routers.	—
Locate LSP from interface name	ping mpls l2circuit interface	Checks the operability of the Layer 2 circuit connections. The J Series device directs outgoing request probes out the specified interface.	—
Locate LSP from virtual circuit information	ping mpls l2circuit virtual-circuit	Checks the operability of the Layer 2 circuit connections. The J Series device pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE router, testing the integrity of the Layer 2 circuit between the inbound and outbound PE routers.	—
Ping end point of LSP	ping mpls lsp-end-point	Checks the operability of an LSP endpoint. The J Series device pings an LSP endpoint using either an LDP FEC prefix or an RSVP LSP endpoint address.	—

## Packet Capture

- [Packet Capture Overview on page 1246](#)

### Packet Capture Overview

---

Packet capture is a tool that helps you to analyze network traffic and troubleshoot network problems. The packet capture tool captures real-time data packets traveling over the network for monitoring and logging.

**NOTE:** Packet capture is supported on physical interfaces, reth interfaces, and tunnel interfaces, such as gr, ip, st0, and lsq-/ls.

Packets are captured as binary data, without modification. You can read the packet information offline with a packet analyzer such as Ethereal or tcpdump. If you need to quickly capture packets destined for, or originating from, the Routing Engine and analyze them online, you can use the J-Web packet capture diagnostic tool.

**NOTE:** The packet capture tool does not support IPv6 packet capture.

You can use either the J-Web configuration editor or CLI configuration editor to configure packet capture.

Network administrators and security engineers use packet capture to perform the following tasks:

- Monitor network traffic and analyze traffic patterns.
- Identify and troubleshoot network problems.
- Detect security breaches in the network, such as unauthorized intrusions, spyware activity, or ping scans.

Packet capture operates like traffic sampling on the device, except that it captures entire packets including the Layer 2 header and saves the contents to a file in libpcap format. Packet capture also captures IP fragments. You cannot enable packet capture and traffic sampling on the device at the same time. Unlike traffic sampling, there are no tracing operations for packet capture.

**NOTE:** You can enable packet capture and port mirroring simultaneously on a device.

This section contains the following topics:

- [Packet Capture on Device Interfaces on page 1247](#)
- [Firewall Filters for Packet Capture on page 1247](#)

- [Packet Capture Files on page 1247](#)
- [Analysis of Packet Capture Files on page 1248](#)

### ***Packet Capture on Device Interfaces***

Packet capture is supported on the T1, T3, E1, E3, serial, Fast Ethernet, ADSL, G.SHDSL, PPPoE, and ISDN interfaces.

To capture packets on an ISDN interface, configure packet capture on the dialer interface. To capture packets on a PPPoE interface, configure packet capture on the PPPoE logical interface.

Packet capture supports PPP, Cisco HDLC, Frame Relay, and other ATM encapsulations. Packet capture also supports Multilink PPP (MLPPP), Multilink Frame Relay end-to-end (MLFR), and Multilink Frame Relay UNI/NNI (MFR) encapsulations.

You can capture all IPv4 packets flowing on an interface in the inbound or outbound direction. However, on traffic that bypasses the flow software module (protocol packets such as ARP, OSPF, and PIM), packets generated by the Routing Engine are not captured unless you have configured and applied a firewall filter on the interface in the outbound direction.

Tunnel interfaces can support packet capture in the outbound direction only.

Use the J-Web configuration editor or CLI configuration editor to specify the maximum packet size, the filename to be used for storing the captured packets, the maximum file size, the maximum number of packet capture files, and the file permissions.

**NOTE:** For packets captured on T1, T3, E1, E3, serial, and ISDN interfaces in the outbound (egress) direction, the size of the packet captured might be 1 byte less than the maximum packet size configured because of the packet loss priority (PLP) bit.

To modify encapsulation on an interface that has packet capture configured, you must first disable packet capture.

### ***Firewall Filters for Packet Capture***

When you enable packet capture on a device, all packets flowing in the direction specified in packet capture configuration (inbound, outbound, or both) are captured and stored. Configuring an interface to capture all packets might degrade the performance of the device. You can control the number of packets captured on an interface with firewall filters and specify various criteria to capture packets for specific traffic flows.

You must also configure and apply appropriate firewall filters on the interface if you need to capture packets generated by the host device, because interface sampling does not capture packets originating from the host device.

### ***Packet Capture Files***

When packet capture is enabled on an interface, the entire packet including the Layer 2 header is captured and stored in a file. You can specify the maximum size of the packet

to be captured, up to 1500 bytes. Packet capture creates one file for each physical interface. You can specify the target filename, the maximum size of the file, and the maximum number of files.

File creation and storage take place in the following way. Suppose you name the packet capture file **pcap-file**. Packet capture creates multiple files (one per physical interface), suffixing each file with the name of the physical interface; for example, **pcap-file.fe-0.0.1** for the Fast Ethernet interface **fe-0.0.1**. When the file named **pcap-file.fe-0.0.1** reaches the maximum size, the file is renamed **pcap-file.fe-0.0.1.0**. When the file named **pcap-file.fe-0.0.1** reaches the maximum size again, the file named **pcap-file.fe-0.0.1.0** is renamed **pcap-file.fe-0.0.1.1** and **pcap-file.fe-0.0.1** is renamed **pcap-file.fe-0.0.1.0**. This process continues until the maximum number of files is exceeded and the oldest file is overwritten. The **pcap-file.fe-0.0.1** file is always the latest file.

Packet capture files are not removed even after you disable packet capture on an interface.

#### ***Analysis of Packet Capture Files***

Packet capture files are stored in libpcap format in the **/var/tmp** directory. You can specify user or administrator privileges for the files.

Packet capture files can be opened and analyzed offline with tcpdump or any packet analyzer that recognizes the libpcap format. You can also use FTP or the Session Control Protocol (SCP) to transfer the packet capture files to an external device.

**NOTE:** Disable packet capture before opening the file for analysis or transferring the file to an external device with FTP or SCP. Disabling packet capture ensures that the internal file buffer is flushed and all the captured packets are written to the file.

## **RPM**

- [RPM Overview on page 1248](#)
- [RPM Support for VPN Routing and Forwarding on page 1252](#)

#### **RPM Overview**

---

The real-time performance monitoring (RPM) feature allows network operators and their customers to accurately measure the performance between two network endpoints. With the RPM tool, you configure and send probes to a specified target and monitor the analyzed results to determine packet loss, round-trip time, and jitter.

RPM allows you to perform service-level monitoring. When RPM is configured on a device, the device calculates network performance based on packet response time, jitter, and packet loss. These values are gathered by Hypertext Transfer Protocol (HTTP) GET requests, Internet Control Message Protocol (ICMP) requests, and TCP and UDP requests, depending on the configuration.

This section contains the following topics:

- [RPM Probes on page 1249](#)
- [RPM Tests on page 1249](#)
- [Probe and Test Intervals on page 1250](#)
- [Jitter Measurement with Hardware Timestamping on page 1250](#)
- [RPM Statistics on page 1250](#)
- [RPM Thresholds and Traps on page 1252](#)
- [RPM for BGP Monitoring on page 1252](#)

### ***RPM Probes***

You gather RPM statistics by sending out probes to a specified probe target, identified by an IP address or URL. When the target receives the probe, it generates responses, which are received by the device. By analyzing the transit times to and from the remote server, the device can determine network performance statistics.

The device sends out the following probe types:

- HTTP GET request at a target URL
- HTTP GET request for metadata at a target URL
- ICMP echo request to a target address (the default)
- ICMP timestamp request to a target address
- UDP ping packets to a target device
- UDP timestamp requests to a target address
- TCP ping packets to a target device

UDP and TCP probe types require that the remote server be configured as an RPM receiver so that it generates responses to the probes.

The RPM probe results are also available in the form of MIB objects through the SNMP protocol.

### ***RPM Tests***

Each probed target is monitored over the course of a test. A test represents a collection of probes, sent out at regular intervals, as defined in the configuration. Statistics are then returned for each test. Because a test is a collection of probes that have been monitored over some amount of time, test statistics such as standard deviation and jitter can be calculated and included with the average probe statistics.

### ***Probe and Test Intervals***

Within a test, RPM probes are sent at regular intervals, configured in seconds. When the total number of probes has been sent and the corresponding responses received, the test is complete. You can manually set the probe interval for each test to control how the RPM test is conducted.

After all the probes for a particular test have been sent, the test begins again. The time between tests is the test interval. You can manually set the test interval to tune RPM performance.

### ***Jitter Measurement with Hardware Timestamping***

Jitter is the difference in relative transit time between two consecutive probes.

You can timestamp the following RPM probes to improve the measurement of latency or jitter:

- ICMP ping
- ICMP ping timestamp
- UDP ping
- UDP ping timestamp

**NOTE:** The device supports hardware timestamping of UDP ping and UDP ping timestamp RPM probes only if the destination port is UDP-ECHO (port 7).

Timestamping takes place during the forwarding process of the device originating the probe (the RPM client), but not on the remote device that is the target of the probe (the RPM server).

The supported encapsulations on a device for timestamping are Ethernet including VLAN, synchronous PPP, and Frame Relay. The only logical interface supported is an **lt** services interface.

RPM probe generation with hardware timestamp can be retrieved through the SNMP protocol.

### ***RPM Statistics***

At the end of each test, the device collects the statistics for packet round-trip time, packet inbound and outbound times (for ICMP timestamp probes only), and probe loss as shown in [Table 131 on page 1250](#).

**Table 131: RPM Statistics**

RPM Statistics	Description
Round-Trip Times	

Table 131: RPM Statistics (*continued*)

RPM Statistics	Description
Minimum round-trip time	Shortest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test
Maximum round-trip time	Longest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test
Average round-trip time	Average round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test
Standard deviation round-trip time	Standard deviation of the round-trip times from the Juniper Networks device to the remote server, as measured over the course of the test
Jitter	Difference between the maximum and minimum round-trip times, as measured over the course of the test
<b>Inbound and Outbound Times (ICMP Timestamp Probes Only)</b>	
Minimum egress time	Shortest one-way time from the Juniper Networks device to the remote server, as measured over the course of the test
Maximum ingress time	Shortest one-way time from the remote server to the Juniper Networks device, as measured over the course of the test
Average egress time	Average one-way time from the Juniper Networks device to the remote server, as measured over the course of the test
Average ingress time	Average one-way time from the remote server to the Juniper Networks device, as measured over the course of the test
Standard deviation egress time	Standard deviation of the one-way times from the Juniper Networks device to the remote server, as measured over the course of the test
Standard deviation ingress time	Standard deviation of the one-way times from the remote server to the Juniper Networks device, as measured over the course of the test
Egress jitter	Difference between the maximum and minimum outbound times, as measured over the course of the test
Ingress jitter	Difference between the maximum and minimum inbound times, as measured over the course of the test
<b>Probe Counts</b>	
Probes sent	Total number of probes sent over the course of the test
Probe responses received	Total number of probe responses received over the course of the test
Loss percentage	Percentage of probes sent for which a response was not received

### ***RPM Thresholds and Traps***

You can configure RPM threshold values for the round-trip times, ingress (inbound) times, and egress (outbound) times that are measured for each probe, as well as for the standard deviation and jitter values that are measured for each test. Additionally, you can configure threshold values for the number of successive lost probes within a test and the total number of lost probes within a test.

If the result of a probe or test exceeds any threshold, the device generates a system log message and sends any Simple Network Management Protocol (SNMP) notifications (traps) that you have configured.

### ***RPM for BGP Monitoring***

When managing peering networks that are connected using Border Gateway Protocol (BGP), you might need to find out if a path exists between the Juniper Networks device and its configured BGP neighbors. You can ping each BGP neighbor manually to determine the connection status, but this method is not practical when the device has a large number of BGP neighbors configured.

In the device, you can configure RPM probes to monitor the BGP neighbors and determine if they are active.

---

### ***RPM Support for VPN Routing and Forwarding***

Real-time performance monitoring (RPM) is supported on all Juniper Network devices.

VRF in a Layer 3 VPN implementation allows multiple instances of a routing table to coexist within the same device at the same time. Because the routing instances are independent, the same or overlapping IP addresses can be used without conflicting each other.

RPM ICMP and UDP probe with VPN routing and forwarding (VRF) has been improved. In previous releases, the RPM probes specified to a VRF table were not handled by the real-time forwarding process (FWDD-RT). In Junos OS Release 10.0, RPM probes specified to a VRF table are handled by the FWDD-RT, thereby providing more accurate results.

This feature supports RPM ICMP and UDP probes configured with routing instances of type VRF.

#### Configuration Statements at the [edit accounting-options] Hierarchy Level

---

This topic shows all possible configuration statements at the **[edit accounting-options]** hierarchy level and their level in the configuration hierarchy. When you are configuring Junos OS, your current hierarchy level is shown in the banner on the line preceding the **user@host#** prompt.

```
[edit]
accounting-options {
  class-usage-profile profile-name {
    file filename;
    interval minutes;
    destination-classes {
      destination-class-name;
    }
    source-classes {
      source-class-name;
    }
  }
  file filename {
    archive-sites {
```

```
    }
    files number;
    nonpersistent;
    size bytes;
    start-time time;
    transfer-interval minutes;
  }
  filter-profile profile-name {
    counters {
      counter-name;
    }
    file filename;
    interval minutes;
  }
}
interface-profile profile-name {
  fields {
    field-name;
  }
  file filename;
  interval minutes;
}

## Accounting Options Configuration

This topic contains the following sections:

- [Accounting Options—Full Configuration on page 1254](#)
- [Minimum Accounting Options Configuration on page 1256](#)

### **Accounting Options—Full Configuration**

To configure accounting options, include the following statements at the **[edit accounting-options]** hierarchy level:

```
accounting-options {
  class-usage-profile profile-name {
```

```

file filename;
interval minutes;
destination-classes {
    destination-class-name;
}
source-classes {
    source-class-name;
}
file filename {
    archive-sites {
        site-name;
    }
    files number;
    nonpersistent;
    size bytes;
    source-classes time
    transfer-interval minutes;
}
filter-profile profile-name {
    counters {
        counter-name;
    }
    file filename;
    interval minutes;
}
}
interface-profile profile-name {
    fields {
        field-name;
    }
    file filename;
    interval minutes;
}
mib-profile profile-name {
    file filename;
    interval seconds;
    object-names {
        mib-object-name;
    }
    operation operation-name;
}
routing-engine-profile profile-name {
    fields {
        field-name;
    }
    file filename;
    interval minutes;
}
}
}

```

By default, accounting options are disabled.

### Minimum Accounting Options Configuration

To enable accounting options on the router, you must perform at least the following tasks:

- Configure accounting options by including a **file** statement and one or more **source-class-usage**, **destination-class-profile**, **filter-profile**, **interface-profile**, **mib-profile**, or **routing-engine-profile** statements at the **[edit accounting-options]** hierarchy level:

```
[edit]
accounting-options {
  class-usage-profile profile-name {
    file filename;
    interval minutes;
    source-classes {
      source-class-name;
      destination-classes {
        destination-class-name;
      }
    }
  }
  file filename {
    archive-sites {
      site-name;
    }
    files number;
    size bytes;
    transfer-interval minutes;
  }
  filter-profile profile-name {
    counters {
      counter-name;
    }
    file filename;
    interval minutes;
  }
  interface-profile profile-name {
    fields {
      field-name;
    }
    file filename;
    interval minutes;
  }
  mib-profile profile-name {
    file filename;
    interval minutes;
    object-names {
      mib-object-name;
    }
    operation operation-name;
  }
  routing-engine-profile profile-name {
    fields {
      field-name;
    }
    file filename;
  }
}
```

```

        interval minutes;
    }
}

```

- Apply the profiles to the chosen interfaces or filters.

Apply an interface profile to a physical or logical interface by including the **accounting-profile** statement at either the **[edit interfaces *interface-name*]** or the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

```

[edit interfaces]
interface-name {
    accounting-profile profile-name;
    unit logical-unit-number {
        accounting-profile profile-name;
    }
}

```

**NOTE:** You do not apply destination class profiles to interfaces. Although the interface needs to have the **destination-class-usage** statement configured, the destination class profile automatically finds all interfaces with the destination class configured.

Apply a filter profile to a firewall filter by including the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** hierarchy level:

```

[edit firewall]
filter filter-name {
    accounting-profile profile-name;
}

```

You do not need to apply the Routing Engine profile to an interface because the statistics are collected on the Routing Engine itself.

#### Related Documentation

- [Accounting Options Overview on page 1235](#)
- [Understanding Device Management Functions in Junos OS](#)
- [Configuring Accounting-Data Log Files on page 1257](#)
- [Configuring the Interface Profile on page 1260](#)
- [Configuring the Filter Profile on page 1263](#)
- [Configuration Statements at the \[edit accounting-options\] Hierarchy Level on page 1253](#)

### Configuring Accounting-Data Log Files

An accounting profile specifies what statistics should be collected and written to a log file. To configure an accounting-data log file, include the **file** statement at the **[edit accounting-options]** hierarchy level:

```

[edit accounting-options]
file filename {

```

```

archive-sites {
    site-name;
}
files number;
nonpersistent;
size bytes;
start-time time;
transfer-interval minutes;
}

```

**filename** is the name of the file in which to write accounting data.

If the filename contains spaces, enclose it in quotation marks (" "). The filename cannot contain a forward slash (/). The file is created in the **/var/log** directory and can contain data from multiple profiles.

All accounting-data log files include header and trailer sections that start with a # in the first column. The header contains the file creation time, the hostname, and the columns that appear in the file. The trailer contains the time that the file was closed.

Whenever any configured value changes that affects the columns in a file, the file creates a new profile layout record that contains a new list of columns.

You must configure the file size; all other properties are optional.

- [Configuring the Storage Location of the File on page 1258](#)
- [Configuring the Maximum Size of the File on page 1259](#)
- [Configuring the Maximum Number of Files on page 1259](#)
- [Configuring the Start Time for File Transfer on page 1259](#)
- [Configuring the Transfer Interval of the File on page 1259](#)
- [Configuring Archive Sites on page 1260](#)

### **Configuring the Storage Location of the File**

On J Series Services Routers, the files are stored by default on the compact flash drive. To configure the storage location of the files in the **mfs/var/log** directory (on DRAM) instead of the **cf/var/log** directory (on the compact flash drive), include the **nonpersistent** statement at the **[edit accounting-options file filename]** hierarchy level:

```

[edit accounting-options file filename]
nonpersistent;

```

This feature is useful for minimizing read/write traffic on the router's compact flash drive.

**NOTE:** If log files for accounting data are stored on DRAM, these files are lost when you reboot the router. Therefore, you should back up these files periodically.

### Configuring the Maximum Size of the File

To configure the maximum size of the files, include the **size** statement at the **[edit accounting-options file filename]** hierarchy level:

```
[edit accounting-options file filename]
size bytes;
```

The **size** statement is the maximum size of the log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). The minimum value for **bytes** is 256 KB. You must configure **bytes**; the remaining attributes are optional.

### Configuring the Maximum Number of Files

To configure the maximum number of files, include the **files** statement at the **[edit accounting-options file filename]** hierarchy level:

```
[edit accounting-options file filename]
files number;
```

When a log file (for example, **profilelog**) reaches its maximum size, it is renamed **profilelog.0**, then **profilelog.1**, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for **number** is 3 and the default value is 10.

### Configuring the Start Time for File Transfer

To configure the start time for transferring files, include the **start-time** statement at the **[edit accounting-options file filename]** hierarchy level:

```
[edit accounting-options file filename]
start-time time;
```

The start-time statement specifies a start time for file transfer (YYYY-MM-DD.hh:mm). For example, 10:00 a.m. on January 30, 2007 is represented as 2007-01-30.10:00.

### Configuring the Transfer Interval of the File

To configure the transfer interval of the files, include the **transfer-interval** statement at the **[edit accounting-options file filename]** hierarchy level:

```
[edit accounting-options file filename]
transfer-interval minutes;
```

The range for **transfer-interval** is 5 through 2880 minutes. The default is 30 minutes.

#### TIP:

Junos OS saves the existing log file and creates a new file at the configured transfer-intervals irrespective of:

- Whether the file has reached the maximum size or not
- Whether an archive site is configured or not

When you have a relatively smaller transfer-interval configured and if no archive site is configured, there is a possibility of losing data as Junos OS overwrites the log files when the maximum number of log files is reached. To ensure that the log information is saved for a reasonably long time:

- Configure an archive site to archive the log files every time a new log file is created.
- Configure the maximum value (2880 minutes) for transfer-interval so that new files are created less frequently; that is, only when the file exceeds the maximum size limit or once in 2 days.

---

### Configuring Archive Sites

After a file reaches its maximum size or the **transfer-interval** time is exceeded, the file is closed, renamed, and, if you configured an archive site, transferred to a remote host. To configure archive sites, include the **archive-sites** statement at the **[edit accounting-options file filename]** hierarchy level:

```
[edit accounting-options file filename]
archive-sites {
  site-name;
}
```

**site-name** is any valid FTP URL. You can specify more than one URL, in any order. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, trying the next site in the list only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format **router-name\_log-filename\_timestamp**.

#### Related Documentation

- [Accounting Options Overview on page 1235](#)
- [Understanding Device Management Functions in Junos OS](#)
- [Accounting Options Configuration on page 1254](#)
- [Configuring the Interface Profile on page 1260](#)
- [Configuring the Filter Profile on page 1263](#)
- [Configuration Statements at the \[edit accounting-options\] Hierarchy Level on page 1253](#)

---

### Configuring the Interface Profile

An interface profile specifies the information collected and written to a log file. You can configure a profile to collect error and statistic information for input and output packets on a particular physical or logical interface.

To configure an interface profile, include the **interface-profile** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
interface-profile profile-name {
  fields {
    field-name;
```

```

}
file filename;
interval minutes;
}

```

By default, the Packet Forwarding Engine (PFE) periodically collects the statistics for all interfaces. To improve the performance, you can optionally disable the periodic refresh by including the **periodic-refresh disable** statement at the **[edit accounting-options]** hierarchy level.

Each accounting profile must have a unique **profile-name**. To apply a profile to a physical or logical interface, include the **accounting-profile** statement at either the **[edit interfaces interface-name]** or the **[edit interfaces interface-name unit logical-unit-number]** hierarchy level. You can also apply an accounting profile at the **[edit firewall family family-type filter filter-name]** hierarchy level.

To configure an interface profile, perform the tasks described in the following sections:

- [Configuring Fields on page 1261](#)
- [Configuring the File Information on page 1261](#)
- [Configuring the Interval on page 1261](#)
- [Example: Configuring the Interface Profile on page 1262](#)

### Configuring Fields

An interface profile must specify what statistics are collected. To configure which statistics should be collected for an interface, include the **fields** statement at the **[edit accounting-options interface-profile profile-name]** hierarchy level:

```

[edit accounting-options interface-profile profile-name]
fields {
    field-name;
}

```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To configure which file to use, include the **file** statement at the **[edit accounting-options interface-profile profile-name]** hierarchy level:

```

[edit accounting-options interface-profile profile-name]
file filename;

```

You must specify a **file** statement for the interface profile that has already been configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

Each interface with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options interface-profile profile-name]** hierarchy level:

```

[edit accounting-options interface-profile profile-name]
interval minutes;

```

**NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of interfaces might cause serious performance degradation.

The range for the **interval** statement is 1 through 2880 minutes. The default is 30 minutes.

### *Example: Configuring the Interface Profile*

Configure the interface profile:

```
[edit]
accounting-options {
  file if_stats {
    size 40 files 5;
  }
  interface-profile if_profile1 {
    file if_stats;
    interval 30;
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-multicast;
      output-multicast;
    }
  }
  interface-profile if_profile2 {
    file if_stats;
    interval 30;
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-multicast;
      output-multicast;
    }
  }
}
interfaces {
  xe-1/0/0 {
    accounting-profile if_profile1;
    unit 0 {
      accounting-profile if_profile2;
      ...
    }
  }
}
```

The two interface profiles, **if-profile1** and **if-profile2**, write data to the same file, **if-stats**.

The **if-stats** file might look like the following:

```
#FILE CREATED 976823478 2000-12-14-19:51:18
#hostname host
```

```
#profile-layout
if_profile2,epoch-timestamp,interface-name,snmp-index,input-bytes,output-bytes,
input-packets,output-packets,input-multicast,output-multicast
#profile-layout
if_profile1,epoch-timestamp,interface-name,snmp-index,input-bytes,output-bytes,
input-packets
if_profile2,976823538,xe-1/0/0.0,8,134696815,3681534,501088,40723,0,0
if_profile1,976823538,xe-1/0/0,7,134696815,3681534,501088
...
#FILE CLOSED 976824378 2000-12-14-20:06:18
```

#### Related Documentation

- [Accounting Options Overview on page 1235](#)
- [Understanding Device Management Functions in Junos OS](#)
- [Accounting Options Configuration on page 1254](#)
- [Configuring Accounting-Data Log Files on page 1257](#)
- [Configuring the Filter Profile on page 1263](#)
- [Configuration Statements at the \[edit accounting-options\] Hierarchy Level on page 1253](#)

### Configuring the Filter Profile

A filter profile specifies error and statistics information collected and written to a file. A filter profile must specify counter names for which statistics are collected.

To configure a filter profile, include the **filter-profile** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
filter-profile profile-name {
  counters {
    counter-name;
  }
  file filename;
  interval minutes;
}
```

To apply the filter profile, include the **accounting-profile** statement at the **[edit firewall filter filter-name]** hierarchy level.

To configure a filter profile, perform the tasks described in the following sections:

- [Configuring the Counters on page 1263](#)
- [Configuring the File Information on page 1264](#)
- [Configuring the Interval on page 1264](#)

#### Configuring the Counters

Statistics are collected for all counters specified in the filter profile. To configure the counters, include the **counters** statement at the **[edit accounting-options filter-profile profile-name]** hierarchy level:

```
[edit accounting-options filter-profile profile-name]
counters {
```

```
}
```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the `/var/log` directory.

To configure which file to use, include the `file` statement at the `[edit accounting-options filter-profile profile-name]` hierarchy level:

```
[edit accounting-options filter-profile profile-name]  
file filename;
```

You must specify a filename for the filter profile that has already been configured at the `[edit accounting-options]` hierarchy level.

**NOTE:** If the configured file size or transfer interval is exceeded, Junos OS closes the file and starts a new one. By default, the transfer interval value is 30 minutes. If the transfer interval is not configured, Junos OS closes the file and starts a new one when the file size exceeds its configured value or the default transfer interval value exceeds 30 minutes. To avoid transferring files every 30 minutes, specify a different value for the transfer interval.

### Configuring the Interval

Each filter with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the `interval` statement at the `[edit accounting-options filter-profile profile-name]` hierarchy level:

```
[edit accounting-options filter-profile profile-name]  
interval;
```

**NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of filters might cause serious performance degradation.

The range for the `interval` statement is 1 through 2880 minutes. The default is 30 minutes.

#### Related Documentation

- [Accounting Options Overview on page 1235](#)
- [Understanding Device Management Functions in Junos OS](#)
- [Accounting Options Configuration on page 1254](#)
- [Configuring Accounting-Data Log Files on page 1257](#)
- [Configuring the Interface Profile on page 1260](#)
- [Configuration Statements at the \[edit accounting-options\] Hierarchy Level on page 1253](#)
- [Example: Configuring a Filter Profile on page 1265](#)
- [Example: Configuring Interface-Specific Firewall Counters and Filter Profiles on page 1265](#)

### Example: Configuring a Filter Profile

Configure a filter profile:

```
[edit]
accounting-options {
  file fw_accounting {
    size 500k files 4;
  }
  filter-profile fw_profile1 {
    file fw_accounting;
    interval 60;
    counters {
      counter1;
      counter2;
      counter3;
    }
  }
}
firewall {
  filter myfilter {
    accounting-profile fw_profile1;
    ...
    term accept-all {
      then {
        count counter1;
        accept;
      }
    }
  }
}
```

The filter profile, **fw-profile1**, writes data to the file **fw\_accounting**. The file might look like the following:

```
#FILE CREATED 976825278 2000-12-14-20:21:18
#hostname host
#profile-layout
fw_profile1,epoch-timestamp,filter-name,counter-name,packet-count,byte-count
fw_profile1,976826058,myfilter,counter1,163,10764
...
#FILE CLOSED 976826178 2000-12-14-20:36:18
```

#### Related Documentation

- [Configuring the Filter Profile on page 1263](#)
- [Example: Configuring Interface-Specific Firewall Counters and Filter Profiles on page 1265](#)

### Example: Configuring Interface-Specific Firewall Counters and Filter Profiles

To collect and log count statistics collected by firewall filters on a per-interface basis, you must configure a filter profile and include the interface-specific statement at the **[edit firewall filter *filter-name*]** hierarchy level.

Configure the firewall filter accounting profile:

```
[edit accounting-options]
```

```

file cust1_accounting {
    size 500k;
}
filter-profile cust1_profile {
    file cust1_accounting;
    interval 1;
    counters {
        r1;
    }
}

```

Configure the interface-specific firewall counter:

```

[edit firewall]
filter f3 {
    accounting-profile cust1_profile;
    interface-specific;
    term f3-term {
        then {
            count r1;
            accept;
        }
    }
}

```

Apply the firewall filter to an interface:

```

[edit interfaces]
xe-1/0/0 {
    unit 0 {
        family inet {
            filter {
                input f3;
                output f3;
            }
            address 20.20.20.30/24;
        }
    }
}

```

The following example shows the contents of the **cust1\_accounting** file in the **/var/log** folder that might result from the preceding configuration:

```

#FILE CREATED 995495212 2001-07-18-22:26:52
#hostname host
#profile-layout cust1_profile,epoch-timestamp,interfaces,filter-name,
counter-name,packet-count,byte-count
cust1_profile,995495572,xe-1/0/0.0,f3-xe-1/0/0.0-i,r1-xe-1/0/0.0-i,5953,1008257
cust1_profile,995495602,xe-1/0/0.0,f3-xe-1/0/0.0-o,r1-xe-1/0/0.0-o,5929,1006481
...

```

If the **interface-specific** statement is not included in the configuration, the following output might result:

```

#FILE CREATED 995495212 2001-07-18-22:26:52
#hostname host
#profile-layout cust1_profile,epoch-timestamp,interfaces,filter-name,
counter-name,packet-count,byte-count

```

```

cust1_profile,995495572,xe-1/0/0.0,f3,r1,5953,1008257
cust1_profile,995495632,xe-1/0/0.0,f3,r1,5929,1006481

```

**Related  
Documentation**

- [Configuring the Filter Profile on page 1263](#)
- [Configuring the Interface Profile on page 1260](#)

## Configuring SCU or DCU

To configure SCU or DCU, perform the following tasks described in this section:

**NOTE:** We recommend that you stop the network traffic on an interface before you modify the DCU or SCU configuration for that interface. Modifying the DCU or SCU configuration without stopping the traffic might corrupt the DCU or SCU statistics. Before you restart the traffic after modifying the configuration, enter the `clear interfaces statistics` command.

- [Creating Prefix Route Filters in a Policy Statement on page 1267](#)
- [Applying the Policy to the Forwarding Table on page 1267](#)
- [Enabling Accounting on Inbound and Outbound Interfaces on page 1267](#)

### *Creating Prefix Route Filters in a Policy Statement*

To define prefix router filters:

```

[edit policy-options]
policy-statement scu-1 {
  term term1;
  from {
    route-filter 192.168.1.0/24 orlonger;
  }
  then source-class gold;
}

```

### *Applying the Policy to the Forwarding Table*

To apply the policy to the forwarding table:

```

[edit]
routing-options {
  forwarding-table {
    export scu-1;
  }
}

```

### *Enabling Accounting on Inbound and Outbound Interfaces*

To enable accounting on inbound and outbound interfaces:

```

[edit]
interfaces {
  so-6/1/0 {
    unit 0 {
      family inet;
    }
  }
}

```

```
        accounting {
            destination-class-usage;
            source-class-usage {
                output;
            }
        }
    }
}
[edit]
interfaces {
    xe-0/1/0 {
        unit 0 {
            family inet6 {
                accounting {
                    source-class-usage {
                        input;
                    }
                }
            }
        }
    }
}
```

Optionally, you can include the input and output statements on a single interface as shown:

```
[edit]
interfaces {
    xe-0/1/2 {
        unit 0 {
            family inet6 {
                accounting {
                    source-class-usage {
                        input;
                        output;
                    }
                }
            }
        }
    }
}
```

**Related Documentation**

- [Understanding Source Class Usage and Destination Class Usage Options on page 1236](#)
- [Configuring SCU on a Virtual Loopback Tunnel Interface on page 1269](#)
- [Configuring Class Usage Profiles on page 1270](#)
- [Configuring the MIB Profile on page 1272](#)
- [Configuring the Routing Engine Profile on page 1274](#)

### Configuring SCU on a Virtual Loopback Tunnel Interface

To configure source class usage on the virtual loopback tunnel interface, perform the tasks described in the following sections:

- [Example: Configuring a Virtual Loopback Tunnel Interface on a Provider Edge Router Equipped with a Tunnel PIC on page 1269](#)
- [Example: Mapping the VRF Instance Type to the Virtual Loopback Tunnel Interface on page 1269](#)
- [Example: Sending Traffic Received from the Virtual Loopback Interface Out the Source Class Output Interface on page 1270](#)

#### **Example: Configuring a Virtual Loopback Tunnel Interface on a Provider Edge Router Equipped with a Tunnel PIC**

Define a virtual loop interface on a provider edge router with a Tunnel PIC:

```
[edit interfaces]
vt-0/3/0 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          input;
        }
      }
    }
  }
}
```

#### **Example: Mapping the VRF Instance Type to the Virtual Loopback Tunnel Interface**

Map the VRF instance type to the virtual loopback tunnel interface:

```
[edit]
routing-instances {
  VPN-A {
    instance-type vrf;
    interface at-2/1/1.0;
    interface vt-0/3/0.0;
    route-distinguisher 10.255.14.225:100;
    vrf-import import-policy-name;
    vrf-export export-policy-name;
    protocols {
      bgp {
        group to-r4 {
          local-address 10.27.253.1;
          peer-as 400;
          neighbor 10.27.253.2;
        }
      }
    }
  }
}
```

**NOTE:** For SCU and DCU to work, do not include the `vrf-table-label` statement at the `[edit routing-instances instance-name]` hierarchy level.

**Example: Sending Traffic Received from the Virtual Loopback Interface Out the Source Class Output Interface**

Send traffic received from the virtual loopback tunnel interface out of the source class output interface:

```
[edit interfaces]
at-1/1/0 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          output;
        }
      }
    }
  }
}
```

**Related Documentation**

- [Understanding Source Class Usage and Destination Class Usage Options on page 1236](#)
- [Configuring SCU or DCU on page 1267](#)
- [Configuring Class Usage Profiles on page 1270](#)
- [Configuring the MIB Profile on page 1272](#)
- [Configuring the Routing Engine Profile on page 1274](#)

## Configuring Class Usage Profiles

To collect class usage statistics, perform the tasks described in these sections:

- [Configuring a Class Usage Profile on page 1270](#)
- [Configuring the File Information on page 1271](#)
- [Configuring the Interval on page 1271](#)
- [Creating a Class Usage Profile to Collect Source Class Usage Statistics on page 1271](#)
- [Creating a Class Usage Profile to Collect Destination Class Usage Statistics on page 1272](#)

### Configuring a Class Usage Profile

You can configure the class usage profile to collect statistics for particular source and destination classes.

To configure the class usage profile to filter by source classes, include the `source-classes` statement at the `[edit accounting-options class-usage-profile profile-name]` hierarchy level:

```
[edit accounting-options class-usage-profile profile-name]
source-classes {
```

```

    source-class-name;
}

```

To configure the class usage profile to filter by destination classes, include the **destination-classes** statement at the **[edit accounting-options class-usage-profile profile-name]** hierarchy level:

```

[edit accounting-options class-usage-profile profile-name]
destination-classes {
    destination-class-name;
}

```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To specify which file to use, include the **file** statement at the **[edit accounting-options class-usage-profile profile-name]** hierarchy level:

```

[edit accounting-options class-usage-profile profile-name]
file filename;

```

You must specify a filename for the source class usage profile that has already been configured at the **[edit accounting-options]** hierarchy level. You can also specify a filename for the destination class usage profile configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

Each interface with a class usage profile enabled has statistics collected once per interval specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options class-usage-profile profile-name]** hierarchy level:

```

[edit accounting-options class-usage-profile profile-name]
interval;

```

### Creating a Class Usage Profile to Collect Source Class Usage Statistics

To create a class usage profile to collect source class usage statistics:

```

[edit]
accounting-options {
    class-usage-profile scu-profile1;
    file usage-stats;
    interval 15;
    source-classes {
        gold;
        silver;
        bronze;
    }
}

```

The class usage profile, **scu-profile1**, writes data to the file **usage\_stats**. The file might look like the following:

```

#FILE CREATED 976825278 2000-12-14-20:21:18
#profile-layout, scu_profile,epoch-timestamp,interface-name,source-class,
packet-count,byte-count
scu_profile,980313078,xe-1/0/0.0,gold,82,6888

```

```

scu_profile,980313078,xe-1/0/0.0,silver,164,13776
scu_profile,980313078,xe-1/0/0.0,bronze,0,0
scu_profile,980313678,xe-1/0/0.0,gold,82,6888
scu_profile,980313678,xe-1/0/0.0,silver,246,20664
scu_profile,980313678,xe-1/0/0.0,bronze,0,0

```

### ***Creating a Class Usage Profile to Collect Destination Class Usage Statistics***

To create a class usage profile to collect destination class usage statistics:

```

[edit]
accounting-options {
  class-usage-profile dcu-profile1;
  file usage-stats
  interval 15;
  destination-classes {
    gold;
    silver;
    bronze;
  }
}

```

The class usage profile, **dcu-profile1**, writes data to the file **usage-stats**. The file might look like the following:

```

#FILE CREATED 976825278 2000-12-14-20:21:18
#profile-layout, dcu_profile,epoch-timestamp,interface-name,destination-class,
packet-count,byte-count
dcu_profile,980313078,xe-1/0/0.0,gold,82,6888
dcu_profile,980313078,xe-1/0/0.0,silver,164,13776
dcu_profile,980313078,xe-1/0/0.0,bronze,0,0
dcu_profile,980313678,xe-1/0/0.0,gold,82,6888
dcu_profile,980313678,xe-1/0/0.0,silver,246,20664
dcu_profile,980313678,xe-1/0/0.0,bronze,0,0
...
#FILE CLOSED 976826178 2000-12-14-20:36:18

```

### **Configuring the MIB Profile**

The MIB profile collects MIB statistics and logs them to a file. The MIB profile specifies the SNMP operation and MIB object names for which statistics are collected.

To configure a MIB profile, include the **mib-profile** statement at the **[edit accounting-options]** hierarchy level:

```

[edit accounting-options]
mib-profile profile-name {
  file filename;
  interval minutes;
  object-names {

```

```

        mib-object-name;
    }
    operation operation-name;
}

```

To configure a MIB profile, perform the tasks described in the following sections:

- [Configuring the File Information on page 1273](#)
- [Configuring the Interval on page 1273](#)
- [Configuring the MIB Operation on page 1273](#)
- [Configuring MIB Object Names on page 1273](#)
- [Example: Configuring a MIB Profile on page 1274](#)

### Configuring the File Information

Each accounting profile logs its statistics to a file in the `/var/log` directory.

To configure which file to use, include the `file` statement at the `[edit accounting-options mib-profile profile-name]` hierarchy level:

```

[edit accounting-options mib-profile profile-name]
file filename;

```

You must specify a *filename* for the MIB profile that has already been configured at the `[edit accounting-options]` hierarchy level.

### Configuring the Interval

A MIB profile has statistics collected once per interval time specified for the profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the `interval` statement at the `[edit accounting-options mib-profile profile-name]` hierarchy level:

```

[edit accounting-options mib-profile profile-name]
interval;

```

The range for the `interval` statement is 1 through 2880 minutes. The default is 30 minutes.

### Configuring the MIB Operation

A MIB profile must specify the operation that is used to collect MIB statistics. To configure which operation is used to collect MIB statistics, include the `operation` statement at the `[edit accounting-options mib-profile profile-name]` hierarchy level:

```

[edit accounting-options mib-profile profile-name]
operation operation-name;

```

You can configure a `get`, `get-next`, or `walk` operation. The default operation is `walk`.

### Configuring MIB Object Names

A MIB profile must specify the MIB objects for which statistics are to be collected. To configure the MIB objects for which statistics are collected, include the `objects-names` statement at the `[edit accounting-options mib-profile profile-name]` hierarchy level:

```

[edit accounting-options mib-profile profile-name]
object-names {
    mib-object-name;
}

```

```
}
```

You can include multiple MIB object names in the configuration.

#### **Example: Configuring a MIB Profile**

Configure a MIB profile:

```
[edit accounting-options]
mib-profile mstatistics {
  file stats;
  interval 60;
  operation walk;
  objects-names {
    ipCidrRouteStatus;
    ifOutOctets;
  }
}
```

#### **Related Documentation**

- [Understanding Source Class Usage and Destination Class Usage Options on page 1236](#)
- [Configuring SCU or DCU on page 1267](#)
- [Configuring SCU on a Virtual Loopback Tunnel Interface on page 1269](#)

- [Configuring the Routing Engine Profile on page 1274](#)

---

### **Configuring the Routing Engine Profile**

The Routing Engine profile collects Routing Engine statistics and logs them to a file. The Routing Engine profile specifies the fields for which statistics are collected.

To configure a Routing Engine profile, include the **routing-engine-profile** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
routing-engine-profile profile-name {
  fields {
    field-name;
  }
  file filename;
  interval minutes;
}
```

To configure a Routing Engine profile, perform the tasks described in the following sections:

- [Configuring Fields on page 1275](#)
- [Configuring the File Information on page 1275](#)
- [Configuring the Interval on page 1275](#)
- [Example: Configuring a Routing Engine Profile on page 1275](#)

### Configuring Fields

A Routing Engine profile must specify what statistics are collected. To configure which statistics should be collected for the Routing Engine, include the **fields** statement at the **[edit accounting-options routing-engine-profile *profile-name*]** hierarchy level:

```
[edit accounting-options routing-engine-profile profile-name]
fields {
  field-name;
}
```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To configure which file to use, include the **file** statement at the **[edit accounting-options routing-engine-profile *profile-name*]** hierarchy level:

```
[edit accounting-options routing-engine-profile profile-name]
file filename;
```

You must specify a ***filename*** for the Routing Engine profile that has already been configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

A Routing Engine profile has statistics collected once per interval time specified for the profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options routing-engine-profile *profile-name*]** hierarchy level:

```
[edit accounting-options routing-engine-profile profile-name]
interval;
```

The range for **interval** is 1 through 2880 minutes. The default is 30 minutes.

### Example: Configuring a Routing Engine Profile

Configure a Routing Engine profile:

```
[edit accounting-options]
file my-file {
  size 300k;
}
routing-engine-profile profile-1 {
  file my-file;
  fields {
    host-name;
    date;
    time-of-day;
    uptime;
    cpu-load-1;
    cpu-load-5;
    cpu-load-15;
  }
}
```

## Alarms

- [Example: Configuring Interface Alarms on page 1276](#)

### Example: Configuring Interface Alarms

This example shows how to configure interface alarms.

- [Requirements on page 1276](#)
- [Overview on page 1276](#)
- [Configuration on page 1277](#)
- [Verification on page 1278](#)

#### **Requirements**

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces. See *Junos OS Interfaces Library for Security Devices*.
- Select the network interface on which to apply an alarm and the condition you want to trigger the alarm. See [“Alarm Overview” on page 1237](#).

#### **Overview**

In this example, you enable interface alarms by explicitly setting alarm conditions. You configure the system to generate a red interface alarm when a yellow alarm is detected on a DS1 link. You configure the system to generate a red interface alarm when a link-down failure is detected on an Ethernet link.

For a serial link, you set `cts-absent` and `dcd-absent` to yellow to signify either the CST or the DCD signal is not detected. You set `loss-of-rx-clock` and `loss-of-tx-clock` to red alarm to signify either the receiver clock signal or the transmission clock signal is not detected.

For a T3 link, you set the interface alarm to red when the remote endpoint is experiencing a failure. You set `exz` to yellow alarm when the upstream bit has more consecutive zeros than are permitted in a T3 interface. You then set a red alarm when there is loss-of-signal on the interface.

Finally, you configure the system to display active system alarms whenever a user with the login class `admin` logs into the device.

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis alarm ds1 ylw red
set chassis alarm ethernet link-down red
set chassis alarm serial cts-absent yellow dcd-absent yellow
set chassis alarm serial loss-of-rx-clock red loss-of-tx-clock red
set chassis alarm t3 ylw red exz yellow los red
set system login class admin login-alarms
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure interface alarms:

1. Configure an alarm.

```
[edit]
user@host# edit chassis alarm
```

2. Specify the interface alarms on a DS1 and an Ethernet link.

```
[edit chassis alarm]
user@host# set ds1 ylw red
user@host# set ethernet link-down red
```

3. Specify the interface alarms on a serial link.

```
[edit chassis alarm]
user@host# set serial cts-absent yellow
user@host# set serial dcd-absent yellow
user@host# set serial loss-of-rx-clock red
user@host# set serial loss-of-tx-clock red
```

4. Specify the interface alarms on a T3 link.

```
[edit chassis alarm]
user@host# set t3 ylw red
user@host# set t3 exz yellow
user@host# set t3 los red
```

5. Configure the system to display active system alarms.

```
[edit]
user@host# edit system login
user@host# set class admin login-alarms
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis alarms** and **show system login** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
```

```
user@host# show chassis alarms
t3 {
  exz yellow;
    los red;
  ylw red;
}
ds1 {
  ylw red;
}
ethernet {
  link-down red;
}
serial {
  loss-of-rx-clock red;
  loss-of-tx-clock red;
  dcd-absent yellow;
  cts-absent yellow;
}
[edit]
user@host# show system login
show system login
show system login
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Verification*

#### *Verifying the Alarm Configurations*

**Purpose** Confirm that the configuration is working properly.

Verify that the alarms are configured.

**Action** From configuration mode, enter the **show chassis alarms** command. Verify that the output shows the intended configuration of the alarms.

## Data Path Debugging and Trace Options

- [Debugging the Data Path \(CLI Procedure\) on page 1279](#)
- [Setting Security Trace Options \(CLI Procedure\) on page 1279](#)
- [Setting Flow Debugging Trace Options \(CLI Procedure\) on page 1281](#)

### Debugging the Data Path (CLI Procedure)

To configure the device for data path debugging:

1. Specify the following request command to set the data path debugging for the multiple processing units along the packet-processing path:

```
[edit]
user@host# set security datapath-debug
```

2. Specify the trace options for data path-debug using the following command:

```
[edit]
user@host# set security datapath-debug traceoptions
```

3. Using the request security packet-filter command, you can set the packet filter to specify the related packets to perform data path-debug action. A maximum of four filters are supported at the same time. For example, the following command sets the first packet-filter:

```
[edit]
user@host# set security datapath-debug packet-filter name
```

4. Using the request security action-profile command, you can set the action for the packet match for a specified filter. Only the default action profile is supported, which is the trace option for network processor ezchip ingress, ezchip egress, spu.lbt, and spu.pot:

```
[edit]
user@host# set security datapath-debug packet-filter name action-profile
```

### Setting Security Trace Options (CLI Procedure)

Use the following configuration statements to configure security trace options in the CLI configuration editor.

- To disable remote tracing, enter the following statement:

```
[edit]
user@host# set security traceoptions no-remote-trace
```

- To write trace messages to a local file, enter the following statement. The system saves the trace file in the `/var/log/` directory.

```
[edit]
user@host# set security traceoptions use-local-files
```

- To specify a name for the trace file, enter the following statement. Valid values range from 1 and 1024 characters. The name cannot include spaces, /, or % characters. The default filename is security.

```
[edit]
user@host# set security traceoptions file filename
```

- To specify the maximum number of trace files that can accumulate, enter the following statement. Valid values range from 2 to 1000. The default value is 3.

```
[edit]
user@host# set security traceoptions file files 3
```

- To specify the match criteria that you want the system to use when logging information to the file, enter the following statement. Enter a regular expression. Wildcard (\*) characters are accepted.

```
[edit]
user@host# set security traceoptions file match *thread
```

- To allow any user to read the trace file, enter the **world-readable** statement. Otherwise, enter the **no-world-readable** statement.

```
[edit]
user@host# set security traceoptions file world-readable
user@host# set security traceoptions file no-world-readable
```

- To specify the maximum size to which the trace file can grow, enter the following statement. Once the file reaches the specified size, it is compressed and renamed *filename0.gz*, the next file is named *filename1.gz*, and so on. Valid values range from 10240 to 1,073,741,824.

```
[edit]
user@host# set security traceoptions file size 10240
```

- To turn on trace options and to perform more than one tracing operation, set the following flags.

```
[edit]
user@host# set security traceoptions flag all
user@host# set security traceoptions flag compilation
user@host# set security traceoptions flag configuration
user@host# set security traceoptions flag routing-socket
```

- To specify the groups that these trace option settings do or do not apply to, enter the following statements:

```
[edit]
user@host# set security traceoptions apply-groups value
user@host# set security traceoptions apply-groups-except value
```

**Related  
Documentation**

### Setting Flow Debugging Trace Options (CLI Procedure)

The following examples display the options you can set by using **security flow traceoptions**.

- To match the imap destination port for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 destination-port imap
```

- To set the 1.2.3.4 destination IPv4 prefix address for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 destination-prefix 1.2.3.4
```

- To set the fxp0 logical interface for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 interface fxp0
```

- To match the TCP IP protocol for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 protocol tcp
```

- To match the HTTP source port for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 source-port http
```

- To set the 5.6.7.8 IPv4 prefix address for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 source-prefix 5.6.7.8
```

### MPLS

- [Configuring Ping MPLS on page 1281](#)

### Configuring Ping MPLS

Before using the ping MPLS feature, make sure that the receiving interface on the VPN or LSP remote endpoint has MPLS enabled, and that the loopback interface on the outbound node is configured as **127.0.0.1**. The source address for MPLS probes must be a valid address on the J Series device.

- **MPLS Enabled**—To process ping MPLS requests, the remote endpoint of the VPN or LSP must be configured appropriately. You must enable MPLS on the receiving interface of the outbound node for the VPN or LSP. If MPLS is not enabled, the remote endpoint drops the incoming request packets and returns an “ICMP host unreachable” message to the J Series device.

- **Loopback Address**--The loopback address (**lo0**) on the outbound node must be configured as **127.0.0.1**. If this interface address is not configured correctly, the outbound node does not have this forwarding entry. It drops the incoming request packets and returns a "host unreachable" message to the J Series device.
- **Source Address for Probes**--The source IP address you specify for a set of probes must be an address configured on one of the J Series device interfaces. If it is not a valid J Series device address, the ping request fails with the error message "Can't assign requested address."

- [Disabling Packet Capture on page 1292](#)
- [Deleting Packet Capture Files on page 1292](#)
- [Changing Encapsulation on Interfaces with Packet Capture Configured on page 1293](#)

### Example: Enabling Packet Capture on a Device

This example shows how to enable packet capture on a device, allowing you to analyze network traffic and troubleshoot network problems

- [Requirements on page 1282](#)
- [Overview on page 1283](#)
- [Configuration on page 1283](#)
- [Verification on page 1284](#)

#### **Requirements**

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces. See *Junos OS Interfaces Library for Security Devices*.

### Overview

In this example, you set the maximum packet capture size in each file as 500 bytes. The range is from 68 through 1500, and the default is 68 bytes. You specify the target filename for the packet capture file as `pcap-file`. You then specify the maximum number of files to capture as 100. The range is from 2 through 10,000, and the default is 10 files. You set the maximum size of each file to 1024 bytes. The range is from 1,024 through 104,857,600, and the default is 512,000 bytes. Finally, you specify that all users have permission to read the packet capture files.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set forwarding-options packet-capture maximum-capture-size 500
set forwarding-options packet-capture file filename pcap-file files 100 size 1024
world-readable
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To enable packet capture on a device:

1. Set the maximum packet capture size.  

```
[edit]
user@host# edit forwarding-options
user@host# set packet-capture maximum-capture-size 500
```
2. Specify the target filename.  

```
[edit forwarding-options]
user@host# set packet-capture file filename pcap-file
```
3. Specify the maximum number of files to capture.  

```
[edit forwarding-options]
user@host# set packet-capture file files 100
```
4. Specify the maximum size of each file.  

```
[edit forwarding-options]
user@host# set packet-capture file size 1024
```
5. Specify that all users have permission to read the file.  

```
[edit forwarding-options]
user@host# set packet-capture file world-readable
```

**Results** From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show forwarding-options
packet-capture {
    file filename pcap-file files 100 size 1k world-readable;
    maximum-capture-size 500;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Packet Capture Configuration on page 1284](#)
- [Verifying Captured Packets on page 1284](#)

### **Verifying the Packet Capture Configuration**

**Purpose** Verify that the packet capture is configured on the device.

**Action** From configuration mode, enter the **show forwarding-options** command. Verify that the output shows the intended file configuration for capturing packets.

### **Verifying Captured Packets**

**Purpose** Verify that the packet capture file is stored under the **/var/tmp** directory and the packets can be analyzed offline.

**Action** 1. Disable packet capture.

Using FTP, transfer a packet capture file (for example, **126b.fe-0.0.1**), to a server where you have installed packet analyzer tools (for example, **tools-server**).

a. From configuration mode, connect to **tools-server** using FTP.

```
[edit]
user@host# run ftp tools-server
Connected to tools-server.mydomain.net
220 tools-server.mydomain.net FTP server (Version 6.00LS) ready
Name (tools-server:user):remoteuser
331 Password required for remoteuser.
Password:
230 User remoteuser logged in.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp>
```

b. Navigate to the directory where packet capture files are stored on the device.

```
ftp> lcd /var/tmp
Local directory now /cf/var/tmp
```

c. Copy the packet capture file that you want to analyze to the server, for example **126b.fe-0.0.1**.

```
ftp> put 126b.fe-0.0.1
```

```

local: 126b.fe-0.0.1 remote: 126b.fe-0.0.1
200 PORT command successful.
150 Opening BINARY mode data connection for '126b.fe-0.0.1'.
100% 1476 00:00 ETA
226 Transfer complete.
1476 bytes sent in 0.01 seconds (142.42 KB/s)

```

- d. Return to configuration mode.

```

ftp> bye
221 Goodbye.
[edit]
user@host#

```

2. Open the packet capture file on the server with tcpdump or any packet analyzer that supports libpcap format and review the output.

```

root@server% tcpdump -r 126b.fe-0.0.1 -xvvvv
01:12:36.279769 Out 0:5:85:c4:e3:d1 > 0:5:85:c8:f6:d1, ethertype IPv4 (0x0800),

## Example: Configuring Packet Capture on an Interface

This example shows how to configure packet capture on an interface to analyze traffic.

- [Requirements on page 1286](#)
- [Overview on page 1286](#)
- [Configuration on page 1286](#)
- [Verification on page 1287](#)

### Requirements

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces. See *Junos OS Interfaces Library for Security Devices*.

### Overview

In this example, you create an interface called fe-0/0/1. You then configure the direction of the traffic for which you are enabling packet capture on the logical interface as inbound and outbound.

**NOTE:** On traffic that bypasses the flow software module (protocol packets such as ARP, OSPF, and PIM), packets generated by the Routing Engine are not captured unless you have configured and applied a firewall filter on the interface in the output direction.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
edit interfaces fe-0/0/1
set unit 0 family inet sampling input output
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure packet capture on an interface:

1. Create an interface.  

```
[edit]
user@host# edit interfaces fe-0/0/1
```
2. Configure the direction of the traffic.  

```
[edit interfaces fe-0/0/1]
```

```
user@host# set unit 0 family inet sampling input output
```

3. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

### **Verification**

#### **Verifying the Packet Capture Configuration**

**Purpose** Confirm that the configuration is working properly.

Verify that packet capture is configured on the interface.

**Action** From configuration mode, enter the **show interfaces fe-0/0/1** command.

- Related Documentation**
- [Packet Capture Overview on page 1246](#)
  - [Changing Encapsulation on Interfaces with Packet Capture Configured on page 1293](#)
  - [Example: Configuring a Firewall Filter for Packet Capture on page 1287](#)
  - [Example: Enabling Packet Capture on a Device on page 1282](#)
  - [Deleting Packet Capture Files on page 1292](#)
  - [Disabling Packet Capture on page 1292](#)

---

### **Example: Configuring a Firewall Filter for Packet Capture**

This example shows how to configure a firewall filter for packet capture and apply it to a logical interface.

- [Requirements on page 1287](#)
- [Overview on page 1287](#)
- [Configuration on page 1288](#)
- [Verification on page 1289](#)

#### **Requirements**

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces. See *Junos OS Interfaces Library for Security Devices*.

#### **Overview**

In this example, you set a firewall filter called dest-all and a term name called dest-term to capture packets from a specific destination address, which is 192.168.1.1/32. You define the match condition to accept the sampled packets. Finally, you apply the dest-all filter to all of the outgoing packets on interface fe-0/0/1.

**NOTE:** If you apply a firewall filter on the loopback interface, it affects all traffic to and from the Routing Engine. If the firewall filter has a **sample** action, packets to and from the Routing Engine are sampled. If packet capture is enabled, then packets to and from the Routing Engine are captured in the files created for the input and output interfaces.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall filter dest-all term dest-term from destination-address 192.168.1.1/32
set firewall filter dest-all term dest-term then sample accept
edit interfaces
set interfaces fe-0/0/1 unit 0 family inet filter output dest-all
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a firewall filter for packet capture and apply it to a logical interface:

1. Specify the firewall filter and its destination address.

```
[edit]
user@host# edit firewall
user@host# set filter dest-all term dest-term from destination-address 192.168.1.1/32
```

2. Define the match condition and its action.

```
[edit firewall]
user@host# set filter dest-all term dest-term then sample accept
```

3. Apply the filter to all the outgoing packets.

```
[edit interfaces]
user@host# set interfaces fe-0/0/1 unit 0 family inet filter output dest-all
```

**Results** From configuration mode, confirm your configuration by entering the **show firewall filter dest-all** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show firewall filter dest-all
term dest-term {
  from {
    destination-address 192.168.1.1/32;
  }
  then {
    sample;
    accept;
  }
}
```

```
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

#### **Verifying the Firewall Filter for Packet Capture Configuration**

**Purpose** Confirm that the configuration is working properly.

Verify that the firewall filter for packet capture is configured.

**Action** From configuration mode, enter the **show firewall filter dest-all** command. Verify that the output shows the intended configuration of the firewall filter for capturing packets sent to the destination address.

### **Related Documentation**

- [Packet Capture Overview on page 1246](#)
- [Example: Configuring Packet Capture on an Interface on page 1286](#)
- [Example: Enabling Packet Capture on a Device on page 1282](#)
- [Deleting Packet Capture Files on page 1292](#)
- [Disabling Packet Capture on page 1292](#)

---

### **Example: Configuring Packet Capture for Datapath Debugging**

This example shows how to configure packet capture to monitor traffic that passes through the device. Packet Capture then dumps the packets into a PCAP file format that can be later examined by the tcpdump utility.

- [Requirements on page 1289](#)
- [Overview on page 1289](#)
- [Configuration on page 1289](#)
- [Verification on page 1291](#)

### **Requirements**

Before you begin, see “[Debugging the Data Path \(CLI Procedure\)](#)” on page 1279.

### **Overview**

A filter is defined to filter traffic; then an action profile is applied to the filtered traffic. The action profile specifies a variety of actions on the processing unit. One of the supported actions is packet dump, which sends the packet to the Routing Engine and stores it in proprietary form to be read using the **show security datapath-debug capture** command.

### **Configuration**

### **CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set security datapath-debug capture-file my-capture
set security datapath-debug capture-file format pcap
set security datapath-debug capture-file size 1m
set security datapath-debug capture-file files 5
set security datapath-debug maximum-capture-size 400
set security datapath-debug action-profile do-capture event np-ingress packet-dump
set security datapath-debug packet-filter my-filter action-profile do-capture
set security datapath-debug packet-filter my-filter source-prefix 1.2.3.4/32
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure packet capture:

1. Edit the security datapath-debug option for the multiple processing units along the packet-processing path:

```
[edit]
user@host# edit security datapath-debug
```

2. Enable the capture file, the file format, the file size, and the number of files. Size number limits the size of the capture file. After the limit size is reached, if the file number is specified, then the capture file will be rotated to filename *x*, where *x* is auto-incremented until it reaches the specified index and then returns to zero. If no files index is specified, the packets will be discarded after the size limit is reached. The default size is 512 kilobytes.

```
[edit security datapath-debug]
user@host# set capture-file my-capture format pcap size 1m files 5
[edit security datapath-debug]
user@host# set maximum-capture-size 400
```

3. Enable action profile and set the event. Set the action profile as do-capture and the event type as np-ingress:

```
[edit security datapath-debug]
user@host# edit action-profile do-capture
[edit security datapath-debug action-profile do-capture]
user@host# edit event np-ingress
```

4. Enable packet dump for the action profile:

```
[edit security datapath-debug action-profile do-capture event np-ingress]
user@host# set packet-dump
```

5. Enable packet filter, action, and filter options. The packet filter is set to my-filter, the action profile is set to do-capture, and filter option is set to source-prefix 1.2.3.4/32.

```
[edit security datapath-debug]
user@host# set security datapath-debug packet-filter my-filter action-profile
do-capture
[edit security datapath-debug]
```

```
user@host# set security datapath-debug packet-filter my-filter source-prefix
1.2.3.4/32
```

**Results** From configuration mode, confirm your configuration by entering the **show security datapath-debug** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. The following is **show security datapath-debug** output from the **show security datapath-debug** command:

```
security {
  datapath-debug {
    capture-file {
      my-capture
      format pcap
      size 1m
      files 5;
    }
  }
  maximum-capture-size 100;
  action-profile do-capture {
    event np-ingress {
      packet-dump
    }
  }
  packet-filter my-filter {
    source-prefix 1.2.3.4/32
    action-profile do-capture
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Packet Capture on page 1291](#)
- [Verifying data path debugging capture on page 1291](#)
- [Verifying data path debugging counter on page 1292](#)

### **Verifying Packet Capture**

**Purpose** Verify if the packet capture is working.

**Action** From operational mode, enter the **request security datapath-debug capture start** command to start packet capture and enter the **request security datapath-debug capture stop** command to stop packet capture.

To view the results, from CLI operational mode, access the local UNIX shell and navigate to the directory `/var/log/my-capture`. The result can be read by using the `tcpdump` utility.

### **Verifying data path debugging capture**

**Purpose** Verify the details of data path debugging capture file.

**Action** From operational mode, enter the [show security datapath-debug capture](#) command.

```
user@host>show security datapath-debug capture
```

#### *Verifying data path debugging counter*

**Purpose** Verify the details of the data path debugging counter.

**Action** From operational mode, enter the [show security datapath-debug counter](#) command.

- Related Documentation**
- [Packet Capture Overview on page 1246](#)
  - [Understanding Data Path Debugging for SRX Series Devices on page 1242](#)
  - [Debugging the Data Path \(CLI Procedure\) on page 1279](#)

---

### Disabling Packet Capture

You must disable packet capture before opening the packet capture file for analysis or transferring the file to an external device. Disabling packet capture ensures that the internal file buffer is flushed and all the captured packets are written to the file.

To disable packet capture, enter from configuration mode:

```
[edit forwarding-options]  
user@host# set packet-capture disable
```

If you are done configuring the device, enter **commit** from configuration mode.

- Related Documentation**
- [Packet Capture Overview on page 1246](#)
  - [Example: Configuring Packet Capture on an Interface on page 1286](#)
  - [Example: Configuring a Firewall Filter for Packet Capture on page 1287](#)
  - [Example: Enabling Packet Capture on a Device on page 1282](#)
  - [Deleting Packet Capture Files on page 1292](#)

---

### Deleting Packet Capture Files

Deleting packet capture files from the /var/tmp directory only temporarily removes the packet capture files. Packet capture files for the interface are automatically created again the next time a packet capture configuration change is committed or as part of a packet capture file rotation.

To delete a packet capture file:

1. Disable packet capture (see [“Disabling Packet Capture” on page 1292](#)).
2. Delete the packet capture file for the interface.
  - a. From operational mode, access the local UNIX shell.

```
user@host> start shell  
%
```

- b. Navigate to the directory where packet capture files are stored.

```
% cd /var/tmp
%
```

- c. Delete the packet capture file for the interface; for example **pcap-file.fe.0.0.0**.

```
% rm pcap-file.fe.0.0.0
%
```

- d. Return to operational mode.

```
% exit
user@host>
```

3. Reenable packet capture (see [“Example: Enabling Packet Capture on a Device” on page 1282](#)).
4. If you are done configuring the device, enter **commit** from configuration mode.

#### Related Documentation

- [Packet Capture Overview on page 1246](#)
- [Example: Configuring Packet Capture on an Interface on page 1286](#)
- [Example: Configuring a Firewall Filter for Packet Capture on page 1287](#)
- [Example: Enabling Packet Capture on a Device on page 1282](#)
- [Changing Encapsulation on Interfaces with Packet Capture Configured on page 1293](#)
- [Disabling Packet Capture on page 1292](#)

### Changing Encapsulation on Interfaces with Packet Capture Configured

Before modifying the encapsulation on a device interface that is configured for packet capture, you must disable packet capture and rename the latest packet capture file. Otherwise, packet capture saves the packets with different encapsulations in the same packet capture file. Packet files containing packets with different encapsulations are not useful, because packet analyzer tools like tcpdump cannot analyze such files.

After modifying the encapsulation, you can safely reenable packet capture on the device.

To change the encapsulation on interfaces with packet capture configured:

1. Disable packet capture (see [“Disabling Packet Capture” on page 1292](#)).
2. Enter **commit** from configuration mode.
3. Rename the latest packet capture file on which you are changing the encapsulation with the **.chdsl** extension.
  - a. From operational mode, access the local UNIX shell.

```
user@host> start shell
%
```

- b. Navigate to the directory where packet capture files are stored.

```
% cd /var/tmp
```

%

- c. Rename the latest packet capture file for the interface on which you are changing the encapsulation; for example **fe.0.0.0**.

```
% mv pcap-file.fe.0.0.0 pcap-file.fe.0.0.0.chdsl
%
```

- d. Return to operational mode.

```
% exit
user@host>
```

4. Change the encapsulation on the interface using the J-Web user interface or CLI configuration editor.
5. If you are done configuring the device, enter **commit** from configuration mode.
6. Reenable packet capture (see [“Example: Enabling Packet Capture on a Device” on page 1282](#)).
7. If you are done configuring the device, enter **commit** from configuration mode.

- [Configuring RPM Timestamping on page 1304](#)
- [Tuning RPM Probes on page 1305](#)
- [RPM Configuration Options on page 1306](#)

### Example: Configuring Basic RPM Probes

This example shows how to configure basic RPM probes to measure performance between two network endpoints.

- [Requirements on page 1295](#)
- [Overview on page 1295](#)
- [Configuration on page 1295](#)
- [Verification on page 1297](#)

### Requirements

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces. See *Junos OS Interfaces Library for Security Devices*.

### Overview

In this example, you configure basic probes for two RPM owners, customerA and customerB. You configure the RPM test as icmp-test for customerA with a test interval of 15 seconds and specify a probe type as icmp-ping-timestamp, a probe timestamp, and a target address as 192.178.16.5. You then configure the RPM thresholds and corresponding SNMP traps to catch ingress (inbound) times greater than 3000 microseconds.

Then you configure the RPM test as http-test for customerB with a test interval of 30 seconds and specify a probe type as http-get and a target URL as http://customerB.net. Finally, you configure RPM thresholds and corresponding SNMP traps as probe-failure and test-failure to catch three or more successive lost probes and total lost probes of 10.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set services rpm probe customerA test icmp-test probe-interval 15
set services rpm probe customerA test icmp-test probe-type icmp-ping-timestamp
set services rpm probe customerA test icmp-test hardware-timestamp
set services rpm probe customerA test icmp-test target address 192.178.16.5
set services rpm probe customerA test icmp-test thresholds ingress-time 3000
set services rpm probe customerA test icmp-test traps ingress-time-exceeded
set services rpm probe customerB test http-test probe-interval 30
set services rpm probe customerB test http-test probe-type http-get
set services rpm probe customerB test http-test target url http://customerB.net
set services rpm probe customerB test http-test thresholds successive-loss 3
set services rpm probe customerB test http-test thresholds total-loss 10
set services rpm probe customerB test http-test traps probe-failure
set services rpm probe customerB test http-test traps test-failure
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure basic RPM probes:

1. Configure the RPM.  

```
[edit]
user@host# edit services rpm
```

2. Configure the RPM owners.  

```
[edit services rpm]
user@host# set probe customerA
user@host# set probe customerB
```
3. Configure the RPM test for customerA.  

```
[edit services rpm]
user@host# edit probe customerA
user@host# set test icmp-test probe-interval 15
user@host# set test icmp-test probe-type icmp-ping-timestamp
```
4. Specify a probe timestamp and a target address.  

```
[edit services rpm probe customerA]
user@host# set test icmp-test hardware-timestamp
user@host# set test icmp-test target address 192.178.16.5
```
5. Configure RPM thresholds and corresponding SNMP traps.  

```
[edit services rpm probe customerA]
user@host# set test icmp-test thresholds ingress-time 3000
user@host# set test icmp-test traps ingress-time-exceeded
```
6. Configure the RPM test for customerB.  

```
[edit]
user@host# edit services rpm probe customerB
user@host# set test http-test probe-interval 30
```
7. Specify a probe type and a target URL.  

```
[edit services rpm probe customerB]
user@host# set test http-test probe-type http-get
user@host# set test http-test target url http://customerB.net
```
8. Configure RPM thresholds and corresponding SNMP traps.  

```
[edit services rpm probe customerB]
user@host# set test http-test thresholds successive-loss 3
user@host# set test http-test thresholds total-loss 10
user@host# set test http-test traps probe-failure
user@host# set test http-test traps test-failure
```

**Results** From configuration mode, confirm your configuration by entering the **show services rpm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show services rpm
probe customerA {
test icmp-test {
probe-type icmp-ping-timestamp;
target address 192.178.16.5;
probe-interval 15;
thresholds {
ingress-time 3000;
}
traps ingress-time-exceeded;
```

```

        hardware-timestamp;
    }
}
probe customerB {
    test http-test {
        probe-type http-get
        target url http://customerB.net;
        probe-interval 30;
        thresholds {
            successive-loss 3;
            total-loss 10;
        }
    }
    traps [ probe-failure test-failure ];
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying RPM Services on page 1297](#)
- [Verifying RPM Statistics on page 1297](#)

### Verifying RPM Services

**Purpose** Verify that the RPM configuration is within the expected values.

**Action** From configuration mode, enter the **show services rpm** command. The output shows the values that are configured for RPM on the device.

### Verifying RPM Statistics

**Purpose** Verify that the RPM probes are functioning and that the RPM statistics are within expected values.

**Action** From configuration mode, enter the **show services rpm probe-results** command.

```

user@host> show services rpm probe-results

Owner: customerD, Test: icmp-test

**Example: Configuring RPM Using TCP and UDP Probes**

---

This example shows how to configure RPM using TCP and UDP probes.

- [Requirements on page 1298](#)
- [Overview on page 1298](#)
- [Configuration on page 1299](#)
- [Verification on page 1300](#)

**Requirements**

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces. See *Junos OS Interfaces Library for Security Devices*.
- Configure the probe owner, the test, and the specific parameters of the RPM probe. See [“Example: Configuring Basic RPM Probes” on page 1294](#).

**Overview**

In this example, you configure both the host (device A) and the remote device (device B) to act as TCP and UDP servers. You configure a probe for customerC, which uses TCP packets. Device B is configured as an RPM server for both TCP and UDP packets, using an lt services interface as the destination interface, and ports 50000 and 50037, respectively.

**CAUTION:** Use probe classification with caution, because improper configuration can cause packets to be dropped.

**NOTE:** On J Series devices, the destination interface must be an lt services interface.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
{device A}
set services rpm probe customerC test tcp-test probe-interval 5
set services rpm probe customerC test tcp-test probe-type tcp-ping
set services rpm probe customerC test tcp-test target address 192.162.45.6
set services rpm probe customerC test tcp-test destination-interface lt-0/0/0
set services rpm probe customerC test tcp-test destination-port 50000

{device B}
set services rpm probe-server tcp port 50000
set services rpm probe-server udp port 50037
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure RPM using TCP and UDP probes:

1. Configure the RPM owner on device A.

```
{device A}
[edit]
user@host# edit services rpm
user@host# set probe customerC
```

2. Configure the RPM test.

```
{device A}
[edit services rpm]
user@host# edit services rpm probe customerC
user@host# set test tcp-test probe-interval 5
```

3. Set the probe type.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test probe-type tcp-ping
```

4. Specify the target address.

```
{device A}
[edit services rpm probe customerC]
```

- ```
user@host# set test tcp-test target address 192.162.45.6
```
5. Configure the destination interface.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test destination-interface lt-0/0/0
```
  6. Configure port 50000 as the TCP port to which the RPM probes are sent.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test destination-port 50000
```
  7. Configure device B to act as a TCP server using port 50000.

```
{device B}
[edit]
user@host# edit services rpm
user@host# set probe-server tcp port 50000
```
  8. Configure device B to act as a UDP server using port 50037.

```
{device B}
[edit services rpm]
user@host# set probe-server udp port 50037
```

**Results** From configuration mode, confirm your configuration by entering the **show services rpm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show services rpm
probe customerC {
  test tcp-test {
    probe-type tcp-ping;
    target address 192.162.45.6;
    probe-interval 5;
    destination-port 50000;
    destination-interface lt-0/0/0.0;
  }
}
probe-server {
  tcp {
    port 50000;
  }
  udp {
    port 50037;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

#### **Verifying RPM Probe Servers**

**Purpose** Confirm that the configuration is working properly.

Verify that the device is configured to receive and transmit TCP and UDP RPM probes on the correct ports.

**Action** From configuration mode, enter the **show services rpm active-servers** command. The output shows a list of the protocols and corresponding ports for which the device is configured as an RPM server.

```
user@host> show services rpm active-servers
```

```
Protocol: TCP, Port: 50000
```

```
Protocol: UDP, Port: 50037
```

**Related  
Documentation**

- [RPM Overview on page 1248](#)
- [RPM Configuration Options on page 1306](#)

- [Tuning RPM Probes on page 1305](#)

---

### Example: Configuring RPM Probes for BGP Monitoring

This example shows how to configure RPM probes to monitor BGP neighbors.

- [Requirements on page 1301](#)
- [Overview on page 1301](#)
- [Configuration on page 1302](#)
- [Verification on page 1303](#)

#### **Requirements**

Before you begin:

- Configure the BGP parameters under RPM configuration to send RPM probes to BGP neighbors. See [“Example: Configuring Basic RPM Probes” on page 1294](#).
- Use TCP or UDP probes by configure both the probe server (Juniper Networks device) and the probe receiver (the remote device) to transmit and receive RPM probes on the same TCP or UDP port. See [“Example: Configuring RPM Using TCP and UDP Probes” on page 1298](#).

#### **Overview**

In this example, you specify a hexadecimal value that you want to use for the data portion of the RPM probe as ABCD123. ( It ranges from 1 through 2048 characters.) You specify the data size of the RPM probe as 1024 bytes. ( The value ranges from 0 through 65,507.)

Then you configure destination port 50000 as the TCP port to which the RPM probes are sent. You specify the number of probe results to be saved in the probe history as 25. (It ranges from 0 through 255, and the default is 50.) You set the probe count to 5 and probe interval as 1. (The probe count ranges from 1 through 15, and the default is 1; and

the probe interval ranges from 1 through 255, and the default is 3.) You then specify tcp-ping as the type of probe to be sent as part of the test.

Finally, you set the test interval as 60. The value ranges from 0 through 86,400 seconds for the interval between tests.

### **Configuration**

#### **CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set services rpm bgp data-fill ABCD123 data-size 1024
set services rpm bgp destination-port 50000 history-size 25
set services rpm bgp probe-count 5 probe-interval 1
set services rpm bgp probe-type tcp-ping test-interval 60
```

#### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure RPM probes to monitor BGP neighbors:

1. Configure the RPM and BGP.  

```
[edit]
user@host# edit services rpm bgp
```
2. Specify a hexadecimal value.  

```
[edit services rpm bgp]
user@host# set data-fill ABCD123
```
3. Specify the data size of the RPM probe.  

```
[edit services rpm bgp]
user@host# set data-size 1024
```
4. Configure the destination port.  

```
[edit services rpm bgp]
user@host# set destination-port 50000
```
5. Specify the number of probes.  

```
[edit services rpm bgp]
user@host# set history-size 25
```
6. Set the probe count and probe interval.  

```
[edit services rpm bgp]
user@host# set probe-count 5 probe-interval 1
```
7. Specify the type of probe.  

```
[edit services rpm bgp]
user@host# set probe-type tcp-ping
```

**NOTE:** If you do not specify the probe type the default ICMP probes are sent.

8. Set the test interval.

```
[edit services rpm bgp]
user@host# set test-interval 60
```

**Results** From configuration mode, confirm your configuration by entering the **show services rpm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show services rpm
bgp {
  probe-type tcp-ping;
  probe-count 5;
  probe-interval 1;
  test-interval 60;
  destination-port 50000;
  history-size 25;
  data-size 1024;
  data-fill ABCD123;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Verification*

#### *Verifying RPM Probes for BGP Monitoring*

**Purpose** Confirm that the configuration is working properly.

Verify that the RPM probes for BGP monitoring is configured.

**Action** From configuration mode, enter the **show services rpm** command.

### **Related Documentation**

- [RPM Overview on page 1248](#)
- [RPM Configuration Options on page 1306](#)
- [Directing RPM Probes to Select BGP Devices on page 1303](#)
- [Tuning RPM Probes on page 1305](#)

### **Directing RPM Probes to Select BGP Devices**

If a device has a large number of BGP neighbors configured, you can direct (filter) the RPM probes to a selected group of BGP neighbors rather than to all the neighbors. To identify the BGP devices to receive RPM probes, you can configure routing instances.

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To direct RPM probes to select BGP neighbors:

1. Configure routing instance **R11** to send RPM probes to BGP neighbors within the routing instance.

```
[edit services rpm bgp]
user@host# set routing-instances R11
```

2. If you are done configuring the device, enter **commit** from configuration mode.

---

### Configuring RPM Timestamping

To account for latency in the communication of probe messages, you can enable timestamping of the probe packets. You can timestamp the following RPM probe types: **icmp-ping**, **icmp-ping-timestamp**, **udp-ping**, and **udp-ping-timestamp**.

This example shows how to enable timestamping for customerA. The test for customerA is identified as customerA-test.

To configure timestamping:

1. Specify the RPM probe owner for which you want to enable timestamping.

```
[edit services rpm]
user@host# edit probe customerA
```

2. Specify a name for the test.

```
[edit services rpm probe customerA]
user@host# edit test customerA-test
```

3. Enable timestamping.

```
[edit services rpm probe customerA test customerA-test]
user@host# edit hardware-timestamp
```

4. (Optional) If preferred, indicate that you want timestamping to be only one-way.

```
[edit services rpm probe customerA test customerA-test]
user@host# edit one-way-hardware-timestamp
```

**NOTE:** You cannot include both the `source-address` and `hardware-timestamp` or `one-way-hardware-timestamp` statements at the `[edit services rpm probe probe-name test test-name]` hierarchy level simultaneously.

### Tuning RPM Probes

After configuring an RPM probe, you can set parameters to control probe functions, such as the interval between probes, the total number of concurrent probes that a system can handle, and the source address used for each probe packet. See “[Example: Configuring Basic RPM Probes](#)” on page 1294.

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To tune RPM probes:

1. Set the maximum number of concurrent probes allowed on the system to **10**.
 

```
[edit services rpm]
user@host# set probe-limit 10
```
2. Access the ICMP probe of customer A.
 

```
[edit]
user@host# edit services rpm probe customerA test icmp-test
```
3. Set the time between probe transmissions to 15 seconds.
 

```
[edit services rpm probe customerA test icmp-test]
user@host# set probe-interval 15
```
4. Set the number of probes within a test to **10**.
 

```
[edit services rpm probe customerA test icmp-test]
user@host# set probe-count 10
```
5. Set the source address for each probe packet to **192.168.2.9**. If you do not explicitly configure a source address, the address on the outgoing interface through which the probe is sent is used as the source address.
 

```
[edit services rpm probe customerA test icmp-test]
user@host# set source-address 192.168.2.9
```
6. If you are done configuring the device, enter **commit** from configuration mode.

### RPM Configuration Options

You can configure real-time performance monitoring (RPM) parameters. See [Table 132 on page 1306](#) for a summary of the configuration options.

**Table 132: RPM Configuration Summary**

| Field                              | Function  | Your Action  |
|------------------------------------|---|--|
| <b>Performance Probe Owners</b>    |   |  |
| Owner Name (required)              | Identifies an RPM owner for which one or more RPM tests are configured. In most implementations, the owner name identifies a network on which a set of tests is being run (a particular customer, for example). | Type the name of the RPM owner.  |
| <b>Identification</b>              |   |  |
| Test name (required)               | Uniquely identifies the RPM test  | Type the name of the RPM test.   |
| Target (Address or URL) (required) | IP address or URL of probe target   | Type the IP address, in dotted decimal notation, or the URL of the probe target. If the target is a URL, type a fully formed URL that includes <b>http://</b> .  |
| Source Address                     | Explicitly configured IP address to be used as the probe source address   | Type the source address to be used for the probe. If the source IP address is not one of the device's assigned addresses, the packet uses the outgoing interface's address as its source.  |
| Routing Instance                   | Particular routing instance over which the probe is sent  | Type the routing instance name. The routing instance applies only to probes of type <b>icmp</b> and <b>icmp-timestamp</b> . The default routing instance is <b>inet.0</b> .  |
| History Size                       | Number of probe results saved in the probe history  | Type a number between 0 and 255. The default history size is 50 probes.  |
| <b>Request Information</b>         |   |  |
| Probe Type (required)              | Specifies the type of probe to send as part of the test.  | Select the desired probe type from the list: <ul style="list-style-type: none"> <li>• <b>http-get</b></li> <li>• <b>http-get-metadata</b></li> <li>• <b>icmp-ping</b></li> <li>• <b>icmp-ping-timestamp</b></li> <li>• <b>tcp-ping</b></li> <li>• <b>udp-ping</b></li> </ul> |

Table 132: RPM Configuration Summary (*continued*)

| Field                           | Function   | Your Action  |
|---------------------------------|--|--|
| Interval                        | Sets the wait time (in seconds) between each probe transmission  | Type a number between 1 and 255 (seconds).   |
| Test Interval (required)        | Sets the wait time (in seconds) between tests.   | Type a number between 0 and 86400 (seconds).   |
| Probe Count                     | Sets the total number of probes to be sent for each test.  | Type a number between 1 and 15.  |
| Destination Port                | Specifies the TCP or UDP port to which probes are sent.<br><br>To use TCP or UDP probes, you must configure the remote server as a probe receiver. Both the probe server and the remote server must be Juniper Networks devices configured to receive and transmit RPM probes on the same TCP or UDP port.   | Type the number 7—a standard TCP or UDP port number—or a port number from 49152 through 65535. |
| DSCP Bits                       | Specifies the Differentiated Services code point (DSCP) bits. This value must be a valid 6-bit pattern. The default is <b>000000</b> .   | Type a valid 6-bit pattern.  |
| Data Size                       | Specifies the size of the data portion of the ICMP probes.   | Type a size (in bytes) between 0 and 65507.  |
| Data Fill                       | Specifies the contents of the data portion of the ICMP probes.   | Type a hexadecimal value between 1 and 800h to use as the contents of the ICMP probe data.     |
| Hardware Timestamp              | Enables timestamping of RPM probe messages. You can timestamp the following RPM probes to improve the measurement of latency or jitter: <ul style="list-style-type: none"> <li>• ICMP ping</li> <li>• ICMP ping timestamp</li> <li>• UDP ping—destination port UDP-ECHO (port 7) only</li> <li>• UDP ping timestamp—destination port UDP-ECHO (port 7) only</li> </ul> | To enable timestamping, select the check box.  |
| <b>Maximum Probe Thresholds</b> |  |  |
| Successive Lost Probes          | Sets the total number of probes that must be lost successively to trigger a probe failure and generate a system log message.   | Type a number between 0 and 15.  |
| Lost Probes                     | Sets the total number of probes that must be lost to trigger a probe failure and generate a system log message.  | Type a number between 0 and 15.  |
| Round Trip Time                 | Sets the total round-trip time (in microseconds), from the device to the remote server, that triggers a probe failure and generates a system log message.  | Type a number between 0 and 60,000,000 (microseconds).   |

Table 132: RPM Configuration Summary (*continued*)

| Field                              | Function   | Your Action   |
|------------------------------------|--|---|
| Jitter                             | Sets the total jitter (in microseconds), for a test, that triggers a probe failure and generates a system log message.   | Type a number between 0 and 60,000,000 (microseconds).  |
| Standard Deviation                 | Sets the maximum allowable standard deviation (in microseconds) for a test, which, if exceeded, triggers a probe failure and generates a system log message.                   | Type a number between 0 and 60,000,000 (microseconds).  |
| Egress Time                        | Sets the total one-way time (in microseconds), from the device to the remote server, that triggers a probe failure and generates a system log message.                         | Type a number between 0 and 60,000,000 (microseconds).  |
| Ingress Time                       | Sets the total one-way time (in microseconds), from the remote server to the device, that triggers a probe failure and generates a system log message.                         | Type a number between 0 and 60,000,000 (microseconds)   |
| Jitter Egress Time                 | Sets the total outbound-time jitter (in microseconds), for a test, that triggers a probe failure and generates a system log message.   | Type a number between 0 and 60,000,000 (microseconds)   |
| Jitter Ingress Time                | Sets the total inbound-time jitter (in microseconds), for a test, that triggers a probe failure and generates a system log message.  | Type a number between 0 and 60,000,000 (microseconds).  |
| Egress Standard Deviation          | Sets the maximum allowable standard deviation of outbound times (in microseconds) for a test, which, if exceeded, triggers a probe failure and generates a system log message. | Type a number between 0 and 60,000,000 (microseconds).  |
| Ingress Standard Deviation         | Sets the maximum allowable standard deviation of inbound times (in microseconds) for a test, which, if exceeded, triggers a probe failure and generates a system log message.  | Type a number between 0 and 60,000,000 (microseconds).  |
| <b>Traps</b>                       |  |   |
| Egress Jitter Exceeded             | Generates SNMP traps when the threshold for jitter in outbound time is exceeded.   | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Egress Standard Deviation Exceeded | Generates SNMP traps when the threshold for standard deviation in outbound times is exceeded.  | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Egress Time Exceeded               | Generates SNMP traps when the threshold for maximum outbound time is exceeded.   | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Ingress Jitter Exceeded            | Generates SNMP traps when the threshold for jitter in inbound time is exceeded.  | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |

Table 132: RPM Configuration Summary (*continued*)

| Field                               | Function   | Your Action   |
|-------------------------------------|--|---|
| Ingress Standard Deviation Exceeded | Generates SNMP traps when the threshold for standard deviation in inbound times is exceeded. | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Ingress Time Exceeded               | Generates traps when the threshold for maximum inbound time is exceeded.                     | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Jitter Exceeded                     | Generates traps when the threshold for jitter in round-trip time is exceeded.                | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Probe Failure                       | Generates traps when the threshold for the number of successive lost probes is reached.      | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| RTT Exceeded                        | Generates traps when the threshold for maximum round-trip time is exceeded.                  | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Standard Deviation Exceeded         | Generates traps when the threshold for standard deviation in round-trip times is exceeded.   | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Test Completion                     | Generates traps when a test is completed.  | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| Test Failure                        | Generates traps when the threshold for the total number of lost probes is reached.           | <ul style="list-style-type: none"> <li>To enable SNMP traps for this condition, select the check box.</li> <li>To disable SNMP traps, clear the check box.</li> </ul> |
| <b>Performance Probe Server</b>     |  |   |
| TCP Probe Server                    | Specifies the port on which the device is to receive and transmit TCP probes.                | Type the number 7—a standard TCP or UDP port number—or a port number from 49160 through 65535.  |
| UDP Probe Server                    | Specifies the port on which the device is to receive and transmit UDP probes.                | Type the number 7—a standard TCP or UDP port number—or a port number from 49160 through 65535.  |

         `packet-summary;`  
         `trace;`  
     `}`  
     `module {`  
         `flow {`  
             `flag {`  
                 `all;`  
             `}`  
         `}`  
     `}`  
     `preserve-trace-order;`  
     `record-pic-history;`  
`}`

**Hierarchy Level** [edit security datapath-debug]

**Release Information** Command introduced in Junos OS Release 10.0.

**Description** Configure the action profile options for data path debugging.

- Options**
- ***action-profile name*** — Name of the action profile.
  - **event**—Enable the events to trace the packet when the packet hit the events (jexec, lbt, lt-enter, lt-leave, mac-egress, mac-ingress, np-egress, np-ingress, pot)
    - **count**—Number of times a packet hits the specified event.
    - **packet-dump**—Capture the packet that hits the specified event.
    - **packet-summary**—Print the source/destination IP address details with protocol number and IP length details along with trace message for the specified event.
    - **trace**—Print the standard trace message when the packet hits the specified event.
  - **module**—Turn on the flow session related trace messages.
    - **flow**—Trace flow session related messages.
    - **flag**—Specify which flow message needs to be traced.
    - **all**—Trace all possible flow trace messages.
    - **trace**—Print the standard trace message when the packet hits the specified event.
  - **preserve-trace-order**—Preserve trace order.
  - **record-pic-history**—Record the PICs in which the packet has been processed.

## archive-sites

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>archive-sites {<br/>    <i>site-name</i>;<br/>}</pre>  |
| <b>Hierarchy Level</b>          | [edit accounting-options <a href="#">file</a> <i>filename</i> ]   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.   |
| <b>Description</b>              | Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format <i>router-name_log-filename_timestamp</i> . |
| <b>Options</b>                  | <i>site-name</i> —Any valid FTP URL to a destination.   |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Archive Sites on page 1260</a></li></ul>  |

## capture-file (Security)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>capture-file {<br/>    filename;<br/>    files number;<br/>    format <i>pcap-format</i>;<br/>    size <i>maximum-file-size</i>;<br/>    (world-readable   no-world-readable);<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit security datapath-debug]  |
| <b>Release Information</b>      | Statement introduced in Release 10.4 of Junos OS.   |
| <b>Description</b>              | Sets packet capture for performing the datapath-debug action.   |
| <b>Options</b>                  | <ul style="list-style-type: none"><li>• <b>filename</b>—Name of the file to receive the output of the packet capturing operation.</li><li>• <b>files</b>—Maximum number of capture files.<br/><br/>If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.<br/><br/>Range: 1 through 10 files</li><li>• <b>format</b>—Describes the format of the capture file. The default format file is pcap. You can also set it as private (binary) format.</li><li>• <b>size</b>—Describes the size limit of the capture file.<br/><br/>If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.<br/><br/>Range: 10 KB through 100 MB</li><li>• <b>world-readable   no-world-readable</b>—By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.</li></ul> |
| <b>Required Privilege Level</b> | security—To view this statement in the configuration.<br>security-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Junos OS Intrusion Detection and Prevention (IDP) Library for Security Devices</i></li><li>• <a href="#">System Log Messages</a></li></ul>   |

## class-usage-profile

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre>class-usage-profile <i>profile-name</i> {   file <i>filename</i>;   interval <i>minutes</i>;   source-classes {     <i>source-class-name</i>;   }   destination-classes {     <i>destination-class-name</i>;   } }</pre>  |
| <b>Hierarchy Level</b>          | [edit accounting-options]  |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>   |
| <b>Description</b>              | Create a class usage profile, which is used to log class usage statistics to a file in the <code>/var/log</code> directory. The class usage profile logs class usage statistics for the configured source classes on every interface that has <b>destination-class-usage</b> configured. |
| <b>Options</b>                  | <p><b><i>profile-name</i></b>—Name of the destination class profile.</p> <p>The remaining statements are explained separately.</p>   |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Class Usage Profiles on page 1270</a></li> </ul>  |

## counters

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>counters {<br/>    counter-name;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit accounting-options <a href="#">filter-profile</a> <i>profile-name</i> ]   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.   |
| <b>Description</b>              | Names of counters for which filter profile statistics are collected. The packet and byte counts for the counters are logged to a file in the <code>/var/log</code> directory. |
| <b>Options</b>                  | <i>counter-name</i> —Name of the counter.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring the Counters on page 1263</a></li></ul>   |

## datapath-debug

```
Syntax  datapath-debug {
        action-profile profile-name {
            event (jexec | lbt | lt-enter | lt-leave | mac-egress | mac-ingress | np-egress | np-ingress
                | pot) {
                count;
                packet-dump;
                packet-summary;
                trace;
            }
            module {
                flow {
                    flag {
                        all;
                    }
                }
            }
        }
        preserve-trace-order;
        record-pic-history;
    }
    capture-file {
        filename;
        files number;
        format pacp-format;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    maximum-capture-size value;
    packet-filter packet-filter-name {
        action-profile (profile-name | default);
        destination-port (port-range | protocol-name);
        destination-prefix destination-prefix;
        interface logical-interface-name;

| <b>Syntax</b>                   | <code>probe-interval <i>interval</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit services rpm bgp],<br>[edit services rpm probe <i>owner</i> test <i>test-name</i> ]                                 |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches. |
| <b>Description</b>              | Specify the time to wait between sending packets, in seconds.   |
| <b>Options</b>                  | <i>interval</i> —Number of seconds, from 1 through 255.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |

## probe-limit

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>probe-limit <i>limit</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit services rpm]   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches. |
| <b>Description</b>              | Specify the maximum number of concurrent probes allowed.  |
| <b>Options</b>                  | <i>limit</i> —A value from 1 through 500.<br><b>Default:</b> 100.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |

## probe-server

---

**Syntax**    `probe-server {  
              tcp {  
                  destination-interface interface-name;  
                  port number;  
              }  
              udp {  
                  destination-interface interface-name;  
                  port number;  
              }  
          }`

**Hierarchy Level**    [edit services rpm]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.3 for EX Series switches.

**Description**    Specify the server to act as a receiver for the probes.  
  
                      The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

---

## probe-type

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>probe-type type;</code>  |
| <b>Hierarchy Level</b>          | [edit services rpm bgp],<br>[edit services rpm probe <i>owner</i> test <i>test-name</i> ]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches.  |
| <b>Description</b>              | Specify the packet and protocol contents of a probe.   |
| <b>Options</b>                  | <p><b>type</b>—Specify one of the following probe type values:</p> <ul style="list-style-type: none"><li>• <b>http-get</b>—(Not available at the [edit services rpm bgp] hierarchy level.) Sends a Hypertext Transfer Protocol (HTTP) get request to a target URL.</li><li>• <b>http-metadata-get</b>—(Not available at the [edit services rpm bgp] hierarchy level.) Sends an HTTP get request for metadata to a target URL.</li><li>• <b>icmp-ping</b>—Sends ICMP echo requests to a target address.</li><li>• <b>icmp-ping-timestamp</b>—Sends ICMP timestamp requests to a target address.</li><li>• <b>tcp-ping</b>—Sends TCP packets to a target.</li><li>• <b>udp-ping</b>—Sends UDP packets to a target.</li><li>• <b>udp-ping-timestamp</b>—Sends UDP timestamp requests to a target address.</li></ul> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |

## routing-engine-profile

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>routing-engine-profile <i>profile-name</i> {<br/>    <b>fields</b> {<br/>        <i>field-name</i>;<br/>    }<br/>    <b>file</b> <i>filename</i>;<br/>    <b>interval</b> <i>minutes</i>;<br/>}</pre> |
| <b>Hierarchy Level</b>          | [edit accounting-options]   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.   |
| <b>Description</b>              | Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the <code>/var/log</code> directory.  |
| <b>Options</b>                  | <p><b><i>profile-name</i></b>—Name of the Routing Engine statistics profile.</p> <p>The remaining statements are explained separately.</p>  |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring the Routing Engine Profile on page 1274</a></li></ul>   |

## rpm (Services)

```
Syntax  rpm {
        bgp {
            data-fill data;
            data-size size;

## size

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>size bytes;</code>   |
| <b>Hierarchy Level</b>          | [edit accounting-options <a href="#">file</a> <i>filename</i> ]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.  |
| <b>Description</b>              | Specify attributes of an accounting-data log file.   |
| <b>Options</b>                  | <p><b>bytes</b>—Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, <b>profilelog</b>) reaches its maximum size, it is renamed <b>profilelog.0</b>, then <b>profilelog.1</b>, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.</p> <p><b>Syntax:</b> <i>x</i> to specify bytes, <i>xk</i> to specify KB, <i>xm</i> to specify MB, <i>xg</i> to specify GB</p> <p><b>Range:</b> 256 KB through 1 GB</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring the Maximum Size of the File on page 1259</a></li> </ul>  |

## source-classes

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>source-classes {     source-class-name; }</pre>  |
| <b>Hierarchy Level</b>          | [edit accounting-options <a href="#">class-usage-profile</a> <i>profile-name</i> ]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches. |
| <b>Description</b>              | Specify the source classes for which statistics are collected.  |
| <b>Options</b>                  | <b>source-class-name</b> —Name of the source class to include in the class usage profile.                                 |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring a Class Usage Profile on page 1270</a></li> </ul>        |

## start-time

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>start-time <i>time</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit accounting-options <a href="#">file</a> <i>filename</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.       |
| <b>Description</b>              | Specify the start time for transfer of an accounting-data log file.   |
| <b>Options</b>                  | <i>time</i> —Start time for file transfer.<br><b>Syntax:</b> <i>YYYY-MM-DD.hh:mm</i>  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.     |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring the Start Time for File Transfer on page 1259</a></li></ul> |

## target

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>target (url <i>url</i>   address <i>address</i>);</code>   |
| <b>Hierarchy Level</b>          | [edit services rpm probe <i>owner</i> test <i>test-name</i> ]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches.  |
| <b>Description</b>              | Specify the destination address used for the probes.   |
| <b>Options</b>                  | <i>url url</i> —For HTTP probe types, specify a fully formed URL that includes <b>http://</b> in the URL address.<br><br><i>address address</i> —For all other probe types, specify an IPv4 address for the target host. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |

## thresholds

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>thresholds thresholds;</code>  |
| <b>Hierarchy Level</b>          | <code>[edit services rpm probe owner test test-name]</code>  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches.  |
| <b>Description</b>              | Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.   |
| <b>Options</b>                  | <p><b>thresholds</b>—Specify one or more threshold measurements. The following options are supported:</p> <ul style="list-style-type: none"> <li>• <b>egress-time</b>—Measures maximum source-to-destination time per probe.</li> <li>• <b>ingress-time</b>—Measures maximum destination-to-source time per probe.</li> <li>• <b>jitter-egress</b>—Measures maximum source-to-destination jitter per test.</li> <li>• <b>jitter-ingress</b>—Measures maximum destination-to- source jitter per test.</li> <li>• <b>jitter-rtt</b>—Measures maximum jitter per test, from 0 through 60,000,000 microseconds.</li> <li>• <b>rtt</b>—Measures maximum round-trip time per probe, in microseconds.</li> <li>• <b>std-dev-egress</b>—Measures maximum source-to-destination standard deviation per test.</li> <li>• <b>std-dev-ingress</b>—Measures maximum destination-to-source standard deviation per test.</li> <li>• <b>std-dev-rtt</b>—Measures maximum standard deviation per test, in microseconds.</li> <li>• <b>successive-loss</b>—Measures successive probe loss count, indicating probe failure.<br/>Default: 1</li> <li>• <b>total-loss</b>—Measures total probe loss count indicating test failure, from 0 through 15.<br/>Default: 1</li> </ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |

## traceoptions (Security Datapath Debug)

```
Syntax  traceoptions {
        file {
            filename;
            files number;
            match regular-expression;
            size maximum-file-size;
            (world-readable | no-world-readable);
        }
        no-remote-trace;
    }
```

**Hierarchy Level** [edit security datapath-debug]

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Sets the trace options for datapath-debug.

**Options** • **file**—Configure the trace file options.

- **filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.
- **files number**—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed to **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

Range: 2 through 1000 files

Default: 10 files

- **match regular-expression**—Refine the output to include lines that contain the regular expression.
- **size maximum-file-size**—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the trace-file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

Syntax: x K to specify KB, x m to specify MB, or x g to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option
- **no-remote-trace**—Set remote tracing as disabled.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

**Related Documentation** • *IDP Monitoring and Troubleshooting Guide for Security Devices*

## transfer-interval

**Syntax** transfer-interval *minutes*;

**Hierarchy Level** [edit accounting-options [file](#) *filename*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the length of time the file remains open and receives new statistics before it is closed and transferred to an archive site.

**Options** *minutes*—Time the file remains open and receives new statistics before it is closed and transferred to an archive site.  
**Range:** 5 through 2880 minutes  
**Default:** 30 minutes

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring the Transfer Interval of the File on page 1259](#)

## traps

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>traps traps;</code>  |
| <b>Hierarchy Level</b>          | <code>[edit services rpm probe <i>owner</i> test <i>test-name</i>]</code>  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches.  |
| <b>Description</b>              | Set the trap bit to generate traps for probes. Traps are sent if the configured threshold is met or exceeded.  |
| <b>Options</b>                  | <p><b>traps</b>—Specify one or more traps. The following options are supported:</p> <ul style="list-style-type: none"><li>• <b>egress-jitter-exceeded</b>—Generates traps when the jitter in egress time threshold is met or exceeded.</li><li>• <b>egress-std-dev-exceeded</b>—Generates traps when the egress time standard deviation threshold is met or exceeded.</li><li>• <b>egress-time-exceeded</b>—Generates traps when the maximum egress time threshold is met or exceeded.</li><li>• <b>ingress-jitter-exceeded</b>—Generates traps when the jitter in ingress time threshold is met or exceeded.</li><li>• <b>ingress-std-dev-exceeded</b>—Generates traps when the ingress time standard deviation threshold is met or exceeded.</li><li>• <b>ingress-time-exceeded</b>—Generates traps when the maximum ingress time threshold is met or exceeded.</li><li>• <b>jitter-exceeded</b>—Generates traps when the jitter in round-trip time threshold is met or exceeded.</li><li>• <b>probe-failure</b>—Generates traps for successive probe loss thresholds crossed.</li><li>• <b>rtt-exceeded</b>—Generates traps when the maximum round-trip time threshold is met or exceeded.</li><li>• <b>std-dev-exceeded</b>—Generates traps when the round-trip time standard deviation threshold is met or exceeded.</li><li>• <b>test-completion</b>—Generates traps when a test is completed.</li><li>• <b>test-failure</b>—Generates traps when the total probe loss threshold is met or exceeded.</li></ul> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |

### Displaying Multicast Path Information

To display information about a multicast path from a source to the J Series device, enter the **mtrace from-source** command with the following syntax:

```
user@host> mtrace from-source source host <extra-hops number> <group address>
<interval seconds> <max-hops number> <max-queries number> <response host>
<routing-instance routing-instance-name> <ttl number> <wait-time seconds> <loop>
<multicast-response | unicast-response> <no-resolve> <no-router-alert> <brief |
detail>
```

[Table 133 on page 1356](#) describes the **mtrace from-source** command options.

**Table 133: CLI mtrace from-source Command Options**

| Option  | Description  |
|---|--|
| <b>source host</b>                            | Traces the path to the specified hostname or IP address.   |
| <b>extra-hops number</b>                      | (Optional) Sets the number of extra hops to trace past nonresponsive devices. Specify a value from 0 through 255.  |
| <b>group address</b>                          | (Optional) Traces the path for the specified group address. The default value is 0.0.0.0.  |
| <b>interval seconds</b>                       | (Optional) Sets the interval between statistics gathering. The default value is 10.  |
| <b>max-hops number</b>                        | (Optional) Sets the maximum number of hops to trace toward the source. Specify a value from 0 through 255. The default value is 32.  |
| <b>max-queries number</b>                     | (Optional) Sets the maximum number of query attempts for any hop. Specify a value from 1 through 32. The default value is 3.   |
| <b>response host</b>                          | (Optional) Sends the response packets to the specified hostname or IP address. By default, the response packets are sent to the J Series device.   |
| <b>routing-instance routing-instance-name</b> | (Optional) Traces the routing instance you specify.  |
| <b>ttl number</b>                             | (Optional) Sets the time-to-live (TTL) value in the IP header of the query packets. Specify a hop count from 0 through 255. The default value for local queries to the <i>all routers</i> multicast group is 1. Otherwise, the default value is 127. |
| <b>wait-time seconds</b>                      | (Optional) Sets the time to wait for a response packet. The default value is 3 seconds.  |

Table 133: CLI mtrace from-source Command Options (*continued*)

| Option                    | Description  |
|---------------------------|--|
| <b>loop</b>               | (Optional) Loops indefinitely, displaying rate and loss statistics. To quit the <b>mtrace</b> command, press Ctrl-C. |
| <b>multicast-response</b> | (Optional) Forces the responses to use multicast.  |
| <b>unicast-response</b>   | (Optional) Forces the response packets to use unicast.   |
| <b>no-resolve</b>         | (Optional) Does not display hostnames.   |
| <b>no-router-alert</b>    | (Optional) Does not use the device alert IP option in the IP header.   |
| <b>brief</b>              | (Optional) Does not display packet rates and losses.   |
| <b>detail</b>             | (Optional) Displays packet rates and losses if a group address is specified.   |

The following is sample output from the **mtrace from-source** command:

```

user@host> mtrace from-source source 192.1.4.1 group 224.1.1.1

Mtrace from 192.1.4.1 to 192.1.30.2 via group 224.1.1.1 Querying full reverse

? v \_ ttl 3 ?/0
0 pps 192.1.30.2 192.1.30.2 Receiver Query Source

```

Each line of the trace display is usually in the following format (depending on the options selected and the responses from the devices along the path):

*hop-number host (ip-address) protocolttl*

Table 134 on page 1357 summarizes the output fields of the display.

**NOTE:** The packet statistics gathered from Juniper Networks devices and routing nodes always display as 0.

Table 134: CLI mtrace from-source Command Output Summary

| Field             | Description   |
|-------------------|---|
| <b>hop-number</b> | Number of the hop (device) along the path.  |
| <b>host</b>       | Hostname, if available, or IP address of the device. If the <b>no-resolve</b> option was entered in the command, the hostname is not displayed. |

Table 134: CLI mtrace from-source Command Output Summary (*continued*)

| Field                                  | Description  |
|--|--|
| <i>ip-address</i>                      | IP address of the device.  |
| <i>protocol</i>                        | Protocol used.   |
| <i>tth</i>                             | TTL threshold.   |
| Round trip time <i>milliseconds ms</i> | Total time between the sending of the query packet and the receiving of the response packet.                     |
| total ttl of <i>number</i> required    | Total number of hops required to reach the source.   |
| Source                                 | Source IP address of the response packet.  |
| Response Dest                          | Response destination IP address.   |
| Overall                                | Average packet rate for all traffic at each hop.   |
| Packet Statistics For Traffic From     | Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop. |
| Receiver                               | IP address receiving the multicast packets.  |
| Query Source                           | IP address of the host sending the query packets.  |

### Displaying Real-Time Interface Information

Enter the **monitor interface** command to display real-time traffic, error, alarm, and filter statistics about a physical or logical interface:

```
user@host> monitor interface (interface-name | traffic)
```

Replace ***interface-name*** with the name of a physical or logical interface. If you specify the **traffic** option, statistics for all active interfaces display.

The real-time statistics update every second. The **Current delta** and **Delta** columns display the amount the statistics counters have changed since the **monitor interface** command was entered or since you cleared the delta counters. [Table 135 on page 1358](#) and [Table 136 on page 1359](#) list the keys you use to control the display using the ***interface-name*** and **traffic** options. (The keys are not case sensitive.)

Table 135: CLI monitor interface Output Control Keys

| Key | Action  |
|-----|---|
| c   | Clears (returns to 0) the delta counters in the <b>Current delta</b> column. The statistics counters are not cleared. |
| f   | Freezes the display, halting the update of the statistics and delta counters.   |

Table 135: CLI monitor interface Output Control Keys (*continued*)

| Key      | Action   |
|----------|--|
| i        | Displays information about a different interface. You are prompted for the name of a specific interface.   |
| n        | Displays information about the next interface. The device scrolls through the physical and logical interfaces in the same order in which they are displayed by the <b>show interfaces terse</b> command. |
| q or ESC | Quits the command and returns to the command prompt.   |
| t        | Thaws the display, resuming the update of the statistics and delta counters.   |

Table 136: CLI monitor interface traffic Output Control Keys

| Key      | Action  |
|----------|---|
| b        | Displays the statistics in units of bytes and bytes per second (bps).   |
| c        | Clears (returns to 0) the delta counters in the <b>Delta</b> column. The statistics counters are not cleared. |
| d        | Displays the <b>Delta</b> column instead of the rate column—in bps or packets per second (pps).               |
| p        | Displays the statistics in units of packets and packets per second (pps).                                     |
| q or ESC | Quits the command and returns to the command prompt.  |
| r        | Displays the rate column—in bps and pps—instead of the <b>Delta</b> column.                                   |

The following are sample displays from the **monitor interface** command:

```
user@host> monitor interface fe-0/0/0
```

```

host1                               Seconds: 5                               Time: 04:38:40
                                      Delay: 3/0/10

### Displaying Real-Time Monitoring Information

To display real-time monitoring information about each device between the J Series device and a specified destination host, enter the **traceroute monitor** command with the following syntax:

```
user@host> traceroute monitor host <count number> <inet | inet6> <interval seconds>
<no-resolve> <size bytes> <source source-address> <summary>
```

Table 137 on page 1360 describes the **traceroute monitor** command options.

**Table 137: CLI traceroute monitor Command Options**

| Option                  | Description   |
|-------------------------|---|
| <i>host</i>             | Sends traceroute packets to the hostname or IP address you specify.   |
| <i>count number</i>     | (Optional) Limits the number of ping requests, in packets, to send in summary mode. If you do not specify a count, ping requests are continuously sent until you press Q. |
| <i>inet</i>             | (Optional) Forces the traceroute packets to an IPv4 destination.  |
| <i>inet6</i>            | (Optional) Forces the traceroute packets to an IPv6 destination.  |
| <i>interval seconds</i> | (Optional) Sets the interval between ping requests, in seconds. The default value is 1 second.  |

Table 137: CLI traceroute monitor Command Options (*continued*)

| Option                | Description  |
|-----------------------|--|
| <b>no-resolve</b>     | (Optional) Suppresses the display of the hostnames of the hops along the path.   |
| <b>size bytes</b>     | (Optional) Sets the size of the ping request packet. The size can be from 0 through 65,468 bytes. The default packet size is 64 bytes. |
| <b>source address</b> | (Optional) Uses the source address that you specify, in the traceroute packet.   |
| <b>summary</b>        | (Optional) Displays the summary traceroute information.  |

To quit the **traceroute monitor** command, press **Q**.

The following is sample output from a **traceroute monitor** command:

```

user@host> traceroute monitor host2

My traceroute  [v0.69]
host (0.0.0.0)(tos=0x0 psize=64 bitpattern=0x00)

| <b>Packets</b>            |   |
| <i>number</i>             | Number of the hop (device) along the route to the final destination host.   |
| <b>Host</b>               | Hostname or IP address of the device at each hop.   |
| <b>Loss%</b>              | Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage. |
| <b>Pings</b>              |   |
| <b>Snt</b>                | Number of ping requests sent to the device at this hop.   |
| <b>Last</b>               | Most recent round-trip time, in milliseconds, to the device at this hop.  |
| <b>Avg</b>                | Average round-trip time, in milliseconds, to the device at this hop.  |
| <b>Best</b>               | Shortest round-trip time, in milliseconds, to the device at this hop.   |
| <b>Wrst</b>               | Longest round-trip time, in milliseconds, to the device at this hop.  |
| <b>StDev</b>              | Standard deviation of round-trip times, in milliseconds, to the device at this hop.                                     |

### Monitoring Address Pools

- Purpose** Use the monitoring functionality to view the Address Pools page.
- Action** To monitor Address Pools, select **Monitor>Access>Address Pools** in the J-Web user interface.
- Meaning** [Table 139 on page 1362](#) summarizes key output fields in the Address Pools page.

Table 139: Address Pools Monitoring Page

| Field                          | Values | Additional Information |
|--------------------------------|--------|------------------------|
| <b>Address Pool Properties</b> |        |                        |

Table 139: Address Pools Monitoring Page (*continued*)

| Field                                  | Values  | Additional Information   |
|--|---|--|
| Address Pool Name                      | Displays the name of the address pool.  | -  |
| Network Address                        | Displays the IP network address of the address pool.                          | -  |
| Address Ranges                         | Displays the name, the lower limit, and the upper limit of the address range. | -  |
| Primary DNS                            | Displays the primary-dns IP address.  | -  |
| Secondary DNS                          | Displays the secondary-dns IP address.  | -  |
| Primary WINS                           | Displays the primary-wins IP address.   | -  |
| Secondary WINS                         | Displays the secondary-wins IP address.                                       | -  |
| <b>Address Pool Address Assignment</b> |   |  |
| IP Address                             | Displays the IP address of the address pool.                                  | -  |
| Hardware Address                       | Displays the hardware MAC address of the address pool.                        | -  |
| Host/User                              | Displays the user name using the address pool.                                | -  |
| Type                                   | Displays the authentication type used by the address pool                     | The authentication types can be extended authentication (XAuth) or IKE Authentication. |

### Monitoring Antivirus Scan Engine Status

**Purpose** Using the CLI, you can view the following scan engine status items:

Antivirus license key status

- View license expiration dates.

Scan engine status and settings

- View last action result.
- View default file extension list.

#### Antivirus pattern update server settings

- View update URL (HTTP or HTTPS-based).
- View update interval.

#### Antivirus pattern database status

- View auto update status.
- View last result of database loading.
- If the download completes, view database version timestamp virus record number.
- If the download fails, view failure reason.

**Action** In the CLI, enter the `user@host> show security utm anti-virus status` command.

Example status result:

```
AV Key Expire Date: 03/01/2010 00:00:00
Update Server: http://update.juniper-updates.net/AV/SRX210
interval: 60 minutes
auto update status: next update in 12 minutes
last result: new database loaded
AV signature version: 12/21/2008 00:35 GMT, virus records: 154018
Scan Engine Info: last action result: No error(0x00000000)
```

### Monitoring Antivirus Scan Results

---

**Purpose** View statistics for antivirus requests, scan results, and fallback counters.

Scan requests provide

- The total number of scan request forwarded to the engine.
- The number of scan request being pre-windowed.
- The number of scan requests using scan-all mode.
- The number of scan requests using scan-by-extension mode.

Scan code counters provide

- Number of clean files.
- Number of infected files.
- Number of password protected files.

- Number of decompress layers.
- Number of corrupt files.
- When the engine is out of resources.
- When there is an internal error.

Fallback applied status provides either a log-and-permit or block result when the following has occurred

- Scan engine not ready.
- Maximum content size reached.
- Too many requests.
- Password protected file found.
- Decompress layer too large.
- Corrupt file found.
- Timeout occurred.
- Out of resources.
- Other.

**Action** To view antivirus scan results using the CLI editor, enter the **user@host> show security utm anti-virus statistics status** command.

To view antivirus scan results using J-Web:

1. Select **Monitor>Security>UTM>Anti-Virus**.

The following information becomes viewable in the right pane.

Antivirus license key status

- View license expiration dates.

Antivirus pattern update server settings

- View update URL (HTTP or HTTPS-based).
- View update interval.

Antivirus pattern database status

- View auto update status.
- View last result of database loading.
- If the download completes, view database version timestamp virus record number.
- If the download fails, view failure reason.

Antivirus statistics provide

- The number of scan request being pre-windowed.
- The total number of scan request forwarded to the engine.
- The number of scan requests using scan-all mode.
- The number of scan requests using scan-by-extension mode.

Scan code counters provide

- Number of clean files.
- Number of infected files.
- Number of password protected files.
- Number of decompress layers.
- Number of corrupt files.
- When the engine is out of resources.
- When there is an internal error.

Fallback applied status provides either a log-and-permit or block result when the following has occurred

- Scan engine not ready.
- Password protected file found.
- Decompress layer too large.
- Corrupt file found.
- Out of resources.
- Timeout occurred.
- Maximum content size reached.
- Too many requests.
- Other.

2. You can click the **Clear Anti-Virus Statistics** button to clear all current viewable statistics and begin collecting new statistics.

**Related  
Documentation**

- [UTM Full Antivirus Protection Feature Guide for Security Devices](#)

---

### Monitoring Antivirus Session Status

**Purpose** Using the CLI, you can view the following session status items:

Antivirus session status displays a snapshot of current antivirus sessions. It includes

- Maximum supported antivirus session numbers.
- Total allocated antivirus session numbers.
- Total freed antivirus session numbers.
- Current active antivirus session numbers.

**Action** In the CLI, enter the `user@host> show security utm session status` command.

### Monitoring Class-of-Service Performance

The J-Web user interface provides information about the class-of-service (CoS) performance on a device. You can view information about the current status of CoS components—classifiers, CoS value aliases, red drop profiles, forwarding classes, rewrite rules and scheduler maps. You can also see the interfaces to which these components are assigned.

In addition, you can display the entire CoS configuration, including system-chosen defaults, by entering the `show class-of-service` command.

This section contains the following topics:

- [Monitoring CoS Interfaces on page 1367](#)
- [Monitoring CoS Classifiers on page 1368](#)
- [Monitoring CoS Value Aliases on page 1369](#)
- [Monitoring CoS RED Drop Profiles on page 1370](#)
- [Monitoring CoS Forwarding Classes on page 1371](#)
- [Monitoring CoS Rewrite Rules on page 1372](#)
- [Monitoring CoS Scheduler Maps on page 1373](#)

#### *Monitoring CoS Interfaces*

**Purpose** Display details about the physical and logical interfaces and the CoS components assigned to them.

**Action** Select **Monitor>Class of Service>Interfaces** in the J-Web user interface, or enter the `show class-of-service interface interface` command.

[Table 140 on page 1368](#) summarizes key output fields for CoS interfaces.

Table 140: Summary of Key CoS Interfaces Output Fields

| Field             | Values  | Additional Information   |
|-------------------|---|--|
| Interface         | Name of a physical interface to which CoS components are assigned.                                | To display names of logical interfaces configured on this physical interface, click the plus sign (+). |
| Scheduler Map     | Name of the scheduler map associated with this interface.   | –  |
| Queues Supported  | Number of queues you can configure on the interface.  | –  |
| Queues in Use     | Number of queues currently configured.  | –  |
| Logical Interface | Name of a logical interface on the physical interface, to which CoS components are assigned.      | –  |
| Object            | Category of an object—for example, <b>classifier</b> , <b>scheduler-map</b> , or <b>rewrite</b> . | –  |
| Name              | Name that you have given to an object—for example, <b>ba-classifier</b> .                         | –  |
| Type              | Type of an object—for example, <b>dscp</b> , or <b>exp</b> for a classifier.                      | –  |
| Index             | Index of this interface or the internal index of a specific object.                               | –  |

### ***Monitoring CoS Classifiers***

**Purpose** Display the mapping of incoming CoS value to forwarding class and loss priority.

**Action** For each classifier, select **Monitor>Class of Service>Classifiers** in the J-Web user interface, or enter the **show class-of-service classifier** command.

[Table 141 on page 1368](#) summarizes key output fields for CoS classifiers.

Table 141: Summary of Key CoS Classifier Output Fields

|                 |                       |   |
|-----------------|-----------------------|---|
| Classifier Name | Name of a classifier. | To display classifier assignments, click the plus sign (+). |
|-----------------|-----------------------|---|

Table 141: Summary of Key CoS Classifier Output Fields (*continued*)

|                            |  |
|----------------------------|--|
| CoS Value Type             | <p>The classifiers are displayed by type:</p> <ul style="list-style-type: none"> <li>• <b>dscp</b>—All classifiers of the DSCP type.</li> <li>• <b>dscp ipv6</b>—All classifiers of the DSCP IPv6 type.</li> <li>• <b>exp</b>—All classifiers of the MPLS EXP type.</li> <li>• <b>ieee-802.1</b>—All classifiers of the IEEE 802.1 type.</li> <li>• <b>inet-precedence</b>—All classifiers of the IP precedence type.</li> </ul> |
| Index                      | Internal index of the classifier.  |
| Incoming CoS Value         | CoS value of the incoming packets, in bits. These values are used for classification.  |
| Assign to Forwarding Class | Forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the device.  |
| Assign to Loss Priority    | Loss priority value that the classifier assigns to the incoming packet based on its CoS value.   |

**Monitoring CoS Value Aliases**

- Purpose** Display information about the CoS value aliases that the system is currently using to represent DSCP, DSCP IPv6, MPLS EXP, and IPv4 precedence bits.
- Action** Select **Monitor>Class of Service>CoS Value Aliases** in the J-Web user interface, or enter the **show class-of-service code-point-aliases** command.

[Table 142 on page 1370](#) summarizes key output fields for CoS value aliases.

Table 142: Summary of Key CoS Value Alias Output Fields

| Field           | Values  | Additional Information  |
|-----------------|---|---|
| CoS Value Type  | Type of the CoS value: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Examines Layer 3 packet headers for IP packet classification.</li> <li>• <b>dscp ipv6</b>—Examines Layer 3 packet headers for IPv6 packet classification.</li> <li>• <b>exp</b>—Examines Layer 2 packet headers for MPLS packet classification.</li> <li>• <b>ieee-802.1</b>—Examines Layer 2 packet header for packet classification.</li> <li>• <b>inet-precedence</b>—Examines Layer 3 packet headers for IP packet classification.</li> </ul> | To display aliases and bit patterns, click the plus sign (+). |
| CoS Value Alias | Name given to a set of bits—for example, <b>af11</b> is a name for <b>001010</b> bits.  | —   |
| Bit Pattern     | Set of bits associated with an alias.   | —   |

### Monitoring CoS RED Drop Profiles

**Purpose** Display data point information for each CoS random early detection (RED) drop profile currently on a system.

**Action** Select **Monitor>Class of Service>RED Drop Profiles** in the J-Web user interface, or enter the **show class-of-service drop-profile** command.

[Table 143 on page 1370](#) summarizes key output fields for CoS RED drop profiles.

Table 143: Summary of Key CoS RED Drop Profile Output Fields

| Field                 | Values  | Additional Information   |
|-----------------------|---|--|
| RED Drop Profile Name | Name of the RED drop profile.<br><br>A drop profile consists of pairs of values between 0 and 100, one for queue buffer fill level and one for drop probability, that determine the relationship between a buffer's fullness and the likelihood it will drop packets. | To display profile values, click the plus sign (+).  |
| Graph RED Profile     | Link to a graph of a RED curve that the system uses to determine the drop probability based on queue buffer fullness.   | The x axis represents the queue buffer fill level, and the y axis represents the drop probability. |

Table 143: Summary of Key CoS RED Drop Profile Output Fields (*continued*)

| Field            | Values   | Additional Information |
|------------------|--|------------------------|
| Type             | Type of a specific drop profile: <ul style="list-style-type: none"> <li>• <b>interpolated</b>—The two coordinates (x and y) of the graph are interpolated to produce a smooth profile.</li> <li>• <b>segmented</b>—The two coordinates (x and y) of the graph are represented by line fragments to produce a segmented profile.</li> </ul> | —                      |
| Index            | Internal index of this drop profile.   | —                      |
| Fill Level       | Percentage fullness of a buffer queue. This value is the x coordinate of the RED drop profile graph.   | —                      |
| Drop Probability | Drop probability of a packet corresponding to a specific queue buffer fill level. This value is the y coordinate of the RED drop profile graph.  | —                      |

**Monitoring CoS Forwarding Classes**

**Purpose** View the current assignment of CoS forwarding classes to queue numbers on the system.

**Action** Select **Monitor>Class of Service>Forwarding Classes** in the J-Web user interface, or enter the **show class-of-service forwarding-class** command.

[Table 144 on page 1372](#) summarizes key output fields for CoS forwarding classes.

Table 144: Summary of Key CoS Forwarding Class Output Fields

| Field            | Values   | Additional Information  |
|------------------|--|---|
| Forwarding Class | Names of forwarding classes assigned to queue numbers. By default, the following forwarding classes are assigned to queues 0 through 3: <ul style="list-style-type: none"> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value, and RED drop profiles are more aggressive.</li> <li>• <b>expedited-forwarding</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.</li> <li>• <b>assured-forwarding</b>—Provides high assurance for packets within specified service profile. Excess packets are dropped.</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> | —   |
| Queue            | Queue number corresponding to the forwarding class name.   | By default, four queues, 0 through 3, are assigned to forwarding classes. |

**Monitoring CoS Rewrite Rules**

**Purpose** Display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action** Select **Monitor>Class of Service>Rewrite Rules** in the J-Web user interface, or enter the **show class-of-service rewrite-rules** command.

Table 145 on page 1372 summarizes key output fields for CoS rewrite rules.

Table 145: Summary of Key CoS Rewrite Rules Output Fields

| Field             | Values   | Additional Information   |
|-------------------|--|--|
| Rewrite Rule Name | Names of rewrite rules.  | —  |
| CoS Value Type    | Rewrite rule type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 DiffServ traffic.</li> <li>• <b>dscp-ipv6</b>—For IPv6 DiffServ traffic.</li> <li>• <b>exp</b>—For MPLS traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> <li>• <b>inet-precedence</b>—For IPv4 traffic.</li> </ul> | To display forwarding classes, loss priorities, and rewritten CoS values, click the plus sign (+). |
| Index             | Internal index for this particular rewrite rule.   | —  |

Table 145: Summary of Key CoS Rewrite Rules Output Fields (*continued*)

| Field                | Values   | Additional Information   |
|----------------------|--|--|
| Forwarding Class     | Forwarding class that in combination with loss priority is used to determine CoS values for rewriting. | Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting. |
| Loss Priority        | Loss priority that in combination with forwarding class is used to determine CoS values for rewriting. | —  |
| Rewrite CoS Value To | Value that the CoS value is rewritten to.  | —  |

**Monitoring CoS Scheduler Maps**

**Purpose** Display assignments of CoS forwarding classes to schedulers.

**Action** Select **Monitor>Class of Service>Scheduler Maps** in the J-Web user interface, or enter the **show class-of-service scheduler-map** command.

Table 146 on page 1373 summarizes key output fields for CoS scheduler maps.

Table 146: Summary of Key CoS Scheduler Maps Output Fields

| Field            | Values  | Additional Information                |
|------------------|---|---------------------------------------|
| Scheduler Map    | Name of a scheduler map.  | For details, click the plus sign (+). |
| Index            | Index of a specific object—scheduler maps, schedulers, or drop profiles.  | —                                     |
| Scheduler Name   | Name of a scheduler.  | —                                     |
| Forwarding Class | Forwarding classes this scheduler is assigned to.   | —                                     |
| Transmit Rate    | Configured transmit rate of the scheduler in bits per second (bps). The rate value can be either of the following: <ul style="list-style-type: none"> <li>A percentage—The scheduler receives the specified percentage of the total interface bandwidth.</li> <li><b>remainder</b>—The scheduler receives the remaining bandwidth of the interface after allocation to other schedulers.</li> </ul> | —                                     |
| Rate Limit       | Rate limiting configuration of the queue: <ul style="list-style-type: none"> <li><b>none</b>—No rate limiting.</li> <li><b>exact</b>—The queue transmits at only the configured rate.</li> </ul>  | —                                     |

Table 146: Summary of Key CoS Scheduler Maps Output Fields (*continued*)

| Field             | Values  | Additional Information |
|-------------------|---|------------------------|
| Buffer Size       | Delay buffer size in the queue or the amount of transmit delay (in milliseconds). The buffer size can be either of the following: <ul style="list-style-type: none"> <li>A percentage—The buffer is a percentage of the total buffer allocation.</li> <li><b>remainder</b>—The buffer is sized according to what remains after other scheduler buffer allocations.</li> </ul>                           | —                      |
| Priority          | Scheduling priority of a queue: <ul style="list-style-type: none"> <li><b>high</b>—Packets in this queue are transmitted first.</li> <li><b>low</b>—Packets in this queue are transmitted last.</li> <li><b>medium-high</b>—Packets in this queue are transmitted after high-priority packets.</li> <li><b>medium-low</b>—Packets in this queue are transmitted before low-priority packets.</li> </ul> | —                      |
| Drop Profiles     | Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.  | —                      |
| Loss Priority     | Packet loss priority corresponding to a drop profile: <ul style="list-style-type: none"> <li><b>low</b>—Packet has a low loss priority.</li> <li><b>high</b>—Packet has a high loss priority.</li> <li><b>medium-low</b>—Packet has a medium-low loss priority.</li> <li><b>medium-high</b>—Packet has a medium-high loss priority.</li> </ul>  | —                      |
| Protocol          | Transport protocol corresponding to a drop profile.   | —                      |
| Drop Profile Name | Name of the drop profile.   | —                      |

### Monitoring Content Filtering Configurations

**Purpose** View content filtering statistics.

**Action** To view content filtering statistics in the CLI, enter the `user@host > show security utm content-filtering statistics` command.

The content filtering **show statistics** command displays the following information:

```
Base on command list: # Blocked
Base on mime list: # Blocked
Base on extension list: # Blocked
ActiveX plugin: # Blocked
Java applet: # Blocked
EXE files: # Blocked
ZIP files: # Blocked
HTTP cookie: # Blocked
```

To view content filtering statistics using J-Web:

1. Select **Clear Content filtering statistics** **Monitor>Security>UTM>Content Filtering** **Monitor>Security>UTM>Content Filtering**.

The following statistics become viewable in the right pane.

```
Base on command list: # Passed # Blocked
Base on mime list: # Passed # Blocked
Base on extension list: # Passed # Blocked
ActiveX plugin: # Passed # Blocked
Java applet: # Passed # Blocked
EXE files: # Passed # Blocked
ZIP files: # Passed # Blocked
HTTP cookie: # Passed # Blocked
```

2. You can click **Clear Content filtering statistics** to clear all current viewable statistics and begin collecting new statistics.

### Monitoring CoS Classifiers

**Purpose** Display the mapping of incoming CoS value to forwarding class and loss priority.

**Action** For each classifier, select **Monitor>Class of Service>Classifiers** in the J-Web user interface, or enter the **show class-of-service classifier** command.

[Table 141 on page 1368](#) summarizes key output fields for CoS classifiers.

**Table 147: Summary of Key CoS Classifier Output Fields**

| Classifier Name | Name of a classifier. | To display classifier assignments, click the plus sign (+). |
|-----------------|-----------------------|---|
|-----------------|-----------------------|---|

Table 147: Summary of Key CoS Classifier Output Fields (*continued*)

|                            |  |
|----------------------------|--|
| CoS Value Type             | <p>The classifiers are displayed by type:</p> <ul style="list-style-type: none"> <li>• <b>dscp</b>—All classifiers of the DSCP type.</li> <li>• <b>dscp ipv6</b>—All classifiers of the DSCP IPv6 type.</li> <li>• <b>exp</b>—All classifiers of the MPLS EXP type.</li> <li>• <b>ieee-802.1</b>—All classifiers of the IEEE 802.1 type.</li> <li>• <b>inet-precedence</b>—All classifiers of the IP precedence type.</li> </ul> |
| Index                      | Internal index of the classifier.  |
| Incoming CoS Value         | CoS value of the incoming packets, in bits. These values are used for classification.  |
| Assign to Forwarding Class | Forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the device.  |
| Assign to Loss Priority    | Loss priority value that the classifier assigns to the incoming packet based on its CoS value.   |

### Monitoring DHCP Client Bindings

**Purpose** View information about DHCP client bindings.

**Action** Select **Monitor>Services>DHCP>Binding** in the J-Web user interface, or enter the **show system services dhcp binding** command.

[Table 148 on page 1377](#) summarizes the key output fields in the DHCP client binding displays.

Table 148: Summary of Key DHCP Client Binding Output Fields

| Field            | Values  | Additional Information |
|------------------|---|------------------------|
| IP Address       | List of IP addresses the DHCP server has assigned to clients.                   | —                      |
| Hardware Address | Corresponding media access control (MAC) address of the client.                 | —                      |
| Type             | Type of binding assigned to the client: dynamic or static.                      | —                      |
| Lease Expires at | Date and time the lease expires, or <b>never</b> for leases that do not expire. | —                      |

- Related Documentation**

### Monitoring Ethernet Switching

**Purpose** View information about the Ethernet Switching interface details.

**Action** Select **Monitor>Switching>Ethernet Switching** in the J-Web user interface, or enter the following CLI commands:

- **show ethernet-switching table**
- **show ethernet-switching mac-learning-log**

[Table 149 on page 1377](#) summarizes the Ethernet Switching output fields.

Table 149: Summary of Ethernet Switching Output Fields

| Field       | Values   | Additional Information |
|-------------|--|------------------------|
| VLAN        | The VLAN for which Ethernet Switching is enabled.  |                        |
| MAC Address | The MAC address associated with the VLAN. If a VLAN range has been configured for a VLAN, the output displays the MAC addresses for the entire series of VLANs that were created with that name.   |                        |
| Type        | The type of MAC address. Values are: <ul style="list-style-type: none"> <li>• static—The MAC address is manually created.</li> <li>• learn—The MAC address is learned dynamically from a packet's source MAC address.</li> <li>• flood—The MAC address is unknown and flooded to all members.</li> </ul> |                        |
| Age         | The time remaining before the entry ages out and is removed from the Ethernet switching table.   |                        |

Table 149: Summary of Ethernet Switching Output Fields (*continued*)

| Field       | Values  | Additional Information |
|-------------|---|------------------------|
| Interfaces  | Interface associated with learned MAC addresses or All-members (flood entry). |                        |
| VLAN-ID     | The VLAN ID.  |                        |
| MAC Address | The learned MAC address.  |                        |
| Time        | Timestamp when the MAC address was added or deleted from the log.             |                        |
| State       | Indicates the MAC address learned on the interface.                           |                        |

### Monitoring Events

**Purpose** Use the monitoring functionality to view the events page.

**Action** To monitor events select **Monitor>Events and Alarms>View Events** in the J-Web user interface.

**NOTE:** When you use an HTTPS connection in the Microsoft Internet Explorer browser to save a report from this page in the J-Web interface, the error message "Internet Explorer was not able to open the Internet site" is displayed. This problem occurs because the Cache-Control: no cache HTTP header is added on the server side and Internet Explorer does not allow you to download the encrypted file with the Cache-Control: no cache HTTP header set in the response from the server.

As a workaround, refer to Microsoft Knowledge Base article 323308, which is available at this URL: <http://support.microsoft.com/kb/323308>. Also, you can alternatively use HTTP in the Internet Explorer browser or use HTTPS in the Mozilla Firefox browser to save a file from this page.

**Meaning** [Table 150 on page 1379](#) summarizes key output fields in the events page.

Table 150: Events Monitoring Page

| Field                  | Value  | Additional Information |
|------------------------|--|------------------------|
| <b>Events Filter</b>   |  |                        |
| System Log File        | Specifies the name of the system log file that records errors and events.                  | —                      |
| Process                | Specifies the system processes that generate the events to display.                        | —                      |
| Include archived files | Specifies to enable the option to include archived files.                                  | Select to enable.      |
| Date From              | Specifies the beginning date range to monitor. Set the date using the calendar pick tool.  | —                      |
| To                     | Specifies the end of the date range to monitor. Set the date using the calendar pick tool. | —                      |
| Event ID               | Specifies the specific ID of the error or event to monitor.                                | —                      |
| Description            | Enter a description for the errors or events.  | —                      |
| Search                 | Fetches the errors and events specified in the search criteria.                            | —                      |
| Reset                  | Clears the cache of errors and events that were previously selected.                       | —                      |
| Generate Report        | Creates an HTML report based on the specified parameters.                                  | —                      |
| <b>Events Detail</b>   |  |                        |
| Process                | Displays the system process that generated the error or event.                             | —                      |

Table 150: Events Monitoring Page (*continued*)

| Field             | Value  | Additional Information |
|-------------------|--|------------------------|
| Severity          | <p>Displays the severity level that indicates how seriously the triggering event affects routing platform functions. Only messages from the facility that are rated at that level or higher are logged. Possible severities and their corresponding color code are:</p> <ul style="list-style-type: none"> <li>• <b>Debug/Info/Notice (Green)</b>—Indicates conditions that are not errors but are of interest or might warrant special handling.</li> <li>• <b>Warning (Yellow)</b> — Indicates conditions that warrant monitoring.</li> <li>• <b>Error (Blue)</b> — Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.</li> <li>• <b>Critical (Pink)</b> — Indicates critical conditions, such as hard drive errors.</li> <li>• <b>Alert (Orange)</b> — Indicates conditions that require immediate correction, such as a corrupted system database.</li> <li>• <b>Emergency (Red)</b> — Indicates system panic or other conditions that cause the routing platform to stop functioning.</li> </ul> | —                      |
| Event ID          | <p>Displays the unique ID of the error or event. The prefix on each code identifies the generating software process. The rest of the code indicates the specific event or error.</p>   | —                      |
| Event Description | <p>Displays a more detailed explanation of the message.</p>  | —                      |
| Time              | <p>Time that the error or event occurred.</p>  | —                      |

### Monitoring GVRP

- Purpose** Use the monitoring functionality to view the GVRP page.
- Action** To monitor GVRP select **Monitor>Switching>GVRP** in the J-Web user interface.
- Meaning** [Table 151 on page 1381](#) summarizes key output fields in the GVRP page.

Table 151: GVRP Monitoring Page

| Field                            | Value   | Additional Information |
|----------------------------------|---|------------------------|
| <b>Global GVRP Configuration</b> |   |                        |
| GVRP Status                      | Displays whether GVRP is enabled or disabled.   | —                      |
| GVRP Timer                       | Displays the GVRP timer in millisecond.   | —                      |
| Join                             | The number of milliseconds the interfaces must wait before sending VLAN advertisements.   | —                      |
| Leave                            | The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message.                     | —                      |
| Leave All                        | The interval in milliseconds at which Leave All messages are sent on interfaces. Leave All messages maintain current GVRP VLAN membership information in the network. | —                      |
| <b>GVRP Interface Details</b>    |   |                        |
| Interface Name                   | The interface on which GVRP is configured.  | —                      |
| Protocol Status                  | Displays whether GVRP is enabled or disabled.   | —                      |

### [Monitoring H.323 ALG Information](#)

**Purpose** View the H.323 ALG counters information.

**Action** Select **Monitor>ALGs>H323** in the J-Web user interface, or enter the **show security alg h323 counters** command.

[Table 152 on page 1381](#) summarizes key output fields in the H.323 counters display.

Table 152: Summary of Key H.323 Counters Output Fields

| Field                             | Values                                | Additional Information |
|-----------------------------------|---------------------------------------|------------------------|
| <b>H.323 Counters Information</b> |                                       |                        |
| Packets received                  | Number of H.323 ALG packets received. | —                      |

Table 152: Summary of Key H.323 Counters Output Fields (*continued*)

| Field                       | Values   | Additional Information  |
|-----------------------------|--|---|
| Packets dropped             | Number of H.323 ALG packets dropped.   | —   |
| RAS message received        | Number of incoming RAS (Endpoint Registration, Admission, and Status) messages per second per gatekeeper received and processed. | —   |
| Q.931 message received      | Counter for Q.931 message received.  | —   |
| H.245 message received      | Counter for H.245 message received.  | —   |
| Number of calls             | Total number of H.323 ALG calls.   | —   |
| Number of active calls      | Number of active H.323 ALG calls.  | This counter displays the number of call legs and might not display the exact number of voice calls that are active. For instance, for a single active voice call between two endpoints, this counter might display a value of 2. |
| <b>H.323 Error Counters</b> |  |   |
| Decoding errors             | Number of decoding errors.   | —   |
| Message flood dropped       | Error counter for message flood dropped.   | —   |
| NAT errors                  | H.323 ALG Network Address Translation (NAT) errors.  | —   |
| Resource manager errors     | H.323 ALG resource manager errors.   | —   |

### Monitoring Interfaces

**Purpose** View general information about all physical and logical interfaces for a device.

**Action** Select **Monitor>Interfaces** in the J-Web user interface. The J-Web Interfaces page displays the following details about each device interface:

- Port—Indicates the interface name.
- Admin Status—Indicates whether the interface is enabled (Up) or disabled (Down).
- Link Status—Indicates whether the interface is linked (Up) or not linked (Down).
- Address—Indicates the IP address of the interface.
- Zone—Indicates whether the zone is an untrust zone or a trust zone.
- Services—Indicates services that are enabled on the device, such as HTTP and SSH.
- Protocols—Indicates protocols that are enabled on the device, such as BGP and IGMP.
- Input Rate graph—Displays interface bandwidth utilization. Input rates are shown in bytes per second.
- Output Rate graph—Displays interface bandwidth utilization. Output rates are shown in bytes per second.
- Error Counters chart—Displays input and output error counters in the form of a bar chart.
- Packet Counters chart—Displays the number of broadcast, unicast, and multicast packet counters in the form of a pie chart. (Packet counter charts are supported only for interfaces that support MAC statistics.)

To change the interface display, use the following options:

- Port for FPC—Controls the member for which information is displayed.
- Start/Stop button—Starts or stops monitoring the selected interfaces.
- Show Graph—Displays input and output packet counters and error counters in the form of charts.
- Pop-up button—Displays the interface graphs in a separate pop-up window.
- Details—Displays extensive statistics about the selected interface, including its general status, traffic information, IP address, I/O errors, class-of-service data, and statistics.
- Refresh Interval—Indicates the duration of time after which you want the data on the page to be refreshed.
- Clear Statistics—Clears the statistics for the selected interface.

Alternatively, you can enter the following **show** commands in the CLI to view interface status and traffic statistics:

- **show interfaces terse**

**NOTE:** On SRX Series devices, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- **show interfaces detail**

- **show interfaces extensive**
- **show interfaces *interface-name***

### Monitoring MGCP ALGs

This section contains the following topics:

- [Monitoring MGCP ALG Calls on page 1384](#)
- [Monitoring MGCP ALG Counters on page 1385](#)
- [Monitoring MGCP ALG Endpoints on page 1386](#)

#### Monitoring MGCP ALG Calls

**Purpose** View information about MGCP ALG calls.

**Action** Select **Monitor>ALGs>MGCP>Calls** in the J-Web user interface. To view detailed information, select the endpoint on the MGCP calls page.

Alternatively, enter the **show security alg mgcp calls** command.

[Table 153 on page 1384](#) summarizes key output fields in the MGCP calls display.

**Table 153: Summary of Key MGCP Calls Output Fields**

| Field                          | Values   | Additional Information |
|--------------------------------|--|------------------------|
| <b>MGCP Calls Information</b>  |  |                        |
| Endpoint@GW                    | Endpoint name.   | —                      |
| Zone                           | <ul style="list-style-type: none"> <li>• <b>trust</b>—Trust zone.</li> <li>• <b>untrust</b>—Untrust zone.</li> </ul> | —                      |
| Call ID                        | Call identifier for ALG MGCP.  | —                      |
| RM Group                       | Resource manager group ID.   | —                      |
| Call Duration                  | Duration for which connection is active.   | —                      |
| Connection Id                  | Connection identifier for MGCP ALG calls.  | —                      |
| <b>Calls Details: Endpoint</b> |  |                        |
| Local SDP                      | IP address of the MGCP ALG local call owner, as per the Session Description Protocol (SDP).                          | —                      |

Table 153: Summary of Key MGCP Calls Output Fields (*continued*)

| Field      | Values  | Additional Information |
|------------|---|------------------------|
| Remote SDP | Remote IP address of the MGCP ALG remote call owner, as per the Session Description Protocol (SDP). | —                      |

**Monitoring MGCP ALG Counters**

**Purpose** View MGCP ALG counters information.

**Action** Select **Monitor>ALGs>MGCP>Counters** in the J-Web user interface, or enter the **show security alg mgcp counters** command.

Table 154 on page 1385 summarizes key output fields in the MGCP counters display.

Table 154: Summary of Key MGCP Counters Output Fields

| Field                            | Values                                 | Additional Information |
|----------------------------------|--|------------------------|
| <b>MGCP Counters Information</b> |  |                        |
| Packets received                 | Number of MGCP ALG packets received.   | —                      |
| Packets dropped                  | Number of MGCP ALG packets dropped.    | —                      |
| Message received                 | Number of MGCP ALG messages received.  | —                      |
| Number of connections            | Number of MGCP ALG connections.        | —                      |
| Number of active connections     | Number of active MGCP ALG connections. | —                      |
| Number of calls                  | Number of MGCP ALG calls.              | —                      |
| Number of active calls           | Number of MGCP ALG active calls.       | —                      |
| Number of active transactions    | Number of active transactions.         | —                      |
| Number of re-transmission        | Number of MGCP ALG retransmissions.    | —                      |
| <b>Error Counters</b>            |  |                        |
| Unknown-method                   | MGCP ALG unknown method errors.        | —                      |
| Decoding error                   | MGCP ALG decoding errors.              | —                      |
| Transaction error                | MGCP ALG transaction errors.           | —                      |
| Call error                       | MGCP ALG counter errors.               | —                      |

Table 154: Summary of Key MGCP Counters Output Fields (*continued*)

| Field                  | Values   | Additional Information |
|------------------------|--|------------------------|
| Connection error       | MGCP ALG connection errors.                        | —                      |
| Connection flood drop  | MGCP ALG connection flood drop errors.             | —                      |
| Message flood drop     | MGCP ALG message flood drop errors.                | —                      |
| IP resolve error       | MGCP ALG IP address resolution errors.             | —                      |
| NAT error              | MGCP ALG Network Address Translation (NAT) errors. | —                      |
| Resource manager error | MGCP ALG resource manager errors.                  | —                      |

**Monitoring MGCP ALG Endpoints**

**Purpose** View information about MGCP ALG endpoints.

**Action** Select **Monitor>ALGs>MGCP>Endpoints** in the J-Web user interface. To view detailed information, select the gateway on the MGCP endpoints page.

Alternatively, enter the **show security alg mgcp endpoints** command.

[Table 155 on page 1386](#) summarizes key output fields in the MGCP endpoints display.

Table 155: Summary of Key MGCP Endpoints Output Fields

| Field                          | Values   | Additional Information |
|--------------------------------|--|------------------------|
| <b>MGCP Endpoints</b>          |  |                        |
| Gateway                        | IP address of the gateway.   | —                      |
| Zone                           | <ul style="list-style-type: none"> <li><b>trust</b>—Trust zone.</li> <li><b>untrust</b>—Untrust zone.</li> </ul> | —                      |
| IP                             | IP address.  | —                      |
| <b>Endpoints: Gateway name</b> |  |                        |
| Endpoint                       | Endpoint name.   | —                      |
| Transaction #                  | Transaction identifier.  | —                      |
| Call #                         | Call identifier.   | —                      |
| Notified Entity                | The certificate authority (CA) currently controlling the gateway.  | —                      |

  - [Monitoring Interfaces on page 1382](#)

### Monitoring MPLS Traffic Engineering Information

This section contains the following topics:

- [Monitoring MPLS Interfaces on page 1387](#)
- [Monitoring MPLS LSP Information on page 1387](#)
- [Monitoring MPLS LSP Statistics on page 1388](#)
- [Monitoring RSVP Session Information on page 1389](#)
- [Monitoring MPLS RSVP Interfaces Information on page 1391](#)

#### Monitoring MPLS Interfaces

**Purpose** View the interfaces on which MPLS is configured, including operational state and any administrative groups applied to an interface.

**Action** Select **Monitor>MPLS>Interfaces** in the J-Web user interface, or enter the **show mpls interface** command.

[Table 156 on page 1387](#) summarizes key output fields in the MPLS interface information display.

**Table 156: Summary of Key MPLS Interface Information Output Fields**

| Field                 | Values   | Additional Information |
|-----------------------|--|------------------------|
| Interface             | Name of the interface on which MPLS is configured.                             | —                      |
| State                 | State of the specified interface: <b>Up</b> or <b>Dn</b> (down).               | —                      |
| Administrative groups | Administratively assigned colors of the MPLS link configured on the interface. | —                      |

#### Monitoring MPLS LSP Information

**Purpose** View all label-switched paths (LSPs) configured on the services router, including all inbound (ingress), outbound (egress), and transit LSP information.

**Action** Select **Monitor>MPLS>LSP Information** in the J-Web user interface, or enter the **show mpls lsp** command.

[Table 157 on page 1388](#) summarizes key output fields in the MPLS LSP information display.

Table 157: Summary of Key MPLS LSP Information Output Fields

| Field       | Values   | Additional Information   |
|-------------|--|--|
| Ingress LSP | Information about LSPs on the inbound device. Each session has one line of output.   | –  |
| Egress LSP  | Information about the LSPs on the outbound device. Each session has one line of output.  | MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.   |
| Transit LSP | Number of LSPs on the transit routers and the state of these paths.  | MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.   |
| To          | Destination (outbound device) of the session.  | –  |
| From        | Source (inbound device) of the session.  | –  |
| State       | State of the path. It can be <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> .   | <b>AdminDn</b> indicates that the LSP is being taken down gracefully.  |
| Rt          | Number of active routes (prefixes) installed in the routing table.   | For inbound RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and outbound RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ). |
| Active Path | Name of the active path: <b>Primary</b> or <b>Secondary</b> .  | This field is used for inbound LSPs only.  |
| P           | An asterisk (*) in this column indicates that the LSP is a primary path.   | This field is used for inbound LSPs only.  |
| LSPname     | Configured name of the LSP.  | –  |
| Style       | RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter). | This field is used for outbound and transit LSPs only.   |
| Labelin     | Incoming label for this LSP.   | –  |
| Labelout    | Outgoing label for this LSP.   | –  |
| Total       | Total number of LSPs displayed for the particular type— <b>ingress</b> (inbound), <b>egress</b> (outbound), or <b>transit</b> .  | –  |

### Monitoring MPLS LSP Statistics

**Purpose** Display statistics for LSP sessions currently active on the device, including the total number of packets and bytes forwarded through an LSP.

**Action** Select **Monitor>MPLS>LSP Statistics** in the J-Web user interface, or enter the **show mpls lsp statistics** command.

**NOTE:** Statistics are not available for LSPs on the outbound device, because the penultimate device in the LSP sets the label to 0. Also, as the packet arrives at the outbound device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

Table 158 on page 1389 summarizes key output fields in the MPLS LSP statistics display.

**Table 158: Summary of Key MPLS LSP Statistics Output Fields**

| Field       | Values  | Additional Information   |
|-------------|---|--|
| Ingress LSP | Information about LSPs on the inbound device. Each session has one line of output.  | —  |
| Egress LSP  | Information about the LSPs on the outbound device. Each session has one line of output.   | MPLS learns this information by querying RSVP, which holds all the transit and outbound session information. |
| Transit LSP | Number of LSPs on the transit routers and the state of these paths.   | MPLS learns this information by querying RSVP, which holds all the transit and outbound session information. |
| To          | Destination (outbound device) of the session.   | —  |
| From        | Source (inbound device) of the session.   | —  |
| State       | State of the path: <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> .  | <b>AdminDn</b> indicates that the LSP is being taken down gracefully.  |
| Packets     | Total number of packets received on the LSP from the upstream neighbor.   | —  |
| Bytes       | Total number of bytes received on the LSP from the upstream neighbor.   | —  |
| LSPname     | Configured name of the LSP.   | —  |
| Total       | Total number of LSPs displayed for the particular type— <b>ingress</b> (inbound), <b>egress</b> (outbound), or <b>transit</b> . | —  |

#### **Monitoring RSVP Session Information**

**Purpose** View information about RSVP-signaled LSP sessions currently active on the device, including inbound (ingress) and outbound (egress) addresses, LSP state, and LSP name.

**Action** Select **Monitor>MPLS>RSVP Sessions** in the J-Web user interface, or enter the **show rsvp session** command.

[Table 159 on page 1390](#) summarizes key output fields in the RSVP session information display.

**Table 159: Summary of Key RSVP Session Information Output Fields**

| Field       | Values   | Additional Information   |
|-------------|--|--|
| Ingress LSP | Information about inbound RSVP sessions. Each session has one line of output.  | –  |
| Egress LSP  | Information about outbound RSVP sessions. Each session has one line of output.   | MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.   |
| Transit LSP | Information about transit RSVP sessions.   | MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.   |
| To          | Destination (outbound device) of the session.  | –  |
| From        | Source (inbound device) of the session.  | –  |
| State       | State of the path: <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> .   | <b>AdminDn</b> indicates that the LSP is being taken down gracefully.  |
| Rt          | Number of active routes (prefixes) installed in the routing table.   | For inbound RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and outbound RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ). |
| Style       | RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter). | This field is used for outbound and transit LSPs only.   |
| Labelin     | Incoming label for this RSVP session.  | –  |
| Labelout    | Outgoing label for this RSVP session.  | –  |
| LSPname     | Configured name of the LSP.  | –  |
| Total       | Total number of RSVP sessions displayed for the particular type— <b>ingress</b> (inbound), <b>egress</b> (outbound), or <b>transit</b> .   | –  |

**Monitoring MPLS RSVP Interfaces Information**

**Purpose** View information about the interfaces on which RSVP is enabled, including the interface name, total bandwidth through the interface, and total current reserved and reservable (available) bandwidth on the interface.

**Action** Select **Monitor>MPLS>RSVP Interfaces** in the J-Web user interface, or enter the **show rsvp interface** command.

[Table 160 on page 1391](#) summarizes key output fields in the RSVP interfaces information display.

**Table 160: Summary of Key RSVP Interfaces Information Output Fields**

| Field          | Values   | Additional Information |
|----------------|--|------------------------|
| RSVP Interface | Number of interfaces on which RSVP is active.<br>Each interface has one line of output.  | —                      |
| Interface      | Name of the interface.   | —                      |
| State          | State of the interface: <ul style="list-style-type: none"> <li>• <b>Disabled</b>—No traffic engineering information is displayed.</li> <li>• <b>Down</b>—The interface is not operational.</li> <li>• <b>Enabled</b>—Displays traffic engineering information.</li> <li>• <b>Up</b>—The interface is operational.</li> </ul> | —                      |
| Active resv    | Number of reservations that are actively reserving bandwidth on the interface.   | —                      |
| Subscription   | User-configured subscription factor.   | —                      |
| Static BW      | Total interface bandwidth, in bits per second (bps).   | —                      |
| Available BW   | Amount of bandwidth that RSVP is allowed to reserve, in bits per second (bps). It is equal to <b>(static bandwidth X subscription factor)</b> .  | —                      |
| Reserved BW    | Currently reserved bandwidth, in bits per second (bps).  | —                      |
| Highwater mark | Highest bandwidth that has ever been reserved on this interface, in bits per second (bps).   | —                      |

## Monitoring NAT

This section contains the following topics:

- [Monitoring Source NAT Information on page 1392](#)
- [Monitoring Destination NAT Information on page 1398](#)
- [Monitoring Static NAT Information on page 1399](#)
- [Monitoring Incoming Table Information on page 1401](#)
- [Monitoring Interface NAT Port Information on page 1402](#)

### Monitoring Source NAT Information

**Purpose** Display configured information about source Network Address Translation (NAT) rules, pools, persistent NAT, and paired addresses.

**Action** Select **Monitor>NAT>Source NAT** in the J-Web user interface, or enter the following CLI commands:

- **show security nat source summary**
- **show security nat source pool *pool-name***
- **show security nat source persistent-nat-table**
- **show security nat source paired-address**

[Table 161 on page 1392](#) describes the available options for monitoring source NAT.

**Table 161: Source NAT Monitoring Page**

| Field         | Description  | Action  |
|---------------|--|---|
| <b>Rules</b>  |  |   |
| Rule-set Name | Name of the rule set.  | Select all rule sets or a specific rule set to display from the list. |
| Total rules   | Number of rules configured.  | —   |
| ID            | Rule ID number.  | —   |
| Name          | Name of the rule .   | —   |
| From          | Name of the routing instance/zone/interface from which the packet flows. | —   |
| To            | Name of the routing instance/zone/interface to which the packet flows.   | —   |

Table 161: Source NAT Monitoring Page (*continued*)

| Field                                  | Description   | Action  |
|--|---|---|
| Source address range                   | Source IP address range in the source pool.   | —   |
| Destination address range              | Destination IP address range in the source pool.  | —   |
| Source ports                           | Source port numbers.  | —   |
| Ip protocol                            | IP protocol.  | —   |
| Action                                 | Action taken for a packet that matches a rule.  | —   |
| Persistent NAT type                    | Persistent NAT type.  | —   |
| Inactivity timeout                     | Inactivity timeout interval for the persistent NAT binding.   | —   |
| Alarm threshold                        | Utilization alarm threshold.  |   |
| Max session number                     | The maximum number of sessions.   | —   |
| Sessions (Succ/<br>Failed/<br>Current) | Successful, failed, and current sessions. <ul style="list-style-type: none"> <li>Succ—Number of successful session installations after the NAT rule is matched.</li> <li>Failed—Number of unsuccessful session installations after the NAT rule is matched.</li> <li>Current—Number of sessions that reference the specified rule.</li> </ul> | —   |
| Translation Hits                       | Number of times a translation in the translation table is used for a source NAT rule.   | —   |
| <b>Pools</b>                           |   |   |
| Pool Name                              | The names of the pools.   | Select all pools or a specific pool to display from the list. |
| Total Pools                            | Total pools added.  | —   |
| ID                                     | ID of the pool.   | —   |
| Name                                   | Name of the source pool.  | —   |

Table 161: Source NAT Monitoring Page (*continued*)

| Field                                  | Description  | Action |
|--|--|--------|
| Address range                          | IP address range in the source pool.   | —      |
| Single/Twin ports                      | Number of allocated single and twin ports.                                     | —      |
| Port                                   | Source port number in the pool.  | —      |
| Address assignment                     | Displays the type of address assignment.                                       | —      |
| Alarm threshold                        | Utilization alarm threshold.   | —      |
| Port overloading factor                | Port overloading capacity.   | —      |
| Routing instance                       | Name of the routing instance.  | —      |
| Total addresses                        | Total IP address, IP address set, or address book entry.                       | —      |
| Host address base                      | Host base address of the original source IP address range.                     | —      |
| Translation hits                       | Number of times a translation in the translation table is used for source NAT. | —      |
| <b>Top 10 Translation Hits</b>         |  |        |
| Graph                                  | Displays the graph of top 10 translation hits.                                 | —      |
| <b>Persistent NAT</b>                  |  |        |
| <b>Persistent NAT table statistics</b> |  |        |
| binding total                          | Displays the total number of persistent NAT bindings for the FPC.              | —      |
| binding in use                         | Number of persistent NAT bindings that are in use for the FPC.                 | —      |
| enode total                            | Total number of persistent NAT enodes for the FPC.                             | —      |
| enode in use                           | Number of persistent NAT enodes that are in use for the FPC.                   | —      |
| <b>Persistent NAT table</b>            |  |        |

Table 161: Source NAT Monitoring Page (*continued*)

| Field                               | Description   | Action   |
|-------------------------------------|---|--|
| Source NAT pool                     | Name of the pool.   | Select all pools or a specific pool to display from the list.              |
| Internal IP                         | Internal IP address.  | Select all IP addresses or a specific IP address to display from the list. |
| Internal port                       | Displays the internal ports configured in the system.   | Select the port to display from the list.                                  |
| Internal protocol                   | Internal protocols .  | Select all protocols or a specific protocol to display from the list.      |
| Internal IP                         | Internal transport IP address of the outgoing session from internal to external.                          | —  |
| Internal port                       | Internal transport port number of the outgoing session from internal to external.                         | —  |
| Internal protocol                   | Internal protocol of the outgoing session from internal to external.                                      | —  |
| Reflective IP                       | Translated IP address of the source IP address.   | —  |
| Reflective port                     | Displays the translated number of the port.   | —  |
| Reflective protocol                 | Translated protocol.  | —  |
| Source NAT pool                     | Name of the source NAT pool where persistent NAT is used.   | —  |
| Type                                | Persistent NAT type.  | —  |
| Left time/Conf time                 | Inactivity timeout period that remains and the configured timeout value.                                  | —  |
| Current session num/Max session num | Number of current sessions associated with the persistent NAT binding and the maximum number of sessions. | —  |
| Source NAT rule                     | Name of the source NAT rule to which this persistent NAT binding applies.                                 | —  |

**External node table**

---

Table 161: Source NAT Monitoring Page (*continued*)

| Field                                   | Description  | Action  |
|---|--|---|
| Internal IP                             | Internal transport IP address of the outgoing session from internal to external. | —   |
| Internal port                           | Internal port number of the outgoing session from internal to external.          | —   |
| External IP                             | External IP address of the outgoing session from internal to external.           | —   |
| External port                           | External port of the outgoing session from internal to external.                 | —   |
| Zone                                    | External zone of the outgoing session from internal to external.                 | —   |
| <b>Paired Address</b>                   |  |   |
| Pool name                               | Name of the pool.  | Select all pools or a specific pool to display from the list.   |
| Specified Address                       | IP address.  | Select all addresses, or select the internal or external IP address to display, and enter the IP address.   |
| Pool name                               | Displays the selected pool or pools.   | —   |
| Internal address                        | Displays the internal IP address.  | —   |
| External address                        | Displays the external IP address.  | —   |
| <b>Resource Usage</b>                   |  |   |
| <b>Utilization for all source pools</b> |  |   |
| Pool name                               | Name of the pool.  | To view additional usage information for Port Address Translation (PAT) pools, select a pool name. The information displays under Detail Port Utilization for Specified Pool. |
| Pool type                               | Pool type: PAT or Non-PAT.   | —   |
| Port overloading factor                 | Port overloading capacity for PAT pools.   | —   |
| Address                                 | Addresses in the pool.   | —   |

Table 161: Source NAT Monitoring Page (*continued*)

| Field   | Description   | Action  |
|---|---|---|
| Used  | <p>Number of used resources in the pool.</p> <p>For Non-PAT pools, the number of used IP addresses is displayed.</p> <p>For PAT pools, the number of used ports is displayed.</p>   | —   |
| Available   | <p>Number of available resources in the pool.</p> <p>For Non-PAT pools, the number of available IP addresses is displayed.</p> <p>For PAT pools, the number of available ports is displayed.</p>  | —   |
| Total   | <p>Number of used and available resources in the pool.</p> <p>For Non-PAT pools, the total number of used and available IP addresses is displayed.</p> <p>For PAT pools, the total number of used and available ports is displayed.</p> | —   |
| Usage   | <p>Percent of resources used.</p> <p>For Non-PAT pools, the percent of IP addresses used is displayed.</p> <p>For PAT pools, the percent of ports, including single and twin ports, is displayed.</p>                                   | —   |
| Peak usage  | Percent of resources used during the peak date and time.  | —   |
| <b>Detail Port Utilization for Specified Pool</b> |   |   |
| Address Name                                      | IP addresses in the PAT pool.   | Select the IP address for which you want to display detailed usage information. |
| Factor-Index                                      | Index number.   | —   |
| Port-range  | Displays the number of ports allocated at a time.   | —   |
| Used  | Displays the number of used ports.  | —   |
| Available   | Displays the number of available ports.   | —   |
| Total   | Displays the number of used and available ports.  | —   |
| Usage   | Displays the percentage of ports used during the peak date and time.  | —   |

**Monitoring Destination NAT Information**

**Purpose** View the destination Network Address Translation (NAT) summary table and the details of the specified NAT destination address pool information.

**Action** Select **Monitor>NAT> Destination NAT** in the J-Web user interface, or enter the following CLI commands:

- **show security nat destination summary**
- **show security nat destination pool *pool-name***

[Table 162 on page 1398](#) summarizes key output fields in the destination NAT display.

**Table 162: Summary of Key Destination NAT Output Fields**

| Field                     | Values   | Action  |
|---------------------------|--|---|
| <b>Rules</b>              |  |   |
| Rule-set Name             | Name of the rule set.  | Select all rule sets or a specific rule set to display from the list. |
| Total rules               | Number of rules configured.  | —   |
| ID                        | Rule ID number.  | —   |
| Name                      | Name of the rule .   | —   |
| Ruleset Name              | Name of the rule set.  | —   |
| From                      | Name of the routing instance/zone/interface from which the packet flows. | —   |
| Source address range      | Source IP address range in the source pool.                              | —   |
| Destination address range | Destination IP address range in the source pool.                         | —   |
| Destination port          | Destination port in the destination pool.                                | —   |
| IP protocol               | IP protocol.   | —   |
| Action                    | Action taken for a packet that matches a rule.                           | —   |
| Alarm threshold           | Utilization alarm threshold.   | —   |

Table 162: Summary of Key Destination NAT Output Fields (*continued*)

| Field                                  | Values  | Action  |
|--|---|---|
| Sessions (Succ/<br>Failed/<br>Current) | Successful, failed, and current sessions. <ul style="list-style-type: none"> <li>Succ—Number of successful session installations after the NAT rule is matched.</li> <li>Failed—Number of unsuccessful session installations after the NAT rule is matched.</li> <li>Current—Number of sessions that reference the specified rule.</li> </ul> | —   |
| Translation hits                       | Number of times a translation in the translation table is used for a destination NAT rule.  | —   |
| <b>Pools</b>                           |   |   |
| Pool Name                              | The names of the pools.   | Select all pools or a specific pool to display from the list. |
| Total Pools                            | Total pools added.  | —   |
| ID                                     | ID of the pool.   | —   |
| Name                                   | Name of the destination pool.   | —   |
| Address range                          | IP address range in the destination pool.   | —   |
| Port                                   | Destination port number in the pool.  | —   |
| Routing instance                       | Name of the routing instance.   | —   |
| Total addresses                        | Total IP address, IP address set, or address book entry.  | —   |
| Translation hits                       | Number of times a translation in the translation table is used for destination NAT.   | —   |
| <b>Top 10 Translation Hits</b>         |   |   |
| Graph                                  | Displays the graph of top 10 translation hits.  | —   |

**Monitoring Static NAT Information**

**Purpose** View static NAT rule information.

**Action** Select **Monitor>NAT>Static NAT** in the J-Web user interface, or enter the following CLI command:

**show security nat static rule**

Table 163 on page 1400 summarizes key output fields in the static NAT display.

**Table 163: Summary of Key Static NAT Output Fields**

| Field                                  | Values  | Action  |
|--|---|---|
| Rule-set Name                          | Name of the rule set.   | Select all rule sets or a specific rule set to display from the list. |
| Total rules                            | Number of rules configured.   | —   |
| ID                                     | Rule ID number.   | —   |
| Position                               | Position of the rule that indicates the order in which it applies to traffic.   | —   |
| Name                                   | Name of the rule.   | —   |
| Ruleset Name                           | Name of the rule set.   | —   |
| From                                   | Name of the routing instance/interface/zone from which the packet comes   | —   |
| Source addresses                       | Source IP addresses.  | —   |
| Source ports                           | Source port numbers.  | —   |
| Destination addresses                  | Destination IP address and subnet mask.   | —   |
| Destination ports                      | Destination port numbers .  | —   |
| Host addresses                         | Name of the host addresses.   | —   |
| Host ports                             | Host port numbers.  | —   |
| Netmask                                | Subnet IP address.  | —   |
| Host routing instance                  | Name of the routing instance from which the packet comes.   | —   |
| Alarm threshold                        | Utilization alarm threshold.  | —   |
| Sessions (Succ/<br>Failed/<br>Current) | Successful, failed, and current sessions. <ul style="list-style-type: none"> <li>• Succ—Number of successful session installations after the NAT rule is matched.</li> <li>• Failed—Number of unsuccessful session installations after the NAT rule is matched.</li> <li>• Current—Number of sessions that reference the specified rule.</li> </ul> | —   |

Table 163: Summary of Key Static NAT Output Fields (*continued*)

| Field                          | Values  | Action |
|--------------------------------|---|--------|
| Translation hits               | Number of times a translation in the translation table is used for a static NAT rule. | —      |
| <b>Top 10 Translation Hits</b> |   |        |
| Graph                          | Displays the graph of top 10 translation hits.  | —      |

**Monitoring Incoming Table Information**

**Purpose** View NAT table information.

**Action** Select **Monitor>NAT>Incoming Table** in the J-Web user interface, or enter the following CLI command:

```
show security nat incoming-table
```

[Table 164 on page 1401](#) summarizes key output fields in the incoming table display.

Table 164: Summary of Key Incoming Table Output Fields

| Field                   | Values  | Additional Information |
|-------------------------|---|------------------------|
| <b>Statistics</b>       |   |                        |
| In use                  | Number of entries in the NAT table.   | —                      |
| Maximum                 | Maximum number of entries possible in the NAT table.                          | —                      |
| Entry allocation failed | Number of entries failed for allocation.                                      | —                      |
| <b>Incoming Table</b>   |   |                        |
| Clear                   |   | —                      |
| Destination             | Destination IP address and port number.                                       | —                      |
| Host                    | Host IP address and port number that the destination IP address is mapped to. | —                      |
| References              | Number of sessions referencing the entry.                                     | —                      |
| Timeout                 | Timeout, in seconds, of the entry in the NAT table.                           | —                      |
| Source-pool             | Name of source pool where translation is allocated.                           | —                      |

**Monitoring Interface NAT Port Information**

**Purpose** View port usage for an interface source pool information.

**Action** Select **Monitor>Firewall/NAT>Interface NAT** in the J-Web user interface, or enter the following CLI command:

- **show security nat interface-nat-ports**

Table 165 on page 1402 summarizes key output fields in the interface NAT display.

**Table 165: Summary of Key Interface NAT Output Fields**

| Field                              | Values   | Additional Information |
|------------------------------------|--|------------------------|
| <b>Interface NAT Summary Table</b> |  |                        |
| Pool Index                         | Port pool index.   | —                      |
| Total Ports                        | Total number of ports in a port pool.                          | —                      |
| Single Ports Allocated             | Number of ports allocated one at a time that are in use.       | —                      |
| Single Ports Available             | Number of ports allocated one at a time that are free for use. | —                      |
| Twin Ports Allocated               | Number of ports allocated two at a time that are in use.       | —                      |
| Twin Ports Available               | Number of ports allocated two at a time that are free for use. | —                      |

**Monitoring Policy Statistics**

**Purpose** Monitor and record traffic that Junos OS permits or denies based on previously configured policies.

**Action** To monitor traffic, enable the count and log options.

**Count**—Configurable in an individual policy. If count is enabled, statistics are collected for the number of packets, bytes, and sessions that enter the firewall for a given policy. For counts (only for packets and bytes), you can specify that alarms be generated whenever the traffic exceeds specified thresholds. See *count* (*Security Policies*).

**Log**—Logging capability can be enabled with security policies during session initialization (**session-init**) or session close (**session-close**) stage. See *log (Security Policies)*.

- To view logs from denied connections, enable log on **session-init**.
- To log sessions after their conclusion/tear-down, enable log on **session-close**.

**NOTE:** Session log is enabled at real time in the flow code which impacts the user performance. If both **session-close** and **session-init** are enabled, performance is further degraded as compared to enabling **session-init** only.

For details about information collected for session logs, see *Information Provided in Session Log Entries for SRX Series Services Gateways*.

### Monitoring PPP

**Purpose** Display PPP monitoring information, including PPP address pool information, session status for PPP interfaces, cumulative statistics for all PPP interfaces, and a summary of PPP sessions.

**NOTE:** PPP monitoring information is available only in the CLI. The J-Web user interface does not include pages for displaying PPP monitoring information.

**Action** Enter the following CLI commands:

- **show ppp address-pool *pool-name***
- **show ppp interface *interface-name***
- **show ppp statistics**
- **show ppp summary**

### Monitoring PPPoE

**Purpose** Display the session status for PPPoE interfaces, cumulative statistics for all PPPoE interfaces on the device, and the PPPoE version configured on the device.

**Action** Select **Monitor>PPPoE** in the J-Web user interface. To view interface-specific properties in the J-Web interface, select the interface name on the PPPoE page.

[Table 166 on page 1404](#) summarizes key output fields in PPPoE displays.

**Table 166: Summary of Key PPPoE Output Fields**

| Field                   | Values   | Additional Information  |
|-------------------------|--|---|
| <b>PPPoE Interfaces</b> |  |   |
| Interface               | Name of the PPPoE interface.   | Click the interface name to display PPPoE information for the interface.  |
| State                   | State of the PPPoE session on the interface.                                       | —   |
| Session ID              | Unique session identifier for the PPPoE session.                                   | To establish a PPPoE session, first the device acting as a PPPoE client obtains the Ethernet address of the PPPoE server or access concentrator, and then the client and the server negotiate a unique session ID. This process is referred to as PPPoE active discovery and is made up of four steps: initiation, offer, request, and session confirmation. The access concentrator generates the session ID for session confirmation and sends it to the PPPoE client in a PPPoE Active Discovery Session-Confirmation (PADS) packet. |
| Service Name            | Type of service required from the access concentrator.                             | Service Name identifies the type of service provided by the access concentrator, such as the name of the Internet service provider (ISP), class, or quality of service.   |
| Configured AC Name      | Configured access concentrator name.   | —   |
| Session AC Names        | Name of the access concentrator.   | —   |
| AC MAC Address          | Media access control (MAC) address of the access concentrator.                     | —   |
| Session Uptime          | Number of seconds the current PPPoE session has been running.                      | —   |
| Auto-Reconnect Timeout  | Number of seconds to wait before reconnecting after a PPPoE session is terminated. | —   |

Table 166: Summary of Key PPPoE Output Fields (*continued*)

| Field                   | Values   | Additional Information |
|-------------------------|--|------------------------|
| Idle Timeout            | Number of seconds a PPPoE session can be idle without disconnecting.   | —                      |
| Underlying Interface    | Name of the underlying logical Ethernet or ATM interface on which PPPoE is running—for example, <b>ge-0/0/0.1</b> .  | —                      |
| <b>PPPoE Statistics</b> |  |                        |
| Active PPPoE Sessions   | Total number of active PPPoE sessions.   | —                      |
| Packet Type             | Packets sent and received during the PPPoE session, categorized by packet type and packet error: <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Terminate packets.</li> <li>• <b>Service Name Error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC System Error</b>—Packets for which the access concentrator experienced an error in processing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic Error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed Packet</b>—Malformed or short packets that caused the packet handler to disregard the frame as unreadable.</li> <li>• <b>Unknown Packet</b>—Unrecognized packets.</li> </ul> | —                      |
| Sent                    | Number of the specific type of packet sent from the PPPoE client.  | —                      |
| Received                | Number of the specific type of packet received by the PPPoE client.  | —                      |

Table 166: Summary of Key PPPoE Output Fields (*continued*)

| Field                         | Values   | Additional Information  |
|-------------------------------|--|---|
| Timeout                       | Information about the timeouts that occurred during the PPPoE session. <ul style="list-style-type: none"> <li>PADI—Number of timeouts that occurred for the PADI packet.</li> <li>PADO—Number of timeouts that occurred for the PADO packet. (This value is always 0 and is not supported.)</li> <li>PADR—Number of timeouts that occurred for the PADR packet.</li> </ul> | —   |
| Sent                          | Number of the timeouts that occurred for PADI, PADO, and PADR packets.   | —   |
| <b>PPPoE Version</b>          |  |   |
| Maximum Sessions              | Maximum number of active PPPoE sessions the device can support. The default is 256 sessions.   | —   |
| PADI Resend Timeout           | Initial time, (in seconds) the device waits to receive a PADO packet for the PADI packet sent—for example, 2 seconds. This timeout doubles for each successive PADI packet sent.   | The PPPoE Active Discovery Initiation (PADI) packet is sent to the access concentrator to initiate a PPPoE session. Typically, the access concentrator responds to a PADI packet with a PPPoE Active Discovery Offer (PADO) packet. If the access concentrator does not send a PADO packet, the device sends the PADI packet again after timeout period is elapsed. The PADI Resend Timeout doubles for each successive PADI packet sent. For example, if the PADI Resend Timeout is 2 seconds, the second PADI packet is sent after 2 seconds, the third after 4 seconds, the fourth after 8 seconds, and so on. |
| PADR Resend Timeout           | Initial time (in seconds) the device waits to receive a PADS packet for the PADR packet sent. This timeout doubles for each successive PADR packet sent.   | The PPPoE Active Discovery Request (PADR) packet is sent to the access concentrator in response to a PADO packet, and to obtain the PPPoE session ID. Typically, the access concentrator responds to a PADR packet with a PPPoE Active Discovery Session-Confirmation (PADS) packet, which contains the session ID. If the access concentrator does not send a PADS packet, the device sends the PADR packet again after the PADR Resend Timeout period is elapsed. The PADR Resend Timeout doubles for each successive PADR packet sent.   |
| Maximum Resend Timeout        | Maximum value (in seconds) that the PADI or PADR resend timer can accept—for example, 64 seconds. The maximum value is 64.   | —   |
| Maximum Configured AC Timeout | Time (in seconds), within which the configured access concentrator must respond.   | —   |

Alternatively, enter the following CLI commands:

- `show pppoe interfaces`
- `show pppoe statistics`
- `show pppoe version`

You can also view status information about the PPPoE interface by entering the **show interfaces pp0** command in the CLI editor.

### Monitoring Reports

On-box reporting offers a comprehensive reporting facility where your security management team can spot a security event when it occurs, immediately access and review pertinent details about the event, and quickly decide appropriate remedial action. The J-Web reporting feature provides one- or two-page reports that are equivalent to a compilation of numerous log entries.

This section contains the following topics:

- [Threats Monitoring Report on page 1407](#)
- [Traffic Monitoring Report on page 1412](#)

#### Threats Monitoring Report

**Purpose** Use the Threats Report to monitor general statistics and activity reports of current threats to the network. You can analyze logging data for threat type, source and destination details, and threat frequency information. The report calculates, displays, and refreshes the statistics, providing graphic presentations of the current state of the network.

**Action** To view the Threats Report:

1. Click **Threats Report** in the bottom right of the Dashboard, or select **Monitor>Reports>Threats** in the J-Web user interface. The Threats Report appears.
2. Select one of the following tabs:
  - **Statistics** tab. See [Table 167 on page 1407](#) for a description of the page content.
  - **Activities** tab. See [Table 168 on page 1410](#) for a description of the page content.

**Table 167: Statistics Tab Output in the Threats Report**

| Field                   | Description |
|-------------------------|-------------|
| General Statistics Pane |             |

Table 167: Statistics Tab Output in the Threats Report (*continued*)

| Field                                     | Description   |
|---|---|
| Threat Category                           | One of the following categories of threats: <ul style="list-style-type: none"> <li>• Traffic</li> <li>• IDP</li> <li>• Content Security <ul style="list-style-type: none"> <li>• Antivirus</li> <li>• Antispam</li> <li>• Web Filter—Click the Web filter category to display counters for 39 subcategories.</li> <li>• Content Filter</li> </ul> </li> <li>• Firewall Event</li> </ul> |
| Severity                                  | Severity level of the threat: <ul style="list-style-type: none"> <li>• emerg</li> <li>• alert</li> <li>• crit</li> <li>• err</li> <li>• warning</li> <li>• notice</li> <li>• info</li> <li>• debug</li> </ul>   |
| Hits in past 24 hours                     | Number of threats encountered per category in the past 24 hours.  |
| Hits in current hour                      | Number of threats encountered per category in the last hour.  |
| <b>Threat Counts in the Past 24 Hours</b> |   |
| By Severity                               | Graph representing the number of threats received each hour for the past 24 hours sorted by severity level.   |
| By Category                               | Graph representing the number of threats received each hour for the past 24 hours sorted by category.   |
| X Axis                                    | Twenty-four hour span with the current hour occupying the right-most column of the display. The graph shifts to the left every hour.  |
| Y Axis                                    | Number of threats encountered. The axis automatically scales based on the number of threats encountered.  |
| <b>Most Recent Threats</b>                |   |
| Threat Name                               | Names of the most recent threats. Depending on the threat category, you can click the threat name to go to a scan engine site for a threat description.   |

Table 167: Statistics Tab Output in the Threats Report (*continued*)

| Field                                | Description   |
|--------------------------------------|---|
| Category                             | Category of each threat: <ul style="list-style-type: none"> <li>• Traffic</li> <li>• IDP</li> <li>• Content Security <ul style="list-style-type: none"> <li>• Antivirus</li> <li>• Antispam</li> <li>• Web Filter</li> <li>• Content Filter</li> </ul> </li> <li>• Firewall Event</li> </ul>  |
| Source IP/Port                       | Source IP address (and port number, if applicable) of the threat.   |
| Destination IP/Port                  | Destination IP address (and port number, if applicable) of the threat.  |
| Protocol                             | Protocol name of the threat.  |
| Description                          | Threat identification based on the category type: <ul style="list-style-type: none"> <li>• Antivirus—URL</li> <li>• Web filter—category</li> <li>• Content filter—reason</li> <li>• Antispam—sender e-mail</li> </ul>   |
| Action                               | Action taken in response to the threat.   |
| Hit Time                             | Time the threat occurred.   |
| <b>Threat Trend in past 24 hours</b> |   |
| Category                             | Pie chart graphic representing comparative threat counts by category: <ul style="list-style-type: none"> <li>• Traffic</li> <li>• IDP</li> <li>• Content Security <ul style="list-style-type: none"> <li>• Antivirus</li> <li>• Antispam</li> <li>• Web Filter</li> <li>• Content Filter</li> </ul> </li> <li>• Firewall Event</li> </ul> |
| <b>Web Filter Counters Summary</b>   |   |
| Category                             | Web filter count broken down by up to 39 subcategories. Clicking on the Web filter listing in the General Statistics pane opens the Web Filter Counters Summary pane.   |
| Hits in past 24 hours                | Number of threats per subcategory in the last 24 hours.   |

Table 167: Statistics Tab Output in the Threats Report (*continued*)

| Field                | Description   |
|----------------------|---|
| Hits in current hour | Number of threats per subcategory in the last hour. |

Table 168: Activities Tab Output in the Threats Report

| Field                                  | Function  |
|--|---|
| <b>Most Recent Virus Hits</b>          |   |
| Threat Name                            | Name of the virus threat. Viruses can be based on services, like Web, FTP, or e-mail, or based on severity level.   |
| Severity                               | Severity level of each threat: <ul style="list-style-type: none"> <li>• emerg</li> <li>• alert</li> <li>• crit</li> <li>• err</li> <li>• warning</li> <li>• notice</li> <li>• info</li> <li>• debug</li> </ul>        |
| Source IP/Port                         | IP address (and port number, if applicable) of the source of the threat.  |
| Destination IP/Port                    | IP address (and port number, if applicable) of the destination of the threat.   |
| Protocol                               | Protocol name of the threat.  |
| Description                            | Threat identification based on the category type: <ul style="list-style-type: none"> <li>• Antivirus—URL</li> <li>• Web filter—category</li> <li>• Content filter—reason</li> <li>• Antispam—sender e-mail</li> </ul> |
| Action                                 | Action taken in response to the threat.   |
| Last Hit Time                          | Last time the threat occurred.  |
| <b>Most Recent Spam E-Mail Senders</b> |   |
| From e-mail                            | E-mail address that was the source of the spam.   |

Table 168: Activities Tab Output in the Threats Report (*continued*)

| Field                                | Function  |
|--------------------------------------|---|
| Severity                             | Severity level of the threat: <ul style="list-style-type: none"> <li>• emerg</li> <li>• alert</li> <li>• crit</li> <li>• err</li> <li>• warning</li> <li>• notice</li> <li>• info</li> <li>• debug</li> </ul> |
| Source IP                            | IP address of the source of the threat.   |
| Action                               | Action taken in response to the threat.   |
| Last Send Time                       | Last time that the spam e-mail was sent.  |
| <b>Recently Blocked URL Requests</b> |   |
| URL                                  | URL request that was blocked.   |
| Source IP/Port                       | IP address (and port number, if applicable) of the source.  |
| Destination IP/Port                  | IP address (and port number, if applicable) of the destination.   |
| Hits in current hour                 | Number of threats encountered in the last hour.   |
| <b>Most Recent IDP Attacks</b>       |   |
| Attack                               |   |
| Severity                             | Severity of each threat: <ul style="list-style-type: none"> <li>• emerg</li> <li>• alert</li> <li>• crit</li> <li>• err</li> <li>• warning</li> <li>• notice</li> <li>• info</li> <li>• debug</li> </ul>      |
| Source IP/Port                       | IP address (and port number, if applicable) of the source.  |
| Destination IP/Port                  | IP address (and port number, if applicable) of the destination.   |
| Protocol                             | Protocol name of the threat.  |

Table 168: Activities Tab Output in the Threats Report (*continued*)

| Field          | Function                                |
|----------------|---|
| Action         | Action taken in response to the threat. |
| Last Send Time | Last time the IDP threat was sent.      |

**Traffic Monitoring Report**

**Purpose** Monitor network traffic by reviewing reports of flow sessions over the past 24 hours. You can analyze logging data for connection statistics and session usage by a transport protocol.

**Action** To view network traffic in the past 24 hours, select **Monitor>Reports>Traffic** in the J-Web user interface. See [Table 169 on page 1412](#) for a description of the report.

Table 169: Traffic Report Output

| Field   | Description  |
|---|--|
| <b>Sessions in Past 24 Hours per Protocol</b> |  |
| Protocol Name                                 | Name of the protocol. To see hourly activity by protocol, click the protocol name and review the "Protocol activities chart" in the lower pane. <ul style="list-style-type: none"> <li>• TCP</li> <li>• UDP</li> <li>• ICMP</li> </ul> |
| Total Session                                 | Total number of sessions for the protocol in the past 24 hours.  |
| Bytes In (KB)                                 | Total number of incoming bytes in KB.  |
| Bytes Out (KB)                                | Total number of outgoing bytes in KB.  |
| Packets In                                    | Total number of incoming packets.  |
| Packets Out                                   | Total number of outgoing packets.  |
| <b>Most Recently Closed Sessions</b>          |  |
| Source IP/Port                                | Source IP address (and port number, if applicable) of the closed session.  |
| Destination IP/Port                           | Destination IP address (and port number, if applicable) of the closed session.   |
| Protocol                                      | Protocol of the closed session. <ul style="list-style-type: none"> <li>• TCP</li> <li>• UDP</li> <li>• ICMP</li> </ul>   |
| Bytes In (KB)                                 | Total number of incoming bytes in KB.  |

Table 169: Traffic Report Output (*continued*)

| Field                            | Description   |
|----------------------------------|---|
| Bytes Out (KB)                   | Total number of outgoing bytes in KB.   |
| Packets In                       | Total number of incoming packets.   |
| Packets Out                      | Total number of outgoing packets.   |
| Timestamp                        | The time the session was closed.  |
| <b>Protocol Activities Chart</b> |   |
| Bytes In/Out                     | Graphic representation of traffic as incoming and outgoing bytes per hour. The byte count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.     |
| Packets In/Out                   | Graphic representation of traffic as incoming and outgoing packets per hour. The packet count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately. |
| Sessions                         | Graphic representation of traffic as the number of sessions per hour. The session count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.       |
| X Axis                           | One hour per column for 24 hours.   |
| Y Axis                           | Byte, packet, or session count.   |
| <b>Protocol Session Chart</b>    |   |
| Sessions by Protocol             | Graphic representation of the traffic as the current session count per protocol. The protocols displayed are TCP, UDP, and ICMP.  |

### Monitoring Routing Information

This section contains the following topics:

- [Monitoring Route Information on page 1414](#)
- [Monitoring RIP Routing Information on page 1416](#)
- [Monitoring OSPF Routing Information on page 1417](#)
- [Monitoring BGP Routing Information on page 1419](#)

**Monitoring Route Information**

**Purpose** View information about the routes in a routing table, including destination, protocol, state, and parameter information.

**Action** Select **Monitor>Routing>Route Information** in the J-Web user interface, or enter the following CLI commands:

- **show route terse**
- **show route detail**

**NOTE:** When you use an HTTPS connection in the Microsoft Internet Explorer browser to save a report from this page in the J-Web interface, the error message "Internet Explorer was not able to open the Internet site" is displayed. This problem occurs because the Cache-Control: no cache HTTP header is added on the server side and Internet Explorer does not allow you to download the encrypted file with the Cache-Control: no cache HTTP header set in the response from the server.

As a workaround, refer to Microsoft Knowledge Base article 323308, which is available at this URL: <http://support.microsoft.com/kb/323308>. Also, you can alternatively use HTTP in the Internet Explorer browser or use HTTPS in the Mozilla Firefox browser to save a file from this page.

Table 170 on page 1414 describes the different filters, their functions, and the associated actions.

Table 171 on page 1415 summarizes key output fields in the routing information display.

**Table 170: Filtering Route Messages**

| Field               | Function   | Your Action                                 |
|---------------------|--|---|
| Destination Address | Specifies the destination address of the route.  | Enter the destination address.              |
| Protocol            | Specifies the protocol from which the route was learned.   | Enter the protocol name.                    |
| Next hop address    | Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | Enter the next hop address.                 |
| Receive protocol    | Specifies the dynamic routing protocol using which the routing information was received through a particular neighbor.               | Enter the routing protocol.                 |
| Best route          | Specifies only the best route available.   | Select the view details of the best route.  |
| Inactive routes     | Specifies the inactive routes.   | Select the view details of inactive routes. |

Table 170: Filtering Route Messages (*continued*)

| Field         | Function   | Your Action   |
|---------------|--|---|
| Exact route   | Specifies the exact route.                                       | Select the view details of the exact route.                     |
| Hidden routes | Specifies the hidden routes.                                     | Select the view details of hidden routes.                       |
| Search        | Applies the specified filter and displays the matching messages. | To apply the filter and display messages, click <b>Search</b> . |
| Reset         | Resets selected options to default                               | To reset the filter, click <b>Reset</b> .                       |

Table 171: Summary of Key Routing Information Output Fields

| Field                  | Values  | Additional Information  |
|------------------------|---|---|
| Static Route Addresses | The list of static route addresses.   | —   |
| Protocol               | Protocol from which the route was learned: <b>Static</b> , <b>Direct</b> , <b>Local</b> , or the name of a particular protocol.   | —   |
| Preference             | The preference is the individual preference value for the route.  | The route preference is used as one of the route selection criteria.  |
| Next-Hop               | Network Layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.  | <p>If a next hop is listed as <b>Discard</b>, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the <b>discard</b> attribute has been set.</p> <p>If a next hop is listed as <b>Reject</b>, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected.</p> <p>If a next hop is listed as <b>Local</b>, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</p> |
| Age                    | How long the route has been active.   | —   |
| State                  | Flags for this route.   | There are many possible flags.  |
| AS Path                | <p>AS path through which the route was learned. The letters of the AS path indicate the path origin:</p> <ul style="list-style-type: none"> <li>I—IGP.</li> <li>E—EGP.</li> <li>?—Incomplete. Typically, the AS path was aggregated.</li> </ul> | —   |

**Monitoring RIP Routing Information**

**Purpose** View RIP routing information, including a summary of RIP neighbors and statistics.

**Action** Select **Monitor>Routing>RIP Information** in the J-Web user interface, or enter the following CLI commands:

- **show rip statistics**
- **show rip neighbors**

[Table 172 on page 1416](#) summarizes key output fields in the RIP routing display in the J-Web user interface.

**Table 172: Summary of Key RIP Routing Output Fields**

| Field                    | Values   | Additional Information  |
|--------------------------|--|---|
| <b>RIP Statistics</b>    |  |   |
| Protocol Name            | The RIP protocol name.   | —   |
| Port number              | The port on which RIP is enabled.  | —   |
| Hold down time           | The interval during which routes are neither advertised nor updated.                   | —   |
| Global routes learned    | Number of RIP routes learned on the logical interface.                                 | —   |
| Global routes held down  | Number of RIP routes that are not advertised or updated during the hold-down interval. | —   |
| Global request dropped   | Number of requests dropped.  | —   |
| Global responses dropped | Number of responses dropped.   | —   |
| <b>RIP Neighbors</b>     |  |   |
| Details                  | Tab used to view the details of the interface on which RIP is enabled.                 | —   |
| Neighbor                 | Name of the RIP neighbor.  | This value is the name of the interface on which RIP is enabled. Click the name to see the details for this neighbor. |
| State                    | State of the RIP connection: <b>Up</b> or <b>Dn</b> (Down).                            | —   |
| Source Address           | Local source address.  | This value is the configured address of the interface on which RIP is enabled.  |
| Destination Address      | Destination address.   | This value is the configured address of the immediate RIP adjacency.  |

Table 172: Summary of Key RIP Routing Output Fields (*continued*)

| Field        | Values  | Additional Information |
|--------------|---|------------------------|
| Send Mode    | The mode of sending RIP messages.                             | —                      |
| Receive Mode | The mode in which messages are received.                      | —                      |
| In Metric    | Value of the incoming metric configured for the RIP neighbor. | —                      |

**Monitoring OSPF Routing Information**

**Purpose** View OSPF routing information, including a summary of OSPF neighbors, interfaces, and statistics.

**Action** Select **Monitor>Routing>OSPF Information** in the J-Web user interface, or enter the following CLI commands:

- **show ospf neighbors**
- **show ospf interfaces**
- **show ospf statistics**

[Table 173 on page 1417](#) summarizes key output fields in the OSPF routing display in the J-Web user interface.

Table 173: Summary of Key OSPF Routing Output Fields

| Field                  | Values  | Additional Information  |
|------------------------|---|---|
| <b>OSPF Interfaces</b> |   |   |
| Details                | Tab used to view the details of the selected OSPF.  | —   |
| Interface              | Name of the interface running OSPF.   | —   |
| State                  | State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DROther</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> . | The <b>Down</b> state, indicating that the interface is not functioning, and <b>PtToPt</b> state, indicating that a point-to-point connection has been established, are the most common states. |
| Area                   | Number of the area that the interface is in.  | —   |
| DR ID                  | ID of the area's designated device.   | —   |
| BDR ID                 | ID of the area's backup designated device.  | —   |
| Neighbors              | Number of neighbors on this interface.  | —   |
| <b>OSPF Statistics</b> |   |   |

Table 173: Summary of Key OSPF Routing Output Fields (*continued*)

| Field                    | Values  | Additional Information   |
|--------------------------|---|--|
| <b>Packets tab</b>       |   |  |
| Sent                     | Displays the total number of packets sent.  | —  |
| Received                 | Displays the total number of packets received.  | —  |
| <b>Details tab</b>       |   |  |
| Flood Queue Depth        | Number of entries in the extended queue.  | —  |
| Total Retransmits        | Number of retransmission entries enqueued.  | —  |
| Total Database Summaries | Total number of database description packets.   | —  |
| <b>OSPF Neighbors</b>    |   |  |
| Address                  | Address of the neighbor.  | —  |
| Interface                | Interface through which the neighbor is reachable.  | —  |
| State                    | State of the neighbor: <b>Attempt, Down, Exchange, ExStart, Full, Init, Loading, or 2way.</b> | Generally, only the <b>Down</b> state, indicating a failed OSPF adjacency, and the <b>Full</b> state, indicating a functional adjacency, are maintained for more than a few seconds. The other states are transitional states that a neighbor is in only briefly while an OSPF adjacency is being established. |
| ID                       | ID of the neighbor.   | —  |
| Priority                 | Priority of the neighbor to become the designated router.                                     | —  |
| Activity Time            | The activity time.  | —  |
| Area                     | Area that the neighbor is in.   | —  |
| Options                  | Option bits received in the hello packets from the neighbor.                                  | —  |
| DR Address               | Address of the designated router.   | —  |
| BDR Address              | Address of the backup designated router.  | —  |
| Uptime                   | Length of time since the neighbor came up.  | —  |
| Adjacency                | Length of time since the adjacency with the neighbor was established.                         | —  |

**Monitoring BGP Routing Information**

**Purpose** Monitor BGP routing information on the routing device, including a summary of BGP routing and neighbor information.

**Action** Select **Monitor>Routing>BGP Information** in the J-Web user interface, or enter the following CLI commands:

- **show bgp summary**
- **show bgp neighbor**

[Table 174 on page 1419](#) summarizes key output fields in the BGP routing display in the J-Web user interface.

**Table 174: Summary of Key BGP Routing Output Fields**

| Field                   | Values   | Additional Information |
|-------------------------|--|------------------------|
| <b>BGP Peer Summary</b> |  |                        |
| Total Groups            | Number of BGP groups.  | —                      |
| Total Peers             | Number of BGP peers.   | —                      |
| Down Peers              | Number of unavailable BGP peers.   | —                      |
| Unconfigured Peers      | Address of each BGP peer.  | —                      |
| <b>RIB Summary tab</b>  |  |                        |
| RIB Name                | Name of the RIB group.   | —                      |
| Total Prefixes          | Total number of prefixes from the peer, both active and inactive, that are in the routing table.   | —                      |
| Active Prefixes         | Number of prefixes received from the EBGp peers that are active in the routing table.  | —                      |
| Suppressed Prefixes     | Number of routes received from EBGp peers currently inactive because of damping or other reasons.  | —                      |
| History Prefixes        | History of the routes received or suppressed.  | —                      |
| Dumped Prefixes         | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. | —                      |
| Pending Prefixes        | Number of pending routes.  | —                      |

Table 174: Summary of Key BGP Routing Output Fields (*continued*)

| Field                | Values  | Additional Information  |
|----------------------|---|---|
| State                | Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete.   | —   |
| <b>BGP Neighbors</b> |   |   |
| Details              | Click this button to view the selected BGP neighbor details.  | —   |
| Peer Address         | Address of the BGP neighbor.  | —   |
| Autonomous System    | AS number of the peer.  | —   |
| Peer State           | <p>Current state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a TCP connection in an attempt to connect to a peer. If the connection is successful, BGP sends an open message.</li> <li>• <b>Connect</b>—BGP is waiting for the TCP connection to become complete.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging BGP update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul> | Generally, the most common states are <b>Active</b> , which indicates a problem establishing the BGP connection, and <b>Established</b> , which indicates a successful session setup. The other states are transition states, and BGP sessions normally do not stay in those states for extended periods of time. |
| Elapsed Time         | Elapsed time since the peering session was last reset.  | —   |
| Description          | Description of the BGP session.   | —   |

## Monitoring SCCP ALGs

This section contains the following topics:

- [Monitoring SCCP ALG Calls on page 1421](#)
- [Monitoring SCCP ALG Counters on page 1421](#)

### Monitoring SCCP ALG Calls

**Purpose** View information about SCCP ALG calls.

**Action** Select **Monitor>ALGs>SCCP>Calls** in the J-Web user interface. To view detailed information, select the client IP address on the SCCP calls page.

Alternatively, enter the **show security alg sccp calls** command.

[Table 175 on page 1421](#) summarizes key output fields in the SCCP calls display.

**Table 175: Summary of Key SCCP Calls Output Fields**

| Field                         | Values                             | Additional Information |
|-------------------------------|------------------------------------|------------------------|
| <b>SCCP Calls Information</b> |                                    |                        |
| Client IP                     | IP address of the client.          | —                      |
| Zone                          | Client zone identifier.            | —                      |
| Call Manager                  | IP address of the call manager.    | —                      |
| Conference ID                 | Conference call identifier.        | —                      |
| RM Group                      | Resource manager group identifier. | —                      |

### Monitoring SCCP ALG Counters

**Purpose** View SCCP ALG counters information.

**Action** Select **Monitor>ALGs>SCCP>Count** in the J-Web user interface, or enter the **show security alg sccp counters** command.

[Table 176 on page 1421](#) summarizes key output fields in the SCCP counters display.

**Table 176: Summary of Key SCCP Counters Output Fields**

| Field                            | Values   | Additional Information |
|----------------------------------|--|------------------------|
| <b>SCCP Counters Information</b> |  |                        |
| Clients currently registered     | Number of SCCP ALG clients currently registered. | —                      |

Table 176: Summary of Key SCCP Counters Output Fields (*continued*)

| Field                      | Values  | Additional Information |
|----------------------------|---|------------------------|
| Active calls               | Number of active SCCP ALG calls.  | —                      |
| Total calls                | Total number of SCCP ALG calls.   | —                      |
| Packets received           | Number of SCCP ALG packets received.  | —                      |
| PDUs processed             | Number of SCCP ALG protocol data units (PDUs) processed.                    | —                      |
| Current call rate          | Number of calls per second.   | —                      |
| <b>Error counters</b>      |   |                        |
| Packets dropped            | Number of packets dropped by the SCCP ALG.                                  | —                      |
| Decode errors              | SCCP ALG decoding errors.   | —                      |
| Protocol errors            | Number of protocol errors.  | —                      |
| Address translation errors | Number of Network Address Translation (NAT) errors encountered by SCCP ALG. | —                      |
| Policy lookup errors       | Number of packets dropped because of a failed policy lookup.                | —                      |
| Unknown PDUs               | Number of unknown protocol data units (PDUs).                               | —                      |
| Maximum calls exceed       | Number of times the maximum SCCP calls limit was exceeded.                  | —                      |
| Maximum call rate exceed   | Number of times the maximum SCCP call rate exceeded.                        | —                      |
| Initialization errors      | Number of initialization errors.  | —                      |
| Internal errors            | Number of internal errors.  | —                      |
| Unsupported feature        | Number of unsupported feature errors.                                       | —                      |

Table 176: Summary of Key SCCP Counters Output Fields (*continued*)

| Field              | Values                        | Additional Information |
|--------------------|-------------------------------|------------------------|
| Non specific error | Number of nonspecific errors. | —                      |

### [Monitoring Security Events by Policy](#)

**Purpose** Monitor security events by policy and display logged event details with the J-Web user interface.

- Action**
1. Select **Monitor>Events and Alarms>Security Events** in the J-Web user interface. The View Policy Log pane appears. [Table 177 on page 1423](#) describes the content of this pane.

Table 177: View Policy Log Fields

| Field                | Value   |
|----------------------|---|
| Log file name        | Name of the event log files to search.                        |
| Policy name          | Name of the policy of the events to be retrieved.             |
| Source address       | Source address of the traffic that triggered the event.       |
| Destination address  | Destination address of the traffic that triggered the event.  |
| Event type           | Type of event that was triggered by the traffic.              |
| Application          | Application of the traffic that triggered the event.          |
| Source port          | Source port of the traffic that triggered the event.          |
| Destination port     | Destination port of the traffic that triggered the event.     |
| Source zone          | Source zone of the traffic that triggered the event.          |
| Destination zone     | Destination zone of the traffic that triggered the event.     |
| Source NAT rule      | Source NAT rule of the traffic that triggered the event.      |
| Destination NAT rule | Destination NAT rule of the traffic that triggered the event. |

If your device is not configured to store session log files locally, the Create log configuration button is displayed in the lower-right portion of the View Policy Log pane.

- To store session log files locally, click **Create log configuration**.

If session logs are being sent to an external log collector (stream mode has been configured for log files), a message appears indicating that event mode must be configured to view policy logs.

**NOTE:** Reverting to event mode will discontinue event logging to the external log collector.

- To reset the **mode** option to **event**, enter the **set security log** command.
2. Enter one or more search fields in the View Policy Log pane and click **Search** to display events matching your criteria.

For example, enter the event type **Session Close** and the policy **pol1** to display event details from all Session Close logs that contain the specified policy. To reduce search results further, add more criteria about the particular event or group of events that you want displayed.

The Policy Events Detail pane displays information from each matching session log. [Table 178 on page 1424](#) describes the contents of this pane.

**Table 178: Policy Events Detail Fields**

| Field                   | Value   |
|-------------------------|---|
| Timestamp               | Time when the event occurred.   |
| Policy name             | Policy that triggered the event.  |
| Record type             | Type of event log providing the data.                                   |
| Source IP/Port          | Source address (and port, if applicable) of the event traffic.          |
| Destination IP/Port     | Destination address (and port, if applicable) of the event traffic.     |
| Service name            | Service name of the event traffic.                                      |
| NAT source IP/Port      | NAT source address (and port, if applicable) of the event traffic.      |
| NAT destination IP/Port | NAT destination address (and port, if applicable) of the event traffic. |

- [Monitoring Firewall Authentication Table on page 1434](#)
- [Monitoring Firewall Authentication History on page 1436](#)
- [Monitoring 802.1x on page 1438](#)

### Monitoring Policies

**Purpose** Display, sort, and review policy activity for every activated policy configured on the device. Policies are grouped by Zone Context (the from and to zones of the traffic) to control the volume of data displayed at one time. From the policy list, select a policy to display statistics and current network activity.

**Action** To review policy activity:

1. Select **Monitor>Security>Policy>Activities** in the J-Web user interface. The Security Policies Monitoring page appears and lists the policies from the first Zone Context. See [Table 179 on page 1425](#) for field descriptions.
2. Select the **Zone Context** of the policy you want to monitor, and click **Filter**. All policies within the zone context appear in match sequence.
3. Select a policy, and click **Clear Statistics** to set all counters to zero for the selected policy.

**Table 179: Security Policies Monitoring Output Fields**

| Field                  | Value   | Additional Information   |
|------------------------|---|--|
| Zone Context (Total #) | Displays a list of all from and to zone combinations for the configured policies. The total number of active policies for each context is specified in the Total # field. By default, the policies from the first Zone Context are displayed. | To display policies for a different context, select a zone context and click <b>Filter</b> . Both inactive and active policies appear for each context. However, the Total # field for a context specifies the number of active policies only. |

Table 179: Security Policies Monitoring Output Fields (*continued*)

| Field                 | Value   | Additional Information  |
|-----------------------|---|---|
| Default Policy action | Specifies the action to take for traffic that does not match any of the policies in the context: <ul style="list-style-type: none"> <li>• permit-all—Permit all traffic that does not match a policy.</li> <li>• deny-all—Deny all traffic that does not match a policy.</li> </ul>   | —   |
| From Zone             | Displays the source zone to be used as match criteria for the policy.   | —   |
| To Zone               | Displays the destination zone to be used as match criteria for the policy.  | —   |
| Name                  | Displays the name of the policy.  | —   |
| Source Address        | Displays the source addresses to be used as match criteria for the policy. Address sets are resolved to their individual names. (In this case, only the names are given, not the IP addresses).   | —   |
| Destination Address   | Displays the destination addresses (or address sets) to be used as match criteria for the policy. Addresses are entered as specified in the destination zone's address book.  | —   |
| Source Identity       | Displays the name of the source identities set for the policy.  | To display the value of the source identities, hover the mouse on this field. Unknown source identities are also displayed.   |
| Application           | Displays the name of a predefined or custom application signature to be used as match criteria for the policy.  | —   |
| Dynamic App           | Displays the dynamic application signatures to be used as match criteria if an application firewall rule set is configured for the policy.<br><br>For a network firewall, a dynamic application is not defined.   | The rule set appears in two lines. The first line displays the configured dynamic application signatures in the rule set. The second line displays the default dynamic application signature.<br><br>If more than two dynamic application signatures are specified for the rule set, hover over the output field to display the full list in a tooltip. |
| Action                | Displays the action portion of the rule set if an application firewall rule set is configured for the policy. <ul style="list-style-type: none"> <li>• permit—Permits access to the network services controlled by the policy. A green background signifies permission.</li> <li>• deny—Denies access to the network services controlled by the policy. A red background signifies denial.</li> </ul> | The action portion of the rule set appears in two lines. The first line identifies the action to be taken when the traffic matches a dynamic application signature. The second line displays the default action when traffic does not match a dynamic application signature.  |

Table 179: Security Policies Monitoring Output Fields (*continued*)

| Field                     | Value  | Additional Information   |
|---------------------------|--|--|
| NW Services               | <p>Displays the network services permitted or denied by the policy if an application firewall rule set is configured. Network services include:</p> <ul style="list-style-type: none"> <li>• gprs-gtp-profile—Specify a GPRS Tunneling Protocol profile name.</li> <li>• idp—Perform intrusion detection and prevention.</li> <li>• redirect-wx—Set WX redirection.</li> <li>• reverse-redirect-wx—Set WX reverse redirection.</li> <li>• uac-policy—Enable unified access control enforcement of the policy.</li> </ul> | —  |
| Policy Hit Counters Graph | Provides a representation of the value over time for a specified counter. The graph is blank if Policy Counters indicates no data. As a selected counter accumulates data, the graph is updated at each refresh interval.  | To toggle a graph on and off, click the counter name below the graph.  |
| Policy Counters           | <p>Lists statistical counters for the selected policy if Count is enabled. The following counters are available for each policy:</p> <ul style="list-style-type: none"> <li>• input-bytes</li> <li>• input-byte-rate</li> <li>• output-bytes</li> <li>• output-byte-rate</li> <li>• input-packets</li> <li>• input-packet-rate</li> <li>• output-packets</li> <li>• output-packet-rate</li> <li>• session-creations</li> <li>• session-creation-rate</li> <li>• active-sessions</li> </ul>                               | To graph or to remove a counter from the Policy Hit Counters Graph, toggle the counter name. The names of enabled counters appear below the graph. |

### Checking Policies

**Purpose** Enter match criteria and conduct a policy search. The search results include all policies that match the traffic criteria in the sequence in which they will be encountered.

Because policy matches are listed in the sequence in which they would be encountered, you can determine whether a specific policy is being applied correctly or not. The first policy in the list is applied to all matching traffic. Policies listed after this one remain in the “shadow” of the first policy and are never encountered by this traffic.

By manipulating the traffic criteria and policy sequence, you can tune policy application to suit your needs. During policy development, you can use this feature to establish the appropriate sequence of policies for optimum traffic matches. When troubleshooting, use this feature to determine if specific traffic is encountering the appropriate policy.

- Action**
1. Select **Monitor>Security>Policy>Shadow Policies** in the J-Web user interface. The Check Policies page appears. [Table 180 on page 1428](#) explains the content of this page.
  2. In the top pane, enter the From Zone and To Zone to supply the context for the search.
  3. Enter match criteria for the traffic, including the source address and port, the destination address and port, and the protocol of the traffic.
  4. Enter the number of matching policies to display.
  5. Click **Search** to find policies matching your criteria. The lower pane displays all policies matching the criteria up to the number of policies you specified.
    - The first policy will be applied to all traffic with this match criteria.
    - Remaining policies will not be encountered by any traffic with this match criteria.
  6. To manipulate the position and activation of a policy, select the policy and click the appropriate button:
    - **Move**—Moves the selected policy up or down to position it at a more appropriate point in the search sequence.
    - **Move to**—Moves the selected policy by allowing you to drag and drop it to a different location on the same page.

**Table 180: Check Policies Output**

| Field                                   | Function  |
|---|---|
| <b>Check Policies Search Input Pane</b> |   |
| From Zone                               | Name or ID of the source zone. If a From Zone is specified by name, the name is translated to its ID internally.    |
| To Zone                                 | Name or ID of the destination zone. If a To Zone is specified by name, the name is translated to its ID internally. |
| Source Address                          | Address of the source in IP notation.   |
| Source Port                             | Port number of the source.  |
| Destination Address                     | Address of the destination in IP notation.  |
| Destination Port                        | Port number of the destination.   |
| Source Identity                         | Name of the source identity.  |

Table 180: Check Policies Output (*continued*)

| Field                      | Function  |
|----------------------------|---|
| Protocol                   | Name or equivalent value of the protocol to be matched.<br><br>ah—51<br>egp—8<br>esp—50<br>gre—47<br>icmp—1<br>igmp—2<br>igp—9<br>ipip—94<br>ipv6—41<br>ospf—89<br>pgm—113<br>pim—103<br>rdp—27<br>rsvp—46<br>sctp—132<br>tcp—6<br>udp—17<br>vrrp—112 |
| Result Count               | (Optional) Number of policies to display. Default value is 1. Maximum value is 16.  |
| <b>Check Policies List</b> |   |
| From Zone                  | Name of the source zone.  |
| To Zone                    | Name of the destination zone.   |
| Total Policies             | Number of policies retrieved.   |
| Default Policy action      | The action to be taken if no match occurs.  |
| Name                       | Policy name   |
| Source Address             | Name of the source address (not the IP address) of a policy. Address sets are resolved to their individual names.   |

Table 180: Check Policies Output (*continued*)

| Field               | Function  |
|---------------------|---|
| Destination Address | Name of the destination address or address set. A packet's destination address must match this value for the policy to apply to it. |
| Source Identity     | Name of the source identity for the policy.   |
| Application         | Name of a preconfigured or custom application of the policy match.  |
| Action              | Action taken when a match occurs as specified in the policy.  |
| Hit Counts          | Number of matches for this policy. This value is the same as the Policy Lookups in a policy statistics report.                      |
| Active Sessions     | Number of active sessions matching this policy.   |

Alternatively, to list matching policies using the CLI, enter the **show security match-policies** command and include your match criteria and the number of matching policies to display.

#### **Monitoring Screen Counters**

**Purpose** View screen statistics for a specified security zone.

**Action** Select **Monitor>Security>Screen Counters** in the J-Web user interface, or enter the following CLI command:

**show security screen statistics zone zone-name**

[Table 181 on page 1430](#) summarizes key output fields in the screen counters display.

Table 181: Summary of Key Screen Counters Output Fields

| Field        | Values  | Additional Information   |
|--------------|---|--|
| <b>Zones</b> |   |  |
| ICMP Flood   | Internet Control Message Protocol (ICMP) flood counter.     | An ICMP flood typically occurs when ICMP echo requests use all resources in responding, such that valid network traffic can no longer be processed.                                  |
| UDP Flood    | User Datagram Protocol (UDP) flood counter.                 | UDP flooding occurs when an attacker sends IP packets containing UDP datagrams with the purpose of slowing down the resources, such that valid connections can no longer be handled. |
| TCP Winnuke  | Number of Transport Control Protocol (TCP) WinNuke attacks. | WinNuke is a denial-of-service (DoS) attack targeting any computer on the Internet running Windows.  |

Table 181: Summary of Key Screen Counters Output Fields (*continued*)

| Field                  | Values   | Additional Information   |
|------------------------|--|--|
| TCP Port Scan          | Number of TCP port scans.                                  | The purpose of this attack is to scan the available services in the hopes that at least one port will respond, thus identifying a service to target.       |
| ICMP Address Sweep     | Number of ICMP address sweeps.                             | An IP address sweep can occur with the intent of triggering responses from active hosts.   |
| IP Tear Drop           | Number of teardrop attacks.                                | Teardrop attacks exploit the reassembly of fragmented IP packets.  |
| TCP SYN Attack         | Number of TCP SYN attacks.                                 | —  |
| IP Spoofing            | Number of IP spoofs.                                       | IP spoofing occurs when an invalid source address is inserted in the packet header to make the packet appear to come from a trusted source.                |
| ICMP Ping of Death     | ICMP ping of death counter.                                | Ping of death occurs when IP packets are sent that exceed the maximum legal length (65,535 bytes).   |
| IP Source Route        | Number of IP source route attacks.                         | —  |
| TCP Land Attack        | Number of land attacks.                                    | Land attacks occur when attacker sends spoofed SYN packets containing the IP address of the victim as both the destination and source IP address.          |
| TCP SYN Fragment       | Number of TCP SYN fragments.                               | —  |
| TCP No Flag            | Number of TCP headers without flags set.                   | A normal TCP segment header has at least one control flag set.   |
| IP Unknown Protocol    | Number of unknown Internet protocols.                      | —  |
| IP Bad Options         | Number of invalid options.                                 | —  |
| IP Record Route Option | Number of packets with the IP record route option enabled. | This option records the IP addresses of the network devices along the path that the IP packet travels.   |
| IP Timestamp Option    | Number of IP timestamp option attacks.                     | This option records the time (in Universal Time) when each network device receives the packet during its trip from the point of origin to its destination. |
| IP Security Option     | Number of IP security option attacks.                      | —  |

Table 181: Summary of Key Screen Counters Output Fields (*continued*)

| Field                         | Values  | Additional Information   |
|-------------------------------|---|--|
| IP Loose route Option         | Number of IP loose route option attacks.                    | This option specifies a partial route list for a packet to take on its journey from source to destination.   |
| IP Strict Source Route Option | Number of IP strict source route option attacks.            | This option specifies the complete route list for a packet to take on its journey from source to destination.  |
| IP Stream Option              | Number of stream option attacks.                            | This option provides a way for the 16-bit SATNET stream identifier to be carried through networks that do not support streams.   |
| ICMP Fragment                 | Number of ICMP fragments.                                   | Because ICMP packets contain very short messages, there is no legitimate reason for ICMP packets to be fragmented. If an ICMP packet is so large that it must be fragmented, something is amiss.   |
| ICMP Large Packet             | Number of large ICMP packets.                               | —  |
| TCP SYN FIN Packet            | Number of TCP SYN FIN packets.                              | —  |
| TCP FIN without ACK           | Number of TCP FIN flags without the acknowledge (ACK) flag. | —  |
| TCP SYN-ACK-ACK Proxy         | Number of TCP flags enabled with SYN-ACK-ACK.               | To prevent flooding with SYN-ACK-ACK sessions, you can enable the SYN-ACK-ACK proxy protection screen option. After the number of connections from the same IP address reaches the SYN-ACK-ACK proxy threshold, Junos OS rejects further connection requests from that IP address. |
| IP Block Fragment             | Number of IP block fragments.                               | —  |

**Monitoring IDP Status**

**Purpose** View detailed information about the IDP Status, Memory, Counters, Policy Rulebase Statistics, and Attack table statistics.

**Action** To view Intrusion Detection and Prevention (IDP) table information, select **Monitor>Security>IDP>Status** in the J-Web user interface, or enter the following CLI commands:

- **show security idp status**
- **show security idp memory**

[Table 182 on page 1433](#) summarizes key output fields in the IDP display.

Table 182: Summary of IDP Status Output Fields

| Field                            | Values  | Additional Information |
|----------------------------------|---|------------------------|
| <b>IDP Status</b>                |   |                        |
| Status of IDP                    | Displays the status of the current IDP policy.  | —                      |
| Up Since                         | Displays the time from when the IDP policy first began running on the system.                         | —                      |
| Packets/Second                   | Displays the number of packets received and returned per second.                                      | —                      |
| Peak                             | Displays the maximum number of packets received per second and the time when the maximum was reached. | —                      |
| Kbits/Second                     | Displays the aggregated throughput (kilobits per second) for the system.                              | —                      |
| Peak Kbits                       | Displays the maximum kilobits per second and the time when the maximum was reached.                   | —                      |
| Latency (Microseconds)           | Displays the delay, in microseconds, for a packet to receive and return by a node .                   | —                      |
| Current Policy                   | Displays the name of the current installed IDP policy.  | —                      |
| <b>IDP Memory Status</b>         |   |                        |
| IDP Memory Statistics            | Displays the status of all IDP data plane memory.   | —                      |
| PIC Name                         | Displays the name of the PIC.   | —                      |
| Total IDP Data Plane Memory (MB) | Displays the total memory space, in megabytes, allocated for the IDP data plane.                      | —                      |
| Used (MB)                        | Displays the used memory space, in megabytes, for the data plane.                                     | —                      |
| Available (MB)                   | Displays the available memory space, in megabytes, for the data plane.                                | —                      |

**Monitoring Flow Gate Information**

**Purpose** View information about temporary openings known as pinholes or gates in the security firewall.

**Action** Select **Monitor>Security>Flow Gate** in the J-Web user interface, or enter the **show security flow gate** command.

[Table 183 on page 1434](#) summarizes key output fields in the flow gate display.

Table 183: Summary of Key Flow Gate Output Fields

| Field                        | Values   | Additional Information |
|------------------------------|--|------------------------|
| <b>Flow Gate Information</b> |  |                        |
| Hole                         | Range of flows permitted by the pinhole.   | —                      |
| Translated                   | Tuples used to create the session if it matches the pinhole: <ul style="list-style-type: none"> <li>• Source address and port</li> <li>• Destination address and port</li> </ul> | —                      |
| Protocol                     | Application protocol, such as UDP or TCP.  | —                      |
| Application                  | Name of the application.   | —                      |
| Age                          | Idle timeout for the pinhole.  | —                      |
| Flags                        | Internal debug flags for pinhole.  | —                      |
| Zone                         | Incoming zone.   | —                      |
| Reference count              | Number of resource manager references to the pinhole.  | —                      |
| Resource                     | Resource manager information about the pinhole.  | —                      |

#### ***Monitoring Firewall Authentication Table***

**Purpose** View information about the authentication table, which divides firewall authentication user information into multiple parts.

**Action** Select **Monitor>Security>Firewall Authentication>Authentication Table** in the J-Web user interface. To view detailed information about the user with a particular identifier, select the ID on the Authentication Table page. To view detailed information about the user at a particular source IP address, select the Source IP on the Authentication Table page.

Alternatively, enter the following CLI **show** commands:

- **show security firewall-authentication users**
- **show security firewall-authentication users address *ip-address***
- **show security firewall-authentication users identifier *identifier***

[Table 184 on page 1435](#) summarizes key output fields in firewall authentication table display.

Table 184: Summary of Key Firewall Authentication Table Output Fields

| Field   | Values   | Additional Information |
|---|--|------------------------|
| <b>Firewall authentication users</b>              |  |                        |
| Total users in table                              | Number of users in the authentication table.                   | –                      |
| <b>Authentication table</b>                       |  |                        |
| ID  | Authentication identification number.                          | –                      |
| Source Ip   | IP address of the authentication source.                       | –                      |
| Age   | Idle timeout for the user.                                     | –                      |
| Status  | Status of authentication ( <b>success</b> or <b>failure</b> ). | –                      |
| user  | Name of the user.  | –                      |
| <b>Detailed report per ID selected: <i>ID</i></b> |  |                        |
| Source Zone                                       | Name of the source zone.                                       | –                      |
| Destination Zone                                  | Name of the destination zone.                                  | –                      |
| profile   | Name of the profile.   | Users information.     |
| Authentication method                             | Path chosen for authentication.                                | –                      |
| Policy Id   | Policy Identifier.   | –                      |
| Interface name                                    | Name of the interface.   | –                      |
| Bytes sent by this user                           | Number of packets in bytes sent by this user.                  | –                      |
| Bytes received by this user                       | Number of packets in bytes received by this user.              | –                      |
| Client-groups                                     | Name of the client group.                                      | –                      |
| <b>Detailed report per Source Ip selected</b>     |  |                        |
| Entries from Source IP                            | IP address of the authentication source.                       | –                      |
| Source Zone                                       | Name of the source zone.                                       | –                      |
| Destination Zone                                  | Name of the destination zone.                                  | –                      |
| profile   | Name of the profile.   | –                      |
| Age   | Idle timeout for the user.                                     | –                      |
| Status  | Status of authentication ( <b>success</b> or <b>failure</b> ). | –                      |

Table 184: Summary of Key Firewall Authentication Table Output Fields (*continued*)

| Field                       | Values  | Additional Information |
|-----------------------------|---|------------------------|
| user                        | Name of the user.                                 | —                      |
| Authentication method       | Path chosen for authentication.                   | —                      |
| Policy Id                   | Policy Identifier.                                | —                      |
| Interface name              | Name of the interface.                            | —                      |
| Bytes sent by this user     | Number of packets in bytes sent by this user.     | —                      |
| Bytes received by this user | Number of packets in bytes received by this user. | —                      |
| Client-groups               | Name of the client group.                         | —                      |

### Monitoring Firewall Authentication History

**Purpose** View information about the authentication history, which is divided into multiple parts.

**Action** Select **Monitor>Security>Firewall Authentication>Authentication History** in the J-Web user interface. To view the detailed history of the authentication with this identifier, select the ID on the Firewall Authentication History page. To view a detailed authentication history of this source IP address, select the Source IP on the Firewall Authentication History page.

Alternatively, enter the following CLI **show** commands:

- **show security firewall-authentication history**
- **show security firewall-authentication history address *ip-address***
- **show security firewall-authentication history identifier *identifier***

[Table 185 on page 1436](#) summarizes key output fields in firewall authentication history display.

Table 185: Summary of Key Firewall Authentication History Output Fields

| Field  | Values                                   | Additional Information |
|--|--|------------------------|
| <b>History of Firewall Authentication Data</b> |  |                        |
| Total authentications                          | Number of authentication.                | —                      |
| <b>History Table</b>                           |  |                        |
| ID   | Identification number.                   | —                      |
| Source Ip                                      | IP address of the authentication source. | —                      |

Table 185: Summary of Key Firewall Authentication History Output Fields (*continued*)

| Field   | Values   | Additional Information |
|---|--|------------------------|
| Start Date  | Authentication date.   | —                      |
| Start Time  | Authentication time.   | —                      |
| Duration  | Authentication duration.                                       | —                      |
| Status  | Status of authentication ( <b>success</b> or <b>failure</b> ). | —                      |
| User  | Name of the user.  | —                      |
| <b>Detail history of selected Id: ID</b>              |  |                        |
| Authentication method                                 | Path chosen for authentication.                                | —                      |
| Policy Id   | Security policy identifier.                                    | —                      |
| Source zone   | Name of the source zone.                                       | —                      |
| Destination Zone                                      | Name of the destination zone.                                  | —                      |
| Interface name  | Name of the interface.   | —                      |
| Bytes sent by this user                               | Number of packets in bytes sent by this user.                  | —                      |
| Bytes received by this user                           | Number of packets in bytes received by this user.              | —                      |
| Client-groups   | Name of the client group.                                      | —                      |
| <b>Detail history of selected Source Ip:Source Ip</b> |  |                        |
| User  | Name of the user.  | —                      |
| Start Date  | Authentication date.   | —                      |
| Start Time  | Authentication time.   | —                      |
| Duration  | Authentication duration.                                       | —                      |
| Status  | Status of authentication ( <b>success</b> or <b>failure</b> ). | —                      |
| Profile   | Name of the profile.   | —                      |
| Authentication method                                 | Path chosen for authentication.                                | —                      |
| Policy Id   | Security policy identifier.                                    | —                      |
| Source zone   | Name of the source zone.                                       | —                      |

Table 185: Summary of Key Firewall Authentication History Output Fields (*continued*)

| Field                       | Values  | Additional Information |
|-----------------------------|---|------------------------|
| Destination Zone            | Name of the destination zone.                     | –                      |
| Interface name              | Name of the interface.                            | –                      |
| Bytes sent by this user     | Number of packets in bytes sent by this user.     | –                      |
| Bytes received by this user | Number of packets in bytes received by this user. | –                      |
| Client-groups               | Name of the client group.                         | –                      |

**Monitoring 802.1x**

**Purpose** View information about 802.1X properties.

**Action** Select **Monitor>Security>802.1x** in the J-Web user interface, or enter the following CLI commands:

- **show dot1x interfaces *interface-name***
- **show dot1x authentication-failed-users**

[Table 186 on page 1438](#) summarizes the Dot1X output fields.

Table 186: Summary of Dot1X Output Fields

| Field                                      | Values  | Additional Information |
|--|---|------------------------|
| Select Port                                | List of ports for selection.  | –                      |
| Number of connected hosts                  | Total number of hosts connected to the port.                            | –                      |
| Number of authentication bypassed hosts    | Total number of authentication-bypassed hosts with respect to the port. | –                      |
| <b>Authenticated Users Summary</b>         |   |                        |
| MAC Address                                | MAC address of the connected host.                                      | –                      |
| User Name                                  | Name of the user.   | –                      |
| Status                                     | Information about the host connection status.                           | –                      |
| Authentication Due                         | Information about host authentication.                                  | –                      |
| <b>Authentication Failed Users Summary</b> |   |                        |
| MAC Address                                | MAC address of the authentication-failed host.                          | –                      |

Table 186: Summary of Dot1X Output Fields (*continued*)

| Field     | Values                                  | Additional Information |
|-----------|---|------------------------|
| User Name | Name of the authentication-failed user. | —                      |

| Field                        | Values  | Additional Information |
|------------------------------|---|------------------------|
| <b>SIP Calls Information</b> |   |                        |
| Call Leg                     | Call length identifier.                       | —                      |
| Zone                         | Client zone identifier.                       | —                      |
| RM Group                     | Resource manager group identifier.            | —                      |
| Local Tag                    | Local tag for the SIP ALG User Agent server.  | —                      |
| Remote Tag                   | Remote tag for the SIP ALG User Agent server. | —                      |

**Monitoring SIP ALG Counters**

**Purpose** View SIP ALG counters information.

**Action** Select **Monitor>ALGs>SIP>Count** in the J-Web user interface, or enter the **show security alg sip counters** command.

[Table 188 on page 1440](#) summarizes key output fields in the SIP counters display.

**Table 188: Summary of Key SIP Counters Output Fields**

| Field                           | Values                            | Additional Information  |
|---------------------------------|-----------------------------------|---|
| <b>SIP Counters Information</b> |                                   |   |
| INVITE                          | Number of INVITE requests sent.   | An INVITE request is sent to invite another user to participate in a session.   |
| CANCEL                          | Number of CANCEL requests sent.   | A user can send a CANCEL request to cancel a pending INVITE request. A CANCEL request has no effect if the SIP server processing the INVITE had sent a final response for the INVITE before it received the CANCEL.   |
| ACK                             | Number of ACK requests sent.      | The user from whom the INVITE originated sends an ACK request to confirm reception of the final response to the INVITE request.   |
| BYE                             | Number of BYE requests sent.      | A user sends a BYE request to abandon a session. A BYE request from either user automatically terminates the session.   |
| REGISTER                        | Number of REGISTER requests sent. | A user sends a REGISTER request to a SIP registrar server to inform it of the current location of the user. A SIP registrar server records all the information it receives in REGISTER requests and makes this information available to any SIP server attempting to locate a user. |
| OPTIONS                         | Number of OPTIONS requests sent.  | An OPTION message is used by the User Agent (UA) to obtain information about the capabilities of the SIP proxy. A server responds with information about what methods, session description protocols, and message encoding it supports.   |
| INFO                            | Number of INFO requests sent.     | An INFO message is used to communicate mid-session signaling information along the signaling path for the call.   |
| MESSAGE                         | Number of MESSAGE requests sent.  | SIP messages consist of requests from a client to a server and responses to the requests from a server to a client with the purpose of establishing a session (or a call).  |
| NOTIFY                          | Number of NOTIFY requests sent.   | A NOTIFY message is sent to inform subscribers of changes in state to which the subscriber has a subscription.  |

Table 188: Summary of Key SIP Counters Output Fields (*continued*)

| Field                       | Values  | Additional Information   |
|-----------------------------|---|--|
| REFER                       | Number of REFER requests sent.  | A REFER request is used to refer the recipient (identified by the Request-URI) to a third party by the contact information provided in the request.  |
| SUBSCRIBE                   | Number of SUBSCRIBE requests sent.  | A SUBSCRIBE request is used to request current state and state updates from a remote node.   |
| UPDATE                      | Number of UPDATE requests sent.   | An UPDATE request is used to create a temporary opening in the firewall (pinhole) for new or updated Session Description Protocol (SDP) information. The following header fields are modified: Via, From, To, Call-ID, Contact, Route, and Record-Route. |
| <b>SIP Error Counters</b>   |   |  |
| Total Pkt-in                | SIP ALG total packets received.   | —  |
| Total Pkt dropped on error  | Number of packets dropped by the SIP ALG.   | —  |
| Transaction error           | SIP ALG transaction errors.   | —  |
| Call error                  | SIP ALG call errors.  | —  |
| IP resolve error            | SIP ALG IP address resolution errors.   | —  |
| NAT error                   | SIP ALG NAT errors.   | —  |
| Resource manager error      | SIP ALG resource manager errors.  | —  |
| RR header exceeded max      | Number of times the SIP ALG RR (Record-Route) headers exceeded the maximum limit. | —  |
| Contact header exceeded max | Number of times the SIP ALG contact header exceeded the maximum limit.            | —  |
| Call dropped due to limit   | SIP ALG calls dropped because of call limits.                                     | —  |
| SIP stack error             | SIP ALG stack errors.   | —  |

**Monitoring SIP ALG Rate Information**

**Purpose** View SIP ALG rate information.

**Action** Select **Monitor>ALGs>SIP>Rate** in the J-Web user interface, or enter the **show security alg sip rate** command.

[Table 189 on page 1442](#) summarizes key output fields in the SIP rate display.

**Table 189: Summary of Key SIP Rate Output Fields**

| Field  | Values   | Additional Information |
|--|--|------------------------|
| <b>SIP Rate Information</b>                        |  |                        |
| CPU ticks per microseconds is                      | SIP ALG CPU ticks per microsecond.   | —                      |
| Time taken for the last message in microseconds is | Time, in microseconds, that the last SIP ALG message needed to transit the network.  | —                      |
| Number of messages in 10 minutes                   | Total number of SIP ALG messages transiting the network in 10 minutes.   | —                      |
| Time taken by the messages in 10 minutes           | Total time, in microseconds, during an interval of less than 10 minutes for the specified number of SIP ALG messages to transit the network. | —                      |
| Rate   | Number of SIP ALG messages per second transiting the network.  | —                      |

**Monitoring SIP ALG Transactions**

**Purpose** View information about SIP ALG transactions.

**Action** Select **Monitor>ALGs>SIP>Transactions** in the J-Web user interface, or enter the **show security alg sip transactions** command.

[Table 190 on page 1442](#) summarizes key output fields in the SIP transactions display.

**Table 190: Summary of Key SIP Transactions Output Fields**

| Field                               | Values   | Additional Information |
|-------------------------------------|--|------------------------|
| <b>SIP Transactions Information</b> |  |                        |
| Transaction Name                    | <ul style="list-style-type: none"> <li>• <b>UAS</b>—SIP ALG User Agent server transaction name.</li> <li>• <b>UAC</b>—SIP ALG User Agent client transaction name.</li> </ul> | —                      |

Table 190: Summary of Key SIP Transactions Output Fields (*continued*)

| Field                           | Values  | Additional Information |
|---------------------------------|---|------------------------|
| Method                          | <p>The method to be performed on the resource. Possible methods:</p> <ul style="list-style-type: none"> <li>• <b>INVITE</b>—Initiate call</li> <li>• <b>ACK</b>—Confirm final response</li> <li>• <b>BYE</b>—Terminate and transfer call</li> <li>• <b>CANCEL</b>—Cancel searches and “ringing”</li> <li>• <b>OPTIONS</b>—Features support by the other side</li> <li>• <b>REGISTER</b>—Register with location service</li> </ul> | —                      |

| <b>Monitoring Spanning Tree</b> |   |                        |
| Purpose                         | Use the monitoring functionality to view the Spanning Tree page.  |                        |
| Action                          | To monitor spanning tree, select <b>Monitor&gt;Switching&gt;Spanning Tree</b> in the J-Web user interface.  |                        |
| Meaning                         | <a href="#">Table 191 on page 1443</a> summarizes key output fields in the spanning tree page.  |                        |

Table 191: Spanning Tree Monitoring Page

| Field                    | Value   | Additional Information  |
|--------------------------|---|---|
| <b>Bridge parameters</b> |   |   |
| Context ID               | An internally generated identifier.                         | —   |
| Enabled Protocol         | Spanning tree protocol type enabled.                        | —   |
| Root ID                  | Bridge ID of the elected spanning tree root bridge.         | The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. |
| Bridge ID                | Locally configured bridge ID.                               | —   |
| Inter instance ID        | An internally generated instance identifier.                | —   |
| Extended system ID       | Extended system generated instance identifier.              | —   |
| Maximum age              | Maximum age of received bridge protocol data units (BPDUs). | —   |

Table 191: Spanning Tree Monitoring Page (*continued*)

| Field                      | Value  | Additional Information |
|----------------------------|--|------------------------|
| Number of topology changes | Total number of STP topology changes detected since the switch last booted.            | –                      |
| Forward delay              | Spanning tree forward delay.   | –                      |
| <b>Interface List</b>      |  |                        |
| Interface Name             | Interface configured to participate in the STP instance.                               | –                      |
| Port ID                    | Logical interface identifier configured to participate in the STP instance.            | –                      |
| Designated Port ID         | Port ID of the designated port for the LAN segment to which the interface is attached. | –                      |
| Port Cost                  | Configured cost for the interface.   | –                      |
| State                      | STP port state. Forwarding (FWD), blocking (BLK), listening, learning, or disabled.    | –                      |
| Role                       | MSTP or RSTP port role. Designated (DESG), backup (BKUP), alternate (ALT), or root.    | –                      |

### Monitoring the System

The J-Web user interface lets you monitor a device's physical characteristics, current processing status and alarms, and ongoing resource utilization to quickly assess the condition of a device at any time.

On SRX Series devices, the **Dashboard** lets you customize your view by selecting which informational panes to include on the Dashboard. On a J Series device, the **Monitor > System View** path provides detailed views of system, chassis, and process information.

This section contains the following topics:

- [Monitoring System Properties for SRX Series Devices on page 1445](#)
- [Monitoring System Properties for J Series Devices on page 1447](#)
- [Monitoring Chassis Information on page 1448](#)
- [Monitoring Process Details for J Series Devices on page 1450](#)
- [System Health Management for Branch SRX Series Devices on page 1451](#)

**Monitoring System Properties for SRX Series Devices**

**Purpose** View system properties and customize the Dashboard.

When you start the J-Web user interface on an SRX Series device, the interface opens to the Dashboard. At the top and bottom of the page, the Dashboard displays an interactive representation of your device and a current log messages pane. By default, the center panes of the Dashboard display System Information, Resource Utilization, Security Resources, and System Alarms. However, you can customize the Dashboard panes to provide the best overview of your system.

**Action** To control the content and appearance of the Dashboard:

1. Click the **Preferences** icon at the top-right corner of the page. The Dashboard Preference dialog box appears.
2. Select the types of information you want to display.
3. (Optional) Specify the Automatically Refresh Data option to specify how often you want the data on the Dashboard to be refreshed.
4. Click **OK** to save the configuration or **Cancel** to clear it.
5. On the Dashboard, minimize, maximize, or drag the individual information panes to customize the display as needed.

Chassis View—Displays an image of the device chassis, including line cards, link states, errors, individual PICs, FPCs, fans, and power supplies.

You can use the Chassis View to link to corresponding configuration and monitoring pages for the device. To link to interface configuration pages for a selected port from the Chassis View, right-click the port in the device image and choose one of the following options:

- Chassis Information—Links to the Chassis page.
- Configure Port: *Port-name*—Links to the interfaces configuration page for the selected port.
- Monitor Port: *Port-name*—Links to the monitor interfaces page for the selected port.

System Identification—Displays the device's serial number, hostname, current software version, the BIOS version, the amount of time since the device was last booted, and the system's time.

---

**NOTE:**

- To view the BIOS version under system identification, delete your browser cookies.
- The hostname that appears in this pane is defined using the `set system hostname` command.

On SRX Series devices, security logs were always timestamped using the UTC time zone by running `set system time-zone utc` and `set security log utc-timestamp` CLI commands. Now, time zone can be defined using the local time zone by running the `set system time-zone time-zone` command to specify the local time zone that the system should use when timestamping the security logs.

---

**Resource Utilization**—Provides a graphic representation of resource use. Each bar represents the percentage of CPU, memory, or storage utilization for the data plane or the control plane.

**Security Resources**—Provides the maximum, configured, and active sessions; firewall and VPN policies; and IPsec VPNs. Click **Sessions**, **FW/VPN Policies**, or **IPsec VPNs** for detailed statistics about each category.

**System Alarms**—Indicates a missing rescue configuration or software license, where valid. System alarms are preset and cannot be modified.

**File Usage**—Displays the usage statistics for log files, temporary files, crash (core) files, and database files.

**Login Sessions**—Provides a list of all currently logged in sessions. The display includes user credentials, login time, and idle time for each session.

**Chassis Status**—Provides a snapshot of the current physical condition of the device, including temperature and fan status.

**Storage Usage**—Displays the storage usage report in detail.

**Threat Activity**—Provides information about the most current threats received on the device.

**Message Logs**—Displays log messages and errors. You can clear old logs from the Message Logs pane by clicking the Clear button.

To control the information that is displayed in the Chassis View, use the following options:

- To view an image of the front of the device, right-click the image and choose **View Front**.
- To view an image of the back of the device, right-click the image and choose **View Rear**.

- To enlarge or shrink the device view, use the **Zoom** bar.
- To return the device image to its original position and size, click **Reset**.

**NOTE:** To use the Chassis View, a recent version of Adobe Flash that supports ActionScript and AJAX (Version 9) must be installed. Also note that the Chassis View appears by default on the Dashboard page. You can enable or disable it using options in the Dashboard Preference dialog box. Clearing cookies in Internet Explorer also causes the Chassis View appear on the Dashboard page.

To return to the Dashboard at any time, select **Dashboard** in the J-Web user interface.

Alternatively, you can view system properties by entering the following **show** commands in the CLI:

- **show system uptime**
- **show system users**
- **show system storage**
- **show version**
- **show chassis hardware**

#### *Monitoring System Properties for J Series Devices*

**Purpose** View the system properties on a J Series device.

**Action** Select **Monitor>System View>System Information** in the J-Web user interface. The System Information page displays the following types of information:

- **General**—General tab of the System Information page displays the device's serial number, current Junos OS version, hostname, IP address, loopback address, domain name server, and time zone.

**NOTE:** The hostname that appears on this page is defined using the `set system hostname` command.

On J Series devices, security logs were always timestamped using the UTC time zone by running `set system time-zone utc` and `set security log utc-timestamp` CLI commands. Now, time zone can be defined using the local time zone by running the `set system time-zone time-zone` command to specify the local time zone that the system should use when timestamping the security logs.

- **Time**—Time tab of the System Information page displays the current time for the device, the last time the device was booted, the last time protocol settings were configured on the device, and the last time the device configuration was updated. Additionally, this tab displays the CPU load averages for the last 1, 5, and 15 minutes.
- **Storage Media**—Storage Media tab of the System Information page displays information about the memory components installed on the device (such as flash memory or USB) and the amount of memory used compared to total memory available.
- **Logged-In User Details**—Logged-In User Details section of the System Information page displays information about the users who are currently logged into the device, including their usernames, the terminals and systems from which they logged in, the length of their user sessions, and how long their sessions have remained idle.
- **Active User Count**—Active User Count field displays the number of users currently signed into the device.

Alternatively, you can view system properties by entering the following **show** commands in the CLI configuration editor:

- `show system uptime`
- `show system users`
- `show system storage`
- `show version`
- `show chassis hardware`
- `show interface terse`

### ***Monitoring Chassis Information***

**Purpose** View chassis properties, which include the status of hardware components on the device.

**Action** To view these chassis properties, select **Monitor>System View>Chassis Information** in the J-Web user interface.

**CAUTION:** Do not install a combination of Physical Interface Modules (PIMs) in a single chassis that exceeds the maximum power and heat capacity of the chassis. If J Series power management is enabled, PIMs that exceed the maximum power and heat limits remain offline when the chassis is powered on. To check PIM power and heat status, use the `show chassis fpc` and `show chassis power-ratings` commands.

The Chassis Information page displays the following types of information:

- **Routing Engine Details**—This section of the page includes the following tabs:
  - **Master**—Master tab displays information about the routing engine, including the routing engine module, model number, version, part number, serial number, memory utilization, temperature, and start time. Additionally, this tab displays the CPU load averages for the last 1, 5, and 15 minutes.
  - **Backup**—If a backup routing engine is available, the Backup tab displays the routing engine module, model number, version, part number, serial number, memory utilization, temperature, and start time. Additionally, this tab displays the CPU load averages for the last 1, 5, and 15 minutes.

**NOTE:** If you need to contact customer support about the device chassis, supply them with the version and serial number displayed in the Routing Engine Details section of the page.

- **Power and Fan Tray Details**—This Details section of the page includes the following tabs:
  - **Power**—Power tab displays the names of the device's power supply units and their statuses.
  - **Fan**—Fan tab displays the names of the device's fans and their speeds (normal or high). (The fan speeds are adjusted automatically according to the current temperature.)
- **Chassis Component Details**—This section of the page includes the following tabs:
  - **General**—General tab displays the version number, part number, serial number, and description of the selected device component.
  - **Temperature**—Temperature tab displays the temperature of the selected device component (if applicable).
  - **Resource**—Resource tab displays the state, total CPU DRAM, and start time of the selected device component (if applicable).

**NOTE:** On some devices, you can have an FPC state as “offline.” You may want to put an FPC offline because of an error or if the FPC is not responding. You can put the FPC offline by using the CLI command `request chassis fpc slot number offline`.

- **Sub-Component**—Sub-Component tab displays information about the device’s sub-components (if applicable). Details include the sub-component’s version, part number, serial number, and description.

To control which component details appear, select a hardware component from the **Select component** list.

Alternatively, you can view chassis details by entering the following **show** commands in the CLI configuration editor:

- `show chassis hardware`
- `show chassis routing-engine`
- `show chassis environment`
- `show chassis redundant-power-supply`
- `show redundant-power-supply status`

#### ***Monitoring Process Details for J Series Devices***

**Purpose** View the process details that indicate the status of each of the processes running on the J Series device.

**Action** Select **Monitor>System View>Process Details** in the J-Web user interface.

The Process Details page displays the following types of information for the entire device:

- **CPU Load**—Displays the average CPU usage of the device over the last minute in the form of a graph.
- **Total Memory Utilization**—Displays the current total memory usage of the device in the form of a graph.

The Process Details page also displays the following types of information for each process running on the device:

- **PID**—Displays the unique number identifying the process.
- **Value**—Displays the name of the process.
- **State**—Displays the current state of the process (runnable, sleeping, or unknown).
- **CPU Load**—Displays the current CPU usage of the process.

- Memory Utilization—Displays the current memory usage of the process.
- Start Time—Displays the time that the process started running.

Alternatively, you can view chassis details from the Dashboard on an SRX Series device or by entering the following **show** commands in the CLI configuration editor:

- **show chassis routing-engine**
- **show system process**

### *System Health Management for Branch SRX Series Devices*

**Purpose** Tracking the utilization of critical resources in the system ensures that all parameters are within normal limits and the system remains functional.

In the event of a malfunction caused by abnormal resource usage, the system health management feature provides the right diagnostic information to identify the source of the problem.

When the system health management action is configured by the user, the system takes appropriate monitoring, preventive, and recovery actions to ensure that the system is accessible. The system configuration might be updated based on the information collected by system health management feature to ensure that the system stays in the normal operating environment. For example, when a system runs out of memory, then the configuration associated with applications identified to be consuming memory resources can be updated to bring down the memory resource consumption.

**Action** The system health management feature periodically monitors critical system resources against configurable thresholds. The resources that can be monitored include CPU usage, memory, storage, open-file-descriptor, process-count, and temperature. The system health management feature collects usage information for each resource at the configured interval and compares it against the three levels of thresholds: moderate, high, and critical. Based on the configurations, appropriate action is taken.

The intervals, thresholds, and action are associated with system health management and can be configured at both the resource level and the global level. Configurable and default levels are as follows:

- Default configuration level—Default configuration is applied when system health monitoring is enabled, and neither a global nor a resource-specific configuration is present.
- Global configuration level—Configuration that is applied to resources when no resource-specific configuration is available.
- Resource-specific configuration level—Configuration that, if available, overrides both the global and the default configurations.

Per-resource configurations take precedence over the global configuration, and a global configuration takes precedence over the defaults.

When resource usage exceeds the configured thresholds, the system collects information that can be used to find the source of the increased usage and saves it in history for analysis and action.

When resource utilization exceeds the high threshold, a minor system alarm is generated, and the alarm LED lights yellow. When resource utilization exceeds the critical threshold, a major alarm is generated, and the alarm LED lights red.

An SNMP trap is also sent to the remote monitoring server (NMS) for all events that exceed the threshold.

To enable the system health monitor, use the **set snmp health-monitor routing engine** command. You can view system properties by using CLI show commands.

### Monitoring Voice ALG H.323

**Purpose** Use the monitoring functionality to view the ALG H.323 page.

**Action** To monitor ALG H.323 select **Monitor>Security>Voice ALGs>H.323** in the J-Web user interface.

**Meaning** [Table 192 on page 1452](#) summarizes key output fields in the ALG H.323 page.

**Table 192: ALG H.323 Monitoring Page**

| Field                     | Value  | Additional Information                            |
|---------------------------|--|---|
| Virtual Chassis Member    | Display the list of virtual chassis member.      | Select one of the virtual chassis members listed. |
| Refresh Interval (30 sec) | Displays the time interval set for page refresh. | Select the time interval from the drop-down list. |
| Refresh                   | Displays the option to refresh the page.         | —   |
| Clear                     | Provides an option to clear the monitor summary. | Click <b>clear</b> to clear the monitor summary.  |

#### H.323 Counter Summary

Table 192: ALG H.323 Monitoring Page (*continued*)

| Field                        | Value  | Additional Information |
|------------------------------|--|------------------------|
| Category                     | Displays the following categories: <ul style="list-style-type: none"> <li>• <b>Packets received</b>—Number of ALG H.323 packets received.</li> <li>• <b>Packets dropped</b>—Number of ALG H.323 packets dropped.</li> <li>• <b>RAS message received</b>—Number of incoming RAS (Registration, Admission, and Status) messages per second per gatekeeper received and processed.</li> <li>• <b>Q.931 message received</b>—Counter for Q.931 message received.</li> <li>• <b>H.245 message received</b>—Counter for H.245 message received.</li> <li>• <b>Number of calls</b>—Total number of ALG H.323 calls.</li> <li>• <b>Number of active calls</b>—Number of active ALG H.323 calls.</li> <li>• <b>Number of DSCP Marked</b>—Number of DSCP Marked on ALG H.323 calls.</li> </ul> | —                      |
| Count                        | Provides count of response codes for each H.323 counter summary category.  | —                      |
| <b>H.323 Error Counter</b>   |  |                        |
| Category                     | Displays the following categories: <ul style="list-style-type: none"> <li>• <b>Decoding errors</b>—Number of decoding errors.</li> <li>• <b>Message flood dropped</b>—Error counter for message flood dropped.</li> <li>• <b>NAT errors</b>—H.323 ALG NAT errors.</li> <li>• <b>Resource manager errors</b>—H.323 ALG resource manager errors.</li> <li>• <b>DSCP Marked errors</b>—H.323 ALG DSCP marked errors.</li> </ul>   | —                      |
| Count                        | Provides count of response codes for each H.323 error counter category.  | —                      |
| <b>Counter Summary Chart</b> |  |                        |
| Packets Received             | Provides the graphical representation of the packets received.   | —                      |
| <b>H.323 Message Counter</b> |  |                        |

Table 192: ALG H.323 Monitoring Page (*continued*)

| Field    | Value   | Additional Information |
|----------|---|------------------------|
| Category | Displays the following categories: <ul style="list-style-type: none"> <li>• <b>RRQ</b>—Registration Request message counter.</li> <li>• <b>RCF</b>—Registration Confirmation Message.</li> <li>• <b>ARQ</b>—Admission Request message counter.</li> <li>• <b>ACF</b>—Admission Confirmation</li> <li>• <b>URQ</b>—Unregistration Request.</li> <li>• <b>UCF</b>—Unregistration Confirmation.</li> <li>• <b>DRQ</b>—Disengage Request.</li> <li>• <b>DCF</b>—Disengage Confirmation.</li> <li>• <b>Oth RAS</b>—Other incoming Registration, Admission, and Status messages message counter.</li> <li>• <b>Setup</b>—Timeout value, in seconds, for the response of the outgoing setup message.</li> <li>• <b>Alert</b>—Alert message type.</li> <li>• <b>Connect</b>—Connect setup process.</li> <li>• <b>CallProd</b>—Number of call production messages sent.</li> <li>• <b>Info</b>—Number of info requests sent.</li> <li>• <b>RelCmpl</b>—Number of Rel Cmpl message ssent.</li> <li>• <b>Facility</b>—Number of facility messages sent.</li> <li>• <b>Empty</b>—Empty capabilities to the support message counter.</li> <li>• <b>OLC</b>—Open Local Channel message counter.</li> <li>• <b>OLC ACK</b>—Open Local Channel Acknowledge message counter.</li> <li>• <b>Oth H245</b>—Other H.245 message counter</li> </ul> | —                      |
| Count    | Provides count of response codes for each H.323 message counter category.   | —                      |

### Monitoring Voice ALG SIP

**Purpose** Use the monitoring functionality to view the voice ALG SIP page.

**Action** To monitor voice ALG SIP select **Monitor>Security>Voice ALGs>SIP** in the J-Web user interface.

**Meaning** [Table 195 on page 1460](#) summarizes key output fields in the voice ALG SIP page.

**Table 195: Voice ALG SIP Monitoring Page**

| Field                     | Value  | Additional Information                            |
|---------------------------|--|---|
| Virtual Chassis Member    | Displays the list of virtual chassis members.    | Select one of the virtual chassis members listed. |
| Refresh Interval (30 sec) | Displays the time interval set for page refresh. | Select the time interval from the drop-down list. |
| Refresh                   | Displays the option to refresh the page.         | —   |
| Clear                     | Provides an option to clear the monitor summary. | Click <b>Clear</b> to clear the monitor summary.  |

#### Counters

##### SIP Counters Information

Table 195: Voice ALG SIP Monitoring Page (*continued*)

| Field  | Value | Additional Information |
|--------|-------|------------------------|
| Method |       | —                      |

Table 195: Voice ALG SIP Monitoring Page (*continued*)

| Field | Value  | Additional Information |
|-------|--|------------------------|
|       | <p>Displays the SIP counter information. The available options are:</p> <ul style="list-style-type: none"> <li>• <b>BYE</b>— Number of BYE requests sent. A user sends a BYE request to abandon a session. A BYE request from either user automatically terminates the session.</li> <li>• <b>REGISTER</b>— Number of REGISTER requests sent. A user sends a REGISTER request to a SIP registrar server to inform it of the current location of the user. The SIP registrar server records all the information it receives in REGISTER requests and makes this information available to any SIP server attempting to locate a user.</li> <li>• <b>OPTIONS</b>— Number of OPTIONS requests sent. An OPTION message is used by the User Agent (UA) to obtain information about the capabilities of the SIP proxy. A server responds with information about what methods, session description protocols, and message encoding it supports.</li> <li>• <b>INFO</b>— Number of INFO requests sent. An INFO message is used to communicate mid-session signaling information along the signaling path for the call.</li> <li>• <b>MESSAGE</b>— Number of MESSAGE requests sent. SIP messages consist of requests from a client to the server and responses to the requests from the server to a client for the purpose of establishing a session (or a call).</li> <li>• <b>NOTIFY</b>— Number of NOTIFY requests sent. A NOTIFY message is sent to inform subscribers about the change in state of the subscription.</li> <li>• <b>PRACK</b>— Number of PRACK requests sent. The PRACK request plays the same role as the ACK request, but for provisional responses.</li> <li>• <b>PUBLISH</b>— Number of PUBLISH requests sent. The PUBLISH request is used for publishing the event state. PUBLISH is similar to REGISTER that allows a user to create, modify, and remove state in another entity which manages this state on behalf of the user.</li> <li>• <b>REFER</b>— Number of REFER requests sent. A REFER request is used to refer the recipient (identified by the Request-URI) to a third party identified by the contact information provided in the request.</li> <li>• <b>SUBSCRIBE</b>— Number of SUBSCRIBE requests sent. A SUBSCRIBE request is used to request current state and state information updates from a remote node.</li> <li>• <b>UPDATE</b>— Number of UPDATE requests sent. An UPDATE request is used to create a temporary opening in the firewall (pinhole) for new or updated Session Description Protocol (SDP) information. The following header fields are modified: Via, From, To, Call-ID, Contact, Route, and Record-Route.</li> <li>• <b>BENOTIFY</b>— Number of BENOTIFY requests sent. A BENOTIFY request is used to reduce the unnecessary SIP signaling traffic on application servers. Applications that do not need a response for a NOTIFY request can enhance performance by enabling BENOTIFY.</li> <li>• <b>SERVICE</b>— Number of SERVICE requests sent. The SERVICE method is used by a SIP client to request a service from a SIP</li> </ul> |                        |

### Monitoring Voice ALG Summary

**Purpose** Use the monitoring functionality to view the voice ALG summary page.

**Action** To monitor voice ALG summary, select **Monitor>Security>Voice ALGs>Summary** in the J-Web user interface.

**Meaning** [Table 196 on page 1465](#) summarizes key output fields in the voice ALG summary page.

**Table 196: Voice ALG Summary Monitoring Page**

| Field                      | Value  | Additional Information                            |
|----------------------------|--|---|
| Virtual Chassis Member     | Display the list of virtual chassis member.      | Select one of the virtual chassis members listed. |
| Refresh Interval (30 sec)  | Displays the time interval set for page refresh. | Select the time interval from the drop-down list. |
| Refresh                    | Displays the option to refresh the page.         | –   |
| Clear                      | Provides an option to clear the monitor summary. | Click <b>Clear</b> to clear the monitor summary.  |
| Protocol Name              | Displays the protocols configured.               | –   |
| Total Calls                | Displays the total number of calls.              | –   |
| Number of Active Calls     | Displays the number of active calls.             | –   |
| Number of Received Packets | Displays the number of packets received.         | –   |
| Number of Errors           | Displays the number of errors.                   | –   |
| H.323 Calls Chart          | Displays the H.323 calls chart.                  | –   |
| MGCP Calls Chart           | Displays the MGCP calls chart.                   | –   |
| SCCP Calls Chart           | Displays the SCCP calls chart.                   | –   |
| SIP Calls Chart            | Displays the SIP calls chart.                    | –   |

## Monitoring VPNs

This section contains the following topics:

- [Monitoring IKE Gateway Information on page 1466](#)
- [Monitoring IPsec VPN—Phase I on page 1469](#)
- [Monitoring IPsec VPN—Phase II on page 1470](#)
- [Monitoring IPsec VPN Information on page 1471](#)

### Monitoring IKE Gateway Information

**Purpose** View information about IKE security associations (SAs).

**Action** Select **Monitor>IPSec VPN>IKE Gateway** in the J-Web user interface. To view detailed information for a particular SA, select the IKE SA index on the IKE gateway page.

Alternatively, enter the following CLI commands:

- **show security ike security-associations**
- **show security ike security-associations index *index-id* detail**

[Table 197 on page 1466](#) summarizes key output fields in the IKE gateway display.

**Table 197: Summary of Key IKE SA Information Output Fields**

| Field                            | Values   | Additional Information  |
|----------------------------------|--|---|
| <b>IKE Security Associations</b> |  |   |
| IKE SA Index                     | Index number of an SA.   | This number is an internally generated number you can use to display information about a single SA. |
| Remote Address                   | IP address of the destination peer with which the local peer communicates.   | —   |
| State                            | State of the IKE security associations: <ul style="list-style-type: none"> <li>• <b>DOWN</b>—SA has not been negotiated with the peer.</li> <li>• <b>UP</b>—SA has been negotiated with the peer.</li> </ul> | —   |
| Initiator cookie                 | Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.  | —   |

Table 197: Summary of Key IKE SA Information Output Fields (*continued*)

| Field                                      | Values   | Additional Information   |
|--|--|--|
| Responder cookie                           | Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.  | A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. |
| Mode                                       | <p>Negotiation method agreed on by the two IPsec endpoints, or peers, used to exchange information between themselves. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are:</p> <ul style="list-style-type: none"> <li>• <b>Main</b>—The exchange is done with six messages. This mode, or exchange type, encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate.</li> <li>• <b>Aggressive</b>—The exchange is done with three messages. This mode, or exchange type, does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> </ul> | —  |
| <b>IKE Security Association (SA) Index</b> |  |  |
| IKE Peer                                   | IP address of the destination peer with which the local peer communicates.   | —  |
| IKE SA Index                               | Index number of an SA.   | This number is an internally generated number you can use to display information about a single SA.  |
| Role                                       | Part played in the IKE session. The device triggering the IKE negotiation is the initiator, and the device accepting the first IKE exchange packets is the responder.  | —  |
| State                                      | <p>State of the IKE security associations:</p> <ul style="list-style-type: none"> <li>• <b>DOWN</b>—SA has not been negotiated with the peer.</li> <li>• <b>UP</b>—SA has been negotiated with the peer.</li> </ul>  | —  |
| Initiator cookie                           | Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.  | —  |
| Responder cookie                           | Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.  | A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. |

Table 197: Summary of Key IKE SA Information Output Fields (*continued*)

| Field                 | Values  | Additional Information |
|-----------------------|---|------------------------|
| Exchange Type         | <p>Negotiation method agreed on by the two IPsec endpoints, or peers, used to exchange information between themselves. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are:</p> <ul style="list-style-type: none"> <li>• <b>Main</b>—The exchange is done with six messages. This mode, or exchange type, encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate.</li> <li>• <b>Aggressive</b>—The exchange is done with three messages. This mode, or exchange type, does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> </ul>  | —                      |
| Authentication Method | Path chosen for authentication.   | —                      |
| Local                 | Address of the local peer.  | —                      |
| Remote                | Address of the remote peer.   | —                      |
| Lifetime              | Number of seconds remaining until the IKE SA expires.   | —                      |
| Algorithm             | <p>IKE algorithms used to encrypt and secure exchanges between the peers during the IPsec Phase 2 process:</p> <ul style="list-style-type: none"> <li>• <b>Authentication</b>—Type of authentication algorithm used. <ul style="list-style-type: none"> <li>• <b>sha1</b>—Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• <b>md5</b>—MD5 authentication.</li> </ul> </li> <li>• <b>Encryption</b>—Type of encryption algorithm used. <ul style="list-style-type: none"> <li>• <b>aes-256-cbc</b>—Advanced Encryption Standard (AES) 256-bit encryption.</li> <li>• <b>aes-192-cbc</b>—Advanced Encryption Standard (AES) 192-bit encryption.</li> <li>• <b>aes-128-cbc</b>—Advanced Encryption Standard (AES) 128-bit encryption.</li> <li>• <b>3des-cbc</b>—3 Data Encryption Standard (DES) encryption.</li> <li>• <b>des-cbc</b>—Data Encryption Standard (DES) encryption.</li> <li>• <b>Pseudorandom function</b>—Cryptographically secure pseudorandom function family.</li> </ul> </li> </ul> | —                      |

Table 197: Summary of Key IKE SA Information Output Fields (*continued*)

| Field                       | Values  | Additional Information |
|-----------------------------|---|------------------------|
| Traffic Statistics          | <p>Traffic statistics include the following:</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—The number of bytes presented for processing by the device.</li> <li>• <b>Output bytes</b>—The number of bytes actually processed by the device.</li> <li>• <b>Input packets</b>—The number of packets presented for processing by the device.</li> <li>• <b>Output packets</b>—The number of packets actually processed by the device.</li> </ul> | —                      |
| IPsec security associations | <ul style="list-style-type: none"> <li>• <b>number created</b>—The number of SAs created.</li> <li>• <b>number deleted</b>—The number of SAs deleted.</li> </ul>  | —                      |
| Role                        | Part played in the IKE session. The device triggering the IKE negotiation is the initiator, and the device accepting the first IKE exchange packets is the responder.   | —                      |
| Message ID                  | Message identifier.   | —                      |
| Local identity              | Specifies the identity of the local peer so that its partner destination gateway can communicate with it. The value is specified as any of the following: IPv4 address, fully qualified domain name, e-mail address, or distinguished name.   | —                      |
| Remote identity             | IPv4 address of the destination peer gateway.   | —                      |

**Monitoring IPsec VPN—Phase I**

**Purpose** View IPsec VPN Phase I information.

**Action** Select **Monitor>IPSec VPN>Phase I** in the J-Web user interface.

[Table 198 on page 1469](#) describes the available options for monitoring IPsec VPN-Phase I.

Table 198: IPsec VPN—Phase I Monitoring Page

| Field                            | Values   | Additional Information |
|----------------------------------|--|------------------------|
| <b>IKE SA Tab Options</b>        |  |                        |
| <b>IKE Security Associations</b> |  |                        |
| SA Index                         | Index number of an SA.   | —                      |
| Remote Address                   | IP address of the destination peer with which the local peer communicates. | —                      |

Table 198: IPsec VPN—Phase I Monitoring Page (*continued*)

| Field            | Values   | Additional Information   |
|------------------|--|--|
| State            | State of the IKE security associations: <ul style="list-style-type: none"> <li>DOWN—SA has not been negotiated with the peer.</li> <li>UP—SA has been negotiated with the peer.</li> </ul>   | —  |
| Initiator Cookie | Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.  | —  |
| Responder Cookie | Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.  | A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. |
| Mode             | Negotiation method agreed upon by the two IPsec endpoints, or peers, used to exchange information. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are: <ul style="list-style-type: none"> <li>Main—The exchange is done with six messages. This mode, or exchange type, encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate.</li> <li>Aggressive—The exchange is done with three messages. This mode, or exchange type, does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> </ul> | —  |

**Monitoring IPsec VPN—Phase II**

**Purpose** View IPsec VPN Phase II information.

**Action** Select **Monitor>IPSec VPN>Phase II** in the J-Web user interface.

[Table 199 on page 1470](#) describes the available options for monitoring IPsec VPN-Phase II.

Table 199: IPsec VPN—Phase II Monitoring Page

| Field                  | Values | Additional Information |
|------------------------|--------|------------------------|
| Statistics Tab Details |        |                        |

Table 199: IPsec VPN—Phase II Monitoring Page (*continued*)

| Field                              | Values  | Additional Information |
|------------------------------------|---|------------------------|
| By bytes                           | Provides total number of bytes encrypted and decrypted by the local system across the IPsec tunnel.   | —                      |
| By packets                         | Provides total number of packets encrypted and decrypted by the local system across the IPsec tunnel.   | —                      |
| IPsec Statistics                   | Provides details of the IPsec statistics.   | —                      |
| <b>IPsec SA Tab Details</b>        |   |                        |
| <b>IPsec Security Associations</b> |   |                        |
| ID                                 | Index number of the SA.   | —                      |
| Gateway/Port                       | IP address of the remote gateway/port.  | —                      |
| Algorithm                          | <p>Cryptography scheme used to secure exchanges between peers during the IKE Phase II negotiations:</p> <ul style="list-style-type: none"> <li>An authentication algorithm used to authenticate exchanges between the peers. Options are hmac-md5-95 or hmac-sha1-96.</li> </ul>  | —                      |
| SPI                                | Security parameter index (SPI) identifier. An SA is uniquely identified by an SPI. Each entry includes the name of the VPN, the remote gateway address, the SPIs for each direction, the encryption and authentication algorithms, and keys. The peer gateways each have two SAs, one resulting from each of the two phases of negotiation: Phase I and Phase II. | —                      |
| Life                               | The lifetime of the SA, after which it expires, expressed either in seconds or kilobytes.   | —                      |
| Monitoring                         | Specifies if VPN-Liveliness Monitoring has been enabled/disabled. Enabled - 'U', Disabled- '—'  | —                      |
| Vsys                               | Specifies the root system.  | —                      |

**Monitoring IPsec VPN Information**

**Purpose** View information about IPsec security (SAs).

**Action** Select **Monitor>IPsec VPN>IPsec VPN** in the J-Web user interface. To view the IPsec statistics information for a particular SA, select the IPsec SA ID value on the IPsec VPN page.

Alternatively, enter the following CLI commands:

- **show security ipsec security-associations**
- **show security ipsec statistics**

Table 200 on page 1472 summarizes key output fields in the IPsec VPN display.

**Table 200: Summary of Key IPsec VPN Information Output Fields**

| Field                              | Values   | Additional Information  |
|------------------------------------|--|---|
| <b>IPsec Security Associations</b> |  |   |
| Total configured SA                | Total number of IPsec security associations (SAs) configured on the device.  | —   |
| ID                                 | Index number of the SA.  | —   |
| Gateway                            | IP address of the remote gateway.  | —   |
| Port                               | If Network Address Translation (NAT-T) is used, this value is 4500. Otherwise, it is the standard IKE port, 500.   | —   |
| Algorithm                          | Cryptography used to secure exchanges between peers during the IKE Phase 2 negotiations: <ul style="list-style-type: none"> <li>• An authentication algorithm used to authenticate exchanges between the peers. Options are <b>hmac-md5-95</b> or <b>hmac-sha1-96</b>.</li> <li>• An encryption algorithm used to encrypt data traffic. Options are <b>3des-cbc</b>, <b>aes-128-cbc</b>, <b>aes-192-cbc</b>, <b>aes-256-cbc</b>, or <b>des-cbc</b>.</li> </ul> | —   |
| SPI                                | Security parameter index (SPI) identifier. An SA is uniquely identified by an SPI. Each entry includes the name of the VPN, the remote gateway address, the SPIs for each direction, the encryption and authentication algorithms, and keys. The peer gateways each have two SAs, one resulting from each of the two phases of negotiation: Phase 1 and Phase 2.   | —   |
| Life: sec/kb                       | The lifetime of the SA, after which it expires, expressed either in seconds or kilobytes.  | —   |
| State                              | State has two options, <b>Installed</b> and <b>Not Installed</b> . <ul style="list-style-type: none"> <li>• <b>Installed</b>—The security association is installed in the security association database.</li> <li>• <b>Not Installed</b>—The security association is not installed in the security association database.</li> </ul>  | For <b>transport</b> mode, the value of <b>State</b> is always <b>Installed</b> . |

Table 200: Summary of Key IPsec VPN Information Output Fields (*continued*)

| Field                        | Values  | Additional Information |
|------------------------------|---|------------------------|
| Vsys                         | The root system.  | —                      |
| IPsec Statistics Information |   |                        |
| ESP Statistics               | <p>Encapsulation Security Protocol (ESP) statistics include the following:</p> <ul style="list-style-type: none"> <li>• <b>Encrypted bytes</b>—Total number of bytes encrypted by the local system across the IPsec tunnel.</li> <li>• <b>Decrypted bytes</b>—Total number of bytes decrypted by the local system across the IPsec tunnel.</li> <li>• <b>Encrypted packets</b>—Total number of packets encrypted by the local system across the IPsec tunnel.</li> <li>• <b>Decrypted packets</b>—Total number of packets decrypted by the local system across the IPsec tunnel.</li> </ul>   | —                      |
| AH Statistics                | <p>Authentication Header (AH) statistics include the following:</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—The number of bytes presented for processing by the device.</li> <li>• <b>Output bytes</b>—The number of bytes actually processed by the device.</li> <li>• <b>Input packets</b>—The number of packets presented for processing by the device.</li> <li>• <b>Output packets</b>—The number of packets actually processed by the device.</li> </ul>  | —                      |
| Errors                       | <p>Errors include the following</p> <ul style="list-style-type: none"> <li>• <b>AH authentication failures</b>—Total number of authentication header (AH) failures. An AH failure occurs when there is a mismatch of the authentication header in a packet transmitted across an IPsec tunnel.</li> <li>• <b>Replay errors</b>—Total number of replay errors. A replay error is generated when a duplicate packet is received within the replay window.</li> <li>• <b>ESP authentication failures</b>—Total number of Encapsulation Security Payload (ESP) failures. An ESP failure occurs when there is an authentication mismatch in ESP packets.</li> <li>• <b>ESP decryption failures</b>—Total number of ESP decryption errors.</li> <li>• <b>Bad headers</b>—Total number of invalid headers detected.</li> <li>• <b>Bad trailers</b>—Total number of invalid trailers detected.</li> </ul> | —                      |

| <b>Details for IPsec SA Index: <i>ID</i></b> |   |                        |
| Virtual System                               | The root system.  | —                      |
| Local Gateway                                | Gateway address of the local system.  | —                      |
| Remote Gateway                               | Gateway address of the remote system.   | —                      |
| Local identity                               | Specifies the identity of the local peer so that its partner destination gateway can communicate with it. The value is specified as any of the following: IPv4 address, fully qualified domain name, e-mail address, or distinguished name.   | —                      |
| Remote identity                              | IPv4 address of the destination peer gateway.   | —                      |
| Df bit                                       | State of the don't fragment bit— <b>set</b> or <b>cleared</b> .   | —                      |
| Policy name                                  | Name of the applicable policy.  | —                      |
| Direction                                    | Direction of the security association— <b>inbound</b> , or <b>outbound</b> .  | —                      |
| SPI  | Security parameter index (SPI) identifier. An SA is uniquely identified by an SPI. Each entry includes the name of the VPN, the remote gateway address, the SPIs for each direction, the encryption and authentication algorithms, and keys. The peer gateways each have two SAs, one resulting from each of the two phases of negotiation: Phase 1 and Phase 2.                              | —                      |
| Mode   | Mode of the security association. Mode can be transport or tunnel. <ul style="list-style-type: none"> <li>• <b>transport</b>—Protects host-to-host connections.</li> <li>• <b>tunnel</b>—Protects connections between security gateways.</li> </ul>   | —                      |
| Type   | Type of the security association, either <b>manual</b> or <b>dynamic</b> . <ul style="list-style-type: none"> <li>• <b>manual</b>—Security parameters require no negotiation. They are static and are configured by the user.</li> <li>• <b>dynamic</b>—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode.</li> </ul> | —                      |

Table 200: Summary of Key IPsec VPN Information Output Fields (*continued*)

| Field                     | Values  | Additional Information  |
|---------------------------|---|---|
| State                     | <p><b>State</b> has two options, <b>Installed</b>, and <b>Not Installed</b>.</p> <ul style="list-style-type: none"> <li>• <b>Installed</b>—The security association is installed in the security association database.</li> <li>• <b>Not Installed</b>—The security association is not installed in the security association database.</li> </ul>   | For <b>transport</b> mode, the value of <b>State</b> is always <b>Installed</b> .   |
| Protocol                  | <p>Protocol supported:</p> <ul style="list-style-type: none"> <li>• <b>Transport</b> mode supports Encapsulation Security Protocol (ESP) and Authentication Header (AH).</li> <li>• <b>Tunnel</b> mode supports ESP and AH. <ul style="list-style-type: none"> <li>• <b>Authentication</b>—Type of authentication used.</li> <li>• <b>Encryption</b>—Type of encryption used.</li> </ul> </li> </ul>  | —   |
| Authentication/Encryption | <ul style="list-style-type: none"> <li>• <b>Authentication</b>—Type of authentication algorithm used. <ul style="list-style-type: none"> <li>• <b>sha1</b>—Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• <b>md5</b>—MD5 authentication.</li> </ul> </li> <li>• <b>Encryption</b>—Type of encryption algorithm used. <ul style="list-style-type: none"> <li>• <b>aes-256-cbc</b>—Advanced Encryption Standard (AES) 256-bit encryption.</li> <li>• <b>aes-192-cbc</b>—Advanced Encryption Standard (AES) 192-bit encryption.</li> <li>• <b>aes-128-cbc</b>—Advanced Encryption Standard (AES) 128-bit encryption.</li> <li>• <b>3des-cbc</b>—3 Data Encryption Standard (DES) encryption.</li> <li>• <b>des-cbc</b>—Data Encryption Standard (DES) encryption.</li> </ul> </li> </ul> | —   |
| Soft Lifetime             | <p>The soft lifetime informs the IPsec key management system that the SA is about to expire.</p> <ul style="list-style-type: none"> <li>• <b>Expires in seconds</b>—Number of seconds left until the SA expires.</li> <li>• <b>Expires in kilobytes</b>—Number of kilobytes left until the SA expires.</li> </ul>   | Each lifetime of a security association has two display options, <b>hard</b> and <b>soft</b> , one of which must be present for a dynamic security association. This allows the key management system to negotiate a new SA before the hard lifetime expires. |
| Hard Lifetime             | <p>The hard lifetime specifies the lifetime of the SA.</p> <ul style="list-style-type: none"> <li>• <b>Expires in seconds</b>—Number of seconds left until the SA expires.</li> <li>• <b>Expires in kilobytes</b>—Number of kilobytes left until the SA expires.</li> </ul>   | —   |

Table 200: Summary of Key IPsec VPN Information Output Fields (*continued*)

| Field               | Values  | Additional Information   |
|---------------------|---|--|
| Anti Replay Service | State of the service that prevents packets from being replayed. It can be <b>Enabled</b> or <b>Disabled</b> .                                     | –  |
| Replay Window Size  | Configured size of the antireplay service window. It can be 32 or 64 packets. If the replay window size is 0, the antireplay service is disabled. | The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. |

### Monitoring the WAN Acceleration Interface

**Purpose** View status information and traffic statistics for the WAN acceleration interface.

**Action** Select **Monitor>WAN Acceleration** in the J-Web user interface, or select **Monitor>Interfaces** and select the interface name (**wx-slot/0/0**). Alternatively, enter the following CLI command:

```
[edit]
user@host# show interfaces wx-slot/0/0 detail
```

- Related Documentation**
- [Monitoring Overview on page 1231](#)

### Monitoring Web Filtering Configurations

**Purpose** View Web-filtering statistics.

**Action** To view Web-filtering statistics using the CLI, enter the following commands:

```
user@host> show security utm web-filtering status
user@host> show security utm web-filtering statistics
```

To view Web-filtering statistics using J-Web:

1. Select **Clear Web Filtering Statistics**.

The following information is displayed in the right pane.

```
Total Requests: #
White List Hit: #
Black List Hit: #
Queries to Server: #
Server Reply Permit: #
```

Server Reply Block: #  
 Custom Category Permit: #  
 Custom Category Block: #  
 Cache Hit Permit: #  
 Cache Hit Block: #  
 Web Filtering Session Total: #  
 Web Filtering Session Inuse: #  
 Fall Back: Log-and-Permit Block  
 Default # #  
 Timeout # #  
 Server-Connectivity # #  
 Too-Many-Requests # #

- You can click the **Clear Web Filtering Statistics** button to clear all current viewable statistics and begin collecting new statistics.

## Alarms

- [Monitoring Active Alarms on a Device on page 1477](#)
- [Monitoring Alarms on page 1478](#)

### Monitoring Active Alarms on a Device

**Purpose** Use to monitor and filter alarms on a Juniper Networks device.

**Action** Select **Monitor>Events and Alarms>View Alarms** in the J-Web user interface. The J-Web View Alarms page displays the following information about preset system and chassis alarms:

- Type—Type of alarm: System, Chassis, or All.
- Severity—Severity class of the alarm: Minor or Major.
- Description—Description of the alarm.
- Time—Time that the alarm was registered.

To filter which alarms appear, use the following options:

- Alarm Type—Specifies which type of alarm to monitor: System, Chassis, or All. System alarms include FRU detection alarms (power supplies removed, for instance). Chassis alarms indicate environmental alarms such as temperature.
- Severity—Specifies the alarm severity that you want to monitor: Major, Minor, or All. A major (red) alarm condition requires immediate action. A minor (yellow) condition requires monitoring and maintenance.

- **Description**—Specifies the alarms you want to monitor. Enter a brief synopsis of the alarms that you want to monitor.
- **Date From**—Specifies the beginning of the date range that you want to monitor. Set the date using the calendar pick tool.
- **To**—Specifies the end of the date range that you want to monitor. Set the date using the calendar pick tool.
- **Go**—Executes the options that you specified.
- **Reset**—Clears the options that you specified.

Alternatively, you can enter the following **show** commands in the CLI editor:

- **show chassis alarms**
- **show system alarms**

## Data Path Debugging and Trace Options

- [Displaying a List of Devices on page 1480](#)
- [Displaying Log and Trace Files on page 1481](#)
- [Displaying Output for Security Trace Options on page 1481](#)
- [Displaying Multicast Trace Operations on page 1482](#)

- [Using the J-Web Traceroute Tool on page 1483](#)
- [J-Web Traceroute Results and Output Summary on page 1484](#)

### Displaying a List of Devices

To display a list of devices between the device and a specified destination host, enter the **traceroute** command with the following syntax:

```
user@host> traceroute host <interface interface-name> <as-number-lookup>
<bypass-routing> <gateway address> <inet | inet6> <no-resolve>
<routing-instance routing-instance-name> <source source-address> <tos number>
<tll number> <wait seconds>
```

[Table 202 on page 1480](#) describes the **traceroute** command options.

**Table 202: CLI traceroute Command Options**

| Option  | Description  |
|---|--|
| <i>host</i>                                   | Sends traceroute packets to the hostname or IP address you specify.  |
| <i>interface interface-name</i>               | (Optional) Sends the traceroute packets on the interface you specify. If you do not include this option, traceroute packets are sent on all interfaces.  |
| <i>as-number-lookup</i>                       | (Optional) Displays the autonomous system (AS) number of each intermediate hop between the device and the destination host.  |
| <i>bypass-routing</i>                         | (Optional) Bypasses the routing tables and sends the traceroute packets only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned.<br><br>Use this option to display a route to a local system through an interface that has no route through it. |
| <i>gateway address</i>                        | (Optional) Uses the gateway you specify to route through.  |
| <i>inet</i>                                   | (Optional) Forces the traceroute packets to an IPv4 destination.   |
| <i>inet6</i>                                  | (Optional) Forces the traceroute packets to an IPv6 destination.   |
| <i>no-resolve</i>                             | (Optional) Suppresses the display of the hostnames of the hops along the path.   |
| <i>routing-instance routing-instance-name</i> | (Optional) Uses the routing instance you specify for the traceroute.   |
| <i>source address</i>                         | (Optional) Uses the source address that you specify, in the traceroute packet.   |
| <i>tos number</i>                             | (Optional) Sets the type-of-service (TOS) value in the IP header of the traceroute packet. Specify a value from 0 through 255.   |
| <i>tll number</i>                             | (Optional) Sets the time-to-live (TTL) value for the traceroute packet. Specify a hop count from 0 through 128.  |
| <i>wait seconds</i>                           | (Optional) Sets the maximum time to wait for a response.   |

To quit the **traceroute** command, press Ctrl-C.

The following is sample output from a **traceroute** command:

```
user@host> traceroute host2

traceroute to 173.24.232.66 (172.24.230.41), 30 hops max, 40 byte packets  1
173.18.42.253 (173.18.42.253)  0.482 ms  0.346 ms  0.318 ms  2  host4.site1.net
(173.18.253.5)  0.401 ms  0.435 ms  0.359 ms  3  host5.site1.net (173.18.253.5)
0.401 ms  0.360 ms  0.357 ms  4  173.24.232.65 (173.24.232.65)  0.420 ms  0.456
ms  0.378 ms  5  173.24.232.66 (173.24.232.66)  0.830 ms  0.779 ms  0.834 ms
```

The fields in the display are the same as those displayed by the J-Web traceroute diagnostic tool.

### Displaying Log and Trace Files

Enter the **monitor start** command to display real-time additions to system logs and trace files:

```
user@host> monitor start filename
```

When the device adds a record to the file specified by *filename*, the record displays on the screen. For example, if you have configured a system log file named **system-log** (by including the **syslog** statement at the [edit system] hierarchy level), you can enter the **monitor start system-log** command to display the records added to the system log.

To display a list of files that are being monitored, enter the **monitor list** command. To stop the display of records for a specified file, enter the **monitor stop filename** command.

### Displaying Output for Security Trace Options

**Purpose** Display output for security trace options.

**Action** Use the **show security traceoptions** command to display the output of your trace files. For example:

```
[edit]
user@host # show security traceoptions file usp_trace
user@host # show security traceoptions flag all
user@host # show security traceoptions rate-limit 888
```

The output for this example is as follows:

```
Apr 11 16:06:42 21:13:15.750395:CID-906489336:FPC-01:PIC-01:THREAD_ID-01:PFE:now

## Displaying Multicast Trace Operations

To monitor and display multicast trace operations, enter the **mtrace monitor** command:

```
user@host> mtrace monitor
```

```
Mtrace query at Apr 21 16:00:54 by 192.1.30.2, resp to 224.0.1.32, qid 2a83aa
packet from 192.1.30.2 to 224.0.0.2 from 192.1.30.2 to 192.1.4.1 via group
224.1.1.1 (mxhop=60) Mtrace query at Apr 21 16:00:57 by 192.1.30.2, resp to
224.0.1.32, qid 25dc17 packet from 192.1.30.2 to 224.0.0.2 from 192.1.30.2 to
192.1.4.1 via group 224.1.1.1 (mxhop=60) Mtrace query at Apr 21 16:01:00 by
192.1.30.2, resp to same, qid 20e046 packet from 192.1.30.2 to 224.0.0.2 from
192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60) Mtrace query at Apr 21
16:01:10 by 192.1.30.2, resp to same, qid 1d25ad packet from 192.1.30.2 to
224.0.0.2 from 192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60)
```

This example displays only **mtrace** queries. However, when the device captures an **mtrace** response, the display is similar, but the complete **mtrace** response also appears (exactly as it is appears in the **mtrace from-source** command output).

[Table 203 on page 1482](#) summarizes the output fields of the display.

**Table 203: CLI mtrace monitor Command Output Summary**

| Field                                       | Description   |
|---|---|
| <b>Mtrace operation-type at time-of-day</b> | <ul style="list-style-type: none"> <li>• <b>operation-type</b>—Type of multicast trace operation: <b>query</b> or <b>response</b>.</li> <li>• <b>time-of-day</b>—Date and time the multicast trace query or response was captured.</li> </ul> |
| <b>by</b>                                   | IP address of the host issuing the query.   |
| <b>resp to address</b>                      | <b>address</b> —Response destination address.   |
| <b>qid qid</b>                              | <b>qid</b> —Query ID number.  |
| <b>packet from source to destination</b>    | <ul style="list-style-type: none"> <li>• <b>source</b>—IP address of the source of the query or response.</li> <li>• <b>destination</b>—IP address of the destination of the query or response.</li> </ul>                                    |
| <b>from source to destination</b>           | <ul style="list-style-type: none"> <li>• <b>source</b>—IP address of the multicast source.</li> <li>• <b>destination</b>—IP address of the multicast destination.</li> </ul>  |
| <b>via group address</b>                    | <b>address</b> —Group address being traced.   |
| <b>mxhop=number</b>                         | <b>number</b> —Maximum hop setting.   |

- Related Documentation**
- [Using the J-Web Traceroute Tool on page 1483](#)
  - [J-Web Traceroute Results and Output Summary on page 1484](#)

### Using the J-Web Traceroute Tool

You can use the traceroute diagnostic tool to display a list of devices between the device and a specified destination host. The output is useful for diagnosing a point of failure in the path from the device to the destination host, and addressing network traffic latency and throughput problems.

The device generates the list of devices by sending a series of ICMP traceroute packets in which the time-to-live (TTL) value in the messages sent to each successive device is incremented by 1. (The TTL value of the first traceroute packet is set to 1.) In this manner, each device along the path to the destination host replies with a Time Exceeded packet from which the source IP address can be obtained.

To use the traceroute tool:

1. Select **Troubleshoot>Traceroute**.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Traceroute page (see [Table 204 on page 1483](#)).

**Table 204: Traceroute Field Summary**

| Field                   | Function  | Your Action  |
|-------------------------|---|--|
| Remote Host             | Identifies the destination host of the traceroute.<br><br>The <b>Remote Host</b> field is the only required field.  | Type the hostname or IP address of the destination host.   |
| <b>Advanced Options</b> |   |  |
| Don't Resolve Addresses | Determines whether hostnames of the hops along the path are displayed, in addition to IP addresses.   | <ul style="list-style-type: none"> <li>• Suppress the display of the hop hostnames by selecting the check box.</li> <li>• Display the hop hostnames by clearing the check box.</li> </ul>  |
| Gateway                 | Specifies the IP address of the gateway to route through.   | Type the gateway IP address.   |
| Source Address          | Specifies the source address of the outgoing traceroute packets.  | Type the source IP address.  |
| Bypass Routing          | <p>Determines whether traceroute packets are routed by means of the routing table.</p> <p>If the routing table is not used, traceroute packets are sent only to hosts on the interface specified in the Interface box. If the host is not on that interface, traceroute responses are not sent.</p> | <ul style="list-style-type: none"> <li>• Bypass the routing table and send the traceroute packets to hosts on the specified interface only by selecting the check box.</li> <li>• Route the traceroute packets by means of the routing table by clearing the check box.</li> </ul> |

Table 204: Traceroute Field Summary (*continued*)

| Field              | Function  | Your Action   |
|--------------------|---|---|
| Interface          | Specifies the interface on which the traceroute packets are sent.   | Select the interface on which traceroute packets are sent from the list. If you select <b>any</b> , the traceroute requests are sent on all interfaces.                         |
| Time-to-Live       | Specifies the maximum time-to-live (TTL) hop count for the traceroute request packet.   | Select the TTL from the list.   |
| Type-of-Service    | Specifies the type-of-service (TOS) value to include in the IP header of the traceroute request packet.                                 | Select the decimal value of the TOS field from the list.  |
| Resolve AS Numbers | Determines whether the autonomous system (AS) number of each intermediate hop between the device and the destination host is displayed. | <ul style="list-style-type: none"> <li>Display the AS numbers by selecting the check box.</li> <li>Suppress the display of the AS numbers by clearing the check box.</li> </ul> |

4. Click **Start**.

The results of the traceroute operation are displayed in the main pane. If no options are specified, each line of the traceroute display is in the following format:

*hop-number host (ip-address) [as-number]time1 time2 time3*

The device sends a total of three traceroute packets to each router along the path and the round-trip time for each traceroute operation appears. If the device times out before receiving a **Time Exceeded** message, an asterisk (\*) appears for that round-trip time.

5. You can stop the traceroute operation before it is complete by clicking **OK** while the results of the traceroute operation appear.

#### J-Web Traceroute Results and Output Summary

Table 205 on page 1484 summarizes the output in the traceroute display.

Table 205: J-Web Traceroute Results and Output Summary

| Field             | Description                                |
|-------------------|--|
| <i>hop-number</i> | Number of the hop (device) along the path. |

Table 205: J-Web Traceroute Results and Output Summary (*continued*)

| Field             | Description  |
|-------------------|--|
| <i>host</i>       | Hostname, if available, or IP address of the device. If the Don't Resolve Addresses check box is selected, the hostname does not appear.                     |
| <i>ip-address</i> | IP address of the device.  |
| <i>as-number</i>  | AS number of the device.   |
| <i>time1</i>      | Round-trip time between the sending of the first traceroute packet and the receiving of the corresponding Time Exceeded packet from that particular device.  |
| <i>time2</i>      | Round-trip time between the sending of the second traceroute packet and the receiving of the corresponding Time Exceeded packet from that particular device. |
| <i>time3</i>      | Round-trip time between the sending of the third traceroute packet and the receiving of the corresponding Time Exceeded packet from that particular device.  |

If the device does not display the complete path to the destination host, one of the following explanations might apply:

- The host is not operational.
- There are network connectivity problems between the device and the host.
- The host, or a router along the path, might be configured to ignore ICMP traceroute messages.
- The host, or a device along the path, might be configured with a firewall filter that blocks ICMP traceroute requests or ICMP time exceeded responses.
- The value you selected in the Time Exceeded box was less than the number of hops in the path to the host. In this case, the host might reply with an ICMP error message.

### Using the ping Command

You can perform certain tasks only through the CLI. Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The device sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

Enter the **ping** command with the following syntax:

```
user@host> ping host <interface source-interface> <bypass-routing> <count number>
<do-not-fragment> <inet | inet6> <interval seconds> <loose-source [hosts]>
<no-resolve> <pattern string> <rapid> <record-route>
<routing-instance routing-instance-name> <size bytes> <source source-address> <strict>
<strict-source [hosts]> <tos number> <ttl number> <wait seconds> <detail> <verbose>
```

[Table 206 on page 1486](#) describes the **ping** command options.

To quit the **ping** command, press Ctrl-C.

**Table 206: CLI ping Command Options**

| Option                            | Description   |
|-----------------------------------|---|
| <i>host</i>                       | Pings the hostname or IP address you specify.   |
| <i>interface source-interface</i> | (Optional) Sends the ping requests on the interface you specify. If you do not include this option, ping requests are sent on all interfaces.   |
| <i>bypass-routing</i>             | (Optional) Bypasses the routing tables and sends the ping requests only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned.<br><br>Use this option to ping a local system through an interface that has no route through it. |
| <i>countnumber</i>                | (Optional) Limits the number of ping requests to send. Specify a count from 1 through 2,000,000,000. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.   |
| <i>do-not-fragment</i>            | (Optional) Sets the Don't Fragment (DF) bit in the IP header of the ping request packet.  |
| <i>inet</i>                       | (Optional) Forces the ping requests to an IPv4 destination.   |
| <i>inet6</i>                      | (Optional) Forces the ping requests to an IPv6 destination.   |
| <i>interval seconds</i>           | (Optional) Sets the interval between ping requests, in seconds. Specify an interval from 0.1 through 10,000. The default value is 1 second.   |
| <i>loose-source [hosts]</i>       | (Optional) For IPv4, sets the loose source routing option in the IP header of the ping request packet.  |
| <i>no-resolve</i>                 | (Optional) Suppresses the display of the hostnames of the hops along the path.  |

Table 206: CLI ping Command Options (*continued*)

| Option   | Description   |
|--|---|
| <b>pattern <i>string</i></b>                         | (Optional) Includes the hexadecimal string you specify, in the ping request packet.   |
| <b>rapid</b>   | (Optional) Sends ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the <b>count</b> option.   |
| <b>record-route</b>                                  | (Optional) For IPv4, sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed on the screen.   |
| <b>routing-instance <i>routing-instance-name</i></b> | (Optional) Uses the routing instance you specify for the ping request.  |
| <b>size <i>bytes</i></b>                             | (Optional) Sets the size of the ping request packet. Specify a size from <b>0</b> through <b>65,468</b> . The default value is <b>56</b> bytes, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.  |
| <b>source <i>source-address</i></b>                  | (Optional) Uses the source address that you specify, in the ping request packet.  |
| <b>strict</b>  | (Optional) For IPv4, sets the strict source routing option in the IP header of the ping request packet.   |
| <b>strict-source [<i>hosts</i>]</b>                  | (Optional) For IPv4, sets the strict source routing option in the IP header of the ping request packet, and uses the list of hosts you specify for routing the packet.  |
| <b>tos <i>number</i></b>                             | (Optional) Sets the type-of-service (TOS) value in the IP header of the ping request packet. Specify a value from <b>0</b> through <b>255</b> .   |
| <b>ttl <i>number</i></b>                             | (Optional) Sets the time-to-live (TTL) value for the ping request packet. Specify a value from <b>0</b> through <b>255</b> .  |
| <b>wait <i>seconds</i></b>                           | (Optional) Sets the maximum time to wait after sending the last ping request packet. If you do not specify this option, the default delay is <b>10</b> seconds. If you use this option without the <b>count</b> option, the J Series device uses a default count of <b>5</b> packets. |
| <b>detail</b>  | (Optional) Displays the interface on which the ping response was received.  |
| <b>verbose</b>                                       | (Optional) Displays detailed output.  |

The following is sample output from a **ping** command:

```

user@host> ping host3 count 4

PING host3.site.net (176.26.232.111): 56 data bytes 64 bytes from 176.26.232.111:
icmp_seq=0 ttl=122 time=0.661 ms 64 bytes from 176.26.232.111: icmp_seq=1 ttl=122
time=0.619 ms 64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms 64
bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms --- host3.site.net
ping statistics --- 4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms

```

The fields in the display are the same as those displayed by the J-Web ping host diagnostic tool.

### Using the J-Web Ping Host Tool

You can ping a host to verify that the host can be reached over the network. The output is useful for diagnosing host and network connectivity problems. The J Series device sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

Alternatively, you can use the CLI **ping** command. (See [“Using the ping Command” on page 1486](#).)

To use the ping host tool:

1. Select **Troubleshoot>Ping Host** from the task bar.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Ping Host page (see [Table 207 on page 1488](#)).

**Table 207: J-Web Ping Host Field Summary**

| Field                   | Function   | Your Action   |
|-------------------------|--|---|
| Remote Host             | Identifies the host to ping.<br><br>This is the only required field.               | Type the hostname or IP address of the host to ping.  |
| <b>Advanced Options</b> |  |   |
| Don't Resolve Addresses | Determines whether to display hostnames of the hops along the path.                | <ul style="list-style-type: none"> <li>• Suppress the display of the hop hostnames by selecting the check box.</li> <li>• Display the hop hostnames by clearing the check box.</li> </ul> |
| Interface               | Specifies the interface on which the ping requests are sent.                       | Select the interface on which ping requests are sent from the list. If you select <b>any</b> , the ping requests are sent on all interfaces.  |
| Count                   | Specifies the number of ping requests to send.                                     | Select the number of ping requests to send from the list.   |
| Don't Fragment          | Specifies the Don't Fragment (DF) bit in the IP header of the ping request packet. | <ul style="list-style-type: none"> <li>• Set the DF bit by selecting the check box.</li> <li>• Clear the DF bit by clearing the check box.</li> </ul>                                     |

Table 207: J-Web Ping Host Field Summary (*continued*)

| Field            | Function  | Your Action  |
|------------------|---|--|
| Record Route     | Sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed in the main pane.   | <ul style="list-style-type: none"> <li>Record and display the path of the packet by selecting the check box.</li> <li>Suppress the recording and display of the path of the packet by clearing the check box.</li> </ul>                                       |
| Type-of-Service  | Specifies the type-of-service (TOS) value in the IP header of the ping request packet.  | Select the decimal value of the TOS field from the list.   |
| Routing Instance | Names the routing instance for the ping attempt.  | Select the routing instance name from the list.  |
| Interval         | Specifies the interval, in seconds, between the transmission of each ping request.  | Select the interval from the list.   |
| Packet Size      | Specifies the size of the ping request packet.  | Type the size, in bytes, of the packet. The size can be from 0 through 65,468. The device adds 8 bytes of ICMP header to the size.   |
| Source Address   | Specifies the source address of the ping request packet.  | Type the source IP address.  |
| Time-to-Live     | Specifies the time-to-live (TTL) hop count for the ping request packet.   | Select the TTL from the list.  |
| Bypass Routing   | <p>Determines whether ping requests are routed by means of the routing table.</p> <p>If the routing table is not used, ping requests are sent only to hosts on the interface specified in the Interface box. If the host is not on that interface, ping responses are not sent.</p> | <ul style="list-style-type: none"> <li>Bypass the routing table and send the ping requests to hosts on the specified interface only by selecting the check box.</li> <li>Route the ping requests using the routing table by clearing the check box.</li> </ul> |

4. Click **Start**.

The results of the ping operation appear in the main pane. If no options are specified, each ping response is in the following format:

*bytes bytes from ip-address: icmp\_seq=number ttl=number time=time*

5. You can stop the ping operation before it is complete by clicking **OK**.

## J-Web Ping Host Results and Output Summary

Table 208 on page 1490 summarizes the output in the ping host display.

**Table 208: Ping Host Results and Output**

| Ping Host Result   | Description   |
|--|---|
| <i>bytes bytes from ip-address</i>   | <ul style="list-style-type: none"> <li><b>bytes</b>—Size of ping response packet, which is equal to the value you entered in the Packet Size box, plus 8.</li> <li><b>ip-address</b>—IP address of destination host that sent the ping response packet.</li> </ul>  |
| <i>icmp_seq=0</i><br><i>icmp_seq=number</i>  | <b>number</b> —Sequence Number field of the ping response packet. You can use this value to match the ping response to the corresponding ping request.  |
| <i>ttl=number</i>  | <b>number</b> —Time-to-live hop-count value of the ping response packet.  |
| <i>number packets transmitted</i>  | <b>number</b> —Number of ping requests (probes) sent to host.   |
| <i>percentage packet loss</i>  | <b>percentage</b> —Number of ping responses divided by the number of ping requests, specified as a percentage.  |
| <i>round-trip min/avg/max/stddev =</i><br><i>min-time/avg-time/max-time/std-dev ms</i> | <ul style="list-style-type: none"> <li><b>min-time</b>—Minimum round-trip time (see <b>time=time</b> field in this table).</li> <li><b>avg-time</b>—Average round-trip time.</li> <li><b>max-time</b>—Maximum round-trip time.</li> <li><b>std-dev</b>—Standard deviation of the round-trip times.</li> </ul> |

If the device does not receive ping responses from the destination host (the output shows a packet loss of 100 percent), one of the following explanations might apply:

- The host is not operational.
- There are network connectivity problems between the device and the host.
- The host might be configured to ignore ICMP echo requests.
- The host might be configured with a firewall filter that blocks ICMP echo requests or ICMP echo responses.
- The size of the ICMP echo request packet exceeds the MTU of a host along the path.
- The value you selected in the Time-to-Live box was less than the number of hops in the path to the host, in which case the host might reply with an ICMP error message.

### Related Documentation

- [Diagnostic Tools Overview on page 1232](#)

### Using the J-Web Ping MPLS Tool

Before using the ping MPLS feature, make sure that the receiving interface on the VPN or LSP remote endpoint has MPLS enabled, and that the loopback interface on the outbound node is configured as **127.0.0.1**. The source address for MPLS probes must be a valid address on the J Series device.

To use the ping MPLS tool:

1. Select **Troubleshoot>Ping MPLS** from the task bar.
2. Next to the ping MPLS option you want to use, click the expand icon.
3. Enter information into the Ping MPLS page (see [Table 209 on page 1491](#)).

**Table 209: J-Web Ping MPLS Field Summary**

| Field                                 | Function   | Your Action   |
|---------------------------------------|--|---|
| <b>Ping RSVP-signaled LSP</b>         |  |   |
| LSP Name                              | Identifies the LSP to ping.                                      | Type the name of the LSP to ping.   |
| Source Address                        | Specifies the source address of the ping request packet.         | Type the source IP address—a valid address configured on a J Series device interface. |
| Count                                 | Specifies the number of ping requests to send.                   | Select the number of ping requests to send from the list. The default is 5 requests.  |
| Detailed Output                       | Requests the display of extensive rather than brief ping output. | Select the check box to display detailed output.                                      |
| <b>Ping LDP-signaled LSP</b>          |  |   |
| FEC Prefix                            | Identifies the LSP to ping.                                      | Type the forwarding equivalence class (FEC) prefix and length of the LSP to ping.     |
| Source Address                        | Specifies the source address of the ping request packet.         | Type the source IP address—a valid address configured on a J Series device interface. |
| Count                                 | Specifies the number of ping requests to send.                   | Select the number of ping requests to send from the list. The default is 5 requests.  |
| Detailed Output                       | Requests the display of extensive rather than brief ping output. | Select the check box to display detailed output.                                      |
| <b>Ping LSP to Layer 3 VPN prefix</b> |  |   |
| Layer 3 VPN Name                      | Identifies the Layer 3 VPN to ping.                              | Type the name of the VPN to ping.   |
| Count                                 | Specifies the number of ping requests to send.                   | Select the number of ping requests to send from the list. The default is 5 requests.  |
| Detailed Output                       | Requests the display of extensive rather than brief ping output. | Select the check box to display detailed output.                                      |

Table 209: J-Web Ping MPLS Field Summary (*continued*)

| Field  | Function  | Your Action  |
|--|---|--|
| VPN Prefix                                       | Identifies the IP address prefix and length of the Layer 3 VPN to ping. | Type the IP address prefix and length of the VPN to ping.  |
| Source Address                                   | Specifies the source address of the ping request packet.                | Type the source IP address—a valid address configured on a J Series device interface.  |
| <b>Locate LSP using interface name</b>           |   |  |
| Interface  | Specifies the interface on which the ping requests are sent.            | Select the J Series device interface on which ping requests are sent from the list. If you select <b>any</b> , the ping requests are sent on all interfaces. |
| Source Address                                   | Specifies the source address of the ping request packet.                | Type the source IP address—a valid address configured on a J Series device interface.  |
| Count  | Specifies the number of ping requests to send.                          | Select the number of ping requests to send from the list. The default is 5 requests.   |
| Detailed Output                                  | Requests the display of extensive rather than brief ping output.        | Select the check box to display detailed output.   |
| <b>Instance to which this connection belongs</b> |   |  |
| Layer 2VPN Name                                  | Identifies the Layer 2 VPN to ping.                                     | Type the name of the VPN to ping.  |
| Remote Site Identifier                           | Specifies the remote site identifier of the Layer 2 VPN to ping.        | Type the remote site identifier for the VPN.   |
| Source Address                                   | Specifies the source address of the ping request packet.                | Type the source IP address—a valid address configured on a J Series device interface.  |
| Local Site Identifier                            | Specifies the local site identifier of the Layer 2 VPN to ping.         | Type the local site identifier for the VPN.  |
| Count  | Specifies the number of ping requests to send.                          | Select the number of ping requests to send from the list. The default is 5 requests.   |
| Detailed Output                                  | Requests the display of extensive rather than brief ping output.        | Select the check box to display detailed output.   |
| <b>Locate LSP from interface name</b>            |   |  |
| Interface  | Specifies the interface on which the ping requests are sent.            | Select the J Series device interface on which ping requests are sent from the list. If you select <b>any</b> , the ping requests are sent on all interfaces. |
| Source Address                                   | Specifies the source address of the ping request packet.                | Type the source IP address—a valid address configured on a J Series device interface.  |
| Count  | Specifies the number of ping requests to send.                          | Select the number of ping requests to send from the list. The default is 5 requests.   |

Table 209: J-Web Ping MPLS Field Summary (*continued*)

| Field  | Function   | Your Action   |
|--|--|---|
| Detailed Output                                    | Requests the display of extensive rather than brief ping output.               | Select the check box to display detailed output.  |
| <b>Locate LSP from virtual circuit information</b> |  |   |
| Remote Neighbor                                    | Identifies the remote neighbor (PE device) within the virtual circuit to ping. | Type the IP address of the remote neighbor within the virtual circuit.                          |
| Circuit Identifier                                 | Specifies the virtual circuit identifier for the Layer 2 circuit to ping.      | Type the virtual circuit identifier for the Layer 2 circuit.                                    |
| Source Address                                     | Specifies the source address of the ping request packet.                       | Type the source IP address—a valid address configured on a J Series device interface.           |
| Count  | Specifies the number of ping requests to send.                                 | Select the number of ping requests to send from the list.                                       |
| Detailed Output                                    | Requests the display of extensive rather than brief ping output.               | Select the check box to display detailed output.  |
| <b>Ping end point of LSP</b>                       |  |   |
| VPN Prefix   | Identifies the LSP endpoint to ping.   | Type either the LDP FEC prefix and length or the RSVP LSP endpoint address for the LSP to ping. |
| Source Address                                     | Specifies the source address of the ping request packet.                       | Type the source IP address—a valid address configured on a J Series device interface.           |
| Count  | Specifies the number of ping requests to send.                                 | Select the number of ping requests to send from the list.                                       |
| Detailed Output                                    | Requests the display of extensive rather than brief ping output.               | Select the check box to display detailed output.  |

4. Click **Start**.

5. You can stop the ping operation before it is complete by clicking **OK**.

## J-Web Ping MPLS Results and Output Summary

Table 210 on page 1494 summarizes the output in the ping MPLS display.

**Table 210: J-Web Ping MPLS Results and Output Summary**

| Field                             | Description   |
|-----------------------------------|---|
| Exclamation point (!)             | Echo reply was received.  |
| Period (.)                        | Echo reply was not received within the timeout period.  |
| x                                 | Echo reply was received with an error code. Errored packets are not counted in the received packets count and are accounted for separately.   |
| <i>number</i> packets transmitted | <i>number</i> —Number of ping requests (probes) sent to a host.   |
| <i>number</i> packets received    | <i>number</i> —Number of ping responses received from a host.   |
| <i>percentage</i> packet loss     | <i>percentage</i> —Number of ping responses divided by the number of ping requests, specified as a percentage.  |
| time                              | For Layer 2 circuits only, the number of milliseconds required for the ping packet to reach the destination. This value is approximate, because the packet has to reach the Routing Engine. |

If the device does not receive ping responses from the destination host (the output shows a packet loss of 100 percent), one of the following explanations might apply:

- The host is not operational.
- There are network connectivity problems between the device and the host.
- The host might be configured to ignore echo requests.
- The host might be configured with a firewall filter that blocks echo requests or echo responses.
- The size of the echo request packet exceeds the MTU of a host along the path.
- The outbound node at the remote endpoint is not configured to handle MPLS packets.
- The remote endpoint's loopback address is not configured to 127.0.0.1.

## Pinging Layer 2 Circuits

Enter the **ping mpls l2circuit** command with the following syntax:

```
user@host> ping mpls l2circuit (interface interface-name | virtual-circuit neighbor
prefix-name virtual-circuit-id) <exp forwarding-class> <count number>
<source source-address> <detail>
```

Table 211 on page 1495 describes the **ping mpls l2circuit** command options.

**Table 211: CLI ping mpls l2circuit Command Options**

Option	Description
<b>l2circuit interface</b> <i>interface-name</i>	Sends ping requests out the specified interface configured for the Layer 2 circuit on the outbound PE device.
<b>l2circuit virtual-circuit</b> <b>neighbor</b> <i>prefix-name</i> <i>virtual-circuit-id</i>	Pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE device, testing the integrity of the Layer 2 circuit between the inbound and outbound PE devices.
<b>exp forwarding-class</b>	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
<b>countnumber</b>	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
<b>source source-address</b>	(Optional) Uses the source address that you specify, in the ping request packet.
<b>detail</b>	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls l2circuit** command, press Ctrl-C.

The following is sample output from a **ping mpls l2circuit** command:

```
user@host> ping mpls l2circuit interface fe-1/0/0.0
Request for seq 1, to interface 69, labels <100000, 100208>
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

#### Pinging Layer 2 VPNs

Enter the **ping mpls l2vpn** command with the following syntax:

```

user@host> ping mpls l2vpn interface interface-name | instance l2vpn-instance-name
local-site-id local-site-id-number remote-site-id remote-site-id-number
<bottom-label-ttl> <exp forwarding-class> <count number> <source source-address>
<detail>

```

Table 212 on page 1496 describes the **ping mpls l2vpn** command options.

Table 212: CLI ping mpls l2vpn Command Options

Option	Description
<b>l2vpn interface</b> <i>interface-name</i>	Sends ping requests out the specified interface configured for the Layer 2 VPN on the outbound (egress) PE device.
<b>l2vpn instance</b> <i>l2vpn-instance-name</i> <i>local-site-id</i> <i>local-site-id-number</i> <i>remote-site-id</i> <i>remote-site-id-number</i>	Pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound (ingress) and outbound PE devices.
<b>bottom-label-ttl</b>	(Optional) Displays the time-to-live (TTL) value for the bottom label in the MPLS label stack.
<b>exp forwarding-class</b>	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
<b>countnumber</b>	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
<b>source source-address</b>	(Optional) Uses the source address that you specify, in the ping request packet.
<b>detail</b>	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls l2vpn** command, press Ctrl-C.

The following is sample output from a **ping mpls l2vpn** command:

```

user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2 detail

Request for seq 1, to interface 68, labels <800001, 100176>
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 68, labels <800001, 100176>
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 68, labels <800001, 100176>
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 68, labels <800001, 100176>
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 68, labels <800001, 100176>
Reply for seq 5, return code: Egress-ok

--- 1ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

**Pinging Layer 3 VPNs**

Enter the **ping mpls l3vpn** command with the following syntax:

```
user@host> ping mpls l3vpn prefix prefix-name <l3vpn-name> <bottom-label-ttl>
<exp forwarding-class> <count number> <source source-address> <detail>
```

[Table 213 on page 1497](#) describes the **ping mpls l3vpn** command options.

**Table 213: CLI ping mpls l3vpn Command Options**

Option	Description
<b>l3vpn prefix <i>prefix-name</i></b>	Pings the remote host specified by the prefix to verify that the prefix is present in the PE device's VPN routing and forwarding (VRF) table. This option does not test the connectivity between a PE device and a CE device.
<b><i>l3vpn-name</i></b>	(Optional) Layer 3 VPN name.
<b>bottom-label-ttl</b>	(Optional) Displays the time-to-live (TTL) value for the bottom label in the MPLS label stack.
<b>exp forwarding-class</b>	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
<b>countnumber</b>	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
<b>source source-address</b>	(Optional) Uses the source address that you specify, in the ping request packet.
<b>detail</b>	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls l3vpn** command, press Ctrl-C.

The following is sample output from a **ping mpls l3vpn** command:

```
user@host> ping mpls l3vpn vpn1 prefix 10.255.245.122/32
!!!!!
--- 1ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

**Pinging RSVP-Signaled LSPs and LDP-Signaled LSPs**

Enter the **ping mpls** command with the following syntax:

```
user@host> ping mpls (ldp fec | lsp-end-point prefix-name | rsvp lsp-name)
<exp forwarding-class> <count number> <source source-address> <detail>
```

[Table 214 on page 1498](#) describes the **ping mpls** command options.

**Table 214: CLI ping mpls ldp and ping mpls lsp-end-point Command Options**

Option	Description
<b>ldp fec</b>	Pings an LDP-signaled LSP identified by the forwarding equivalence class (FEC) prefix and length.
<b>lsp-end-point prefix-name</b>	Pings an LSP endpoint using either an LDP FEC or a RSVP LSP endpoint address.
<b>rsvp lsp-name</b>	Pings an RSVP-signaled LSP identified by the specified LSP name.
<b>exp forwarding-class</b>	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
<b>countnumber</b>	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
<b>source source-address</b>	(Optional) Uses the source address that you specify, in the ping request packet.
<b>detail</b>	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls** command, press Ctrl-C.

The following is sample output from a **ping mpls** command:

```
user@host> ping mpls rsvp count 5

!!xxx
--- 1sping statistics ---
5 packets transmitted, 2 packets received, 60% packet loss
3 packets received with error status, not counted as received.
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

## Packet Capture

- [Displaying Packet Headers on page 1499](#)
- [Using the J-Web Packet Capture Tool on page 1503](#)
- [J-Web Packet Capture Results and Output Summary on page 1506](#)

### Displaying Packet Headers

Enter the **monitor traffic** command to display packet headers transmitted through network interfaces with the following syntax:

**NOTE:** Using the **monitor traffic** command can degrade system performance. We recommend that you use filtering options—such as **count** and **matching**—to minimize the impact to packet throughput on the system.

```
user@host> monitor traffic <absolute-sequence> <count number>
<interface interface-name> <layer2-headers> <matching "expression">
<no-domain-names> <no-promiscuous> <no-resolve> <no-timestamp> <print-ascii>
<print-hex> <size bytes> <brief | detail | extensive>
```

Table 215 on page 1499 describes the **monitor traffic** command options.

**Table 215: CLI monitor traffic Command Options**

Option	Description
<b>absolute-sequence</b>	(Optional) Displays the absolute TCP sequence numbers.
<b>count number</b>	(Optional) Displays the specified number of packet headers. Specify a value from 0 through 100,000. The command quits and exits to the command prompt after this number is reached.
<b>interface interface-name</b>	(Optional) Displays packet headers for traffic on the specified interface. If an interface is not specified, the lowest numbered interface is monitored.
<b>layer2-headers</b>	(Optional) Displays the link-layer packet header on each line.

Table 215: CLI monitor traffic Command Options (*continued*)

Option	Description
<b>matching "expression"</b>	(Optional) Displays packet headers that match an expression enclosed in quotation marks (" "). <a href="#">Table 216 on page 1501</a> through <a href="#">Table 218 on page 1503</a> list match conditions, logical operators, and arithmetic, binary, and relational operators you can use in the expression.
<b>no-domain-names</b>	(Optional) Suppresses the display of the domain name portion of the hostname.
<b>no-promiscuous</b>	(Optional) Specifies <i>not</i> to place the monitored interface in promiscuous mode.  In promiscuous mode, the interface reads every packet that reaches it. In nonpromiscuous mode, the interface reads only the packets addressed to it.
<b>no-resolve</b>	(Optional) Suppresses the display of hostnames.
<b>no-timestamp</b>	(Optional) Suppresses the display of packet header timestamps.
<b>print-ascii</b>	(Optional) Displays each packet header in ASCII format.
<b>print-hex</b>	(Optional) Displays each packet header, except link-layer headers, in hexadecimal format.
<b>size bytes</b>	(Optional) Displays the number of bytes for each packet that you specify. If a packet header exceeds this size, the displayed packet header is truncated. The default value is <b>96</b> .
<b>brief</b>	(Optional) Displays minimum packet header information. This is the default.
<b>detail</b>	(Optional) Displays packet header information in moderate detail. For some protocols, you must also use the <b>size</b> option to see detailed information.
<b>extensive</b>	(Optional) Displays the most extensive level of packet header information. For some protocols, you must also use the <b>size</b> option to see extensive information.

To quit the **monitor traffic** command and return to the command prompt, press Ctrl-C.

To limit the packet header information displayed by the **monitor traffic** command, include the **matching "expression"** option. An expression consists of one or more match conditions listed in [Table 216 on page 1501](#), enclosed in quotation marks (" "). You can combine match conditions by using the logical operators listed in [Table 217 on page 1502](#) (shown in order of highest to lowest precedence).

For example, to display TCP or UDP packet headers, enter:

```
user@host> monitor traffic matching "tcp || udp"
```

To compare the following types of expressions, use the relational operators listed in [Table 218 on page 1503](#) (listed from highest to lowest precedence):

- Arithmetic—Expressions that use the arithmetic operators listed in [Table 218 on page 1503](#).
- Binary—Expressions that use the binary operators listed in [Table 218 on page 1503](#).
- Packet data accessor—Expressions that use the following syntax:

```
protocol [byte-offset <size>]
```

Replace *protocol* with any protocol in [Table 216 on page 1501](#). Replace *byte-offset* with the byte offset, from the beginning of the packet header, to use for the comparison. The optional *size* parameter represents the number of bytes examined in the packet header—1, 2, or 4 bytes.

For example, the following command displays all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

**Table 216: CLI monitor traffic Match Conditions**

Match Condition	Description
<b>Entity Type</b>	
<b>host</b> [ <i>address</i>   <i>hostname</i> ]	Matches packet headers that contain the specified address or hostname. You can prepend any of the following protocol match conditions, followed by a space, to <b>host</b> : <b>arp</b> , <b>ip</b> , <b>rarp</b> , or any of the Directional match conditions.
<b>network address</b>	Matches packet headers with source or destination addresses containing the specified network address.
<b>network address mask</b> <i>mask</i>	Matches packet headers containing the specified network address and subnet mask.
<b>port</b> [ <i>port-number</i>   <i>port-name</i> ]	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.
<b>Directional</b>	
<b>destination</b>	Matches packet headers containing the specified destination. Directional match conditions can be prepended to any Entity Type match conditions, followed by a space.
<b>source</b>	Matches packet headers containing the specified source.
<b>source and destination</b>	Matches packet headers containing the specified source <i>and</i> destination.
<b>source or destination</b>	Matches packet headers containing the specified source <i>or</i> destination.
<b>Packet Length</b>	
<b>less bytes</b>	Matches packets with lengths less than or equal to the specified value, in bytes.
<b>greater bytes</b>	Matches packets with lengths greater than or equal to the specified value, in bytes.

Table 216: CLI monitor traffic Match Conditions (*continued*)

Match Condition	Description
<b>Protocol</b>	
<b>arp</b>	Matches all ARP packets.
<b>ether</b>	Matches all Ethernet frames.
<b>ether [broadcast   multicast]</b>	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>source</b> or <b>destination</b> .
<b>ether protocol [address   (\arp   \ip   \rarp)]</b>	Matches Ethernet frames with the specified address or protocol type. The arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded with a backslash (\) when used in the <b>ether protocol</b> match condition.
<b>icmp</b>	Matches all ICMP packets.
<b>ip</b>	Matches all IP packets.
<b>ip [broadcast   multicast]</b>	Matches broadcast or multicast IP packets.
<b>ip protocol [address   (\icmp   igmp   \tcp   \udp)]</b>	Matches IP packets with the specified address or protocol type. The arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded with a backslash (\) when used in the <b>ip protocol</b> match condition.
<b>isis</b>	Matches all IS-IS routing messages.
<b>rarp</b>	Matches all RARP packets.
<b>tcp</b>	Matches all TCP packets.
<b>udp</b>	Matches all UDP packets.

Table 217: CLI monitor traffic Logical Operators

Logical Operator	Description
<b>!</b>	Logical NOT. If the first condition does not match, the next condition is evaluated.
<b>&amp;&amp;</b>	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
<b>  </b>	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
<b>()</b>	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

Table 218: CLI monitor traffic Arithmetic, Binary, and Relational Operators

Operator	Description
<b>Arithmetic Operator</b>	
+	Addition operator.
–	Subtraction operator.
/	Division operator.
<b>Binary Operator</b>	
&	Bitwise AND.
*	Bitwise exclusive OR.
	Bitwise inclusive OR.
<b>Relational Operator</b>	
<=	A match occurs if the first expression is less than or equal to the second.
>=	A match occurs if the first expression is greater than or equal to the second.
<	A match occurs if the first expression is less than the second.
>	A match occurs if the first expression is greater than the second.
=	A match occurs if the first expression is equal to the second.
!=	A match occurs if the first expression is not equal to the second.

The following is sample output from the **monitor traffic** command:

```
user@host> monitor traffic count 4 matching "arp" detail
```

```
Listening on fe-0/0/0, capture size 96 bytes 15:04:16.276780 In arp who-has
193.1.1.1 tell host1.site2.net 15:04:16.376848 In arp who-has host2.site2.net
tell host1.site2.net 15:04:16.376887 In arp who-has 193.1.1.2 tell host1.site2.net
15:04:16.601923 In arp who-has 193.1.1.3 tell host1.site2.net
```

#### Related Documentation

- [Packet Capture Overview on page 1246](#)
- [Using the J-Web Packet Capture Tool on page 1503](#)
- [Changing Encapsulation on Interfaces with Packet Capture Configured on page 1293](#)
- [Example: Configuring Packet Capture on an Interface on page 1286](#)

#### Using the J-Web Packet Capture Tool

You can use the J-Web packet capture diagnostic tool when you need to quickly capture and analyze router control traffic on a device. Packet capture on the J-Web user interface

allows you to capture traffic destined for, or originating from, the Routing Engine. You can use the J-Web packet capture tool to compose expressions with various matching criteria to specify the packets that you want to capture. You can either choose to decode and view the captured packets in the J-Web user interface as they are captured, or save the captured packets to a file and analyze them offline using packet analyzers such as Ethereal. The J-Web packet capture tool does not capture transient traffic.

To capture transient traffic and entire IPv4 data packets for offline analysis, you must configure packet capture with the J-Web user interface or CLI configuration editor.

To use J-Web packet capture:

1. Select **Troubleshoot>Packet Capture**.
2. Enter information into the Packet Capture page (see [Table 219 on page 1504](#)). The sample configuration captures the next 10 TCP packets originating from the IP address **10.1.40.48** on port 23 and passing through the Gigabit Ethernet interface **ge-0/0/0**.
3. Save the captured packets to a file, or specify other advanced options by clicking the expand icon next to Advanced options.
4. Click **Start**.

The captured packet headers are decoded and appear in the Packet Capture display.

5. Do one of the following:
  - To stop capturing the packets and stay on the same page while the decoded packet headers are being displayed, click **Stop Capturing**.
  - To stop capturing packets and return to the Packet Capture page, click **OK**.

**Table 219: Packet Capture Field Summary**

Field	Function	Your Action
Interface	Specifies the interface on which the packets are captured.  If you select <b>default</b> , packets on the Ethernet management port 0 are captured.	Select an interface from the list—for example, <b>ge-0/0/0</b> .
Detail level	Specifies the extent of details to be displayed for the packet headers. <ul style="list-style-type: none"> <li>• Brief—Displays the minimum packet header information. This is the default.</li> <li>• Detail—Displays packet header information in moderate detail.</li> <li>• Extensive—Displays the maximum packet header information.</li> </ul>	Select <b>Detail</b> from the list.
Packets	Specifies the number of packets to be captured. Values range from 1 to <b>1000</b> . Default is <b>10</b> . Packet capture stops capturing packets after this number is reached.	Select the number of packets to be captured from the list—for example, <b>10</b> .

Table 219: Packet Capture Field Summary (*continued*)

Field	Function	Your Action
Addresses	<p>Specifies the addresses to be matched for capturing the packets using a combination of the following parameters:</p> <ul style="list-style-type: none"> <li>Direction—Matches the packet headers for IP address, hostname, or network address of the source, destination or both.</li> <li>Type—Specifies if packet headers are matched for host address or network address.</li> </ul> <p>You can add multiple entries to refine the match criteria for addresses.</p>	<p>Select address-matching criteria. For example:</p> <ol style="list-style-type: none"> <li>From the Direction list, select <b>source</b>.</li> <li>From the Type list, select <b>host</b>.</li> <li>In the Address box, type <b>10.1.40.48</b>.</li> <li>Click <b>Add</b>.</li> </ol>
Protocols	Matches the protocol for which packets are captured. You can choose to capture TCP, UDP, or ICMP packets or a combination of TCP, UDP, and ICMP packets.	Select a protocol from the list—for example, <b>tcp</b> .
Ports	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.	<p>Select a direction and a port. For example:</p> <ol style="list-style-type: none"> <li>From the Type list, select <b>src</b>.</li> <li>In the Port box, type <b>23</b>.</li> </ol>
<b>Advanced Options</b>		
Absolute TCP Sequence	Specifies that absolute TCP sequence numbers are to be displayed for the packet headers.	<ul style="list-style-type: none"> <li>Display absolute TCP sequence numbers in the packet headers by selecting this check box.</li> <li>Stop displaying absolute TCP sequence numbers in the packet headers by clearing this check box.</li> </ul>
Layer 2 Headers	Specifies that link-layer packet headers to display.	<ul style="list-style-type: none"> <li>Include link-layer packet headers while capturing packets, by selecting this check box.</li> <li>Exclude link-layer packet headers while capturing packets by clearing this check box.</li> </ul>
Non-Promiscuous	<p>Specifies not to place the interface in promiscuous mode, so that the interface reads only packets addressed to it.</p> <p>In promiscuous mode, the interface reads every packet that reaches it.</p>	<ul style="list-style-type: none"> <li>Read all packets that reach the interface by selecting this check box.</li> <li>Read only packets addressed to the interface by clearing this check box.</li> </ul>
Display Hex	Specifies that packet headers, except link-layer headers, are to be displayed in hexadecimal format.	<ul style="list-style-type: none"> <li>Display the packet headers in hexadecimal format by selecting this check box.</li> <li>Stop displaying the packet headers in hexadecimal format by clearing this check box.</li> </ul>
Display ASCII and Hex	Specifies that packet headers are to be displayed in hexadecimal and ASCII format.	<ul style="list-style-type: none"> <li>Display the packet headers in ASCII and hexadecimal formats by selecting this check box.</li> <li>Stop displaying the packet headers in ASCII and hexadecimal formats by clearing this check box.</li> </ul>

Table 219: Packet Capture Field Summary (*continued*)

Field	Function	Your Action
Header Expression	Specifies the match condition for the packets to capture.  The match conditions you specify for Addresses, Protocols, and Ports appear in expression format in this field.	Enter match conditions in expression format or modify the expression composed from the match conditions you specified for Addresses, Protocols, and Ports. If you change the match conditions specified for Addresses, Protocols, and Ports again, packet capture overwrites your changes with the new match conditions.
Packet Size	Specifies the number of bytes to be displayed for each packet. If a packet header exceeds this size, the display is truncated for the packet header. The default value is 96 bytes.	Type the number of bytes you want to capture for each packet header—for example, <b>256</b> .
Don't Resolve Addresses	Specifies that IP addresses are not to be resolved into hostnames in the packet headers displayed.	<ul style="list-style-type: none"> <li>Prevent packet capture from resolving IP addresses to hostnames by selecting this check box.</li> <li>Resolve IP addresses into hostnames by clearing this check box.</li> </ul>
No Timestamp	Suppresses the display of packet header timestamps.	<ul style="list-style-type: none"> <li>Stop displaying timestamps in the captured packet headers by selecting this check box.</li> <li>Display the timestamp in the captured packet headers by clearing this check box.</li> </ul>
Write Packet Capture File	Writes the captured packets to a file in PCAP format in <code>/var/tmp</code> . The files are named with the prefix <code>jweb-pcap</code> and the extension <code>.pcap</code> .  If you select this option, the decoded packet headers do not appear on the packet capture page.	<ul style="list-style-type: none"> <li>Save the captured packet headers to a file by selecting this check box.</li> <li>Decode and display the packet headers on the J-Web page by clearing this check box.</li> </ul>

### [J-Web Packet Capture Results and Output Summary](#)

[Table 220 on page 1507](#) summarizes the output in the packet capture display.

Table 220: J-Web Packet Capture Results and Output Summary

Field	Description
<i>timestamp</i>	Time when the packet was captured. The timestamp <b>00:45:40.823971</b> means 00 hours (12.00 a.m.), 45 minutes, and 40.823971 seconds.  <b>NOTE:</b> The time displayed is local time.
<i>direction</i>	Direction of the packet. Specifies whether the packet originated from the Routing Engine ( <b>Out</b> ), or was destined for the Routing Engine ( <b>In</b> ).
<i>protocol</i>	Protocol for the packet.  In the sample output, <b>IP</b> indicates the Layer 3 protocol.
<i>source address</i>	Hostname, if available, or IP address and the port number of the packet's origin. If the Don't Resolve Addresses check box is selected, only the IP address of the source displays.  <b>NOTE:</b> When a string is defined for the port, the packet capture output displays the string instead of the port number.
<i>destination address</i>	Hostname, if available, or IP address of the packet's destination with the port number. If the Don't Resolve Addresses check box is selected, only the IP address of the destination and the port appear.  <b>NOTE:</b> When a string is defined for the port, the packet capture output displays the string instead of the port number.
<i>protocol</i>	Protocol for the packet.  In the sample output, <b>TCP</b> indicates the Layer 4 protocol.
<i>data size</i>	Size of the packet (in bytes).

## RPM

- [Monitoring RPM Probes on page 1507](#)

### Monitoring RPM Probes

The RPM information includes the round-trip time, jitter, and standard deviation values for each configured RPM test on the device. To view these RPM properties, select **Troubleshoot>RPM>View RPM** in the J-Web user interface, or in configuration mode enter the **show** command:

```
[edit]
user@host# run show services rpm probe-results
```

In addition to the RPM statistics for each RPM test, the J-Web user interface displays the round-trip times and cumulative jitter graphically. [Figure 40 on page 633](#) shows sample graphs for an RPM test.

**Figure 55: Sample RPM Graphs**

In [Figure 40 on page 633](#), the round-trip time and jitter values are plotted as a function of the system time. Large spikes in round-trip time or jitter indicate a slower outbound (egress) or inbound (ingress) time for the probe sent at that particular time.

[Table 221 on page 1508](#) summarizes key output fields in RPM displays.

**Table 221: Summary of Key RPM Output Fields**

Field	Values	Additional Information
<b>Currently Running Tests</b>		
Graph		Click the <b>Graph</b> link to display the graph (if it is not already displayed) or to update the graph for a particular test.
Owner	Configured owner name of the RPM test.	—
Test Name	Configured name of the RPM test.	—

Table 221: Summary of Key RPM Output Fields (*continued*)

Field	Values	Additional Information
Probe Type	Type of RPM probe configured for the specified test: <ul style="list-style-type: none"> <li>• <b>http-get</b></li> <li>• <b>http-get-metadata</b></li> <li>• <b>icmp-ping</b></li> <li>• <b>icmp-ping-timestamp</b></li> <li>• <b>tcp-ping</b></li> <li>• <b>udp-ping</b></li> </ul>	–
Target Address	IP address or URL of the remote server that is being probed by the RPM test.	–
Source Address	Explicitly configured source address that is included in the probe packet headers.	If no source address is configured, the RPM probe packets use the outgoing interface as the source address, and the Source Address field is empty.
Minimum RTT	Shortest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test.	–
Maximum RTT	Longest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test.	–
Average RTT	Average round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test.	–
Standard Deviation RTT	Standard deviation of round-trip times from the Juniper Networks device to the remote server, as measured over the course of the test.	–
Probes Sent	Total number of probes sent over the course of the test.	–
Loss Percentage	Percentage of probes sent for which a response was not received.	–
<b>Round-Trip Time for a Probe</b>		
Samples	Total number of probes used for the data set.	The Juniper Networks device maintains records of the most recent 50 probes for each configured test. These 50 probes are used to generate RPM statistics for a particular test.
Earliest Sample	System time when the first probe in the sample was received.	–
Latest Sample	System time when the last probe in the sample was received.	–

Table 221: Summary of Key RPM Output Fields (*continued*)

Field	Values	Additional Information
Mean Value	Average round-trip time for the 50-probe sample.	–
Standard Deviation	Standard deviation of the round-trip times for the 50-probe sample.	–
Lowest Value	Shortest round-trip time from the device to the remote server, as measured over the 50-probe sample.	–
Time of Lowest Sample	System time when the lowest value in the 50-probe sample was received.	–
Highest Value	Longest round-trip time from the Juniper Networks device to the remote server, as measured over the 50-probe sample.	–
Time of Highest Sample	System time when the highest value in the 50-probe sample was received.	–
<b>Cumulative Jitter for a Probe</b>		
Samples	Total number of probes used for the data set.	The Juniper Networks device maintains records of the most recent 50 probes for each configured test. These 50 probes are used to generate RPM statistics for a particular test.
Earliest Sample	System time when the first probe in the sample was received.	–
Latest Sample	System time when the last probe in the sample was received.	–
Mean Value	Average jitter for the 50-probe sample.	–
Standard Deviation	Standard deviation of the jitter values for the 50-probe sample.	–
Lowest Value	Smallest jitter value, as measured over the 50-probe sample.	–
Time of Lowest Sample	System time when the lowest value in the 50-probe sample was received.	–
Highest Value	Highest jitter value, as measured over the 50-probe sample.	–
Time of Highest Sample	System time when the highest jitter value in the 50-probe sample was received.	–

## monitor list

<b>Syntax</b>	monitor list
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display the status of monitored log and trace files.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are those configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols protocol]</b> hierarchy levels.
<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">monitor start on page 1513</a></li> <li><a href="#">monitor stop on page 1515</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">monitor list on page 1512</a>
<b>Output Fields</b>	<a href="#">Table 222 on page 1512</a> describes the output fields for the <b>monitor list</b> command. Output fields are listed in the approximate order in which they appear.

**Table 222: monitor list Output Fields**

Field Name	Field Description
<b>monitor start</b>	Indicates the file is being monitored.
<b>"filename"</b>	Name of the file that is being monitored.
<b>Last changed</b>	Date and time at which the file was last modified.

## Sample Output

### monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

## monitor start

<b>Syntax</b>	<code>monitor start <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Start displaying the system log or trace file and additional entries being added to those files.
<b>Options</b>	<i>filename</i> —Specific log or trace file.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols protocol]</b> hierarchy levels.

**NOTE:** To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">monitor list on page 1512</a></li> <li>• <a href="#">monitor stop on page 1515</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">monitor start on page 1514</a>
<b>Output Fields</b>	<a href="#">Table 223 on page 1513</a> describes the output fields for the <b>monitor start</b> command. Output fields are listed in the approximate order in which they appear.

**Table 223: monitor start Output Fields**

Field Name	Field Description
<b>***<i>filename</i>***</b>	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
<b><i>Date and time</i></b>	Timestamp for the log entry.

## Sample Output

### monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from host.example.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

## monitor stop

---

<b>Syntax</b>	<code>monitor stop <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Stop displaying the system log or trace file.
<b>Options</b>	<i>filename</i> —Specific log or trace file.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are those configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols <i>protocol</i>]</b> hierarchy levels.
<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">monitor list on page 1512</a></li> <li>• <a href="#">monitor start on page 1513</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">monitor stop on page 1515</a>
<b>Output Fields</b>	This command produces no output.

## Sample Output

### monitor stop

```
user@host> monitor stop
```

## monitor traffic

**Syntax**    `monitor traffic`  
               `<brief | detail | extensive>`  
               `<absolute-sequence>`  
               `<count count>`  
               `<interface interface-name>`  
               `<layer2-headers>`  
               `<matching matching>`  
               `<no-domain-names>`  
               `<no-promiscuous>`  
               `<no-resolve>`  
               `<no-timestamp>`  
               `<print-ascii>`  
               `<print-hex>`  
               `<resolve-timeout>`  
               `<size size>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display packet headers or packets received and sent from the Routing Engine.

### NOTE:

- Using the `monitor-traffic` command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the `no-resolve` option.

**NOTE:** This command is not supported on the QFX3000 QFabric switch.

**Options**    `none`—(Optional) Display packet headers transmitted through `fxp0`. On a TX Matrix Plus router, display packet headers transmitted through `em0`.

`brief | detail | extensive`—(Optional) Display the specified level of output.

`absolute-sequence`—(Optional) Display absolute TCP sequence numbers.

`count count`—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The `monitor traffic` command quits automatically after displaying the number of packets specified.

**interface *interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

**layer2-headers**—(Optional) Display the link-level header on each line.

**matching *matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

**no-domain-names**—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **host.example.com**.

**no-promiscuous**—(Optional) Do not put the interface into promiscuous mode.

**no-resolve**—(Optional) Suppress reverse lookup of the IP addresses.

**no-timestamp**—(Optional) Suppress timestamps on displayed packets.

**print-ascii**—(Optional) Display each packet in ASCII format.

**print-hex**—(Optional) Display each packet, except the link-level header, in hexadecimal format.

**resolve-timeout *timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

**size *size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

**Additional Information** In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace ***expression*** with one or more of the match conditions listed in [Table 224 on page 1518](#).

Table 224: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	<b>host</b> [ <i>address</i>   <i>hostname</i> ]	Matches packets that contain the specified address or hostname.  The protocol match conditions <b>arp</b> , <b>ip</b> , or <b>rarp</b> , or any of the directional match conditions can be prepended to the <b>host</b> match condition.
	<b>net</b> <i>address</i>	Matches packets with source or destination addresses containing the specified network address.
	<b>net</b> <i>address mask mask</i>	Matches packets containing the specified network address and subnet mask.
	<b>port</b> ( <i>port-number</i>   <i>port-name</i> )	Matches packets containing the specified source or destination TCP or UDP port number or port name.  In place of the numeric port address, you can specify a text synonym, such as <b>bgp</b> (179), <b>dhcp</b> (67), or <b>domain</b> (53) (the port numbers are also listed).
Directional	<b>dst</b>	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	<b>src</b>	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	<b>src and dst</b>	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	<b>src or dst</b>	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	<b>less</b> <i>value</i>	Matches packets shorter than or equal to the specified value, in bytes.
	<b>greater</b> <i>value</i>	Matches packets longer than or equal to the specified value, in bytes.

Table 224: Match Conditions for the monitor traffic Command (*continued*)

Match Type	Condition	Description
Protocol	<b>amt</b>	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	<b>arp</b>	Matches all ARP packets.
	<b>ether</b>	Matches all Ethernet packets.
	<b>ether (broadcast   multicast)</b>	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>src</b> and <b>dst</b> .
	<b>ether protocol (address   (arp   ip   rarp))</b>	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The <b>ether protocol</b> arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ether protocol</b> match condition.
	<b>icmp</b>	Matches all ICMP packets.
	<b>ip</b>	Matches all IP packets.
	<b>ip (broadcast   multicast)</b>	Matches broadcast or multicast IP packets.
	<b>ip protocol (address   (icmp   igmp   tcp   udp))</b>	Matches packets with the specified address or protocol type. The <b>ip protocol</b> arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ip protocol</b> match condition.
	<b>isis</b>	Matches all IS-IS routing messages.
	<b>rarp</b>	Matches all RARP packets.
	<b>tcp</b>	Matches all TCP datagrams.
	<b>udp</b>	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in [Table 225 on page 1519](#).

Table 225: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
<b>!</b>	Logical NOT. If the first condition does not match, the next condition is evaluated.

Table 225: Logical Operators for the monitor traffic Command (*continued*)

Logical Operator (Highest to Lowest Precedence)	Description
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
( )	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 226 on page 1521](#).

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 224 on page 1518](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as `ae0`) only shows inbound traffic data, the command does not show VLAN tag information in the output.

**Table 226: Arithmetic and Relational Operators for the monitor traffic Command**

Arithmetic or Relational Operator	Description
<b>Arithmetic Operator</b>	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
	Bitwise inclusive OR.
<b>Relational Operator (Highest to Lowest Precedence)</b>	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

**Required Privilege Level** trace  
maintenance

## mtrace monitor

<b>Syntax</b>	mtrace monitor
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Listen passively for IP multicast responses. To exit the <b>mtrace monitor</b> command, type Ctrl+c.
<b>Options</b>	<b>none</b> —Trace the master instance.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">mtrace monitor on page 1527</a>
<b>Output Fields</b>	<a href="#">Table 227 on page 1526</a> describes the output fields for the <b>mtrace monitor</b> command. Output fields are listed in the approximate order in which they appear.

**Table 227: mtrace monitor Output Fields**

Field Name	Field Description
<b>Mtrace query at</b>	Date and time of the query.
<b>by</b>	Address of the host issuing the query.
<b>resp to</b>	Response destination.
<b>qid</b>	Query ID number.
<b>packet from...to</b>	IP address of the query source and default group destination.
<b>from...to</b>	IP address of the multicast source and the response address.
<b>via group</b>	IP address of the group to trace.
<b>mxhop</b>	Maximum hop setting.

## Sample Output

### mtrace monitor

```
user@host> mtrace monitor
Mtrace query at Oct 22 13:36:14 by 192.1.3.2, resp to 224.0.1.32, qid 74a5b8
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:17 by 192.1.3.2, resp to 224.0.1.32, qid 1d07ba
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:20 by 192.1.3.2, resp to same, qid 2fea1d
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:30 by 192.1.3.2, resp to same, qid 7c88ad
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)
```

## ping mpls l2vpn

<b>Syntax</b>	<p>ping mpls l2vpn (instance <i>instance-name</i> local-site-id <i>local-site-id-number</i> remote-site-id <i>remote-site-id-number</i>   interface <i>interface-name</i>)</p> <p>&lt;bottom-label-ttl&gt;</p> <p>&lt;count <i>count</i>&gt;</p> <p>&lt;destination <i>address</i>&gt;</p> <p>&lt;detail&gt;</p> <p>&lt;exp <i>forwarding-class</i>&gt;</p> <p>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</p> <p>reply-mode (application-level-control-channel   ip-udp   no-reply)</p> <p>&lt;size <i>bytes</i>&gt;</p> <p>&lt;source <i>source-address</i>&gt;</p> <p>&lt;sweep&gt;</p>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The <b>size</b> and <b>sweep</b> options were introduced in Junos OS Release 9.6.</p> <p>The <b>reply-mode</b> option and its suboptions are introduced in Junos OS Release 10.4R1.</p>
<b>Description</b>	<p>Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a <b>ping mpls l2vpn</b> command.</p>
<b>Options</b>	<p><b>bottom-label-ttl</b>—(Optional) Display the time-to-live value for the bottom label in the label stack.</p> <p><b>count <i>count</i></b>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p><b>destination <i>address</i></b>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp <i>forwarding-class</i></b>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>instance <i>instance-name</i> local-site-id <i>local-site-id-number</i> remote-site-id <i>remote-site-id-number</i></b>—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.</p> <p><b>interface <i>interface-name</i></b>—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>reply-mode</b>—(Optional) Reply mode for the ping request. This option has the following suboptions:</p> <p><b>application-level-control-channel</b>—Reply using an application level control channel.</p>

**ip-udp**—Reply using an IPv4 or IPv6 UDP packet.

**no-reply**—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

<b>Additional Information</b>	<p>You must configure MPLS at the <b>[edit protocols mpls]</b> hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.</p> <p>In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.</p>
<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<p><a href="#">ping mpls l2vpn instance on page 1529</a>  <a href="#">ping mpls l2vpn instance detail on page 1530</a>  <a href="#">ping mpls l2vpn interface &lt;interface-name&gt; reply-mode on page 1530</a></p>
<b>Output Fields</b>	<p>When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.</p>

## Sample Output

### ping mpls l2vpn instance

```

user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

```

### ping mpls l2vpn instance detail

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2 detail
Request for seq 1, to interface 68, labels <800001, 100176>
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 68, labels <800001, 100176>
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 68, labels <800001, 100176>
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 68, labels <800001, 100176>
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 68, labels <800001, 100176>
Reply for seq 5, return code: Egress-ok

--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls l2vpn interface <interface-name> reply-mode

```
user@host> ping mpls l2vpn interface lt-1/2/0.21 reply-mode ip-udp
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## ping mpls l2circuit

**Syntax** ping mpls l2circuit (interface *interface-name* | virtual-circuit *virtual-circuit-id* neighbor *address*)  
 <count *count*>  
 <destination *address*>  
 <detail>  
 <exp *forwarding-class*>  
 <logical-system (all | *logical-system-name*)>  
 reply-mode (application-level-control-channel | ip-udp | no-reply)  
 <size *bytes*>  
 <source *source-address*>  
 <sweep>  
 <v1>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
 The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

**Description** Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command.

**Options** **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination** *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface** *interface-name*—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**reply-mode**—(Optional) Reply mode for the ping request. This option has the following suboptions:

**application-level-control-channel**—Reply using an application level control channel.

**ip-udp**—Reply using an IPv4 or IPv6 UDP packet.

**no-reply**—Do not reply to the ping request.

**NOTE:** The reply-mode option and its suboptions application-level-control-channel, ip-udp, and no-reply are also available in Junos OS Release 10.2R4 and 10.3R2.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**vl**—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

**virtual-circuit virtual-circuit-id neighbor address**—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls l2circuit interface on page 1532](#)  
[ping mpls l2circuit virtual-circuit detail on page 1532](#)  
[ping mpls l2circuit interface <interface-name> reply-mode on page 1533](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

### ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
```

Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms

**ping mpls l2circuit interface <interface-name> reply-mode**

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## ping mpls l3vpn

<b>Syntax</b>	<pre>ping mpls l3vpn prefix <i>prefix-name</i> &lt;<i>l3vpn-name</i>&gt; &lt;bottom-label-ttl&gt; &lt;count <i>count</i>&gt; &lt;destination <i>address</i>&gt; &lt;detail&gt; &lt;exp <i>forwarding-class</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;size <i>bytes</i>&gt; &lt;source <i>source-address</i>&gt; &lt;sweep&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The <b>size</b> and <b>sweep</b> options were introduced in Junos OS Release 9.6.</p>
<b>Description</b>	<p>Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a <b>ping mpls l3vpn</b> command.</p>
<b>Options</b>	<p><b>bottom-label-ttl</b>—(Optional) Display the time-to-live value for the bottom label in the label stack.</p> <p><b>count <i>count</i></b>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through <b>1,000,000</b>. The default value is <b>5</b>.</p> <p><b>destination <i>address</i></b>—(Optional) Specify an address other than the default (<b>127.0.0.1/32</b>) for the ping echo requests. The address can be anything within the <b>127/8</b> subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp <i>forwarding-class</i></b>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b><i>l3vpn-name</i></b>—(Optional) Layer 3 VPN name.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>prefix <i>prefix-name</i></b>—Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.</p> <p><b>size <i>bytes</i></b>—(Optional) Size of the label-switched path (LSP) ping request packet (<b>96</b> through <b>65468</b> bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.</p>

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

## ping mpls ldp

<b>Syntax</b>	<pre>ping mpls ldp fec &lt;count count&gt; &lt;destination address&gt; &lt;detail&gt; &lt;exp forwarding-class&gt; &lt;instance routing-instance-name&gt; &lt;logical-system (all   logical-system-name)&gt; &lt;p2mp root-addr ip-address lsp-id identifier&gt; &lt;size bytes&gt; &lt;source source-address&gt; &lt;sweep&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>size</b> and <b>sweep</b> options introduced in Junos OS Release 9.6.</p> <p><b>instance</b> option introduced in Junos OS Release 10.0.</p> <p><b>p2mp</b>, <b>root-address</b>, and <b>lsp-id</b> options introduced in Junos OS Release 11.2.</p>
<b>Description</b>	<p>Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a <b>ping mpls</b> command.</p>
<b>Options</b>	<p><b>count</b> <i>count</i>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through <b>1,000,000</b>. The default value is <b>5</b>.</p> <p><b>destination</b> <i>address</i>—(Optional) Specify an address other than the default (<b>127.0.0.1/32</b>) for the ping echo requests. The address can be anything within the <b>127/8</b> subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp forwarding-class</b>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>fec</b>—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.</p> <p><b>instance</b> <i>routing-instance-name</i>—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.</p> <p><b>logical-system</b> (<b>all</b>   <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>p2mp root-addr</b> <i>ip-address</i> <b>lsp-id</b> <i>identifier</i>—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.</p> <p><b>size</b> <i>bytes</i>—(Optional) Size of the LSP ping request packet (<b>88</b> through <b>65468</b> bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.</p>

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. .

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls ldp fec count on page 1537](#)

## ping mpls rsvp

**Syntax** ping mpls rsvp  
 <lsp-name>  
 <count count>  
 <destination address>  
 <detail>  
 <dynamic-bypass>  
 <egress egress-address>  
 <exp forwarding-class>  
 <interface interface-name>  
 <logical-system (all | logical-system-name)>  
 <manual-bypass>  
 <multipoint>  
 <size bytes>  
 <source source-address>  
 <standby standby-path-name>  
 <sweep>

**Release Information** Command introduced before Junos OS Release 7.4.  
 The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.  
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
 The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.

**Description** Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a **ping mpls** command.

**Options** **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**NOTE:** When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

**dynamic-bypass**—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

**egress *egress-address***—(Optional) Only the specified egress router or switch responds to the ping request.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface**—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

***lsp-name***—Ping an RSVP-signaled LSP using an LSP name.

**manual-bypass**—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

**multipoint**—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

**size *bytes***—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

**standby *standby-path-name***—(Optional) Name of the standby path.

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

## request pppoe connect

---

<b>Syntax</b>	request pppoe connect
<b>Release Information</b>	Statement supported on SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 is introduced in Release 11.2 and 11.4 of Junos OS.
<b>Description</b>	Connect all sessions that are down.
<b>Options</b>	<b>pppoe interface name</b> — (Optional) Connect to a specified session.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request pppoe connect on page 1546</a>
<b>Output Fields</b>	When you enter this command, this command returns no output.

### Sample Output

request pppoe connect

```
user@host> request pppoe connect
```

## request pppoe disconnect

---

<b>Syntax</b>	request pppoe disconnect
<b>Release Information</b>	Statement supported on SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 is introduced in Release 11.2 and 11.4 of Junos OS.
<b>Description</b>	Connect all sessions that are down.
<b>Options</b>	<b>session id</b> — (Optional) Disconnect the session for which the session ID is specified. <b>pppoe interface name</b> — (Optional) Disconnect the session for a specific pppoe interface name.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request pppoe disconnect on page 1547</a>
<b>Output Fields</b>	When you enter this command, this command returns no output.

### Sample Output

#### request pppoe disconnect

```
user@host> request pppoe disconnect
```

## show configuration

---

**Syntax**    `show configuration`  
              `<statement-path>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Display the configuration that currently is running on the router or switch, which is the last committed configuration.

**Options**    **none**—Display the entire configuration.

**statement-path**—(Optional) Display one of the following hierarchies in a configuration. (Each **statement-path** option has additional suboptions not described here. See the appropriate feature guide or EX Series switch documentation for more information.)

- **access**—Network access configuration.
- **access-profile**—Access profile configuration.
- **accounting-options**—Accounting data configuration.
- **applications**—Applications defined by protocol characteristics.
- **apply-groups**—Groups from which configuration data is inherited.
- **chassis**—Chassis configuration.
- **chassis network-services**—Current running mode.
- **class-of-service**—Class-of-service configuration.
- **diameter**—Diameter base protocol layer configuration.
- **ethernet-switching-options**—(EX Series switch only) Ethernet switching configuration.
- **event-options**—Event processing configuration.
- **firewall**—Firewall configuration.
- **forwarding-options**—Options that control packet sampling.
- **groups**—Configuration groups.
- **interfaces**—Interface configuration.
- **jsrc**—JSRC partition configuration.
- **jsrc-partition**—JSRC partition configuration.
- **logical-systems**—Logical system configuration.
- **poe**—(EX Series switch only) Power over Ethernet configuration.
- **policy-options**—Routing policy option configuration.
- **protocols**—Routing protocol configuration.

- **routing-instances**—Routing instance configuration.
- **routing-options**—Protocol-independent routing option configuration.
- **security**—Security configuration.
- **services**—Service PIC applications configuration.
- **snmp**—Simple Network Management Protocol configuration.
- **system**—System parameters configuration.
- **virtual-chassis**—(EX Series switch only) Virtual Chassis configuration.
- **vlan**—(EX Series switch only) VLAN configuration.

**Additional Information** The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text **ACCESS-DENIED** is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the **secret** permission bit is not set for your user account, the text **SECRET-DATA** is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

}
```

## show chassis alarms

<b>Syntax</b>	show chassis alarms
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for SRX Series devices.
<b>Description</b>	Display information about the conditions that have been configured to trigger alarms.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	<p>You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the device in a manner that we do not recommend.</p> <p>On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.</p> <p>In Junos OS Release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.</p>

```

## show interfaces (SRX Series)

**Syntax** show interfaces {  
     <brief | detail | extensive | terse>  
     controller *interface-name*  
     descriptions *interface-name*  
     destination-class (all | *destination-class-name logical-interface-name*)  
     diagnostics optics *interface-name*  
     far-end-interval *interface-fpc/pic/port*  
     filters *interface-name*  
     flow-statistics *interface-name*  
     interval *interface-name*  
     load-balancing (detail | *interface-name*)  
     mc-ae id *identifier* unit *number* revertive-info  
     media *interface-name*  
     policers *interface-name*  
     queue both-ingress-egress egress forwarding-class *forwarding-class* ingress l2-statistics  
     redundancy (detail | *interface-name*)  
     routing brief detail summary *interface-name*  
     routing-instance (all | *instance-name*)  
     snmp-index *snmp-index*  
     source-class (all | *destination-class-name logical-interface-name*)  
     statistics *interface-name*  
     switch-port *switch-port number*  
     transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all |  
         *interface-name*)  
 }

**Release Information** Command modified in Junos OS Release 9.5.

**Description** Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

On SRX Series appliance, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- Options**
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
    - **at-pim/0/port**—ATM-over-ADSL or ATM-over-SHDSL interface.
    - **ce1-pim/0/ port**—Channelized E1 interface.
    - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
    - **ct1-pim/0/port**—Channelized T1 interface.
    - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
    - **e1-pim/0/port**—E1 interface.
    - **e3-pim/0/port**—E3 interface.
    - **fe-pim/0/port**—Fast Ethernet interface.

- **ge-pim/0/port**—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **controller**—(Optional) Show controller information.
- **descriptions**—(Optional) Display interface description strings.
- **destination-class**—(Optional) Show statistics for destination class.
- **diagnostics**—(Optional) Show interface diagnostics information.
- **far-end-interval**—(Optional) Show far end interval statistics.
- **filters**—(Optional) Show interface filters information.
- **flow-statistics**—(Optional) Show security flow counters and errors.
- **interval**—(Optional) Show interval statistics.
- **load-balancing**—(Optional) Show load-balancing status.
- **mc-ae**—(Optional) Show MC-AE configured interface information.
- **media**—(Optional) Display media information.
- **policers**—(Optional) Show interface policers information.
- **queue**—(Optional) Show queue statistics for this interface.
- **redundancy**—(Optional) Show redundancy status.
- **routing**—(Optional) Show routing status.
- **routing-instance**—(Optional) Name of routing instance.
- **snmp-index**—(Optional) SNMP index of interface.
- **source-class**—(Optional) Show statistics for source class.
- **statistics**—(Optional) Display statistics and detailed output.
- **switch-port**—(Optional) Front end port number (0..15).
- **transport**—(Optional) Show interface transport information.

**Output Fields** [Table 229 on page 1555](#) lists the output fields for the **show interfaces** command. Output fields are listed in the approximate order in which they appear.

**Table 229: show interfaces Output Fields**

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface.	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
Source filtering	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
Flow control	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Current address	Configured MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Active alarms and Active defects</b>	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>	<b>detail extensive none</b>
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Output errors</b>	<p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Ingress queues</b>	Total number of ingress queues supported on the specified interface.	<b>extensive</b>
<b>Queue counters and queue number</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>detail extensive</b>

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul>	extensive

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Filter statistics</b>	<p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul>	<b>extensive</b>
<b>Autonegotiation information</b>	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> </ul>	<b>extensive</b>
<b>Packet Forwarding Engine configuration</b>	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> </ul>	<b>extensive</b>

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>CoS information</b>	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>	<b>extensive</b>
<b>Interface transmit statistics</b>	Status of the <b>interface-transmit-statistics</b> configuration: Enabled or Disabled.	<b>detail extensive</b>
<b>Queue counters (Egress)</b>	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>detail extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP interface index number for the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface.	All levels
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>Traffic statistics</b>	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>	<b>detail extensive</b>

Table 229: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Local statistics</b>	Number and rate of bytes and packets destined to the device.	<b>extensive</b>
<b>Transit statistics</b>	Number and rate of bytes and packets transiting the switch.  <b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	<b>extensive</b>
<b>Security</b>	Security zones that interface belongs to.	<b>extensive</b>
<b>Flow Input statistics</b>	Statistics on packets received by flow module.	<b>extensive</b>
<b>Flow Output statistics</b>	Statistics on packets sent by flow module.	<b>extensive</b>
<b>Flow error statistics (Packets dropped due to)</b>	Statistics on errors in the flow module.	<b>extensive</b>
<b>Protocol</b>	Protocol family.	<b>detail extensive none</b>
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route Table</b>	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	<b>detail extensive none</b>
<b>Flags</b>	Information about protocol family flags. .	<b>detail extensive</b>
<b>Addresses, Flags</b>	Information about the address flags..	<b>detail extensive none</b>
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive none</b>
<b>Local</b>	IP address of the logical interface.	<b>detail extensive none</b>
<b>Broadcast</b>	Broadcast address of the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

## show poe interface (View)

<b>Syntax</b>	show poe interface <ge-fpc/pic/port>
<b>Release Information</b>	Command introduced in Release 9.5 of Junos OS.
<b>Description</b>	Display the status of Power over Ethernet (PoE) ports.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>none</b>—Display the status of all PoE ports on the SRX Series device.</li> <li><b>ge-fpc/pic/port</b>— (Optional) Display the status of a specific PoE port on the SRX Series device.</li> </ul>
<b>Required Privilege Level</b>	View
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Ethernet Interfaces Feature Guide for Security Devices</i></li> <li><i>Example: Configuring PoE on All Interfaces</i></li> </ul>
<b>Output Fields</b>	Table 230 on page 1582 lists the output fields for the <b>show poe interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 230: show poe interface Output Fields**

Field name	Field Description
PoE Interface	Specifies the interface name.
Admin Status	Specifies whether PoE capabilities are enabled or disabled.
Oper status	Specifies the operational status of the port.
Max-power	Specifies the maximum power configured on the port.
Priority	Specifies whether the port is high priority or low priority.
Power-consumption	Specifies how much power is being used by the port.
Class	Indicates the class of the powered device as defined by the IEEE 802 AF standard.

## Sample Output

### show poe interface

```
user@host>show poe interface
```

```

## show pppoe interfaces

<b>Syntax</b>	show pppoe interfaces <brief   detail   extensive> <pp0.logical>
<b>Release Information</b>	For SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 devices, statement introduced in Release 9.5 of Junos OS.
<b>Description</b>	Display session-specific information about PPPoE interfaces.
<b>Options</b>	<p><b>none</b>—Display interface information for all PPPoE interfaces.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>extensive</b>—(Optional) Display information about the number of packets sent and received and the number of timeouts during a PPPoE session.</p> <p><b>pp0.logical</b>—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16385. The logical unit number for dynamic interfaces can be a value from 1073741824 through the maximum number of logical interfaces supported on your SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 devices.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Junos OS Interfaces Library for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show pppoe interfaces on page 1588</a> <a href="#">show pppoe interfaces brief on page 1588</a> <a href="#">show pppoe interfaces detail on page 1588</a> <a href="#">show pppoe interfaces extensive on page 1588</a>
<b>Output Fields</b>	Table 232 on page 1586 lists the output fields for the <b>show pppoe interfaces</b> command. Output fields are listed in the approximate order in which they appear.

Table 232: show pppoe interfaces Output Fields

Field Name	Field Description
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.
<b>State</b>	State of the logical interface: <b>up</b> or <b>down</b> .
<b>Session ID</b>	Session ID.
<b>Service name</b>	Type of service required (can be used to indicate an ISP name, a class, or quality of service).
<b>Configured AC name</b>	Configured access concentrator name.

Table 232: show pppoe interfaces Output Fields (*continued*)

Field Name	Field Description
<b>Session AC name</b>	Name of the access concentrator.
<b>Remote MAC address or Remote MAC</b>	MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.
<b>Auto-reconnect timeout</b>	Timeout value for reconnecting after a PPPoE session is terminated (in seconds).
<b>Idle timeout</b>	Length of time (in seconds) that a connection can be idle before disconnecting.
<b>Session uptime</b>	Length of time the session has been up, in <i>hh:mm:ss</i> .
<b>Underlying interface</b>	Interface on which PPPoE is running.
<b>Packet Type</b>	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul>
<b>Timeout</b>	<p>Timeouts that occur during the PPPoE session:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—No PADI packets received within the timeout period.</li> <li>• <b>PADO</b>—No PADO packets received within the timeout period. (This value is always zero and is not supported.)</li> <li>• <b>PADR</b>—No PADR packets received within the timeout period.</li> </ul>
<b>Receive Error Counters</b>	<p>Error counters received during the PPPoE session:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—No PADI error counters received during the session.</li> <li>• <b>PADO</b>—No PADO error counters received during the session.</li> <li>• <b>PADR</b>—No PADR error counters received during the session.</li> <li>• <b>PADS</b>—No PADS error counters received during the session.</li> </ul>

## show pppoe statistics

<b>Syntax</b>	<code>show pppoe statistics</code> <code>&lt;logical-interface-name&gt;</code>
<b>Release Information</b>	For SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 devices, statement introduced in Release 9.5 of Junos OS.
<b>Description</b>	Display statistics information about PPPoE interfaces.
<b>Options</b>	<b>none</b> —Display PPPoE statistics for all interfaces.  <i>logical-interface-name</i> —(Optional) Name of an underlying PPPoE logical interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show pppoe interfaces on page 1586</a></li> <li><i>Junos OS Interfaces Library for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show pppoe statistics on page 1591</a>
<b>Output Fields</b>	<a href="#">Table 233 on page 1590</a> lists the output fields for the <b>show pppoe statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 233: show pppoe statistics Output Fields**

Field Name	Field Description
Active PPPoE sessions	Total number of active PPPoE sessions.
Packet Type	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li><b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li><b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li><b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li><b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li><b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li><b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li><b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li><b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li><b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li><b>Unknown packets</b>—Unrecognized packets.</li> </ul>

Table 233: show pppoe statistics Output Fields (*continued*)

Field Name	Field Description
<b>Timeout</b>	Timeouts that occur during the PPPoE session: <ul style="list-style-type: none"> <li>• <b>PADI</b>—No PADI packets received within the timeout period.</li> <li>• <b>PADO</b>—No PADO packets received within the timeout period. (This value is always zero and is not supported.)</li> <li>• <b>PADR</b>—No PADR packets received within the timeout period.</li> </ul>
<b>Receive Error Counters</b>	Error counters received during the PPPoE session: <ul style="list-style-type: none"> <li>• <b>PADI</b>—No PADI error counters received during the session.</li> <li>• <b>PADO</b>—No PADO error counters received during the session.</li> <li>• <b>PADR</b>—No PADR error counters received during the session.</li> <li>• <b>PADS</b>—No PADS error counters received during the session.</li> </ul>

## Sample Output

## show security alarms

---

**Syntax**    show security alarms  
              <detail>  
              <alarm-id *id-number*>  
              <alarm-type [ *types* ]>  
              <newer-than YYYY-MM-DD.HH:MM:SS>  
              <older-than YYYY-MM-DD.HH:MM:SS>  
              <process *process*>  
              <severity *severity*>

**Release Information**    Command introduced in Junos OS Release 11.2.

**Description**    Display the alarms that are active on the device. Run this command when the CLI prompt indicates that a security alarm has been raised, as shown here:

```
[1 SECURITY ALARM] user@host#
```

**Options**    **none**—Display all active alarms.

**detail**—(Optional) Display detailed output.

**alarm-id *id-number***—(Optional) Display the specified alarm.

**alarm-type [ *types* ]**—(Optional) Display the specified alarm type or a set of types.

You can specify one or more of the following alarm types:

- authentication
- cryptographic-self-test
- decryption-failures
- encryption-failures
- ike-phase1-failures
- ike-phase2-failures
- key-generation-self-test
- non-cryptographic-self-test
- policy
- replay-attacks

**newer-than YYYY-MM-DD.HH:MM:SS**—(Optional) Display active alarms that were raised after the specified date and time.

**older-than YYYY-MM-DD.HH:MM:SS**—(Optional) Display active alarms that were raised before the specified date and time.

**process *process***—(Optional) Display active alarms that were raised by the specified system process.

**severity severity**—(Optional) Display active alarms of the specified severity.

You can specify the following severity levels:

- **alert**
- **crit**
- **debug**
- **emerg**
- **err**
- **info**
- **notice**
- **warning**

**Required Privilege Level** security—To view this statement in the configuration.

**Related Documentation**

- *clear security alarms*
- *Security Policies Feature Guide for Security Devices*

**List of Sample Output**

[show security alarms detail on page 1594](#)  
[show security alarms alarm-id on page 1594](#)  
[show security alarms alarm-type authentication on page 1594](#)  
[show security alarms newer-than <time> on page 1595](#)  
[show security alarms older-than <time> on page 1595](#)  
[show security alarms process <process> on page 1595](#)  
[show security alarms severity <severity> on page 1595](#)

**Output Fields** [Table 234 on page 1593](#) lists the output fields for the **show security alarms** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used.

**Table 234: show security alarms**

Field Name	Field Description	Level of Output
<b>ID</b>	Identification number of the alarm.	All levels
<b>Alarm time</b>	Date and time the alarm was raised..	All levels
<b>Message</b>	Information about the alarm, including the alarm type, username, IP address, and port number.	All levels
<b>Process</b>	System process (For example, login or sshd) and process identification number associated with the alarm.	<b>detail</b>

Table 234: show security alarms (*continued*)

Field Name	Field Description	Level of Output
Severity	Severity level of the alarm.	detail

## Sample Output

### show security alarms

## show security monitoring fpc fpc-number

<b>Syntax</b>	<b>show security monitoring fpc <i>fpc-number</i></b> <b>&lt;node ( <i>node-id</i>   all   local   primary )&gt;</b>
<b>Release Information</b>	Command introduced in Release 9.2 of Junos OS.
<b>Description</b>	Display security monitoring information about the FPC slot.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b><i>fpc-number</i></b>—Display security monitoring information for the specified FPC slot. It can be in the range from 0 to 11.</li> <li>• <b>node</b>—(Optional) For chassis cluster configurations, display security monitoring information for the specified FPC on a specific node (device) in the cluster. <ul style="list-style-type: none"> <li>• <b><i>node-id</i></b>—Identification number of the node. It can be 0 or 1.</li> <li>• <b>all</b>—Display information about all nodes.</li> <li>• <b>local</b>—Display information about the local node.</li> <li>• <b>primary</b>—Display information about the primary node.</li> </ul> </li> </ul>
<b>Additional Information</b>	For complete list of slot numbering, physical port, and logical interface numbering for SRX Series devices in chassis cluster, see <i>Chassis Cluster Feature Guide for Security Devices</i> .
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show security monitoring fpc 0 on page 1599</a> <a href="#">show security monitoring fpc 1 on page 1599</a> <a href="#">show security monitoring fpc 8 on page 1599</a>
<b>Output Fields</b>	<a href="#">Table 235 on page 1598</a> lists the output fields for the <b>show security monitoring fpc <i>fpc-number</i></b> command. Output fields are listed in the approximate order in which they appear.

**Table 235: show security monitoring fpc fpc-number Output Fields**

Field Name	Field Description
FPC	Slot number in which the FPC is installed.
PIC	Slot number in which the PIC is installed.
CPU Utilization (%)	Total percentage of CPU being used by the PIC's processors.
Memory Utilization (%)	Percentage of heap space (dynamic memory) being used by the PIC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).
Current flow session	The current number of flow sessions. When SRX Series devices operate in packet mode, flow sessions will not be created and this field will remain zero.

Table 235: show security monitoring fpc fpc-number Output Fields (*continued*)

Field Name	Field Description
Max flow session	The maximum number of flow sessions allowed. This number will differ from one device to another.
SPU current cp session	The current number of cp sessions for the SPU (on SRX3400, SRX3600, SRX5600, and SRX5800 devices only).
SPU max cp session	The maximum number of cp sessions allowed for the SPU (on SRX3400, SRX3600, SRX5600, and SRX5800 devices only).

## Sample Output

### show security monitoring fpc 0

```

user@host> show security monitoring fpc 0
FPC 0

```

## show security monitoring performance session

**Syntax** show security monitoring performance session

<fpc slot-number>

<pic slot-number>

**Release Information** Command introduced in Release of 10.2 of Junos OS.

**Description** Display the current session (total number of sessions at that time) for the last 60 seconds.

- Options**
- **fpc slot-number** — Display information about the FPC slot. Use this option to filter the output based on the slot number.
  - **pic slot-number** — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

**NOTE:** The `fpc slot-number` and `pic slot-number` options are not available on SRX100, SRX210, SRX240, and SRX650 devices.

**Required Privilege Level** View

## show security monitoring performance spu

**Syntax** show security monitoring performance spu

<fpc slot-number>

<pic slot-number>

**Release Information** Command introduced in Release 10.2 of Junos OS.

**Description** Display the services processing unit (SPU) statistics for all FPC slots over the last 60 seconds.

- Options**
- **fpc slot-number** — Display information about the FPC slot. Use this option to filter the output based on the slot number.
  - **pic slot-number** — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

**NOTE:** The `fpc slot-number` and `pic slot-number` options are not available on SRX100, SRX210, SRX240, and SRX650 devices.

**Required Privilege Level** View

## show services rpm probe-results (View)

<b>Syntax</b>	show services rpm probe-results <owner <i>owner</i> > <test <i>name</i> >
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Display the results of the most recent real-time performance monitoring (RPM) probes.
<b>Options</b>	<p><b>none</b>—Display all results of the most recent RPM probes.</p> <p><b>owner <i>owner</i></b>—(Optional) Display information for the specified probe owner.</p> <p><b>test <i>name</i></b>—(Optional) Display information for the specified test.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>IP Monitoring Feature Guide for Security Devices</i></li> <li><i>show services ip-monitoring status</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show services rpm probe-results on page 1606</a>
<b>Output Fields</b>	<a href="#">Table 236 on page 1603</a> lists the output fields for the <b>show services rpm probe-results</b> command. Output fields are listed in the approximate order in which they appear.

**Table 236: show services rpm probe-results Output Fields**

Field Name	Field Description
<b>Owner</b>	Owner name. When you configure the probe owner statement at the <b>[edit services rpm]</b> hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is <b>Rpm-Bgp-Owner</b> .
<b>Test</b>	Name of a test representing a collection of probes. When you configure the test test-name statement at the <b>[edit services rpm probe owner]</b> hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is <b>Rpm-BGP-Test-<i>n</i></b> , where <i>n</i> is a cumulative number.
<b>Target address</b>	Destination address used for the probes.
<b>Source address</b>	Source address used for the probes.
<b>Probe type</b>	Protocol configured on the receiving probe server: <b>http-get</b> , <b>http-metadata-get</b> , <b>icmp-ping</b> , <b>icmp-ping-timestamp</b> , <b>tcp-ping</b> , <b>udp-ping</b> , or <b>udp-ping-timestamp</b> .
<b>Test size</b>	Number of probes within a test.

Table 236: show services rpm probe-results Output Fields (*continued*)

Field Name	Field Description
<b>Routing Instance Name</b>	<p>(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured:</p> <ul style="list-style-type: none"> <li>When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash ( / ) is used to separate the two entities. For example, if the routing instance called <b>R1</b> is configured within the logical system called <b>LS</b>, the name in the output field is <b>LS/R1</b>.</li> <li>When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance.</li> <li>When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by <b>default</b>. A slash ( / ) is used to separate the two entities. For example, <b>LS/default</b>.</li> </ul>
<b>Probe results</b>	<p>Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement:</p> <ul style="list-style-type: none"> <li><b>Response received</b>—Timestamp when the probe result was determined.</li> <li><b>Client and server hardware timestamps</b>—If timestamps are configured, an entry appears at this point.</li> <li><b>Rtt</b>—Average ping round-trip time (RTT), in microseconds.</li> <li><b>Egress jitter</b>—Egress jitter, in microseconds.</li> <li><b>Ingress jitter</b>—Ingress jitter, in microseconds.</li> <li><b>Round trip jitter</b>—Round-trip jitter, in microseconds.</li> <li><b>Egress interarrival jitter</b>—Egress interarrival jitter, in microseconds.</li> <li><b>Ingress interarrival jitter</b>—Ingress interarrival jitter, in microseconds.</li> <li><b>Round trip interarrival jitter</b>—Round-trip interarrival jitter, in microseconds.</li> </ul>
<b>Results over current test</b>	<p>Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes.</p> <ul style="list-style-type: none"> <li><b>Probes sent</b>—Number of probes sent within the current test.</li> <li><b>Probes received</b>—Number of probe responses received within the current test.</li> <li><b>Loss percentage</b>—Percentage of lost probes for the current test.</li> <li><b>Measurement</b>—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type <b>icmp-ping-timestamp</b>, the egress delay and ingress delay.</li> </ul> <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> <li><b>Samples</b>—Number of probes.</li> <li><b>Minimum</b>—Minimum RTT, ingress delay, or egress delay measured over the course of the current test.</li> <li><b>Maximum</b>—Maximum RTT, ingress delay, or egress delay measured over the course of the current test.</li> <li><b>Average</b>—Average RTT, ingress delay, or egress delay measured over the course of the current test.</li> <li><b>Peak to peak</b>—Peak-to-peak difference, in microseconds.</li> <li><b>Stddev</b>—Standard deviation, in microseconds.</li> <li><b>Sum</b>—Statistical sum.</li> </ul>

Table 236: show services rpm probe-results Output Fields (*continued*)

Field Name	Field Description
<b>Results over last test</b>	<p>Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed</p> <ul style="list-style-type: none"> <li>• <b>Probes sent</b>—Number of probes sent for the most recently completed test.</li> <li>• <b>Probes received</b>—Number of probe responses received for the most recently completed test.</li> <li>• <b>Loss percentage</b>—Percentage of lost probes for the most recently completed test.</li> <li>• <b>Test completed</b>—Time the most recent test was completed.</li> <li>• <b>Measurement</b>—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type <b>icmp-ping-timestamp</b>, the egress delay and ingress delay.</li> </ul> <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> <li>• <b>Samples</b>—Number of probes.</li> <li>• <b>Minimum</b>—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test.</li> <li>• <b>Maximum</b>—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test.</li> <li>• <b>Average</b>—Average RTT, ingress delay, or egress delay measured for the most recently completed test.</li> <li>• <b>Peak to peak</b>—Peak-to-peak difference, in microseconds.</li> <li>• <b>Stddev</b>—Standard deviation, in microseconds.</li> <li>• <b>Sum</b>—Statistical sum.</li> </ul>
<b>Results over all tests</b>	<p>Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test.</p> <ul style="list-style-type: none"> <li>• <b>Probes sent</b>—Number of probes sent in all tests.</li> <li>• <b>Probes received</b>—Number of probe responses received in all tests.</li> <li>• <b>Loss percentage</b>—Percentage of lost probes in all tests.</li> <li>• <b>Measurement</b>—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types <b>icmp-ping-timestamp</b> and <b>udp-ping-timestamp</b>, the egress delay and ingress delay.</li> </ul> <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> <li>• <b>Samples</b>—Number of probes.</li> <li>• <b>Minimum</b>—Minimum RTT, ingress delay, or egress delay measured over the course of the current test.</li> <li>• <b>Maximum</b>—Maximum RTT, ingress delay, or egress delay measured over the course of the current test.</li> <li>• <b>Average</b>—Average RTT, ingress delay, or egress delay measured over the course of the current test.</li> <li>• <b>Peak to peak</b>—Peak-to-peak difference, in microseconds.</li> <li>• <b>Stddev</b>—Standard deviation, in microseconds.</li> <li>• <b>Sum</b>—Statistical sum.</li> </ul>

### show services rpm probe-results

```
user@host> show services rpm probe-results
```

```
Owner: probe_a, Test: a1
Target address: 200.1.1.2, Probe type: icmp-ping
Destination interface name: ge-0/0/6.0
Test size: 10 probes
Probe results:
  Response received, Sat Jul 30 11:52:21 2011, No hardware timestamps
  Rtt: 1897 usec
Results over current test:
  Probes sent: 8, Probes received: 8, Loss percentage: 0
  Measurement: Round trip time
    Samples: 8, Minimum: 1897 usec, Maximum: 7205 usec, Average: 2848 usec,
    Peak to peak: 5308 usec, Stddev: 1715 usec, Sum: 22783 usec
Results over last test:
  Probes sent: 10, Probes received: 10, Loss percentage: 0
  Test completed on Sat Jul 30 11:52:01 2011
  Measurement: Round trip time
    Samples: 10, Minimum: 1907 usec, Maximum: 8201 usec, Average: 3111 usec,
    Peak to peak: 6294 usec, Stddev: 2306 usec, Sum: 31106 usec
Results over all tests:
  Probes sent: 598, Probes received: 327, Loss percentage: 45
  Measurement: Round trip time
    Samples: 327, Minimum: 1878 usec, Maximum: 133729 usec,
    Average: 3304 usec, Peak to peak: 131851 usec, Stddev: 7561 usec,
    Sum: 1080434 usec
```

## show system alarms

---

<b>Syntax</b>	show system alarms
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for SRX Series devices.
<b>Description</b>	Display active system alarms.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	System alarms are preset. They include a <b>configuration</b> alarm that appears when no rescue configuration alarm is set and a <b>license</b> alarm that appears when a software feature is configured but no valid license is configured for the feature.
<b>Required Privilege Level</b>	admin
<b>List of Sample Output</b>	<a href="#">show system alarms on page 1607</a>

### Sample Output

#### show system alarms

```

user@host> show system alarms
5 alarms currently active
Alarm time      Class  Description
2012-05-29 16:47:18 UTC Major  /var partition usage crossed critical threshold
2012-05-29 16:47:18 UTC Minor  /var partition usage crossed high threshold
2012-05-29 16:47:18 UTC Major  /root partition usage crossed critical threshold
2012-05-29 16:47:18 UTC Minor  /root partition usage crossed high threshold
2012-05-29 16:47:18 UTC Minor  Rescue configuration is not set

```

**Release Information**   Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               **mpls** option introduced in Junos OS Release 9.2.  
                               **propagate-ttl** option introduced in Junos OS Release 12.1.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**   Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

**Options**   **host**—IP address or name of remote host.

**as-number-lookup**—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

**bypass-routing**—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached

network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

**clns**—(Optional) Trace the route belonging to Connectionless Network Service (CLNS).

**gateway address**—(Optional) Address of a router or switch through which the route transits.

**inet | inet6**—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

**interface interface-name**—(Optional) Name of the interface over which to send packets.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**monitor host**—(Optional) Display real-time monitoring information for the specified host.

**monitor host**—(Optional) Perform this operation to display real-time monitoring information.

**monitor host**—(Optional) Perform this operation to display real-time monitoring information.

**mpls (ldp FEC address | rsvp label-switched-path name)**—(Optional).

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**propagate-ttl**—(Optional) On the PE router, use this option to view locally-generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

**NOTE:** Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

**routing-instance routing-instance-name**—(Optional) Name of the routing instance for the traceroute attempt.

**source source-address**—(Optional) Source address of the outgoing traceroute packets.

**tos value**—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

**ttl value**—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

**wait seconds**—(Optional) Maximum time to wait for a response to the traceroute request.

**Required Privilege Level** network

**Output Fields** [Table 237 on page 1610](#) describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

**Table 237: traceroute Output Fields**

Field Name	Field Description
<b>traceroute to</b>	IP address of the receiver.
<b>hops max</b>	Maximum number of hops allowed.
<b>byte packets</b>	Size of packets being sent.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
<b>Round trip time</b>	Average round-trip time, in milliseconds (ms).

## Sample Output

### traceroute

## Recovering the Root Password for J Series Devices

If you forget the root password for the device, you can use the password recovery procedure to reset the root password.

**NOTE:** You need console access to recover the root password.

To recover the root password for a J Series device:

1. Power off the device by pressing the power button on the front panel.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45 to DB-9 serial port adapter supplied with the device (see [Figure 56 on page 1612](#)).
4. Plug the RJ-45 to DB-9 serial port adapter into the serial port on the management device (see [Figure 56 on page 1612](#)).
5. Connect the other end of the Ethernet rollover cable to the console port on the device (see [Figure 56 on page 1612](#)).

**Figure 56: Connecting to the Console Port on the J Series Device**

6. Turn on the power to the management device.
7. Connect a management device, such as a PC or laptop computer, to the console port on the device.
8. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
9. Configure the port settings as follows:

- Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
10. Power on the device by pressing the power button on the front panel. Verify that the **POWER** LED on the front panel turns green.

The device's boot sequence on your management device appears on the terminal emulation screen.

11. Press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```

12. Enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

13. Enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or
RETURN for /bin/sh: recovery
```

14. Enter configuration mode in the CLI.

15. Set the root password.

```
user@host# set system root-authentication plain-text-password
```

16. Enter the new root password.

```
New password: juniper1
Retype new password:
```

17. At the second prompt, reenter the new root password.

18. If you are finished configuring the network, commit the configuration.

```
root@host# commit
commit complete
```

19. Exit from configuration mode.

20. Exit from operational mode.

21. At the prompt, enter **y** to reboot the router.

```
Reboot the system? [y/n] y
```

## Recovering the Root Password for SRX Series Devices

---

If you forget the root password for an SRX Series device, you can use the password recovery procedure to reset the root password. This procedure also involves disabling the watchdog functionality to allow the system to properly boot into single-user mode (KB article 17565).

**NOTE:** You need console access to recover the root password

---

To recover the root password for an SRX Series device:

1. Power on the device by pressing the power button on the front panel. Verify that the **POWER** LED on the front panel turns green.

The device's boot sequence on your management device appears on the terminal emulation screen.

2. When the autoboot completes, press the Spacebar a few times to access the bootstrap loader prompt.
3. In operational mode, disable the watchdog functionality and enter **boot -s** to start up the system in single-user mode.

```
loader>boot -s
```

The SRX Series device will start up in single-user mode.

4. Enter **recovery** to start the root password recovery procedure.

```
System watchdog timer disabled.
```

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```

5. Enter configuration mode in the CLI.
6. Set the root password.

```
[edit]
```

```
user@host# set system root-authentication plain-text-password
```

7. Enter the new root password.

```
New password: juniper1
```

```
Retype new password:
```

8. At the second prompt, reenter the new root password.
9. If you are finished configuring the network, commit the configuration.

```
root@host# commit
```

```
commit complete
```

10. Exit from configuration mode.
11. Exit from operational mode.
12. Enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

The start up messages display on the screen.

13. Once again, press the Spacebar a few times to access the bootstrap loader prompt.

14. In operational mode, enable the watchdog functionality and enter **boot** to start up the system.

```
loader>watchdog enable
loader>boot
```

15. The SRX Series device starts up again and prompts you to enter a user name and password. Enter the newly configured password:

```
Wed Jul 12 14:20:21 UTC 2011
Deviceabc (ttyu0)
login: root
Password: juniper1
```

### Troubleshooting Access Manager Client-Side Problems

**Problem**    **Description:** Users are having problems connecting to the remote access server using Access Manager.

**Solution**    Use the following tools to troubleshoot client-side issues:

- Client-side logs—To view client-side logs, open Access Manager and choose **Save logs and diagnostics** from the File menu. Select a location on your computer to save the zipped log files and click **Save**.
- Detailed logs—To create more detailed client-side logs, open Access Manager and choose **Enable Detailed Logging** from the File menu.
- Firewall connection information—To view connection information for a given firewall, open Access Manager, right-click to select the firewall, and choose **Status**.

### Troubleshooting DNS Name Resolution in Logical System Security Policies

**Problem**    **Description:** The address of a hostname in an address book entry that is used in a security policy may fail to resolve correctly.

**Cause**    Normally, address book entries that contain dynamic hostnames refresh automatically for SRX Series devices. The TTL field associated with a DNS entry indicates the time after which the entry should be refreshed in the policy cache. Once the TTL value expires, the SRX Series device automatically refreshes the DNS entry for an address book entry.

However, if the SRX Series device is unable to obtain a response from the DNS server (for example, the DNS request or response packet is lost in the network or the DNS server cannot send a response), the address of a hostname in an address book entry may fail to resolve correctly. This can cause traffic to drop as no security policy or session match is found.

**Solution**    The master administrator can use the **show security dns-cache** command to display DNS cache information on the SRX Series device. If the DNS cache information needs to be refreshed, the master administrator can use the **clear security dns-cache** command.

**NOTE:** These commands are only available to the master administrator on devices that are configured for logical systems. This command is not available in user logical systems or on devices that are not configured for logical systems.

### Troubleshooting the Link Services Interface

To solve configuration problems on a link services interface:

- [Determine Which CoS Components Are Applied to the Constituent Links on page 1617](#)
- [Determine What Causes Jitter and Latency on the Multilink Bundle on page 1618](#)
- [Determine If LFI and Load Balancing Are Working Correctly on page 1618](#)
- [Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device on page 1625](#)

***Determine Which CoS Components Are Applied to the Constituent Links***

**Problem** **Description:** You are configuring a multilink bundle, but you also have traffic without MLPPP encapsulation passing through constituent links of the multilink bundle. Do you apply all CoS components to the constituent links, or is applying them to the multilink bundle enough?

**Solution** You can apply a scheduler map to the multilink bundle and its constituent links. Although you can apply several CoS components with the scheduler map, configure only the ones that are required. We recommend that you keep the configuration on the constituent links simple to avoid unnecessary delay in transmission.

Table 238 on page 1617 shows the CoS components to be applied on a multilink bundle and its constituent links.

**Table 238: CoS Components Applied on Multilink Bundles and Constituent Links**

Cos Component	Multilink Bundle	Constituent Links	Explanation
Classifier	Yes	No	CoS classification takes place on the incoming side of the interface, not on the transmitting side, so no classifiers are needed on constituent links.
Forwarding class	Yes	No	Forwarding class is associated with a queue, and the queue is applied to the interface by a scheduler map. The queue assignment is predetermined on the constituent links. All packets from Q2 of the multilink bundle are assigned to Q2 of the constituent link, and packets from all the other queues are queued to Q0 of the constituent link.
Scheduler map	Yes	Yes	<p>Apply scheduler maps on the multilink bundle and the constituent link as follows:</p> <ul style="list-style-type: none"> <li>• Transmit rate—Make sure that the relative order of the transmit rate configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle.</li> <li>• Scheduler priority—Make sure that the relative order of the scheduler priority configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle.</li> <li>• Buffer size—Because all non-LFI packets from the multilink bundle transit on Q0 of the constituent links, make sure that the buffer size on Q0 of the constituent links is large enough.</li> <li>• RED drop profile—Configure a RED drop profile on the multilink bundle only. Configuring the RED drop profile on the constituent links applies a back pressure mechanism that changes the buffer size and introduces variation. Because this behavior might cause fragment drops on the constituent links, make sure to leave the RED drop profile at the default settings on the constituent links.</li> </ul>

Table 238: CoS Components Applied on Multilink Bundles and Constituent Links (*continued*)

Cos Component	Multilink Bundle	Constituent Links	Explanation
Shaping rate for a per-unit scheduler or an interface-level scheduler	No	Yes	Because per-unit scheduling is applied only at the end point, apply this shaping rate to the constituent links only. Any configuration applied earlier is overwritten by the constituent link configuration.
Transmit-rate exact or queue-level shaping	Yes	No	The interface-level shaping applied on the constituent links overrides any shaping on the queue. Thus apply transmit-rate exact shaping on the multilink bundle only.
Rewrite rules	Yes	No	Rewrite bits are copied from the packet into the fragments automatically during fragmentation. Thus what you configure on the multilink bundle is carried on the fragments to the constituent links.
Virtual channel group	Yes	No	Virtual channel groups are identified through firewall filter rules that are applied on packets only before the multilink bundle. Thus you do not need to apply the virtual channel group configuration to the constituent links.

***Determine What Causes Jitter and Latency on the Multilink Bundle***

**Problem**    **Description:** To test jitter and latency, you send three streams of IP packets. All packets have the same IP precedence settings. After configuring LFI and CRTP, the latency increased even over a noncongested link. How can you reduce jitter and latency?

**Solution**    To reduce jitter and latency, do the following:

1. Make sure that you have configured a shaping rate on each constituent link.
2. Make sure that you have not configured a shaping rate on the link services interface.
3. Make sure that the configured shaping rate value is equal to the physical interface bandwidth. See *Example: Configuring Interface Shaping Rates*.
4. If shaping rates are configured correctly, and jitter still persists, contact the Juniper Networks Technical Assistance Center (JTAC).

***Determine If LFI and Load Balancing Are Working Correctly***

**Problem**    **Description:** In this case, you have a single network that supports multiple services. The network transmits data and delay-sensitive voice traffic. After configuring MLPPP and LFI, make sure that voice packets are transmitted across the network with very little delay and jitter. How can you find out if voice packets are being treated as LFI packets and load balancing is performed correctly?

**Solution**    When LFI is enabled, data (non-LFI) packets are encapsulated with an MLPPP header and fragmented to packets of a specified size. The delay-sensitive, voice (LFI) packets

are PPP-encapsulated and interleaved between data packet fragments. Queuing and load balancing are performed differently for LFI and non-LFI packets.

To verify that LFI is performed correctly, determine that packets are fragmented and encapsulated as configured. After you know whether a packet is treated as an LFI packet or a non-LFI packet, you can confirm whether the load balancing is performed correctly.

**Solution Scenario**—Suppose two Juniper Networks devices, R0 and R1, are connected by a multilink bundle **lsq-0/0/0.0** that aggregates two serial links, **se-1/0/0** and **se-1/0/1**. On R0 and R1, MLPPP and LFI are enabled on the link services interface and the fragmentation threshold is set to 128 bytes.

In this example, we used a packet generator to generate voice and data streams. You can use the packet capture feature to capture and analyze the packets on the incoming interface.

The following two data streams were sent on the multilink bundle:

- 100 data packets of 200 bytes (larger than the fragmentation threshold)
- 500 data packets of 60 bytes (smaller than the fragmentation threshold)

The following two voice streams were sent on the multilink bundle:

- 100 voice packets of 200 bytes from source port 100
- 300 voice packets of 200 bytes from source port 200

To confirm that LFI and load balancing are performed correctly:

**NOTE:** Only the significant portions of command output are displayed and described in this example. For more information, see *Verifying the Link Services Interface*.

1. Verify packet fragmentation. From operational mode, enter the **show interfaces lsq-0/0/0** command to check that large packets are fragmented correctly.

```
user@R0#> show interfaces lsq-0/0/0
Physical interface: lsq-0/0/0, Enabled, Physical link is Up
Interface index: 136, SNMP ifIndex: 29
Link-level type: LinkService, MTU: 1504
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps
Last flapped   : 2006-08-01 10:45:13 PDT (2w0d 06:06 ago)
Input rate      : 0 bps (0 pps)
Output rate     : 0 bps (0 pps)

Logical interface lsq-0/0/0.0 (Index 69) (SNMP ifIndex 42)
Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: Multilink-PPP
Bandwidth: 16mbps
Statistics
Bundle:
  Fragments:
    Input :      0      0      0      0
    Output:    1100      0    118800    0
  Packets:
    Input :      0      0      0      0
    Output:    1000      0    112000    0
...
Protocol inet, MTU: 1500
Flags: None
Addresses, Flags: Is-Preferred Is-Primary
Destination: 9.9.9/24, Local: 9.9.9.10
```

**Meaning**—The output shows a summary of packets transiting the device on the multilink bundle. Verify the following information on the multilink bundle:

- The total number of transiting packets = 1000
- The total number of transiting fragments=1100
- The number of data packets that were fragmented =100

The total number of packets sent (600 + 400) on the multilink bundle match the number of transiting packets (1000), indicating that no packets were dropped.

The number of transiting fragments exceeds the number of transiting packets by 100, indicating that 100 large data packets were correctly fragmented.

**Corrective Action**—If the packets are not fragmented correctly, check your fragmentation threshold configuration. Packets smaller than the specified fragmentation threshold are not fragmented. See *Example: Configuring Link Fragmentation and Interleaving*.

2. Verify packet encapsulation. To find out whether a packet is treated as an LFI or non-LFI packet, determine its encapsulation type. LFI packets are PPP encapsulated, and non-LFI packets are encapsulated with both PPP and MLPPP. PPP and MLPPP encapsulations have different overheads resulting in different-sized packets. You can compare packet sizes to determine the encapsulation type.

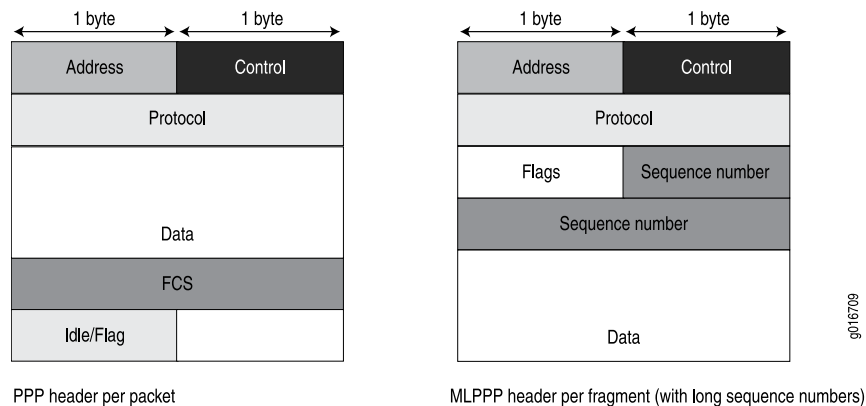

A small unfragmented data packet contains a PPP header and a single MLPPP header. In a large fragmented data packet, the first fragment contains a PPP header and an MLPPP header, but the consecutive fragments contain only an MLPPP header.

PPP and MLPPP encapsulations add the following number of bytes to a packet:

- PPP encapsulation adds 7 bytes:  
4 bytes of header+2 bytes of frame check sequence (FCS)+1 byte that is idle or contains a flag
- MLPPP encapsulation adds between 6 and 8 bytes:  
4 bytes of PPP header+2 to 4 bytes of multilink header

Figure 57 on page 1621 shows the overhead added to PPP and MLPPP headers.

**Figure 57: PPP and MLPPP Headers**

For CRTP packets, the encapsulation overhead and packet size are even smaller than for an LFI packet. For more information, see *Example: Configuring the Compressed Real-Time Transport Protocol*.

Table 239 on page 1621 shows the encapsulation overhead for a data packet and a voice packet of 70 bytes each. After encapsulation, the size of the data packet is larger than the size of the voice packet.

**Table 239: PPP and MLPPP Encapsulation Overhead**

Packet Type	Encapsulation	Initial Packet Size	Encapsulation Overhead	Packet Size after Encapsulation
Voice packet (LFI)	PPP	70 bytes	4 + 2 + 1 = 7 bytes	77 bytes
Data fragment (non-LFI) with short sequence	MLPPP	70 bytes	4 + 2 + 1 + 4 + 2 = 13 bytes	83 bytes

Table 239: PPP and MLPPP Encapsulation Overhead (*continued*)

Packet Type	Encapsulation	Initial Packet Size	Encapsulation Overhead	Packet Size after Encapsulation
Data fragment (non-LFI) with long sequence	MLPPP	70 bytes	4 + 2 + 1 + 4 + 4 = 15 bytes	85 bytes

From operational mode, enter the **show interfaces queue** command to display the size of transmitted packet on each queue. Divide the number of bytes transmitted by the number of packets to obtain the size of the packets and determine the encapsulation type.

3. Verify load balancing. From operational mode, enter the **show interfaces queue** command on the multilink bundle and its constituent links to confirm whether load balancing is performed accordingly on the packets.

```

user@R0> show interfaces queue lsq-0/0/0

```

**Meaning**—The output from these commands shows the packets transmitted and queued on each queue of the link services interface and its constituent links.

[Table 240 on page 1624](#) shows a summary of these values. (Because the number of transmitted packets equaled the number of queued packets on all the links, this table shows only the queued packets.)

**Table 240: Number of Packets Transmitted on a Queue**

Packets Queued	Bundle lsq-0/0/0.0	Constituent Link se-1/0/0	Constituent Link se-1/0/1	Explanation
Packets on Q0	600	350	350	The total number of packets transiting the constituent links (350+350 = 700) exceeded the number of packets queued (600) on the multilink bundle.
Packets on Q2	400	100	300	The total number of packets transiting the constituent links equaled the number of packets on the bundle.
Packets on Q3	0	19	18	The packets transiting Q3 of the constituent links are for keepalive messages exchanged between constituent links. Thus no packets were counted on Q3 of the bundle.

On the multilink bundle, verify the following:

- The number of packets queued matches the number transmitted. If the numbers match, no packets were dropped. If more packets were queued than were transmitted, packets were dropped because the buffer was too small. The buffer size on the constituent links controls congestion at the output stage. To correct this problem, increase the buffer size on the constituent links. For more information, see *Example: Configuring Scheduler Maps*.
- The number of packets transiting Q0 (600) matches the number of large and small data packets received (100+500) on the multilink bundle. If the numbers match, all data packets correctly transited Q0.
- The number of packets transiting Q2 on the multilink bundle (400) matches the number of voice packets received on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

On the constituent links, verify the following:

- The total number of packets transiting Q0 (350+350) matches the number of data packets and data fragments (500+200). If the numbers match, all the data packets after fragmentation correctly transited Q0 of the constituent links.

Packets transited both constituent links, indicating that load balancing was correctly performed on non-LFI packets.

- The total number of packets transiting Q2 (300+100) on constituent links matches the number of voice packets received (400) on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

LFI packets from source port **100** transited **se-1/0/0**, and LFI packets from source port **200** transited **se-1/0/1**. Thus all LFI (Q2) packets were hashed based on the source port and correctly transited both constituent links.

**Corrective Action**—If the packets transited only one link, take the following steps to resolve the problem:

- a. Determine whether the physical link is **up** (operational) or **down** (unavailable). An unavailable link indicates a problem with the PIM, interface port, or physical connection (link-layer errors). If the link is operational, move to the next step.
  - b. Verify that the classifiers are correctly defined for non-LFI packets. Make sure that non-LFI packets are not configured to be queued to Q2. All packets queued to Q2 are treated as LFI packets.
  - c. Verify that at least one of the following values is different in the LFI packets: source address, destination address, IP protocol, source port, or destination port. If the same values are configured for all LFI packets, the packets are all hashed to the same flow and transit the same link.
4. Use the results to verify load balancing.

#### ***Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device***

**Problem Description:** You are configuring a permanent virtual circuit (PVC) between T1, E1, T3, or E3 interfaces on a Juniper Networks device and a third-party device, and packets are being dropped and ping fails.

**Solution** If the third-party device does not have the same FRF.12 support as the Juniper Networks device or supports FRF.12 in a different way, the Juniper Networks device interface on the PVC might discard a fragmented packet containing FRF.12 headers and count it as a "Policed Discard."

As a workaround, configure multilink bundles on both peers, and configure fragmentation thresholds on the multilink bundles.

---

### **Troubleshooting Security Policies**

- [Synchronizing Policies Between Routing Engine and Packet Forwarding Engine on page 1625](#)
- [Checking a Security Policy Commit Failure on page 1626](#)
- [Verifying a Security Policy Commit on page 1626](#)
- [Debugging Policy Lookup on page 1627](#)

#### ***Synchronizing Policies Between Routing Engine and Packet Forwarding Engine***

**Problem Description:** Security policies are stored in both the Routing Engine and the Packet Forwarding Engine. After you modify a policy, you commit the configuration on the Routing Engine, and it is synchronized to the Packet Forwarding Engine.

**Environment:** The policies in the Routing Engine and Packet Forwarding Engine must be in sync for the configuration to be committed. However, under certain circumstances, policies in the Routing Engine and the Packet Forwarding Engine might be out of sync, which causes the commit to fail.

**Symptoms:** The following error message appears if you attempt to commit a configuration when the policies in the Routing Engine and Packet Forwarding Engine are out of sync:  
**Policy is out of sync between RE and PFE <SPU-name(s)> Please resync before commit.**

**Solution** Synchronize the policies as follows:

- Reboot the device (standalone)
- Reboot the devices (chassis cluster)

#### ***Checking a Security Policy Commit Failure***

**Problem Description:** Most policy configuration failures occur during a commit or runtime. Commit failures are reported directly on the CLI when you execute the CLI command **commit-check** in configuration mode. These errors are configuration errors, and you cannot commit the configuration without fixing these errors.

**Solution** To fix these errors, do the following:

1. Review your configuration data.
2. Open the file `/var/log/nsd_chk_only`. This file is overwritten each time you perform a commit check and contains detailed failure information.

#### ***Verifying a Security Policy Commit***

**Problem Description:** Upon performing a policy configuration commit, if you notice that the system behavior is incorrect, use the following steps to troubleshoot this problem:

**Solution**

1. Operational **show** Commands—Execute the operational commands for security policies and verify that the information shown in the output is consistent with what you expected. If not, the configuration needs to be changed appropriately.
2. Traceoptions—Set the **traceoptions** command in your policy configuration. The flags under this hierarchy can be selected as per user analysis of the **show** command output. If you cannot determine what flag to use, the flag option **all** can be used to capture all trace logs.

```
user@host# set security policies traceoptions <flag all>
```

You can also configure an optional filename to capture the logs.

```
user@host# set security policies traceoptions <filename>
```

If you specified a filename in the trace options, you can look in the `/var/log/<filename>` for the log file to ascertain if any errors were reported in the file. (If you did not specify a filename, the default filename is `eventd`.) The error messages indicate the place of failure and the appropriate reason.

After configuring the trace options, you must recommit the configuration change that caused the incorrect system behavior.

### ***Debugging Policy Lookup***

**Problem Description:** When you have the correct configuration, but some traffic was incorrectly dropped or permitted, you can enable the **lookup** flag in the security policies traceoptions. The **lookup** flag logs the lookup related traces in the trace file.

**Solution**      `user@host# set security policies traceoptions <flag lookup>`

### ***Troubleshooting the TGM550 Module and VoIP Interface***

**Problem Description:** The TGM550 module is installed but the VoIP interface is unavailable. The TGM550 module is installed and the VoIP interface—for example, `vp-3/0/0` is configured, but the interface is not accessible. The **show chassis hardware** command displays the TGM550 installed on slot 3. However, the **show interfaces terse** command does not display the `vp-3/0/0` interface, and the **show interfaces vp-3/0/0** command displays an error:

```
user@host> show interfaces vp-3/0/0
error: device vp-3/0/0 not found
```

**Solution**      The VoIP interface might be unavailable because the TGM550 firmware version is not compatible with the Junos OS version installed on the device.

To correct the TGM550 firmware and Junos OS version compatibility error:

1. Check the router's system log messages for a version incompatibility error similar to the following:  

```
Jan 5 11:07:03 host fwdd[2857]: TGMT: RE (1.0) - TGM (2.0) major protocol version mismatch: not marking TGM slot ready
```
2. If the error exists, connect to the TGM550 through the console port.
3. View the TGM550 firmware version.

```
TGM550-003(super)# show image version
Bank      Version
-----
A (current) 26.23.0
B          26.22.0
```

In this example, the current TGM550 firmware version is **26.23.0**.

4. Identify the Junos OS version that is compatible with the current TGM550 firmware version.
5. Upgrade the router with the compatible Junos OS version.

### Troubleshooting ISSU-Related Problems Using Log Error Messages

The following problems might occur during an ISSU upgrade. You can identify the errors by using the details in the logs. You can also see the details of the error messages in the *Junos OS System Log Reference*.

- [Chassisd Process Errors on page 1628](#)
- [Kernel State Synchronization on page 1628](#)
- [Installation Related Errors on page 1629](#)
- [ISSU Support Related Errors on page 1629](#)
- [RG Groups Failover Errors on page 1629](#)
- [Initial Validation Checks Fail on page 1629](#)

#### ***Chassisd Process Errors***

**Problem**    **Description:** There are errors related to chassisd.

**Solution**    Use the error messages to understand the issues related to chassisd.

When ISSU starts, a request is sent to chassisd to check whether there are any problems related to ISSU from a chassis perspective. If there is a problem, a log message is created.

#### ***Kernel State Synchronization***

**Problem**    **Description:** There are errors related to ksyncd.

**Solution** Use the following error messages to understand the issues related to ksyncd:

Failed to get kernel-replication error information from Standby Routing Engine.  
mgd\_slave\_peer\_has\_errors() returns error at line 4414 in mgd\_package\_issu.

ISSU checks whether there are any ksyncd errors on the secondary node (node 1) and displays the error message if there are any problems and aborts the ISSU.

#### ***Installation Related Errors***

**Problem** **Description:** The install image file does not exist or the remote site is inaccessible.

**Solution** Use the following error messages to understand the installation related problems:

error: File does not exist: /var/tmp/junos-srx5000-11.4X3.2-domest  
error: Couldn't retrieve package /var/tmp/junos-srx5000-11.4X3.2-domest

ISSU downloads the install image as specified in the ISSU command as an argument. The image file can be a local file or located at a remote site. If the file does not exist or the remote site is inaccessible, an error is reported.

#### ***ISSU Support Related Errors***

**Problem** **Description:** There is an installation failure because of unsupported software and unsupported feature configuration.

**Solution** Use the following error messages to understand the compatibility-related problems:

WARNING: Current configuration not compatible with  
/var/tmp/junos-srx5000-11.4X3.2-domestic.tgz  
Exiting in-service-upgrade window  
Exiting in-service-upgrade window

#### ***RG Groups Failover Errors***

**Problem** **Description:** There is a problem with automatic redundancy group failure.

**Solution** Use the following error messages to understand the problem:

failover all RG 1+ groups to node 0  
error: Command failed. None of the redundancy-groupss has been failed over.  
Some redundancy-groups on node1 are already in manual failover mode.  
Please execute 'failover reset all' first..

#### ***Initial Validation Checks Fail***

**Problem** **Description:** The initial validation checks fail.

**Solution** The following error messages are displayed when initial validation checks fail when the image is not present and ISSU is aborted:

### When Image is Not Present

```
user@host> ...0120914_srx_12q1_major2.2-539764-domestic.tgz reboot
Chassis ISSU Started
Chassis ISSU Started
ISSU: Validating Image
Initiating in-service-upgrade
Initiating in-service-upgrade
Fetching package...
error: File does not exist:
/var/tmp/junos-srx1k3k-12.1I20120914_srx_12q1_major2.2-539764-domestic.tgz
error: Couldn't retrieve package
/var/tmp/junos-srx1k3k-12.1I20120914_srx_12q1_major2.2-539764-domestic.tgz
Exiting in-service-upgrade window
Exiting in-service-upgrade window
Chassis ISSU Aborted
Chassis ISSU Aborted
Chassis ISSU Aborted
ISSU: IDLE
ISSU aborted; exiting ISSU window.
```

### When Image File is Corrupted

```
user@host> ...junos-srx1k3k-11.4X9-domestic.tgz_1 reboot
Chassis ISSU Started
node1:
-----
Chassis ISSU Started
ISSU: Validating Image
Initiating in-service-upgrade

node1:
-----
Initiating in-service-upgrade
ERROR: Cannot use /var/tmp/junos-srx1k3k-11.4X9-domestic.tgz_1:
gzip: stdin: invalid compressed data--format violated
tar: Child returned status 1
tar: Error exit delayed from previous errors
ERROR: It may have been corrupted during download.
ERROR: Please try again, making sure to use a binary transfer.
Exiting in-service-upgrade window

node1:
-----
Exiting in-service-upgrade window
Chassis ISSU Aborted
Chassis ISSU Aborted

node1:
-----
Chassis ISSU Aborted
ISSU: IDLE
ISSU aborted; exiting ISSU window.

{primary:node0}
```

The primary node validates the device configuration to ensure that it can be committed using the new software version. If anything goes wrong, ISSU aborts and error messages are displayed.

# System Log Monitoring and Troubleshooting Guide for Security Devices

- [Overview on page 1633](#)
- [Configuration on page 1647](#)
- [Administration on page 1696](#)

### Overview

---

- [System Log Messages on page 1633](#)
- [Security Devices on page 1643](#)
- [Single-Chassis Systems on page 1646](#)

### System Log Messages

- [Junos OS System Log Configuration Overview on page 1633](#)
- [Junos OS Platform-Specific Default System Log Messages on page 1634](#)
- [Displaying and Interpreting System Log Message Descriptions on page 1635](#)
- [Interpreting Messages Generated in Structured-Data Format on page 1636](#)
- [Interpreting Messages Generated in Standard Format by Services on a PIC on page 1641](#)
- [Junos OS System Logging Facilities and Message Severity Levels on page 1642](#)

#### [Junos OS System Log Configuration Overview](#)

---

The Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the router, including the following:

- Routine operations, such as creation of an Open Shortest Path First (OSPF) protocol adjacency or a user login into the configuration database
- Failure and error conditions, such as failure to access a configuration file or unexpected closure of a connection to a peer process
- Emergency or critical conditions, such as router power-down due to excessive temperature

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Reference*.

**NOTE:** This topic describes system log messages for Junos OS processes and libraries and not the system logging services on a Physical Interface Card (PIC) such as the Adaptive Services PIC.

#### Related Documentation

- [Junos OS System Log Configuration Hierarchy](#)
- [Junos OS Minimum System Logging Configuration on page 1655](#)

### Junos OS Platform-Specific Default System Log Messages

The following messages are generated by default on specific routers. To view any of these types of messages, you must configure at least one destination for messages as described in “[Junos OS Minimum System Logging Configuration](#)” on page 1655.

- On J Series routers, a message is logged when a process running in the kernel consumes 500 or more consecutive milliseconds of CPU time.

To log the kernel process message on an M Series, MX Series, or T Series router, include the **kernel info** statement at the appropriate hierarchy level:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  kernel info;
}
```

- On a routing matrix composed of a TX Matrix router and T640 routers, the master Routing Engine on each T640 router forwards all messages with a severity of **info** and higher to the master Routing Engine on the TX Matrix router. This is equivalent to the following configuration statement included on the TX Matrix router:

```
[edit system syslog]
host scc-master {
  any info;
}
```

- Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, the master Routing Engine on each T1600 router forwards to the master Routing Engine on the TX Matrix Plus router all messages with a severity of **info** and higher. This is equivalent to the following configuration statement included on the TX Matrix Plus router:

```
[edit system syslog]
host sfc0-master {
  any info;
}
```

### Displaying and Interpreting System Log Message Descriptions

The *Junos OS System Log Reference* lists the messages available at the time of its publication. To display the list of messages that applies to the version of the Junos OS that is running on a routing platform, enter Junos OS CLI operational mode and issue the following command:

```
user@host> help syslog ?
```

To display the list of available descriptions for tags whose names begin with a specific character string, substitute the string (in all capital letters) for the variable **TAG-PREFIX** (there is no space between the prefix and the question mark):

```
user@host> help syslog TAG-PREFIX?
```

To display the complete descriptions for tags whose name includes a regular expression, substitute a Perl-based expression for the variable **regex**. The match is not case-sensitive. For information about Perl-based regular expressions, consult a Perl reference manual or website such as <http://perldoc.perl.org>.

```
user@host> help syslog regex
```

To display the complete description of a particular message, substitute its name for the variable **TAG** (in all capital letters):

```
user@host> help syslog TAG
```

[Table 241 on page 1635](#) describes the fields in a system log message description in this reference or in the CLI.

**Table 241: Fields in System Log Message Descriptions**

Field Name in Reference	Field Name in CLI	Description
—	<b>Name</b>	The message tag in all capital letters.
<b>System Log Message</b>	<b>Message</b>	<p>Text of the message written to the system log. In the log, a specific value is substituted for each variable that appears in italics in this reference or in angle brackets (&lt;&gt;) in the CLI.</p> <p>In this reference, the message text appears on the second line of the <b>System Log Message</b> field. The first line is the message tag (the same text as in the CLI Name field). The prefix on each tag identifies the message source and the rest of the tag indicates the specific event or error.</p>

Table 241: Fields in System Log Message Descriptions (*continued*)

Field Name in Reference	Field Name in CLI	Description
—	<b>Help</b>	Short description of the message, which also appears in the right-hand column of CLI output for the <b>help syslog</b> command when the output lists multiple messages.
<b>Description</b>	<b>Description</b>	More detailed explanation of the message.
<b>Type</b>	<b>Type</b>	Category to which the message belongs: <ul style="list-style-type: none"> <li>• <b>Error:</b> The message reports an error or failure condition that might require corrective action.</li> <li>• <b>Event:</b> The message reports a condition or occurrence that does not generally require corrective action.</li> </ul>
<b>Severity</b>	<b>Severity</b>	Message severity level as described in Table: <b>System Log Message Severity Levels</b> in <i>Specifying the Facility and Severity of Messages to Include in the Log</i> .
<b>Cause</b>	<b>Cause</b>	(Optional) Possible cause for message generation. There can be more than one cause.
<b>Action</b>	<b>Action</b>	(Optional) Action you can perform to resolve the error or failure condition described in the message. If this field does not appear in an entry, either no action is required or the action is self-explanatory.

### Interpreting Messages Generated in Structured-Data Format

Beginning in Junos OS Release 8.3, when the **structured-data** statement is included in the configuration for a log file, Junos processes and software libraries write messages to the file in structured-data format instead of the standard Junos format. For information about the **structured-data** statement, see [“Logging Messages in Structured-Data Format” on page 1659](#).

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the

circumstances that triggered the message) makes it easy for an application to extract those values. In standard format, the variables are interspersed in the message text and not identified as variables.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

```
<priority code>version timestamp hostname process processID TAG [junos@2636.platform
variable-value-pairs] message-text
```

Table 242 on page 1637 describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen ( - ) appears instead.

**Table 242: Fields in Structured-Data Messages**

Field	Description	Examples
<b>&lt;priority code&gt;</b>	Number that indicates the message's facility and severity. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see Table: <b>Facility and Severity Codes in the priority-code Field in Specifying the Facility and Severity of Messages to Include in the Log.</b>	<165> for a message from the pfe facility (facility=20) with severity notice (severity=5).
<b>version</b>	Version of the Internet Engineering Task Force (IETF) system logging protocol specification.	1 for the initial version
<b>timestamp</b>	Time when the message was generated, in one of two representations: <ul style="list-style-type: none"> <li><b>YYYY-MM-DDTHH:MM:SS.MSZ</b> is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC)</li> <li><b>YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM</b> is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC</li> </ul>	2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007. 2007-02-15T01:17:15.719-08:00 is the same timestamp expressed as Pacific Standard Time in the United States.
<b>hostname</b>	Name of the host that originally generated the message.	router1
<b>process</b>	Name of the Junos process that generated the message.	mgd
<b>processID</b>	UNIX process ID (PID) of the Junos process that generated the message.	3046
<b>TAG</b>	Junos system log message tag, which uniquely identifies the message.	UI_DBASE_LOGOUT_EVENT

Table 242: Fields in Structured-Data Messages (*continued*)

Field	Description	Examples
<code>junos@2636.platform</code>	An identifier for the type of hardware platform that generated the message. The <code>junos@2636</code> prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type. For a list of the identifiers, see <a href="#">Table 244 on page 1640</a> .	<code>junos@2636.1.1.1.2.18</code> for the M120 router
<i>variable-value-pairs</i>	A variable-value pair for each element in the <i>message-text</i> string that varies depending on the circumstances that triggered the message. Each pair appears in the format <i>variable</i> = " <i>value</i> ".	<code>username="user"</code>
<i>message-text</i>	English-language description of the event or error (omitted if the brief statement is included at the <code>[edit system syslog file <i>filename</i> structured-data]</code> hierarchy level). For the text for each message, see the chapters following System Log Messages.	User 'user' exiting configuration mode

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="user"] User 'user' exiting configuration mode
```

When the brief statement is included at the `[edit system syslog file filename structured-data]` hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="user"]
```

[Table 243 on page 1638](#) maps the codes that appear in the *priority-code* field to facility and severity level.

**NOTE:** Not all of the facilities and severities listed in [Table 243 on page 1638](#) can be included in statements at the `[edit system syslog]` hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see *Specifying the Facility and Severity of Messages to Include in the Log*.

Table 243: Facility and Severity Codes in the priority-code Field

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug
kernel (0)	1	1	2	3	4	5	6	7

Table 243: Facility and Severity Codes in the priority-code Field (*continued*)

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug

Table 244 on page 1640 lists the numerical identifiers for routing platforms that appear in the **platform** field. The identifier is derived from the platform's SNMP object identifier (OID) as defined in the Juniper Networks routing platform MIB. For more information about OIDs, see the *SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices*.

**Table 244: Platform Identifiers in the platform Field**

Identifier	Platform Name
1.1.1.2.1	M40 router
1.1.1.2.2	M20 router
1.1.1.2.3	M160 router
1.1.1.2.4	M10 router
1.1.1.2.5	M5 router
1.1.1.2.6	T640 routing node
1.1.1.2.7	T320 router
1.1.1.2.8	M40e router
1.1.1.2.9	M320 router
1.1.1.2.10	M7i router
1.1.1.2.11	M10i router
1.1.1.2.13	J2300 Services Router
1.1.1.2.14	J4300 Services Router
1.1.1.2.15	J6300 Services Router
1.1.1.2.17	TX Matrix platform
1.1.1.2.18	M120 router
1.1.1.2.19	J4350 Services Router
1.1.1.2.20	J6350 Services Router
1.1.1.2.23	J2320 Services Router
1.1.1.2.24	J2350 Services Router
1.1.1.2.27	T1600 router

Table 244: Platform Identifiers in the platform Field (*continued*)

Identifier	Platform Name
1.1.1.2.83	T4000 router

### Interpreting Messages Generated in Standard Format by Services on a PIC

Standard-format system log messages generated by services on a PIC, such as the Adaptive Services (AS) PIC, have the following syntax:

```
timestamp (FPC Slot fpc-slot, PIC Slot pic-slot) {service-set} [SERVICE]:
optional-string TAG: message-text
```

**NOTE:** System logging for services on PICs is not configured at the [edit system syslog] hierarchy level as discussed in this chapter.

The (FPC Slot *fpc-slot*, PIC Slot *pic-slot*) field appears only when the standard system logging utility that runs on the Routing Engine writes the messages to the system log. When the PIC writes the message directly, the field does not appear.

Table 245 on page 1641 describes the message fields.

Table 245: Fields in Messages Generated by a PIC

Field	Description
<i>timestamp</i>	Time at which the message was logged.
<i>fpc-slot</i>	Slot number of the Flexible PIC Concentrator (FPC) that houses the PIC that generated the message.
<i>pic-slot</i>	Number of the PIC slot on the FPC in which the PIC that generated the message resides.
<i>service-set</i>	Name of the service set that generated the message.
<i>SERVICE</i>	Code representing the service that generated the message. The codes include the following: <ul style="list-style-type: none"> <li>• FWNAT—Network Address Translation (NAT) service</li> <li>• IDS—Intrusion detection service</li> </ul>
<i>optional-string</i>	A text string that appears if the configuration for the PIC includes the log-prefix statement at the [edit interfaces interface-name services-options syslog] hierarchy level.
<i>TAG</i>	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating PIC. The entries in this reference are ordered alphabetically by this prefix.

Table 245: Fields in Messages Generated by a PIC (*continued*)

Field	Description
<b>message-text</b>	Text of the message. For the text of each message, see System Log Messages.

### Junos OS System Logging Facilities and Message Severity Levels

Table 246 on page 1642 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

Table 246: Junos OS System Logging Facilities

Facility	Type of Event or Error
<b>any</b>	All (messages from all facilities)
<b>authorization</b>	Authentication and authorization attempts
<b>change-log</b>	Changes to the Junos OS configuration
<b>conflict-log</b>	Specified configuration is invalid on the router type
<b>daemon</b>	Actions performed or errors encountered by system processes
<b>dfc</b>	Events related to dynamic flow capture
<b>firewall</b>	Packet filtering actions performed by a firewall filter
<b>ftp</b>	Actions performed or errors encountered by the FTP process
<b>interactive-commands</b>	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
<b>kernel</b>	Actions performed or errors encountered by the Junos OS kernel
<b>pfe</b>	Actions performed or errors encountered by the Packet Forwarding Engine
<b>user</b>	Actions performed or errors encountered by user-space processes

Table 247 on page 1643 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see “Disabling the System Logging of a Facility” on page 1666.

Table 247: System Log Message Severity Levels

Severity Level	Description
<b>any</b>	Includes all severity levels
<b>none</b>	Disables logging of the associated facility to a destination
<b>emergency</b>	System panic or other condition that causes the router to stop functioning
<b>alert</b>	Conditions that require immediate correction, such as a corrupted system database
<b>critical</b>	Critical conditions, such as hard errors
<b>error</b>	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
<b>warning</b>	Conditions that warrant monitoring
<b>notice</b>	Conditions that are not errors but might warrant special handling
<b>info</b>	Events or nonerror conditions of interest

### Understanding System Logging for Security Devices

Junos OS supports configuring and monitoring of system log messages (also called *syslog messages*). You can configure files to log system messages and also assign attributes, such as severity levels, to messages. Reboot requests are recorded to the system log files, which you can view with the **show log** command.

This section contains the following topics:

- [Redundant System Log Server on page 1643](#)
- [Control Plane and Data Plane Logs on page 1644](#)

#### **Redundant System Log Server**

Security system logging traffic intended for remote servers is sent through the network interface ports, which support two simultaneous system log destinations. Each system logging destination must be configured separately. When two system log destination addresses are configured, identical logs are sent to both destinations. While two destinations can be configured on any device that supports the feature, adding a second

destination is primarily useful as a redundant backup for standalone and active/backup configured chassis cluster deployments.

The following redundant server information is available:

- Facility: **cron**
- Description: cron scheduling process
- Severity Level (from highest to lowest severity): **debug**
- Description: Software debugging messages

### **Control Plane and Data Plane Logs**

Junos OS generates separate log messages to record events that occur on the system's control and data planes.

- The control plane logs include events that occur on the routing platform. The system sends control plane events to the **eventd** process on the Routing Engine, which then handles the events by using Junos OS policies, by generating system log messages, or both. You can choose to send control plane logs to a file, user terminal, routing platform console, or remote machine. To generate control plane logs, use the **syslog** statement at the **[system]** hierarchy level.
- The data plane logs primarily include security events that the system has handled directly inside the data plane. These system logs are also referred to as *security logs*. How the system handles data plane events depends on the device:
  - For J Series devices, the most common logging configuration is the Junos OS configuration in which the system sends data plane events to the **eventd** process on the Routing Engine to be processed, formatted, and written to system log files in a similar manner to control plane events.
  - For SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices, the default logging mode is stream mode. The system streams already-processed data plane events directly to external log servers, bypassing the Routing Engine.

We recommend stream mode logging for the data plane. Data plane logs can be forwarded to the Routing Engine only when data plane logging is configured as an event mode.

**NOTE:** We recommend that only stream mode be used for security logs on high-end SRX Series devices. We do not recommend using event mode logging for high-end SRX Series devices. Supported logging rates apply to stream mode only. Logs may be dropped if you configure event mode logging on high-end SRX Series devices.

- For SRX100, SRX210, SRX220, SRX240, and SRX650 devices, by default, the system sends data plane events to the **eventd** process on the Routing Engine to be processed, formatted, and written to system log files in a similar manner to control plane events.

---

**Understanding Binary Format for Security Logs**

---

The Junos operating system (Junos OS) generates separate log messages to record events that occur on the system's control plane and data plane. The control plane monitors events that occur on the routing platform. Such events are recorded in system log messages. To generate system log messages, use the **syslog** statement at the **[system]** hierarchy level.

Data plane log messages, referred to as security log messages, record security events that the system handles directly inside the data plane. To generate security log messages, use the **log** statement at the **[security]** hierarchy level.

System log messages are maintained in log files in text-based formats, such as BSD Syslog, Structured Syslog, and WebTrends Enhanced Log Format (WELF).

Security log messages can also be maintained in text-based formats. Because security logging can produce large amounts of data, however, text-based log files can quickly consume storage and CPU resources. Depending on your implementation of security logging, a log file in a binary-based format can provide more efficient use of on-box or off-box storage and improved CPU utilization. Binary format for security log messages is available on all SRX Series devices.

When configured in event mode, security log messages generated in the data plane are directed to the control plane and stored locally on the device. Security log messages stored in binary format are maintained in a log file separate from that used to maintain system log messages. Events stored in a binary log file are not accessible with advanced log-scripting commands intended for text-based log files. A separate CLI operational command supports decoding, converting, and viewing binary log files that are stored locally on the device.

When configured in stream mode, security log messages generated in the data plane are streamed to a remote device. When these messages are stored in binary format, they are streamed directly to external log collection clients in a Juniper-specific binary format. The external client handles decoding, converting, and viewing binary log files that are stored on a remote device.

## Single-Chassis Systems

- [Displaying a Log File from a Single-Chassis System on page 1646](#)
- [The message-source Field on a Single-Chassis System on page 1646](#)

---

### Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue either of the following commands:

```
user@host> show log log-filename
user@host> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine. To display the file stored on a particular Routing Engine, prefix the file- or pathname with the string **re0** or **re1** and a colon. The following examples both display the **/var/log/messages** file stored on the Routing Engine in slot 1:

```
user@host> show log re1:messages
user@host> file show re1:/var/log/messages
```

---

### The message-source Field on a Single-Chassis System

The format of the **message-source** field in a message on a single-chassis system depends on whether the message was generated on the local Routing Engine or the other Routing Engine (on a system with two Routing Engines installed and operational). Messages from the other Routing Engine appear only if its configuration includes the **other-routing-engine** statement at the **[edit system syslog host]** hierarchy level.

- When the local Routing Engine generated the message, there are two subfields:  
`hostname process[process-ID]`
- When the other Routing Engine generated the message, there are three subfields:  
`hostname reX process[process-ID]`

**hostname** is the hostname of the local Routing Engine.

**process[process-ID]** is the name and PID of the process that generated the message. If the **reX** field also appears, the process is running on the other Routing Engine. If a process does not report its PID, the **[process-ID]** part does not appear.

reX indicates that the other Routing Engine generated the message (X is 0 or 1).

- [Examples: Displaying System Log Message Descriptions on page 1650](#)

### Examples: Configuring System Logging

---

The following example shows how to configure the logging of messages about all commands entered by users at the CLI prompt or invoked by client applications such as Junos XML protocol or NETCONF client applications, and all authentication or authorization attempts, both to the file **cli-commands** and to the terminal of any user who is logged in:

```
[edit system]
syslog {
  file cli-commands {
    interactive-commands info;
    authorization info;
  }
  user * {
    interactive-commands info;
    authorization info;
  }
}
```

The following example shows how to configure the logging of all changes in the state of alarms to the file **/var/log/alarms**:

```
[edit system]
syslog {
  file alarms {
    kernel warning;
  }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user **alex**, to a remote machine, and to the console:

```
[edit system]
syslog {
  /* write all security-related messages to file /var/log/security */
```

```

file security {
    authorization info;
    interactive-commands info;
}
/* write messages about potential problems to file /var/log/messages: */
/* messages from "authorization" facility at level "notice" and above, */
/* messages from all other facilities at level "warning" and above */
file messages {
    authorization notice;
    any warning;
}
/* write all messages at level "critical" and above to terminal of user "alex" if */
/* that user is logged in */
user alex {
    any critical;
}
/* write all messages from the "daemon" facility at level "info" and above, and */
/* messages from all other facilities at level "warning" and above, to the */
/* machine monitor.mycompany.com */
host monitor.mycompany.com {
    daemon info;
    any warning;
}
/* write all messages at level "error" and above to the system console */
console {
    any error;
}
}

```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the **interactive-commands** facility at the following severity levels:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file **/var/log/user-actions**.
- **notice**—Logs a message when users issue the configuration mode commands **rollback** and **commit**. The example writes the messages to the terminal of user **philip**.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

```

[edit system]
syslog {
    file user-actions {
        interactive-commands info;
    }
    user philip {
        interactive-commands notice;
    }
    console {
        interactive-commands warning;
    }
}

```

- Related Documentation**
- *Single-Chassis System Logging Configuration Overview*

### Examples: Assigning an Alternative Facility

Log all messages generated on the local routing platform at the error level or higher to the **local0** facility on the remote machine called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

Configure routing platforms located in California and routing platforms located in New York to send messages to a single remote machine called **central-logger.mycompany.com**. The messages from California are assigned alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- Configure California routing platforms to aggregate messages in the **local0** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- Configure New York routing platforms to aggregate messages in the **local2** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On **central-logger**, you can then configure the system logging utility to write messages from the **local0** facility to the file **california-config** and the messages from the **local2** facility to the file **new-york-config**.

- Related Documentation**
- *Junos OS System Log Alternate Facilities for Remote Logging*

### Examples: Displaying a Log File

Display the contents of the **/var/log/messages** file stored on the local Routing Engine. (The **/var/log** directory is the default location for log files, so you do not need to include it in the filename. The **messages** file is a commonly configured destination for system log messages.)

```
user@host> show log messages Apr 11 10:27:25 router1 mgd[3606]:
  UI_DBASE_LOGIN_EVENT: User 'barbara' entering configuration mode
Apr 11 10:32:22 router1 mgd[3606]: UI_DBASE_LOGOUT_EVENT: User 'barbara' exiting
  configuration mode
Apr 11 11:36:15 router1 mgd[3606]: UI_COMMIT: User 'root' performed commit: no comment
Apr 11 11:46:37 router1 mib2d[2905]: SNMP_TRAP_LINK_DOWN: ifIndex 82, ifAdminStatus
  up(1), ifOperStatus down(2), ifName at-1/0/0
```

Display the contents of the file `/var/log/processes`, which has been previously configured to include messages from the **daemon** facility. When issuing the **file show** command, you must specify the full pathname of the file:

```
user@host> file show /var/log/processes Feb 22 08:58:24 router1 snmpd[359]:
SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm start
Feb 22 20:35:07 router1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 router1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 router1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
```

Display the contents of the file `/var/log/processes` when the **explicit-priority** statement is included at the `[edit system syslog file processes]` hierarchy level:

```
user@host> file show /var/log/processes Feb 22 08:58:24 router1 snmpd[359]:
%DAEMON-3-SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm
start
Feb 22 20:35:07 router1 snmpd[359]:
%DAEMON-6-SNMPD_THROTTLE_QUEUE_DRAINED: trap_throttle_timer_handler: cleared
all throttled traps
Feb 23 07:34:56 router1 snmpd[359]:
%DAEMON-3-SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm
start
Feb 23 07:38:19 router1 snmpd[359]:
%DAEMON-2-SNMPD_TRAP_COLD_START: trap_generate_cold: SNMP trap: cold start
```

### Examples: Displaying System Log Message Descriptions

Display the list of all currently available system log message descriptions:

```
user@host> help syslog ?

Possible completions:
<syslog-tag> Syslog tag
. . . . .
BOOTPD_ARG_ERR Command-line option was invalid
BOOTPD_BAD_ID Request failed because assembly ID was unknown
BOOTPD_BOOTSTRING tnp.bootpd provided boot string
BOOTPD_CONFIG_ERR tnp.bootpd could not parse configuration file;
used default settings
BOOTPD_CONF_OPEN tnp.bootpd could not open configuration file
BOOTPD_DUP_REV Extra boot string definitions for revision were
ignored
---(more 4%)---
```

Display the list of all currently available system log message descriptions for tags that begin with the letters **ACCT** (there is no space between **ACCT** and the question mark, and some descriptions are shortened for legibility):

```
user@host> help syslog ACCT?

Possible completions:
<syslog-tag> System log tag or regular expression
ACCT_ACCOUNTING_FERROR Error occurred during file processing
ACCT_ACCOUNTING_FOPEN_ERROR Open operation failed on file
ACCT_ACCOUNTING_SMALL_FILE_SIZE Maximum file size is smaller than ...
ACCT_BAD_RECORD_FORMAT Record format does not match accounting profile
```

```

ACCT_CU_RTSLIB_ERROR    Error occurred obtaining current class usage ...
ACCT_FORK_ERR           Could not create child process
ACCT_FORK_LIMIT_EXCEEDED Could not create child process because of limit
ACCT_GETHOSTNAME_ERROR  gethostname function failed
ACCT_MALLOC_FAILURE     Memory allocation failed
ACCT_UNDEFINED_COUNTER_NAME Filter profile used undefined counter name
ACCT_XFER_FAILED        Attempt to transfer file failed
ACCT_XFER_POPEN_FAIL    File transfer failed

```

Display the description of the `UI_CMDLINE_READ_LINE` message:

```
user@host> help syslog UI_CMDLINE_READ_LINE
```

```

Name:      UI_CMDLINE_READ_LINE
Message:   User '<users>', command '<input>'
Help:      User entered command at CLI prompt
Description: The indicated user typed the indicated command at the CLI
             prompt and pressed the Enter key, sending the command string
             to the management process (mgd).
Type:      Event: This message reports an event, not an error
Severity:  info

```

## Security Devices

- [Configuring Binary Security Log Files on page 1651](#)
- [Sending System Log Messages to a File on page 1652](#)
- [Setting the System to Send All Log Messages Through eventd on page 1653](#)
- [Setting the System to Stream Security Logs Through Revenue Ports on page 1654](#)

### Configuring Binary Security Log Files

You can configure security files in binary format using the **log** statement at the **[security]** hierarchy level.

The following procedure specifies binary format for event-mode or stream-mode logging, and defines the log filename, path, and log file characteristics.

1. Specify the format for the log file.
  - For on-box, event-mode logging:
 

```
set security log mode event
set security log format binary
```
  - For off-box, stream-mode logging:
 

```
set security log mode stream
set security log stream test-stream format binary host 1.3.54.22
```
2. For off-box security logging, specify the source address, which identifies the SRX Series device that generated the log messages. The source address is required.
 

```
set security log source-address 2.3.45.66
```
3. Optionally, define a log filename and a path. By default, the file `bin_messages` is created in the `/var/log` directory.
 

```
set security log file name security-binary-log
```

```
set security log file path security/log-folder
```

4. Optionally, change the maximum size of the log file and the maximum number of log files that can be archived. By default, the maximum size of the log file is 3 MB, and a total of three log files can be archived.

```
set security log file size 5
```

```
set security log file files 5
```

5. Optionally, select the hpl flag to enable diagnostic traces for binary logging. The prefix smf\_hpl identifies all binary logging traces.

```
set security log traceoptions flag hpl
```

6. View the content of the event-mode log file stored on the device.

**NOTE:** The `show security log` command displays event-mode security log messages if they are in a text-based format. The `show security log file` command displays event-mode security log messages if they are in binary format.

```
show security log file
```

Use the following command to clear the content of the binary event-mode security log file.

```
clear security log file
```

**NOTE:** Third-party tools decode and convert log files to binary text when they are streamed to a remote device. Refer to your third-party documentation for details about displaying streamed security log messages.

### Sending System Log Messages to a File

You can direct system log messages to a file on the CompactFlash (CF) card. The default directory for log files is `/var/log`. To specify a different directory on the CF card, include the complete pathname.

Create a file named **security**, and send log messages of the **authorization** class at the severity level **info** to the file.

To set the filename, the facility, and severity level:

```
{primary:node0}
user@host# set system syslog file security authorization info
```

### Setting the System to Send All Log Messages Through eventd

The **eventd** process of logging configuration is most commonly used for Junos OS. In this configuration, control plane logs and data plane, or security, logs are forwarded from the data plane to the Routing Engine control plane **rtlogd** process. The **rtlogd** process then either forwards syslog or sd-syslog-formatted logs to the **eventd** process or the WELF-formatted logs to the external or remote WELF log collector.

To send all log messages through **eventd**:

1. Set the **eventd** process to handle security logs and send them to a remote server.

```
{primary:node0}
user@host# set security log mode event
```

2. Configure the server that will receive the system log messages.

```
{primary:node0}
user@host# set system syslog host hostname any any
```

where **hostname** is the fully qualified hostname or IP address of the server that will receive the logs.

**NOTE:** To send duplicate logs to a second remote server, repeat the command with a new fully qualified **hostname** or IP address of a second server.

If your deployment is an active/active chassis cluster, you can also configure security logging on the active node to be sent to separate remote servers to achieve logging redundancy.

To rename or redirect one of the logging configurations, you need to delete and recreate it. To delete a configuration:

```
{primary:node0}
user@host# delete security log mode event
```

#### Related Documentation

- [Setting the System to Stream Security Logs Through Revenue Ports on page 1654](#)
- [Sending System Log Messages to a File on page 1652](#)
- [Monitoring System Log Messages with the J-Web Event Viewer on page 1696](#)

### Setting the System to Stream Security Logs Through Revenue Ports

You can increase the number of data plane, or security, logs that are sent by modifying the manner in which they are sent. When the logging mode is set to **stream**, security logs generated in the data plane are streamed out a revenue traffic port directly to a remote server.

To use the **stream** mode, enter the following commands:

```
{primary:node0}
user@host# set security log mode stream source-address source-address
user@host# set security log stream streamname format (syslog|sd-syslog|welf) category
(all|content-security) host ipaddr
```

where *source-address* is the IP address of the source machine; **syslog**, **sd-syslog** (structured system logging messages) and **welf** are logging formats; **all** and **content-security** are the categories of logging; and *ipaddr* is the IP address of the server to which the logs will be streamed.

**NOTE:** WELF logs must be streamed through a revenue port because the **eventd** process does not recognize the WELF format. The category must be set to **content-security**. For example:

```
{primary:node0}
user@host# set security log stream securitylog1 format welf category
content-security host 10.121.23.5
```

To send duplicate logs to a second remote server, repeat the command with a new *ipaddr*. If your deployment is an active/active chassis cluster, you can also configure security logging on the active node to be sent to separate remote servers to achieve logging redundancy.

- [Junos OS System Log Configuration Overview on page 1633](#)
- [Junos OS Platform-Specific Default System Log Messages on page 1634](#)

### Junos OS Platform-Specific Default System Log Messages

The following messages are generated by default on specific routers. To view any of these types of messages, you must configure at least one destination for messages as described in “[Junos OS Minimum System Logging Configuration](#)” on page 1655.

- On J Series routers, a message is logged when a process running in the kernel consumes 500 or more consecutive milliseconds of CPU time.

To log the kernel process message on an M Series, MX Series, or T Series router, include the **kernel info** statement at the appropriate hierarchy level:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  kernel info;
}
```

- On a routing matrix composed of a TX Matrix router and T640 routers, the master Routing Engine on each T640 router forwards all messages with a severity of **info** and higher to the master Routing Engine on the TX Matrix router. This is equivalent to the following configuration statement included on the TX Matrix router:

```
[edit system syslog]
host scc-master {
  any info;
}
```

- Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, the master Routing Engine on each T1600 router forwards to the master Routing Engine on the TX Matrix Plus router all messages with a severity of **info** and higher. This is equivalent to the following configuration statement included on the TX Matrix Plus router:

```
[edit system syslog]
host sfc0-master {
  any info;
}
```

- Related Documentation**
- [Junos OS System Log Configuration Overview on page 1633](#)
  - [Junos OS Default System Log Settings on page 1656](#)

### Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level or higher are logged to the destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  facility severity;
}
```

- Related Documentation**
- [Junos OS System Logging Facilities and Message Severity Levels on page 1642](#)
  - [Single-Chassis System Logging Configuration Overview](#)
  - [Examples: Configuring System Logging on page 1647](#)

### Directing System Log Messages to a Log File

To direct system log messages to a file in the `/var/log` directory of the local Routing Engine, include the **file** statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
file filename {
  facility severity;
  archive <archive-sites (ftp-url <password password>)> <files number> <size size>
    <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
    no-world-readable>;
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

For the list of facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1658](#).

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the **archive** statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see [Specifying Log File Size, Number, and Archiving Properties](#).

For information about the following statements, see the indicated sections:

- **explicit-priority**—See “Including Priority Information in System Log Messages” on page 1662
- **match**—See “Using Regular Expressions to Refine the Set of Logged Messages” on page 1664
- **structured-data**—See “Logging Messages in Structured-Data Format” on page 1659

#### Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- [Examples: Configuring System Logging on page 1647](#)

### Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol*, which is at <http://tools.ietf.org/html/draft-ietf-syslog-protocol-23>. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]
  facility severity;
  structured-data {
    brief;
  }
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. .

The structured format is used for all messages logged to the file that are generated by a Junos process or software library.

**NOTE:** If you include either or both of the **explicit-priority** and **time-format** statements along with the **structured-data** statement, they are ignored. These statements apply to the standard Junos system log format, not to structured-data format.

- [Examples: Configuring System Logging on page 1647](#)

## Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (\*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1658](#). For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 1664](#).

### Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging on page 1647](#)

## Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1658](#).

### Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)

## System Log Default Facilities for Messages Directed to a Remote Destination

[Table 250 on page 1660](#) lists the default alternative facility name next to the Junos OS-specific facility name for which it is used. For facilities that are not listed, the default alternative name is the same as the local facility name.

**Table 250: Default Facilities for Messages Directed to a Remote Destination**

Junos OS-specific Local Facility	Default Facility When Directed to Remote Destination
change-log	local6

**Table 250: Default Facilities for Messages Directed to a Remote Destination (*continued*)**

Junos OS—specific Local Facility	Default Facility When Directed to Remote Destination
<b>conflict-log</b>	<b>local5</b>
<b>dfc</b>	<b>local1</b>
<b>firewall</b>	<b>local3</b>
<b>interactive-commands</b>	<b>local7</b>
<b>pfe</b>	<b>local4</b>

**Related Documentation**

- *Single-Chassis System Logging Configuration Overview*

**Adding a Text String to System Log Messages**

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
  facility severity;
  log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign ( = ) and the colon ( : ). It also cannot include the space character; do not enclose the string in quotation marks ( " ") in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string **M120** to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine **hardware-logger.mycompany.com**:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
}
```

When these configuration statements are included on an M120 router called **origin1**, a message in the system log on **hardware-logger.mycompany.com** looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run show version'
```

- Related Documentation**
- *Single-Chassis System Logging Configuration Overview*
  - *Specifying Log File Size, Number, and Archiving Properties*

### Adding a String

Add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine `hardware-logger.mycompany.com`:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
}
```

When these configuration statements are included on an M120 router called `origin1`, a message in the system log on `hardware-logger.mycompany.com` looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run
show version'
```

### Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the `[edit system syslog file filename]` hierarchy level:

```
[edit system syslog file filename]
facility severity;
explicit-priority;
```

**NOTE:** Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the `[edit system syslog file filename]` hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see [“Logging Messages in Structured-Data Format” on page 1659](#).

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the `[edit system syslog host (hostname | other-routing-engine)]` hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
explicit-priority;
```

**NOTE:** The **other-routing-engine** option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see *Changing the Alternative Facility Name for Remote System Log Messages*.

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

*FACILITY-severity[-TAG]*

(The tag is a unique identifier assigned to some Junos OS system log messages.)

In the following example, the **CHASSISD\_PARSE\_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info (6)**:

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
configuration
```

#### Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- [Examples: Configuring System Logging on page 1647](#)

#### Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (**401**) and the year (**2006**):

```
Aug 21 12:36:30.401 2006
```

**NOTE:** Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the [edit system syslog file *filename*] hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see [“Logging Messages in Structured-Data Format” on page 1659](#).

#### Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging on page 1647](#)

### Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

```
match "regular-expression";
```

You can include this statement at the following hierarchy levels:

- [edit system syslog file *filename*] (for a file)
- [edit system syslog user (*username* | \*)] (for a specific user session or for all user sessions on a terminal)
- [edit system syslog host (*hostname* | other-routing-engine)] (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, <http://www.ieee.org>).

[Table 251 on page 1665](#) specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

**NOTE:** The match statement is not case-sensitive.

Table 251: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
(pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets.  One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
\$ (dollar sign)	End of a line.
[ ] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen ( - ) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
( ) (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

**Using Regular Expressions**

Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
  interactive-commands any;
  match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
  daemon error;
```

```
match "!(.*snmpd.*)";
}
file snmpd-errors {
  daemon error;
  match ".*snmpd.*";
}
```

  - [Examples: Configuring System Logging on page 1647](#)

---

### Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the **facility none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the **any severity** statement and then a **facility none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file `>/var/log/internals` instead:

```
[edit system syslog]
console {
  any error;
  daemon none;
  kernel none;
}
file internals {
  daemon info;
  kernel info;
}
```

## allow-duplicates

---

<b>Syntax</b>	allow-duplicates;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog], [edit logical-systems <i>logical-system-name</i> system syslog file <i>file-name</i> ], [edit logical-systems <i>logical-system-name</i> system syslog host <i>host-name</i> ], [edit logical-systems <i>logical-system-name</i> system syslog user <i>user-name</i> ], [edit system syslog], [edit system syslog file <i>file-name</i> ], [edit system syslog host <i>host-name</i> ], [edit system syslog user <i>user-name</i> ],
<b>Release Information</b>	Statement introduced in Release 11.1 of Junos OS. Logical systems support introduced in Release 11.4 of Junos OS.
<b>Description</b>	Specify whether to allow the repeated messages in the system log output files. This can be set either at global configuration level or for individual file, host, or user. By default, this parameter is set to disable.
<b>Options</b>	<b>file</b> —Name of the file to log messages  <b>host</b> —Host to receive the messages  <b>user</b> —User to receive the notification of the event
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## archive (All System Log Files)

<b>Syntax</b>	<code>archive &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;start-time<i>time</i>&gt; &lt;transfer-interval <i>interval</i>&gt; &lt;world-readable   no-world-readable&gt; ;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure archiving properties for all system log files.
<b>Options</b>	<p><b>files <i>number</i></b>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <b><i>logfile</i></b>, it closes the file, compresses it, and renames it <b><i>logfile.0.gz</i></b> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <b><i>logfile</i></b>. When the new file reaches the maximum size, the <b><i>logfile.0.gz</i></b> file is renamed to <b><i>logfile.1.gz</i></b>, and the new file is closed, compressed, and renamed <b><i>logfile.0.gz</i></b>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>size <i>size</i></b>—Maximum amount of data that the Junos OS logging utility writes to a log file <b><i>logfile</i></b> before archiving it (closing it, compressing it, and changing its name to <b><i>logfile.0.gz</i></b>). The utility then opens and writes to a new file called <b><i>logfile</i></b>.</p> <p><b>Syntax:</b> <b><i>xk</i></b> to specify the number of kilobytes, <b><i>xm</i></b> for the number of megabytes, or <b><i>xg</i></b> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b> 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers</p> <p><b>world-readable   no-world-readable</b>—Grant all users permission to read archived log files, or restrict the permission only to the <b>root</b> user and users who have the Junos OS <b>maintenance</b> permission.</p> <p><b>Default:</b> no-world-readable</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Specifying Log File Size, Number, and Archiving Properties</i></li> </ul>

## cache (Security Log)

---

**Syntax**    `cache {  
              exclude exlude-name {  
                  destination-address destination-address;  
                  destination-port destination-port;  
                  event-id event-id;  
                  failure;  
                  interface-name interface-name;  
                  policy-name policy-name;  
                  process process-name;  
                  protocol protocol;  
                  source-address source-address;  
                  source-port source-address;  
                  success;  
                  user-name user-name;  
              }  
              limit value;  
          }`

**Hierarchy Level**    [edit security log]

**Release Information**    Statement modified in Release 9.2 of Junos OS.

**Description**    Cache security log events in the audit log buffer.

**Options**    The remaining statements are explained separately.

**Required Privilege Level**    security—To view this statement in the configuration.  
                                  security-control—To add this statement to the configuration.

**Related Documentation**

- *System Log Monitoring and Troubleshooting Guide for Security Devices*

## console (System Logging)

---

<b>Syntax</b>	<pre>console {     <i>facility severity</i>; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the logging of system messages to the system console.
<b>Options</b>	<p><b><i>facility</i></b>—Class of messages to log. To specify multiple classes, include multiple <b><i>facility severity</i></b> statements. For a list of the facilities, see <a href="#">Table 246 on page 1642</a>.</p> <p><b><i>severity</i></b>—Severity of the messages that belong to the facility specified by the paired <b><i>facility</i></b> name. Messages with severities of the specified level and higher are logged. For a list of the severities, see <a href="#">Table 247 on page 1643</a>.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Directing System Log Messages to the Console on page 1660</a></li><li>• <i>Junos OS System Log Reference</i></li></ul>

## destination-override

---

<b>Syntax</b>	<code>destination-override {     syslog host <i>ip-address</i>; }</code>
<b>Hierarchy Level</b>	[edit system tracing]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	This option overrides the system-wide configuration under <b>[edit system tracing]</b> and has no effect if system tracing is not configured.
<b>Options</b>	<p>These options specify the system logs and the host to which remote tracing output is sent:</p> <ul style="list-style-type: none"><li>• <b>syslog</b>—Specify the system process log files to send to the remote tracing host.</li><li>• <b>host <i>ip-address</i></b>—Specify the IP address to which to send tracing information.</li></ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">tracing on page 1694</a></li></ul>

## event-rate

---

<b>Syntax</b>	<code>Syntax event-rate <i>rate</i></code>
<b>Hierarchy Level</b>	[edit security log]
<b>Release Information</b>	Statement introduced in Release 10.0 of Junos OS.
<b>Description</b>	Limits the rate (0 to 1500) at which logs will be streamed per second.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>

## explicit-priority

---

<b>Syntax</b>	explicit-priority;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit logical-systems <i>logical-system-name</i> system syslog host], [edit system syslog file <i>filename</i> ], [edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.  When the <b>structured-data</b> statement is also included at the [edit system syslog file <i>filename</i> ] hierarchy level, this statement is ignored for the file.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Including Priority Information in System Log Messages on page 1662</a></li><li>• <i>Junos OS System Log Reference</i></li><li>• <a href="#">structured-data on page 1688</a></li></ul>

## exclude (Security Log)

---

Syntax	<pre>exclude <i>exlude-name</i> {     destination-address <i>destination-address</i>;     destination-port <i>destination-port</i>;     event-id <i>event-id</i>;     failure;     interface-name <i>interface-name</i>;     policy-name <i>policy-name</i>;     process <i>process-name</i>;     protocol <i>protocol</i>;     source-address <i>source-address</i>;     source-port <i>source-port</i>;     success;     user-name <i>user-name</i>; }</pre>
Hierarchy Level	[edit security log cache]
Release Information	Statement introduced in Release 11.2 of Junos OS.
Description	Configure a list of auditable events that can be excluded from the audit log.
Options	<ul style="list-style-type: none"><li>• <b>destination-ip</b> <i>destination-address</i>—Destination IP address.</li><li>• <b>destination-port</b> <i>destination-port</i>—Destination port number.</li><li>• <b>event-id</b> <i>event-id</i>—Error message identification number.</li><li>• <b>failure</b>—Failed audit event logs.</li><li>• <b>interface-name</b> <i>interface-name</i>—Name of the interface.</li><li>• <b>policy-name</b> <i>policy-name</i>—Policy name filter.</li><li>• <b>process</b> <i>process-name</i>—Process that generated the event.</li><li>• <b>protocol</b> <i>protocol</i>—Protocol that generated the event.</li><li>• <b>source-ip</b> <i>source-address</i>—Source IP address.</li><li>• <b>source-port</b> <i>source-port</i>—Source port number.</li><li>• <b>success</b>—Successful audit event logs.</li><li>• <b>username</b> <i>user-name</i>—User name filter.</li></ul>
Required Privilege Level	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show security log on page 1709</a></li><li>• <a href="#">clear security log on page 1700</a></li></ul>

## facility-override

---

<b>Syntax</b>	<code>facility-override <i>facility</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.
<b>Options</b>	<i>facility</i> —Alternate facility to substitute for the default facilities. For a list of the possible facilities, see <i>Junos OS System Log Alternate Facilities for Remote Logging</i> .
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Changing the Alternative Facility Name for Remote System Log Messages</i></li><li>• <i>Junos OS System Log Reference</i></li></ul>

## file (Security Log)

---

Syntax	<pre>file {     files <i>max-file-number</i>;     name <i>file-name</i>;     path <i>binary-log-file-path</i>;     size <i>maximum-file-size</i>; }</pre>
Hierarchy Level	[edit security log]
Release Information	Statement modified in Release 9.2 of Junos OS.
Description	Configure security log file options for logs in binary format.
Options	<ul style="list-style-type: none"><li>• <b>files <i>number</i></b>—Specify the maximum number of binary log files. <b>Range:</b> 2 through 10 files.</li><li>• <b>name <i>name</i></b> —Name of the file to log messages.</li><li>• <b>path <i>filepath</i></b>—Specify the path of the binary log file.</li><li>• <b>size <i>maximum-file-size</i></b>—Maximum size of each trace file, in megabytes (MB). <b>Range:</b> 1 KB through 10 MB</li></ul>
Required Privilege Level	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## file (System Logging)

<b>Syntax</b>	<pre> file <i>filename</i> {     <i>facility severity</i>;     archive {         <i>files number</i>;         <i>size size</i>;         (no-world-readable   world-readable);     }     explicit-priority;     match "<i>regular-expression</i>";     structured-data {         brief;     } } </pre>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the logging of system messages to a file.
<b>Options</b>	<p><b><i>facility</i></b>—Class of messages to log. To specify multiple classes, include multiple <b><i>facility severity</i></b> statements. For a list of the facilities, see <a href="#">Table 246 on page 1642</a>.</p> <p><b><i>file filename</i></b>—File in the <code>/var/log</code> directory in which to log messages from the specified facility. To log messages to more than one file, include more than one <b><i>file</i></b> statement.</p> <p><b><i>severity</i></b>—Severity of the messages that belong to the facility specified by the paired <b><i>facility</i></b> name. Messages with severities of the specified level and higher are logged. For a list of the severities, see <a href="#">Table 247 on page 1643</a>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Directing System Log Messages to a Log File on page 1658</a></li> <li>• <a href="#">Junos OS System Log Reference</a></li> </ul>

## files

---

<b>Syntax</b>	<code>files <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog archive], [edit system syslog file <i>filename</i> archive]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i> , it closes the file, compresses it, and renames it to <i>logfile.0.gz</i> (for information about the maximum file size, see <a href="#">size</a> ). The utility then opens and writes to a new file called <i>logfile</i> . When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i> , and the new file is closed, compressed, and renamed <i>logfile.0.gz</i> . By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).
<b>Options</b>	<i>number</i> —Maximum number of archived files. <b>Range:</b> 1 through 1000 <b>Default:</b> 10 files
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Specifying Log File Size, Number, and Archiving Properties</i></li><li>• <i>Junos OS System Log Reference</i></li><li>• <a href="#">size on page 1687</a></li></ul>

## host (Security Log)

---

<b>Syntax</b>	host { <code>ip-address</code> ; port <code>port-number</code> ; }
<b>Hierarchy Level</b>	[edit security log stream <i>stream-name</i> ]
<b>Release Information</b>	Statement introduced in Release 9.2 of Junos OS.
<b>Description</b>	You can specify the IP address of the server to which the security logs will be streamed.
<b>Options</b>	<ul style="list-style-type: none"><li>• <code>ip-address</code>—Specify IP address of the host.</li><li>• port <code>port-number</code>—Specify UDP port number.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## limit (Security Log)

---

<b>Syntax</b>	limit <i>value</i> ;
<b>Hierarchy Level</b>	[edit security log cache]
<b>Release Information</b>	Statement modified in Release 9.2 of Junos OS.
<b>Description</b>	Specify the number of security log entries to be kept in memory.
<b>Options</b>	Once the maximum value limit is reached, new entries will not be added until the cache size drops. <b>Range:</b> 0 through 4,294,967,295
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## log (Services)

---

<b>Syntax</b>	<pre>log {   all;   errors;   info;   sessions-allowed;   sessions-dropped;   sessions-ignored;   sessions-whitelisted;   warning; }</pre>
<b>Hierarchy Level</b>	[edit services ssl proxy profile <i>profile-name</i> actions]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10.
<b>Description</b>	Specify the logging actions.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>all</b>—Log all events.</li><li>• <b>errors</b>—Log all error events.</li><li>• <b>info</b>—Log all information events.</li><li>• <b>sessions-allowed</b>—Log SSL session allowed events after an error.</li><li>• <b>sessions-dropped</b>—Log only SSL session dropped events.</li><li>• <b>sessions-ignored</b>—Log session ignored events.</li><li>• <b>sessions-whitelisted</b>—Log SSL session whitelisted events.</li><li>• <b>warning</b>—Log all warning events.</li></ul>
<b>Required Privilege Level</b>	services—To view this statement in the configuration. services-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Firewall User Authentication Feature Guide for Security Devices</i></li><li>• <i>Application Identification Feature Guide for Security Devices</i></li></ul>

## log-prefix

---

<b>Syntax</b>	<code>log-prefix <i>string</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Include a text string in each message directed to a remote destination.
<b>Options</b>	<i>string</i> —Text string to include in each message.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Text String to System Log Messages on page 1661</a></li><li>• <i>Junos OS System Log Reference</i></li></ul>

## log-rotate-frequency

---

<b>Syntax</b>	<code>log-rotate-frequency <i>frequency</i>;</code>
<b>Hierarchy Level</b>	[set system <a href="#">syslog</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3.
<b>Description</b>	Configure the system log file rotation frequency by configuring the time interval for checking the log file size.  When the log file size has exceeded the configured limit, the old log file is archived and a new log file is created.
<b>Options</b>	<i>frequency</i> —Frequency of rotation of the system log file. <b>Range:</b> 1 minute through 59 minutes <b>Default:</b> 15 minutes
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Specifying Log File Size, Number, and Archiving Properties</i></li><li>• <a href="#">syslog on page 1689</a></li></ul>

## match

---

<b>Syntax</b>	<code>match "regular-expression";</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit logical-systems <i>logical-system-name</i> system syslog user ( <i>username</i>   *)], [edit system syslog file <i>filename</i> ], [edit system syslog host <i>hostname</i>   other-routing-engine  scc-master)], [edit system syslog user ( <i>username</i>   *)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Using Regular Expressions to Refine the Set of Logged Messages on page 1664</a></li></ul>

## mode (Security Log)

---

<b>Syntax</b>	<code>mode (event   stream)</code>
<b>Hierarchy Level</b>	[edit security log]
<b>Release Information</b>	Statement introduced in Release 10.0 of Junos OS.
<b>Description</b>	Set the mode of logging (event for traditional system logging or stream for streaming security logs through a revenue port to a server).
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>event</b>—Process security logs in the control plane.</li><li>• <b>stream</b>—Process security logs directly in the forwarding plane.</li></ul> <p><b>Default:</b> event.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## no-remote-trace

---

See [tracing](#).

## pic-services-logging

---

<b>Syntax</b>	<pre>pic-services-logging {     command <i>binary-file-path</i>;     disable;     failover (alternate-media   other-routing-engine); }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Enable PICs to send special logging information to the Routing Engine for archiving on a hard disk.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>command <i>binary-file-path</i></b>—Path to the binary process.</li><li>• <b>disable</b>—Disable the PIC services logging process.</li><li>• <b>failover</b>—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.<ul style="list-style-type: none"><li>• <b>alternate-media</b>—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.</li><li>• <b>other-routing-engine</b>—Instruct the secondary Routing Engine to take mastership if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, the device reboots from the secondary Routing Engine.</li></ul></li></ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## port

---

<b>Syntax</b>	<code>port <i>port number</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog host <i>hostname</i>   other-routing-engine  scc-master)]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3.
<b>Description</b>	Specify the port number for the remote syslog server.
<b>Options</b>	<b><i>port number</i></b> —Port number of the remote syslog server. <b>Range:</b> 0 through 65535 <b>Default:</b> 514
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">syslog on page 1689</a></li><li>• <i>host</i></li></ul>

## security-log

<b>Syntax</b>	security-log { command <i>binary-file-path</i> ; disable; failover (alternate-media   other-routing-engine); }
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the security log process.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>command <i>binary-file-path</i></b>—Path to the binary process.</li> <li>• <b>disable</b>—Disable the security log process.</li> <li>• <b>failover</b>—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot. <ul style="list-style-type: none"> <li>• <b>alternate-media</b>—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.</li> <li>• <b>other-routing-engine</b>—Instruct the secondary Routing Engine to take mastership if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## security-log-percent-full

<b>Syntax</b>	security-log-percent-full <i>percentage</i> ;
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Release 11.2 of Junos OS.
<b>Description</b>	Raise a security alarm when security log exceeds a specified percent of total capacity.
<b>Options</b>	<i>percentage</i> —Percentage of security log capacity at which a security alarm is raised. <b>Range:</b> 0 through 100 percent
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>

## severity (Security Log)

---

<b>Syntax</b>	severity (alert   critical   debug   emergency   error   info   notice   warning)
<b>Hierarchy Level</b>	[edit security log stream <i>stream-name</i> ]
<b>Release Information</b>	Statement modified in Release 9.2 of Junos OS.
<b>Description</b>	Set severity threshold for security logs.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>alert</b>—Conditions that require immediate attention.</li><li>• <b>critical</b>—Critical conditions.</li><li>• <b>debug</b>—Information normally used in debugging.</li><li>• <b>emergency</b>—Conditions that cause security functions to stop.</li><li>• <b>error</b>—General error conditions.</li><li>• <b>info</b>—Information about normal security operations.</li><li>• <b>notice</b>—Nonerror conditions that are of interest.</li><li>• <b>warning</b>—General warning conditions.</li></ul> <p><b>Default:</b> debug.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## size

<b>Syntax</b>	<code>size size;</code>
<b>Hierarchy Level</b>	[edit system syslog archive], [edit system syslog file <i>filename</i> archive]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum amount of data that the Junos OS logging utility writes to a log file <b>logfile</b> before archiving it (closing it, compressing it, and changing its name to <b>logfile.0.gz</b> ). The utility then opens and writes to a new file called <b>logfile</b> . For information about the number of archive files that the utility creates in this way, see <a href="#">files</a> .
<b>Options</b>	<b>size</b> —Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). <b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes <b>Range:</b> 64 KB through 1 GB <b>Default:</b> 1 MB for MX Series routers and the QFX Series
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Specifying Log File Size, Number, and Archiving Properties</i></li> <li>• <i>Junos OS System Log Reference</i></li> <li>• <a href="#">files on page 1678</a></li> </ul>

## system

<b>Syntax</b>	<code>system { ... }</code>
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure system management properties.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## structured-data

---

<b>Syntax</b>	structured-data { brief; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit system syslog file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, <i>The syslog Protocol</i> ( <a href="http://tools.ietf.org/html/draft-ietf-syslog-protocol-23">http://tools.ietf.org/html/draft-ietf-syslog-protocol-23</a> ).
<div>  <p><b>NOTE:</b> When this statement is included, other statements that specify the format for messages written to the file are ignored (the <code>explicit-priority</code> statement at the [edit system syslog file <i>filename</i>] hierarchy level and the <code>time-format</code> statement at the [edit system syslog] hierarchy level).</p> </div>	
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Logging Messages in Structured-Data Format on page 1659</a></li> <li>• <i>Junos OS System Log Reference</i></li> <li>• <a href="#">explicit-priority on page 1673</a></li> <li>• <a href="#">time-format on page 1691</a></li> </ul>

## syslog

```

Syntax  syslog {
        archive {
            (binary-data | no-binary-data);
            files number;
            size maximum-file-size;
            start-time "YYYY-MM-DD.hh:mm";
            transfer-interval minutes;
            (world-readable | no-world-readable);
        }
        console {
            facility severity;
        }
        file filename {
            facility severity;
            explicit-priority;
            match "regular-expression";
            archive {
                (binary-data | no-binary-data);
                files number;
                size maximum-file-size;
                start-time "YYYY-MM-DD.hh:mm";
                transfer-interval minutes;
                (world-readable | no-world-readable);
            }
            structured-data {
                brief;
            }
        }
        host (hostname | other-routing-engine | scc-master) {
            facility severity;
            explicit-priority;
            facility-override facility;
            log-prefix string;
            match "regular-expression";
            source-address source-address;
            structured-data {
                brief;
            }
            port port number;
        }
        log-rotate-frequency frequency;
        source-address source-address;
        time-format (millisecond | year | year millisecond);
        user (username | *) {
            facility severity;
            match "regular-expression";
        }
    }

```

**Hierarchy Level** [edit logical-systems *logical-system-name* system],  
[edit system]

<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Support at the <b>[edit logical-systems <i>logical-system-name</i> system]</b> hierarchy level introduced in Junos OS Release 11.4.
<b>Description</b>	Configure the types of system log messages to log to files, a remote destination, user terminals, or the system console.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Junos OS System Log Configuration Overview on page 1633</a></li><li>• <a href="#">Junos OS System Log Reference</a></li></ul>

## time-format

<b>Syntax</b>	<code>time-format (year   millisecond   year millisecond);</code>
<b>Hierarchy Level</b>	<code>[edit system syslog]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a <b>file</b>, <b>console</b>, or <b>user</b> statement at the <code>[edit system syslog]</code> hierarchy level, but not to destinations configured by a <b>host</b> statement.</p> <p>By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, <b>Aug 21 12:36:30</b>. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the <code>[edit system syslog time-format]</code> statement.</p>
	<p> <b>NOTE:</b> When the <b>structured-data</b> statement is included at the <code>[edit system syslog file filename]</code> hierarchy level, this statement is ignored for the file.</p>
<b>Options</b>	<p><b>millisecond</b>—Include the millisecond in the timestamp.</p> <p><b>year</b>—Include the year in the timestamp.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Including the Year or Millisecond in Timestamps on page 1663</a></li> <li>• <a href="#">Junos OS System Log Reference</a></li> <li>• <a href="#">structured-data on page 1688</a></li> </ul>

## traceoptions (Security Log)

<b>Syntax</b>	<pre> traceoptions {   file {     filename;     files number;     match regular-expression;     size maximum-file-size;     (world-readable   no-world-readable);   }   flag flag;   no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit security log]
<b>Release Information</b>	Statement modified in Release 9.2 of Junos OS.
<b>Description</b>	Configure security log tracing options.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>file</b>—Configure the trace file options. <ul style="list-style-type: none"> <li><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>. By default, the name of the file is the name of the process being traced.</li> <li><b>files number</b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten. <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> </li> </ul> </li> <li><b>match regular-expression</b>—Refine the output to include lines that contain the regular expression.</li> <li><b>size maximum-file-size</b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option and a filename.</p> <p>Syntax: <b>x K</b> to specify KB, <b>x m</b> to specify MB, or <b>x g</b> to specify GB</p> <p>Range: 10 KB through 1 GB</p> </li> </ul>

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.
  - **all**—Trace with all flags enabled
  - **configuration**—Trace configuration events
  - **hpl**— Trace HPL logging
  - **report**— Trace HPL logging
  - **source**—Communicate with security log forwarder
- **no-remote-trace**—Set remote tracing as disabled.

<b>Required Privilege</b>	trace—To view this statement in the configuration.
<b>Level</b>	trace-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>
------------------------------	---

## tracing

---

Syntax	<pre>tracing {   destination-override syslog host <i>ip-address</i>; }</pre>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	<p>Configure the router to enable remote tracing to a specified host IP address. The default setting is disabled.</p> <p>The following processes are supported:</p> <ul style="list-style-type: none"><li>• <b>chassisd</b>—Chassis-control process</li><li>• <b>eventd</b>—Event-processing process</li><li>• <b>cosd</b>—Class-of-service process</li><li>• <b>spd</b>—Adaptive-services process</li></ul> <p>You can use the <b>no-remote-trace</b> statement, under the [edit system process-name <b>traceoptions</b>] hierarchy, to disable remote tracing.</p>
Options	<b>destination-override syslog host <i>ip-address</i></b> —Overrides the global config under <b>system tracing</b> and has no effect if <b>system tracing</b> is not configured.
Required Privilege Level	<b>system</b> —To view this statement in the configuration. <b>system-control</b> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">destination-override on page 1672</a></li><li>• <a href="#">no-remote-trace on page 1682</a></li></ul>

## user (System Logging)

<b>Syntax</b>	<pre> user (username   *) {     facility severity;     match "regular-expression"; } </pre>
<b>Hierarchy Level</b>	[edit system syslog]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the logging of system messages to user terminals.
<b>Options</b>	<p><b>*</b> (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.</p> <p><b>facility</b>—Class of messages to log. To specify multiple classes, include multiple <b>facility severity</b> statements. For a list of the facilities, see <a href="#">Table 246 on page 1642</a>.</p> <p><b>severity</b>—Severity of the messages that belong to the facility specified by the paired <b>facility</b> name. Messages with severities the specified level and higher are logged. For a list of the severities, see <a href="#">Table 247 on page 1643</a>.</p> <p><b>username</b>—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one <b>user</b> statement.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Directing System Log Messages to a User Terminal on page 1660</a></li> <li>• <a href="#">Junos OS System Logging Facilities and Message Severity Levels on page 1642</a></li> <li>• <a href="#">Junos OS System Log Reference</a></li> </ul>

## world-readable

---

<b>Syntax</b>	world-readable   no-world-readable;
<b>Hierarchy Level</b>	[edit system <a href="#">syslog archive</a> ], [edit system <a href="#">syslog file filename</a> archive]
<b>Release Information</b>	Statement introduced before OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Grant all users permission to read log files, or restrict the permission only to the <b>root</b> user and users who have the Junos <b>maintenance</b> permission.
<b>Default</b>	no-world-readable
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Specifying Log File Size, Number, and Archiving Properties</a></li><li>• <a href="#">Junos OS System Log Reference</a></li></ul>

## Administration

---

- [System Log Messages on page 1696](#)
- [Operational Commands on page 1697](#)

### System Log Messages

- [Monitoring System Log Messages with the J-Web Event Viewer on page 1696](#)

#### [Monitoring System Log Messages with the J-Web Event Viewer](#)

---

<b>Purpose</b>	Monitor errors and events that occur on the device.
<b>Action</b>	Select <b>Monitor&gt;Events and Alarms&gt;View Events</b> in the J-Web user interface.  The J-Web View Events page displays the following information about each event: <ul style="list-style-type: none"><li>• <b>Process</b>—System process that generated the error or event.</li><li>• <b>Severity</b>— A severity level indicates how seriously the triggering event affects routing platform functions. Only messages from the facility that are rated at that level or higher are logged. Possible severities and their corresponding color code are:<ul style="list-style-type: none"><li>• <b>Debug/Info/Notice (Green)</b>—Indicates conditions that are not errors but are of interest or might warrant special handling.</li><li>• <b>Warning (Yellow)</b>—Indicates conditions that warrant monitoring.</li><li>• <b>Error (Blue)</b>—Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.</li></ul></li></ul>

- Critical (Pink)—Indicates critical conditions, such as hard drive errors.
- Alert (Orange)—Indicates conditions that require immediate correction, such as a corrupted system database.
- Emergency (Red)—Indicates system panic or other conditions that cause the routing platform to stop functioning.
- Event ID—Unique ID of the error or event. The prefix on each code identifies the generating software process. The rest of the code indicates the specific event or error.
- Event Description—Displays a more detailed explanation of the message.
- Time—Time that the error or event occurred.

To control which errors and events are displayed in the list, use the following options:

- System Log File—Specify the name of the system log file that records the errors and events.
- Process—Specify the system processes that generate the events you want to display. To view all the processes running on your system, enter the **show system processes** CLI command.
- Date From—Specify the beginning of the date range that you want to monitor. Set the date using the calendar pick tool.
- To—Specify the end of the date range that you want to monitor. Set the date using the calendar pick tool.
- Event ID—Specify the specific ID of the error or event that you want to monitor.
- Description—Enter a description for the errors or events.
- Search—Fetches the errors and events specified in the search criteria.
- Reset—Clears the cache of errors and events that were previously selected.
- Generate Report—Creates an HTML report based on the specified parameters.

## clear log

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<i>filename</i> —Name of the specific log file to delete.  <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show log on page 1707</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 1699</a>

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r----- 1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r----- 1 root  wheel      57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear security log

---

**Syntax** clear security log  
<all>  
<destination-address>  
<destination-port>  
<event-id>  
<failure>  
<interface-name>  
<newer-than>  
<older-than>  
<process>  
<protocol>  
<severity>  
<source-address>  
<source-port>  
<success>  
<username>

**Release Information** Command introduced in Release 11.2 of Junos OS.

**Description** Deletes the event log.

**Options** **all**—Clears all audit event logs stored in the device memory.

**destination-address**—Clears audit event logs with the specified destination address.

**destination-port**—Clears audit event logs with the specified destination port.

**event-id**—Clears audit event logs with the specified event identification number.

**failure**—Clears failed audit event logs.

**interface-name**—Clears audit event logs with the specified interface.

**newer-than**—Clears audit event logs newer than the specified date and time.

**older-than**—Clears audit event logs older than the specified date and time.

**process**—Clears audit event logs with the specified process that generated the event.

**protocol**—Clears audit event logs generated through the specified protocol.

**severity**—Clears audit event logs generated with the specified severity.

**source-address**—Clears audit event logs with the specified source address.

**source-port**—Clears audit event logs with the specified source port.

**success**—Clears successful audit event logs.

**username**—Clears audit event logs generated for the specified user.

**Required Privilege Level**    clear

## Sample Output

`clear security log all`

```
user@host> clear security log all
7905 security log events cleared
```

## clear security log file

---

<b>Syntax</b>	clear security log file
<b>Release Information</b>	Command introduced in Release 12.1 of Junos OS.
<b>Description</b>	Deletes the content of an event mode security log file stored on the device in binary format.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security log file on page 1712</a></li><li>• <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## Sample Output

### clear security log file

```
user@host> clear security log file
7905 security log events cleared
```

## monitor list

<b>Syntax</b>	monitor list
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display the status of monitored log and trace files.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are those configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols protocol]</b> hierarchy levels.
<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">monitor start on page 1513</a></li> <li><a href="#">monitor stop on page 1515</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">monitor list on page 1703</a>
<b>Output Fields</b>	<a href="#">Table 222 on page 1512</a> describes the output fields for the <b>monitor list</b> command. Output fields are listed in the approximate order in which they appear.

**Table 252: monitor list Output Fields**

Field Name	Field Description
<b>monitor start</b>	Indicates the file is being monitored.
<b>"filename"</b>	Name of the file that is being monitored.
<b>Last changed</b>	Date and time at which the file was last modified.

## Sample Output

### monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

## monitor start

<b>Syntax</b>	<code>monitor start <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Start displaying the system log or trace file and additional entries being added to those files.
<b>Options</b>	<i>filename</i> —Specific log or trace file.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols protocol]</b> hierarchy levels.

**NOTE:** To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">monitor list on page 1512</a></li> <li><a href="#">monitor stop on page 1515</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">monitor start on page 1705</a>
<b>Output Fields</b>	<a href="#">Table 223 on page 1513</a> describes the output fields for the <b>monitor start</b> command. Output fields are listed in the approximate order in which they appear.

**Table 253: monitor start Output Fields**

Field Name	Field Description
<b>***<i>filename</i>***</b>	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
<b><i>Date and time</i></b>	Timestamp for the log entry.

## Sample Output

### monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from host.example.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

## monitor stop

---

<b>Syntax</b>	<code>monitor stop <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Stop displaying the system log or trace file.
<b>Options</b>	<i>filename</i> —Specific log or trace file.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are those configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols <i>protocol</i>]</b> hierarchy levels.
<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">monitor list on page 1512</a></li><li>• <a href="#">monitor start on page 1513</a></li></ul>

## show security log

<b>Syntax</b>	<code>show security log {<i>all</i> <i>destination-address</i> <i>destination-port</i> <i>event-id</i> <i>failure</i> <i>interface-name</i> <i>newer-than</i> <i>older-than</i> <i>process</i> <i>protocol</i> <i>severity</i> <i>sort-by</i> <i>source-address</i> <i>source-port</i> <i>success</i> <i>user</i>}</code>
<b>Release Information</b>	Command introduced in Release 11.2 of Junos OS.
<b>Description</b>	Display security event logs. This command continuously displays security events on the screen. To stop the display, press Ctrl+c.
<b>Options</b>	<p><b>all</b>—Displays all audit event logs stored in the device memory.</p> <p><b>destination-address</b>—Displays audit event logs with the specified destination address.</p> <p><b>destination-port</b>—Displays audit event logs with the specified destination port.</p> <p><b>event-id</b>—Displays audit event logs with the specified event identification number.</p> <p><b>failure</b>—Displays failed audit event logs.</p> <p><b>interface-name</b>—Displays audit event logs with the specified interface.</p> <p><b>newer-than</b>—Displays audit event logs newer than the specified date and time.</p> <p><b>older-than</b>—Displays audit event logs older than the specified date and time.</p> <p><b>process</b>—Displays audit event logs with the specified process that generated the event.</p> <p><b>protocol</b>—Displays audit event logs generated through the specified protocol.</p> <p><b>severity</b>—Displays audit event logs generated with the specified severity.</p> <p><b>sort-by</b>—Displays audit event logs generated sorted with the specified options.</p> <p><b>source-address</b>—Displays audit event logs with the specified source address.</p> <p><b>source-port</b>—Displays audit event logs with the specified source port.</p> <p><b>success</b>—Displays successful audit event logs.</p> <p><b>username</b>—Displays audit event logs generated for the specified user.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">exclude (Security Log) on page 1674</a></li> <li>• <a href="#">clear security log on page 1700</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security log on page 1710</a>

**Output Fields** Table 254 on page 1710 lists the output fields for the **show security log** command. Output fields are listed in the approximate order in which they appear.

**Table 254: show security log Output Fields**

Field Name	Field Description
Event time	The timestamp of the events received.  On SRX Series devices, security logs were always timestamped using the UTC time zone by running <b>set system time-zone utc</b> and <b>set security log utc-timestamp</b> CLI commands. Now, time zone can be defined using the local time zone by running the <b>set system time-zone time-zone</b> command to specify the local time zone that the system should use when timestamping the security logs.
Message	Security events are listed.

## Sample Output

## Understanding the SNMP Implementation in Junos OS

---

SNMP enables the monitoring of network devices from a central location. This topic provides an overview of SNMP and describes how SNMP is implemented in the Junos OS.

This topic includes the following sections:

- [SNMP Architecture on page 1716](#)
- [Junos OS SNMP Agent Features on page 1718](#)

### **SNMP Architecture**

The SNMP agent exchanges network management information with SNMP manager software running on a network management system (NMS), or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

The SNMP manager collects information about network connectivity, activity, and events by polling managed devices.

Communication between the agent and the manager occurs in one of the following forms:

- **Get, GetBulk, and GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

This topic contains the following sections:

- [SNMP MIBs on page 1716](#)
- [SNMP Traps and Informs on page 1717](#)

### **SNMP MIBs**

A MIB is a hierarchy of information used to define managed objects in a network device. The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device.

MIBs are either standard or enterprise-specific. Standard MIBs are created by the Internet Engineering Task Force (IETF) and documented in various RFCs. Depending on the vendor, many standard MIBs are delivered with the NMS software. You can also download the standard MIBs from the IETF website, [www.ietf.org](http://www.ietf.org), and compile them into your NMS, if necessary.

For a list of standard supported MIBs, see [“Standard SNMP MIBs Supported by Junos OS” on page 1719](#).

Enterprise-specific MIBs are developed and supported by a specific equipment manufacturer. If your network contains devices that have enterprise-specific MIBs, you must obtain them from the manufacturer and compile them into your network management software.

For a list of Juniper Networks enterprise-specific supported MIBs, see [“Juniper Networks Enterprise-Specific MIBs” on page 1733](#).

### ***SNMP Traps and Informs***

Routers can send notifications to SNMP managers when significant events occur on a network device, most often errors or failures. SNMP notifications can be sent as traps or inform requests. SNMP traps are unconfirmed notifications. SNMP informs are confirmed notifications.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. The standard traps are compiled into the network management software. You can also download the standard traps from the IETF website, [www.ietf.org](http://www.ietf.org).

For more information about standard traps supported by the Junos OS, see [“Standard SNMP Traps Supported on Devices Running Junos OS” on page 1785](#).

Enterprise-specific traps are developed and supported by a specific equipment manufacturer. If your network contains devices that have enterprise-specific traps, you must obtain them from the manufacturer and compile them into your network management software.

For more information about enterprise-specific traps supported by the Junos OS, see [“Juniper Networks Enterprise-Specific SNMP Traps” on page 1785](#). For information about system logging severity levels for SNMP traps, see [“System Logging Severity Levels for SNMP Traps” on page 1718](#).

With traps, the receiver does not send any acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. To increase reliability, SNMP informs are supported in SNMPv3. An SNMP manager that receives an inform acknowledges the message with a response. For information about SNMP informs, see [“Configuring SNMP Informs” on page 1823](#).

### ***SNMP Trap Queuing***

The Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and to control the trap traffic.

The Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and adds the subsequent traps to the same destination to the queue. The Junos OS checks for availability of routes every 30 seconds and sends the traps from the destination queue in a round-robin fashion. If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next

delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is 10. After 10 unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

The Junos OS also has a throttle mechanism to control the number of traps (**throttle threshold**; default value of 500 traps) sent during a particular time period (**throttle interval**; default of 5 seconds) and to ensure consistency in trap traffic, especially when a large number of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The maximum size of trap queues (that is, the throttle queue and the destination queue combined) is 40,000 traps. However, on EX Series switches, the maximum size of the trap queue is 1000 traps. The maximum size of any one queue is 20,000 traps for devices other than EX Series switches. On EX Series switches, the maximum size of one queue is 500 traps. If a trap is sent from a destination queue when the throttle queue has exceeded the maximum size, the trap is added back to the top of the destination queue, and all subsequent attempts from the destination queue are stopped for a 30-second period, after which the destination queue restarts sending the traps.

**NOTE:** Users cannot configure the Junos OS for trap queuing. Users cannot view any information about trap queues except what is available in the syslog.

---

### ***System Logging Severity Levels for SNMP Traps***

For some traps, when a trap condition occurs, regardless of whether the SNMP agent sends a trap to an NMS, the trap is logged if the system logging is configured to log an event with that system logging severity level. For more information about system logging severity levels, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.

For more information about system logging severity levels for standard traps, see [“Standard SNMP Version 1 Traps” on page 1786](#) and [“Standard SNMP Version 2 Traps” on page 1789](#). For more information about system logging severity levels for enterprise-specific traps, see *Juniper Networks Enterprise-Specific SNMP Version 1 Traps* and *Juniper Networks Enterprise-Specific SNMP Version 2 Traps*.

### ***Junos OS SNMP Agent Features***

The Junos OS SNMP agent software consists of an SNMP master agent that delegates all SNMP requests to subagents. Each subagent is responsible for the support of a specific set of MIBs.

The Junos OS supports the following versions of SNMP:

- **SNMPv1**—The initial implementation of SNMP that defines the architecture and framework for SNMP.
- **SNMPv2c**—The revised protocol, with improvements to performance and manager-to-manager communications. Specifically, SNMPv2c implements community strings, which act as passwords when determining who, what, and how the SNMP

clients can access the data in the SNMP agent. The community string is contained in SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests. The agent may require a different community string for **Get**, **GetBulk**, and **GetNext** requests (**read-only** access) than it does for **Set** requests (**read-write** access).

- **SNMPv3**—The most up-to-date protocol focuses on security. SNMPv3 defines a security model, user-based security model (USM), and a view-based access control model (VACM). SNMPv3 USM provides data integrity, data origin authentication, message replay protection, and protection against disclosure of the message payload. SNMPv3 VACM provides access control to determine whether a specific type of access (read or write) to the management information is allowed.

In addition, the Junos OS SNMP agent software accepts IPv4 and IPv6 addresses for transport over IPv4 and IPv6. For IPv6, the Junos OS supports the following features:

- SNMP data over IPv6 networks
- IPv6-specific MIB data
- SNMP agents for IPv6

### Standard SNMP MIBs Supported by Junos OS

Table 256 on page 1720 contains the list of standard SNMP MIBs and RFCs that are supported on various devices running Junos OS. RFCs can be found at <http://www.ietf.org>

**NOTE:** In this table, a value of 1 in any of the platform columns (M, T, J, MX, EX, and SRX) denotes that the corresponding MIB is supported on that particular platform, and a value of 0 denotes that the MIB is not supported on the platform.

### Juniper Networks Enterprise-Specific MIBs

The Junos OS supports the following enterprise-specific MIBs:

- **AAA Objects MIB**—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-user-aaa.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-user-aaa.txt). For more information, see *AAA Objects MIB*.
- **Access Authentication Objects MIB**—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt). For more information, see *Access Authentication Objects MIB*.
- **Alarm MIB**—Provides support for alarms from the router. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt).

For more information, see *Alarm MIB*.

- ATM Class-of-Service MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm-cos.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm-cos.txt)

For more information, see *ATM Class-of-Service MIB*.

- ATM MIB—Provides support for ATM interfaces and virtual connections. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm.txt).

For more information, see *ATM MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, *Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version*. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt).

For more information, see *BGP4 V2 MIB*.

- Bidirectional Forwarding Detection MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bfd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bfd.txt).

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis Definitions for Router Model MIB—Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify platform and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chas-defines.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chas-defines.txt).

For more information, see *Chassis MIBs*.

- Chassis Forwarding MIB—Enables J Series Services Routers to fully support the Junos OS health monitor. This MIB extends the scope of health monitoring to include Junos forwarding process (**fwdd**) components. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-fwdd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-fwdd.txt).

For more information, see *Chassis Forwarding MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switch Board (SSB), Switching and Forwarding Module (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis.txt) .

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-jsrpd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-jsrpd.txt) .

For more information, see *Chassis Cluster MIB* .

- Class-of-Service MIB—Provides support for monitoring interface output queue statistics per interface and per forwarding class. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-cos.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-cos.txt) .

For more information, see *Class-of-Service MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-cfgmgmt.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-cfgmgmt.txt) .

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by the input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-dcu.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-dcu.txt) .

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-dns.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-dns.txt) .

For more information, see *DNS Objects MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-event.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-event.txt) .

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-firewall.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-firewall.txt).

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage format. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-hostresources.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-hostresources.txt).

For more information, see *Host Resources MIB*.

- IDP Objects MIB—Provides support for monitoring SNMP IDP queries, requests, responses, and failures. This MIB defines the key monitoring and threshold crossing trap support, IDP database update status and trap support, attack-related monitoring and trap support for SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways. This MIB models IDP attributes specific to the appropriate Juniper Networks implementation. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-idp.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-idp.txt).

For more information, see *IDP MIB*.

- Interface MIB—Extends the standard **ifTable** (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-if-extensions.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-if-extensions.txt).

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipforward.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipforward.txt).

For more information, see *IP Forward MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt).

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this

MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt).

For more information, see *IPsec Monitoring MIB*.

- IPsec VPN Objects MIB—Provides support for monitoring IPsec and IPsec VPN management objects for Juniper security product lines. This MIB is an extension of **jnx-ipsec-flow-mon.mib**. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-ipsec-vpn.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-ipsec-vpn.txt).

For more information, see *IPsec VPN Objects MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv4.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv4.txt).

For more information, see *IPv4 MIB*.

- IPv6 and ICMPv6 MIB—Provides IPv6 and Internet Control Message Protocol version 6 (ICMPv6) statistics. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv6.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv6.txt).

For more information, see *IPv6 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-license.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-license.txt).

For more information, see *License MIB*.

- Logical Systems MIBs—Extend SNMP support to logical systems security profile through various MIBs defined under **jnxLsysSecurityProfile**.

For more information about logical systems MIBs and downloadable versions of the MIBs, see *Logical Systems MIB*.

- NAT Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-nat.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-nat.txt).

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-pfe.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-pfe.txt).

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in **pingCtlTable** of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ping.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ping.txt).

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-policy.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-policy.txt).

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-rpf.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-rpf.txt).

**NOTE:** The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments **alarmTable** with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-rmon.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-rmon.txt).

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-if-ext.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-if-ext.txt).

For more information, see *Security Interface Extension Objects MIB*.

- Security Screening Objects MIB—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-screening.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-screening.txt).

For more information, see *Security Screening Objects MIB*.

- Source Class Usage MIB—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-scu.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-scu.txt).

For more information, see *Source Class Usage MIB*.

- SPU Monitoring MIB—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt).

For more information, see *SPU Monitoring Objects MIB*.

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for J Series and SRX Series devices, services, and traps. This MIB is currently supported by Junos OS for J Series and SRX Series devices only.

Explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-smi.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-smi.txt).

For more information, see *Structure of Management Information MIB*.

- System Log MIB—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-syslog.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-syslog.txt).

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the **traceRouteCtlTable** of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-traceroute.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-traceroute.txt).

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information about each type of data, such as integer and string. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-util.txt).

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-cert.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-cert.txt).

For more information, see *VPN Certificate Objects MIB*.

- VPN MIB—Provides monitoring for Layer 3 VPNs, Layer 2 VPNs, and virtual private LAN service (VPLS) (read access only). For a downloadable version of the MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-vpn.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-vpn.txt).

For more information, see *VPN MIB*.

#### Related Documentation

#### List of SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways Supported Enterprise-Specific MIBs

---

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for J Series and SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-smi.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-smi.txt). For more information, see *Structure of Management Information MIB*.

- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt).

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt).

For more information, see *Alarm MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt).

For more information, see *BGP4 V2 MIB*.

- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-bfd.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-bfd.txt).

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-chassis.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-chassis.txt).

For more information, see *Chassis MIBs*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-cfgmgmt.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-cfgmgmt.txt).

For more information, see *Configuration Management MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inocets**, **inframes**, **outocets**, and **outframes** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-mac.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-mac.txt).

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-event.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-event.txt).

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-firewall.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-firewall.txt).

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the

**hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-hostresources.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-hostresources.txt).

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-if-extensions.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-if-extensions.txt).

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipforward.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipforward.txt).

For more information, see *IP Forward MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt).

For more information, see *IPsec Monitoring MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt).

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipv4.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-ipv4.txt).

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-license.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-license.txt).

For more information, see *License MIB*.

- Network Address Translation (NAT) Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-nat.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-nat.txt).

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-pfe.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-pfe.txt).

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-ping.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-ping.txt).

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-policy.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-policy.txt).

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-rpf.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-rpf.txt).

**NOTE:** The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments alarmTable with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-rmon.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-rmon.txt).

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported only by Junos OS for J Series

and SRX Series devices. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-if-ext.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-if-ext.txt).

For more information, see *Security Interface Extension Objects MIB*.

- **SNMP IDP Objects MIB**—Provides support for monitoring SNMP IDP queries, requests, responses, and failures. This MIB defines the key monitoring and threshold crossing trap support, IDP database update status and trap support, attack-related monitoring and trap support for SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways. This MIB models IDP attributes specific to the appropriate Juniper Networks implementation. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-idp.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-idp.txt).

For more information, see *SNMP IDP MIB*.

- **System Log MIB**—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-syslog.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-syslog.txt).

For more information, see *System Log MIB*.

- **Traceroute MIB**—Supports the Junos extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the traceRouteCtlTable of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-traceroute.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-traceroute.txt).

For more information, see *Traceroute MIB*.

- **Utility MIB**—Provides SNMP support for exposing Junos data and has tables that contain information on each type of data, such as integer and string. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-util.txt).

For more information, see *Utility MIB*.

- **VPN Certificate Objects MIB**—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-cert.txt](http://www.juniper.net/techpubs/en_US/junos12.1X46/topics/reference/mibs/mib-jnx-js-cert.txt).

For more information, see *VPN Certificate Objects MIB*.

- *Structure of Management Information MIB*

## List of SRX1400, SRX3400, and SRX3600 Services Gateways Supported Enterprise-Specific MIBs

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for J Series and SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-smi.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-smi.txt). For more information, see *Structure of Management Information MIB*.

- AAA Objects MIB—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-user-aaa.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-user-aaa.txt).

For more information, see *AAA Objects MIB*.

- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt).

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt).

For more information, see *Alarm MIB*.

- ATM CoS MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm-cos.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm-cos.txt).

For more information, see *ATM Class-of-Service MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt).

For more information, see *BGP4 V2 MIB*.

- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bfd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bfd.txt).

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis.txt).

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-jsrpd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-jsrpd.txt).

For more information, see *Chassis Cluster MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-cfgmgmt.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-cfgmgmt.txt).

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-dcu.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-dcu.txt).

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-dns.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-dns.txt).

For more information, see *DNS Objects MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inOctets**, **inFrames**, **outOctets**, and **outFrames** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-mac.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-mac.txt).

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-event.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-event.txt).

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-firewall.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-firewall.txt).

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-hostresources.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-hostresources.txt).

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard **ifTable** (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-if-extensions.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-if-extensions.txt).

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipforward.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipforward.txt).

For more information, see *IP Forward MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt).

For more information, see *IPsec Monitoring MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt).

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv4.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv4.txt).

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-license.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-license.txt).

For more information, see *License MIB*.

- Logical Systems MIB—Provides support for logical systems security profile. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt).

For more information, see *Logical Systems MIB*.

- NAT Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-nat.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-nat.txt).

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-pfe.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-pfe.txt).

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in **pingCtlTable** of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ping.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ping.txt).

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported by Junos

OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-policy.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-policy.txt).

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-rpf.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-rpf.txt).

**NOTE:** The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments **alarmTable** with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-rmon.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-rmon.txt).

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-if-ext.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-if-ext.txt).

For more information, see *Security Interface Extension Objects MIB*.

- Security Screening Objects MIB—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-screening.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-screening.txt).

For more information, see *Security Screening Objects MIB*.

- Source Class Usage MIB—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-scu.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-scu.txt).

For more information, see *Source Class Usage MIB*.

- SPU Monitoring MIB—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt) .

For more information, see *SPU Monitoring Objects MIB*.

- System Log MIB—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-syslog.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-syslog.txt) .

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the **traceRouteCtlTable** of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-traceroute.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-traceroute.txt) .

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information about each type of data, such as integer and string. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-util.txt) .

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported by Junos OS for J Series and SRX Series devices only. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-cert.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-cert.txt) .

For more information, see *VPN Certificate Objects MIB*.

- *Structure of Management Information MIB*

#### List of SRX5400, SRX5600 and SRX5800 Services Gateways Supported Enterprise-Specific MIBs

---

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for J Series and SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-smi.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-smi.txt) . For more information, see *Structure of Management Information MIB*.
- AAA Objects MIB—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-user-aaa.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-user-aaa.txt) .  
  
For more information, see *AAA Objects MIB*.
- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-auth.txt) .  
  
For more information, see *Access Authentication Objects MIB*.
- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis-alarm.txt) .  
  
For more information, see *Alarm MIB*.
- ATM CoS MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm-cos.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-atm-cos.txt) .  
  
For more information, see *ATM Class-of-Service MIB*.
- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bgpmib2.txt) .  
  
For more information, see *BGP4 V2 MIB*.
- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-bfd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-bfd.txt) .

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-chassis.txt).

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-jsrpd.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-jsrpd.txt).

For more information, see *Chassis Cluster MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-cfgmgmt.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-cfgmgmt.txt).

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-dcu.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-dcu.txt).

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-dns.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-dns.txt).

For more information, see *DNS Objects MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inocets**, **inframes**, **outocets**, and **outframes** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/jnx-mac.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/jnx-mac.txt).

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-event.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-event.txt).

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-firewall.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-firewall.txt).

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-hostresources.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-hostresources.txt).

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-if-extensions.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-if-extensions.txt).

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipforward.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipforward.txt).

For more information, see *IP Forward MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt).

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt).

For more information, see *IPsec Monitoring MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv4.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ipv4.txt).

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-license.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-license.txt).

For more information, see *License MIB*.

- Logical Systems MIB—Provides support for logical systems security profile. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt).

For more information, see *Logical Systems MIB*.

- Network Address Translation (NAT) Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-nat.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-nat.txt).

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-pfe.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-pfe.txt).

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-ping.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-ping.txt).

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-policy.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-policy.txt).

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB,

see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-rpf.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-rpf.txt).

**NOTE:** The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- **RMON Events and Alarms MIB**—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments alarmTable with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-rmon.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-rmon.txt).

For more information, see *RMON Events and Alarms MIB*.

- **Security Interface Extension Objects MIB**—Provides support for the security management of interfaces. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-if-ext.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-if-ext.txt).

For more information, see *Security Interface Extension Objects MIB*.

- **Security Screening Objects MIB**—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-screening.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-screening.txt).

For more information, see *Security Screening Objects MIB*.

- **Source Class Usage MIB**—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-scu.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-scu.txt).

For more information, see *Source Class Usage MIB*.

- **SPU Monitoring MIB**—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt).

For more information, see *SPU Monitoring Objects MIB*.

- **System Log MIB**—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-syslog.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-syslog.txt).

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the traceRouteCtlTable of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-traceroute.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-traceroute.txt).

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information on each type of data, such as integer and string. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-util.txt).

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported only by Junos OS for J Series and SRX Series devices. For a downloadable version of this MIB, see [http://www.juniper.net/techpubs/en\\_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-cert.txt](http://www.juniper.net/techpubs/en_US/junos12.1x46/topics/reference/mibs/mib-jnx-js-cert.txt).

For more information, see *VPN Certificate Objects MIB*.

### Enterprise-Specific MIBs and Supported Devices

Table 257 on page 1757 lists the enterprise-specific MIBs that are supported on various devices running the Junos OS.

**NOTE:** In this table, a value of 1 in any of the platform columns (M, MX, T, EX, J, and SRX) denotes that the corresponding MIB is supported on that particular platform. A value of 0 denotes that the MIB is not supported on the platform.

**NOTE:** This topic uses the following classification for SRX Series devices: Low-End (SRX100, SRX110, SRX210, SRX220, and SRX240), Mid-Range (SRX550 and SRX650), and High-End (SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800).

Table 257: Enterprise-Specific MIBs and Supported Devices

Enterprise-Specific MIB	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
AAA Objects MIB <a href="http://www.juniper.net/techpubs/en_US/junos12.1/topics/reference/mibs/mib-jnx-user-aaa.txt">http://www.juniper.net/techpubs/en_US/junos12.1/topics/reference/mibs/mib-jnx-user-aaa.txt</a>	1	1	0	0	0	0	1	1
Access Authentication Objects MIB <a href="http://www.juniper.net/techpubs/en_US/junos12.1/topics/reference/mibs/mib-jnx-js-auth.txt">http://www.juniper.net/techpubs/en_US/junos12.1/topics/reference/mibs/mib-jnx-js-auth.txt</a>	0	0	0	0	1	1	1	1

## MIB Support Details

Table 258 on page 1766 shows enterprise-specific MIB objects supported by Junos OS and provides notes detailing how they are handled when a routing instance is specified in an SNMP request. An en dash (–) indicates that the item is not applicable.

**Table 258: MIB Support for Routing Instances (Juniper Networks MIBs)**

Object	Support Class	Description/Notes
jnxProducts(1)	–	Product Object IDs
jnxServices(2)	–	Services
jnxMibs(3) jnxBoxAnatomy(1)	Class 3	Objects are exposed only for the default logical system.
mpls(2)	Class 2	All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
ifJnx(3)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxAlarms(4)	Class 3	Objects are exposed only for the default logical system.
jnxFirewalls(5)	Class 4	Data is not segregated by routing instance. All instances are exposed.
jnxDCUs(6)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxPingMIB(7)	Class 3	Objects are exposed only for the default logical system.
jnxTraceRouteMIB(8)	Class 3	Objects are exposed only for the default logical system.
jnxATM(10)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxIpv6(11)	Class 4	Data is not segregated by routing instance. All instances are exposed.
jnxIpv4(12)	Class 1	<b>jnxIpv4AddrTable(1).</b> Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.

Table 258: MIB Support for Routing Instances (Juniper Networks MIBs) (*continued*)

Object	Support Class	Description/Notes
jnxRmon(13)	Class 3	jnxRmonAlarmTable(1). Objects are exposed only for the default logical system.
jnxLdp(14)	Class 2	jnxLdpTrapVars(1). All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
jnxCos(15) jnxCosIfqStatsTable(1) jnxCosFcTable(2) jnxCosFcIdTable(3) jnxCosQstatTable(4)	Class 3	Objects are exposed only for the default logical system.
jnxScu(16) jnxScuStatsTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxRpf(17) jnxRpfStatsTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxCfgMgmt(18)	Class 3	Objects are exposed only for the default logical system.
jnxPMon(19) jnxPMonFlowTable(1) jnxPMonErrorTable(2) jnxPMonMemoryTable(3)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxSonet(20) jnxSonetAlarmTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxAtmCos(21) jnxCosAtmVcTable(1) jnxCosAtmScTable(2) jnxCosAtmVcQstatsTable(3) jnxCosAtmTrunkTable(4)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
ipSecFlowMonitorMIB(22)	—	—

**Table 258: MIB Support for Routing Instances (Juniper Networks MIBs) (continued)**

Object	Support Class	Description/Notes
jnxMac(23) jnxMacStats(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
apsMIB(24)	Class 3	Objects are exposed only for the default logical system.
jnxChassisDefines(25)	Class 3	Objects are exposed only for the default logical system.
jnxVpnMIB(26)	Class 2	All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
jnxSericesInfoMib(27)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxCollectorMIB(28)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxHistory(29)	—	—
jnxSpMIB(32)	Class 3	Objects are exposed only for the default logical system.

[Table 259 on page 1769](#) shows Class 1 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 1 objects, only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.

Table 259: Class 1 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 1	802.3ad.mib	(dot3adAgg) MIB objects:  dot3adAggTable  dot3adAggPortListTable  (dot3adAggPort)  dot3adAggPortTable  dot3adAggPortStatsTable  dot3adAggPortDebugTable
	rfc2863a.mib	ifTable  ifXTable  ifStackTable
	rfc2011a.mib	ipAddrTable  ipNetToMediaTable
	rtmib.mib	ipForward (ipCidrRouteTable)
	rfc2665a.mib	dot3StatsTable  dot3ControlTable  dot3PauseTable
	rfc2495a.mib	dsx1ConfigTable  dsx1CurrentTable  dsx1IntervalTable  dsx1TotalTable  dsx1FarEndCurrentTable  dsx1FarEndIntervalTable  dsx1FarEndTotalTable  dsx1FracTable ...
	rfc2496a.mib	dsx3 (dsx3ConfigTable)
	rfc2115a.mib	frDlcmiTable (and related MIB objects)
	rfc3592.mib	sonetMediumTable (and related MIB objects)

Table 259: Class 1 MIB Objects (Standard and Juniper MIBs) (*continued*)

Class	MIB	Objects
	<b>rfc3020.mib</b>	<b>mfrMIB</b> <b>mfrBundleTable</b> <b>mfrMibBundleLinkObjects</b> <b>mfrBundleIfIndexMappingTable</b> (and related MIB objects)
	<b>ospf2mib.mib</b>	All objects
	<b>ospf2trap.mib</b>	All objects
	<b>bgpmib.mib</b>	All objects
	<b>rfc2819a.mib</b>	Example: <b>etherStatsTable</b>

Table 259: Class 1 MIB Objects (Standard and Juniper MIBs) (*continued*)

Class	MIB	Objects
Class 1	rfc2863a.mib	Examples:  ifXtable  ifStackTable
	rfc2665a.mib	etherMIB
	rfc2515a.mib	atmMIB objects  Examples:  atmInterfaceConfTable  atmVplTable  atmVclTable
	rfc2465.mib	ip-v6mib  Examples:  ipv6IfTable  ipv6AddrPrefixTable  ipv6NetToMediaTable  ipv6RouteTable
	rfc2787a.mib	vrrp mib
	rfc2932.mib	ipMRouteMIB  ipMRouteStdMIB
	mroutemib.mib	ipMRoute1MIBObjects
	isismib.mib	isisMIB
	pimmib.mib	pimMIB
	msdpmib.mib	msdpmib
	jnx-if-extensions.mib	Examples:  ifJnxTable  ifChassisTable
	jnx-dcu.mib	jnxDCUs
	jnx-atm.mib	

Table 259: Class 1 MIB Objects (Standard and Juniper MIBs) (*continued*)

Class	MIB	Objects
		Examples:  <code>jnxAtmIfTable</code>  <code>jnxAtmVcTable</code>  <code>jnxAtmVpTable</code>
	<code>jnx-ipv4.mib</code>	<code>jnxipv4</code>  Example: <code>jnxIpv4AddrTable</code>
	<code>jnx-cos.mib</code>	Examples:  <code>jnxCosIfqStatsTable</code>  <code>jnxCosQstatTable</code>
	<code>jnx-scu.mib</code>	Example: <code>jnxScuStatsTable</code>
	<code>jnx-rpf.mib</code>	Example: <code>jnxRpfStatsTable</code>
	<code>jnx-pmon.mib</code>	Example: <code>jnxPMonFlowTable</code>
	<code>jnx-sonet.mib</code>	Example: <code>jnxSonetAlarmTable</code>
	<code>jnx-atm-cos.mib</code>	Examples:  <code>jnxCosAtmVcTable</code>  <code>jnxCosAtmVcScTable</code>  <code>jnxCosAtmVcQstatsTable</code>  <code>jnxCosAtmTrunkTable</code>
	<code>jnx-mac.mib</code>	Example: <code>jnxMacStatsTable</code>
	<code>jnx-services.mib</code>	Example: <code>jnxSvcFlowTableAggStatsTable</code>
Class 1	<code>jnx-coll.mib</code>	<code>jnxCollectorMIB</code>  Examples:  <code>jnxCollPicIfTable</code>  <code>jnxCollFileEntry</code>

Table 260 on page 1773 shows Class 2 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 2 objects, all instances within a logical system are exposed. Data will not be segregated down to the routing instance level.

Table 260: Class 2 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 2	rfc3813.mib	<b>mplsLsrStdMIB</b>  Examples:  <b>mplsInterfaceTable</b>  <b>mplsInSegmentTable</b>  <b>mplsOutSegmentTable</b>  <b>mplsLabelStackTable</b>  <b>mplsXCTable</b>  (and related MIB objects)
	igmpmib.mib	<b>igmpStdMIB</b>
	l3vpn.mib	<b>mplsVpnMIB</b>
	jnx-mpls.mib	Example: <b>mplsLspList</b>
	jnx-ldp.mib	<b>jnxLdp</b>  Example: <b>jnxLdpStatsTable</b>
	jnx-vpn.mib	<b>jnxVpnMIB</b>
	jnx-bgp.mib	<b>jnxBgpM2Experiment</b>

Table 261 on page 1774 shows Class 3 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 3, objects are exposed only for the default logical system.

Table 261: Class 3 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 3	rfc2819a.mib	rmonEvents alarmTable logTable eventTable agentxMIB
	rfc2925a.mib	pingmib
	rfc2925b.mib	tracerouteMIB
	jnxchassis.mib	jnxBoxAnatomy
	jnx-chassis-alarm.mib	jnxAlarms
	jnx-ping.mib	jnxPingMIB
	jnx-traceroute.mib	jnxTraceRouteMIB
	jnx-rmon.mib	jnxRmonAlarmTable
	jnx-cos.mib	Example: jnxCosFcTable
	jnx-cfgmgmt.mib	Example: jnxCfgMgmt
	jnx-sonetaps.mib	apsMIBObjects
	jnx-sp.mib	jnxSpMIB
	ggsn.mib	ejnmobileipABmib
	rfc1907.mib	snmpModules
	snmpModules	Examples: snmpMIB snmpFrameworkMIB

Table 262 on page 1775 shows Class 4 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 4 objects, data is not segregated by routing instance. All instances are exposed.

Table 262: Class 4 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 4	system	Example: sysORTable
	rfc2011a.mib	ip (ipDefaultTTL, ipInReceives) icmp
	rfc2012a.mib	tcp tcpConnTable ipv6TcpConnTable
	rfc2013a.mib	udp udpTable ipv6UdpTable
	rfc2790a.mib	hrSystem
	rfc2287a.mib	sysApplOBJ
	jnx-firewall.mib	jnxFirewalls
	jnx-ipv6.mib	jnxIpv6

### SNMP MIB Objects Supported by Junos OS for the Set Operation

The following table lists the SNMP MIB objects that are supported for the **snmp set** operation by Junos OS.

Object Name	Object Identifier
RFC 1907	
sysContact	1.3.6.1.2.1.1.4
sysName	1.3.6.1.2.1.1.5
sysLocation	1.3.6.1.2.1.1.6
snmpEnableAuthenTraps	1.3.6.1.2.1.1.30
RFC 2819a	

Object Name	Object Identifier
alarmInterval	1.3.6.1.2.1.16.3.1.1.2
alarmVariable	1.3.6.1.2.1.16.3.1.1.2
alarmSampleType	1.3.6.1.2.1.16.3.1.1.4
alarmStartupAlarm	1.3.6.1.2.1.16.3.1.1.6
alarmRisingThreshold	1.3.6.1.2.1.16.3.1.1.7
alarmFallingThreshold	1.3.6.1.2.1.16.3.1.1.8
alarmRisingEventIndex	1.3.6.1.2.1.16.3.1.1.9
alarmFallingEventIndex	1.3.6.1.2.1.16.3.1.1.10
alarmOwner	1.3.6.1.2.1.16.3.1.1.11
alarmStatus	1.3.6.1.2.1.16.3.1.1.12
eventDescription	1.3.6.1.2.1.16.9.1.1.2
eventType	1.3.6.1.2.1.16.9.1.1.3
eventCommunity	1.3.6.1.2.1.16.9.1.1.4
eventOwner	1.3.6.1.2.1.16.9.1.1.6
eventStatus	1.3.6.1.2.1.16.9.1.1.7
RFC 2925a	
pingMaxConcurrentRequests	1.3.6.1.2.1.80.1.1
pingCtlTargetAddressType	1.3.6.1.2.1.80.1.2.1.3
pingCtlTargetAddress	1.3.6.1.2.1.80.1.2.1.4
pingCtlDataSize	1.3.6.1.2.1.80.1.2.1.5
pingCtlTimeOut	1.3.6.1.2.1.80.1.2.1.6
pingCtlProbeCount	1.3.6.1.2.1.80.1.2.1.7
pingCtlAdminStatus	1.3.6.1.2.1.80.1.2.1.8
pingCtlDataFill	1.3.6.1.2.1.80.1.2.1.9

Object Name	Object Identifier
pingCtlFrequency	1.3.6.1.2.1.80.1.2.1.10
pingCtlMaxRows	1.3.6.1.2.1.80.1.2.1.11
pingCtlStorageType	1.3.6.1.2.1.80.1.2.1.12
pingCtlTrapGeneration	1.3.6.1.2.1.80.1.2.1.13
pingCtlTrapProbeFailureFilter	1.3.6.1.2.1.80.1.2.1.14
pingCtlTrapTestFailureFilter	1.3.6.1.2.1.80.1.2.1.15
pingCtlType	1.3.6.1.2.1.80.1.2.1.16
pingCtlDescr	1.3.6.1.2.1.80.1.2.1.17
pingCtlSourceAddressType	1.3.6.1.2.1.80.1.2.1.18
pingCtlSourceAddress	1.3.6.1.2.1.80.1.2.1.19
pingCtlIfIndex	1.3.6.1.2.1.80.1.2.1.20
pingCtlByPassRouteTable	1.3.6.1.2.1.80.1.2.1.21
pingCtlDSField	1.3.6.1.2.1.80.1.2.1.22
pingCtlRowStatus	1.3.6.1.2.1.80.1.2.1.23
RFC 2925B	
traceRouteMaxConcurrentRequests	1.3.6.1.2.1.81.1.1
traceRouteCtlTargetAddressType	1.3.6.1.2.1.81.1.2.1.3
traceRouteCtlTargetAddress	1.3.6.1.2.1.81.1.2.1.4
traceRouteCtlByPassRouteTable	1.3.6.1.2.1.81.1.2.1.5
traceRouteCtlDataSize	1.3.6.1.2.1.81.1.2.1.6
traceRouteCtlTimeOut	1.3.6.1.2.1.81.1.2.1.7
traceRouteCtlProbesPerHop	1.3.6.1.2.1.81.1.2.1.8
traceRouteCtlPort	1.3.6.1.2.1.81.1.2.1.9
traceRouteCtlMaxTtl	1.3.6.1.2.1.81.1.2.1.10

Object Name	Object Identifier
traceRouteCtlDSField	1.3.6.1.2.1.81.1.2.1.11
traceRouteCtlSourceAddressType	1.3.6.1.2.1.81.1.2.1.12
traceRouteCtlSourceAddress	1.3.6.1.2.1.81.1.2.1.13
traceRouteCtlIfIndex	1.3.6.1.2.1.81.1.2.1.14
traceRouteCtlMiscOptions	1.3.6.1.2.1.81.1.2.1.15
traceRouteCtlMaxFailure	1.3.6.1.2.1.81.1.2.1.16
traceRouteCtlDontFragment	1.3.6.1.2.1.81.1.2.1.17
traceRouteCtlInitialTtl	1.3.6.1.2.1.81.1.2.1.18
traceRouteCtlFrequency	1.3.6.1.2.1.81.1.2.1.19
traceRouteCtlStorageType	1.3.6.1.2.1.81.1.2.1.20
traceRouteCtlAdminStatus	1.3.6.1.2.1.81.1.2.1.21
traceRouteCtlDescr	1.3.6.1.2.1.81.1.2.1.22
traceRouteCtlMaxRows	1.3.6.1.2.1.81.1.2.1.23
traceRouteCtlTrapGeneration	1.3.6.1.2.1.81.1.2.1.24
traceRouteCtlCreateHopEntries	1.3.6.1.2.1.81.1.2.1.25
traceRouteCtlType	1.3.6.1.2.1.81.1.2.1.26
traceRouteCtlRowStatus	1.3.6.1.2.1.81.1.2.1.27
<b>Enterprise-Specific PING MIB</b>	
jnxPingCtlIfName	1.3.6.1.4.1.2636.3.7.1.2.1.3
jnxPingCtlRoutingIfIndex	1.3.6.1.4.1.2636.3.7.1.2.1.4
jnxPingCtlRoutingIfName	1.3.6.1.4.1.2636.3.7.1.2.1.5
jnxPingCtlRoutingInstanceName	1.3.6.1.4.1.2636.3.7.1.2.1.6
jnxPingCtlRttThreshold	1.3.6.1.4.1.2636.3.7.1.2.1.7
jnxPingCtlRttStdDevThreshold	1.3.6.1.4.1.2636.3.7.1.2.1.8

Object Name	Object Identifier

### SNMPv3 Overview

In contrast to SNMP version 1 (SNMPv1) and SNMP version 2 (SNMPv2), SNMP version 3 (SNMPv3) supports authentication and encryption. SNMPv3 uses the user-based security model (USM) for message security and the view-based access control model (VACM) for access control. USM specifies authentication and encryption. VACM specifies access-control rules.

USM uses the concept of a user for which security parameters (levels of security, authentication, privacy protocols, and keys) are configured for both the agent and the manager. Messages sent using USM are better protected than messages sent with community strings, where passwords are sent in the clear. With USM, messages exchanged between the manager and the agent can have data integrity checking and data origin authentication. USM protects against message delays and message replays by using time indicators and request IDs. Encryption is also available.

To complement the USM, SNMPv3 uses the VACM, a highly granular access-control model for SNMPv3 applications. Based on the concept of applying security policies to the name of the groups querying the agent, the agent decides whether the group is allowed to view or change specific MIB objects. VACM defines collections of data (called views), groups of data users, and access statements that define which views a particular group of users can use for reading, writing, or receiving traps.

Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag. The tag defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target

address defines a management application's address and other attributes to be used in sending notifications. Target parameters define the message processing and security parameters to be used in sending notifications to a particular management target.

To configure SNMPv3, perform the following tasks:

- [Creating SNMPv3 Users on page 1824](#)
- [Configuring MIB Views on page 1821](#)
- [Defining Access Privileges for an SNMP Group on page 1853](#)
- [Configuring SNMPv3 Traps on a Device Running Junos OS on page 1844](#)

### Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though Junos OS includes built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**. You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- **request snmp utility-mib set instance *name* object-type <counter | counter 64 | integer | string | unsigned integer> object-value *value***
- **request snmp utility-mib clear instance *name* object-type <counter | counter 64 | integer | string | unsigned integer>**

The **instance *name*** option of the **request snmp utility-mib <set | clear>** command specifies the name of the data instance and is the main identifier of the data. The **object-type <counter | counter 64 | integer | string | unsigned integer>** option enables you specify the object type, and the **object-value *value*** option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

**Event Policy Configuration** To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the [edit] hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 3600;
  }
  policy MBUFS {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

**check-mbufs.slax Script** The following example shows the **check-mbufs.slax** script that is stored under **/var/db/scripts/event/**:

```
----- script START -----
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
  <op-script-results>{
    var $cmd = <command> "show system buffers";
    var $out = jcs:invoke($cmd);

    var $lines = jcs:break_lines($out);
    for-each ($lines) {
      if (contains(., "current/peak/max")) {
        var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
        var $split = jcs:regex($pattern, .);
        var $result = $split[2];

        var $rpc = <request-snmp-utility-mib-set> {
          <object-type> "integer";
          <instance> "current-mbufs";
          <object-value> $result;
        }
        var $res = jcs:invoke($rpc);
      }
    }
  }
}
----- script END -----
```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```
user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
user@host>
```

### Standard SNMP Version 1 Traps

Table 263 on page 1786 provides an overview of the standard traps for SNMPv1. The traps are organized first by trap category and then by trap name, and include their enterprise ID, generic trap number, and specific trap number. The system logging severity levels are listed for those traps that have them with their corresponding system log tag. Traps that do not have corresponding system logging severity levels are marked with an en dash (–) in the table.

For more information about system log messages, see *System Log Monitoring and Troubleshooting Guide for Security Devices*.

Defined in	Trap Name	snmpTrapOID	System Logging Severity Level	Syslog Tag	Supported On
RFC 2787, <i>Definitions of Managed Objects for the Virtual Router Redundancy Protocol</i>	<b>vrpTrapNewMaster</b>	1.3.6.1.2.1.68.0.1	Warning	VRRPD_NEWMASTER_TRAP	All devices running Junos OS.
	<b>vrpTrapAuthFailure</b>	1.3.6.1.2.1.68.0.2	Warning	VRRPD_AUTH_FAILURE_TRAP	All devices running Junos OS.

The Junos OS also supports the following standard SNMP version 2 traps:

- [SNMP Version 2 MPLS Traps on page 1792](#)

#### **SNMP Version 2 MPLS Traps**

The Junos OS supports the MPLS SNMP version 2 traps defined in RFC 3812, *Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base*.

You can disable the MPLS traps by including the **no-trap** option at the **[edit protocol mpls log-updown]** hierarchy level.

The Junos OS supports the following MPLS traps:

- **mplsTunnelUp**—Generated when an **mplsTunnelOperStatus** object for one of the configured tunnels leaves the **down** state and transitions into another state, other than the **notPresent** state.
- **mplsTunnelDown**—Generated when an **mplsTunnelOperStatus** object for one of the configured tunnels enters the **down** state from a state other than the **notPresent** state.

**NOTE:** When an LSP flaps, only the ingress and egress routers of that LSP generate the **mplsTunnelUp** and **mplsTunnelDown** traps. Previously, all the routers associated with an LSP—that is, the ingress, egress, and transit routers—used to generate the traps when the LSP flaps.

- **mplsTunnelRerouted**—Generated when a tunnel is rerouted.
- **mplsTunnelReoptimized**—Generated when a tunnel is reoptimized.

**NOTE:** In Junos OS Release 8.3 and earlier, **mplsTunnelReoptimized** was generated every time the optimization timer expired; that is, when the optimization timer exceeded the value set for the **optimize-timer** statement at the **[edit protocols mpls label-switched-path path-name]** hierarchy level. However, in Release 8.4 and later, this trap is generated only when the path is reoptimized, and not when the optimization timer expires.

### **Unsupported Standard SNMP Traps**

---

Standard SNMP traps that are defined in MIBs supported by the Junos OS but are not generated by the Junos OS are shown in [Table 265 on page 1794](#).

Table 265: Unsupported Standard SNMP Traps

MIB	Trap Name	Description
isismib.mib	isisDatabaseOverload	Generated when the system enters or leaves the overload state.
	isisManualAddressDrops	Generated when one of the manual <b>areaAddresses</b> assigned to the system is ignored when computing routes.
	isisCorruptedLSPDetected	Generated when an LSP stored in memory becomes corrupted.
	isisAttemptToExceedMaxSequence	Generated when the sequence number on a generated LSP wraps the 32-bit sequence counter and the number is purged.
	isisIDLenMismatch	Generated when a protocol data unit (PDU) is received with a different value for the system ID length. This trap includes an index to identify the circuit where the PDU was received and the PDU header.
	isisMaxAreaAddressesMismatch	Generated when a PDU with a different value for the maximum area addresses is received.
	isisOwnLSPPurge	Generated when a PDU is received with a system ID and zero age. This notification includes the circuit index if available.
	isisSequenceNumberSkip	Generated when an LSP is received with a system ID and different contents, indicating the LSP might require a higher sequence number.
	isisAuthenticationTypeFailure	Generated when a PDU with the wrong authentication type field is received.
	isisAuthenticationFailure	Generated when a PDU with an incorrect authentication information field is received.
	isisVersionSkew	Generated when a hello PDU from an IS running a different version of the protocol is received.
	isisAreaMismatch	Generated when a hello PDU from an IS which does not share any area address is received.
	isisRejectedAdjacency	Generated when a hello PDU from an IS is received, but no adjacency is established because of a lack of resources.
	isisLSPTooLargeToPropagate	Generated when a link-state PDU that is larger than the <b>dataLinkBlockSize</b> for a circuit is attempted, but not propagated.
	isisOriginatingLSPBufferSizeMismatch	

Table 265: Unsupported Standard SNMP Traps (*continued*)

MIB	Trap Name	Description
l3vpn-mib.mib		Generated when a Level 1 link-state PDU or Level 2 link-state PDU is received that is larger than the local value for originating <b>L1LSPBufferSize</b> or originating <b>L2LSPBufferSize</b> , respectively, or when a Level 1 link-state PDU or Level 2 link-state PDU is received containing the originating <b>LSPBufferSize</b> option and the value in the PDU option field does not match the local value for originating <b>L1LSPBufferSize</b> or originating <b>L2LSPBufferSize</b> , respectively.
	<b>isisProtocolsSupportedMismatch</b>	Generated when a nonpseudonode, segment 0 link-state PDU is received that has no matching protocols.
	<b>mplsVrflfUp</b>	Generated when the <b>ifOperStatus</b> of an interface associated with a VRF table changes to the <b>up(1)</b> state, or when an interface with <b>ifOperStatus = up(1)</b> is associated with a VRF table.
	<b>mplsVrflfDown</b>	Generated when the <b>ifOperStatus</b> of an interface associated with a VRF table changes to the <b>down(1)</b> state, or when an interface with <b>ifOperStatus = up(1)</b> state is disassociated from a VRF table.
	<b>mplsNumVrfRouteMidThreshExceeded</b>	Generated when the number of routes contained by the specified VRF table exceeds the value indicated by <b>mplsVrfMidRouteThreshold</b> .
msdpmib.mib	<b>mplsNumVrfRouteMaxThreshExceeded</b>	Generated when the number of routes contained by the specified VRF table reaches or attempts to exceed the maximum allowed value as indicated by <b>mplsVrfMaxRouteThreshold</b> .
	<b>mplsNumVrfSecIllegalLblThrshExcd</b>	Generated when the number of illegal label violations on a VRF table as indicated by <b>mplsVpnVrfSecIllegalLblVltns</b> has exceeded <b>mplsVpnVrfSecIllegalLblRcvThrsh</b> .
	<b>msdpEstablished</b>	Generated when the Multicast Source Discovery Protocol (MSDP) finite state machine (FSM) enters the <b>Established</b> state.
ospf2trap.mib	<b>msdpBackwardTransition</b>	Generated when the MSDP FSM moves from a higher numbered state to a lower numbered state.
	<b>ospfOriginateLsa</b>	Generated when a new LSA is originated by the router because of a topology change.
	<b>ospfLsdbOverflow</b>	Generated when the number of LSAs in the router's link-state database exceeds the value of <b>ospfExtLsdbLimit</b> .
	<b>ospfLsdbApproachingOverflow</b>	Generated when the number of LSAs in the router's link-state database exceeds 90% of the value of <b>ospfExtLsdbLimit</b> .

Table 265: Unsupported Standard SNMP Traps (*continued*)

MIB	Trap Name	Description
rfc1747.mib	sdlcPortStatusChange	Generated when the state of an SDLC port transitions to active or inactive.
	sdlcLSStatusChange	Generated when the state of an SDLC link station transitions to contacted or disconnected.
rfc2115a.mib	frDLCIStatusChange	Generated when a virtual circuit changes state (has been created or invalidated, or has toggled between the active and inactive states).
rfc2662.mib	adslAtucRateChangeTrap	Generated when the ATUCs transmit rate has changed (RADSL mode only).
	adslAtucPerfLofsThreshTrap	Generated when the loss of framing 15-minute interval threshold is reached.
	adslAtucInitFailureTrap	Generated when ATUC initialization fails.
	adslAturPerfLprsThreshTrap	Generated when the loss of power 15-minute interval threshold is reached.
	adslAturRateChangeTrap	Generated when the ATURs transmit rate changes (RADSL mode only).
rfc3020.mib	mfrMibTrapBundleLinkMismatch	Generated when a bundle link mismatch is detected.
rfc3813.mib	mplsXCUp	Generated when <b>mplsXCOperStatus</b> for one or more contiguous entries in <b>mplsXCTable</b> enters the <b>up(1)</b> state from some other state.
	mplsXCDown	Generated when <b>mplsXCOperStatus</b> for one or more contiguous entries in <b>mplsXCTable</b> enters the <b>down(2)</b> state from some other state.

## Routing Instances

- [Identifying a Routing Instance on page 1797](#)
- [Understanding SNMP Support for Routing Instances on page 1797](#)
- [Trap Support for Routing Instances on page 1799](#)

### Identifying a Routing Instance

With this feature, routing instances are identified by either the context field in v3 requests or encoded in the community string in v1 or v2c requests.

When encoded in a community string, the routing instance name appears first and is separated from the actual community string by the @ character.

To avoid conflicts with valid community strings that contain the @ character, the community is parsed only if typical community string processing fails. For example, if a routing instance named **RI** is configured, an SNMP request with **RI@public** is processed within the context of the **RI** routing instance. Access control (views, source address restrictions, access privileges, and so on) is applied according to the actual community string (the set of data after the @ character—in this case **public**). However, if the community string **RI@public** is configured, the protocol data unit (PDU) is processed according to that community and the embedded routing instance name is ignored.

Logical systems perform a subset of the actions of a physical router and have their own unique routing tables, interfaces, policies, and routing instances. When a routing instance is defined within a logical system, the logical system name must be encoded along with the routing instance using a slash ( / ) to separate the two. For example, if the routing instance **RI** is configured within the logical system **LS**, that routing instance must be encoded within a community string as **LS/RI@public**. When a routing instance is configured outside a logical system (within the default logical system), no logical system name (or / character) is needed.

Also, when a logical system is created, a default routing instance (named **default**) is always created within the logical system. This name should be used when querying data for that routing instance (for example, **LS/default@public**). For v3 requests, the name **logical system/routing instance** should be identified directly in the context field.

**NOTE:** To identify a virtual LAN (VLAN) spanning-tree instance (VSTP on MX Series 3D Universal Edge Routers), specify the routing instance name followed by a double colon (::) and the VLAN ID. For example, to identify VSTP instance for VLAN 10 in the global default routing instance, include **default::10@public** in the context (SNMPv3) or community (SNMPv1 or v2) string.

#### Related Documentation

- [Enabling SNMP Access over Routing Instances on page 1858](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858](#)

### Understanding SNMP Support for Routing Instances

Junos OS enables SNMP managers for all routing instances to request and manage SNMP data related to the corresponding routing instances and logical system networks.

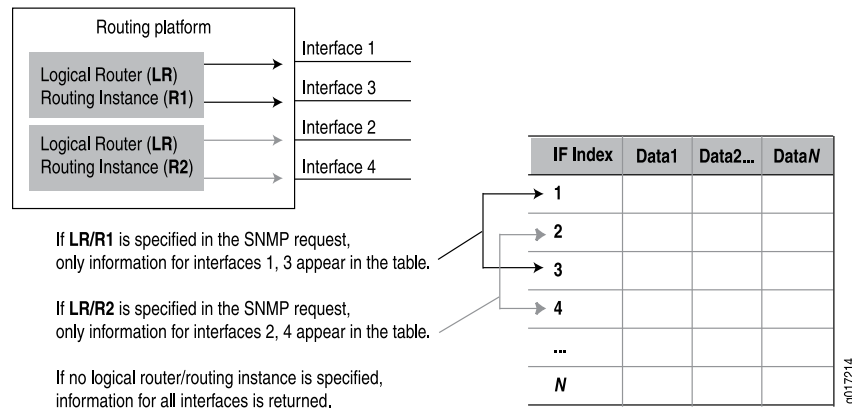

In Junos OS:

- Clients from routing instances other than the default can access MIB objects and perform SNMP operations only on the logical system networks to which they belong.
- Clients from the default routing instance can access information related to all routing instances and logical system networks.

Before Junos OS Release 8.4, only the SNMP manager in the default routing instance (**inet.0**) had access to the MIB objects

With the increase in virtual private network (VPN) service offerings, this feature is useful particularly for service providers who need to obtain SNMP data for specific routing instances (see [Figure 58 on page 1798](#)). Service providers can use this information for their own management needs or export the data for use by their customers.

**Figure 58: SNMP Data for Routing Instances**

If no routing instance is specified in the request, the SNMP agent operates as before:

- For nonrouting table objects, all instances are exposed.
- For routing table objects, only those associated with the default routing instance are exposed.

**NOTE:** The actual protocol data units (PDUs) are still exchanged over the default (**inet.0**) routing instance, but the data contents returned are dictated by the routing instance specified in the request PDUs.

### Trap Support for Routing Instances

---

You can restrict the trap receivers from receiving traps that are not related to the logical system networks to which they belong. To do this, include the **logical-system-trap-filter** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
logical-system-trap-filter;
```

If the **logical-system-trap-filter** statement is not included in the SNMP configuration, all traps are forwarded to the configured routing instance destinations. However, even when this statement is configured, the trap receiver associated with the default routing instance will receive all SNMP traps.

When configured under the trap-group object, all v1 and v2c traps that apply to routing instances (or interfaces belonging to a routing instance) have the routing instance name encoded in the community string. The encoding is identical to that used in request PDUs.

For traps configured under the v3 framework, the routing instance name is carried in the context field when the v3 message processing model has been configured. For other message processing models (v1 or v2c), the routing instance name is not carried in the trap message header (and not encoded in the community string).

### Understanding Device Management Functions in Junos OS

---

After you have installed a device into your network, you need to manage the device within your network. Device management can be divided into five tasks:

- Fault management—Monitor the device; detect and fix faults.
- Configuration management—Configure device attributes.
- Accounting management—Collect statistics for accounting purposes.
- Performance management—Monitor and adjust device performance.
- Security management—Control device access and authenticate users.

The Junos OS network management features work in conjunction with an operations support system (OSS) to manage the devices within the network. Junos OS can assist you in performing these management tasks, as described in [Table 266 on page 1800](#).

Table 266: Device Management Features in Junos OS

Task	Junos OS Feature
Fault management	<p>Monitor and see faults using:</p> <ul style="list-style-type: none"> <li>Operational mode commands—For more information about operational mode commands, see the <i>CLI User Guide</i>.</li> <li>SNMP MIBs—For more information about SNMP MIBs supported by Junos OS, see “<a href="#">Standard SNMP MIBs Supported by Junos OS</a>” on page 1719 and “<a href="#">Juniper Networks Enterprise-Specific MIBs</a>” on page 1733.</li> <li>Standard SNMP traps—For more information about standard SNMP traps, see the “<a href="#">Standard SNMP Traps Supported on Devices Running Junos OS</a>” on page 1785.</li> <li>Enterprise-specific SNMP traps—For more information about enterprise-specific traps, see “<a href="#">Juniper Networks Enterprise-Specific SNMP Traps</a>” on page 1785.</li> <li>System log messages—For more information about how to configure system log messages, see <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i>.</li> </ul>
Configuration management	<ul style="list-style-type: none"> <li>Configure device attributes using the command-line interface (CLI). For more information about configuring the device using the CLI, see the <i>CLI User Guide</i>.</li> <li>Configuration Management MIB—For more information about the Configuration Management MIB, see the <i>Configuration Management MIB</i>.</li> </ul>
Accounting management	<p>Perform the following accounting-related tasks:</p> <ul style="list-style-type: none"> <li>Collect statistics for interfaces, firewall filters, destination classes, source classes, and the Routing Engine. For more information about collecting statistics, see “<a href="#">Accounting Options Configuration</a>” on page 1254.</li> <li>Use interface-specific traffic statistics and other counters, available in the Standard Interfaces MIB, Juniper Networks enterprise-specific extensions to the Interfaces MIB, and media-specific MIBs, such as the enterprise-specific ATM MIB.</li> <li>Count packets as part of a firewall filter. For more information about firewall filter policies, see “<a href="#">Juniper Networks Enterprise-Specific MIBs</a>” on page 1733 and the <i>Junos OS Routing Protocols Library for Security Devices</i>.</li> </ul>
Performance management	<p>Monitor performance in the following ways:</p> <ul style="list-style-type: none"> <li>Use operational mode commands. For more information about monitoring performance using operational mode commands, see the <i>CLI User Guide</i>.</li> <li>Use firewall filters. For more information about performance monitoring using firewall filters, see the <i>Junos OS Routing Protocols Library for Security Devices</i>.</li> </ul>

Table 266: Device Management Features in Junos OS (*continued*)

Task	Junos OS Feature
Security management	<p>Assure security in your network in the following ways:</p> <ul style="list-style-type: none"> <li>Control access to the router and authenticate users. For more information about access control and user authentication, see the <i>Junos OS User Authentication Library for Security Devices</i>.</li> <li>Control access to the router using SNMPv3 and SNMP over IPv6. For more information, see “Configuring the Local Engine ID” on page 1823 and “Tracing SNMP Activity on a Device Running Junos OS” on page 1968.</li> </ul>

### Understanding the Integrated Local Management Interface

The Integrated Local Management Interface (ILMI) provides a mechanism for Asynchronous Transfer Mode (ATM)-attached devices, such as hosts, routers, and ATM switches, to transfer management information. ILMI provides bidirectional exchange of management information between two ATM interfaces across a physical connection. ILMI information is exchanged over a direct encapsulation of SNMP version 1 (RFC 1157, *A Simple Network Management Protocol*) over ATM Adaptation Layer 5 (AAL5) using a virtual path identifier/virtual channel identifier (VPI/VCI) value (VPI=0, VCI=16).

Junos OS supports only two ILMI MIB variables: **atmfMYIPNmAddress** and **atmfPortMyIfname**. For ATM1 and ATM2 intelligent queuing (IQ) interfaces, you can configure ILMI to communicate directly with an attached ATM switch to enable querying of the switch’s IP address and port number.

For more information about the ILMI MIB, see the ATM Forum at <http://www.atmforum.com/>.

- Related Documentation**
- [Understanding Device Management Functions in Junos OS on page 1799](#)

### Remote Operations

- [SNMP Remote Operations Overview on page 1801](#)

### SNMP Remote Operations Overview

A SNMP remote operation is any process on the router that can be controlled remotely using SNMP. Junos OS currently provides support for two SNMP remote operations: the Ping MIB and Traceroute MIB, defined in RFC 2925. Using these MIBs, an SNMP client in the network management system (NMS) can:

- Start a series of operations on a router
- Receive notification when the operations are complete

- Gather the results of each operation

Junos OS also provides extended functionality to these MIBs in the Juniper Networks enterprise-specific extensions **jnxPingMIB** and **jnxTraceRouteMIB**. For more information about **jnxPingMIB** and **jnxTraceRouteMIB**, see *PING MIB* and *Traceroute MIB*.

This topic covers the following sections:

- [SNMP Remote Operation Requirements on page 1802](#)
- [Setting SNMP Views on page 1802](#)
- [Setting Trap Notification for Remote Operations on page 1803](#)
- [Using Variable-Length String Indexes on page 1803](#)
- [Enabling Logging on page 1804](#)

### ***SNMP Remote Operation Requirements***

To use SNMP remote operations, you should be experienced with SNMP conventions. You must also configure Junos OS to allow the use of the remote operation MIBs.

### ***Setting SNMP Views***

All remote operation MIBs supported by Junos OS require that the SNMP clients have read-write privileges. The default SNMP configuration of Junos OS does not provide clients with a community string with such privileges.

To set read-write privileges for an SNMP community string, include the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community community-name {
  authorization authorization;
  view view-name;
}
view view-name {
  oid object-identifier (include | exclude);
}
```

### ***Example: Setting SNMP Views***

To create a community named **remote-community** that grants SNMP clients read-write access to the Ping MIB, **jnxPingMIB**, Traceroute MIB, and **jnxTraceRouteMIB**, include the following statements at the **[edit snmp]** hierarchy level:

```
snmp {
  view remote-view {
    oid 1.3.6.1.2.1.80 include; # pingMIB
    oid 1.3.6.1.4.1.2636.3.7 include; # jnxPingMIB
    oid 1.3.6.1.2.1.81 include; # traceRouteMIB
    oid 1.3.6.1.4.1.2636.3.8 include; # jnxTraceRouteMIB
  }
  community remote-community {
    view remote-view;
    authorization read-write;
  }
}
```

For more information about the **community** statement, see [“Configuring the SNMP Community String” on page 1862](#) and **community**.

For more information about the **view** statement, see [“Configuring MIB Views” on page 1821](#), [view \(Associating a MIB View with a Community\)](#), and [view \(Configuring a MIB View\)](#).

### ***Setting Trap Notification for Remote Operations***

In addition to configuring the remote operations MIB for trap notification, you must also configure Junos OS. You must specify a target host for remote operations traps.

To configure trap notification for SNMP remote operations, include the **categories** and **targets** statements at the **[edit snmp trap-group group-name]** hierarchy level:

```
[edit snmp trap-group group-name]
  categories {
    category;
  }
  targets {
    address;
  }
}
```

### ***Example: Setting Trap Notification for Remote Operations***

Specify 172.17.12.213 as a target host for all remote operation traps:

```
snmp {
  trap-group remote-traps {
    categories remote-operations;
    targets {
      172.17.12.213;
    }
  }
}
```

For more information about trap groups, see [“Configuring SNMP Trap Groups” on page 1841](#).

### ***Using Variable-Length String Indexes***

All tabular objects in the remote operations MIBs supported by Junos OS are indexed by two variables of type **SnmpAdminString**. For more information about **SnmpAdminString**, see RFC 2571.

Junos OS does not handle **SnmpAdminString** any differently from the octet string variable type. However, the indexes are defined as variable length. When a variable length string is used as an index, the length of the string must be included as part of the object identifier (OID).

### ***Example: Set Variable-Length String Indexes***

To reference the **pingCtlTargetAddress** variable of a row in **pingCtlTable** where **pingCtlOwnerIndex** is **bob** and **pingCtlTestName** is **test**, use the following object identifier (OID):

```
pingMIB.pingObjects.pingCtlTable.pingCtlEntry.pingCtlTargetAddress."bob"."test"
1.3.6.1.2.1.80.1.2.1.4.3.98.111.98.4.116.101.115.116
```

For more information about the definition of the Ping MIB, see RFC 2925.

### **Enabling Logging**

The SNMP error code returned in response to SNMP requests can only provide a generic description of the problem. The error descriptions logged by the remote operations process can often provide more detailed information about the problem and help you to solve the problem faster. This logging is not enabled by default. To enable logging, include the **flag general** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit]
snmp {
  traceoptions {
    flag general;
  }
}
```

For more information about traceoptions, see [“Tracing SNMP Activity on a Device Running Junos OS” on page 1968](#).

If the remote operations process receives an SNMP request that it cannot accommodate, the error is logged in the **/var/log/rmopd** file. To monitor this log file, issue the **monitor start rmopd** command in operational mode of the command-line interface (CLI).

## **Remote Monitoring, Health Monitoring, and Service Quality**

- [Understanding RMON Alarms on page 1804](#)
- [Understanding RMON Events on page 1806](#)
- [Understanding Measurement Points, Key Performance Indicators, and Baseline Values on page 1807](#)
- [Understanding RMON for Monitoring Service Quality on page 1808](#)

### **Understanding RMON Alarms**

---

An RMON alarm identifies:

- A specific MIB object that is monitored.
- The frequency of sampling.
- The method of sampling.
- The thresholds against which the monitored values are compared.

An RMON alarm can also identify a specific **eventTable** entry to be triggered when a threshold is crossed.

Configuration and operational values are defined in **alarmTable** in RFC 2819. Additional operational values are defined in Juniper Networks enterprise-specific extensions to **alarmTable** (**jnxRmonAlarmTable**).

This topic covers the following sections:

- [alarmTable](#) on page 1805
- [jnxRmonAlarmTable](#) on page 1805

### ***alarmTable***

**alarmTable** in the RMON MIB allows you to monitor and poll the following:

- **alarmIndex**—The index value for **alarmTable** that identifies a specific entry.
- **alarmInterval**—The interval, in seconds, over which data is sampled and compared with the rising and falling thresholds.
- **alarmVariable**—The MIB variable that is monitored by the alarm entry.
- **alarmSampleType**—The method of sampling the selected variable and calculating the value to be compared against the thresholds.
- **alarmValue**—The value of the variable during the last sampling period. This value is compared with the rising and falling thresholds.
- **alarmStartupAlarm**—The alarm sent when the entry is first activated.
- **alarmRisingThreshold**—The upper threshold for the sampled variable.
- **alarmFallingThreshold**—The lower threshold for the sampled variable.
- **alarmRisingEventIndex**—The **eventTable** entry used when a rising threshold is crossed.
- **alarmFallingEventIndex**—The **eventTable** entry used when a falling threshold is crossed.
- **alarmStatus**—Method for adding and removing entries from the table. It can also be used to change the state of an entry to allow modifications.

**NOTE:** If this object is not set to **valid**, the associated event alarm does not take any action.

### ***jnxRmonAlarmTable***

The **jnxRmonAlarmTable** is a Juniper Networks enterprise-specific extension to **alarmTable**. It provides additional operational information and includes the following objects:

- **jnxRmonAlarmGetFailCnt**—The number of times the internal **Get** request for the variable monitored by this entry has failed.
- **jnxRmonAlarmGetFailTime**—The value of **sysUpTime** when an internal **Get** request for the variable monitored by this entry last failed.
- **jnxRmonAlarmGetFailReason**—The reason an internal **Get** request for the variable monitored by this entry last failed.
- **jnxRmonAlarmGetOkTime**—The value of **sysUpTime** when an internal **Get** request for the variable monitored by this entry succeeded and the entry left the **getFailure** state.
- **jnxRmonAlarmState**—The current state of this RMON alarm entry.

To view the Juniper Networks enterprise-specific extensions to the RMON Events and Alarms and Event MIB, see [http://www.juniper.net/techpubs/en\\_US/junos10.3/topics/reference/mibs/mib-jnx-rmon.txt](http://www.juniper.net/techpubs/en_US/junos10.3/topics/reference/mibs/mib-jnx-rmon.txt).

For more information about the Juniper Networks enterprise-specific extensions to the RMON Events and Alarms MIB, see “*RMON Events and Alarms MIB*” in the *SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices*.

- [Configuring an Alarm Entry and Its Attributes on page 1870](#)

---

### Understanding RMON Events

An RMON event allows you to log the crossing of thresholds of other MIB objects. It is defined in **eventTable** for the RMON MIB.

This section covers the following topics:

- [eventTable on page 1806](#)

#### **eventTable**

**eventTable** contains the following objects:

- **eventIndex**—An index that uniquely identifies an entry in **eventTable**. Each entry defines one event that is generated when the appropriate conditions occur.
- **eventDescription**—A comment describing the event entry.
- **eventType**—Type of notification that the probe makes about this event.
- **eventCommunity**—Trap group used if an SNMP trap is to be sent. If **eventCommunity** is not configured, a trap is sent to each trap group configured with the **rmon-alarm** category.
- **eventLastTimeSent**—Value of **sysUpTime** when this event entry last generated an event.
- **eventOwner**—Any text string specified by the creating management application or the command-line interface (CLI). Typically, it is used to identify a network manager (or application) and can be used for fine access control between participating management applications.
- **eventStatus**—Status of this event entry.

**NOTE:** If this object is not set to valid, no action is taken by the associated event entry. When this object is set to valid, all previous log entries associated with this entry (if any) are deleted.

---

## Understanding Measurement Points, Key Performance Indicators, and Baseline Values

This chapter topic provides guidelines for monitoring the service quality of an IP network. It describes how service providers and network administrators can use information provided by Juniper Networks routers to monitor network performance and capacity. You should have a thorough understanding of the SNMP and the associated MIB supported by Junos OS.

**NOTE:** For a good introduction to the process of monitoring an IP network, see RFC 2330, *Framework for IP Performance Metrics*.

This topic contains the following sections:

- [Measurement Points on page 1807](#)
- [Basic Key Performance Indicators on page 1808](#)
- [Setting Baselines on page 1808](#)

### Measurement Points

Defining the measurement points where metrics are measured is equally as important as defining the metrics themselves. This section describes measurement points within the context of this chapter and helps identify where measurements can be taken from a service provider network. It is important to understand exactly where a measurement point is. Measurement points are vital to understanding the implication of what the actual measurement means.

An IP network consists of a collection of routers connected by physical links that are all running the Internet Protocol. You can view the network as a collection of routers with an ingress (entry) point and an egress (exit) point. See [Figure 59 on page 1807](#).

- Network-centric measurements are taken at measurement points that most closely map to the ingress and egress points for the network itself. For example, to measure delay across the provider network from Site A to Site B, the measurement points should be the ingress point to the provider network at Site A and the egress point at Site B.
- Router-centric measurements are taken directly from the routers themselves, but be careful to ensure that the correct router subcomponents have been identified in advance.

**Figure 59: Network Entry Points**

9017042

**NOTE:** [Figure 59 on page 1807](#) does not show the client networks at customer premises, but they would be located on either side of the ingress and egress points. Although this chapter does not discuss how to measure network services as perceived by these client networks, you can use measurements taken for the service provider network as input into such calculations.

---

### ***Basic Key Performance Indicators***

For example, you could monitor a service provider network for three basic key performance indicators (KPIs):

- *Availability* measures the “reachability” of one measurement point from another measurement point at the network layer (for example, using ICMP ping). The underlying routing and transport infrastructure of the provider network will support the availability measurements, with failures highlighted as unavailability.
- *Health* measures the number and type of errors that are occurring on the provider network, and can consist of both router-centric and network-centric measurements, such as hardware failures or packet loss.
- *Performance* of the provider network measures how well it can support IP services (for example, in terms of delay or utilization).

### ***Setting Baselines***

How well is the provider network performing? We recommend an initial three-month period of monitoring to identify a network’s normal operational parameters. With this information, you can recognize exceptions and identify abnormal behavior. You should continue baseline monitoring for the lifetime of each measured metric. Over time, you must be able to recognize performance trends and growth patterns.

Within the context of this chapter, many of the metrics identified do not have an allowable operational range associated with them. In most cases, you cannot identify the allowable operational range until you have determined a baseline for the actual variable on a specific network.

### **Related Documentation**

- [Understanding RMON for Monitoring Service Quality on page 1808](#)

---

### **Understanding RMON for Monitoring Service Quality**

Health and performance monitoring can benefit from the remote monitoring of SNMP variables by the local SNMP agents running on each router. The SNMP agents compare MIB values against predefined thresholds and generate exception alarms without the need for polling by a central SNMP management platform. This is an effective mechanism for proactive management, as long as the thresholds have baselines determined and set correctly. For more information, see RFC 2819, *Remote Network Monitoring MIB*.

This topic includes the following sections:

- [Setting Thresholds on page 1809](#)
- [RMON Command-Line Interface on page 1810](#)
- [RMON Event Table on page 1810](#)
- [RMON Alarm Table on page 1811](#)
- [Troubleshooting RMON on page 1811](#)

### Setting Thresholds

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside of the allowable operational range. (See [Figure 60 on page 1809](#).)

**Figure 60: Setting Thresholds**

Events are only generated when the threshold is first crossed in any one direction rather than after each sample period. For example, if a rising threshold crossing event is raised, no more threshold crossing events will occur until a corresponding falling event. This considerably reduces the quantity of alarms that are produced by the system, making it easier for operations staff to react when alarms do occur.

To configure remote monitoring, specify the following pieces of information:

- The variable to be monitored (by its SNMP object identifier)
- The length of time between each inspection
- A rising threshold
- A falling threshold
- A rising event
- A falling event

Before you can successfully configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline

period of at least three months is not unusual when first identifying the operational ranges and defining thresholds, but baseline monitoring should continue over the life span of each monitored variable.

### ***RMON Command-Line Interface***

Junos OS provides two mechanisms you use to control the Remote Monitoring agent on the router: command-line interface (CLI) and SNMP. To configure an RMON entry using the CLI, include the following statements at the **[edit snmp]** hierarchy level:

```
rmon {
  alarm index {
    description;
    falling-event-index;
    falling-threshold;
    intervals;
    rising-event-index;
    rising-threshold;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling | rising | rising-or-falling);
    variable;
  }
  event index {
    community;
    description;
    type (log | trap | log-and-trap | none);
  }
}
```

If you do not have CLI access, you can configure remote monitoring using the SNMP Manager or management application, assuming SNMP access has been granted. (See [Table 267 on page 1810](#).) To configure RMON using SNMP, perform SNMP **Set** requests to the RMON event and alarm tables.

### ***RMON Event Table***

Set up an event for each type that you want to generate. For example, you could have two generic events, *rising* and *falling*, or many different events for each variable that is being monitored (for example, *temperature rising* event, *temperature falling* event, *firewall hit* event, *interface utilization* event, and so on). Once the events have been configured, you do not need to update them.

**Table 267: RMON Event Table**

Field	Description
<b>eventDescription</b>	Text description of this event
<b>eventType</b>	Type of event (for example, <b>log</b> , <b>trap</b> , or <b>log and trap</b> )
<b>eventCommunity</b>	Trap group to which to send this event (as defined in the Junos OS configuration, which is not the same as the community)
<b>eventOwner</b>	Entity (for example, <b>manager</b> ) that created this event

Table 267: RMON Event Table (*continued*)

Field	Description
<b>eventStatus</b>	Status of this row (for example, <b>valid</b> , <b>invalid</b> , or <b>createRequest</b> )

**RMON Alarm Table**

The RMON alarm table stores the SNMP object identifiers (including their instances) of the variables that are being monitored, together with any rising and falling thresholds and their corresponding event indexes. To create an RMON request, specify the fields shown in [Table 268 on page 1811](#).

Table 268: RMON Alarm Table

Field	Description
<b>alarmStatus</b>	Status of this row (for example, <b>valid</b> , <b>invalid</b> , or <b>createRequest</b> )
<b>alarmInterval</b>	Sampling period (in seconds) of the monitored variable
<b>alarmVariable</b>	OID (and instance) of the variable to be monitored
<b>alarmValue</b>	Actual value of the sampled variable
<b>alarmSampleType</b>	Sample type ( <b>absolute</b> or <b>delta</b> changes)
<b>alarmStartupAlarm</b>	Initial alarm ( <b>rising</b> , <b>falling</b> , or <b>either</b> )
<b>alarmRisingThreshold</b>	Rising threshold against which to compare the value
<b>alarmFallingThreshold</b>	Falling threshold against which to compare the value
<b>alarmRisingEventIndex</b>	Index (row) of the rising event in the event table
<b>alarmFallingEventIndex</b>	Index (row) of the falling event in the event table

Both the **alarmStatus** and **eventStatus** fields are **entryStatus** primitives, as defined in RFC 2579, *Textual Conventions for SMIV2*.

**Troubleshooting RMON**

You troubleshoot the RMON agent, **rmopd**, that runs on the router by inspecting the contents of the Juniper Networks enterprise RMON MIB, **jnxRmon**, which provides the extensions listed in [Table 269 on page 1811](#) to the RFC 2819 **alarmTable**.

Table 269: jnxRmon Alarm Extensions

Field	Description
<b>jnxRmonAlarmGetFailCnt</b>	Number of times the internal <b>Get</b> request for the variable failed

Table 269: jnxRmon Alarm Extensions (*continued*)

Field	Description
<code>jnxRmonAlarmGetFailTime</code>	Value of <code>sysUpTime</code> when the last failure occurred
<code>jnxRmonAlarmGetFailReason</code>	Reason why the <code>Get</code> request failed
<code>jnxRmonAlarmGetOkTime</code>	Value of <code>sysUpTime</code> when the variable moved out of failure state
<code>jnxRmonAlarmState</code>	Status of this alarm entry

Monitoring the extensions in this table provides clues as to why remote alarms may not behave as expected.

### Configuring SNMP on a Device Running Junos OS

By default, SNMP is disabled on devices running Junos OS. To enable SNMP on a router or switch, you must include the SNMP configuration statements at the **[edit snmp]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit snmp]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

The community defined here as **public** grants read access to all MIB data to any client.

To configure complete SNMP features, include the following statements at the **[edit snmp]** hierarchy level:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
  }
  routing-instance routing-instance-name {
    clients {
      addresses;
    }
  }
  logical-system logical-system-name {
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
  }
  view view-name;
}
contact contact;
description description;
engine-id {
  (local engine-id | use-mac-address | use-default-ip-address);
}
```

```

filter-duplicates;
health-monitor {
    falling-threshold integer;
    interval seconds;
    rising-threshold integer;
}
interface [ interface-names ];
location location;
name name;
nonvolatile {
    commit-delay seconds;
}
rmon {
    alarm index {
        description text-description;
        falling-event-index index;
        falling-threshold integer;
        falling-threshold-interval seconds;
        interval seconds;
        request-type (get-next-request | get-request | walk-request);
        rising-event-index index;
        sample-type type;
        startup-alarm alarm;
        syslog-subtag syslog-subtag;
        variable oid-variable;
    }
    event index {
        community community-name;
        description text-description;
        type type;
    }
}
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
        regular-expression>;
    flag flag;
}
trap-group group-name {
    categories {
        category;
    }
    destination-port port-number;
    routing-instance instance;
    targets {
        address;
    }
    version (all | v1 | v2);
}
trap-options {
    agent-address outgoing-interface;
    source-address address;
}
view view-name {
    oid object-identifier (include | exclude);
}
}

```

### Configuring the System Contact on a Device Running Junos OS

You can specify an administrative contact for each system being managed by SNMP. This name is placed into the MIB II **sysContact** object. To configure a contact name, include the **contact** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
contact contact;
```

If the name contains spaces, enclose it in quotation marks (" ").

To define a system contact name that contains spaces:

```
[edit]
snmp {
  contact "Juniper Berry, (650) 555-1234";
}
```

  - [Configuring the System Name on page 1816](#)
  - [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)

---

### Configuring the System Description on a Device Running Junos OS

You can specify a description for each system being managed by SNMP. This string is placed into the MIB II **sysDescription** object. To configure a description, include the **description** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
description description;
```

If the description contains spaces, enclose it in quotation marks (" ").

To specify the system description:

```
[edit]
snmp {
  description "M40 router with 8 FPCs";
}
```

- Related Documentation**

  - [Configuring the System Name on page 1816](#)

- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)

---

### Configuring the System Location for a Device Running Junos OS

You can specify the location of each system being managed by SNMP. This string is placed into the MIB II **sysLocation** object. To configure a system location, include the **location** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
location location;
```

If the location contains spaces, enclose it in quotation marks (" ").

To specify the system location:

```
[edit]
snmp {
  location "Row 11, Rack C";
}
```

- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)

---

### Configuring the System Name

Junos OS enables you to override the system name by including the **name** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
name name;
```

If the name contains spaces, enclose it in quotation marks (" ").

To specify the system name override:

```
[edit]
snmp {
  name "snmp 1";
}
```

### Configuring the Commit Delay Timer

---

When a router or switch first receives an SNMP nonvolatile **Set** request, a Junos OS XML protocol session opens and prevents other users or applications from changing the candidate configuration (equivalent to the command-line interface [CLI] **configure exclusive** command). If the router does not receive new SNMP **Set** requests within 5 seconds (the default value), the candidate configuration is committed and the Junos OS XML protocol session closes (the configuration lock is released). If the router receives new SNMP **Set** requests while the candidate configuration is being committed, the SNMP **Set** request is rejected and an error is generated. If the router receives new SNMP **Set** requests before 5 seconds have elapsed, the commit-delay timer (the length of time between when the last SNMP request is received and the commit is requested) resets to 5 seconds.

By default, the timer is set to 5 seconds. To configure the timer for the SNMP **Set** reply and start of the commit, include the **commit-delay** statement at the **[edit snmp nonvolatile]** hierarchy level:

```
[edit snmp nonvolatile]
  commit-delay seconds;
```

**seconds** is the length of the time between when the SNMP request is received and the commit is requested for the candidate configuration. For more information about the **configure exclusive** command and locking the configuration, see the *CLI User Guide*.

#### Related Documentation

### Loading MIB Files to a Network Management System

---

For your network management system (NMS) to identify and understand the MIB objects used by the Junos OS, you must first load the MIB files to your NMS using a MIB compiler. A MIB compiler is a utility that parses the MIB information such as the MIB object name, IDs, and data type for the NMS.

You can download the Junos MIB package from the **Enterprise-Specific MIBs and Traps** section of the Junos OS Technical Publications index page at <http://www.juniper.net/techpubs/software/junos/index.html>. The Junos MIB package is available in **.zip** and **.tar** packages. You can download the appropriate format based on your requirements.

The Junos MIB package contains two folders: **StandardMibs** and **JuniperMibs**. The **StandardMibs** folder contains the standard MIBs and RFCs that are supported on devices running the Junos OS, whereas the **JuniperMibs** folder contains the Juniper Networks enterprise-specific MIBs.

To load MIB files that are required for managing and monitoring devices running the Junos OS:

1. Go to the Junos OS Technical Publications index page (<http://www.juniper.net/techpubs/software/junos/index.html>).
2. Click the tab that corresponds to the Junos OS Release for which you want to download the MIB files.
3. On the selected tab, click the + (plus) sign that corresponds to the **Enterprise-Specific MIBs and Traps** section to expand the section.
4. Click the **TAR** or **ZIP** link that corresponds to the **Enterprise MIBs** link under the **Enterprise-Specific MIBs and Traps** section to download the Junos MIB package.
5. Decompress the file (.tar or .zip) using an appropriate utility.
6. Load the standard MIB files (from the **StandardMibs** folder) in the following order:

**NOTE:** Some of the MIB compilers that are commonly used have the standard MIBs preloaded on them. If the standard MIBs are already loaded on the MIB compiler that you are using, skip this step and proceed to Step 7.

- a. **mib-SNMPv2-SMI.txt**
  - b. **mib-SNMPv2-TC.txt**
  - c. **mib-IANAifType-MIB.txt**
  - d. **mib-IANA-RTPROTO-MIB.txt**
  - e. **mib-rfc1907.txt**
  - f. **mib-rfc2011a.txt**
  - g. **mib-rfc2012a.txt**
  - h. **mib-rfc2013a.txt**
  - i. **mib-rfc2863a.txt**
7. Load the remaining standard MIB files.

**NOTE:** You must follow the order specified in this procedure, and ensure that all standard MIBs are loaded before you load the enterprise-specific MIBs. There might be dependencies that require a particular MIB to be present on the compiler before loading some other MIB. You can find such dependencies listed in the **IMPORT** section of the MIB file.

8. Load the Juniper Networks enterprise-specific SMI MIB, **mib-jnx-smi.txt**, and the following optional SMI MIBs based on your requirements:
  - **mib-jnx-js-smi.txt**—(Optional) For Juniper Security MIB tree objects

- **mib-jnx-ex-smi.txt**—(Optional) For EX Series Ethernet Switches
- **mib-jnx-exp.txt**—(Recommended) For Juniper Networks experimental MIB objects

9. Load the remaining enterprise-specific MIBs from the **JuniperMibs** folder.

**TIP:** While loading a MIB file, if the compiler returns an error message saying that any of the objects is undefined, open the MIB file using a text editor and ensure that all the MIB files listed in the **IMPORT** section are loaded on the compiler. If any of the MIB files listed in the **IMPORT** section is not loaded on the compiler, load that MIB file, and then try to load the MIB file that failed to load.

For example, the enterprise-specific PING MIB, **mib-jnx-ping.txt**, has dependencies on RFC 2925, DiSMAN-PING-MIB, **mib-rfc2925a.txt**. If you try to load **mib-jnx-ping.txt** before loading **mib-rfc2925a.txt**, the compiler returns an error message saying that certain objects in **mib-jnx-ping.txt** are undefined. Load **mib-rfc2925a.txt**, and then try to load **mib-jnx-ping.txt**. The enterprise-specific PING MIB, **mib-jnx-ping.txt**, then loads without any issue.

### Filtering Duplicate SNMP Requests

By default, filtering duplicate **get**, **getNext**, and **getBulk** SNMP requests is disabled on devices running Junos OS. If a network management station retransmits a **Get**, **GetNext**, or **GetBulk** SNMP request too frequently to the router, that request might interfere with the processing of previous requests and slow down the response time of the agent. Filtering these duplicate requests improves the response time of the SNMP agent. Junos OS uses the following information to determine if an SNMP request is a duplicate:

- Source IP address of the SNMP request
- Source UDP port of the SNMP request
- Request ID of the SNMP request

To filter duplicate SNMP requests, include the **filter-duplicates** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  filter-duplicates;
```

#### Related Documentation

- [Configuring SNMP on a Device Running Junos OS on page 1813](#)

- [Filtering Interface Information Out of SNMP Get and GetNext Output on page 1820](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)

### Configuring the Interfaces on Which SNMP Requests Can Be Accepted

---

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

#### Related Documentation

- [Configuring SNMP on a Device Running Junos OS on page 1813](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)
- [Example: Configuring Secured Access List Checking on page 1820](#)

### Example: Configuring Secured Access List Checking

---

Grant SNMP access privileges only to devices on interfaces **so-0/0/0** and **at-1/0/1**. The following example does this by configuring a list of logical interfaces:

```
[edit]
snmp {
  interface [ so-0/0/0.0 so-0/0/0.1 at-1/0/1.0 at-1/0/1.1 ];
}
```

The following example grants the same access by configuring a list of physical interfaces:

```
[edit]
snmp {
  interface [ so-0/0/0 at-1/0/1 ];
}
```

#### Related Documentation

- [Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 1820](#)
- [Filtering Interface Information Out of SNMP Get and GetNext Output on page 1820](#)
- [Configuring SNMP on a Device Running Junos OS on page 1813](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)

### Filtering Interface Information Out of SNMP Get and GetNext Output

---

Junos OS enables you to filter out information related to specific interfaces from the output of SNMP **Get** and **GetNext** requests performed on interface-related MIBs such as IF MIB, ATM MIB, RMON MIB, and the Juniper Networks enterprise-specific IF MIB.

You can use the following options of the **filter-interfaces** statement at the **[edit snmp]** hierarchy level to specify the interfaces that you want to exclude from SNMP **Get** and **GetNext** queries:

- **interfaces**—Interfaces that match the specified regular expressions.

- **all-internal-interfaces**—Internal interfaces.

```
[edit]
snmp {
  filter-interfaces {
    interfaces {
      interface1;
      interface2;
    }
    all-internal-interfaces;
  }
}
```

However, note that these settings are limited to SNMP operations, and the users can continue to access information related to the interfaces (including those hidden using the **filter-interfaces** options) using the appropriate Junos OS command-line interface (CLI) commands.

#### Related Documentation

### Configuring MIB Views

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (\*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

**NOTE:** To remove an OID completely, use the **delete view all oid oid-number** command but omit the **include** parameter.

To associate MIB views with a community, include the **view** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]  
  view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the *PING MIB* topic.

**Related  
Documentation**

- [Configuring SNMP on a Device Running Junos OS on page 1813](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)
- [Example: Ping Proxy MIB on page 1822](#)
- [view \(Configuring a MIB View\) on page 1962](#)
- [oid on page 1921](#)

---

### Example: Ping Proxy MIB

Restrict the *ping-mib* community to read and write access of the Ping MIB and **jnxpingMIB** only. Read or write access to any other MIB using this community is not allowed.

```
[edit snmp]  
  view ping-mib-view {  
    oid 1.3.6.1.2.1.80 include; #pingMIB  
    oid jnxPingMIB include; #jnxPingMIB  
  }  
  community ping-mib {  
    authorization read-write;  
    view ping-mib-view;  
  }
```

The following configuration prevents the *no-ping-mib* community from accessing Ping MIB and **jnxPingMIB** objects. However, this configuration does not prevent the *no-ping-mib* community from accessing any other MIB object that is supported on the device.

```
[edit snmp]  
  view no-ping-mib-view {  
    oid 1.3.6.1.2.1.80 exclude; # deny access to pingMIB objects  
    oid jnxPingMIB exclude; # deny access to jnxPingMIB objects  
  }  
  community no-ping-mib {  
    authorization read-write;  
    view ping-mib-view;  
  }
```

## Configuring the Local Engine ID

By default, the local engine ID uses the default IP address of the router. The local engine ID is the administratively unique identifier for the SNMPv3 engine. This statement is optional. To configure the local engine ID, include the **engine-id** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

- **local engine-id-suffix**—The engine ID suffix is explicitly configured.
- **use-default-ip-address**—The engine ID suffix is generated from the default IP address.
- **use-mac-address**—The SNMP engine identifier is generated from the Media Access Control (MAC) address of the management interface on the router.

The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

**NOTE:** SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID. For the engine ID, we recommend using the master IP address of the device if the device has multiple routing engines and has the master IP address configured. Alternatively, you can use the MAC address of the management port if the device has only one Routing Engine.

## Configuring SNMP Informs

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 61 on page 1824](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

**Figure 61: Inform Request and Response**

- [Example: Security Group Configuration on page 1834](#)
- [Example: Configuring the Tag List on page 1835](#)
- [Example: Creating SNMPv3 Users Configuration on page 1835](#)

### Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key

based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

**NOTE:** You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
  user username;
```

**username** is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user username]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
  authentication-md5 {
    authentication-password authentication-password;
  }
  authentication-sha {
    authentication-password authentication-password;
  }
  authentication-none;
  privacy-aes128 {
    privacy-password privacy-password;
  }
  privacy-des {
    privacy-password privacy-password;
  }
  privacy-3des {
    privacy-password privacy-password;
  }
  privacy-none;
```

#### Example: SNMPv3 Configuration

Define an SNMPv3 configuration:

```
[edit snmp]
  engine-id {
    use-mac-address;
  }
  view jnxAlarms {
    oid 1.3.6.1.4.1.2636.3.4 include;
  }
  view interfaces {
```

```
oid 1.3.6.1.2.1.2 include;
}
view ping-mib {
oid 1.3.6.1.2.1.80 include;
}
[edit snmp v3]
notify n1 {
tag router1; # Identifies a set of target addresses
type trap; # Defines type of notification
}
notify n2 {
tag host1;
type trap;
}
notify-filter nf1 {
oid .1 include; # Defines which traps to send
} # In this case, includes all traps
notify-filter nf2 {
oid 1.3.6.1.4.1 include; # Sends enterprise-specific traps only
}
notify-filter nf3 {
oid 1.3.6.1.2.1.1.5 include; # Sends BGP traps only
}
snmp-community index1 {
community-name "$ABC123"; # SECRET-DATA
security-name john; # Matches the security name at the target parameters
tag host1; # Finds the addresses that are allowed to be used with
}
target-address ta1 { # Associates the target address with the group
# san-francisco.
address 10.1.1.1;
address-mask 255.255.255.0; # Defines the range of addresses
port 162;
tag-list router1;
target-parameters tp1; # Applies configured target parameters
}
target-address ta2 {
address 10.1.1.2;
address-mask 255.255.255.0;
port 162;
tag-list host1;
target-parameters tp2;
}
target-address ta3 {
address 10.1.1.3;
address-mask 255.255.255.0;
port 162;
tag-list "router1 host1";
target-parameters tp3;
}
target-parameters tp1 { # Defines the target parameters
notify-filter nf1; # Specifies which notify filter to apply
parameters {
message-processing-model v1;
security-model v1;
security-level none;
}
```

```

        security-name john; # Matches the security name configured at the
    } # [edit snmp v3 snmp-community community-index hierarchy level.
}
target-parameters tp2 {
    notify-filter nf2;
    parameters {
        message-processing-model v1;
        security-model v1;
        security-level none;
        security-name john;
    }
}
target-parameters tp3 {
    notify-filter nf3;
    parameters {
        message-processing-model v1;
        security-model v1;
        security-level none;
        security-name john;
    }
}
}
usm {
    local-engine { #Defines authentication and encryption for SNMPv3 users
        user user1 {
            authentication-md5 {
                authentication-password authentication-password;
            }
            privacy-des {
                privacy-password privacy-password;
            }
        }
        user user2 {
            authentication-sha {
                authentication-password authentication-password;
            }
            privacy-none;
        }
        user user3 {
            authentication-none;
            privacy-none;
        }
        user user4 {
            authentication-sha {
                authentication-password authentication-password;
            }
            privacy-aes128 {
                privacy-password privacy-password;
            }
        }
        user user5 {
            authentication-sha {
                authentication-password authentication-password;
            }
            privacy-none;
        }
    }
}

```

```

}
vacm {
  access {
    group san-francisco { #Defines the access privileges for the group
      default-context-prefix { # called san-francisco
        security-model v1 {
          security-level none {
            notify-view ping-mib;
            read-view interfaces;
            write-view jnxAlarms;
          }
        }
      }
    }
  }
}
security-to-group {
  security-model v1 {
    security-name john { # Assigns john to the security group
      group san-francisco; # called san-francisco
    }
    security-name bob {
      group new-york;
    }
    security-name elizabeth {
      group chicago;
    }
  }
}
}
}

```

### Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

**NOTE:** You must configure at least one view (notify, read, or write) at the `[edit snmp view-name]` hierarchy level.

```

[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {

```

```

    security-name security-name;
  }
  target-address target-address-name {
    address address;
    target-parameters target-parameters-name;
  }
  target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
      message-processing-model (v1 | v2c | v3);
      security-level (authentication | none | privacy);
      security-model (usm | v1 | v2c);
      security-name security-name;
    }
  }
  usm {
    local-engine {
      user username {
      }
    }
  }
  vacm {
    access {
      group group-name {
        (default-context-prefix | context-prefix context-prefix){
          security-model (any | usm | v1 | v2c) {
            security-level (authentication | none | privacy) {
              notify-view view-name;
              read-view view-name;
              write-view view-name;
            }
          }
        }
      }
    }
    security-to-group {
      security-model (usm | v1 | v2c) {
        security-name security-name {
          group group-name;
        }
      }
    }
  }
}

```

## Configuring the SNMPv3 Authentication Type

---

By default, in a Junos OS configuration the SNMPv3 authentication type is set to none.

This topic includes the following sections:

- [Configuring MD5 Authentication on page 1830](#)
- [Configuring SHA Authentication on page 1830](#)
- [Configuring No Authentication on page 1831](#)

### Configuring MD5 Authentication

To configure the message digest algorithm (MD5) as the authentication type for an SNMPv3 user, include the **authentication-md5** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-md5 {  
    authentication-password authentication-password;  
}
```

***authentication-password*** is the password used to generate the key used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

### Configuring SHA Authentication

To configure the secure hash algorithm (SHA) as the authentication type for an SNMPv3 user, include the **authentication-sha** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-sha {  
    authentication-password authentication-password;  
}
```

***authentication-password*** is the password used to generate the key used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

### Configuring No Authentication

To configure no authentication for an SNMPv3 user, include the **authentication-none** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-none;
```

#### Related Documentation

- [Complete SNMPv3 Configuration Statements on page 1885](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1828](#)

### Configuring the Encryption Type

By default, encryption is set to none.

**NOTE:** Before you configure encryption, you must configure MD5 or SHA authentication.

Before you configure the **privacy-des**, **privacy-3des** and **privacy-aes128** statements, you must install the **jcrypto** package, and either restart the SNMP process or reboot the router.

This topic includes the following sections:

- [Configuring the Advanced Encryption Standard Algorithm on page 1831](#)
- [Configuring the Data Encryption Algorithm on page 1832](#)
- [Configuring Triple DES on page 1832](#)
- [Configuring No Encryption on page 1832](#)

#### Configuring the Advanced Encryption Standard Algorithm

To configure the Advanced Encryption Standard (AES) algorithm for an SNMPv3 user, include the **privacy-aes128** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
privacy-aes128 {  
  privacy-password privacy-password;  
}
```

***privacy-password*** is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

### **Configuring the Data Encryption Algorithm**

To configure the data encryption algorithm (DES) for an SNMPv3 user, include the **privacy-des** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
privacy-des {  
  privacy-password privacy-password;  
}
```

***privacy-password*** is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

### **Configuring Triple DES**

To configure triple DES for an SNMPv3 user, include the **privacy-3des** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
privacy-3des {  
  privacy-password privacy-password;  
}
```

***privacy-password*** is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

### **Configuring No Encryption**

To configure no encryption for an SNMPv3 user, include the **privacy-none** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
privacy-none;
```

#### **Related Documentation**

- [Configuring the SNMPv3 Authentication Type on page 1830](#)
- [Defining Access Privileges for an SNMP Group on page 1853](#)

- [Configuring the Access Privileges Granted to a Group on page 1854](#)
- [Assigning Security Model and Security Name to a Group on page 1833](#)
- [Complete SNMPv3 Configuration Statements on page 1885](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1828](#)

### Assigning Security Model and Security Name to a Group

To assign security names to groups, include the following statements at the `[edit snmp v3 vacm security-to-group]` hierarchy level:

```
[edit snmp v3 vacm security-to-group]
security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}
```

This topic includes the following sections:

- [Configuring the Security Model on page 1833](#)
- [Assigning Security Names to Groups on page 1833](#)
- [Configuring the Group on page 1834](#)

#### Configuring the Security Model

To configure the security model, include the `security-model` statement at the `[edit snmp v3 vacm security-to-group]` hierarchy level:

```
[edit snmp v3 vacm security-to-group]
security-model (usm | v1 | v2c);
```

- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2 security model

#### Assigning Security Names to Groups

To associate a security name with an SNMPv3 user, or a v1 or v2 community string, include the `security-name` statement at the `[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]` hierarchy level:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
security-name security-name;
```

For SNMPv3, the `security-name` is the username configured at the `[edit snmp v3 usm local-engine user username]` hierarchy level. For SNMPv1 and SNMPv2c, the security name is the community string configured at the `[edit snmp v3 snmp-community community-index]` hierarchy level. For information about configuring usernames, see [“Creating SNMPv3 Users” on page 1824](#). For information about configuring a community string, see [“Configuring the SNMPv3 Community” on page 1864](#).

**NOTE:** The USM security name is separate from the SNMPv1 and SNMPv2c security name. If you support SNMPv1 and SNMPv2c in addition to SNMPv3, you must configure separate security names within the security-to-group configuration at the `[edit snmp v3 vacm access]` hierarchy level.

### Configuring the Group

After you have created SNMPv3 users, or v1 or v2 security names, you associate them with a group. A group is a set of security names belonging to a particular security model. A group defines the access rights for all users belonging to it. Access rights define what SNMP objects can be read, written to, or created. A group also defines what notifications a user is allowed to receive.

If you already have a group that is configured with all of the view and access permissions that you want to give a user, you can add the user to that group. If you want to give a user view and access permissions that no other groups have, or if you do not have any groups configured, create a group and add the user to it.

To configure the access privileges granted to a group, include the **group** statement at the `[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name security-name]` hierarchy level:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
    security-name]
    group group-name;
```

**group-name** identifies a collection of SNMP security names that share the same access policy. For more information about groups, see [“Defining Access Privileges for an SNMP Group” on page 1853](#).

### Example: Security Group Configuration

Assign security names to groups:

```
vacm {
  security-to-group {
    security-model usm {
      security-name user1 {
        group group1;
      }
      security-name user2 {
        group group2;
      }
      security-name user3 {
        group group3;
      }
    }
  }
}
```

#### Related Documentation

- [Assigning Security Model and Security Name to a Group on page 1833](#)
- [Complete SNMPv3 Configuration Statements on page 1885](#)

- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1828](#)

### Example: Configuring the Tag List

---

In the following example, two tag entries (**router1** and **router2**) are defined at the **[edit snmp v3 notify *notify-name*]** hierarchy level. When an event triggers a notification, Junos OS sends a trap to all target addresses that have **router1** or **router2** configured in their target-address tag list. This results in the first two targets getting one trap each, and the third target getting two traps.

```
[edit snmp v3]
notify n1 {
  tag router1; # Identifies a set of target addresses
  type trap; # Defines the type of notification
}
notify n2 {
  tag router2;
  type trap;
}
target-address ta1 {
  address 10.1.1.1;
  address-mask 255.255.255.0;
  port 162;
  tag-list router1;
  target-parameters tp1;
}
target-address ta2 {
  address 10.1.1.2;
  address-mask 255.255.255.0;
  port 162;
  tag-list router2;
  target-parameters tp2;
}
target-address ta3 {
  address 10.1.1.3;
  address-mask 255.255.255.0;
  port 162;
  tag-list "router1 router2"; #Define multiple tags in the target address tag list
  target-parameters tp3;
}
```

#### Related Documentation

### Example: Creating SNMPv3 Users Configuration

---

Define SNMPv3 users:

```
[edit]
snmp {
```

```

v3 {
  usm {
    local-engine {
      user user1 {
        authentication-md5 {
          authentication-password authentication-password;
        }
        privacy-des {
          privacy-password password;
        }
      }
      user user2 {
        authentication-sha {
          authentication-password authentication-password;
        }
        privacy-none;
      }
      user user3 {
        authentication-none;
        privacy-none;
      }
      user user4 {
        authentication-md5 {
          authentication-password authentication-password;
        }
        privacy-des {
          privacy-password authentication-password;
        }
      }
      user user5 {
        authentication-sha {
          authentication-password authentication-password;
        }
        privacy-aes128 {
          privacy-password authentication-password;
        }
      }
    }
  }
}

```

- [Defining and Configuring the Trap Target Parameters on page 1849](#)
- [Example: Configuring SNMPv3 Trap Notification on page 1852](#)

### Configuring SNMP Trap Options

Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router to a single address regardless of the outgoing interface. In addition, you can set the agent address of the SNMPv1 traps. For more information about the contents of SNMPv1 traps, see RFC 1157.

**NOTE:** SNMP cannot be associated with any routing instances other than the master routing instance.

To configure SNMP trap options, include the **trap-options** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
  enterprise-oid
  logical-system
  routing-instance
  source-address address;
}
```

You must also configure a trap group for the trap options to take effect. For information about trap groups, see [“Configuring SNMP Trap Groups” on page 1841](#).

This topic contains the following sections:

- [Configuring the Source Address for SNMP Traps on page 1837](#)
- [Configuring the Agent Address for SNMP Traps on page 1839](#)
- [Adding snmpTrapEnterprise Object Identifier to Standard SNMP Traps on page 1840](#)

#### Configuring the Source Address for SNMP Traps

You can configure the source address of trap packets in many ways: **lo0**, a valid IPv4 address configured on one of the router interfaces, a logical-system address, or the address of a routing-instance. The value **lo0** indicates that the source address of the SNMP trap packets is set to the lowest loopback address configured on the interface **lo0**.

You can configure the source address of trap packets in one of the following formats:

- a valid IPv4 address configured on one of the router interfaces
- **lo0**; that is the lowest loopback address configured on the interface **lo0**.

- a logical-system name
- a routing-instance name

#### A valid IPv4 Address As the Source Address

To specify a valid interface address as the source address for SNMP traps on one of the router interfaces, include the **source-address** statement at the **[edit snmp trap-options]** hierarchy level:

```
[edit snmp trap-options]
source-address address;
```

**address** is a valid IPv4 address configured on one of the router interfaces.

#### The Lowest Loopback Address As the Source Address

To specify the source address of the SNMP traps so that they use the lowest loopback address configured on the interface **lo0** as the source address, include the **source-address** statement at the **[edit snmp trap-options]** hierarchy level:

```
[edit snmp trap-options]
source-address lo0;
```

To enable and configure the loopback address, include the **address** statement at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level:

```
[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address ip-address;
    }
  }
}
```

To configure the loopback address as the source address of trap packets:

```
[edit snmp]
trap-options {
  source-address lo0;
}
trap-group "urgent-dispatcher" {
  version v2;
  categories link startup;
  targets {
    192.168.10.22;
    172.17.1.2;
  }
}
[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address 10.0.0.1/32;
      address 127.0.0.1/32;
    }
  }
}
```

In this example, the IP address **10.0.0.1** is the source address of every trap sent from this router.

**Logical System Name  
as the Source Address**

To specify a logical system name as the source address of SNMP traps, include the **logical-system** *logical-system-name* statement at the **[edit snmp trap-options]** hierarchy level.

For example, the following configuration sets logical system name **ls1** as the source address of SNMP traps:

```
[edit snmp]
  trap-options {
    logical-system ls1;
  }
```

**Routing Instance  
Name as the Source  
Address**

To specify a routing instance name as the source address of SNMP traps, include the **routing-instance** *routing-instance-name* statement at the **[edit snmp trap-options]** hierarchy level.

For example, the following configuration sets the routing instance name **ri1** as the source address for SNMP traps:

```
[edit snmp]
  trap-options {
    routing-instance ri1;
  }
```

**Configuring the Agent Address for SNMP Traps**

The agent address is only available in SNMPv1 trap packets (see RFC 1157). By default, the router's default local address is used in the agent address field of the SNMPv1 trap. To configure the agent address, include the **agent-address** statement at the **[edit snmp trap-options]** hierarchy level. Currently, the agent address can only be the address of the outgoing interface:

```
[edit snmp]
  trap-options {
    agent-address outgoing-interface;
  }
```

To configure the outgoing interface as the agent address:

```
[edit snmp]
  trap-options {
    agent-address outgoing-interface;
  }
  trap-group "urgent-dispatcher" {
    version v1;
    categories link startup;
    targets {
      192.168.10.22;
      172.17.1.2;
    }
  }
```

In this example, each SNMPv1 trap packet sent has its agent address value set to the IP address of the outgoing interface.

### ***Adding snmpTrapEnterprise Object Identifier to Standard SNMP Traps***

The **snmpTrapEnterprise** object helps you identify the enterprise that has defined the trap. Typically, the **snmpTrapEnterprise** object appears as the last varbind in enterprise-specific SNMP version 2 traps. However, starting Release 10.0, Junos OS enables you to add the **snmpTrapEnterprise** object identifier to standard SNMP traps as well.

To add **snmpTrapEnterprise** to standard traps, include the **enterprise-oid** statement at the **[edit snmp trap-options]** hierarchy level. If the **enterprise-oid** statement is not included in the configuration, **snmpTrapEnterprise** is added only for enterprise-specific traps.

```
[edit snmp]
trap-options {
  enterprise-oid;
}
```

---

### ***Configuring the Trap Notification Filter***

SNMPv3 uses the notify filter to define which traps (or which objects from which traps) are sent to the network management system (NMS). The trap notification filter limits the type of traps that are sent to the NMS.

Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as **interfaces**). You can also use the wildcard character asterisk (\*) in the object identifier (OID) to specify object identifiers that match a particular pattern.

To configure the trap notifications filter, include the **notify-filter** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
notify-filter profile-name;
```

**profile-name** is the name assigned to the notify filter.

By default, the OID is set to **include**. To define access to traps (or objects from traps), include the **oid** statement at the **[edit snmp v3 notify-filter profile-name]** hierarchy level:

```
[edit snmp v3 notify-filter profile-name]
oid oid (include | exclude);
```

**oid** is the object identifier. All MIB objects represented by this statement have the specified OID as a prefix. It can be specified either by a sequence of dotted integers or by a subtree name.

- **include**—Include the subtree of MIB objects represented by the specified OID.

- **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

#### Related Documentation

- [Complete SNMPv3 Configuration Statements on page 1885](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1828](#)

### Configuring SNMP Trap Groups

You can create and name a group of one or more types of SNMP traps and then define which systems receive the group of SNMP traps. The trap group must be configured for SNMP traps to be sent. To create an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 or IPv6 address of each recipient, not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement. For information about the category to which the traps belong, see the “[Standard SNMP Traps Supported on Devices Running Junos OS](#)” on page 1785 and “[Juniper Networks Enterprise-Specific SNMP Traps](#)” on page 1785 topics.

Specify the routing instance used by the trap group in the **routing-instance** statement. All targets configured in the trap group use this routing instance.

A trap group can receive the following categories:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications (up-down transitions, DS-3 and DS-1 line status change, IPv6 interface state change, and Passive Monitoring PIC overload)

**NOTE:** To send Passive Monitoring PIC overload interface traps, select the link trap category.

- **remote-operations**—Remote operation notifications
- **rmon-alarm**—Alarm for RMON events
- **routing**—Routing protocol notifications
- **sonet-alarms**—SONET/SDH alarms

**NOTE:** If you omit the SONET/SDH subcategories, all SONET/SDH trap alarm types are included in trap notifications.

- **loss-of-light**—Loss of light alarm notification
- **pll-lock**—PLL lock alarm notification
- **loss-of-frame**—Loss of frame alarm notification
- **loss-of-signal**—Loss of signal alarm notification
- **severely-errored-frame**—Severely errored frame alarm notification
- **line-ais**—Line alarm indication signal (AIS) alarm notification
- **path-ais**—Path AIS alarm notification
- **loss-of-pointer**—Loss of pointer alarm notification
- **ber-defect**—SONET/SDH bit error rate alarm defect notification
- **ber-fault**—SONET/SDH error rate alarm fault notification
- **line-remote-defect-indication**—Line remote defect indication alarm notification
- **path-remote-defect-indication**—Path remote defect indication alarm notification
- **remote-error-indication**—Remote error indication alarm notification
- **unequipped**—Unequipped alarm notification
- **path-mismatch**—Path mismatch alarm notification
- **loss-of-cell**—Loss of cell delineation alarm notification
- **vt-ais**—Virtual tributary (VT) AIS alarm notification
- **vt-loss-of-pointer**—VT loss of pointer alarm notification

- **vt-remote-defect-indication**—VT remote defect indication alarm notification
- **vt-unequipped**—VT unequipped alarm notification
- **vt-label-mismatch**—VT label mismatch error notification
- **vt-loss-of-cell**—VT loss of cell delineation notification
- **startup**—System warm and cold starts
- **vrrp-events**—Virtual Router Redundancy Protocol (VRRP) events such as new-master or authentication failures

If you include SONET/SDH subcategories, only those SONET/SDH trap alarm types are included in trap notifications.

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

### Configuring SNMP Trap Options and Groups on a Device Running Junos OS

Some carriers have more than one trap receiver that forwards traps to a central NMS. This allows for more than one path for SNMP traps from a router to the central NMS through different trap receivers. A device running Junos OS can be configured to send the same copy of each SNMP trap to every trap receiver configured in the trap group.

The source address in the IP header of each SNMP trap packet is set to the address of the outgoing interface by default. When a trap receiver forwards the packet to the central NMS, the source address is preserved. The central NMS, looking only at the source address of each SNMP trap packet, assumes that each SNMP trap came from a different source.

In reality, the SNMP traps came from the same router, but each left the router through a different outgoing interface.

The statements discussed in the following sections are provided to allow the NMS to recognize the duplicate traps and to distinguish SNMPv1 traps based on the outgoing interface.

To configure SNMP trap options and trap groups, include the **trap-options** and **trap-group** statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
```

```

    source-address address;
  }
  trap-group group-name {
    categories {
      category;
    }
    destination-port port-number;
    targets {
      address;
    }
    version (all | v1 | v2);
  }

```

#### Related Documentation

### Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 1823](#).

The target address defines a management application's address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

**NOTE:** When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the `[edit snmp v3 vacm access]` and `[edit snmp v3 vacm security-to-group]` hierarchy levels.

To configure SNMP traps, include the following statements at the `[edit snmp v3]` hierarchy level:

```

[edit snmp v3]
  notify name {
    tag tag-name;
    type trap;
  }
  notify-filter name {
    oid object-identifier (include | exclude);
  }
  target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system logical-system;
  }

```

```

port port-number;
routing-instance instance;
tag-list tag-list;
target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}

```

### Configuring the SNMPv3 Trap Notification

The **notify** statement specifies the type of notification (trap) and contains a single tag. The tag defines a set of target addresses to receive a trap. The tag list contains one or more tags and is configured at the **[edit snmp v3 target-address *target-address-name*]** hierarchy level. If the tag list contains this tag, Junos OS sends a notification to all the target addresses associated with this tag.

To configure the trap notifications, include the **notify** statement at the **[edit snmp v3]** hierarchy level:

```

[edit snmp v3]
notify name {
  tag tag-name;
  type trap;
}

```

***name*** is the name assigned to the notification.

***tag-name*** defines the target addresses to which this notification is sent. This notification is sent to all the target-addresses that have this tag in their tag list. The ***tag-name*** is not included in the notification.

**trap** is the type of notification.

**NOTE:** Each notify entry name must be unique.

Junos OS supports two types of notification: **trap** and **inform**.

For information about how to configure the tag list, see [“Configuring the Trap Target Address”](#) on page 1848.

- [Minimum SNMPv3 Configuration on a Device Running Junos OS](#) on page 1828
- [Example: Configuring SNMPv3 Trap Notification](#) on page 1852

#### Example: Configuring SNMP Trap Groups

Set up a trap notification list named **urgent-dispatcher** for link and startup traps. This list is used to identify the network management hosts (1.2.3.4 and fe80::1:2:3:4) to which traps generated by the local router should be sent. The name specified for a trap group is used as the SNMP community string when the agent sends traps to the listed targets.

```
[edit]
snmp {
  trap-group "urgent-dispatcher" {
    version v2;
    categories link startup;
    targets {
      1.2.3.4;
      fe80::1:2:3:4;
    }
  }
}
```

#### Related Documentation

- [Configuring SNMP Trap Options](#) on page 1837

#### Configuring the Trap Target Address

The target address defines a management application's address and parameters that are used in sending notifications. It can also identify management stations that are allowed to use specific community strings. When you receive a packet with a recognized community string and a tag is associated with it, Junos OS looks up all the target addresses

with this tag and verifies that the source address of this packet matches one of the configured target addresses.

**NOTE:** You must configure the address mask when you configure the SNMP community.

To specify where you want the traps to be sent and define what SNMPv1 and SNMPv2cc packets are allowed, include the **target-address** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  target-address target-address-name;
```

**target-address-name** is the string that identifies the target address.

To configure the target address properties, include the following statements at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
  address address;
  address-mask address-mask;
  logical-system logical-system;
  port port-number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
```

This section includes the following topics:

- [Configuring the Address on page 1847](#)
- [Configuring the Address Mask on page 1847](#)
- [Configuring the Port on page 1848](#)
- [Configuring the Routing Instance on page 1848](#)
- [Configuring the Trap Target Address on page 1848](#)
- [Applying Target Parameters on page 1849](#)

### **Configuring the Address**

To configure the address, include the **address** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
  address address;
```

**address** is the SNMP target address.

### **Configuring the Address Mask**

The address mask specifies a set of addresses that are allowed to use a community string and verifies the source addresses for a group of target addresses.

To configure the address mask, include the **address-mask** statement at the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]  
  address-mask address-mask;
```

**address-mask** combined with the address defines a range of addresses. For information about how to configure the community string, see [“Configuring the SNMPv3 Community” on page 1864](#).

### **Configuring the Port**

By default, the UDP port is set to 162. To configure a different port number, include the **port** statement at the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]  
  port port-number;
```

**port-number** is the SNMP target port number.

### **Configuring the Routing Instance**

Traps are sent over the default routing instance. To configure the routing instance for sending traps, include the **routing-instance** statement at the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]  
  routing-instance instance;
```

**instance** is the name of the routing instance. To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash ( / ) to separate the two names (for example, **test-lr/test-ri**). To configure the default routing instance on a logical system, specify the logical system name followed by **default** (for example, **test-lr/default**).

### **Configuring the Trap Target Address**

Each **target-address** statement can have one or more tags configured in its tag list. Each tag can appear in more than one tag list. When a significant event occurs on the network device, the tag list identifies the targets to which a notification is sent.

To configure the tag list, include the **tag-list** statement at the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]  
  tag-list "tag-list";
```

**tag-list** specifies one or more tags as a space-separated list enclosed within double quotes.

For an example of tag list configuration, see [“Example: Configuring the Tag List” on page 1835](#).

For information about how to specify a tag at the **[edit snmp v3 notify *notify-name*]** hierarchy level, see [“Configuring the SNMPv3 Trap Notification” on page 1845](#).

**NOTE:** When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Configure access privileges at the `[edit snmp v3 vacm access]` hierarchy level.

### Applying Target Parameters

The **target-parameters** statement at the `[edit snmp v3]` hierarchy level applies the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level.

To reference configured target parameters, include the **target-parameters** statement at the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
[edit snmp v3 target-address target-address-name]  
  target-parameters target-parameters-name;
```

*target-parameters-name* is the name associated with the message processing and security parameters that are used in sending notifications to a particular management target.

### Defining and Configuring the Trap Target Parameters

Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target.

To define a set of target parameters, include the **target-parameters** statement at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]  
  target-parameters target-parameters-name;
```

*target-parameters-name* is the name assigned to the target parameters.

To configure target parameter properties, include the following statements at the `[edit snmp v3 target-parameters target-parameter-name]` hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name]  
  notify-filter profile-name;  
  parameters {  
    message-processing-model (v1 | v2c | V3);  
    security-level (authentication | none | privacy);
```

```

    security-model (usm | v1 | v2c);
    security-name security-name;
}

```

This topic includes the following sections:

- [Applying the Trap Notification Filter on page 1850](#)
- [Configuring the Target Parameters on page 1850](#)

#### ***Applying the Trap Notification Filter***

To apply the trap notification filter, include the **notify-filter** statement at the **[edit snmp v3 target-parameters target-parameter-name]** hierarchy level:

```

[edit snmp v3 target-parameters target-parameter-name]
  notify-filter profile-name;

```

**profile-name** is the name of a configured notify filter. For information about configuring notify filters, see [“Configuring the Trap Notification Filter” on page 1840](#).

#### ***Configuring the Target Parameters***

To configure target parameter properties, include the following statements at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```

[edit snmp v3 target-parameters target-parameter-name parameters]
  message-processing-model (v1 | v2c | v3);
  security-level (authentication | none | privacy);
  security-model (usm | v1 | v2c);
  security-name security-name;

```

This section includes the following topics:

- [Configuring the Message Processing Model on page 1850](#)
- [Configuring the Security Model on page 1851](#)
- [Configuring the Security Level on page 1851](#)
- [Configuring the Security Name on page 1851](#)

#### ***Configuring the Message Processing Model***

The message processing model defines which version of SNMP to use when generating SNMP notifications. To configure the message processing model, include the **message-processing-model** statement at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```

[edit snmp v3 target-parameters target-parameter-name parameters]
  message-processing-model (v1 | v2c | v3);

```

- **v1**—SNMPv1 message processing model
- **v2c**—SNMPv2c message processing model
- **v3**—SNMPv3 message processing model

### Configuring the Security Model

To define the security model to use when generating SNMP notifications, include the **security-model** statement at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
security-model (usm | v1 | v2c);
```

- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2c security model

### Configuring the Security Level

The **security-level** statement specifies whether the trap is authenticated and encrypted before it is sent.

To configure the security level to use when generating SNMP notifications, include the **security-level** statement at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
security-level (authentication | none | privacy);
```

- **authentication**—Provides authentication but no encryption.
- **none**—No security. Provides no authentication and no encryption.
- **privacy**—Provides authentication and encryption.

**NOTE:** If you are configuring the SNMPv1 or SNMPv2c security model, use **none** as your security level. If you are configuring the SNMPv3 (USM) security model, use the **authentication** or **privacy** security level.

### Configuring the Security Name

To configure the security name to use when generating SNMP notifications, include the **security-name** statement at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
security-name security-name;
```

If the USM security model is used, the **security-name** identifies the user that is used when the notification is generated. If the v1 or v2c security models are used, **security-name** identifies the SNMP community used when the notification is generated.

**NOTE:** The access privileges for the group associated with a security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the [edit snmp v3 vacm security-to-group] hierarchy level must match the security name at the [edit snmp v3 snmp-community *community-index*] hierarchy level.

#### Related Documentation

#### Example: Configuring SNMPv3 Trap Notification

Specify three sets of destinations to send traps:

```
[edit snmp v3]
notify n1 {
  tag router1;
  type trap;
}
notify n2 {
  tag router2;
  type trap;
}
notify n3 {
  tag router3;
  type trap;
}
```

## Access Privileges

- [Defining Access Privileges for an SNMP Group on page 1853](#)
- [Configuring the Access Privileges Granted to a Group on page 1854](#)
- [Example: Access Privilege Configuration on page 1857](#)

## Defining Access Privileges for an SNMP Group

The SNMP version 3 (SNMPv3) uses the view-based access control model (VACM), which allows you to configure the access privileges granted to a group. Access is controlled by filtering the MIB objects available for a specific operation through a predefined view. You assign views to determine the objects that are visible for read, write, and notify operations for a particular group, using a particular context, a particular security model (v1, v2c, or usm), and particular security level (authenticated, privacy, or none). For information about how to configure views, see [“Configuring MIB Views” on page 1821](#).

You define user access to management information at the **[edit snmp v3 vacm]** hierarchy level. All access control within VACM operates on groups, which are collections of users as defined by USM, or community strings as defined in the SNMPv1 and SNMPv2c security models. The term **security-name** refers to these generic end users. The group to which a specific security name belongs is configured at the **[edit snmp v3 vacm security-to-group]** hierarchy level. That security name can be associated with a group defined at the **[edit snmp v3 vacm security-to-group]** hierarchy level. A group identifies a collection of SNMP users that share the same access policy. You then define the access privileges associated with a group at the **[edit snmp v3 vacm access]** hierarchy level. Access privileges are defined using views. For each group, you can apply different views depending on the SNMP operation; for example, read (**get**, **getNext**, or **getBulk**) write (**set**), notifications, the security level used (authentication, privacy, or none), and the security model (v1, v2c, or usm) used within an SNMP request.

You configure members of a group with the **security-name** statement. For v3 packets using USM, the security name is the same as the username. For SNMPv1 or SNMPv2c packets, the security name is determined based on the community string. Security names are specific to a security model. If you are also configuring VACM access policies for SNMPv1 or SNMPv2c packets, you must assign security names to groups for each security model (SNMPv1 or SNMPv2c) at the **[edit snmp v3 vacm security-to-group]** hierarchy level. You must also associate a security name with an SNMP community at the **[edit snmp v3 snmp-community community-index]** hierarchy level.

To configure the access privileges for an SNMP group, include statements at the **[edit snmp v3 vacm]** hierarchy level:

```
[edit snmp v3 vacm]
access {
  group group-name {
    (default-context-prefix | context-prefix context-prefix){
      security-model (any | usm | v1 | v2c) {
        security-level (authentication | none | privacy) {
          notify-view view-name;
          read-view view-name;
          write-view view-name;
        }
      }
    }
  }
}
security-to-group {
  security-model (usm | v1 | v2c) {
```

```
    security-name security-name {  
        group group-name;  
    }  
}  
}
```

### Configuring the Access Privileges Granted to a Group

This topic includes the following sections:

- [Configuring the Group on page 1854](#)
- [Configuring the Security Model on page 1854](#)
- [Configuring the Security Level on page 1855](#)
- [Associating MIB Views with an SNMP User Group on page 1855](#)

#### *Configuring the Group*

To configure the access privileges granted to a group, include the **group** statement at the **[edit snmp v3 vacm access]** hierarchy level:

```
[edit snmp v3 vacm access]  
group group-name;
```

**group-name** is a collection of SNMP users that belong to a common SNMP list that defines an access policy. Users belonging to a particular SNMP group inherit all access privileges granted to that group.

#### *Configuring the Security Model*

To configure the security model, include the **security-model** statement at the **[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix  
context-prefix)]  
security-model (any | usm | v1 | v2c);
```

- **any**—Any security model
- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2c security model

### Configuring the Security Level

To configure the access privileges granted to packets with a particular security level, include the **security-level** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name default-context-prefix security-model (any
| usm | v1 | v2c)]
security-level (authentication | none | privacy);
```

- **none**—Provides no authentication and no encryption.
- **authentication**—Provides authentication but no encryption.
- **privacy**—Provides authentication and encryption.

**NOTE:** Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or SNMPv2c security model, use **none** as your security level. If you are configuring the SNMPv3 security model (USM), use the **authentication**, **none**, or **privacy** security level.

### Associating MIB Views with an SNMP User Group

MIB views define access privileges for members of a group. Separate views can be applied for each SNMP operation (read, write, and notify) within each security model (usm, v1, and v2c) and each security level (authentication, none, and privacy) supported by SNMP.

To associate MIB views with an SNMP user group, include the following statements at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
| privacy)]
notify-view view-name;
read-view view-name;
write-view view-name;
```

**NOTE:** You must associate at least one view (notify, read, or write) at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level.

You must configure the MIB view at the **[edit snmp view *view-name*]** hierarchy level. For information about how to configure MIB views, see [“Configuring MIB Views” on page 1821](#).

This section describes the following topics related to this configuration:

- [Configuring the Notify View on page 1856](#)
- [Configuring the Read View on page 1856](#)
- [Configuring the Write View on page 1856](#)

#### **Configuring the Notify View**

To associate notify access with an SNMP user group, include the **notify-view** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  notify-view view-name;
```

**view-name** specifies the notify access, which is a list of notifications that can be sent to each user in an SNMP group. A view name cannot exceed 32 characters.

#### **Configuring the Read View**

To associate a read view with an SNMP group, include the **read-view** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  read-view view-name;
```

**view-name** specifies read access for an SNMP user group. A view name cannot exceed 32 characters.

#### **Configuring the Write View**

To associate a write view with an SNMP user group, include the **write-view** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  write-view view-name;
```

**view-name** specifies write access for an SNMP user group. A view name cannot exceed 32 characters.

- [Example: Access Privilege Configuration on page 1857](#)

### Example: Access Privilege Configuration

Define access privileges:

```
[edit snmp v3]
access {
  group group1 {
    default-context-prefix {
      security-model usm {      #Define an SNMPv3 security model
        security-level privacy {
          notify-view nv1;
          read-view rv1;
          write-view wv1;
        }
      }
    }
    context-prefix lr1/ri1 { # routing instance ri1 in logical system lr1
      security-model usm {
        security-level privacy {
          notify-view nv1;
          read-view rv1;
          write-view wv1;
        }
      }
    }
  }
  group group2 {
    default-context-prefix {
      security-model usm {      #Define an SNMPv3 security model
        security-level authentication {
          read-view rv2;
          write-view wv2;
        }
      }
    }
  }
  group group3 {
    default-context-prefix {
      security-model v1 {      #Define an SNMPv3 security model
        security-level none {
          read-view rv3;
          write-view wv3;
        }
      }
    }
  }
}
```

#### Related Documentation

## Routing Instances

- [Enabling SNMP Access over Routing Instances on page 1858](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858](#)
- [Example: Configuring Interface Settings for a Routing Instance on page 1859](#)
- [Configuring Access Lists for SNMP Access over Routing Instances on page 1861](#)

### Enabling SNMP Access over Routing Instances

To enable SNMP managers in routing instances other than the default routing instance to access SNMP information, include the **routing-instance-access** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
routing-instance-access;
```

If this statement is not included in the SNMP configuration, SNMP managers from routing instances other than the default routing instance cannot access SNMP information.

#### Related Documentation

- [Understanding SNMP Support for Routing Instances on page 1797](#)
- [Identifying a Routing Instance on page 1797](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858](#)
- [Configuring Access Lists for SNMP Access over Routing Instances on page 1861](#)

### Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community

You can specify the routing instance along with the client information when you add a client to an SNMP community. To specify the routing instance to which a client belongs, include the **routing-instance** statement followed by the routing instance name and client information in the SNMP configuration.

The following example shows the configuration statement to add routing instance **test-ri** to SNMP community **community1**.

**NOTE:** Routing instances specified at the **[edit snmp community community-name]** hierarchy level are added to the default logical system in the community.

```
[edit snmp]
community community1 {
  clients {
    10.209.152.33/32;
  }
  routing-instance test-ri {
    clients {
      10.19.19.1/32;
```

```

    }
  }
}

```

If the routing instance is defined within a logical system, include the **routing-instance** statement at the **[edit snmp community *community-name* logical-system *logical-system-name*]** hierarchy level, as in the following example:

```

[edit snmp]
community community1 {
  clients {
    10.209.152.33/32;
  }
  logical-system test-LS {
    routing-instance test-ri {
      clients {
        10.19.19.1/32;
      }
    }
  }
}

```

#### Related Documentation

- [Identifying a Routing Instance on page 1797](#)
- [Enabling SNMP Access over Routing Instances on page 1858](#)
- [Configuring Access Lists for SNMP Access over Routing Instances on page 1861](#)
- [Example: Configuring Interface Settings for a Routing Instance on page 1859](#)

#### Example: Configuring Interface Settings for a Routing Instance

This example shows an **802.3ad ae0** interface configuration allocated to a routing instance named **INFrtid**:

```

[edit chassis]
aggregated-devices {
  ethernet {
    device-count 5;
  }
}
[edit interfaces ae0]
vlan-tagging;
aggregated-ether-options {
  minimum-links 2;
  link-speed 100m;
}
unit 0 {
  vlan-id 100;
  family inet {
    address 10.1.0.1/24;
  }
}
[edit interfaces fe-1/1/0]
fastether-options {

```

```

    802.3ad ae0;
}
[edit interfaces fe-1/1/1]
fastether-options {
    802.3ad ae0;
}
[edit routing-instances]
INFrt {
    instance-type virtual-router;
    interface fe-1/1/0.0;
    interface fe-1/1/1.0;
    interface fe-1/1/5.0;
    interface ae0.0;
    protocols {
        ospf {
            area 0.0.0.0 {
                interface all;
            }
        }
    }
}
}

```

The following **snmpwalk** command shows how to retrieve SNMP-related information from **router1** and the 802.3ae bundle interface belonging to routing instance **INFrt** with the SNMP community **public**:

```

router# snmpwalk -Os router1 INFrt@public dot3adAggTable
dot3adAggMACAddress.59 = 0:90:69:92:93:f0
dot3adAggMACAddress.65 = 0:90:69:92:93:f0
dot3adAggActorSystemPriority.59 = 0
dot3adAggActorSystemPriority.65 = 0
dot3adAggActorSystemID.59 = 0:0:0:0:0:0
dot3adAggActorSystemID.65 = 0:0:0:0:0:0
dot3adAggAggregateOrIndividual.59 = true(1)
dot3adAggAggregateOrIndividual.65 = true(1)
dot3adAggActorAdminKey.59 = 0
dot3adAggActorAdminKey.65 = 0
dot3adAggActorOperKey.59 = 0
dot3adAggActorOperKey.65 = 0
dot3adAggPartnerSystemID.59 = 0:0:0:0:0:0
dot3adAggPartnerSystemID.65 = 0:0:0:0:0:0
dot3adAggPartnerSystemPriority.59 = 0
dot3adAggPartnerSystemPriority.65 = 0
dot3adAggPartnerOperKey.59 = 0
dot3adAggPartnerOperKey.65 = 0
dot3adAggCollectorMaxDelay.59 = 0
dot3adAggCollectorMaxDelay.65 = 0

```

**Related  
Documentation**

- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858](#)

### Configuring Access Lists for SNMP Access over Routing Instances

---

You can create and maintain access lists to manage access to SNMP information. Access list configuration enables you to allow or deny SNMP access to clients of a specific routing instance.

The following example shows how to create an access list:

```
[edit snmp]
routing-instance-access {
  access-list {
    ri1 restrict;
    ls1/default;
    ls1/ri2;
    ls1*;
  }
}
```

The configuration given in the example:

- Restricts clients in **ri1** from accessing SNMP information.
- Allows clients in **ls1/default**, **ls1/ri2**, and all other routing instances with names starting with **ls1** to access SNMP information.

You can use the wildcard character (\*) to represent a string in the routing instance name.

**NOTE:** You cannot restrict the SNMP manager of the default routing instance from accessing SNMP information.

---

#### Related Documentation

- [Understanding SNMP Support for Routing Instances on page 1797](#)
- [Enabling SNMP Access over Routing Instances on page 1858](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858](#)

### Community Strings

- [Configuring the SNMP Community String on page 1862](#)
- [Examples: Configuring the SNMP Community String on page 1862](#)
- [Adding a Group of Clients to an SNMP Community on page 1863](#)
- [Configuring the SNMPv3 Community on page 1864](#)
- [Example: SNMPv3 Community Configuration on page 1866](#)

## Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see "Configuring MIB Views" on page 1821.

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 or IPv6 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local router.

**NOTE:** Community names must be unique. You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community community-index]** hierarchy levels.

### Related Documentation

- [Adding a Group of Clients to an SNMP Community on page 1863](#)
- [Configuring SNMP on a Device Running Junos OS on page 1813](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 1882](#)
- [Examples: Configuring the SNMP Community String on page 1862](#)

## Examples: Configuring the SNMP Community String

Grant read-only access to all clients. With the following configuration, the system responds to SNMP **Get**, **GetNext**, and **GetBulk** requests that contain the community string **public**:

```
[edit]
```

```
snmp {
  community public {
    authorization read-only;
  }
}
```

Grant all clients read-write access to the ping MIB and `jnxPingMIB`. With the following configuration, the system responds to SNMP **Get**, **GetNext**, **GetBulk**, and **Set** requests that contain the community string **private** and specify an OID contained in the ping MIB or `jnxPingMIB` hierarchy:

```
[edit]
snmp {
  view ping-mib-view {
    oid pingMIB include;
    oid jnxPingMIB include;
    community private {
      authorization read-write;
      view ping-mib-view;
    }
  }
}
```

The following configuration allows read-only access to clients with IP addresses in the range `1.2.3.4/24`, and denies access to systems in the range `fe80::1:2:3:4/64`:

```
[edit]
snmp {
  community field-service {
    authorization read-only;
    clients {
      default restrict; # Restrict access to all SNMP clients not explicitly
                        # listed on the following lines.
      1.2.3.4/24; # Allow access by all clients in 1.2.3.4/24 except
      fe80::1:2:3:4/64 restrict; # fe80::1:2:3:4/64.
    }
  }
}
```

#### Related Documentation

- [Configuring the SNMP Community String on page 1862](#)

### Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the `client-list-name name` statement at the `[edit snmp community community-name]` hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the `client-list` statement followed by the IP addresses of the clients at the `[edit snmp]` hierarchy level:

```
[edit snmp]
  client-list client-list-name {
    ip-addresses;
  }
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]
client-list-name client-list-name;
```

**NOTE:** The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
  client-list clientlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
  }
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]
snmp {
  community community1 {
    authorization read-only;
    client-list-name clientlist1;
  }
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
  prefix-list prefixlist {
    10.3.3.3/32;
    10.5.5.5/32;
  }
}
snmp {
  community community2 {
    client-list-name prefixlist;
  }
}
```

- Related Documentation**
- [client-list on page 1896](#)
  - [client-list-name on page 1896](#)

### Configuring the SNMPv3 Community

The SNMP community defines the relationship between an SNMP server system and the client systems. This statement is optional.

To configure the SNMP community, include the **snmp-community** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
snmp-community community-index;
```

**community-index** is the index for the SNMP community.

To configure the SNMP community properties, include the following statements at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
community-name community-name;
security-name security-name;
tag tag-name;
```

This section includes the following topics:

- [Configuring the Community Name on page 1865](#)
- [Configuring the Security Names on page 1866](#)
- [Configuring the Tag on page 1866](#)

### Configuring the Community Name

The community name defines the SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2c clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (read, write, or notify) allowed on those objects.

To configure the SNMP community name, include the **community-name** statement at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
community-name community-name;
```

**community-name** is the community string for an SNMPv1 or SNMPv2c community.

If unconfigured, it is the same as the community index.

If the community name contains spaces, enclose it in quotation marks (" ").

**NOTE:** Community names must be unique. You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community community-index]** hierarchy levels. The configured community name at the **[edit snmp v3 snmp-community community-index]** hierarchy level is encrypted. You cannot view the community name after you have configured it and committed your changes. In the command-line interface (CLI), the community name is concealed.

### Configuring the Security Names

To assign a community string to a security name, include the **security-name** statement at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
security-name security-name;
```

**security-name** is used when access control is set up. The **security-to-group** configuration at the **[edit snmp v3 vacm]** hierarchy level identifies the group.

**NOTE:** This security name must match the security name configured at the **[edit snmp v3 target-parameters target-parameters-name parameters]** hierarchy level when you configure traps.

### Configuring the Tag

To configure the tag, include the **tag** statement at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
tag tag-name;
```

**tag-name** identifies the address of managers that are allowed to use a community string.

### Example: SNMPv3 Community Configuration

Define an SNMP community:

```
[edit snmp v3]
snmp-community index1 {
  community-name "$ABC123"; # SECRET-DATA
  security-name john;
  tag router1; # Identifies managers that are allowed to use
  # a community string
  target-address ta1 {
    address 10.1.1.1;
    address-mask 255.255.255.0; # Defines the range of addresses
    port 162;
    tag-list router1;
    target-parameters tp1; # Applies configured target parameters
  }
}
```

#### Related Documentation

## Inform Notifications

- [Configuring the Inform Notification Type and Target Address on page 1867](#)
- [Example: Configuring the Inform Notification Type and Target Address on page 1868](#)

### Configuring the Inform Notification Type and Target Address

To configure the inform notification type and target information, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type (trap | inform);
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system logical-system;
  port port-number;
  retry-count number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

**notify *name*** is the name assigned to the notification. Each notify entry name must be unique.

**tag *tag-name*** defines the target addresses that are sent this notification. The notification is sent to all target addresses that have this tag in their tag list. The **tag-name** is not included in the notification. For information about how to configure the tag list, see [“Configuring the Trap Target Address” on page 1848](#).

**type inform** is the type of notification.

**target-address *target-address-name*** identifies the target address. The target address defines a management application’s address and parameters that are used to respond to informs.

**timeout** *seconds* is the number of seconds to wait for an acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. The default timeout is **15** seconds.

**retry-count** *number* is the maximum number of times an inform is transmitted if no acknowledgment is received. The default is **3**. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.

**message-processing-model** defines which version of SNMP to use when SNMP notifications are generated. Informs require a **v3** message processing model.

**security-model** defines the security model to use when SNMP notifications are generated. Informs require a **usm** security model.

**security-level** specifies whether the inform is authenticated and encrypted before it is sent. For the **usm** security model, the security level must be one of the following:

- **authentication**—Provides authentication but no encryption.
- **privacy**—Provides authentication and encryption.

**security-name** identifies the username that is used when generating the inform.

---

#### Example: Configuring the Inform Notification Type and Target Address

In the following example, target **172.17.20.184** is configured to respond to informs. The inform timeout is **30** seconds and the maximum retransmit count is **3**. The inform is sent to all targets in the **tl1** list. The security model for the remote user is **usm** and the remote engine username is **u10**.

```
[edit snmp v3]
notify n1 {
  type inform;
  tag tl1;
}
notify-filter nf1 {
  oid .1.3 include;
}
target-address ta1 {
  address 172.17.20.184;
  retry-count 3;
  tag-list tl1;
  address-mask 255.255.255.0;
  target-parameters tp1;
```

```
    timeout 30;
  }
  target-parameters tp1 {
    parameters {
      message-processing-model v3;
      security-model usm;
      security-level privacy;
      security-name u10;
    }
    notify-filter nf1;
  }
}
```

### Understanding RMON Alarms and Events Configuration

Junos OS supports monitoring routers from remote devices. These values are measured against thresholds and trigger events when the thresholds are crossed. You configure remote monitoring (RMON) alarm and event entries to monitor the value of a MIB object.

To configure RMON alarm and event entries, you include statements at the **[edit snmp]** hierarchy level of the configuration:

```
[edit snmp]
rmon {
```

```
alarm index {  
  description text-description;  
  falling-event-index index;  
  falling-threshold integer;  
  falling-threshold-interval seconds;  
  interval seconds;  
  rising-event-index index;  
  rising-threshold integer;  
  request-type (get-next-request | get-request | walk-request);  
  sample-type (absolute-value | delta-value);  
  startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);  
  syslog-subtag syslog-subtag;  
  variable oid-variable;  
  event index {  
    community community-name;  
    description description;  
    type type;  
  }  
}  
}
```

---

**Configuring an Alarm Entry and Its Attributes**

An alarm entry monitors the value of a MIB variable. You can configure how often the value is sampled, the type of sampling to perform, and what event to trigger if a threshold is crossed.

This section discusses the following topics:

- [Configuring the Alarm Entry on page 1871](#)
- [Configuring the Description on page 1871](#)
- [Configuring the Falling Event Index or Rising Event Index on page 1871](#)
- [Configuring the Falling Threshold or Rising Threshold on page 1871](#)
- [Configuring the Interval on page 1872](#)
- [Configuring the Falling Threshold Interval on page 1872](#)
- [Configuring the Request Type on page 1873](#)
- [Configuring the Sample Type on page 1873](#)
- [Configuring the Startup Alarm on page 1873](#)
- [Configuring the System Log Tag on page 1874](#)
- [Configuring the Variable on page 1874](#)

### Configuring the Alarm Entry

An alarm entry monitors the value of a MIB variable. The **rising-event-index**, **rising-threshold**, **sample-type**, and **variable** statements are mandatory. All other statements are optional.

To configure the alarm entry, include the **alarm** statement and specify an index at the **[edit snmp rmon]** hierarchy level:

```
[edit snmp rmon]
alarm index {
  description description;
  falling-event-index index;
  falling-threshold integer;
  falling-threshold-interval seconds;
  interval seconds;
  rising-event-index index;
  rising-threshold integer;
  sample-type (absolute-value | delta-value);
  startup-alarm (falling-alarm | rising alarm | rising-or-falling-alarm);
  variable oid-variable;
}
```

**index** is an integer that identifies an alarm or event entry.

### Configuring the Description

The description is a text string that identifies the alarm entry.

To configure the description, include the **description** statement and a description of the alarm entry at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
description description;
```

### Configuring the Falling Event Index or Rising Event Index

The falling event index identifies the event entry that is triggered when a falling threshold is crossed. The rising event index identifies the event entry that is triggered when a rising threshold is crossed.

To configure the falling event index or rising event index, include the **falling-event-index** or **rising-event-index** statement and specify an index at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
falling-event-index index;
rising-event-index index;
```

**index** can be from 0 through 65,535. The default for both the falling and rising event index is 0.

### Configuring the Falling Threshold or Rising Threshold

The falling threshold is the lower threshold for the monitored variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also

generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup alarm is equal to **falling-alarm** or **rising-or-falling-alarm**. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising threshold. You must specify the falling threshold as an integer. Its default is 20 percent less than the rising threshold.

By default, the rising threshold is 0. The rising threshold is the upper threshold for the monitored variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated **startup-alarm** is equal to **rising-alarm** or **rising-or-falling-alarm**. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold. You must specify the rising threshold as an integer.

To configure the falling threshold or rising threshold, include the **falling-threshold** or **rising-threshold** statement at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
  falling-threshold integer;
  rising-threshold integer;
```

**integer** can be a value from -2,147,483,647 through 2,147,483,647.

### Configuring the Interval

The interval represents the period of time, in seconds, over which the monitored variable is sampled and compared with the rising and falling thresholds.

To configure the interval, include the **interval** statement and specify the number of seconds at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
  interval seconds;
```

**seconds** can be a value from 1 through 2,147,483,647. The default is 60 seconds.

### Configuring the Falling Threshold Interval

The falling threshold interval represents the interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.

**NOTE:** You cannot configure the falling threshold interval for alarms that have the request type set to **walk-request**.

To configure the falling threshold interval, include the **falling-threshold-interval** statement at the **[edit snmp rmon alarm index]** hierarchy level and specify the number of seconds:

```
[edit snmp rmon alarm index]
  falling-threshold-interval seconds;
```

**seconds** can be a value from 1 through 2,147,483,647. The default is 60 seconds.

### *Configuring the Request Type*

By default an RMON alarm can monitor only one object instance (as specified in the configuration). You can configure a **request-type** statement to extend the scope of the RMON alarm to include all object instances belonging to a MIB branch or to include the next object instance after the instance specified in the configuration.

To configure the request type, include the **request-type** statement at the **[edit snmp rmon alarm index]** hierarchy level and specify **get-next-request**, **get-request**, or **walk-request**:

```
[edit snmp rmon alarm index]
request-type (get-next-request | get-request | walk-request);
```

**walk** extends the RMON alarm configuration to all object instances belonging to a MIB branch. **next** extends the RMON alarm configuration to include the next object instance after the instance specified in the configuration.

### *Configuring the Sample Type*

The sample type identifies the method of sampling the selected variable and calculating the value to be compared against the thresholds. If the value of this object is **absolute-value**, the value of the selected variable is compared directly with the thresholds at the end of the sampling interval. If the value of this object is **delta-value**, the value of the selected variable at the last sample is subtracted from the current value, and the difference is compared with the thresholds.

To configure the sample type, include the **sample-type** statement and specify the type of sample at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
sample-type (absolute-value | delta-value);
```

- **absolute-value**—Actual value of the selected variable is compared against the thresholds.
- **delta-value**—Difference between samples of the selected variable is compared against the thresholds.

### *Configuring the Startup Alarm*

The startup alarm identifies the type of alarm that can be sent when this entry is first activated. You can specify it as **falling-alarm**, **rising-alarm**, or **rising-or-falling-alarm**.

To configure the startup alarm, include the **startup-alarm** statement and specify the type of alarm at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
```

- **falling-alarm**—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.
- **rising-alarm**—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.

- **rising-or-falling-alarm**—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

The default is **rising-or-falling-alarm**.

### **Configuring the System Log Tag**

The **syslog-subtag** statement specifies the tag to be added to the system log message. You can specify a string of not more than 80 uppercase characters as the system log tag.

To configure the system log tag, include the **syslog-subtag** statement at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
syslog-subtag syslog-subtag;
```

### **Configuring the Variable**

The variable identifies the MIB object that is being monitored.

To configure the variable, include the **variable** statement and specify the object identifier or object name at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
variable oid-variable;
```

**oid-variable** is a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.1.10.1) or MIB object name (for example, ifInOctets.1).

---

### **Configuring an Event Entry and Its Attributes**

An event entry generates a notification for an alarm entry when its rising or falling threshold is crossed. You can configure the type of notification that is generated. To configure the event entry, include the **event** statement at the **[edit snmp rmon]** hierarchy level. All statements except the **event** statement are optional.

```
[edit snmp rmon]
event index {
  community community-name;
  description description;
  type type;
}
```

**index** identifies an entry event.

**community-name** is the trap group that is used when generating a trap. If that trap group has the **rmon-alarm** trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group. If nothing is configured, all the trap groups are examined, and traps are sent using each group with the **rmon-alarm** category set.

**description** is a text string that identifies the entry.

The **type** variable of an event entry specifies where the event is to be logged. You can specify the type as one of the following:

- **log**—Adds the event entry to the **logTable**.
- **log-and-trap**—Sends an SNMP trap and creates a log entry.
- **none**—Sends no notification.
- **snmptrap**—Sends an SNMP trap.

The default for the event entry type is **log-and-trap**.

**Related  
Documentation**

- [Understanding RMON Alarms and Events Configuration on page 1869](#)

---

### Example: Configuring an RMON Alarm and Event Entry

Configure an RMON alarm and event entry:

```
[edit snmp]
rmon {
  alarm 100 {
    description "input traffic on fxp0";
    falling-event-index 100;
    falling-threshold 10000;
    interval 60;
    rising-event-index 100;
    rising-threshold 100000;
    sample-type delta-value;
    startup-alarm rising-or-falling-alarm;
    variable ifInOctets.1;
  }
  event 100 {
    community bedrock;
    description "emergency events";
    type log-and-trap;
  }
}
```

### Configuring Health Monitoring on Devices Running Junos OS

As the number of devices managed by a typical network management system (NMS) grows and the complexity of the devices themselves increases, it becomes increasingly impractical for the NMS to use polling to monitor the devices. A more scalable approach is to rely on network devices to notify the NMS when something requires attention.

On Juniper Networks routers, RMON alarms and events provide much of the infrastructure needed to reduce the polling overhead from the NMS. However, with this approach, you must set up the NMS to configure specific MIB objects into RMON alarms. This often requires device-specific expertise and customizing of the monitoring application. In addition, some MIB object instances that need monitoring are set only at initialization or change at runtime and cannot be configured in advance.

To address these issues, the health monitor extends the RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (for file system usage, CPU usage, and memory usage) and includes support for unknown or dynamic object instances (such as Junos OS processes).

Health monitoring is designed to minimize user configuration requirements. To configure health monitoring entries, include the **health-monitor** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

This topic describes the minimum required configuration and discusses the following tasks for configuring the health monitor:

- [Monitored Objects on page 1876](#)
- [Minimum Health Monitoring Configuration on page 1877](#)
- [Configuring the Falling Threshold or Rising Threshold on page 1877](#)
- [Configuring the Interval on page 1878](#)
- [Log Entries and Traps on page 1878](#)

### **Monitored Objects**

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 270 on page 1876](#).

**Table 270: Monitored Object Instances**

Object	Description
<code>jnxHrStoragePercentUsed.1</code>	Monitors the following file system on the router or switch:  <code>/dev/ad0s1a:</code>  This is the root file system mounted on <code>/</code> .

Table 270: Monitored Object Instances (*continued*)

Object	Description
<code>jnxHrStoragePercentUsed.2</code>	Monitors the following file system on the router or switch:  <code>/dev/ad0s1e:</code>  This is the configuration file system mounted on <code>/config</code> .
<code>jnxOperatingCPU (RE0)</code>	Monitors CPU usage for Routing Engines ( <b>RE0</b> and <b>RE1</b> ). The index values assigned to Routing Engines depend on whether the Chassis MIB uses a zero-based or ones-based indexing scheme. Because the indexing scheme is configurable, the proper index is determined when the router or switch is initialized and when there is a configuration change. If the router or switch has only one Routing Engine, the alarm entry monitoring <b>RE1</b> is removed after five failed attempts to obtain the CPU value.
<code>jnxOperatingCPU (RE1)</code>	
<code>jnxOperatingBuffer (RE0)</code>	Monitors the amount of memory available on Routing Engines ( <b>RE0</b> and <b>RE1</b> ). Because the indexing of this object is identical to that used for <code>jnxOperatingCPU</code> , index values are adjusted depending on the indexing scheme used in the Chassis MIB. As with <code>jnxOperatingCPU</code> , the alarm entry monitoring <b>RE1</b> is removed if the router or switch has only one Routing Engine.
<code>jnxOperatingBuffer (RE1)</code>	
<code>sysApplElmtRunCPU</code>	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
<code>sysApplElmtRunMemory</code>	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

**Minimum Health Monitoring Configuration**

To enable health monitoring on the router or switch, include the **health-monitor** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
health-monitor;
```

**Configuring the Falling Threshold or Rising Threshold**

The falling threshold is the lower threshold (expressed as a percentage of the maximum possible value) for the monitored variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising threshold. You must specify the falling threshold as a percentage of the maximum possible value. The default is **70** percent.

By default, the rising threshold is **80** percent of the maximum possible value for the monitored object instance. The rising threshold is the upper threshold for the monitored

variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold. You must specify the rising threshold as a percentage of the maximum possible value for the monitored variable.

To configure the falling threshold or rising threshold, include the **falling-threshold** or **rising-threshold** statement at the **[edit snmp health-monitor]** hierarchy level:

```
[edit snmp health-monitor]
  falling-threshold percentage;
  rising-threshold percentage;
```

**percentage** can be a value from 1 through 100.

The falling and rising thresholds apply to all object instances monitored by the health monitor.

### **Configuring the Interval**

The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

To configure the interval, include the **interval** statement and specify the number of seconds at the **[edit snmp health-monitor]** hierarchy level:

```
[edit snmp health-monitor]
  interval seconds;
```

**seconds** can be a value from 1 through 2147483647. The default is 300 seconds (5 minutes).

### **Log Entries and Traps**

The system log entries generated for any health monitor events (thresholds crossed, errors, and so on) have a corresponding **HEALTHMONITOR** tag rather than a generic **SNMPD\_RMON\_EVENTLOG** tag. However, the health monitor sends generic RMON **risingThreshold** and **fallingThreshold** traps.

#### **Related Documentation**

- [Understanding RMON Alarms and Events Configuration on page 1869](#)

- [Configuring an Event Entry and Its Attributes on page 1874](#)
- [Example: Configuring Health Monitoring on page 1878](#)
- [Understanding Device Management Functions in Junos OS on page 1799](#)

---

### **Example: Configuring Health Monitoring**

Configure the health monitor:

```
[edit snmp]
  health-monitor {
```

```
falling-threshold 85;  
interval 600;  
rising-threshold 75;  
}
```

In this example, the sampling interval is every **600** seconds (10 minutes), the falling threshold is **85** percent of the maximum possible value for each object instance monitored, and the rising threshold is **75** percent of the maximum possible value for each object instance monitored.

### Configuration Statements at the `[edit snmp]` Hierarchy Level

---

This topic shows all possible configuration statements at the `[edit snmp]` hierarchy level and their level in the configuration hierarchy. When you are configuring Junos OS, your current hierarchy level is shown in the banner on the line preceding the `user@host#` prompt.

```
[edit]
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address <restrict>;
    }
    logical-system logical-system-name {
      routing-instance routing-instance-name;
      clients {
        address <restrict>;
      }
    }

### Complete SNMPv3 Configuration Statements

To configure SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

```

[edit snmp]
engine-id {
    (local engine-id | use-mac-address | use-default-ip-address);
}
view view-name {
    oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
    tag tag-name;
    type (trap | inform);
}
notify-filter profile-name {
    oid object-identifier (include | exclude);
}
snmp-community community-index {
    community-name community-name;
    security-name security-name;
    tag tag-name;
}
target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system logical-system;
    port port-number;
    retry-count number;
    routing-instance instance;
}

```

```

tag-list tag-list;
target-parameters target-parameters-name;
timeout seconds;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  (local-engine | remote-engine engine-id) {
    user username {
      authentication-md5 {
        authentication-password authentication-password;
      }
      authentication-none;
      authentication-sha {
        authentication-password authentication-password;
      }
      privacy-3des {
        privacy-password privacy-password;
      }
      privacy-aes128 {
        privacy-password privacy-password;
      }
      privacy-des {
        privacy-password privacy-password;
      }
      privacy-none;
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
}
security-to-group {
  security-model (usm | v1 | v2c) {
    security-name security-name {
      group group-name;
    }
  }
}

```

```
    }
  }
```

## access-list

**Syntax**

```
[edit snmp]
  routing-instance-access {
    access-list {
      routing-instance;
      routing-instance restrict;
    }
  }
```

**Hierarchy Level** [edit snmp routing-instance-access]

**Release Information** Statement introduced in Junos OS Release 8.4.

**Description** Create access lists to control SNMP agents in routing instances from accessing SNMP information. To enable the SNMP agent on a routing instance to access SNMP information, specify the routing instance name. To disable the SNMP agent on a routing instance from accessing SNMP information, include the routing-instance name followed by the **restrict** keyword.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Related Documentation**

- [routing-instance-access on page 1935](#)

## address

---

<b>Syntax</b>	<code>address <i>address</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the SNMP target address.
<b>Options</b>	<b><i>address</i></b> —IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Address on page 1847</a></li></ul>

## address-mask

---

<b>Syntax</b>	<code>address-mask <i>address-mask</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Verify the source addresses for a group of target addresses.
<b>Options</b>	<b><i>address-mask</i></b> combined with the address defines a range of addresses.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Address Mask on page 1847</a></li></ul>

## agent-address

---

<b>Syntax</b>	agent-address outgoing-interface;
<b>Hierarchy Level</b>	[edit snmp trap-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
<b>Options</b>	<b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. <b>Default:</b> disabled (the agent address is not specified in SNMPv1 traps).
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Agent Address for SNMP Traps on page 1839</a></li></ul>

## alarm

---

<b>Syntax</b>	<pre>alarm <i>index</i> {     <i>description</i> <i>description</i>;     <i>falling-event-index</i> <i>index</i>;     <i>falling-threshold</i> <i>integer</i>;     <i>falling-threshold-interval</i> <i>seconds</i>;     <i>interval</i> <i>seconds</i>;     <i>request-type</i> (get-next-request   get-request   walk-request);     <i>rising-event-index</i> <i>index</i>;     <i>rising-threshold</i> <i>integer</i>;     <i>sample-type</i> (absolute-value   delta-value);     <i>startup-alarm</i> (falling-alarm   rising-alarm   rising-or-falling alarm);     <i>syslog-subtag</i> <i>syslog-subtag</i>;     <i>variable</i> <i>oid-variable</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp rmon]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure RMON alarm entries.
<b>Options</b>	<p><i>index</i>—Identifies this alarm entry as an integer.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Alarm Entry and Its Attributes on page 1870</a></li><li>• <a href="#">event on page 1904</a></li></ul>

## authentication-md5

<b>Syntax</b>	authentication-md5 { authentication-password <i>authentication-password</i> ; }
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure MD5 as the authentication type for the SNMPv3 user.

**NOTE:** You can only configure one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MD5 Authentication on page 1830</a></li> </ul>

## authentication-none

---

<b>Syntax</b>	authentication-none;
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure that there should be no authentication for the SNMPv3 user.

**NOTE:** You can configure only one authentication type for each SNMPv3 user.

---

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring No Authentication on page 1831</a></li></ul>

## authentication-password

<b>Syntax</b>	<code>authentication-password <i>authentication-password</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> authentication-md5], [edit snmp v3 usm local-engine user <i>username</i> authentication-sha], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> authentication-md5], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> authentication-sha]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the password for user authentication.
<b>Options</b>	<p><b><i>authentication-password</i></b>—Password that a user enters. The password is then converted into a key that is used for authentication.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"> <li>• The password must be at least eight characters long.</li> <li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li> </ul>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MD5 Authentication on page 1830</a></li> <li>• <a href="#">Configuring SHA Authentication on page 1830</a></li> </ul>

## authentication-sha

---

<b>Syntax</b>	<code>authentication-sha {     <code>authentication-password</code> <i>authentication-password</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.

**NOTE:** You can configure only one authentication type for each SNMPv3 user.

---

The remaining statement is explained separately.

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SHA Authentication on page 1830</a></li></ul>

## authorization

<b>Syntax</b>	<code>authorization <i>authorization</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp community <i>community-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the access authorization for SNMP <b>Get</b> , <b>GetBulk</b> , <b>GetNext</b> , and <b>Set</b> requests.
<b>Options</b>	<p><i>authorization</i>—Access authorization level:</p> <ul style="list-style-type: none"> <li><b>read-only</b>—Enable <b>Get</b>, <b>GetNext</b>, and <b>GetBulk</b> requests.</li> <li><b>read-write</b>—Enable all requests, including <b>Set</b> requests. You must configure a view to enable <b>Set</b> requests.</li> </ul> <p><b>Default:</b> <code>read-only</code></p>
<b>Required Privilege Level</b>	<p><code>snmp</code>—To view this statement in the configuration.</p> <p><code>snmp-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring the SNMP Community String on page 1862</a></li> </ul>

## categories

<b>Syntax</b>	<pre>categories {   category; }</pre>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define the types of traps that are sent to the targets of the named trap group.
<b>Default</b>	If you omit the <b>categories</b> statement, all trap types are included in trap notifications.
<b>Options</b>	<i>category</i> —Name of a trap type: <b>authentication</b> , <b>chassis</b> , <b>configuration</b> , <b>link</b> , <b>remote-operations</b> , <b>rmon-alarm</b> , <b>routing</b> , <b>sonet-alarms</b> , <b>startup</b> , or <b>vrp-events</b> .
<b>Required Privilege Level</b>	<p><code>snmp</code>—To view this statement in the configuration.</p> <p><code>snmp-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring SNMP Trap Groups on page 1841</a></li> </ul>

## client-list

---

<b>Syntax</b>	<code>client-list <i>client-list-name</i> {     <i>ip-addresses</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Define a list of SNMP clients.
<b>Options</b>	<i>client-list-name</i> —Name of the client list.  <i>ip-addresses</i> —IP addresses of the SNMP clients to be added to the client list,
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 1863</a></li></ul>

## client-list-name

---

<b>Syntax</b>	<code>client-list-name <i>client-list-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for FX Series switches.
<b>Description</b>	Add a client list or prefix list to an SNMP community.
<b>Options</b>	<i>client-list-name</i> —Name of the client list or prefix list.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 1863</a></li></ul>

## clients

<b>Syntax</b>	clients { <i>address</i> <restrict>; }
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for FX Series switches.
<b>Description</b>	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
<b>Default</b>	If you omit the <b>clients</b> statement, all SNMP clients using this community string are authorized to access the router.
<b>Options</b>	<b>address</b> —Address of an SNMP client that is authorized to access this router. You must specify an address, not a hostname. To specify more than one client, include multiple <b>address</b> options.  <b>restrict</b> —(Optional) Do not allow the specified SNMP client to access the router.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the SNMP Community String on page 1862</a></li> </ul>

## commit-delay

<b>Syntax</b>	commit-delay <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit snmp nonvolatile]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the timer for the SNMP <b>Set</b> reply and start of the commit.
<b>Options</b>	<b>seconds</b> —Delay between an affirmative SNMP <b>Set</b> reply and start of the commit. <b>Default:</b> 5 seconds
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Commit Delay Timer on page 1817</a></li> </ul>

## community

---

<b>Syntax</b>	<pre>community <i>community-name</i> {     authorization <i>authorization</i>;     client-list-name <i>client-list-name</i>;     clients {         address restrict;     }     view <i>view-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.</p> <p>The SNMP client application specifies an SNMP community name in <b>Get</b>, <b>GetBulk</b>, <b>GetNext</b>, and <b>Set</b> SNMP requests.</p>
<b>Default</b>	If you omit the <b>community</b> statement, all SNMP requests are denied.
<b>Options</b>	<p><b><i>community-name</i></b>—Community string. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SNMP Community String on page 1862</a></li></ul>

## community

---

<b>Syntax</b>	<code>community <i>community-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon event <i>index</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The trap group that is used when generating a trap (if <b>eventType</b> is configured to send traps). If that trap group has the <b>rmon-alarm</b> trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of <b>eventCommunity</b> ). If nothing is configured, traps are sent to each group with the <b>rmon-alarm</b> category set.
<b>Options</b>	<b><i>community-name</i></b> —Identifies the trap group that is used when generating a trap if the event is configured to send traps.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Event Entry and Its Attributes on page 1874</a></li></ul>

## community-name

---

<b>Syntax</b>	<code>community-name <i>community-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 snmp-community <i>community-index</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The community name defines an SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2 clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (notify, read, or write) allowed on those objects.
<b>Options</b>	<i>community-name</i> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose it in quotation marks (" ").
<hr/>	
<div> <b>NOTE:</b> Community names must be unique. You cannot configure the same community name at the <code>[edit snmp community]</code> and <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy levels.</div> <p>The community name at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level is encrypted and not displayed in the command-line interface (CLI).</p> <div><hr/></div>	
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SNMPv3 Community on page 1864</a></li></ul>

## contact

---

<b>Syntax</b>	<code>contact <i>contact</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define the value of the MIB II <b>sysContact</b> object, which is the contact person for the managed system.
<b>Options</b>	<b>contact</b> —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the System Contact on a Device Running Junos OS on page 1815</a></li> </ul>

## description

---

<b>Syntax</b>	<code>description <i>description</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysDescription</b> object, which is the description of the system being managed.
<b>Options</b>	<b>description</b> —System description. If the name includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the System Description on a Device Running Junos OS on page 1815</a></li> </ul>

## description

---

<b>Syntax</b>	<code>description <i>description</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ], [edit snmp rmon event <i>index</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Text description of alarm or event.
<b>Options</b>	<b><i>description</i></b> —Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Description on page 1871</a></li><li>• <a href="#">Configuring an Event Entry and Its Attributes on page 1874</a></li></ul>

## destination-port

---

<b>Syntax</b>	<code>destination-port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit snmp trap-group]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Assign a trap port number other than the default.
<b>Default</b>	If you omit this statement, the default port is 162.
<b>Options</b>	<b><i>port-number</i></b> —SNMP trap port number.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 1841</a></li></ul>

## engine-id

<b>Syntax</b>	engine-id { (local <i>engine-id-suffix</i>   use-default-ip-address   use-mac-address); }
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> . You can configure the suffix here.
<div>  <p><b>NOTE:</b> SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.</p> <p>For the engine ID, we recommend using the MAC address of the management port.</p> </div>	
<b>Options</b>	<p><b>local <i>engine-id-suffix</i></b>—Explicit setting for the engine ID suffix.</p> <p><b>use-default-ip-address</b>—The engine ID suffix is generated from the default IP address.</p> <p><b>use-mac-address</b>—The SNMP engine identifier is generated from the MAC address of the management interface on the router.</p> <p><b>Default:</b> use-default-ip-address</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Local Engine ID on page 1823</a></li> </ul>

## enterprise-oid

---

Syntax	enterprise-oid;
Hierarchy Level	[edit snmp <a href="#">trap-options</a> ]
Release Information	Statement introduced in Junos OS Release 10.0
Description	Add the <b>snmpTrapEnterprise</b> object, which shows the association between an enterprise-specific trap and the organization that defined the trap, to standard SNMP traps. By default, the <b>snmpTrapEnterprise</b> object is added only to the enterprise-specific traps. When the <b>enterprise-oid</b> statement is included in the configuration, <b>snmpTrapEnterprise</b> is added to all the traps generated from the device.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Options on page 1837</a></li></ul>

## event

---

Syntax	event <i>index</i> { <a href="#">community</a> <i>community-name</i> ; <a href="#">description</a> <i>description</i> ; <a href="#">type</a> <i>type</i> ; }
Hierarchy Level	[edit snmp <a href="#">rmon</a> ]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure RMON event entries.
Options	<i>index</i> —Identifier for a specific event entry.  The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Event Entry and Its Attributes on page 1874</a></li><li>• <a href="#">alarm on page 1890</a></li></ul>

## falling-event-index

---

<b>Syntax</b>	<code>falling-event-index <i>index</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm index</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The index of the event entry that is used when a falling threshold is crossed. If this value is zero, no event is triggered.
<b>Options</b>	<b><i>index</i></b> —Index of the event entry that is used when a falling threshold is crossed. <b>Range:</b> 0 through 65,535 <b>Default:</b> 0
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Falling Event Index or Rising Event Index on page 1871</a></li><li>• <a href="#">rising-event-index on page 1930</a></li></ul>

## falling-threshold

---

<b>Syntax</b>	<code>falling-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp ]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The lower threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the <b>rising-threshold</b> .
<b>Options</b>	<b><i>percentage</i></b> —The lower threshold for the alarm entry. <b>Range:</b> 1 through 100 <b>Default:</b> 70 percent of the maximum possible value
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Falling Threshold or Rising Threshold on page 1877</a></li><li>• <a href="#">rising-threshold on page 1931</a></li></ul>

## falling-threshold

---

<b>Syntax</b>	<code>falling-threshold <i>integer</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm index</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The lower threshold for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup-alarm value is equal to falling-alarm value or rising-or-falling-alarm value. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the <b>rising-threshold</b> .
<b>Options</b>	<b>integer</b> —The lower threshold for the alarm entry. <b>Range:</b> -2,147,483,648 through 2,147,483,647 <b>Default:</b> 20 percent less than <b>rising-threshold</b>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Falling Threshold or Rising Threshold on page 1871</a></li><li>• <a href="#">rising-threshold on page 1930</a></li></ul>

## falling-threshold-interval

---

<b>Syntax</b>	<code>falling-threshold-interval seconds;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon <a href="#">alarm index</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.
<b>Options</b>	<b>seconds</b> —Time between samples, in seconds. <b>Range:</b> 1 through 2,147,483,647 seconds <b>Default:</b> 60 seconds
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Falling Threshold Interval on page 1872</a></li><li>• <a href="#">interval on page 1912</a></li></ul>

## filter-duplicates

---

<b>Syntax</b>	<code>filter-duplicates;</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Filter duplicate <b>Get</b> , <b>GetNext</b> , or <b>GetBulk</b> SNMP requests.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Duplicate SNMP Requests on page 1819</a></li></ul>

## filter-interfaces

---

<b>Syntax</b>	<pre>filter-interfaces {   interfaces {     all-internal-interfaces;     interface 1;     interface 2;   } }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.4.</p> <p>Statement introduced in Junos OS Release 9.4 for EX Series Switches.</p>
<b>Description</b>	Filter out information related to specific interfaces from the output of SNMP <b>Get</b> and <b>GetNext</b> requests performed on interface-related MIBs.
<b>Options</b>	<p><b>all-internal-interfaces</b>—Filters out information from SNMP <b>Get</b> and <b>GetNext</b> requests for the specified interfaces.</p> <p><b>interfaces</b>—Specifies the interfaces to filter out from the output of SNMP <b>Get</b> and <b>GetNext</b> requests.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Filtering Interface Information Out of SNMP Get and GetNext Output on page 1820</a></li> </ul>

## group (Configuring Group Name)

```
Syntax  group group-name {
        (default-context-prefix | context-prefix context-prefix){
            security-model (any | usm | v1 | v2c) {
                security-level (authentication | none | privacy) {
                    notify-view view-name;
                    read-view view-name;
                    write-view view-name;
                }
            }
        }
    }
```

**Hierarchy Level** [edit snmp v3 vacm access]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group. When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group.

The remaining statements under this hierarchy are documented in separate topics.

**Options** *group-name*—SNMPv3 group name created for the SNMPv3 group.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring the Group on page 1854](#)

## group (Defining Access Privileges for an SNMPv3 Group)

---

<b>Syntax</b>	<code>group <i>group-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 vacm security-to-group security-model (usm   v1   v2c)     <i>security-name security-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define access privileges granted to a group.
<b>Options</b>	<i>group-name</i> —Identifies a collection of SNMP security names that belong to the same access policy SNMP.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Group on page 1834</a></li> </ul>

## health-monitor

---

<b>Syntax</b>	<pre>health-monitor {     <i>falling-threshold percentage</i>;     <i>interval seconds</i>;     <i>rising-threshold percentage</i>; }</pre>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Configure health monitoring.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Health Monitoring on Devices Running Junos OS on page 1875</a></li> </ul>

## interface

---

<b>Syntax</b>	<code>interface [ <i>interface-names</i> ];</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the interfaces on which SNMP requests can be accepted.
<b>Default</b>	If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.
<b>Options</b>	<i>interface-names</i> —Names of one or more logical interfaces.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 1820</a></li></ul>

## interval

---

<b>Syntax</b>	<code>interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm index</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Interval between samples.
<b>Options</b>	<i>seconds</i> —Time between samples, in seconds. <b>Range:</b> 1 through 2,147,483,647 seconds <b>Default:</b> 60 seconds
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interval on page 1872</a></li></ul>

## interval

---

<b>Syntax</b>	interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Interval between samples.
<b>Options</b>	<b><i>seconds</i></b> —Time between samples, in seconds. <b>Range:</b> 1 through 2147483647 seconds <b>Default:</b> 300 seconds
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interval on page 1878</a></li></ul>

## local-engine

<b>Syntax</b>	<pre> local-engine {   user username {     authentication-md5 {       authentication-password authentication-password;     }     authentication-none;     authentication-sha {       authentication-password authentication-password;     }     privacy-aes128 {       privacy-password privacy-password;     }     privacy-des {       privacy-password privacy-password;     }     privacy-3des {       privacy-password privacy-password;     }     privacy-none {       privacy-password privacy-password;     }   } } </pre>
<b>Hierarchy Level</b>	[edit snmp v3 <a href="#">usm</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure local engine information for the user-based security model (USM).</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating SNMPv3 Users on page 1824</a></li> </ul>

## location

---

<b>Syntax</b>	<code>location <i>location</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define the value of the MIB II <b>sysLocation</b> object, which is the physical location of the managed system.
<b>Options</b>	<i>location</i> —Location of the local system. You must enclose the name within quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the System Location for a Device Running Junos OS on page 1816</a></li></ul>

## logical-system

<b>Syntax</b>	<pre>logical-system <i>logical-system-name</i> {     <i>routing-instance routing-instance-name</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit snmp <i>community community-name</i>], [edit snmp <i>trap-group</i>], [edit snmp <i>trap-options</i>] [edit snmp <i>v3target-address target-address-name</i>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.3</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<div>  <p><b>NOTE:</b> The <code>logical-system</code> statement replaces the <code>logical-router</code> statement, and is backward-compatible with Junos OS Release 8.3 and later.</p> </div>	
<b>Description</b>	<p>Specify a logical system name for SNMP v1 and v2c clients.</p> <p>Include at the <code>[edit snmp trap-options]</code> hierarchy level to specify a logical-system address as the source address of an SNMP trap.</p> <p>Include at the <code>[edit snmp v3 target-address]</code> hierarchy level to specify a logical-system name as the destination address for an SNMPv3 trap or inform.</p>
<b>Options</b>	<p><i>logical-system-name</i>—Name of the logical system.</p> <p><i>routing-instance routing-instance-name</i>—Statement to specify a routing instance associated with the logical system.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858</a></li> <li>• <a href="#">Configuring the Trap Target Address on page 1846</a></li> </ul>

## logical-system-trap-filter

---

<b>Syntax</b>	logical-system-trap-filter;
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4.
<b>Description</b>	Restrict the routing instances from receiving traps that are not related to the logical system networks to which they belong.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Trap Support for Routing Instances on page 1799</a></li> </ul>

## message-processing-model

---

<b>Syntax</b>	message-processing-model (v1   v2c   v3);
<b>Hierarchy Level</b>	[edit snmp v3 target-parameters <i>target-parameter-name</i> parameters]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the message processing model to be used when generating SNMP notifications.
<b>Options</b>	v1—SNMPv1 message process model.  v2c—SNMPv2c message process model.  v3—SNMPv3 message process model.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Message Processing Model on page 1850</a></li> </ul>

## name

---

<b>Syntax</b>	<code>name <i>name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the system name from the command-line interface.
<b>Options</b>	<i>name</i> —System name override.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the System Name on page 1816</a></li></ul>

## nonvolatile

---

<b>Syntax</b>	<code>nonvolatile {     <a href="#">commit-delay</a> <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. The <a href="#">commit-delay</a> statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure options for SNMP <b>Set</b> requests.  The statement is explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Commit Delay Timer on page 1817</a></li><li>• <a href="#">commit-delay on page 1897</a></li></ul>

## notify

---

<b>Syntax</b>	<code>notify <i>name</i> {     tag <i>tag-name</i>;     type (trap   inform); }</code>
<b>Hierarchy Level</b>	[edit snmp v3]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>type inform</b> option added in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.
<b>Options</b>	<b><i>name</i></b> —Name assigned to the notification.  <b><i>tag-name</i></b> —Notifications are sent to all targets configured with this tag.  <b><i>type</i></b> —Notification type is <b>trap</b> or <b>inform</b> . Traps are unconfirmed notifications. Informs are confirmed notifications.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Inform Notification Type and Target Address on page 1867</a></li> <li>• <a href="#">Configuring the SNMPv3 Trap Notification on page 1845</a></li> </ul>

## notify-filter (Applying to the Management Target)

---

<b>Syntax</b>	<code>notify-filter <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 <b>target-parameters</b> <i>target-parameters-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the notify filter to be used by a specific set of target parameters.
<b>Options</b>	<b><i>profile-name</i></b> —Name of the notify filter to apply to notifications.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Applying the Trap Notification Filter on page 1850</a></li> </ul>

## notify-filter (Configuring the Profile Name)

---

<b>Syntax</b>	<code>notify-filter <i>profile-name</i> {     oid <i>oid</i> (include   exclude); }</code>
<b>Hierarchy Level</b>	[edit snmp v3]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.
<b>Options</b>	<i>profile-name</i> —Name assigned to the notify filter.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Trap Notification Filter on page 1840</a></li><li>• <a href="#">oid on page 1921</a></li></ul>

## notify-view

---

<b>Syntax</b>	<code>notify-view <i>view-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i> ) security-model (any   usm   v1   v2c) security-level (authentication   none   privacy)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
<b>Options</b>	<i>view-name</i> —Name of the view to which the SNMP user group has access.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MIB Views on page 1821</a></li><li>• <a href="#">Configuring the Notify View on page 1856</a></li></ul>

## oid

<b>Syntax</b>	<code>oid <i>object-identifier</i> (exclude   include);</code>
<b>Hierarchy Level</b>	<code>[edit snmp view <i>view-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify an object identifier (OID) used to represent a subtree of MIB objects.
<b>Options</b>	<p><b>exclude</b>—Exclude the subtree of MIB objects represented by the specified OID.</p> <p><b>include</b>—Include the subtree of MIB objects represented by the specified OID.</p> <p><b><i>object-identifier</i></b>—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MIB Views on page 1821</a></li> </ul>

## oid

<b>Syntax</b>	<code>oid <i>oid</i> (include   exclude);</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 notify-filter <i>profile-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify an object identifier (OID) used to represent a subtree of MIB objects. This OID is a prefix that the represented MIB objects have in common.
<b>Options</b>	<p><b>exclude</b>—Exclude the subtree of MIB objects represented by the specified OID.</p> <p><b>include</b>—Include the subtree of MIB objects represented by the specified OID.</p> <p><b><i>oid</i></b>—Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Trap Notification Filter on page 1840</a></li> </ul>

## parameters

---

<b>Syntax</b>	<pre>parameters {   message-processing-model (v1   v2c   v3);   security-level (none   authentication   privacy);   security-model (usm   v1   v2c);   security-name security-name; }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 target-parameters <i>target-parameters-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a set of target parameters for message processing and security.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Defining and Configuring the Trap Target Parameters on page 1849</a></li></ul>

## port

---

<b>Syntax</b>	<pre>port port-number;</pre>
<b>Hierarchy Level</b>	[edit snmp v3 target-address <i>target-address-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a UDP port number for an SNMP target.
<b>Default</b>	If you omit this statement, the default port is 162.
<b>Options</b>	<i>port-number</i> —Port number for the SNMP target.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Port on page 1848</a></li></ul>

## privacy-3des

---

<b>Syntax</b>	<pre>privacy-3des {     <b>privacy-password</b> <i>privacy-password</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the triple Data Encryption Standard (3DES) as the privacy type for the SNMPv3 user.</p>
<b>Options</b>	<p><b>privacy-password</b> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"> <li>• The password must be at least eight characters long.</li> <li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li> </ul>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Encryption Type on page 1831</a></li> </ul>

## privacy-aes128

---

<b>Syntax</b>	<pre>privacy-aes128 {     <b>privacy-password</b> <i>privacy-password</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Advanced Encryption Standard encryption algorithm (CFB128-AES-128 Privacy Protocol) for the SNMPv3 user.
<b>Options</b>	<p><b>privacy-password</b> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"><li>• The password must be at least eight characters long.</li><li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li></ul>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Encryption Type on page 1831</a></li></ul>

## privacy-des

<b>Syntax</b>	<code>privacy-des {     <b>privacy-password</b> <i>privacy-password</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Data Encryption Standard (DES) as the privacy type for the SNMPv3 user.
<b>Options</b>	<p><b>privacy-password</b> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"> <li>• The password must be at least eight characters long.</li> <li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li> </ul>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Encryption Type on page 1831</a></li> </ul>

## privacy-none

<b>Syntax</b>	<code>privacy-none;</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure that no encryption be used for the SNMPv3 user.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Encryption Type on page 1831</a></li> </ul>

## privacy-password

---

<b>Syntax</b>	<code>privacy-password <i>privacy-password</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 usm local-engine user <i>username</i> privacy-3des],</code> <code>[edit snmp v3 usm local-engine user <i>username</i> privacy-aes128],</code> <code>[edit snmp v3 usm local-engine user <i>username</i> privacy-des],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-3des],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-aes128],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-des]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a privacy password for the SNMPv3 user.
<b>Options</b>	<p><b><i>privacy-password</i></b>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"><li>• The password must be at least eight characters long.</li><li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li></ul>
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Encryption Type on page 1831</a></li></ul>

---

## read-view

---

<b>Syntax</b>	<code>read-view <i>view-name</i>;</code>
<b>Hierarchy Level</b>	[ <code>edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i>) security-model (any   usm   v1   v2c) security-level (authentication   none   privacy)</code> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate the read-only view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
<b>Options</b>	<b><i>view-name</i></b> —The name of the view to which the SNMP user group has access.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Read View on page 1856</a></li><li>• <a href="#">Configuring MIB Views on page 1821</a></li></ul>

## remote-engine

<b>Syntax</b>	<pre> remote-engine <i>engine-id</i> {   user <i>username</i> {     authentication-md5 {       authentication-password <i>authentication-password</i>;     }     authentication-none;     authentication-sha {       authentication-password <i>authentication-password</i>;     }     privacy-aes128 {       privacy-password <i>privacy-password</i>;     }     privacy-des {       privacy-password <i>privacy-password</i>;     }     privacy-3des {       privacy-password <i>privacy-password</i>;     }     privacy-none {       privacy-password <i>privacy-password</i>;     }   } } </pre>
<b>Hierarchy Level</b>	[edit snmp v3 usm]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.
<b>Options</b>	<p><b><i>engine-id</i></b>—Engine identifier. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring the Remote Engine and Remote User on page 1966</a></li> </ul>

## request-type

<b>Syntax</b>	<code>request-type (get-next-request   get-request   walk-request);</code>
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm index</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Extend monitoring to a specific SNMP object instance ( <b>get-request</b> ), or extend monitoring to all object instances belonging to a MIB branch ( <b>walk-request</b> ), or extend monitoring to the next object instance after the instance specified in the configuration ( <b>get-next-request</b> ).
<b>Options</b>	<p><b>get-next-request</b>—Performs an SNMP get next request.</p> <p><b>get-request</b>—Performs an SNMP get request.</p> <p><b>walk-request</b>—Performs an SNMP walk request.</p> <p><b>Default:</b> walk-request</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Request Type on page 1873</a></li> <li>• <a href="#">variable on page 1960</a></li> </ul>

## retry-count

<b>Syntax</b>	<code>retry-count <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 <a href="#">target-address target-address-name</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4.
<b>Description</b>	Configure the retry count for SNMP informs.
<b>Options</b>	<p><b>number</b>—Maximum number of times the inform is transmitted if no acknowledgment is received. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.</p> <p><b>Default:</b> 3 times</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Informs on page 1823</a></li> <li>• <a href="#">timeout on page 1949</a></li> </ul>

## rising-event-index

---

<b>Syntax</b>	<code>rising-event-index <i>index</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon <a href="#">alarm index</a>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Index of the event entry that is used when a rising threshold is crossed. If this value is zero, no event is triggered.
<b>Options</b>	<i>index</i> —Index of the event entry that is used when a rising threshold is crossed. <b>Range:</b> 0 through 65,535 <b>Default:</b> 0
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Falling Event Index or Rising Event Index on page 1871</a></li><li>• <a href="#">falling-event-index on page 1905</a></li></ul>

## rising-threshold

---

<b>Syntax</b>	<code>rising-threshold <i>integer</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon <a href="#">alarm index</a>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Upper threshold for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated startup alarm value is equal to the falling alarm or rising or falling alarm value. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold.
<b>Options</b>	<i>integer</i> —The lower threshold for the alarm entry. <b>Range:</b> -2,147,483,648 through 2,147,483,647
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Falling Threshold or Rising Threshold on page 1871</a></li><li>• <a href="#">falling-threshold on page 1907</a></li></ul>

## rising-threshold

---

<b>Syntax</b>	<code>rising-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp ]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The upper threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the <b>falling-threshold</b> .
<b>Options</b>	<b><i>percentage</i></b> —The lower threshold for the alarm entry. <b>Range:</b> 1 through 100 <b>Default:</b> 80 percent of the maximum possible value
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">falling-threshold on page 1906</a></li> <li>• <a href="#">Configuring the Falling Threshold or Rising Threshold on page 1877</a></li> </ul>

## rmon

---

<b>Syntax</b>	<code>rmon { ... }</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure Remote Monitoring.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an Alarm Entry and Its Attributes on page 1870</a></li> </ul>

## routing-engine (SNMP Resource Level)

**Syntax**    routing-engine {  
               resource <cpu | memory | open-files-count | process-count | storage | temperature> ;  
               {  
                   interval <interval in secs>;  
                   moderate-threshold <percentage level>;  
                   high-threshold <percentage level>;  
                   critical-threshold <percentage level>;  
                   action <monitor | prevent | recover>;  
               }  
           }

**Hierarchy Level**    [edit snmp health-monitor routing-engine]

**Release Information**    Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 12.1X45-D10.

**Description**    Override the global configuration for a resource.

- Options**
- **interval**—Monitoring interval in seconds.  
           Default: 300 seconds
  - **moderate-threshold**—Percentage of moderate threshold level resource utilization.  
           Default: 70 percent.
  - **high-threshold** —Percentage of high-threshold level resource utilization.  
           Default: 80 percent.
  - **critical-threshold** —Percentage of critical threshold level resource utilization.  
           Default: 90 percent.
  - **action**—Enable action for all resources.  
           Default: If action is not enabled, the default action is prevent.

**WARNING:** If the system health management action for an affected resource is configured to recover, then certain intrusive operations necessary for preventing system breakdown are taken. Intrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.

**Required Privilege Level**    security—To view this statement in the configuration.  
                                   security-control—To add this statement to the configuration.

## routing-engine (SNMP Global Level)

**Syntax** routing-engine

```
{
  interval <interval in secs>;
  moderate-threshold <percentage level>;
  high-threshold <percentage level>;
  critical-threshold <percentage level>;
  traceoptions;
  action <monitor | prevent | recover>;
}
```

**Hierarchy Level** [edit snmp health-monitor routing-engine]

**Release Information** Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 12.1X45-D10.

**Description** Enable the system health management feature to use the specified parameters.

- Options**
- **interval**—Monitoring interval in seconds.  
Default: 300 seconds
  - **moderate-threshold**—Percentage of moderate threshold level resource utilization.  
Default: 70 percent.
  - **high-threshold** —Percentage of high-threshold level resource utilization.  
Default: 80 percent.
  - **critical-threshold** —Percentage of critical threshold level resource utilization.  
Default: 90 percent.
  - **traceoptions**—Enable tracing of system health monitoring daemon.
  - **action**—Enable action for all resources.  
Default: If action is not enabled, the default is prevent.

**WARNING:** If the system health management action for an affected resource is configured to recover, then certain intrusive operations necessary for preventing system breakdown are taken. Intrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.

**Required Privilege Level**

security	—To view this statement in the configuration.
security-control	—To add this statement to the configuration.

## routing-instance

---

<b>Syntax</b>	<code>routing-instance <i>routing-instance-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp <b>community</b> <i>community-name</i>],</code> <code>[edit snmp <b>community</b> <i>community-name</i> logical-system <i>logical-system-name</i>],</code> <code>[edit snmp <b>trap-group</b> <i>group</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Added to the <code>[edit snmp <b>community</b> <i>community-name</i>]</code> hierarchy level in Junos OS Release 8.4. Added to the <code>[edit snmp <b>community</b> <i>community-name</i> logical-system <i>logical-system-name</i>]</code> hierarchy level in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	<p>Specify a routing instance for SNMPv1 and SNMPv2 trap targets. All targets configured in the trap group use this routing instance.</p> <p>If the routing instance is defined within a logical system, include the <b>logical-system</b> <i>logical-system-name</i> statement at the <code>[edit snmp <b>community</b> <i>community-name</i>]</code> hierarchy level and specify the <b>routing-instance</b> statement under the <code>[edit snmp <b>community</b> <i>community-name</i> logical-system <i>logical system-name</i>]</code> hierarchy level.</p>
<b>Options</b>	<b><i>routing-instance-name</i></b> —Name of the routing instance.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 1841</a></li><li>• <a href="#">Configuring the Source Address for SNMP Traps on page 1837</a></li><li>• <a href="#">Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1858</a></li></ul>

## routing-instance

<b>Syntax</b>	<code>routing-instance <i>routing-instance-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 <a href="#">target-address</a> <i>target-address-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify a routing instance for an SNMPv3 trap target.
<b>Options</b>	<p><b><i>routing-instance-name</i></b>—Name of the routing instance.</p> <p>To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash ( / ) to separate the two names (for example, <b>test-ls/test-ri</b>). To configure the default routing instance on a logical system, specify the logical system name followed by <b>default</b> (for example, <b>test-ls/default</b>).</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Trap Target Address on page 1846</a></li> </ul>

## routing-instance-access

<b>Syntax</b>	<pre>[edit snmp]   routing-instance-access {     access-list {       <i>routing-instance</i>;       <i>routing-instance</i> restrict;     }   }</pre>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4.
<b>Description</b>	Enable SNMP managers in routing instances other than the default routing instance to access SNMP information. For information about the <b>access-list</b> option, see <a href="#">access-list</a> .
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling SNMP Access over Routing Instances on page 1858</a></li> </ul>

## sample-type

---

<b>Syntax</b>	sample-type (absolute-value   delta-value);
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm</a> index]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Method of sampling the selected variable.
<b>Options</b>	<p><b>absolute-value</b>—Actual value of the selected variable is used when comparing against the thresholds.</p> <p><b>delta-value</b>—Difference between samples of the selected variable is used when comparing against the thresholds.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Sample Type on page 1873</a></li></ul>

## security-level (Defining Access Privileges)

<b>Syntax</b>	<pre>security-level (authentication   none   privacy) {     notify-view view-name;     read-view view-name;     write-view view-name; }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i> ) security-model (any   usm   v1   v2c)]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Define the security level used for access privileges.
<b>Default</b>	none
<b>Options</b>	<p><b>authentication</b>—Provide authentication but no encryption.</p> <p><b>none</b>—No authentication and no encryption.</p> <p><b>privacy</b>—Provide authentication and encryption.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Security Level on page 1855</a></li> </ul>

## security-level (Generating SNMP Notifications)

---

<b>Syntax</b>	security-level (authentication   none   privacy);
<b>Hierarchy Level</b>	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security level to use when generating SNMP notifications.
<b>Default</b>	none
<b>Options</b>	<b>authentication</b> —Provide authentication but no encryption.  <b>none</b> —No authentication and no encryption.  <b>privacy</b> —Provide authentication and encryption.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Security Level on page 1851</a></li></ul>

## security-model (Access Privileges)

---

<b>Syntax</b>	<code>security-model (usm   v1   v2c);</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i>)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.
<b>Options</b>	<code>usm</code> —SNMPv3 security model.  <code>v1</code> —SNMPv1 security model.  <code>v2c</code> —SNMPv2c security model.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Security Model on page 1854</a></li> </ul>

## security-model (Group)

---

<b>Syntax</b>	<pre>security-model (usm   v1   v2c) {     security-name security-name {         group group-name;     } }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 vacm <a href="#">security-to-group</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define a security model for a group.
<b>Options</b>	<b>usm</b> —SNMPv3 security model.  <b>v1</b> —SNMPv1 security model.  <b>v2c</b> —SNMPv2c security model.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Security Model on page 1833</a></li></ul>

## security-model (SNMP Notifications)

---

<b>Syntax</b>	<pre>security-model (usm   v1   v2c);</pre>
<b>Hierarchy Level</b>	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.
<b>Options</b>	<b>usm</b> —SNMPv3 security model.  <b>v1</b> —SNMPv1 security model.  <b>v2c</b> —SNMPv2c security model.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Security Model on page 1851</a></li></ul>

## security-name (Community String)

Syntax	<code>security-name <i>security-name</i>;</code>
Hierarchy Level	<code>[edit snmp v3 <b>snmp-community</b> <i>community-index</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Associate the community string configured at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level to a security name.
Options	<i>security-name</i> —Name used when performing access control.

**NOTE:** The security name must match the configured security name at the `[edit snmp v3 target-parameters target-parameters-name parameters]` hierarchy level when you configure traps or informs.

Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Security Names on page 1866</a></li> </ul>

## security-name (Security Group)

Syntax	<code>security-name <i>security-name</i> {     <b>group</b> <i>group-name</i>; }</code>
Hierarchy Level	<code>[edit snmp v3 vacm security-to-group <b>security-model</b> (usm   v1   v2c)]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Associate a group or a community string with a configured security group.
Options	<i>security-name</i> —Username configured at the <code>[edit snmp v3 usm local-engine user <i>username</i>]</code> hierarchy level. For SNMPv1 and SNMPv2c, the security name is the community string configured at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Assigning Security Names to Groups on page 1833</a></li> </ul>

## security-name (SNMP Notifications)

<b>Syntax</b>	<code>security-name <i>security-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security name used when generating SNMP notifications.
<b>Options</b>	<b><i>security-name</i></b> —If the SNMPv3 USM security model is used, identify the user when generating the SNMP notification. If the v1 or v2c security models are used, identify the SNMP community used when generating the notification.
<div>  <p><b>NOTE:</b> The access privileges for the group associated with this security name must allow this notification to be sent.</p> <p>If you are using the v1 or v2 security models, the security name at the <code>[edit snmp v3 vacm security-to-group]</code> hierarchy level must match the security name at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level.</p> </div>	
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Security Name on page 1851</a></li> </ul>

## security-to-group

---

<b>Syntax</b>	<pre>security-to-group {   security-model (usm   v1   v2c) {     group group-name;     security-name security-name;   } }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 vacm]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the group to which a specific SNMPv3 security name belongs. The security name is used for messaging security.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Assigning Security Model and Security Name to a Group on page 1833</a></li> </ul>

## snmp

---

<b>Syntax</b>	snmp { ... }
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure SNMP.
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP on a Device Running Junos OS on page 1813</a></li> </ul>

## source-address

<b>Syntax</b>	<code>source-address <i>address</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-options]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.
<b>Options</b>	<p><b><i>address</i></b>—Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the router interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b>.</p> <p><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.)</p>
<b>Required Privilege Level</b>	<p><b>snmp</b>—To view this statement in the configuration.</p> <p><b>snmp-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Source Address for SNMP Traps on page 1837</a></li> </ul>

## snmp-community

<b>Syntax</b>	<pre>snmp-community <i>community-index</i> {   <b>community-name</b> <i>community-name</i>;   <b>security-name</b> <i>security-name</i>;   <b>tag</b> <i>tag-name</i>; }</pre>
<b>Hierarchy Level</b>	<code>[edit snmp v3]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the SNMP community.
<b>Options</b>	<p><b><i>community-index</i></b>—(Optional) String that identifies an SNMP community.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p><b>snmp</b>—To view this statement in the configuration.</p> <p><b>snmp-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the SNMPv3 Community on page 1864</a></li> </ul>

## startup-alarm

---

<b>Syntax</b>	startup-alarm (falling-alarm   rising-alarm   rising-or-falling-alarm);
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm</a> index]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	The alarm that can be sent upon entry startup.
<b>Options</b>	<p><b>falling-alarm</b>—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.</p> <p><b>rising-alarm</b>—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.</p> <p><b>rising-or-falling-alarm</b>—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.</p> <p><b>Default:</b> rising-or-falling-alarm</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Startup Alarm on page 1873</a></li> </ul>

## syslog-subtag

---

<b>Syntax</b>	syslog-subtag <i>syslog-subtag</i> ;
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm</a> index]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Add a tag to the system log message.
<b>Options</b>	<p><b>syslog-subtag <i>syslog-subtag</i></b>—Tag of not more than 80 uppercase characters to be added to syslog messages.</p> <p><b>Default:</b> None</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the System Log Tag on page 1874</a></li> </ul>

## tag

---

<b>Syntax</b>	<code>tag tag-name;</code>
<b>Hierarchy Level</b>	[edit snmp v3 <a href="#">notify name</a> ], [edit snmp v3 <a href="#">snmp-community community-index</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure a set of targets to receive traps or informs (for IPv4 packets only).
<b>Options</b>	<i>tag-name</i> —Identifies the address of managers that are allowed to use a community string.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Tag on page 1866</a></li><li>• <a href="#">Configuring the SNMPv3 Trap Notification on page 1845</a></li></ul>

## tag-list

---

<b>Syntax</b>	<code>tag-list tag-list;</code>
<b>Hierarchy Level</b>	[edit snmp v3 target-address <i>target-address-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an SNMP tag list used to select target addresses.
<b>Options</b>	<i>tag-list</i> —Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Trap Target Address on page 1848</a></li></ul>

## target-address

---

<b>Syntax</b>	<pre>target-address <i>target-address-name</i> {   address <i>address</i>;   address-mask <i>address-mask</i>;   logical-system <i>logical-system</i>;   port <i>port-number</i>;   retry-count <i>number</i>;   routing-instance <i>instance</i>;   tag-list <i>tag-list</i>;   target-parameters <i>target-parameters-name</i>;   timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp v3]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure the address of an SNMP management application and the parameters to be used in sending notifications.
<b>Options</b>	<p><b><i>target-address-name</i></b>—String that identifies the target address.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Trap Target Address on page 1846</a></li> </ul>

## target-parameters

**Syntax** At the `[edit snmp v3]` hierarchy level:

```
target-parameters target-parameters-name {
  profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

At the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
target-parameters target-parameters-name;
```

**Hierarchy Level** `[edit snmp v3]`  
`[edit snmp v3 target-address target-address-name]`

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the `[edit snmp v3]` hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level to the target address configuration at the `[edit snmp v3]` hierarchy level.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

## targets

---

<b>Syntax</b>	<code>targets {     <i>address</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure one or more systems to receive SNMP traps.
<b>Options</b>	<b><i>address</i></b> —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Trap Groups on page 1841</a></li> </ul>

## timeout

---

<b>Syntax</b>	<code>timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 <a href="#">target-address</a> <i>target-address-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4.
<b>Description</b>	Configure the timeout period (in seconds) for SNMP informs.
<b>Options</b>	<b><i>seconds</i></b> —Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. <b>Default:</b> 15
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Informs on page 1823</a></li> <li>• <a href="#">retry-count on page 1929</a></li> </ul>

## traceoptions

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i>;     no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>file <i>filename</i></b> option added in Junos OS Release 8.1.</p> <p><b>world-readable   no-world-readable</b> option added in Junos OS Release 8.1.</p> <p><b>match <i>regular-expression</i></b> option added in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>The output of the tracing operations is placed into log files in the <b>/var/log</b> directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the <b>/var/log</b> directory when the <b>traceoptions</b> statement is used:</p> <ul style="list-style-type: none"> <li>• chassisd</li> <li>• craftd</li> <li>• ilmids</li> <li>• mib2d</li> <li>• rmopd</li> <li>• serviced</li> <li>• snmpd</li> </ul>
<b>Options</b>	<p><b>file <i>filename</i></b>—By default, the name of the log file that records trace output is the name of the process being traced (for example, <b>mib2d</b> or <b>snmpd</b>). Use this option to specify another name.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, <b>snmpd</b>) reaches its maximum size, it is archived by being renamed to <b>snmpd.0</b>. The previous <b>snmpd.1</b> is renamed to <b>snmpd.2</b>, and so on. The oldest archived file is deleted.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Log all SNMP events.</li> <li>• <b>general</b>—Log general events.</li> </ul>

- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **subagent**—Log subagent restarts.
- **timer**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**size *size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

**Range:** 10 KB through 1 GB

**Default:** 1000 KB

**world-readable | no-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

------------------------------	---

## trap-group

---

<b>Syntax</b>	<pre>trap-group <i>group-name</i> {     <b>categories</b> {         <i>category</i>;     }     <b>destination-port</b> <i>port-number</i>;     <b>routing-instance</b> <i>instance</i>;     <b>targets</b> {         <i>address</i>;     }     <b>version</b> (all   v1   v2); }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
<b>Options</b>	<p><b><i>group-name</i></b>—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 1841</a></li></ul>

## trap-options

<b>Syntax</b>	<pre>trap-options {     agent-address outgoing-interface;     source-address address; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Trap Options on page 1837</a></li> </ul>

## type

<b>Syntax</b>	type (inform   trap);
<b>Hierarchy Level</b>	[edit snmp v3 notify <i>name</i> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>inform</b> option added in Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the type of SNMP notification.
<b>Options</b>	<p><b>inform</b>—Defines the type of notification as an inform. SNMP informs are confirmed notifications.</p> <p><b>trap</b>—Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Informs on page 1823</a></li> <li>• <a href="#">Configuring the SNMPv3 Trap Notification on page 1845</a></li> </ul>

## type

---

<b>Syntax</b>	<code>type type;</code>
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">event index</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Type of notification generated when a threshold is crossed.
<b>Options</b>	<b>type</b> —Type of notification: <ul style="list-style-type: none"><li>• <b>log</b>—Add an entry to <b>logTable</b>.</li><li>• <b>log-and-trap</b>—Send an SNMP trap and make a log entry.</li><li>• <b>none</b>—No notifications are sent.</li><li>• <b>snmptrap</b>—Send an SNMP trap.</li></ul> <b>Default:</b> log-and-trap
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Event Entry and Its Attributes on page 1874</a></li></ul>

## user

---

<b>Syntax</b>	<code>user username;</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine], [edit snmp v3 usm remote-engine <i>engine-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a user associated with an SNMPv3 group on a local or remote SNMP engine.
<b>Options</b>	<b>username</b> —SNMPv3 user-based security model (USM) username.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating SNMPv3 Users on page 1824</a></li></ul>

## usm

```

Syntax  usm {
        local-engine {

## variable

---

<b>Syntax</b>	<code>variable <i>oid-variable</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon <a href="#">alarm index</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Object identifier (OID) of MIB variable to be monitored.
<b>Options</b>	<i>oid-variable</i> —OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.1.10.1). Alternatively, use the MIB object name (for example, <code>ifInOctets.1</code> ).
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Variable on page 1874</a></li></ul>

## version

---

<b>Syntax</b>	<code>version (all   v1   v2);</code>
<b>Hierarchy Level</b>	[edit snmp trap-group <i>group-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the version number of SNMP traps.
<b>Default</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
<b>Options</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.  v1—Send SNMPv1 traps only.  v2—Send SNMPv2 traps only.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 1841</a></li></ul>

## view (Associating a MIB View with a Community)

---

<b>Syntax</b>	<code>view <i>view-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp community <i>community-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Associate a view with a community. A view represents a group of MIB objects.
<b>Options</b>	<b><i>view-name</i></b> —Name of the view. You must use a view name already configured in the <b>view</b> statement at the <code>[edit snmp]</code> hierarchy level.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SNMP Community String on page 1862</a></li></ul>

## view (Configuring a MIB View)

---

Syntax	<pre>view <i>view-name</i> {     <i>oid object-identifier</i> (include   exclude); }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The <b>view</b> statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the <b>view</b> statement at the <b>[edit snmp community <i>community-name</i>]</b> hierarchy level.
<div> <b>NOTE:</b> To remove an OID completely, use the <b>delete view all oid oid-number</b> command but omit the <b>include</b> parameter.</div>	
Options	<p><b><i>view-name</i></b>—Name of the view.</p> <p>The remaining statement is explained separately.</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring MIB Views on page 1821</a></li><li>• <a href="#">Associating MIB Views with an SNMP User Group on page 1855</a></li><li>• <a href="#">community on page 1898</a></li></ul>

## write-view

---

<b>Syntax</b>	<code>write-view <i>view-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i> ) security-model (any   usm   v1   v2c) security-level (authentication   none   privacy)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series switches.
<b>Description</b>	Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
<b>Options</b>	<b><i>view-name</i></b> —Name of the view for which the SNMP user group has write permission.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MIB Views on page 1821</a></li> <li>• <a href="#">Configuring the Write View on page 1856</a></li> </ul>

## SNMP Traps

- [Managing Traps and Informs on page 1963](#)

### Managing Traps and Informs

---

The following sections contain a few tips on managing SNMP notifications:

- [Generating Traps Based on SysLog Events on page 1963](#)
- [Filtering Traps Based on the Trap Category on page 1964](#)
- [Filtering Traps Based on the Object Identifier on page 1964](#)

#### **Generating Traps Based on SysLog Events**

Event policies can include an action that raises traps for events based on system log messages. This feature enables notification of an SNMP trap-based application when an important system log message occurs. You can convert any system log message, for

which there is no corresponding trap, into a trap. If you are using network management system traps rather than system log messages to monitor your network, you can use this feature to ensure that you are notified of all the major events.

To configure a policy that raises a trap on receipt of an event, include the following statements at the `[edit event-options policy policy-name]` hierarchy level:

```
[edit event-options policy policy-name]
events [ events ];
then {
  raise-trap;
}
```

The following example shows the sample configuration for raising a trap for the event `ui_mgd_terminate`:

#### Generating Traps Based on SysLog Events

```
[edit event-options policy p1]
events ui_mgd_terminate;
then {
  raise-trap;
}
```

#### *Filtering Traps Based on the Trap Category*

SNMP traps are categorized into many categories. The Junos OS provides a configuration option, `categories` at the `[edit snmp trap-group trap-group]` hierarchy level, that enables you to specify categories of traps that you want to receive on a particular host. You can use this option when you want to monitor only specific modules of the Junos OS.

The following example shows a sample configuration for receiving only `link`, `vrp-events`, `services`, and `otn-alarms` traps:

```
[edit snmp]
trap-group jnpr {
  categories {
    link;
    vrp-events;
    services;
    otn-alarms;
  }
  targets {
    192.168.69.179;
  }
}
```

#### *Filtering Traps Based on the Object Identifier*

The Junos OS also provides a more advanced filter option that enables you to filter out specific traps based on their object identifiers. You can use the `notify-filter` option to filter out a specific trap or a group of traps.

The following example shows the sample configuration for excluding Juniper Networks enterprise-specific configuration management traps (note that the SNMPv3 configuration also supports filtering of SNMPv1 and SNMPv2 traps as is shown in the following example):

```
[edit snmp]
```

```

v3 {
  vacm {
    security-to-group {
      security-model v2c {
        security-name sn_v2c_trap {
          group gr_v2c_trap;
        }
      }
    }
  }
  access {
    group gr_v2c_trap {
      default-context-prefix {
        security-model v2c {
          security-level none {
            read-view all;
            notify-view all;
          }
        }
      }
    }
  }
}
target-address TA_v2c_trap {
  address 10.209.196.166;
  port 9001;
  tag-list tg1;
  target-parameters TP_v2c_trap;
}
target-parameters TP_v2c_trap {
  parameters {
    message-processing-model v2c;
    security-model v2c;
    security-level none;
    security-name sn_v2c_trap;
  }
  notify-filter nf1;
}
notify v2c_notify {
  type trap;
  tag tg1;
}
notify-filter nf1 {
  oid .1.3.6.1.4.1.2636.4.5 exclude;
  oid .1 include;
}
snmp-community index1 {
  community-name "$ABC123"; ## SECRET-DATA
  security-name sn_v2c_trap;
  tag tg1;
}
view all {
  oid .1 include;
}
}

```

## Remote Operations

- [Using the Ping MIB for Remote Monitoring Devices Running Junos OS on page 1966](#)
- [Configuring the Remote Engine and Remote User on page 1966](#)
- [Example: Configuring the Remote Engine ID and Remote Users on page 1967](#)

---

### Using the Ping MIB for Remote Monitoring Devices Running Junos OS

A ping test is used to determine whether packets sent from the local host reach the designated host and are returned. If the designated host can be reached, the ping test provides the approximate round-trip time for the packets. Ping test results are stored in **pingResultsTable** and **pingProbeHistoryTable**.

RFC 2925 is the authoritative description of the Ping MIB in detail and provides the ASN.1 MIB definition of the Ping MIB.

### Configuring the Remote Engine and Remote User

To send inform messages to an SNMPv3 user on a remote device, you must first specify the engine identifier for the SNMP agent on the remote device where the user resides. The remote engine ID is used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host. When sending an inform message, the agent uses the credentials of the user configured on the remote engine (inform target).

To configure a remote engine and remote user to receive and respond to SNMP informs, include the following statements at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  usm {
    remote-engine engine-id {
```

```

user username {
  authentication-md5 {
    authentication-key key;
  }
  authentication-none;
  authentication-sha {
    authentication-key key;
  }
  privacy-3des {
    privacy-key key;
  }
  privacy-aes128 {
    privacy-key key;
  }
  privacy-des {
    privacy-key key;
  }
  privacy-none;
}
}

```

For informs, **remote-engine engine-id** is the identifier for the SNMP agent on the remote device where the user resides.

For informs, **user username** is the user on a remote SNMP engine who receives the informs.

Informs generated can be **unauthenticated**, **authenticated**, or **authenticated\_and\_encrypted**, depending on the security level of the SNMPv3 user configured on the remote engine (the inform receiver). The authentication key is used for generating message authentication code (MAC). The privacy key is used to encrypt the inform PDU part of the message.

#### Example: Configuring the Remote Engine ID and Remote Users

The following example configures user **u10** located on remote engine **0x800007E5804089071BC6D10A41** and the user's authentication and privacy keys. The keys are autogenerated from the passwords entered by the command-line interface (CLI) user.

```

[edit snmp v3]
usm {
  remote-engine 800007E5804089071BC6D10A41 {
    authentication-md5 {

```

```
        authentication-key "$ABC123"
    }
    privacy-des {
        privacy-key "$ABC123"
    }
}
}
```

## Tracing Activity

- [Tracing SNMP Activity on a Device Running Junos OS on page 1968](#)
- [Example: Tracing SNMP Activity on page 1971](#)

### Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (`/var/log`) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the `[edit snmp]` hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 1969](#)
- [Configuring Access to the Log File on page 1969](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 1970](#)
- [Configuring the Trace Operations on page 1970](#)

### **Configuring the Number and Size of SNMP Log Files**

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

### **Configuring Access to the Log File**

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

### Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

Table 271 on page 1970 describes the meaning of the SNMP tracing flags.

**Table 271: SNMP Tracing Flags**

Flag	Description	Default Setting
<b>all</b>	Log all operations.	Off
<b>configuration</b>	Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level.	Off
<b>database</b>	Log events involving storage and retrieval in the events database.	Off
<b>events</b>	Log important events.	Off
<b>general</b>	Log general events.	Off
<b>interface-stats</b>	Log physical and logical interface statistics.	Off
<b>nonvolatile-set</b>	Log nonvolatile SNMP set request handling.	Off

Table 271: SNMP Tracing Flags (*continued*)

Flag	Description	Default Setting
<b>pdu</b>	Log SNMP request and response packets.	Off
<b>policy</b>	Log policy processing.	Off
<b>protocol-timeouts</b>	Log SNMP response timeouts.	Off
<b>routing-socket</b>	Log routing socket calls.	Off
<b>server</b>	Log communication with processes that are generating events.	Off
<b>subagent</b>	Log subagent restarts.	Off
<b>timer</b>	Log internal timer events.	Off
<b>varbind-error</b>	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log *agentd* | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where ***agent*** is the name of an SNMP agent.

## Ping Tests

- [Starting a Ping Test on page 1972](#)
- [Monitoring a Running Ping Test on page 1973](#)
- [Gathering Ping Test Results on page 1976](#)
- [Stopping a Ping Test on page 1977](#)
- [Interpreting Ping Variables on page 1977](#)

---

### Starting a Ping Test

Before you start a ping test, configure a Ping MIB view. This allows SNMP **Set** requests on **pingMIB**. To start a ping test, create a row in **pingCtlTable** and set **pingCtlAdminStatus** to **enabled**. The minimum information that must be specified before setting **pingCtlAdminStatus** to **enabled** is:

- **pingCtlOwnerIndexSnmpAdminString**
- **pingCtlTestNameSnmpAdminString**
- **pingCtlTargetAddressInetAddress**
- **pingCtlTargetAddressTypeInetAddressType**
- **pingCtlRowStatusRowStatus**

For all other values, defaults are chosen unless otherwise specified. **pingCtlOwnerIndex** and **pingCtlTestName** are used as the index, so their values are specified as part of the object identifier (OID). To create a row, set **pingCtlRowStatus** to **createAndWait** or **createAndGo** on a row that does not already exist. A value of **active** for **pingCtlRowStatus** indicates that all necessary information has been supplied and the test can begin; **pingCtlAdminStatus** can be set to **enabled**. An SNMP **Set** request that sets **pingCtlRowStatus** to **active** will fail if the necessary information in the row is not specified or is inconsistent. For information about how to configure a view, see [“Setting SNMP Views” on page 1802](#).

There are two ways to start a ping test:

- [Using Multiple Set Protocol Data Units \(PDUs\) on page 1972](#)
- [Using a Single Set PDU on page 1973](#)

#### ***Using Multiple Set Protocol Data Units (PDUs)***

You can use multiple **Set** request PDUs (multiple PDUs, with one or more varbinds each) and set the following variables in this order to start the test:

- **pingCtlRowStatus** to **createAndWait**
- All appropriate test variables
- **pingCtlRowStatus** to **active**

Junos OS now verifies that all necessary information to run a test has been specified.

- **pingCtlAdminStatus** to **enabled**

### *Using a Single Set PDU*

You can use a single **Set** request PDU (one PDU, with multiple varbinds) to set the following variables to start the test:

- **pingCtlRowStatus** to **createAndGo**
- All appropriate test variables
- **pingCtlAdminStatus** to **enabled**

---

### Monitoring a Running Ping Test

When **pingCtlAdminStatus** is successfully set to **enabled**, the following is done before the acknowledgment of the SNMP **Set** request is sent back to the client:

- **pingResultsEntry** is created if it does not already exist.
- **pingResultsOperStatus** transitions to **enabled**.

For more information, see the following sections:

- [pingResultsTable](#) on page 1973
- [pingProbeHistoryTable](#) on page 1975
- [Generating Traps](#) on page 1975

### *pingResultsTable*

While the test is running, **pingResultsEntry** keeps track of the status of the test. The value of **pingResultsOperStatus** is **enabled** while the test is running and **disabled** when it has stopped.

The value of **pingCtlAdminStatus** remains **enabled** until you set it to **disabled**. Thus, to get the status of the test, you must examine **pingResultsOperStatus**.

The **pingCtlFrequency** variable can be used to schedule many tests for one **pingCtlEntry**. After a test ends normally (you did not stop the test) and the **pingCtlFrequency** number of seconds has elapsed, the test is started again just as if you had set **pingCtlAdminStatus** to **enabled**. If you intervene at any time between repeated tests (you set **pingCtlAdminStatus** to **disabled** or **pingCtlRowStatus** to **notInService**), the repeat feature is disabled until another test is started and ends normally. A value of 0 for **pingCtlFrequency** indicates this repeat feature is not active.

**pingResultsIpTgtAddr** and **pingResultsIpTgtAddrType** are set to the value of the resolved destination address when the value of **pingCtlTargetAddressType** is **dns**. When a test starts successfully and **pingResultsOperStatus** transitions to **enabled**:

- **pingResultsIpTgtAddr** is set to **null-string**.
- **pingResultsIpTgtAddrType** is set to **unknown**.

**pingResultsIpTgtAddr** and **pingResultsIpTgtAddrType** are not set until **pingCtlTargetAddress** can be resolved to a numeric address. To retrieve these values,

poll **pingResultsIpTgtAddrType** for any value other than **unknown** after successfully setting **pingCtlAdminStatus** to **enabled**.

At the start of a test, **pingResultsSentProbes** is initialized to 1 and the first probe is sent. **pingResultsSentProbes** increases by 1 each time a probe is sent.

As the test runs, every **pingCtlTimeOut** seconds, the following occur:

- **pingProbeHistoryStatus** for the corresponding **pingProbeHistoryEntry** in **pingProbeHistoryTable** is set to **requestTimedOut**.
- A **pingProbeFailed** trap is generated, if necessary.
- An attempt is made to send the next probe.

**NOTE:** No more than one outstanding probe exists for each test.

For every probe, you can receive one of the following results:

- The target host acknowledges the probe with a response.
- The probe times out; there is no response from the target host acknowledging the probe.
- The probe could not be sent.

Each probe result is recorded in **pingProbeHistoryTable**. For more information about **pingProbeHistoryTable**, see "[pingProbeHistoryTable](#)" on page 1975.

When a response is received from the target host acknowledging the current probe:

- **pingResultsProbeResponses** increases by 1.
- The following variables are updated:
  - **pingResultsMinRtt**—Minimum round-trip time
  - **pingResultsMaxRtt**—Maximum round-trip time
  - **pingResultsAverageRtt**—Average round-trip time
  - **pingResultsRttSumOfSquares**—Sum of squares of round-trip times
  - **pingResultsLastGoodProbe**—Timestamp of the last response

**NOTE:** Only probes that result in a response from the target host contribute to the calculation of the round-trip time (RTT) variables.

When a response to the last probe is received or the last probe has timed out, the test is complete.

### *pingProbeHistoryTable*

An entry in **pingProbeHistoryTable** (**pingProbeHistoryEntry**) represents a probe result and is indexed by three variables:

- The first two variables, **pingCtlOwnerIndex** and **pingCtlTestName**, are the same ones used for **pingCtlTable**, which identifies the test.
- The third variable, **pingProbeHistoryIndex**, is a counter to uniquely identify each probe result.

The maximum number of **pingProbeHistoryTable** entries created for a given test is limited by **pingCtlMaxRows**. If **pingCtlMaxRows** is set to 0, no **pingProbeHistoryTable** entries are created for that test.

Each time a probe result is determined, a **pingProbeHistoryEntry** is created and added to **pingProbeHistoryTable**. **pingProbeHistoryIndex** of the new **pingProbeHistoryEntry** is 1 greater than the last **pingProbeHistoryEntry** added to **pingProbeHistoryTable** for that test. **pingProbeHistoryIndex** is set to 1 if this is the first entry in the table. The same test can be run multiple times, so this index keeps growing.

If **pingProbeHistoryIndex** of the last **pingProbeHistoryEntry** added is 0xFFFFFFFF, the next **pingProbeHistoryEntry** added has **pingProbeHistoryIndex** set to 1.

The following are recorded for each probe result:

- **pingProbeHistoryResponse**—Time to live (TTL)
- **pingProbeHistoryStatus**—What happened and why
- **pingProbeHistoryLastRC**—Return code (RC) value of ICMP packet
- **pingProbeHistoryTime**—Timestamp when probe result was determined

When a probe cannot be sent, **pingProbeHistoryResponse** is set to 0. When a probe times out, **pingProbeHistoryResponse** is set to the difference between the time when the probe was discovered to be timed out and the time when the probe was sent.

### *Generating Traps*

For any trap to be generated, the appropriate bit of **pingCtlTrapGeneration** must be set. You must also configure a trap group to receive remote operations. A trap is generated under the following conditions:

- A **pingProbeFailed** trap is generated every time **pingCtlTrapProbeFailureFilter** number of consecutive probes fail during the test.
- A **pingTestFailed** trap is generated when the test completes and at least **pingCtlTrapTestFailureFilter** number of probes fail.
- A **pingTestCompleted** trap is generated when the test completes and fewer than **pingCtlTrapTestFailureFilter** probes fail.

**NOTE:** A probe is considered a failure when `pingProbeHistoryStatus` of the probe result is anything besides `responseReceived`.

For information about how to configure a trap group to receive remote operations, see [“Configuring SNMP Trap Groups” on page 1841](#) and [“Example: Setting Trap Notification for Remote Operations” on page 1803](#).

### Gathering Ping Test Results

You can either poll `pingResultsOperStatus` to find out when the test is complete or request that a trap be sent when the test is complete. For more information about `pingResultsOperStatus`, see [“pingResultsTable” on page 1973](#). For more information about Ping MIB traps, see [“Generating Traps” on page 1975](#).

The statistics calculated and then stored in `pingResultsTable` include:

- `pingResultsMinRtt`—Minimum round-trip time
- `pingResultsMaxRtt`—Maximum round-trip time
- `pingResultsAverageRtt`—Average round-trip time
- `pingResultsProbeResponses`—Number of responses received
- `pingResultsSentProbes`—Number of attempts to send probes
- `pingResultsRttSumOfSquares`—Sum of squares of round-trip times
- `pingResultsLastGoodProbe`—Timestamp of the last response

You can also consult `pingProbeHistoryTable` for more detailed information about each probe. The index used for `pingProbeHistoryTable` starts at 1, goes to 0xFFFFFFFF, and wraps to 1 again.

For example, if `pingCtlProbeCount` is 15 and `pingCtlMaxRows` is 5, then upon completion of the first run of this test, `pingProbeHistoryTable` contains probes like those in [Table 272 on page 1976](#).

**Table 272: Results in `pingProbeHistoryTable`: After the First Ping Test**

<code>pingProbeHistoryIndex</code>	Probe Result
11	Result of 11th probe from run 1
12	Result of 12th probe from run 1
13	Result of 13th probe from run 1
14	Result of 14th probe from run 1
15	Result of 15th probe from run 1

Upon completion of the first probe of the second run of this test, **pingProbeHistoryTable** will contain probes like those in [Table 273 on page 1977](#).

**Table 273: Results in pingProbeHistoryTable: After the First Probe of the Second Test**

pingProbeHistoryIndex	Probe Result
12	Result of 12th probe from run 1
13	Result of 13th probe from run 1
14	Result of 14th probe from run 1
15	Result of 15th probe from run 1
16	Result of 1st probe from run 2

Upon completion of the second run of this test, **pingProbeHistoryTable** will contain probes like those in [Table 274 on page 1977](#).

**Table 274: Results in pingProbeHistoryTable: After the Second Ping Test**

pingProbeHistoryIndex	Probe Result
26	Result of 11th probe from run 2
27	Result of 12th probe from run 2
28	Result of 13th probe from run 2
29	Result of 14th probe from run 2
30	Result of 15th probe from run 2

History entries can be deleted from the MIB in two ways:

- More history entries for a given test are added and the number of history entries exceeds **pingCtlMaxRows**. The oldest history entries are deleted to make room for the new ones.
- You delete the entire test by setting **pingCtlRowStatus** to **destroy**.

### Stopping a Ping Test

To stop an active test, set **pingCtlAdminStatus** to **disabled**. To stop the test and remove its **pingCtlEntry**, **pingResultsEntry**, and any **pingHistoryEntry** objects from the MIB, set **pingCtlRowStatus** to **destroy**.

### Interpreting Ping Variables

This section clarifies the ranges for the following variables that are not explicitly specified in the Ping MIB:

- **pingCtlDataSize**—The value of this variable represents the total size of the payload (in bytes) of an outgoing probe packet. This payload includes the timestamp (8 bytes) that is used to time the probe. This is consistent with the definition of **pingCtlDataSize** (maximum value of 65,507) and the standard ping application.

If the value of **pingCtlDataSize** is between 0 and 8 inclusive, it is ignored and the payload is 8 bytes (the timestamp). The Ping MIB assumes all probes are timed, so the payload must always include the timestamp.

For example, if you wish to add an additional 4 bytes of payload to the packet, you must set **pingCtlDataSize** to 12.

- **pingCtlDataFill**—The first 8 bytes of the data segment of the packet is for the timestamp. After that, the **pingCtlDataFill** pattern is used in repetition. The default pattern (when **pingCtlDataFill** is not specified) is (00, 01, 02, 03 ... FF, 00, 01, 02, 03 ... FF, ...).
- **pingCtlMaxRows**—The maximum value is 255.
- **pingMaxConcurrentRequests**—The maximum value is 500.
- **pingCtlTrapProbeFailureFilter** and **pingCtlTrapTestFailureFilter**—A value of 0 for **pingCtlTrapProbeFailureFilter** or **pingCtlTrapTestFailureFilter** is not well defined by the Ping MIB. If **pingCtlTrapProbeFailureFilter** is 0, **pingProbeFailed** traps will not be generated for the test under any circumstances. If **pingCtlTrapTestFailureFilter** is 0, **pingTestFailed** traps will not be generated for the test under any circumstances.

## Operational Commands

## show snmp health-monitor

<b>Syntax</b>	show snmp health-monitor <alarms <detail>>   <logs>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX Series devices.
<b>Description</b>	Display information about SNMP health monitor alarms and logs.
<b>Options</b>	<p><b>none</b>—Display information about all health monitor alarms and logs.</p> <p><b>alarms &lt;detail&gt;</b>—(Optional) Display detailed information about health monitor alarms.</p> <p><b>logs</b>—(Optional) Display information about health monitor logs.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show snmp health-monitor on page 1981</a> <a href="#">show snmp health-monitor alarms detail on page 1982</a> <a href="#">show snmp health-monitor alarms brief on page 1983</a>
<b>Output Fields</b>	Table 275 on page 1979 describes the output fields for the <b>show snmp health-monitor</b> command. Output fields are listed in the approximate order in which they appear.

**Table 275: show snmp health-monitor Output Fields**

Field Name	Field Description
Alarm Index	Alarm identifier.
Variable description	Description of the health monitor object instance being monitored.
Variable name	Name of the health monitor object instance being monitored.
Value	Current value of the monitored variable in the most recent sample interval.

Table 275: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description
<b>State</b>	<p>State of the alarm or event entry:</p> <ul style="list-style-type: none"> <li>Alarms: <ul style="list-style-type: none"> <li><b>moderate-threshold</b>—Percentage of moderate threshold level resource utilization.</li> <li><b>high-threshold</b>—Percentage of high-threshold level resource utilization.</li> <li><b>critical-threshold</b>—Percentage of critical threshold level resource utilization.</li> <li><b>active</b>—Entry is fully configured and activated.</li> <li><b>falling threshold crossed</b>—Value of the variable has crossed the lower threshold limit.</li> <li><b>rising threshold crossed</b>—Value of the variable has crossed the upper threshold limit.</li> <li><b>under creation</b>—Entry is being configured and is not yet activated.</li> <li><b>startup</b>—Alarm is waiting for the first sample of the monitored variable.</li> <li><b>object not available</b>—Monitored variable of that type is not available to the health monitor agent.</li> <li><b>instance not available</b>—Monitored variable's instance is not available to the health monitor agent.</li> <li><b>object type invalid</b>—Monitored variable is not a numeric value.</li> <li><b>object processing errored</b>—An error occurred when the monitored variable was processed.</li> <li><b>unknown</b>—State is not one of the above.</li> </ul> </li> </ul>
<b>Variable OID</b>	Object ID to which the variable name is resolved. The format is x.x.x.x.
<b>Sample type</b>	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of <b>absolute value</b> or <b>delta value</b> .
<b>Startup alarm</b>	<p>Alarm that might be sent when this entry is first activated, depending on the following criteria:</p> <ul style="list-style-type: none"> <li>Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> <li>Value of the alarm is above or equal to the rising threshold and the startup type is either <b>rising alarm</b> or <b>rising or falling alarm</b>.</li> <li>Value of the alarm is below or equal to the falling threshold and the startup type is either <b>falling alarm</b> or <b>rising or falling alarm</b>.</li> </ul> </li> <li>Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> <li>Value of the alarm is above or equal to the rising threshold and the startup type is <b>falling alarm</b>.</li> <li>Value of the alarm is below or equal to the falling threshold and the startup type is <b>rising alarm</b>.</li> <li>Value of the alarm is between the thresholds.</li> </ul> </li> </ul>
<b>Owner</b>	Name of the entry configured by the user. If the entry was created through the CLI, the owner has <b>monitor</b> prepended to it.
<b>Creator</b>	Mechanism by which the entry was configured ( <b>Health Monitor</b> ).

Table 275: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description
Sample interval	Time period between samples (in seconds).
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.
Rising event index	Event triggered when the rising threshold is crossed.
Falling event index	Event triggered when the falling threshold is crossed.

## Sample Output

### show snmp health-monitor

```
user@host> show snmp health-monitor
```

```
Alarm
Index  Variable description                                Value State

32770 Health Monitor: md3:/jail/mfs utilization
      jnxHrStoragePercentUsed.16                      0 active

32773 Health Monitor: md2:/mfs/var/run/utm utilization
      jnxHrStoragePercentUsed.15                      0 active

32776 Health Monitor: md1:/mfs utilization
      jnxHrStoragePercentUsed.11                      11 active

32779 Health Monitor: /var file system utilization
      jnxHrStoragePercentUsed.10                      44 critical threshold

32782 Health Monitor: root file system utilization
      jnxHrStoragePercentUsed.1                      52 critical threshold

32785 Health Monitor: /config file system utilization
      jnxHrStoragePercentUsed.2                      0 active

32788 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                        20 active

32791 Health Monitor: RE 0 memory utilization
      jnxOperatingBuffer.9.1.0.0                     52 active

32792 Health Monitor: Max Kernel Memory Used (%)
      jnxBoxKernelMemoryUsedPercent.0                3 active

32793 Health Monitor: jroute daemon memory usage
      Routing protocols process                      51452 active
      Management process                            38284 active
      Periodic packet management process             9828 active
      Bidirectional Forwarding Detection process     13088 active
      Service Deployment Client                     10012 active
      Event processing process                      12692 active
      Layer 2 address flooding and learning process  20212 active
```

MPLS Periodic Traceroute process	10488 active
Multicast Snooping process	9608 active
Feature license management process	12372 active

## show snmp health-monitor alarms detail

user@host> show snmp health-monitor alarms detail

Alarm Index 32770:

Variable name	jnxHrStoragePercentUsed.16
Variable OID	1.3.6.1.4.1.2636.3.31.1.1.1.1.16
Sample type	absolute value
Startup alarm	rising alarm
Owner	Health Monitor: md3:/jail/mfs utilization

Creator	Health Monitor
State	active
Sample interval	15 seconds
Moderate threshold	20
High threshold	30
Critical threshold	40
Rising event index	32768
Falling event index	32768
Instance Value:	0
Instance State:	active

Alarm Index 32773:

Variable name	jnxHrStoragePercentUsed.15
Variable OID	1.3.6.1.4.1.2636.3.31.1.1.1.1.15
Sample type	absolute value
Startup alarm	rising alarm
Owner	Health Monitor: md2:/mfs/var/run/utm utilization
Creator	Health Monitor
State	active
Sample interval	15 seconds
Moderate threshold	20
High threshold	30
Critical threshold	40
Rising event index	32768
Falling event index	32768
Instance Value:	0
Instance State:	active

Alarm Index 32793:

Variable name	sysAppElmtRunMemory.5
Variable OID	1.3.6.1.2.1.54.1.2.3.1.10.5
Sample type	absolute value
Startup alarm	rising alarm
Owner	Health Monitor: jroute daemon memory usage
Creator	Health Monitor
State	active
Sample interval	20 seconds
Rising threshold	104857
Falling threshold	91750
Rising event index	32768
Falling event index	32768
Instance Name:	sysAppElmtRunMemory.5.5.1258
Instance Description:	Routing protocols process

```

Instance Value: 51452
Instance State: active

Instance Name: sysAppElmtRunMemory.5.6.1255
Instance Description: Management process
Instance Value: 38284
Instance State: active

Instance Name: sysAppElmtRunMemory.5.6.3816
Instance Description: Management process
Instance Value: 38352
Instance State: active

Instance Name: sysAppElmtRunMemory.5.8.3815
Instance Description: Command-line interface
Instance Value: 49108
Instance State: active

```

## show snmp health-monitor routing-engine history

<b>Syntax</b>	<code>show snmp health-monitor routing-engine history resource &lt;cpu   memory   open-files-count   process-count   storage   temperature&gt;;</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for branch SRX Series devices. Statement modified in Junos OS Release 12.1X45-D10.
<b>Description</b>	Display the health-monitoring information collected for a Routing Engine.
<b>Options</b>	<b>brief</b> —Displays brief health monitor history. <b>extensive</b> —Displays extensive health monitor history. <b>terse</b> —Displays terse health monitor history.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show snmp health-monitor on page 1979</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show snmp health-monitor routing-engine history on page 1986</a> <a href="#">show snmp health-monitor routing-engine history extensive on page 1987</a> <a href="#">show snmp health-monitor routing-engine history terse on page 1988</a>
<b>Output Fields</b>	<a href="#">Table 276 on page 1985</a> describes the output fields for the <b>show snmp health-monitor routing engine history</b> command. Output fields are listed in the approximate order in which they appear.

**Table 276: show snmp health-monitor routing engine history Output Fields**

Field Name	Field Description
<b>Resource</b>	Name of the health monitor object instance being monitored.
<b>Event</b>	Displays the latest event and time associated with the resource. The available events are: <ul style="list-style-type: none"> <li>• Moderate Rising</li> <li>• High Rising</li> <li>• Critical Rising</li> <li>• Moderate Falling</li> <li>• High Falling</li> <li>• Critical Falling</li> </ul>

Table 276: show snmp health-monitor routing engine history Output Fields (*continued*)

Field Name	Field Description
<b>Configuration</b>	Effective configuration of a resource. <ul style="list-style-type: none"> <li><b>interval</b> — Configured interval in seconds.</li> <li><b>moderate-threshold</b>—Percentage of moderate threshold level resource utilization.</li> <li><b>high-threshold</b> — Percentage of high-threshold level resource utilization.</li> <li><b>critical-threshold</b> — Percentage of critical threshold level resource utilization.</li> <li><b>action</b> — Configured action for a resource.</li> </ul>
<b>Usage Trail</b>	Displays the previous usage records.
<b>Top daemon</b>	List of processes with high resource utilization.
<b>Growing daemons</b>	List of processes with high incremental resource utilization from the previous sample.
<b>Top files</b>	List of large files in a partition.
<b>Growing files</b>	List of files in a partition that have gotten larger since the previous sample.
<b>Resource name</b>	Name of the resource.
<b>Latest event</b>	Displays the latest event associated with the resource. The available events are: <ul style="list-style-type: none"> <li>Moderate Rising</li> <li>High Rising</li> <li>Critical Rising</li> <li>Moderate Falling</li> <li>High Falling</li> <li>Critical Falling</li> </ul>
<b>Time elapsed</b>	Displays the time elapsed since the event occurred.
<b>Action</b>	Displays the action associated with the resource. The available actions are: <ul style="list-style-type: none"> <li>Monitor</li> <li>Prevent</li> <li>Recover</li> </ul>

## show snmp health-monitor routing-engine status

<b>Syntax</b>	show snmp health-monitor routing-engine status;
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X45-D10 for branch SRX Series devices.
<b>Description</b>	Display the SNMP health-monitoring information for a Routing Engine.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show snmp health-monitor routing-engine history on page 1985</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show snmp health-monitor routing-engine status on page 1989</a>
<b>Output Fields</b>	Table 277 on page 1989 describes the output fields for the <b>show snmp health-monitor routing-engine status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 277: show snmp health-monitor routing engine status Output Fields**

Field Name	Field Description
Alarm Index	Alarm identifier.
Resource name	Name of the resource.
Current State	Current state of the monitored variable.
Config Action	Displays the configured action.
Threshold	Displays the threshold value for medium, high, and critical as a percentage.
Interval	Displays the time taken in seconds.

## Sample Output

### show snmp health-monitor routing-engine status

```
user@host> show snmp health-monitor routing-engine status
```

```
Health monitor status
```

Alarm Index	Resource Name	Current State	Config Action	Threshold (M/H/C)%	Interval (sec)
32770	MD3:/jail/mfs	Active(47)	Monitor	70/80/90	1
32773	MD2:/mfs/var/run/utm	Moderate(69)	Monitor	70/80/90	1
32776	MD1:/mfs	Active(13)	Monitor	70/80/90	1
32782	Root:/cf	Moderate(54)	Monitor	30/70/85	1
32785	Config:/config	Active(0)	Monitor	30/70/85	1
32779	Var:/cf/var	Critical(85)	Monitor	30/70/85	1
32788	CPU	Critical(100)	Monitor	30/70/85	1

32791	Memory	Critical(88)	Monitor	70/80/90	1
32800	RE process count	High(81)	Monitor	30/70/85	1

32797	RE Temperature	Moderate(44)	Monitor	30/70/85	1

## show snmp mib (View)

<b>Syntax</b>	<code>show snmp mib (get   get-next   walk) (ascii   decimal) <i>object-id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.4. Support for IPv4 and IPv6 systemwide policy statistics added in Junos OS Release 12.1X46-D10.
<b>Description</b>	Display local SNMP MIB object values.
<b>Options</b>	<p><b>get</b>—Retrieve and display one or more SNMP object values.</p> <p><b>get-next</b>—Retrieve and display the next SNMP object values.</p> <p><b>walk</b>—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p><b>ascii</b>—Display the SNMP object's string indices as an ASCII-key representation.</p> <p><b>decimal</b>—Display the SNMP object values in the decimal (default) format. The <b>decimal</b> option is the default option for this command. Therefore, issuing the <b>show snmp mib (get   get-next   walk) decimal object-id</b> and the <b>show snmp mib (get   get-next   walk) object-id</b> commands display the same output.</p> <p><b>object-id</b>—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as <b>interfaces</b>). When entering multiple objects, enclose the objects in quotation marks.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show snmp mib walk (standalone) on page 1992</a></p> <p><a href="#">show snmp mib walk (HA) on page 1992</a></p> <p><a href="#">show snmp mib walk jnxJsPolicySystemStats on page 1993</a></p> <p><a href="#">show snmp mib walk jnxJsPolicySystemStatsIPv4 on page 1993</a></p> <p><a href="#">show snmp mib walk jnxJsPolicySystemStatsTotalAllowIPv4Packets on page 1993</a></p>
<b>Output Fields</b>	Table 278 on page 1991 describes the output fields for the <b>show snmp mib</b> command. Output fields are listed in the approximate order in which they appear.

**Table 278: show snmp mib Output Fields**

Field Name	Field Description
<i>name</i>	Object name and numeric instance value.
<i>object value</i>	Object value. The Junos OS translates OIDs into the corresponding object names.

## Sample Output

## IDP Logging

- [Understanding IDP Logging on page 1995](#)
- [Understanding IDP Log Suppression Attributes on page 1996](#)
- [Understanding IDP Log Information Usage on the IC Series UAC Appliance on page 1997](#)

### Understanding IDP Logging

---

The basic Junos OS system logging continues to function after Intrusion Detection and Prevention (IDP) is enabled. An IDP-enabled device continues to record events that occur because of routine operations, such as a user login into the configuration database. It records failure and error conditions, such as failure to access a configuration file. You can configure files to log system messages and also assign attributes, such as severity levels, to messages. In addition to the regular system log messages, IDP generates event logs for attacks.

IDP generates event logs when an event matches an IDP policy rule in which logging is enabled. When you configure a rule for logging, the device creates a log entry for each event that matches that rule. You can use the CLI or J-Web to configure the policy rules to generate event logs.

Because IDP event logs are generated during an attack, log generation happens in bursts, generating a much larger volume of messages during an attack. In comparison to other event messages, the message size is also much larger for attack generated messages.

The log volume and message size are important concerns for log management. To better manage the volume of log messages, IDP supports log suppression.

By configuring log suppression you can suppress multiple instances of the same log occurring from the same or similar sessions over the same period of time. Enabling log suppression ensures that minimal numbers of logs are generated for the same event or attack that occurs multiple times.

---

### Understanding IDP Log Suppression Attributes

Log suppression ensures that minimal numbers of logs are generated for the same event or attack that occurs multiple times. Log suppression is enabled by default. You can configure certain log suppression attributes to suppress logs according to your needs. When configuring log suppression, keep in mind that log suppression can negatively impact sensor performance if you set the reporting interval too high.

You can configure the following log suppression attributes:

- Include destination addresses while performing log suppression—You can choose to combine log records for events with a matching source address. By default, the IDP sensor does not consider destination when matching events for log suppression.
- Number of log occurrences after which log suppression begins—You can specify the number of instances that a specific event must occur before log suppression begins. By default, log suppression begins after the first occurrence.
- Maximum number of logs that log suppression can operate on—When log suppression is enabled, Intrusion Detection and Prevention (IDP) must cache log records so that it can identify when multiple occurrences of the same event occur. You can specify how many log records are tracked simultaneously by IDP. By default, the maximum number of log records that IDP can operate on is 16,384.
- Time after which suppressed logs are reported—When log suppression is enabled, IDP maintains a count of occurrences of the same event. After the specified number of seconds have passed, IDP writes a single log entry containing the count of occurrences. By default, IDP reports suppressed logs after 5 seconds.

### [Understanding IDP Log Information Usage on the IC Series UAC Appliance](#)

---

The IC Series UAC Appliance for the Unified Access Control (UAC) appliance can use Intrusion Detection and Prevention (IDP) attack log information sent from the Juniper Networks device to apply access policies for traffic in which IDP logs indicate an attack has been detected. Using a secure channel of communication, these IDP logs are sent to the IC Series appliance directly and securely. IDP attack logs are sent to the IC Series appliance through the JUEP communication channel.

This topic contains the following sections:

- [Message Filtering to the IC Series UAC Appliance on page 1997](#)
- [Configuring IC Series UAC Appliance Logging on page 1997](#)

#### **Message Filtering to the IC Series UAC Appliance**

When you configure the IC Series UAC Appliance to receive IDP log messages, you set certain filtering parameters on the IC Series appliance. Without this filtering, the IC Series appliance could potentially receive too many log messages. The filtering parameters could include the following:

- The IC Series appliance should only receive communications from IDP for sessions it has authenticated. See the *Unified Access Control Administration Guide* for details.
- You can create IC Series appliance filters for receiving IDP logs files based on the their severity. For example, if on the IC Series appliance the severity is set to high, then IDP only sends logs which have a severity greater than or equal to high. See the *Unified Access Control Administration Guide* for details.
- From the IC Series appliance, you can disable the receiving of all IDP logs. See the *Unified Access Control Administration Guide* for details.

#### **Configuring IC Series UAC Appliance Logging**

All the configuration for receiving and filtering IDP logs is done on the IC Series UAC Appliance. You should refer to the *Unified Access Control Administration Guide* for configuration information for receiving IDP logs and details on the JUEP communication channel.

#### **Packet Capture**

- [Understanding Security Packet Capture on page 1998](#)

## Understanding Security Packet Capture

---

Viewing packets that precede and follow an attack helps you determine the purpose and extent of an attempted attack, whether an attack was successful, and if any network damage was caused by an attack. Packet analysis also aids in defining attack signatures to minimize false positives.

If packet capture is enabled when an attack is logged, a specified number of packets before and after the attack can be captured for the session. When all packets have been collected, they are transmitted in Device Management Interface (DMI) to a host device for offline analysis.

A notification option in the IDP policy rule enables packet capture when a rule match occurs. The option further defines the number of packets to be captured and the duration of packet capture for the associated session.

An IDP sensor configuration defines the device specifications for the packet capture. Options for this command determine the memory to be allocated for packet capture, and the source and host devices between which the packet capture object will be transmitted.

A **show** command displays packet capture counters that provide details about the progress, success, and failure of packet capture activity on the device.

Support for packet capture is available only once on each session.

## Tuning

- [Performance and Capacity Tuning for IDP Overview on page 1998](#)

## Performance and Capacity Tuning for IDP Overview

---

This topic provides an overview on performance and capacity tuning for an Intrusion Detection and Prevention (IDP) session.

If you are deploying IDP policies, you can configure the device to increase IDP session capacity. By using the provided commands to change the way the system allocates resources, you can achieve higher IDP session capacity.

By using the **maximize-idp-sessions** command, you can increase the IDP session capacity. In this mode, by default, the device assigns a greater weight value to firewall functions. Based on your IDP policy, you can shift the weight to IDP functions to maximize IDP performance. By shifting weight, you are increasing capacity and allocating more processing power for the given service.

**NOTE:** You should not configure the device to increase IDP session capacity if you are not using an IDP policy.

The device ships with an implicit default session capacity setting. This default value adds weight to firewall sessions. You can manually override the default by adding the **maximize-idp-sessions** setting to your configuration. When you do this, in addition to IDP session scaling, you can choose to assign weight values of equal, firewall, or IDP to firewall and IDP functions. Typically, when you only include IDP-recommended attacks or client-to-server attacks in your IDP policy, IDP functions consume less CPU resources, for this reason, you would select weight firewall to maximize device performance. Alternatively, if you add server-to-client attacks to your IDP policy, IDP functions consume higher CPU resources. For this reason, you would select weight IDP to maximize performance. Essentially, you will need to configure the weight based on the desired IDP policy and performance. You do this by examining the CPU resource utilization on the packet forwarding engine by using the **show security monitoring fpc number** command.

## Configuration

- [IDP Logging on page 1999](#)
- [Configuration Statements on page 2000](#)

### IDP Logging

- [Example: Configuring IDP Log Suppression Attributes on page 1999](#)

#### Example: Configuring IDP Log Suppression Attributes

This example shows how to configure log suppression attributes.

##### Requirements

Before you begin:

- Configure network interfaces.
- Download the signature database. See *Updating the IDP Signature Database Manually Overview*.

##### Overview

Log suppression ensures that minimal numbers of logs are generated for the same event or attack that occurs multiple times. Log suppression is enabled by default. You can configure certain log suppression attributes to suppress logs according to your needs.

In this example, you configure log suppression to begin after the second occurrence of an event and specify that logs are reported after 20 seconds.

### Configuration

#### Step-by-Step Procedure

To configure log suppression attributes:

1. Specify the log number after which you want to start log suppression.  

```
[edit]  
user@host# set security idp sensor-configuration log suppression start-log 2
```
2. Specify the maximum time after which suppressed logs are reported.  

```
[edit]  
user@host# set security idp sensor-configuration log suppression max-time-report 20
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]  
user@host# commit
```

### Verification

To verify log statistics, enter the **show security idp counters log** command.

### Security Configuration Statement Hierarchy

Use the statements in the **security** configuration hierarchy to configure actions, certificates, dynamic virtual private networks (VPNs), firewall authentication, flow, forwarding options, group VPNs, Intrusion Detection Prevention (IDP), Internet Key Exchange (IKE), Internet Protocol Security (IPsec), logging, Network Address Translation (NAT), public key infrastructure (PKI), policies, resource manager, rules, screens, secure shell known hosts,

trace options, user identification, Unified Threat Management (UTM), and zones. Statements that are exclusive to the J Series and SRX Series devices running Junos OS are described in this section.

Each of the following topics lists the statements at a sub-hierarchy of the **[edit security]** hierarchy.

## ack-number

---

<b>Syntax</b>	<pre>ack-number {     match (equal   greater-than   less-than   not-equal);     value <i>acknowledgement-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the ACK number of the packet. This number identifies the next sequence number; the ACK flag must be set to activate this field.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value <i>acknowledgement-number</i></b>—Match the ACK number of the packet.</li></ul> <p><b>Range:</b> 0 through 4,294,967,295</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## action (Security Application-Level DDoS)

---

<b>Syntax</b>	<pre>action {     (close-server   drop-connection   drop-packet   no-action); }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0.
<b>Description</b>	Specify the actions you want IDP to take when the monitored traffic matches the application-ddos objects specified in the application-level DDoS rule.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>close-server</b>—Closes the connection and sends an RST packet to the server but not to the client.</li><li>• <b>drop-connection</b>—Drops all packets associated with the connection, preventing traffic for the connection from reaching its destination. Use this action to drop connections for traffic that is not prone to spoofing.</li><li>• <b>drop-packet</b>—Drops a matching packet before it can reach its destination but does not close the connection. Use this action to drop packets for attacks in traffic that is prone to spoofing, such as UDP traffic. Dropping a connection for such traffic could result in a denial of service that prevents you from receiving traffic from a legitimate source-IP address.</li><li>• <b>no-action</b>—No action is taken. Use this action when you want to only generate logs for some traffic.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## action (Security Rulebase IPS)

<b>Syntax</b>	<pre> action {   class-of-service {     dscp-code-point <i>number</i>;     forwarding-class <i>forwarding-class</i>;   }   (close-client   close-client-and-server   close-server   drop-connection   drop-packet      ignore-connection   mark-diffserv <i>value</i>   no-action   recommended); }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the actions you want IDP to take when the monitored traffic matches the attack objects specified in the rules.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>class-of-service</b>—Associates a class-of-service forwarding class as an action to the IDP policy; also sets the value of the DSCP code point. You can use the default forwarding class names or define new ones. Forwarding-class and dscp-code-point are optional, but one must be set.</li> <li>• <b>close-client</b>—Closes the connection and sends an RST packet to the client but not to the server.</li> <li>• <b>close-client-and-server</b>—Closes the connection and sends an RST packet to both the client and the server.</li> <li>• <b>close-server</b>—Closes the connection and sends an RST packet to the server but not to the client.</li> <li>• <b>drop-connection</b>—Drops all packets associated with the connection, preventing traffic for the connection from reaching its destination. Use this action to drop connections for traffic that is not prone to spoofing.</li> <li>• <b>drop-packet</b>—Drops a matching packet before it can reach its destination but does not close the connection. Use this action to drop packets for attacks in traffic that is prone to spoofing, such as UDP traffic. Dropping a connection for such traffic could result in a denial of service that prevents you from receiving traffic from a legitimate source-IP address.</li> <li>• <b>ignore-connection</b>—Stops scanning traffic for the rest of the connection if an attack match is found. IDP disables the rulebase for the specific connection.</li> <li>• <b>mark-diffserv <i>value</i></b>—Assigns the indicated service-differentiation value to the packet in an attack, then passes them on normally.</li> <li>• <b>no-action</b>—No action is taken. Use this action when you want to only generate logs for some traffic.</li> <li>• <b>recommended</b>—All predefined attack objects have a default action associated with them. This is the action that Juniper Networks recommends when that attack is detected.</li> </ul>

<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Class of Service Action Feature Guide for Security Devices</i></li></ul>

---

## active-policy

---

<b>Syntax</b>	active-policy <i>policy-name</i> ;
<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify which policy among the configured policies to activate.
<b>Options</b>	<i>policy-name</i> —Name of the active policy.

**NOTE:** You need to make sure the active policy is enforced in the data plane.

---

<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li></ul>

## action-profile

**Syntax** `action-profile profile-name {`  
     `event (jexec | lbt | lt-enter | lt-leave | mac-egress | mac-ingress | np-egress | np-ingress |`  
     `pot) {`  
         `count;`  
         `packet-dump;`  
         `packet-summary;`  
         `trace;`  
     `}`  
     `module {`  
         `flow {`  
             `flag {`  
                 `all;`  
             `}`  
         `}`  
     `}`  
     `preserve-trace-order;`  
     `record-pic-history;`  
`}`

**Hierarchy Level** [edit security datapath-debug]

**Release Information** Command introduced in Junos OS Release 10.0.

**Description** Configure the action profile options for data path debugging.

- Options**
- ***action-profile name*** — Name of the action profile.
  - **event**—Enable the events to trace the packet when the packet hit the events (jexec, lbt, lt-enter, lt-leave, mac-egress, mac-ingress, np-egress, np-ingress, pot)
    - **count**—Number of times a packet hits the specified event.
    - **packet-dump**—Capture the packet that hits the specified event.
    - **packet-summary**—Print the source/destination IP address details with protocol number and IP length details along with trace message for the specified event.
    - **trace**—Print the standard trace message when the packet hits the specified event.
  - **module**—Turn on the flow session related trace messages.
    - **flow**—Trace flow session related messages.
    - **flag**—Specify which flow message needs to be traced.
    - **all**—Trace all possible flow trace messages.
    - **trace**—Print the standard trace message when the packet hits the specified event.
  - **preserve-trace-order**—Preserve trace order.
  - **record-pic-history**—Record the PICs in which the packet has been processed.

<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Network Monitoring and Troubleshooting Guide for Security Devices</i></li><li>• <a href="#">Example: Configuring Packet Capture for Datapath Debugging on page 1289</a></li></ul>

---

## alert

<b>Syntax</b>	alert;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then notification] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then notification]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Set an alert flag in the Alert column of the Log Viewer for the matching log record.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

---

## allow-icmp-without-flow

<b>Syntax</b>	(allow-icmp-without-flow   no-allow-icmp-without-flow);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration flow]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Allow an ICMP packet without matched request. By default the ICMP flow is enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## anomaly

---

<b>Syntax</b>	<pre> anomaly {   direction (any   client-to-server   server-to-client);   service <i>service-name</i>;   shellcode (all   intel   no-shellcode   sparc);   test <i>test-condition</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Protocol anomaly attack objects detect abnormal or ambiguous messages within a connection according to the set of rules for the particular protocol being used.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## application (Security Custom Attack)

---

<b>Syntax</b>	application <i>application-name</i> ;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to match the attack for a specified application.
<b>Options</b>	<i>application-name</i> —Name of the application.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## application (Security Application-Level DDoS)

---

<b>Syntax</b>	application ( <i>application-name</i>   any   default);
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>idp-policy-name</i> rulebase-ddos rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0.
<b>Description</b>	Configure the application or application set name to match.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>application-name</b>—Name of the application or application set to match.</li><li>• <b>any</b>—Match all ports to the only application implied in the attack objects.</li><li>• <b>default</b>—Match default and automatically detected ports to the applications implied in the attack object.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## application (Security IDP)

---

<b>Syntax</b>	application <i>application-name</i> ;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify an application or an application set name to match.
<b>Options</b>	<i>application-name</i> —Name of the application.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## application-ddos

<b>Syntax</b>	<pre> application-ddos <i>application-name</i> {   connection-rate-threshold <i>number</i>;   context <i>context-name</i> {     exclude-context-values [<i>value</i>];     hit-rate-threshold <i>number</i>;     max-context-values <i>number</i>;     time-binding-count <i>number</i>;     time-binding-period <i>seconds</i>;     value-hit-rate-threshold <i>number</i>;   }   service <i>service-name</i>; } </pre>
<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0.
<b>Description</b>	Configure application-level distributed denial-of-service (DDoS) protection.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## application-identification

---

<b>Syntax</b>	<pre>application-identification {     max-packet-memory-ratio <i>percentage-value</i>;     max-reass-packet-memory-ratio <i>percentage-value</i>;     max-tcp-session-packet-memory <i>value</i>;     max-udp-session-packet-memory <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Packet memory percentages added in Junos OS Release 12.1X44-D20.
<b>Description</b>	<p>Enable to identify the TCP/UDP application session running on nonstandard ports to match the application properties of transiting network traffic.</p> <p>Options define the allocation of IDP memory to application identification for packet and reassembler use.</p>
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## attack-type (Security Anomaly)

---

<b>Syntax</b>	<pre>attack-type {   anomaly {     direction (any   client-to-server   server-to-client);     service <i>service-name</i>;     shellcode (all   intel   no-shellcode   sparc);     test <i>test-condition</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the type of attack.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## attack-type (Security Chain)

```
Syntax  attack-type {
        chain {
            expression boolean-expression;
            member member-name {
                attack-type {
                    (anomaly ...same statements as in [edit security idp custom-attack attack-name
                     attack-type anomaly] hierarchy level | signature ...same statements as in [edit
                     security idp custom-attack attack-name attack-type signature] hierarchy level);
                }
            }
        }
        order;
        protocol-binding {
            application application-name;
            icmp;
            icmpv6;
            ip {
                protocol-number transport-layer-protocol-number;
            }
            ipv6 {
                protocol-number transport-layer-protocol-number;
            }
            nested-application nested-application-name;
            rpc {
                program-number rpc-program-number;
            }
            tcp {
                minimum-port port-number <maximum-port port-number>;
            }
            udp {
                minimum-port port-number <maximum-port port-number>;
            }
        }
        reset;
        scope (session | transaction);
    }
```

**Hierarchy Level** [edit security idp custom-attack *attack-name*]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Specify the type of attack.

**NOTE:** In a chain attack, you can configure multiple member attacks.

In an attack, under protocol binding TCP/UDP, you can specify multiple ranges of ports.

**Options** The remaining statements are explained separately.

<b>Required Privilege</b>	security—To view this statement in the configuration.
<b>Level</b>	security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## attack-type (Security IDP)

```

Syntax  attack-type {

## attacks (Security Exempt Rulebase)

---

<b>Syntax</b>	<pre>attacks {   custom-attack-groups [attack-group-name];   custom-attacks [attack-name];   dynamic-attack-groups [attack-group-name];   predefined-attack-groups [attack-group-name];   predefined-attacks [attack-name]; }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the attacks that you do not want the device to match in the monitored network traffic. Each attack is defined as an attack object, which represents a known pattern of attack.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## attacks (Security IPS Rulebase)

<b>Syntax</b>	<pre>attacks {   custom-attack-groups [attack-group-name];   custom-attacks [attack-name];   dynamic-attack-groups [attack-group-name];   predefined-attack-groups [attack-group-name];   predefined-attacks [attack-name]; }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the attacks you want the device to match in the monitored network traffic. Each attack is defined as an attack object, which represents a known pattern of attack.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## automatic (Security)

---

<b>Syntax</b>	<pre>automatic {   download-timeout <i>minutes</i>;   enable;   interval <i>hours</i>;   start-time <i>start-time</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp security-package]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable the device to automatically download the updated signature database from the specified URL.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li></ul>

## cache-size (Security)

---

<b>Syntax</b>	<pre>cache-size <i>size</i>;</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration log]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the size in bytes for each user's log cache.
<b>Options</b>	<b>size</b> —Cache size. <b>Range:</b> 1 through 65,535 bytes <b>Default:</b> 12800 bytes
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## category (Security Dynamic Attack Group)

---

<b>Syntax</b>	<pre>category {     values [category-value]; }</pre>
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a category filter to add attack objects based on the category.
<b>Options</b>	<b>values</b> —Name of the category filter. You can configure multiple filters separated by spaces and enclosed in square brackets.
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## chain

**Syntax**

```
chain {
  expression boolean-expression;
  member member-name {
    attack-type {
      (anomaly ...same statements as in [edit security idp custom-attack attack-name
        attack-type anomaly] hierarchy level | signature ...same statements as in [edit security
        idp custom-attack attack-name attack-type signature] hierarchy level);
    }
  }
  order;
  protocol-binding {
    application application-name;
    icmp;
    icmpv6;
    ip {
      protocol-number transport-layer-protocol-number;
    }
    ipv6 {
      protocol-number transport-layer-protocol-number;
    }
    nested-application nested-application-name;
    rpc {
      program-number rpc-program-number;
    }
    tcp {
      minimum-port port-number <maximum-port port-number>;
    }
    udp {
      minimum-port port-number <maximum-port port-number>;
    }
  }
  reset;
  scope (session | transaction);
}
```

**Hierarchy Level** [edit security idp custom-attack *attack-name* attack-type]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Chain attack object combines multiple signatures and/or protocol anomalies into a single object. Traffic must match all of the combined signatures and/or protocol anomalies to match the chain attack object.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## code

---

<b>Syntax</b>	code { match (equal   greater-than   less-than   not-equal); value <i>code-value</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol icmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the secondary code that identifies the function of the request/reply within a given type.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value</b> <i>code-value</i>—Match a decimal value.</li> </ul> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## content-decompression-max-memory-kb

---

<b>Syntax</b>	content-decompression-max-memory-kb <i>value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	<p>Set the maximum memory allocation in kilobytes for content decompression.</p> <p>The default memory allocation provides 33 KB per session for an average number of sessions requiring decompression at the same time. To determine if this value is consistent with your environment, analyze values from decompression-related counters and the total number of IDP sessions traversing the device. Estimate the number of sessions requiring decompression at the same time. Assuming that each of these sessions requires 33 KB of memory for decompression, compare your estimated needs to the default value.</p>
	<div> <b>NOTE:</b> Because content decompression requires a significant allocation of memory, system performance will be impacted by increasing the maximum memory allocation for decompression.</div>
<b>Options</b>	<b>Range:</b> 50 through 2,000,000 KB
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## content-decompression-max-ratio

<b>Syntax</b>	<code>content-decompression-max-ratio <i>value</i>;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	<p>Set the maximum decompression ratio of the size of decompressed data to the size of compressed data.</p> <p>Some attacks are introduced through compressed content. When the content is decompressed, it can inflate to a very large size taking up valuable system resources resulting in denial of service. This type of attack can be recognized by the ratio of the size of decompressed data to the size of compressed data. Keep in mind, however, that a higher ratio lessens the chance of detecting this type of attack.</p>
<b>Options</b>	<b>Range:</b> 1 through 128
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## context (Security Custom Attack)

<b>Syntax</b>	<code>context <i>context-name</i>;</code>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Define the location of the signature where IDP should look for the attack in a specific Application Layer protocol.
<b>Options</b>	<b><i>context-name</i></b> —Name of the context under which the attack has to be matched.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## count (Security Custom Attack)

---

<b>Syntax</b>	<code>count <i>count-value</i>;</code>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> time-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the number of times that IDP detects the attack within the specified scope before triggering an event.
<b>Options</b>	<i>count-value</i> —Number of times IDP detects the attack.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## custom-attack

```

Syntax  custom-attack attack-name {

<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement modified in Junos OS Release 9.3.
<b>Description</b>	Configure custom attack objects to detect a known or unknown attack that can be used to compromise your network.
<b>Options</b>	<p><b><i>attack-name</i></b>—Name of the custom attack object.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## custom-attack-group

---

<b>Syntax</b>	<code>custom-attack-group <i>custom-attack-group-name</i> {     group-members [<i>attack-or-attack-group-name</i>]; }</code>
<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Configure custom attack group. A custom attack group is a list of attacks that would be matched on the traffic if the group is selected in a policy.
<b>Options</b>	<i>custom-attack-group-name</i> —Name of the custom attack group.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## custom-attack-groups (Security IDP)

---

<b>Syntax</b>	<code>custom-attack-groups <i>attack-group-name</i>;</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match attacks] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match attacks]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify a name for the custom attack group.
<b>Options</b>	<i>attack-group-name</i> —Name of the custom attack group.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## custom-attacks

<b>Syntax</b>	<code>custom-attacks [attack-name];</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match attacks], [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match attacks]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Select custom attacks defined under [edit security idp custom-attack] by specifying their names.
<b>Options</b>	<b>attack-name</b> —Name of the new custom attack object.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## data-length

<b>Syntax</b>	<pre>data-length {   match (equal   greater-than   less-than   not-equal);   value tcp-data-length; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol udp] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol icmp] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the number of bytes in the data payload. In the TCP header, for SYN, ACK, and FIN packets, this field should be empty.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value data-length</b>—Match the number of bytes in the data payload.</li> </ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## datapath-debug

```
Syntax  datapath-debug {

                        all;
                    }
                }
            }
        }
        preserve-trace-order;
        record-pic-history;
    }
    capture-file {
        filename;
        files number;
        format pacp-format;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    maximum-capture-size value;
    packet-filter packet-filter-name {
        action-profile (profile-name | default);
        destination-port (port-range | protocol-name);
        destination-prefix destination-prefix;
        interface logical-interface-name;
        protocol (protocol-number | protocol-name);
        source-port (port-range | protocol-name);
        source-prefix source-prefix;
    }
    traceoptions {
        file {
            filename;
            files number;
            match regular-expression;
            size maximum-file-size;
            (world-readable | no-world-readable);
        }
        no-remote-trace;
    }
}
```

Hierarchy Level [edit security]

Release Information Command introduced in Junos OS Release 10.0.

<b>Description</b>	Configure the data path debugging options.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Master Administrator for Logical Systems Feature Guide for Security Devices</i></li> </ul>

## description (Security IDP Policy)

<b>Syntax</b>	description text;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> ] [edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> ] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify descriptive text for an exempt rule, or IPS rule.
<b>Options</b>	<b>text</b> —Descriptive text about an exempt rule, or IPS rule.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## destination (Security IP Headers Attack)

---

<b>Syntax</b>	<pre>destination {     match (equal   greater-than   less-than   not-equal);     value <i>ip-address-or-hostname</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv6]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the IP address of the attack target.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>ip-address-or-hostname</i>—Match an IP address or a hostname.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## destination-address (Security IDP Policy)

<b>Syntax</b>	<code>destination-address ([<i>address-name</i>]   any   any-ipv4   any-ipv6);</code>
<b>Hierarchy Level</b>	<code>[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> match]</code> <code>[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match]</code> <code>[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify a destination IP address or IP address set object to be used as the match destination address object. The default value is any.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b><i>address-name</i></b>—IP address or IP address set object.</li> <li>• <b><i>any</i></b>—Specify any IPv4 or IPv6 address.</li> <li>• <b><i>any-ipv4</i></b>—Specify any IPv4 address.</li> <li>• <b><i>any-ipv6</i></b>—Specify any IPv6 address.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## destination-except

<b>Syntax</b>	<code>destination-except [address-name];</code>
<b>Hierarchy Level</b>	<code>[edit security idp idp-policy policy-name rulebase-ddos rule rule-name match]</code> <code>[edit security idp idp-policy policy-name rulebase-exempt rule rule-name match]</code> <code>[edit security idp idp-policy policy-name rulebase-ips rule rule-name match]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify a destination IP address or IP address set object to specify all destination address objects except the specified address objects. The default value is any.
<b>Options</b>	<b>address-name</b> —IP address or IP address set object.
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## destination-port (Security Signature Attack)

<b>Syntax</b>	<pre>destination-port {   match (equal   greater-than   less-than   not-equal);   value destination-port; }</pre>
<b>Hierarchy Level</b>	<code>[edit security idp custom-attack attack-name attack-type signature protocol udp]</code> <code>[edit security idp custom-attack attack-name attack-type signature protocol tcp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the port number of the attack target.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match (equal   greater-than   less-than   not-equal)</b>—Match an operand.</li> <li>• <b>value destination-port</b>—Match the port number of the attack target.</li> </ul>
	<b>Range:</b> 0 through 65,535
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## detect-shellcode

<b>Syntax</b>	(detect-shellcode   no-detect-shellcode);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable to detect the shell code and prevent buffer overflow attacks. By default this setting is enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## detector

<b>Syntax</b>	<pre> detector {   protocol-name <i>protocol-name</i> {     tunable-name <i>tunable-name</i> {       tunable-value <i>protocol-value</i>;     }   } } </pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure protocol detector engine for a specific service.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> <li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li> </ul>

## direction (Security Custom Attack)

---

<b>Syntax</b>	direction (any   client-to-server   server-to-client);
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type anomaly] [edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Define the connection direction of the attack.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>any</b>—Detect the attack in either direction.</li><li>• <b>client-to-server</b>—Detect the attack only in client-to-server traffic.</li><li>• <b>server-to-client</b>—Detect the attack only in server-to-client traffic.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## direction (Security Dynamic Attack Group)

<b>Syntax</b>	<pre>direction {   expression (and   or);   values [any client-to-server exclude-any exclude-client-to-server exclude-server-to-client   server-to-client]; }</pre>
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. The <b>expression</b> option added in Junos OS Release 11.4.
<b>Description</b>	Specify a direction filter to add predefined attacks to the dynamic group based on the direction specified in the attacks.
<b>Options</b>	<p><b>expression</b>—Boolean operators:</p> <ul style="list-style-type: none"> <li>• <b>and</b>— If both the member name patterns match, the expression matches.</li> <li>• <b>or</b>— If either of the member name patterns match, the expression matches.</li> </ul> <p><b>values</b>—Name of the direction filter. You can select from the following directions:</p> <ul style="list-style-type: none"> <li>• <b>any</b>—Monitors traffic from client to server and server to client.</li> <li>• <b>client-to-server</b>—Monitors traffic from client to server (most attacks occur over <b>client-to-server</b> connections) only.</li> <li>• <b>exclude-any</b>—Allows traffic from client to server and server to client.</li> <li>• <b>exclude-client-to-server</b>—Allows traffic from client to server only.</li> <li>• <b>exclude-server-to-client</b>—Allows traffic from server to client only.</li> <li>• <b>server-to-client</b>—Monitors traffic from server to client only.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## download-timeout

---

<b>Syntax</b>	download-timeout <i>minutes</i> ;
<b>Hierarchy Level</b>	[edit security idp security-package automatic]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6R3.
<b>Description</b>	Specify the time that the device automatically times out and stops downloading the updated signature database from the specified URL.

**NOTE:** The default value for download-timeout is one minute. If download is completed before the download times out, the signature is automatically updated after the download. If the download takes longer than the configured period, the automatic signature update is aborted.

**Options** *minutes*—Time in minutes.  
**Range:** 1 through 60 minutes  
**Default:** 1 minute

**NOTE:** For SRX Series devices the applicable range is 1 through 4,000,000 per second.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- *IDP Application Identification Feature Guide for Security Devices*

## dynamic-attack-group

<b>Syntax</b>	<pre>dynamic-attack-group <i>dynamic-attack-group-name</i> {   filters {     category {       values [<i>category-value</i>];     }     direction {       expression (and   or);       values [any client-to-server exclude-any exclude-client-to-server         exclude-server-to-client server-to-client];     }     false-positives {       values [frequently occasionally rarely unknown];     }     performance {       values [fast normal slow unknown];     }     products {       values [<i>product-value</i>];     }     recommended;     service {       values [<i>service-value</i>];     }     severity {       values [critical info major minor warning];     }     type {       values [anomaly signature];     }   } }</pre>
<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. The <b>expression</b> option added in Junos OS Release 11.4.
<b>Description</b>	Configure a dynamic attack group. A dynamic attack group selects its members based on the filters specified in the group. Therefore, the list of attacks is updated (added or removed) when a new signature database is used.
<b>Options</b>	<p><b><i>dynamic-attack-group-name</i></b>—Name of the dynamic attack group.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## dynamic-attack-groups (Security IDP)

---

<b>Syntax</b>	<code>dynamic-attack-groups <i>attack-group-name</i>;</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match attacks] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match attacks]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify a name for the dynamic attack group.
<b>Options</b>	<i>attack-group-name</i> —Name of the dynamic attack group.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## enable-all-qmodules

---

<b>Syntax</b>	<code>(enable-all-qmodules   no-enable-all-qmodules);</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration global]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable all the qmodules of the global rulebase IDP security policy. By default all the qmodules are enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## enable-packet-pool

<b>Syntax</b>	(enable-packet-pool   no-enable-packet-pool);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration global]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable the packet pool to use when the current pool is exhausted. By default packet pool is enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## expression

<b>Syntax</b>	expression <i>boolean-expression</i> ;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	<p>Configure the Boolean expression. The Boolean expression defines the condition for the individual members of a chain attack that will decide if the chain attack is hit.</p> <p>For standalone IDP devices, expression overrides order function.</p> <p>For SRX Series devices, expression and order cannot be configured together. Only one of them can be specified.</p>
<b>Options</b>	<p><b><i>boolean-expression</i></b>—Boolean operators:</p> <ul style="list-style-type: none"> <li>• <b>or</b>—If either of the member name patterns match, the expression matches.</li> <li>• <b>and</b>—If both of the member name patterns match, the expression matches. It does not matter which order the members appear in.</li> <li>• <b>oand</b>—If both of the member name patterns match, and if they appear in the same order as in the Boolean Expression, the expression matches.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## false-positives

---

<b>Syntax</b>	false-positives { values [frequently occasionally rarely unknown]; }
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a false positives filter to track attack objects based on the frequency that the attack produces a false positive on your network.
<b>Options</b>	<p><b>values</b>—Name of the false positives filter. You can select from the following false positive frequency:</p> <ul style="list-style-type: none"><li>• <b>frequently</b>—Frequently track false positive occurrences.</li><li>• <b>occasionally</b>—Occasionally track false positive occurrences.</li><li>• <b>rarely</b>—Rarely track false positive occurrences.</li><li>• <b>unknown</b>—By default, all compound attack objects are set to Unknown. As you fine-tune IDP to your network traffic, you can change this setting to help you track false positives.</li></ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## filters

<b>Syntax</b>	<pre> filters {   category {     values [<i>category-value</i>];   }   direction {     expression (and   or);     values [any client-to-server exclude-any exclude-client-to-server exclude-server-to-client server-to-client];   }   false-positives {     values [frequently occasionally rarely unknown];   }   performance {     values [fast normal slow unknown];   }   products {     values [<i>product-value</i>];   }   recommended;   service {     values [<i>service-value</i>];   }   severity {     values [critical info major minor warning];   }   type {     values [anomaly signature];   } } </pre>
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. The <b>expression</b> option added in Junos OS Release 11.4.
<b>Description</b>	To create a dynamic attack group, set the criteria using different types of filters.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## flow (Security IDP)

---

<b>Syntax</b>	<pre>flow {     (allow-icmp-without-flow   no-allow-icmp-without-flow);     fifo-max-size <i>value</i>;     hash-table-size <i>value</i>;     (log-errors   no-log-errors);     max-timers-poll-ticks <i>value</i>;     reject-timeout <i>value</i>;     (reset-on-policy   no-reset-on-policy);     udp-anticipated-timeout <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure the IDP engine to manage the packet flow.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## from-zone (Security IDP Policy)

---

<b>Syntax</b>	<pre>from-zone (<i>zone-name</i>   any);</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> match] [edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify a source zone to be associated with the security policy. The default value is any.
<b>Options</b>	<b>zone-name</b> —Name of the source zone object.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## global (Security IDP)

---

<b>Syntax</b>	<pre>global {     (enable-all-qmodules   no-enable-all-qmodules);     (enable-packet-pool   no-enable-packet-pool);     gtp (decapsulation   no-decapsulation);     memory-limit-percent <i>value</i>;     (policy-lookup-cache   no-policy-lookup-cache); }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure the global rulebase IDP security policy.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## group-members

---

<b>Syntax</b>	<code>group-members [attack-or-attack-group-name];</code>
<b>Hierarchy Level</b>	<code>[edit security idp custom-attack-group custom-attack-group-name]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	<p>Specify the group members in a custom group. The members can be predefined attacks, predefined attack groups, custom attacks, or custom dynamic groups.</p> <p>Use custom groups for the following tasks:</p> <ul style="list-style-type: none"><li>• To define a specific set of attacks to which you know your network is vulnerable.</li><li>• To group your custom attack objects.</li><li>• To define a specific set of informational attack objects that you use to keep you aware of what is happening on your network.</li></ul>
<b>Options</b>	<b>attack-or-attack-group-name</b> —Name of the attack object or group attack object.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## header-length

<b>Syntax</b>	header-length { match (equal   greater-than   less-than   not-equal); value <i>header-length</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the number of bytes in the TCP header.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value</b> <i>header-length</i>—Match the number of bytes in the TCP header.</li> </ul> <p><b>Range:</b> 0 through 15 bytes</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## host (Security IDP Sensor Configuration)

<b>Syntax</b>	host <i>ip-address</i> <port number>;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Configure the IP address and port number of the server where the packet capture object will be sent.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>host</b> <i>ip-address</i>—The IP address of the server where the packet capture object will be sent.</li> <li>• <b>port</b> <i>number</i>—The port number of the server where the packet capture object will be sent.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>

## icmp (Security IDP Custom Attack)

---

<b>Syntax</b>	icmp;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to match the attack for the specified ICMP.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## icmp (Security IDP Signature Attack)

```
Syntax  icmp {
        code {
            match (equal | greater-than | less-than | not-equal);
            value code-value;
        }
        data-length {
            match (equal | greater-than | less-than | not-equal);
            value data-length;
        }
        identification {
            match (equal | greater-than | less-than | not-equal);
            value identification-value;
        }
        sequence-number {
            match (equal | greater-than | less-than | not-equal);
            value sequence-number;
        }
        type {
            match (equal | greater-than | less-than | not-equal);
            value type-value;
        }
    }
```

**Hierarchy Level** [edit security idp custom-attack *attack-name* attack-type signature protocol]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Allow IDP to match the ICMP header information for the signature attack.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- *IDP Policies Feature Guide for Security Devices*
- *IDP Application Identification Feature Guide for Security Devices*

## icmpv6 (Security IDP)

---

<b>Syntax</b>	icmpv6;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify that the attack is for ICMPv6 packets only.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## identification (Security ICMP Headers)

---

<b>Syntax</b>	identification { match (equal   greater-than   less-than   not-equal); value <i>identification-value</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol icmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a unique value used by the destination system to associate requests and replies.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>identification-value</i>—Match a decimal value.</li></ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## identification (Security IP Headers)

<b>Syntax</b>	identification { match (equal   greater-than   less-than   not-equal); value <i>identification-value</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a unique value used by the destination system to reassemble a fragmented packet.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value</b> <i>identification-value</i>—Match a decimal value.</li> </ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## idp (Application Services)

<b>Syntax</b>	idp;
<b>Hierarchy Level</b>	[edit security policies from-zone <i>zone-name</i> to-zone <i>zone-name</i> policy <i>policy-name</i> then permit application-services]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1.
<b>Description</b>	Configure Intrusion Detection and Prevention (IDP) for application services.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>

## idp (Security Alarms)

---

<b>Syntax</b>	idp;
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Configure alarms for IDP attack.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>

## idp-policy (Security)

```
Syntax  idp-policy policy-name {
    rulebase-ddos {
        rule rule-name {

```

<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure a security IDP policy.
<b>Options</b>	<i>policy-name</i> —Name of the IDP policy.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

---

## ignore-memory-overflow

<b>Syntax</b>	(ignore-memory-overflow   no-ignore-memory-overflow);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration re-assembler]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable the TCP reassembler to ignore the memory overflow to prevent the dropping of IDP custom applications. By default this feature is enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ignore-reassembly-overflow

---

<b>Syntax</b>	ignore-reassembly-overflow
<b>Hierarchy Level</b>	[edit security idp sensor-configuration re-assembler]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Enable the TCP reassembler to ignore the global reassembly overflow to prevent the dropping of application traffic. This feature is enabled by default.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ignore-regular-expression

---

<b>Syntax</b>	(ignore-regular-expression   no-ignore-regular-expression);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable regular expression to detect intrusion attempts. By default this setting is disabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## include-destination-address

---

<b>Syntax</b>	(include-destination-address   no-include-destination-address);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration log suppression]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	When log suppression is enabled, multiple occurrences of events with the same source, service, and matching attack object generate a single log record with a count of occurrences. If you enable this option, log suppression will only combine log records for events with a matching source as well. The IDP Sensor does not consider destination when determining matching events for log suppression. By default this setting is disabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## install

---

<b>Syntax</b>	install { ignore-version-check; }
<b>Hierarchy Level</b>	[edit security idp security-package]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configures the <b>install</b> command.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>

## interval (Security IDP)

---

<b>Syntax</b>	<code>interval <i>hours</i>;</code>
<b>Hierarchy Level</b>	[edit security idp security-package automatic]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the amount of time that the device waits before updating the signature database. User should insert a default value.
<b>Options</b>	<b>hours</b> —Number of hours that the device waits. <b>Range:</b> 24 through 336 hours
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ip (Security IDP Custom Attack)

---

<b>Syntax</b>	<pre>ip {   protocol-number <i>transport-layer-protocol-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to match the attack for a specified IP protocol type.
<b>Options</b>	<b>protocol-number <i>transport-layer-protocol-number</i></b> —Transport Layer protocol number. <b>Range:</b> 0 through 139
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>

---

## ip-action (Security Application-Level DDoS)

---

<b>Syntax</b>	<pre>ip-action {   (ip-block   ip-close   ip-connection-rate-limit <i>connections-per-second</i>   ip-notify);   log;   log-create;   refresh-timeout;   timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0.
<b>Description</b>	Specify the actions you want IDP to take against future connections that use the same IP address.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ip-action (Security IDP Rulebase IPS)

<b>Syntax</b>	<pre> ip-action {   (ip-block   ip-close   ip-notify);   log;   log-create;   refresh-timeout;   target (destination-address   service   source-address   source-zone   source-zone-address       zone-service);   timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the actions you want IDP to take against future connections that use the same IP address.
<b>Options</b>	The remaining statements are explained separately.
<div style="display: flex; align-items: center; margin-top: 20px;">  <div> <p><b>NOTE:</b> For ICMP flows, the destination port is 0; therefore, any ICMP flow matching source port, source address, and destination address is blocked.</p> </div> </div>	
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## ip-block

<b>Syntax</b>	ip-block;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Block future connections of any session that matches the IP action. If there is an IP action match with multiple rules, then the most severe IP action of all the matched rules is applied. The highest IP action priority (that is, the most severe action) is Drop/Block, then Close, then Notify.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## ip-close

<b>Syntax</b>	ip-close;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Close future connections of any new sessions that match the IP action by sending RST packets to the client and server.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## ip-connection-rate-limit

---

<b>Syntax</b>	<code>ip-connection-rate-limit <i>connections-per-second</i>;</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	When a match is made in a rulebase-ddos rule you can set the <b>then</b> action to <code>ip-connection-rate-limit</code> , which will limit the rate of future connections based on a connections per second limit that you set. This can be used to reduce the number of attacks from a client.
<b>Options</b>	<b>value</b> —Defines the connection rate limit per second on the matched host. <b>Range:</b> 1 to the maximum connections per second capability of the device.
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ip-flags

<b>Syntax</b>	ip-flags { (df   no-df); (mf   no-mf); (rb   no-rb); }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify that IDP looks for a pattern match whether or not the IP flag is set.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>df   no-df</b>—When set, the df (Don't Fragment) indicates that the packet cannot be fragmented for transmission. When unset, it indicates that the packet can be fragmented.</li> <li>• <b>mf   no-mf</b>—When set, the mf (More Fragments) indicates that the packet contains more fragments. When unset, it indicates that no more fragments remain.</li> <li>• <b>rb   no-rb</b>—When set, the rb (Reserved Bit) indicates that the bit is reserved.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## ip-notify

<b>Syntax</b>	ip-notify;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Do not take any action against future traffic, but do log the event.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## ips

---

<b>Syntax</b>	<pre>ips {   content-decompression-max-memory-kb <i>value</i>;   content-decompression-max-ratio <i>value</i>;   (detect-shellcode   no-detect-shellcode);   fifo-max-size <i>value</i>;   (ignore-regular-expression   no-ignore-regular-expression);   log-supercede-min <i>minimum-value</i>;   pre-filter-shellcode;   (process-ignore-s2c   no-process-ignore-s2c);   (process-override   no-process-override);   process-port <i>port-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure IPS security policy sensor settings.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ipv4 (Security IDP Signature Attack)

```
Syntax  ipv4 {
        destination {
            match (equal | greater-than | less-than | not-equal);
            value ip-address-or-hostname;
        }
        identification {
            match (equal | greater-than | less-than | not-equal);
            value identification-value;
        }
        ip-flags {
            (df | no-df);
            (mf | no-mf);
            (rb | no-rb);
        }
        protocol {
            match (equal | greater-than | less-than | not-equal);
            value transport-layer-protocol-id;
        }
        source {
            match (equal | greater-than | less-than | not-equal);
            value ip-address-or-hostname;
        }
        tos {
            match (equal | greater-than | less-than | not-equal);
            value type-of-service-in-decimal;
        }
        total-length {
            match (equal | greater-than | less-than | not-equal);
            value total-length-of-ip-datagram;
        }
        ttl {
            match (equal | greater-than | less-than | not-equal);
            value time-to-live;
        }
    }
```

**Hierarchy Level** [edit security idp custom-attack *attack-name* attack-type signature protocol]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Allow IDP to match the IP header information for the signature attack.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- *IDP Policies Feature Guide for Security Devices*
- *IDP Application Identification Feature Guide for Security Devices*

## ipv6 (Security IDP)

---

<b>Syntax</b>	ipv6;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify that the attack is for all IPv6 packets only.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## key-protection (Security IDP Sensor Configuration)

---

<b>Syntax</b>	key-protection;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ssl-inspection]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Enable secure key handling. This option is off by default.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>

## log (Security IDP)

<b>Syntax</b>	<pre>log {   cache-size <i>size</i>;   suppression {     disable;     (include-destination-address   no-include-destination-address);     max-logs-operate <i>value</i>;     max-time-report <i>value</i>;     start-log <i>value</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure IDP security policy logs.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## log (Security IDP Policy)

<b>Syntax</b>	log;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Log the information about the IP action against the traffic that matches a rule.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## log-attacks

---

<b>Syntax</b>	log-attacks { alert; }
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then notification] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then notification]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Enable the log attacks to create a log record that appears in the log viewer.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## log-create

---

<b>Syntax</b>	log-create;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Generate a log event on installing the ip-action filter.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## log-errors

---

<b>Syntax</b>	(log-errors   no-log-errors);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration flow]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable the error log to generate the result of success or failure about the flow. A flow-related error is when IDP receives a packet that does not fit into expected flow. By default error log is enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## log-supersede-min

---

<b>Syntax</b>	log-supersede-min <i>minimum-value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the amount of time to supersede the IPS sensor logs.
<b>Options</b>	<i>minimum-value</i> —Minimum time to supersede the log. <b>Range:</b> 0 through 65,535 seconds <b>Default:</b> 1 second
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## match (Security IDP Policy)

---

<b>Syntax</b>	<pre>match {   attacks {     custom-attack-groups [attack-group-name];     custom-attacks [attack-name];     dynamic-attack-groups [attack-group-name];     predefined-attack-groups [attack-group-name];     predefined-attacks [attack-name];   }   destination-address ([address-name]   any   any-ipv4   any-ipv6);   destination-except [address-name];   from-zone (zone-name   any );   source-address ([address-name]   any   any-ipv4   any-ipv6);   source-except [address-name];   to-zone (zone-name   any); }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> ] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the rules to be used as match criteria.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## match (Security Rulebase DDoS)

<b>Syntax</b>	<pre>match {   application (<i>application-name</i>   any   default);   application-ddos &lt;<i>application-name</i>&gt;;   destination-address ([<i>address-name</i>]   any   any-ipv4   any-ipv6);   destination-except [<i>address-name</i>];   from-zone (<i>zone-name</i>   any);   source-address ([<i>address-name</i>]   any   any-ipv4   any-ipv6);   source-except [<i>address-name</i>];   to-zone (<i>zone-name</i>   any); }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0.
<b>Description</b>	Specify the rules to be used as match criteria for application-level DDoS protection.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## max-flow-mem

<b>Syntax</b>	max-flow-mem <i>value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration re-assembler]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Define the maximum TCP flow memory that the IDP sensor can handle.
<b>Options</b>	<i>value</i> —Maximum TCP flow memory in kilobytes. <b>Range:</b> 64 through 4,294,967,295 kilobytes <b>Default:</b> 1024 kilobytes
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## max-logs-operate

---

<b>Syntax</b>	<code>max-logs-operate value;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration log suppression]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	When log suppression is enabled, IDP must cache log records so that it can identify when multiple occurrences of the same event occur. This setting specifies how many log records are tracked simultaneously by IDP.
<b>Options</b>	<b>value</b> —Maximum number of log records are tracked by IDP. <b>Range:</b> 256 through 65536 records <b>Default:</b> 16384 records
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## max-packet-mem-ratio

---

<b>Syntax</b>	<code>max-packet-mem-ratio percentage-value;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration re-assembler]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D20.
<b>Description</b>	<p>By default, values for IDP reassembler packet memory are established as percentages of all memory. In most cases, these default values are adequate.</p> <p>If a deployment exhibits an excessive number of dropped TCP packets or retransmissions resulting in high IDP reassembly memory usage, use the <b>max-packet-mem-ratio</b> option to reset the percentage of available IDP memory for IDP reassembly packet memory. Acceptable values are between 5% and 40%.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## max-packet-memory-ratio

<b>Syntax</b>	max-packet-memory-ratio <i>percentage-value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration application-identification]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D20.
<b>Description</b>	<p>By default, the amount of IDP memory used for application identification packet memory is established as a percentage of all IDP memory. In most cases, the default value is adequate.</p> <p>If a deployment exhibits an excessive number of ignored IDP sessions due to application identification memory allocation failures, use the <b>max-packet-memory-ratio</b> option to set application identification packet memory limit at a higher percentage of available IDP memory. This memory is only used by IDP in cases where application identification delays identifying an application. Acceptable values are between 5% and 40%.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>

## max-reass-packet-memory-ratio

<b>Syntax</b>	max-reass-packet-memory-ratio <i>percentage-value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration application-identification]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D20.
<b>Description</b>	<p>By default, the amount of IDP memory used for packet memory by the application identification reassembler is established as a percentage of all IDP memory. In most cases, the default value is adequate.</p> <p>If a deployment exhibits an excessive number of ignored IDP sessions due to packet memory limitations of the application identification reassembler, use the <b>max-reass-packet-memory-ratio</b> option to set the reassembler packet memory limit to a higher percentage of available IDP memory. Acceptable values are between 5% and 40%.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>

## max-sessions (Security Packet Log)

---

<b>Syntax</b>	max-sessions <i>percentage</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Configure the maximum number of sessions actively conducting pre-attack packet captures on a device at one time. This value is expressed as a percentage of the maximum number of IDP sessions for the device.
<b>Options</b>	<b>percentage</b> —Maximum number of packet capture sessions expressed as a percentage of the IDP session capacity for the device. <b>Range:</b> 1 to 100 percent <b>Default:</b> 10
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## max-tcp-session-packet-memory

---

<b>Syntax</b>	max-tcp-session-packet-memory <i>value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration application-identification]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the maximum number of TCP sessions that IDP maintains. If the sensor reaches the maximum, it drops all new TCP sessions.
<b>Options</b>	<b>value</b> —Maximum number of TCP sessions. <b>Range:</b> 0 through 60,000
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## max-time-report

---

<b>Syntax</b>	max-time-report <i>value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration log suppression]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	When log suppression is enabled, IDP maintains a count of multiple occurrences of the same event. After the specified number of seconds has passed, IDP writes a single log entry containing the count of occurrences.
<b>Options</b>	<i>value</i> —Time after which IDP writes a single log entry containing the count of occurrences. <b>Range:</b> 1 through 60 seconds <b>Default:</b> 5 seconds
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## max-timers-poll-ticks

---

<b>Syntax</b>	max-timers-poll-ticks <i>value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration flow]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the time at which timer ticks at regular interval.
<b>Options</b>	<i>value</i> —Maximum amount of time at which the timer ticks. <b>Range:</b> 0 through 1000 ticks <b>Default:</b> 1000 ticks
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## max-udp-session-packet-memory

---

<b>Syntax</b>	<code>max-udp-session-packet-memory value;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration application-identification]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the maximum number of UDP sessions that IDP maintains. If the sensor reaches the maximum, it drops all new UDP sessions.
<b>Options</b>	<b>value</b> —Maximum number of UDP sessions. <b>Range:</b> 0 through 20000
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## member (Security IDP)

---

<b>Syntax</b>	<pre>member member-name {   attack-type {     (anomaly ...same statements as in [edit security idp custom-attack attack-name       attack-type anomaly] hierarchy level   signature ...same statements as in [edit security       idp custom-attack attack-name attack-type signature] hierarchy level);   } }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Create the list of member attacks.
<b>Options</b>	<b>member-name</b> —Name of the member list.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## mss (Security IDP)

<b>Syntax</b>	<pre>mss {     match (equal   greater-than   less-than   not-equal);     value <i>maximum-segment-size</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the maximum segment size (MSS) in the TCP header.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value</b> <i>maximum-segment-size</i>—Match the maximum segment size value.</li> </ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## negate

<b>Syntax</b>	negate;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Select negate to exclude the specified pattern from being matched.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## nested-application (Security IDP)

---

<b>Syntax</b>	<code>nested-application <i>nested-application-name</i>;</code>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the nested application name.
<b>Options</b>	<i>nested-application-name</i> —Name of the nested application.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## notification

---

<b>Syntax</b>	<pre>notification {   log-attacks {     alert;   }   packet-log {     post-attack <i>number</i>;     post-attack-timeout <i>seconds</i>;     pre-attack <i>number</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Added packet capture support in Junos OS Release 10.2.
<b>Description</b>	Configure the logging options against the action. When attacks are detected, you can choose to log an attack and create log records with attack information and send that information to the log server.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## option (Security IDP)

<b>Syntax</b>	option { match (equal   greater-than   less-than   not-equal); value <i>tcp-option</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the TCP option type (kind field in the TCP header).
<b>Options</b>	<p><b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</p> <p><b>value <i>tcp-option</i></b>—Match the option value.</p> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## order (Security IDP)

<b>Syntax</b>	order;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Create a compound attack object that must match each member signature or protocol anomaly in the order you specify. If you do not specify an ordered match, the compound attack object still must match all members, but the attacks or protocol anomalies can appear in random order.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## packet-log (Security IDP Policy)

---

<b>Syntax</b>	<pre>packet-log {     post-attack <i>number</i>;     post-attack-timeout <i>seconds</i>;     pre-attack <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then notification]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	In response to a rule match, capture the packets received before and after the attack for further offline analysis of attacker behavior. You can configure the number of pre-attack and post-attack packets to be captured for this attack, and limit the duration of post-attack packet capture by specifying a timeout value.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## packet-log (Security IDP Sensor Configuration)

<b>Syntax</b>	<pre>packet-log {     host <i>ip-address</i> &lt;port <i>number</i>&gt;;     max-sessions <i>percentage</i>;     source-address <i>ip-address</i>;     total-memory <i>percentage</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Configure the sensor for packet capture. This configuration defines the amount of memory to be allocated for packet capture and the maximum number of sessions that can generate packet capture data for the device at one time. The configuration also identifies the source address and host address for transmission of the completed packet capture object.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## pattern (Security IDP)

<b>Syntax</b>	<code>pattern <i>signature-pattern</i>;</code>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the pattern IDP should match. You construct the attack pattern just as you would when creating a new signature attack object.
<b>Options</b>	<i>signature-pattern</i> —Specify the signature pattern.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## performance

---

<b>Syntax</b>	<pre>performance {   values [fast normal slow unknown]; }</pre>
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a performance filter to add attack objects based on the performance level that is vulnerable to the attack.
<b>Options</b>	<p><b>values</b>—Name of the performance filter. You can select from the following performance levels:</p> <ul style="list-style-type: none"><li>• <b>fast</b>—Fast track performance level.</li><li>• <b>normal</b>—Normal track performance level.</li><li>• <b>slow</b>—Slow track performance level.</li><li>• <b>unknown</b>—By default, all compound attack objects are set to Unknown. As you fine-tune IDP to your network traffic, you can change this setting to help you track performance level.</li></ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## policy-lookup-cache

---

<b>Syntax</b>	(policy-lookup-cache   no-policy-lookup-cache);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration global]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable cache to accelerate IDP policy lookup.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## post-attack

<b>Syntax</b>	<code>post-attack <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then notification packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Specify the number of packets received after an attack that should be captured for further analysis of attacker behavior. If post-attack packets are not significant to your analysis or the configured attack response ends packet transfer, you can set the post-attack option to 0.
<b>Options</b>	<p><b><i>number</i></b>—Number of post-attack packets to be captured.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 1</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## post-attack-timeout

<b>Syntax</b>	<code>post-attack-timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then notification packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Specify a time limit for capturing post-attack packets for a session. No packet capture is conducted after the timeout has expired.
<b>Options</b>	<p><b><i>seconds</i></b>—Maximum number of seconds for post-attack packet capture.</p> <p><b>Range:</b> 0 through 1800 seconds</p> <p><b>Default:</b> 5</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## pre-attack

---

<b>Syntax</b>	<code>pre-attack <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then notification packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Specify the number of packets received before an attack that should be captured for further analysis of attacker behavior.
<b>Options</b>	<i>number</i> —Number of pre-attack packets. <b>Range:</b> 1 through 255 <b>Default:</b> 1
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## pre-filter-shellcode

---

<b>Syntax</b>	<code>pre-filter-shellcode;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Enable to pre-filter the shell code and protects it from buffer overflow attacks. By default this setting is enabled.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## predefined-attack-groups

---

<b>Syntax</b>	<code>predefined-attack-groups [attack-group-name];</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match attacks], [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match attacks]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify predefined attack groups that you can use to match the traffic against known attack objects. You can update only the list of attack objects.
<b>Options</b>	<b>attack-name</b> —Name of the predefined attack object group.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## predefined-attacks

---

<b>Syntax</b>	<code>predefined-attacks [attack-name];</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match attacks], [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match attacks]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify predefined attack objects that you can use to match the traffic against known attacks. You can update only the list of attack objects.
<b>Options</b>	<b>attack-name</b> —Name of the predefined attack objects.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## process-ignore-s2c

---

<b>Syntax</b>	(process-ignore-s2c   no-process-ignore-s2c);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Set the command to disable the server-to-client inspection.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## process-override

---

<b>Syntax</b>	(process-override   no-process-override);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Set the command to forcefully run the IDS inspection module even if there is no policy match.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## process-port

---

<b>Syntax</b>	<code>process-port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ips]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Set the command to a specific port to forcefully run the IDS inspection module on that TCP/UDP port even if there is no policy match.
<b>Options</b>	<p><b><i>port-number</i></b>—Port Number.</p> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## products

---

<b>Syntax</b>	<pre>products {   values [<i>product-value</i>]; }</pre>
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a products filter to add attack objects based on the application that is vulnerable to the attack.
<b>Options</b>	<b>values</b> —Name of the products filter. You can configure multiple filters separated by spaces and enclosed in square brackets.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>

## protocol-binding

---

<b>Syntax</b>	<pre>protocol-binding {   application <i>application-name</i>;   icmp;   icmpv6;   ip {     protocol-number <i>transport-layer-protocol-number</i>;   }   ipv6 {     protocol-number <i>transport-layer-protocol-number</i>;   }   nested-application <i>nested-application-name</i>;   rpc {     program-number <i>rpc-program-number</i>;   }   tcp {     minimum-port <i>port-number</i> &lt;maximum-port <i>port-number</i>&gt;;   }   udp {     minimum-port <i>port-number</i> &lt;maximum-port <i>port-number</i>&gt;;   } }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain] [edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Select a protocol that the attack uses to enter your network.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## protocol-name

---

<b>Syntax</b>	<pre> protocol-name <i>protocol-name</i> {     tunable-name <i>tunable-name</i> {         tunable-value <i>protocol-value</i>;     } } </pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration detector]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for file format decoding over HTTP using MIME added in Junos OS Release 11.2.
<b>Description</b>	Specify the name of the protocol to be used to configure each of the protocol detector engines.
<b>Options</b>	<p><b><i>protocol-name</i></b>—Name of the specific protocol.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> <li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li> </ul>

## protocol (Security IDP IP Headers)

---

<b>Syntax</b>	<pre>protocol {     match (equal   greater-than   less-than   not-equal);     value <i>transport-layer-protocol-id</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the Transport Layer protocol number.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>transport-layer-protocol-id</i>—Match the Transport Layer protocol ID.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## protocol (Security IDP Signature Attack)

```
Syntax  protocol {
        icmp {
            code {

```

**Hierarchy Level** [edit security idp custom-attack *attack-name* attack-type signature]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Specify a protocol to match the header information for the signature attack.

<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

---

## re-assembler

<b>Syntax</b>	<pre>re-assembler {   action-on-reassembly-failure (drop   drop-session   ignore);   (ignore-memory-overflow   no-ignore-memory-overflow);   (ignore-reassembly-memory-overflow   no-ignore-reassembly-memory-overflow);   ignore-reassembly-overflow;   max-flow-mem <i>value</i>;   max-packet-mem-ratio <i>percentage-value</i>;   (tcp-error-logging   no-tcp-error-logging); }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Packet memory ratios added in Junos OS Release 12.1X44-D20.
<b>Description</b>	Configure TCP reassembler for IDP sensor settings.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li></ul>

## recommended-action

<b>Syntax</b>	<code>recommended-action (close   close-client   close-server   drop   drop-packet   ignore   none);</code>
<b>Hierarchy Level</b>	<code>[edit security idp custom-attack <i>attack-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	When the security device detects an attack, it performs the specified action.
<b>Options</b>	<p>The seven actions are as follows, from most to least severe:</p> <ul style="list-style-type: none"> <li>• <b>close</b>—Reset the client and the server.</li> <li>• <b>close-client</b>—Reset the client.</li> <li>• <b>close-server</b>—Reset the server.</li> <li>• <b>drop</b>—Drop the particular packet and all subsequent packets of the flow.</li> <li>• <b>drop-packet</b>—Drop the particular packet of the flow.</li> <li>• <b>ignore</b>—Do not inspect any further packets.</li> <li>• <b>none</b>—Do not perform any action.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## refresh-timeout

<b>Syntax</b>	<code>refresh-timeout;</code>
<b>Hierarchy Level</b>	<p><code>[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action]</code></p> <p><code>[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]</code></p>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Refresh the ip-action timeout so it does not expire when future connections match the installed ip-action filter.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## regex

---

<b>Syntax</b>	<code>regex <i>regular-expression</i>;</code>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a Perl Compatible Regular Expression (PCRE) expression.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## reject-timeout

---

<b>Syntax</b>	<code>reject-timeout <i>value</i>;</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration flow]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	<p>Specify the amount of time in seconds within which a response must be received.</p> <p>This time-out is applied on flow when drop-connection action is taken by IPS for TCP flow.</p>
<b>Options</b>	<p><b>value</b>—Maximum amount of time in seconds.</p> <p><b>Range:</b> 1 through 65,535 seconds</p> <p><b>Default:</b> 300 seconds</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## reset (Security IDP)

---

<b>Syntax</b>	reset;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Select <b>reset</b> if the compound attack should be matched more than once within a single session or transaction.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## reset-on-policy

---

<b>Syntax</b>	(reset-on-policy   no-reset-on-policy);
<b>Hierarchy Level</b>	[edit security idp sensor-configuration flow]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	IDP keeps track of connections in a table. If enabled, the security module resets the flow table each time a security policy loads or unloads. If this setting is disabled, then the security module continues to retain a previous security policy until all flows referencing that security policy go away. Juniper Networks recommends that you keep this setting enabled to preserve memory.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## rpc

---

<b>Syntax</b>	<pre>rpc {   program-number <i>rpc-program-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to match the attack for a specified remote procedure call (RPC) program number.
<b>Options</b>	<b>program-number <i>rpc-program-number</i></b> —RPC program number.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## rule (Security Exempt Rulebase)

**Syntax**

```
rule rule-name {
  description text;
  match {
    attacks {
      custom-attack-groups [attack-group-name];
      custom-attacks [attack-name];
      dynamic-attack-groups [attack-group-name];
      predefined-attack-groups [attack-group-name];
      predefined-attacks [attack-name];
    }
    destination-address ([address-name] | any | any-ipv4 | any-ipv6);
    destination-except [address-name];
    from-zone (zone-name | any);
    source-address ([address-name] | any | any-ipv4 | any-ipv6);
    source-except [address-name];
    to-zone (zone-name | any);
  }
}
```

**Hierarchy Level** [edit security idp idp-policy *policy-name* rulebase-exempt]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Specify exempt rule to create, modify, delete, and reorder the rules in a rulebase.

**Options** *rule-name*—Name of the exempt rulebase rule.

The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

## rule (Security DDoS Rulebase)

```

Syntax    rule rule-name {
              description text;
              match {
                application (application-name | any | default);
                application-ddos <application-name>;
                destination-address ([address-name] | any | any-ipv4 | any-ipv6);
                destination-except [address-name];
                from-zone (zone-name | any);
                source-address ([address-name] | any | any-ipv4 | any-ipv6);
                source-except [address-name];
                to-zone (zone-name | any);
              }
              then {
                action {
                  (close-server | drop-connection | drop-packet | no-action);
                }
                ip-action {
                  (ip-block | ip-close | ip-connection-rate-limit connections-per-second | ip-notify);
                  log;
                  log-create;
                  refresh-timeout;
                  timeout seconds;
                }
                notification {
                  log-attacks {
                    alert;
                  }
                }
              }
            }

```

**Hierarchy Level** [edit security idp idp-policy *policy-name* rulebase-ddos]

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Configure application-level DDoS rule match criteria, and the action to be taken on attack clients.

**Options** *rule-name*—Name of the DDoS rulebase rule.

The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

                }
            }
            severity (critical | info | major | minor | warning);
        }
    }

```

Hierarchy Level [edit security idp idp-policy *policy-name* rulebase-ips]

<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify IPS rule to create, modify, delete, and reorder the rules in a rulebase.
<b>Options</b>	<p><i>rule-name</i>—Name of the IPS rulebase rule.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## rulebase-ddos

```
Syntax rulebase-ddos {
    rule rule-name {
        description text;
        match {
            application (application-name | any | default);
            application-ddos <application-name>;
            destination-address ([address-name] | any | any-ipv4 | any-ipv6);
            destination-except [address-name];
            from-zone (zone-name | any);
            source-address ([address-name] | any | any-ipv4 | any-ipv6);
            source-except [address-name];
            to-zone (zone-name | any);
        }
        then {
            action {
                (close-server | drop-connection | drop-packet | no-action);
            }
            ip-action {
                (ip-block | ip-close | ip-connection-rate-limit connections-per-second | ip-notify);
                log;
                log-create;
                refresh-timeout;
                timeout seconds;
            }
            notification {
                log-attacks {
                    alert;
                }
            }
        }
    }
}
```

**Hierarchy Level** [edit security idp idp-policy *policy-name*]

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Configure the rulebase parameters for application-level DDoS attacks.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## rulebase-exempt

**Syntax**

```
rulebase-exempt {
  rule rule-name {
    description text;
    match {
      attacks {
        custom-attack-groups [attack-group-name];
        custom-attacks [attack-name];
        dynamic-attack-groups [attack-group-name];
        predefined-attack-groups [attack-group-name];
        predefined-attacks [attack-name];
      }
      destination-address ([address-name] | any | any-ipv4 | any-ipv6);
      destination-except [address-name];
      from-zone (zone-name | any );
      source-address ([address-name] | any | any-ipv4 | any-ipv6);
      source-except [address-name];
      to-zone (zone-name | any);
    }
  }
}
```

**Hierarchy Level** [edit security idp idp-policy *policy-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure the exempt rulebase to skip detection of a set of attacks in certain traffic.

**NOTE:** You must configure the IPS rulebase before configuring the exempt rulebase.

**Options** The remaining statements are explained separately.

**Required Privilege Level**  
 security—To view this statement in the configuration.  
 security-control—To add this statement to the configuration.

**Related Documentation**

                }
                packet-log {
                    post-attack number;
                    post-attack-timeout seconds;
                    pre-attack number;
                }
            }
            severity (critical | info | major | minor | warning);
        }
    }
}
```

<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure the IPS rulebase to detect attacks based on stateful signature and protocol anomalies.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Class of Service Action Feature Guide for Security Devices</i></li></ul>

---

## scope (Security IDP Chain Attack)

---

<b>Syntax</b>	scope (session   transaction);
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify whether the match should occur over a single session or can be made across multiple transactions within a session.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>session</b>—Allow multiple matches for the object within the same session.</li><li>• <b>transaction</b>—Match the object across multiple transactions that occur within the same session.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## scope (Security IDP Custom Attack)

---

<b>Syntax</b>	scope (destination   peer   source);
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> time-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify whether the counting of the attack is from the same source IP address, the same destination IP address, or a peer.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>destination</b>—IDP detects attacks to a given destination IP address for the specified number of times, regardless of the source IP address.</li><li>• <b>peer</b>—IDP detects attacks between source and destination IP addresses of the sessions for the specified number of times.</li><li>• <b>source</b>—IDP detects attacks from a given source IP address for the specified number of times, regardless of the destination IP address.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## security-package

---

<b>Syntax</b>	<pre>security-package {   automatic {     download-timeout <i>minutes</i>;     enable;     interval <i>hours</i>;     start-time <i>start-time</i>;   }   install {     ignore-version-check;   }   source-address <i>address</i>;   url <i>url-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure the device to automatically download the updated signature database from the specified URL.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li></ul>

## sensor-configuration

}

```

<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Packet memory ratios added in Junos OS Release 12.1X44-D20.
<b>Description</b>	Configure various IDP parameters to match the properties of transiting network traffic.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> <li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li> <li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>

## sequence-number (Security IDP ICMP Headers)

<b>Syntax</b>	sequence-number { match (equal   greater-than   less-than   not-equal); value <i>sequence-number</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol icmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the sequence number of the packet. This number identifies the location of the request/reply in relation to the entire sequence.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value</b> <i>sequence-number</i>—Match a decimal value.</li> </ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## sequence-number (Security IDP TCP Headers)

---

<b>Syntax</b>	sequence-number { match (equal   greater-than   less-than   not-equal); value <i>sequence-number</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the sequence number of the packet. This number identifies the location of the data in relation to the entire data sequence.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>sequence-number</i>—Match a decimal value.</li></ul> <p><b>Range:</b> 0 through 4,294,967,295</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## service (Security IDP Anomaly Attack)

---

<b>Syntax</b>	service <i>service-name</i> ;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type anomaly]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Service is the protocol whose anomaly is defined in the attack. IP, TCP, UDP, and ICMP are also valid as services. (Protocol names must be entered in lowercase.)
<b>Options</b>	<b><i>service-name</i></b> —Name of the protocol in lowercase.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## service (Security IDP Dynamic Attack Group)

<b>Syntax</b>	service { values [ <i>service-value</i> ]; }
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a service filter to add attack objects based on the attack service, such as FTP, HTTP, NetBios, and so on.
<b>Options</b>	<b>values</b> —Name of the service filter. You can configure multiple filters separated by spaces and enclosed in square brackets.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## sessions

<b>Syntax</b>	sessions <i>number</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration ssl-inspection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Maximum number of SSL sessions for inspection. This limit is per Services Processing Unit (SPU).
<b>Options</b>	<b>number</b> —Number of SSL session to inspect. <b>Range:</b> 1 through 100,000 <b>Default:</b> 10,000
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> <li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li> </ul>

## severity (Security IDP Custom Attack)

---

<b>Syntax</b>	severity (critical   info   major   minor   warning);
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Select the severity that matches the lethality of the attack object on your network.
<b>Options</b>	<p>You can set the severity level to the following levels:</p> <ul style="list-style-type: none"><li>• <b>critical</b>—Contains attack objects matching exploits that attempt to evade detection, cause a network device to crash, or gain system-level privileges.</li><li>• <b>info</b>—Contains attack objects matching normal, harmless traffic containing URLs, DNS lookup failures, SNMP public community strings, and Peer-to-Peer (P2P) parameters. You can use informational attack objects to obtain information about your network.</li><li>• <b>major</b>—Contains attack objects matching exploits that attempt to disrupt a service, gain user-level access to a network device, or activate a Trojan horse previously loaded on a device.</li><li>• <b>minor</b>—Contains attack objects matching exploits that detect reconnaissance efforts attempting to access vital information through directory traversal or information leaks.</li><li>• <b>warning</b>—Contains attack objects matching exploits that attempt to obtain noncritical information or scan a network with a scanning tool.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## severity (Security IDP Dynamic Attack Group)

---

<b>Syntax</b>	severity { values [critical info major minor warning]; }
<b>Hierarchy Level</b>	[edit security idp dynamic-attack-group <i>dynamic-attack-group-name</i> filters]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify a severity filter to add attack objects based on the attack severity levels.
<b>Options</b>	<p><b>values</b>—Name of the severity filter. You can select from the following severity:</p> <ul style="list-style-type: none"><li>• <b>critical</b>—The attack is a critical one.</li><li>• <b>info</b>—Provide information of attack when it matches.</li><li>• <b>major</b>—The attack is a major one.</li><li>• <b>minor</b>—The attack is a minor one.</li><li>• <b>warning</b>—Issue a warning when attack matches.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## severity (Security IDP IPS Rulebase)

---

<b>Syntax</b>	severity (critical   info   major   minor   warning);
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Set the rule severity levels in logging to support better organization and presentation of log records on the log server. You can use the default severity settings of the selected attack object, or choose a specific severity for your rule. The severity you configure in the rules overrides the inherited attack severity.
<b>Options</b>	<p>You can set the severity level to the following levels:</p> <ul style="list-style-type: none"><li>• <b>critical</b>—2</li><li>• <b>info</b>—3</li><li>• <b>major</b>—4</li><li>• <b>minor</b>—5</li><li>• <b>warning</b>—7</li></ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## shellcode

---

<b>Syntax</b>	shellcode (all   intel   no-shellcode   sparc);
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type anomaly] [edit security idp custom-attack <i>attack-name</i> attack-type signature]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Shellcode signifies that the attack is a shellcode attack and is capable of creating its own shell.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>all</b>—All shellcode checks will be performed if this attack matches.</li> <li>• <b>intel</b>—Basic shellcode checks and Intel-specific shellcode checks will be performed.</li> <li>• <b>no-shellcode</b>—No shellcode checks will be performed.</li> <li>• <b>sparc</b>—Basic shellcode checks and Sparc-specific shellcode checks will be performed.</li> </ul> <p><b>Default:</b> Basic shellcode checks will be performed when this field is not configured.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## signature (Security IDP)

---

**Syntax**    `signature {`  
              `context context-name;`  
              `direction (any | client-to-server | server-to-client);`  
              `negate;`  
              `pattern signature-pattern;`  
              `protocol {`  
                  `icmp {`

**Hierarchy Level** [edit security idp custom-attack *attack-name* attack-type]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** IDP uses stateful signatures to detect attacks. Stateful signatures are more specific than regular signatures. With stateful signatures, IDP can look for the specific protocol or service used to perpetrate the attack.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## source (Security IDP IP Headers)

---

<b>Syntax</b>	<pre>source {     match (equal   greater-than   less-than   not-equal);     value <i>ip-address-or-hostname</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the IP address or hostname of the attacking device.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>ip-address-or-hostname</i>—Match an IP address or a hostname.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## source-address (Security IDP Policy)

<b>Syntax</b>	source-address ([ <i>address-name</i> ]   any   any-ipv4   any-ipv6);
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> match] [edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify a source IP address or IP address set object to be used as the match source address object. The default value is any.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b><i>address-name</i></b>—IP address or IP address set object.</li> <li>• <b><i>any</i></b>—Specify any IPv4 or IPv6 address.</li> <li>• <b><i>any-ipv4</i></b>—Specify any IPv4 address.</li> <li>• <b><i>any-ipv6</i></b>—Specify any IPv6 address.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## source-address (Security IDP Sensor Configuration)

<b>Syntax</b>	source-address <i>ip-address</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Configure the source IP address for the carrier UDP packet.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## source-except

---

<b>Syntax</b>	<code>source-except [<i>address-name</i>];</code>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> match] [edit security idp idp-policy <i>policy-name</i> rulebase-exempt rule <i>rule-name</i> match] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify a source IP address or IP address set object to specify all source address objects except the specified address objects. The default value is any.
<b>Options</b>	<b><i>address-name</i></b> —IP address or IP address set object.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## source-port (Security IDP)

---

<b>Syntax</b>	<code>source-port {     match (equal   greater-than   less-than   not-equal);     value <i>source-port</i>; }</code>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol udp] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the port number on the attacking device.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match (equal   greater-than   less-than   not-equal)</b>—Match an operand.</li><li>• <b>value <i>source-port</i></b>—Port number on the attacking device.</li></ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## ssl-inspection

---

<b>Syntax</b>	<pre>ssl-inspection {   cache-prune-chunk-size <i>number</i>;   key-protection;   maximum-cache-size <i>number</i>;   session-id-cache-timeout <i>seconds</i>;   sessions <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Inspect HTTP traffic encrypted in SSL protocol. SSL inspection is disabled by default. It is enabled if you configure SSL inspection.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> <li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li> </ul>

## start-log

---

<b>Syntax</b>	start-log <i>value</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration log suppression]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify how many instances of a specific event must occur before log suppression begins.
<b>Options</b>	<i>value</i> —Log suppression begins after how many occurrences. <b>Range:</b> 1 through 128 <b>Default:</b> 1
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## start-time (Security IDP)

---

<b>Syntax</b>	<code>start-time <i>start-time</i>;</code>
<b>Hierarchy Level</b>	[edit security idp security-package automatic]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the time that the device automatically starts downloading the updated signature database from the specified URL.
<b>Options</b>	<i>start-time</i> —Time in MM-DD.hh:mm format.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## statistics (Security IDP)

---

<b>Syntax</b>	<pre>statistics {     interval <i>minutes</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration application-ddos]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	The <b>statistics</b> option enables application-level DDoS statistic collection at the defined interval. Statistic report files are stored on the routing engine data storage device in /var/log/addos in comma separated value (CSV) format. The data storage device must have at least 2 GB of free space before logging will occur.
<b>Options</b>	<b>interval <i>minutes</i></b> —Set the interval in minutes that will define when application statistic will be collected. <b>Range:</b> 1 through 60 minutes (1-minute increments) <b>Default:</b> 1 minute
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## suppression

---

<b>Syntax</b>	<pre> suppression {   disable;   (include-destination-address   no-include-destination-address);   max-logs-operate <i>value</i>;   max-time-report <i>value</i>;   start-log <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration log]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Log suppression reduces the number of logs by displaying a single record for multiple occurrences of the same event. Log suppression can negatively impact sensor performance if the reporting interval is set too high. By default this feature is enabled.
<b>Options</b>	<p><b>disable</b>—Disable log suppression.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p><b>security</b>—To view this statement in the configuration.</p> <p><b>security-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## target (Security IDP)

---

<b>Syntax</b>	target (destination-address   service   source-address   source-zone   source-zone-address   zone-service);
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the blocking options that you want to set to block the future connections. Blocking options can be based on the following matches of the attack traffic:
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>destination-address</b>—Matches traffic based on the destination address of the attack traffic.</li><li>• <b>service</b>—For TCP and UDP, matches traffic based on the source address, source port, destination address, and destination port of the attack traffic. This is the default.  For ICMP flows, the destination port is 0. Any ICMP flow matching source port, source address, and destination address is blocked.</li><li>• <b>source-address</b>—Matches traffic based on the source address of the attack traffic.</li><li>• <b>source-zone</b>—Matches traffic based on the source zone of the attack traffic.</li><li>• <b>source-zone-address</b>—Matches traffic based on the source zone and source address of the attack traffic.</li><li>• <b>zone-service</b>—Matches traffic based on the source zone, destination address, destination port, and protocol of the attack traffic.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

---

## tcp (Security IDP Protocol Binding)

---

<b>Syntax</b>	tcp { minimum-port <i>port-number</i> <maximum-port <i>port-number</i> >; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Allow IDP to match the attack for specified TCP ports.
<b>Options</b>	<b>minimum-port <i>port-number</i></b> —Minimum port in the port range. <b>Range:</b> 0 through 65,535  <b>maximum-port <i>port-number</i></b> —Maximum port in the port range. <b>Range:</b> 0 through 65,535
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## tcp (Security IDP Signature Attack)

```

Syntax  tcp {
        ack-number {
            match (equal | greater-than | less-than | not-equal);
            value acknowledgement-number;
        }
        data-length {
            match (equal | greater-than | less-than | not-equal);
            value tcp-data-length;
        }
        destination-port {
            match (equal | greater-than | less-than | not-equal);
            value destination-port;
        }
        header-length {
            match (equal | greater-than | less-than | not-equal);
            value header-length;
        }
        mss {
            match (equal | greater-than | less-than | not-equal);
            value maximum-segment-size;
        }
        option {
            match (equal | greater-than | less-than | not-equal);
            value tcp-option;
        }
        sequence-number {
            match (equal | greater-than | less-than | not-equal);
            value sequence-number;
        }
        source-port {
            match (equal | greater-than | less-than | not-equal);
            value source-port;
        }
        tcp-flags {
            (ack | no-ack);
            (fin | no-fin);
            (psh | no-psh);
            (r1 | no-r1);
            (r2 | no-r2);
            (rst | no-rst);
            (syn | no-syn);
            (urg | no-urg);
        }
        urgent-pointer {
            match (equal | greater-than | less-than | not-equal);
            value urgent-pointer;
        }
        window-scale {
            match (equal | greater-than | less-than | not-equal);
            value window-scale-factor;
        }
        window-size {

```

```
        match (equal | greater-than | less-than | not-equal);
        value window-size;
    }
}
```

<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to match the TCP header information for the signature attack.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## tcp-flags

<b>Syntax</b>	<pre> tcp-flags {   (ack   no-ack);   (fin   no-fin);   (psh   no-psh);   (r1   no-r1);   (r2   no-r2);   (rst   no-rst);   (syn   no-syn);   (urg   no-urg); } </pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify that IDP looks for a pattern match whether or not the TCP flag is set.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>ack   no-ack</b>—When set, the acknowledgment flag acknowledges receipt of a packet.</li> <li>• <b>fin   no-fin</b>—When set, the final flag indicates that the packet transfer is complete and the connection can be closed.</li> <li>• <b>psh   no-psh</b>—When set, the push flag indicates that the receiver should push all data in the current sequence to the destination application (identified by the port number) without waiting for the remaining packets in the sequence.</li> <li>• <b>r1   no-r1</b>—When set, indicates that the R1 retransmission threshold has been reached.</li> <li>• <b>r2   no-r2</b>—When set, indicates that the R2 retransmission threshold has been reached.</li> <li>• <b>rst   no-rst</b>—When set, the reset flag resets the TCP connection, discarding all packets in an existing sequence.</li> <li>• <b>syn   no-syn</b>—When set, indicates that the sending device is asking for a three-way handshake to initialize communications.</li> <li>• <b>urg   no-urg</b>—When set, the urgent flag indicates that the packet data is urgent.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## terminal

---

<b>Syntax</b>	terminal;
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Set or unset a terminal rule flag. The device stops matching rules for a session when a terminal rule is matched.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## test (Security IDP)

---

<b>Syntax</b>	test <i>test-condition</i> ;
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type anomaly]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify protocol anomaly condition to be checked.
<b>Options</b>	<i>test-condition</i> —Name of the anomaly test condition.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.

## then (Security IDP Policy)

```
Syntax  then {
        action {
            class-of-service {
                dscp-code-point number;
                forwarding-class forwarding-class;
            }
            (close-client | close-client-and-server | close-server | drop-connection | drop-packet |
             ignore-connection | mark-diffserv value | no-action | recommended);
        }
        ip-action {
            (ip-block | ip-close | ip-notify);
            log;
            log-create;
            refresh-timeout;
            target (destination-address | service | source-address | source-zone | source-zone-address
                  | zone-service);
            timeout seconds;
        }
        notification {
            log-attacks {
                alert;
            }
            packet-log {
                post-attack number;
                post-attack-timeout seconds;
                pre-attack number;
            }
        }
        severity (critical | info | major | minor | warning);
    }
```

**Hierarchy Level** [edit security idp idp-policy *policy-name* rulebase-ips rule *rule-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Specify the action to be performed when traffic matches the defined criteria.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## then (Security Rulebase DDos)

```
Syntax  then {
        action {
            (close-server | drop-connection | drop-packet | no-action);
        }
        ip-action {
            (ip-block | ip-close | ip-connection-rate-limit connections-per-second | ip-notify);
            log;
            log-create;
            refresh-timeout;
            timeout seconds;
        }
        notification {
            log-attacks {
                alert;
            }
        }
    }
```

**Hierarchy Level** [edit security idp idp-policy *policy-name* rulebase-ddos rule *rule-name*]

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Specify the session action to be performed when traffic matches the defined criteria.

**Options** The remaining statements are explained separately.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## time-binding

---

<b>Syntax</b>	<pre>time-binding {     count <i>count-value</i>;     scope (destination   peer   source); }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to detect a sequence of the same attacks over a period of time.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## timeout (Security IDP Policy)

---

<b>Syntax</b>	<pre>timeout <i>seconds</i>;</pre>
<b>Hierarchy Level</b>	[edit security idp idp-policy <i>policy-name</i> rulebase-ddos rule <i>rule-name</i> then ip-action] [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then ip-action]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify the number of seconds that you want the IP action to remain in effect after a traffic match.
<b>Options</b>	<b>seconds</b> —Number of seconds the IP action should remain effective. <b>Range:</b> 0 through 64,800 seconds <b>Default:</b> 0 second
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## to-zone (Security IDP Policy)

<b>Syntax</b>	<code>to-zone (zone-name   any);</code>
<b>Hierarchy Level</b>	<code>[edit security idp idp-policy policy-name rulebase-ddos rule rule-name match]</code> <code>[edit security idp idp-policy policy-name rulebase-exempt rule rule-name match]</code> <code>[edit security idp idp-policy policy-name rulebase-ips rule rule-name match]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for <b>rulebase-ddos</b> introduced in Junos OS Release 10.0.
<b>Description</b>	Specify a destination zone to be associated with the security policy. The default value is any.
<b>Options</b>	<b>zone-name</b> —Name of the destination zone object.
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## tos

---

<b>Syntax</b>	<pre>tos {     match (equal   greater-than   less-than   not-equal);     value <i>type-of-service-in-decimal</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the type of service.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value <i>type-of-service-in-decimal</i></b>—The following service types are available:<ul style="list-style-type: none"><li>• 0000—Default</li><li>• 0001—Minimize Cost</li><li>• 0002—Maximize Reliability</li><li>• 0003—Maximize Throughput</li><li>• 0004—Minimize Delay</li><li>• 0005—Maximize Security</li></ul></li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## total-length

<b>Syntax</b>	total-length { match (equal   greater-than   less-than   not-equal); value <i>total-length-of-ip-datagram</i> ; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the number of bytes in the packet, including all header fields and the data payload.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li>• <b>value</b> <i>total-length-of-ip-datagram</i>—Length of the IP datagram.</li> </ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## total-memory

<b>Syntax</b>	total-memory <i>percentage</i> ;
<b>Hierarchy Level</b>	[edit security idp sensor-configuration packet-log]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Configure the maximum amount of memory to be allocated to packet capture for the device. This value is expressed as a percentage of the memory available on the device. The total memory for a device will differ depending on its operating mode.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>percentage</b>—Amount of packet capture memory expressed as a percentage of total memory for the device mode.</li> </ul> <p><b>Range:</b> 1 to 100 percent <b>Default:</b> 10</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## traceoptions (Security Datapath Debug)

```
Syntax  traceoptions {
        file {
            filename;
            files number;
            match regular-expression;
            size maximum-file-size;
            (world-readable | no-world-readable);
        }
        no-remote-trace;
    }
```

**Hierarchy Level** [edit security datapath-debug]

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Sets the trace options for datapath-debug.

**Options** • **file**—Configure the trace file options.

- **filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.
- **files number**—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed to **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

Range: 2 through 1000 files

Default: 10 files

- **match regular-expression**—Refine the output to include lines that contain the regular expression.
- **size maximum-file-size**—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the trace-file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

Syntax: x K to specify KB, x m to specify MB, or x g to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option
- **no-remote-trace**—Set remote tracing as disabled.

**Required Privilege Level**    trace—To view this statement in the configuration.  
                                  trace-control—To add this statement to the configuration.

**Related Documentation**    • *IDP Monitoring and Troubleshooting Guide for Security Devices*

## traceoptions (Security IDP)

<b>Syntax</b>	<pre> traceoptions {   file {     filename;     files number;     match regular-expression;     size maximum-file-size;     (world-readable   no-world-readable);   }   flag all;   level (all   error   info   notice   verbose   warning);   no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit security idp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure IDP tracing options.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>file</b>—Configure the trace file options. <ul style="list-style-type: none"> <li><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, the name of the file is the name of the process being traced.</li> <li><b>files number</b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b> then <b>trace-file.1</b> and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> </li> <li><b>match regular-expression</b>—Refine the output to include lines that contain the regular expression.</li> <li><b>size maximum-file-size</b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When <b>trace-file.0</b> again reaches its maximum size, <b>trace-file.1</b> is renamed <b>trace-file.2</b> and <b>trace-file.0</b> is renamed <b>trace-file.1</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option and a filename.</p> <p>Syntax: <b>x K</b> to specify KB, <b>x m</b> to specify MB, or <b>x g</b> to specify GB</p> <p>Range: 10 KB through 1 GB</p>

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Trace operation to perform.
  - **all**—Trace with all flags enabled
- **level**—Set the level of debugging the output option.
  - **all**—Match all levels
  - **error**—Match error conditions
  - **info**—Match informational messages
  - **notice**—Match conditions that should be handled specially
  - **verbose**—Match verbose messages
  - **warning**—Match warning messages
- **no-remote-trace**—Set remote tracing as disabled.

<b>Required Privilege</b>	trace—To view this statement in the configuration.
<b>Level</b>	trace-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li></ul>
------------------------------	--

## ttl (Security IDP)

---

<b>Syntax</b>	<pre>ttl {     match (equal   greater-than   less-than   not-equal);     value <i>time-to-live</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the time-to-live (TTL) value of the packet. This value represents the number of routers the packet can pass through. Each router that processes the packet decrements the TTL by 1; when the TTL reaches 0, the packet is discarded.
<b>Options</b>	<p><b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</p> <p><b>value <i>time-to-live</i></b>—The time-to-live value.</p> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## tunable-name

---

<b>Syntax</b>	<code>tunable-name <i>tunable-name</i> {     tunable-value <i>protocol-value</i>; }</code>
<b>Hierarchy Level</b>	[edit security idp sensor-configuration detector protocol-name <i>protocol-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for file format decoding over HTTP using MIME added in Junos OS Release 11.2.
<b>Description</b>	Specify the name of the tunable parameter to enable or disable the protocol detector for each of the service. By default, the protocol decoders for all services are enabled.
<b>Options</b>	<p><i>tunable-name</i>—Name of the specific tunable parameter.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li></ul>

## tunable-value

---

<b>Syntax</b>	<code>tunable-value protocol-value;</code>
<b>Hierarchy Level</b>	<code>[edit security idp sensor-configuration detector protocol-name protocol-name tunable-name tunable-name]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Support for file format decoding over HTTP using MIME added in Junos OS Release 11.2.
<b>Description</b>	Specify the value of the tunable parameter to enable or disable the protocol detector for each of the services.
<b>Options</b>	<i>tunable-value</i> —Integer representing a selected option for the switch specified in <i>tunable-name</i> . The range of values depends on the options defined for the specified switch.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP SSL Inspection Feature Guide for Security Devices</i></li></ul>

## type (Security IDP Dynamic Attack Group)

---

<b>Syntax</b>	<pre>type {   values [anomaly signature]; }</pre>
<b>Hierarchy Level</b>	<code>[edit security idp dynamic-attack-group dynamic-attack-group-name filters]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify an attack type filter to add attack objects based on the type of attack object (signature or protocol anomaly).
<b>Options</b>	<i>values</i> —Name of the attack type filter.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## type (Security IDP ICMP Headers)

---

<b>Syntax</b>	<pre>type {     match (equal   greater-than   less-than   not-equal);     value <i>type-value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol icmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the primary code that identifies the function of the request/reply.
<b>Options</b>	<p><b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</p> <p><b>value <i>type-value</i></b>—Match a decimal value.</p> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## udp (Security IDP Protocol Binding)

---

<b>Syntax</b>	udp { minimum-port <i>port-number</i> <maximum-port <i>port-number</i> >; }
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type chain protocol-binding] [edit security idp custom-attack <i>attack-name</i> attack-type signature protocol-binding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Allow IDP to match the attack for specified UDP ports.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>minimum-port <i>port-number</i></b>—Minimum port in the port range. <b>Range:</b> 0 through 65,535</li><li>• <b>maximum-port <i>port-number</i></b>—Maximum port in the port range. <b>Range:</b> 0 through 65,535</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## udp (Security IDP Signature Attack)

```
Syntax  udp {
          data-length {
            match (equal | greater-than | less-than | not-equal);
            value data-length;
          }
          destination-port {
            match (equal | greater-than | less-than | not-equal);
            value destination-port;
          }
          source-port {
            match (equal | greater-than | less-than | not-equal);
            value source-port;
          }
        }
```

**Hierarchy Level** [edit security idp custom-attack *attack-name* attack-type signature protocol]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Allow IDP to match the UDP header information for the signature attack.

**Options** The remaining statements are explained separately.

**Required Privilege** security—To view this statement in the configuration.  
**Level** security-control—To add this statement to the configuration.

**Related Documentation**

- *IDP Policies Feature Guide for Security Devices*
- *IDP Application Identification Feature Guide for Security Devices*

## urgent-pointer

---

<b>Syntax</b>	<pre>urgent-pointer {   match (equal   greater-than   less-than   not-equal);   value <i>urgent-pointer</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the data in the packet is urgent; the URG flag must be set to activate this field.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>urgent-pointer</i>—Match the value of the urgent pointer.</li></ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## url (Security IDP)

---

<b>Syntax</b>	<pre>url <i>url-name</i>;</pre>
<b>Hierarchy Level</b>	[edit security idp security-package]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Specify the URL to automatically download the updated signature database.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li></ul>

## window-scale

---

<b>Syntax</b>	<pre> window-scale {     match (equal   greater-than   less-than   not-equal);     value <i>window-scale-factor</i>; } </pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the scale factor that the session of the attack will use. The window scale extension expands the definition of the TCP window to 32 bits and then uses a scale factor to carry this 32-bit value in the 16-bit window field of the TCP header.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li> <li><b>value</b> <i>window-scale-factor</i>—Match the number of bytes.</li> </ul> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>IDP Policies Feature Guide for Security Devices</i></li> <li><i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>

## window-size

---

<b>Syntax</b>	<pre>window-size {     match (equal   greater-than   less-than   not-equal);     value <i>window-size</i>; }</pre>
<b>Hierarchy Level</b>	[edit security idp custom-attack <i>attack-name</i> attack-type signature protocol tcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the number of bytes in the TCP window size.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>match</b> (equal   greater-than   less-than   not-equal)—Match an operand.</li><li>• <b>value</b> <i>window-size</i>—Match the number of bytes.</li></ul> <p><b>Range:</b> 0 through 65,535</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>

## Administration

---

- [Alarms and Auditing on page 2176](#)
- [Packet Capture on page 2177](#)

- [Clear Commands on page 2183](#)
- [Request Commands on page 2198](#)
- [Show Commands on page 2208](#)

## Alarms and Auditing

- [IDP Alarms and Auditing on page 2176](#)

### IDP Alarms and Auditing

---

By default, IDP logs the occurrence of an event without raising an alarm to the administrator. When the system is configured to log an event and the **potential-violation** option is set, IDP logs on the Packet Forwarding Engine are forwarded to Routing Engine. The Routing Engine then parses the IDP attack logs and raises IDP alarms as necessary.

- To enable an IDP alarm, use the **set security alarms potential-violation idp** command.
- To verify that the configuration is working properly, use the **show security alarms** command.

**NOTE:** In releases before Junos OS Release 11.2, IDP attack logs contain information about an attack event but do not raise alarms to the administrator.

## Packet Capture

- [Example: Configuring Security Packet Capture on page 2177](#)
- [Example: Configuring Packet Capture for Datapath Debugging on page 2179](#)
- [Verifying Security Packet Capture on page 2182](#)

### Example: Configuring Security Packet Capture

This example shows how to configure the security packet capture.

- [Requirements on page 2177](#)
- [Overview on page 2177](#)
- [Configuration on page 2177](#)
- [Verification on page 2179](#)

#### Requirements

Before you begin, configure network interfaces.

#### Overview

In this example, you configure a packet capture for rule 1 of policy pol0. The rule specifies that, if an attack occurs, 10 packets before the attack and 3 packets after the attack will be captured, and that the post-attack capture should time out after 60 seconds. The sensor configuration is modified to allocate 5 percent of available memory and 15 percent of the IDP sessions to packet capture. When the packet capture object is prepared, it is transmitted from device 10.56.97.3 to port 5 on device 10.24.45.7.

#### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set security idp idp-policy pol0 rulebase-ips rule 1 then notification packet-log pre-attack
  10 post-attack 3 post-attack-timeout 60
set security idp sensor-configuration packet-log total-memory 5 max-sessions 15
  source-address 10.56.97.3 host 10.24.45.7 port 5
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the security packet capture:

1. Navigate to the notification level for rule 1, policy pol0 in the configuration hierarchy.

```
[edit]
user@host# edit security idp idp-policy pol0 rulebase-ips rule 1 then notification
```

2. Define the size and timing constraints for each packet capture.

```
[edit security idp idp-policy pol0 rulebase-ips rule 1 then notification]
user@host# set packet-log pre-attack 10 post-attack 3 post-attack-timeout 60
```

3. Enable the security idp sensor-configuration.

```
[edit]
user@host# edit security idp sensor-configuration
```

4. Allocate the device resources to be used for packet capture.

```
[edit security idp sensor-configuration]
user@host# set packet-log total-memory 5 max-sessions 15
```

5. Identify the source and host devices for transmitting the packet-capture object.

```
[edit security idp sensor-configuration]
user@host# set packet-log source-address 10.56.97.3 host 10.24.45.7 port 5
```

**Results** From configuration mode, confirm your configuration by entering the **show security idp** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security idp

idp-policy pol0 {
  rulebase-ips {
    rule 1 {
      then {
        notification {
          packet-log {
            pre-attack 10;
            post-attack 3;
            post-attack-timeout 60;
          }
        }
      }
    }
  }
  sensor-configuration {
    packet-log {
      host 10.24.45.7 5;
      max-sessions 15;
      source-address 10.56.97.3;
      total-memory 5;
    }
  }
}
```

```
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying Security Packet Capture on page 2179](#)

### Verifying Security Packet Capture

**Purpose** Verify security packet capture.

**Action** From operational mode, enter the **show security idp counters packet-log** command.

```
user@host> show security idp counters packet-log
```

IDP counters:	Value
Total packets captured since packet capture was activated	0
Total sessions enabled since packet capture was activated	0
Sessions currently enabled for packet capture	0
Packets currently captured for enabled sessions	0
Packet clone failures	0
Session log object failures	0
Session packet log object failures	0
Sessions skipped because session limit exceeded	0
Packets skipped because total memory limit exceeded	0

**Related Documentation** • [Understanding Security Packet Capture on page 1998](#)

### Example: Configuring Packet Capture for Datapath Debugging

This example shows how to configure packet capture to monitor traffic that passes through the device. Packet Capture then dumps the packets into a PCAP file format that can be later examined by the tcpdump utility.

- [Requirements on page 2179](#)
- [Overview on page 2179](#)
- [Configuration on page 2180](#)
- [Verification on page 2181](#)

### Requirements

Before you begin, see “[Debugging the Data Path \(CLI Procedure\)](#)” on page 1279.

### Overview

A filter is defined to filter traffic; then an action profile is applied to the filtered traffic. The action profile specifies a variety of actions on the processing unit. One of the supported actions is packet dump, which sends the packet to the Routing Engine and stores it in proprietary form to be read using the **show security datapath-debug capture** command.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set security datapath-debug capture-file my-capture
set security datapath-debug capture-file format pcap
set security datapath-debug capture-file size 1m
set security datapath-debug capture-file files 5
set security datapath-debug maximum-capture-size 400
set security datapath-debug action-profile do-capture event np-ingress packet-dump
set security datapath-debug packet-filter my-filter action-profile do-capture
set security datapath-debug packet-filter my-filter source-prefix 1.2.3.4/32
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure packet capture:

1. Edit the security datapath-debug option for the multiple processing units along the packet-processing path:

```
[edit]
user@host# edit security datapath-debug
```

2. Enable the capture file, the file format, the file size, and the number of files. Size number limits the size of the capture file. After the limit size is reached, if the file number is specified, then the capture file will be rotated to filename x, where x is auto-incremented until it reaches the specified index and then returns to zero. If no files index is specified, the packets will be discarded after the size limit is reached. The default size is 512 kilobytes.

```
[edit security datapath-debug]
user@host# set capture-file my-capture format pcap size 1m files 5
[edit security datapath-debug]
user@host# set maximum-capture-size 400
```

3. Enable action profile and set the event. Set the action profile as do-capture and the event type as np-ingress:

```
[edit security datapath-debug]
user@host# edit action-profile do-capture
[edit security datapath-debug action-profile do-capture]
user@host# edit event np-ingress
```

4. Enable packet dump for the action profile:

```
[edit security datapath-debug action-profile do-capture event np-ingress]
user@host# set packet-dump
```

5. Enable packet filter, action, and filter options. The packet filter is set to my-filter, the action profile is set to do-capture, and filter option is set to source-prefix 1.2.3.4/32.

```
[edit security datapath-debug]
user@host# set security datapath-debug packet-filter my-filter action-profile
do-capture

[edit security datapath-debug]
user@host# set security datapath-debug packet-filter my-filter source-prefix
1.2.3.4/32
```

**Results** From configuration mode, confirm your configuration by entering the **show security datapath-debug** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. The following is **show security datapath-debug** output from the **show security datapath-debug** command:

```
security {
  datapath-debug {
    capture-file {
      my-capture
      format pcap
      size 1m
      files 5;
    }
  }
  maximum-capture-size 100;
  action-profile do-capture {
    event np-ingress {
      packet-dump
    }
  }
  packet-filter my-filter {
    source-prefix 1.2.3.4/32
    action-profile do-capture
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying Packet Capture on page 2181](#)
- [Verifying data path debugging capture on page 2182](#)
- [Verifying data path debugging counter on page 2182](#)

### Verifying Packet Capture

**Purpose** Verify if the packet capture is working.

**Action** From operational mode, enter the **request security datapath-debug capture start** command to start packet capture and enter the **request security datapath-debug capture stop** command to stop packet capture.

To view the results, from CLI operational mode, access the local UNIX shell and navigate to the directory `/var/log/my-capture`. The result can be read by using the `tcpdump` utility.

**Verifying data path debugging capture**

**Purpose** Verify the details of data path debugging capture file.

**Action** From operational mode, enter the `show security datapath-debug capture` command.

```
user@host>show security datapath-debug capture
```

**Verifying data path debugging counter**

**Purpose** Verify the details of the data path debugging counter.

**Action** From operational mode, enter the `show security datapath-debug counter` command.

- [Packet Capture Overview on page 1246](#)
  - [Understanding Data Path Debugging for SRX Series Devices on page 1242](#)
  - [Debugging the Data Path \(CLI Procedure\) on page 1279](#)

**Verifying Security Packet Capture**

**Purpose** Monitor packet capture statistics issuing the following `show` command from the CLI prompt.

**Action** `user@host> show security idp counters packet-log`

IDP counters:	Value
Total packets captured since packet capture was activated	0
Total sessions enabled since packet capture was activated	0
Sessions currently enabled for packet capture	0
Packets currently captured for enabled sessions	0
Packet clone failures	0
Session log object failures	0
Session packet log object failures	0
Sessions skipped because session limit exceeded	0
Packets skipped because total memory limit exceeded	0

- [Understanding Security Packet Capture on page 1998](#)
  - [Example: Configuring Security Packet Capture on page 2177](#)
  - [Example: Configuring Packet Capture for Datapath Debugging on page 1289](#)

**Tuning**

- [Configuring Session Capacity for IDP \(CLI Procedure\) on page 2182](#)

**Configuring Session Capacity for IDP (CLI Procedure)**

The configuration instructions in this topic describe how modify session capacity for IDP policies.

You do this by adding the `maximize-idp-sessions` command and then adding the weight option to specify IDP sessions.

**NOTE:** The weight option depends on the `maximize-idp-sessions` command being set.

1. If you have an active IDP policy, you can configure the device to increase IDP session capacity by entering following command:  

```
user@host#set security forwarding-process application-services maximize-idp-sessions
```
2. You can further adjust the weight of the firewall and IDP processing functions, such as in the case of heavier IDP policies with the following command:..  

```
user@host#set security forwarding-process application-services maximize-idp-sessions weight idp
```
3. Commit your changes. You must reboot the device for any session capacity setting changes to take effect.

**NOTE:** If the device has `maximize-idp-sessions` weight enabled for IDP, and you do not have an IDP policy configured, a warning message appears when you commit your configuration. If you see this warning, you should remove your configured settings.

To turn `maximize-idp-sessions` settings off, remove the `maximize-idp-sessions` configuration.

**NOTE:** You must reboot the device for any `maximize-idp-sessions` setting changes to take effect.

## clear security idp counters application-identification

---

<b>Syntax</b>	clear security idp counters application-identification
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the application identification counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">application-identification on page 2026</a></li><li>• <a href="#">show security idp counters application-identification on page 2224</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters dfa

---

<b>Syntax</b>	clear security idp counters dfa
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the DFA counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp counters dfa on page 2226</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters flow

---

<b>Syntax</b>	clear security idp counters flow
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the IDP flow-related counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">flow (Security IDP) on page 2068</a></li><li>• <a href="#">show security idp counters flow on page 2227</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters http-decoder

---

<b>Syntax</b>	clear security idp counters http-decoder
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Reset all the HTTP decoder counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp counters http-decoder on page 2234</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters ips

---

<b>Syntax</b>	clear security idp counters ips
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the ips counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">ips on page 2088</a></li><li>• <a href="#">show security idp counters ips on page 2235</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters log

---

<b>Syntax</b>	clear security idp counters log
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the IDP log counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">event-rate on page 1672</a></li><li>• <a href="#">show security idp counters log on page 2238</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters packet

---

<b>Syntax</b>	clear security idp counters packet
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the IDP packet counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp counters packet on page 2241</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## [clear security idp counters policy-manager](#)

---

<b>Syntax</b>	clear security idp counters policy-manager
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the IDP policies counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp counters policy-manager on page 2246</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp counters tcp-reassembler

---

<b>Syntax</b>	clear security idp counters tcp-reassembler
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Reset all the TCP reassembler counter values.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">re-assembler on page 2118</a></li><li>• <a href="#">show security idp counters tcp-reassembler on page 2247</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security idp ssl-inspection session-id-cache

---

<b>Syntax</b>	clear security idp ssl-inspection session-id-cache
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	Clear all the entries stored in the SSL session ID cache.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp ssl-inspection session-id-cache on page 2261</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>List of Sample Output</b>	<a href="#">clear security idp ssl-inspection session-id-cache on page 2198</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear security idp ssl-inspection session-id-cache

```
user@host> clear security idp ssl-inspection session-id-cache
Total SSL session cache entries cleared : 2
```

### Request Commands

- [request security datapath-debug capture start](#)
- [request security idp security-package download](#)
- [request security idp security-package install](#)
- [request security idp ssl-inspection key add](#)

## request security datapath-debug capture start

---

<b>Syntax</b>	request security datapath-debug capture start
<b>Release Information</b>	Command introduced in Junos OS Release 10.0.
<b>Description</b>	Start the data path debugging capture.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Master Administrator for Logical Systems Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security datapath-debug capture start

```
user@host> request security datapath-debug capture start
datapath-debug capture started on file
```

## request security idp security-package download

<b>Syntax</b>	<pre>request security idp security-package download &lt;check-server&gt; &lt;full-update&gt; &lt;policy-templates&gt; &lt;version <i>version-number</i> &gt; &lt;status&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Detailed status added in Junos OS Release 10.1. Description modified in Junos OS Release 11.1. Application package support added in Junos OS Release 11.4.
<b>Description</b>	<p>Manually download the individual components of the security package from the Juniper Security Engineering portal. The components are downloaded into a staging folder inside the device.</p> <p>By default, this command tries to download the delta set attack signature table. It also downloads IDP, IPS, and application package signatures.</p>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>check-server</b>—(Optional) Retrieve the version information of the latest security package from the security portal server.</li> <li>• <b>full-update</b>—(Optional) Download the latest security package with the full set of attack signature tables from the portal.</li> <li>• <b>policy-templates</b>—(Optional) Download the latest policy templates from the portal.</li> <li>• <b>version <i>version-number</i></b>—(Optional) Download the security package of a specific version from the portal.</li> <li>• <b>status</b>—(Optional) Provide detailed status of security package download operation.</li> </ul>
<b>Additional Information</b>	The <b>request security idp security-package download</b> command does not download security package files if the installed version on the device is same as the security package version on the server ( <a href="https://services.netscreen.com/cgi-bin/index.cgi">https://services.netscreen.com/cgi-bin/index.cgi</a> always). The <b>request security idp security-package download full-update</b> command downloads the latest security package files on the device from the server, irrespective of the version on the device and the server.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li> <li>• <a href="#">show security idp active-policy on page 99</a></li> <li>• <a href="#">show security idp security-package-version on page 2258</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security idp security-package download on page 2201</a>

[request security idp security-package download policy-templates on page 2201](#)  
[request security idp security-package download version 1151 full-update on page 2201](#)  
[request security idp security-package download status on page 2201](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security idp security-package download

```
user@host> request security idp security-package download
Successfully downloaded from(https://services.netscreen.com/cgi-bin/index.cgi).
Version info:1152(Thu Apr 24 14:37:44 2008, Detector=9.1.140080400)
```

## Sample Output

### request security idp security-package download policy-templates

```
user@host> request security idp security-package download policy-templates
Successfully downloaded from(https://services.netscreen.com/cgi-bin/index.cgi).
Version info:35
```

## Sample Output

### request security idp security-package download version 1151 full-update

```
user@host> request security idp security-package download version 1151 full-update
Successfully downloaded from(https://services.netscreen.com/cgi-bin/index.cgi).
Version info:1151(Wed Apr 23 14:39:15 2008, Detector=9.1.140080400)
```

### request security idp security-package download status

To request status for a package download:

```
user@host> request security idp security-package download status
Done;Successfully downloaded
from(https://services.netscreen.com/cgi-bin/index.cgi).
Version info:2014(Thu Oct 20 12:07:01 2011, Detector=11.6.140110920)
```

To request status for a template download:

```
user@host> request security idp security-package download status
Done; Successfully downloaded from
(https://services.netscreen.com/cgi-bin/index.cgi).
```

When devices are operating in chassis cluster mode, when you check the security package download status, a message is displayed confirming that the downloaded security package is being synchronized to the primary and secondary nodes.

```
user@host> request security idp security-package download status
node0:
-----
Done;Successfully downloaded from(https://services.netscreen.com/cgi-bin/index.cgi)
and synchronized to backup.
Version info:2011(Mon Oct 17 15:13:06 2011, Detector=11.6.140110920)
```

## request security idp security-package install

---

<b>Syntax</b>	<code>request security idp security-package install</code> <code>&lt;policy-templates&gt;</code> <code>&lt;status&gt;</code> <code>&lt;update-attack-database-only&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Description modified in Junos OS Release 11.1. Added application package support in Junos OS Release 11.4.
<b>Description</b>	<p>Updates the attack database inside the device with the newly downloaded one from the staging folder, recompiles the existing running policy, and pushes the recompiled policy to the data plane.</p> <p>Also, if there is an existing running policy, and the previously installed detector's version is different from the newly downloaded one, the downloaded components are pushed to the data plane. This command installs IDP, IPS, and application package signatures.</p>
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>policy-templates</b>—(Optional) Installs the policy template file into <code>/var/db/scripts/commit/templates</code>.</li><li>• <b>status</b>—(Optional) The command <b>security-package install</b> may take a long time depending on the new Security database size. Hence, <b>security-package install</b> command returns immediately and a background process performs the task. User can check the status using <b>security-package install status</b> command.</li><li>• <b>update-attack-database-only</b>—(Optional) Loads the security package into IDP database but does not compile/push the active policy or the new detector to the data plane.</li></ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li><li>• <a href="#">show security idp active-policy on page 99</a></li><li>• <a href="#">show security idp security-package-version on page 2258</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security idp security-package install on page 2202</a> <a href="#">request security idp security-package install status on page 2203</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security idp security-package install

```
user@host> request security idp security-package install
Will be processed in async mode. Check the status using the status checking CLI
```

## Sample Output

### request security idp security-package install status

To request status on a package installation:

```
user@host> request security idp security-package install status
Done; Attack DB update : successful - [UpdateNumber=1152, ExportDate=Thu Apr 24
14:37:44 2008]
    Updating data-plane with new attack or detector : not performed
    due to no existing active policy found.
```

To request status on a template installation:

```
user@host> request security idp security-package install status
Done; policy-template has been successfully updated into internal repository
(=>/var/db/scripts/commit/templates.xml)!
```

## request security idp ssl-inspection key add

<b>Syntax</b>	<code>request security idp ssl-inspection key add &lt;key-name&gt; [file &lt;file-name&gt;] [password &lt;password-string&gt;] [server &lt;server-ip&gt;]</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	Install a Privacy-Enhanced Mail (PEM) key that is optionally password protection, and associate a server with an installed key. The length of each key name and password string should not exceed 32 alphanumeric characters.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>key-name</b>—Name of the SSL private key.</li> <li>• <b>file &lt;file-name&gt;</b>—(Optional) Location of RSA private key (PEM format) file.</li> <li>• <b>password &lt;password-string&gt;</b>—(Optional) Password used to encrypt specified key.</li> <li>• <b>server &lt;server-ip&gt;</b>—(Optional) Server IP address to be added to the specified key.</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security idp ssl-inspection key on page 2259</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security idp ssl-inspection key add key1 file /var/tmp/enc1.key password encrypted on page 2204</a> <a href="#">request security idp ssl-inspection key add key2 file /var/tmp/enc2.key password encrypted on page 2204</a> <a href="#">request security idp ssl-inspection key add key3 file /var/tmp/norm.key on page 2205</a> <a href="#">request security idp ssl-inspection key add key1 server 1.1.0.1 on page 2205</a> <a href="#">request security idp ssl-inspection key add key1 server 1.1.0.2 on page 2205</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

[request security idp ssl-inspection key add key1 file /var/tmp/enc1.key password encrypted](#)

```
user@host> request security idp ssl-inspection key add key1 file /var/tmp/enc1.key password encrypted
Added key 'key1'
```

### Sample Output

[request security idp ssl-inspection key add key2 file /var/tmp/enc2.key password encrypted](#)

```
user@host> request security idp ssl-inspection key add key2 file /var/tmp/enc2.key password encrypted
Added key 'key2', server 2.2.0.1
```

### Sample Output

request security idp ssl-inspection key add key3 file /var/tmp/norm.key

```
user@host> request security idp ssl-inspection key add key3 file /var/tmp/norm.key
Added key 'key3'
```

### Sample Output

request security idp ssl-inspection key add key1 server 1.1.0.1

```
user@host> request security idp ssl-inspection key add key1 server 1.1.0.1
Added key 'key1', server 1.1.0.1
```

### Sample Output

request security idp ssl-inspection key add key1 server 1.1.0.2

```
user@host> request security idp ssl-inspection key add key1 server 1.1.0.2
Added key 'key1', server 1.1.0.2
```

## request security idp ssl-inspection key delete

<b>Syntax</b>	request security idp ssl-inspection key delete [ <b>&lt;key-name&gt;</b> ] [ <b>server &lt;server-ip&gt;</b> ]
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	Delete the specified server IP from the given key if the server is specified. If the server IP is not specified, the given key will be deleted along with all the server addresses associated with it.
<div>  <b>NOTE:</b> You will get a delete confirmation question before deleting one or more keys or server. </div>	
<b>Options</b>	<ul style="list-style-type: none"> <li><b>key-name</b>—(Optional) Name of the SSL private key.</li> <li><b>server &lt;server-ip&gt;</b> —(Optional) Server IP address associated with the specified key to be deleted.</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show security idp ssl-inspection key on page 2259</a></li> <li><i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security idp ssl-inspection key delete on page 2206</a> <a href="#">request security idp ssl-inspection key delete key1 on page 2206</a> <a href="#">request security idp ssl-inspection key delete key2 server 2.2.0.1 on page 2207</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security idp ssl-inspection key delete

```
user@host> request security idp ssl-inspection key delete
```

```
This command will delete one or more ssl keys.  
Continue? [yes,no] (no) yes
```

```
Number of keys 4, server 3 deleted
```

### Sample Output

#### request security idp ssl-inspection key delete key1

```
user@host> request security idp ssl-inspection key delete key1
```

```
This command will delete one or more ssl keys.  
Continue? [yes,no] (no) yes
```

Number of keys 1, server 2 deleted

## Sample Output

`request security idp ssl-inspection key delete key2 server 2.2.0.1`

```
user@host> request security idp ssl-inspection key delete key2 server 2.2.0.1
```

This command will delete one or more ssl keys.

Continue? [yes,no] (no) yes

Number of keys 0, server 1 deleted

## request security idp storage-cleanup

---

<b>Syntax</b>	request security idp storage-cleanup
<b>Release Information</b>	Command introduced in Junos OS Release 11.4.
<b>Description</b>	Delete unused files to free up storage space on a device.
<b>Options</b>	<b>cache-files</b> — Delete DFA cache files used for optimizing idp policy compilation.  <b>downloaded-files</b> — Delete downloaded security-package files (with out affecting the installed database).
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request security idp storage-cleanup on page 2208</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security idp storage-cleanup

```
user@host> request security idp storage-cleanup downloaded-files
Successfully deleted downloaded secdb files
```

## show security flow session idp family

<b>Syntax</b>	show security flow session idp family (inet   inet6)
<b>Release Information</b>	Command introduced in Junos OS Release 10.2. Support for family inet6 added in Junos OS Release 12.1X46-D10.
<b>Description</b>	Display filtered summary of information about existing sessions, including types of sessions, active and failed sessions, and the maximum allowed number of sessions.
<b>Options</b>	inet—Display details summary of IPv4 sessions.  inet6—Display details summary of IPv6 sessions.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Monitoring and Troubleshooting Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security flow session summary family inet on page 2210</a> <a href="#">show security flow session summary family inet6 on page 2211</a>
<b>Output Fields</b>	Table 279 on page 2210 lists the output fields for the <b>show security flow session summary family</b> command. Output fields are listed in the approximate order in which they appear.

Table 279: show security flow session summary Output Fields

Field Name	Field Description
Valid sessions	Count of valid sessions.
Pending sessions	Count of pending sessions.
Invalidated sessions	Count of sessions the security device has determined to be invalid.
Sessions in other states	Count of sessions not in valid, pending, or invalidated state.
Total sessions	Total of the above counts.

## Sample Output

### show security flow session summary family inet

```

user@host> show security flow session summary family inet
Flow Sessions on FPC4 PIC0:
Valid sessions: 3
Pending sessions: 0
Invalidated sessions: 0
Sessions in other states: 0
Total sessions: 3

Flow Sessions on FPC5 PIC0:

```

```
Valid sessions: 4  
Pending sessions: 0  
Invalidated sessions: 0  
Sessions in other states: 0  
Total sessions: 4
```

#### `show security flow session summary family inet6`

```
user@host> show security flow session summary family inet6
```

```
Flow Sessions on FPC1 PIC1:  
Valid sessions: 20  
Pending sessions: 0  
Invalidated sessions: 0  
Sessions in other states: 0  
Total sessions: 20
```

## show security flow session idp summary

<b>Syntax</b>	<b>show security flow session idp summary</b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2.
<b>Description</b>	Display summary output.
<b>Options</b>	<ul style="list-style-type: none"> <li>• application—Application name</li> <li>• destination-port—Destination port</li> <li>• destination-prefix—Destination IP prefix or address</li> <li>• family—Display session by family.</li> <li>• interface—Name of incoming or outgoing interface</li> <li>• protocol—IP protocol number</li> <li>• source-port—Source port</li> <li>• source-prefix—Source IP prefix</li> </ul>

```

```
Pending sessions: 0
```

```
Invalidated sessions: 0
```

```
Sessions in other states: 0
```

```
Total sessions: 4
```

## show security idp active-policy

<b>Syntax</b>	show security idp active-policy
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display information about the policy name and running detector version with which the policy is compiled from the IDP data plane module.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request security idp security-package download on page 2200</a></li> <li>• <a href="#">request security idp security-package install on page 2202</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Class of Service Action Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp active-policy on page 2214</a>
<b>Output Fields</b>	Table 12 on page 99 lists the output fields for the <b>show security idp active-policy</b> command. Output fields are listed in the approximate order in which they appear.

Table 281: show security idp active-policy Output Fields

Field Name	Field Description
Policy Name	Name of the running policy.
Running Detector Version	Current version of the running detector.

## Sample Output

### show security idp active-policy

```
user@host> show security idp active-policy
Policy Name : viking-policy
Running Detector Version : 9.1.140080300
```

## show security idp application-ddos application

<b>Syntax</b>	show security idp application-ddos application
<b>Release Information</b>	Command introduced in Junos OS Release 10.0.
<b>Description</b>	Display basic statistics for the servers being protected by the IDP application-level DDoS feature.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>application-name</b>—Display information on a specific application-level DDoS application profile.</li> <li>• <b>context</b>—Name of the application context for <i>application-name</i></li> <li>• <b>detail</b>—Display a detailed view of the protected servers.</li> <li>• <b>server</b>—IP address of protected server.</li> <li>• <b>zone</b>—Zone name where the protected server resides.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp application-ddos application on page 2216</a> <a href="#">show security idp application-ddos application detail on page 2216</a>
<b>Output Fields</b>	<a href="#">Table 282 on page 2215</a> lists the output fields for the <b>show security idp application-ddos application</b> command.

**Table 282: show security idp application-ddos Output Fields**

Field Name	Field Description
Zone	Security zone where the protected server resides.
Server	IP address of the protected server.
Application	Name of the application-level DDoS application.
Conn/sec	Number of client connections to the protected server.
Context	Protocol context that is being monitored.
Contexts/tick	Number of protocol context hits measured per tick. One tick equals 60 seconds by default.

## Sample Output

### show security idp application-ddos application

```
user@host> show security idp application-ddos application
```

Zone	Server	Application	Conn/sec	Context	Contexts/tick
trust	81.0.3.1	http-server-1	2648/sec	http-header-user-agent	35746/60sec
trust	81.1.0.2	dns-server-1	4517/sec	dns-type-name	263234/60sec
trust	81.1.0.2	dns-server-1	1497/sec	dns-type-name	88061/60sec
trust	81.0.3.1	http-server1	1496/sec	http-url-parsed	81177/60sec

...

## Sample Output

### show security idp application-ddos application detail

```
user@host> show security idp application-ddos application detail
```

```
Zone: trust Server: 81.1.0.2 Application: dns-server-1 Connections/sec:
1499/secContext: dns-type-name Contexts/tick: 88061/60sec
Value: 00 05 74 65 73 74 6e 61 6d 65 2e 6a 75 6e 69 70 testname.juniper.net
Value: 65 72 2e 6e 65 74
Context values/tick : 29143/60sec
```

```
Zone: trust Server: 81.0.3.1 Application: http-server-1 Connections/sec:

Context values/tick : 26809/60sec
```

...

## show security idp attack description

Syntax	<code>show security idp attack description <i>attack-name</i></code>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Display description of a specified IDP attack.
Options	<ul style="list-style-type: none"> <li><i>attack-name</i> —IDP attack name.</li> </ul>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">clear security idp attack table on page 2188</a></li> <li><i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
List of Sample Output	<a href="#">show security idp attack description on page 2217</a>
Output Fields	<a href="#">Table 283 on page 2217</a> lists the output fields for the <code>show security idp attack description</code> command. Output fields are listed in the approximate order in which they appear.

Table 283: show security idp attack description Output Fields

Field Name	Field Description
Description	IDP attack description.

## Sample Output

### show security idp attack description

```
user@host> show security idp attack description FTP:USER:ROOT
```

Description: This signature detects attempts to login to an FTP server using the "root" account. This can indicate an attacker trying to gain root-level access, or it can indicate poor security practices. FTP typically uses plain-text passwords, and using the root account to FTP could expose sensitive data over the network.

## show security idp attack detail

<b>Syntax</b>	<b>show security idp attack detail <i>attack-name</i></b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4.
<b>Description</b>	Display details of a specified IDP attack.
<b>Options</b>	<ul style="list-style-type: none"> <li><b><i>attack-name</i></b> —IDP attack name.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear security idp attack table on page 2188</a></li> <li><i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp attack detail on page 2218</a>
<b>Output Fields</b>	<a href="#">Table 284 on page 2218</a> lists the output fields for the <b>show security idp attack detail</b> command. Output fields are listed in the approximate order in which they appear.

**Table 284: show security idp attack detail Output Fields**

Field Name	Field Description
Display Name	Display name of the IDP attack.
Severity	Severity level of the IDP attack.
Category	IDP attack category.
Recommended	Specifies whether a default action for the IDP attack is recommended by Juniper Networks (true or false).
Recommended Action	Recommended action for the IDP attack.
Type	Type of IDP attack.
Direction	Direction of the IDP attack.
False Positives	Specifies whether the IDP attack produces false positive on the network.
Service	IDP service configured for the IDP attack. If a service is configured for the IDP attack, the IDP service name is displayed. Otherwise, <b>Not available</b> is displayed.

## Sample Output

### show security idp attack detail

```
user@host> show security idp attack detail FTP:USER:ROOT
```

Display Name: FTP: "root" Account Login  
Severity: Minor  
Category: FTP  
Recommended: false  
Recommended Action: None  
Type: signature  
Direction: CTS  
False Positives: unknown  
Service: Not available

## show security idp attack table

<b>Syntax</b>	show security idp attack table
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display detailed information of IDP attack table.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp attack table on page 2188</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp attack table on page 2220</a>
<b>Output Fields</b>	Table 285 on page 2220 lists the output fields for the <b>show security idp attack table</b> command. Output fields are listed in the approximate order in which they appear.

**Table 285: show security idp attack table Output Fields**

Field Name	Field Description
<b>Attack name</b>	Name of the attack that you want to match in the monitored network traffic.
<b>Hits</b>	<p>Total number of attack matches.</p> <p>On SRX Series and J Series devices, for brute force and time-binding-related attacks, the logging is to be done only when the match <b>count</b> is equal to the <b>threshold</b>. That is, only one log is generated within the 60-second period in which the threshold is measured. This process prevents repetitive logs from being generated and ensures consistency with other IDP platforms, such as IDP-standalone.</p> <p>When no attack is seen within the 60-second period and the BFQ entry is flushed out, the match count starts over the new attack match shows up in the attack table, and the log is generated.</p>

## Sample Output

### show security idp attack table

```

user@host> show security idp attack table
IDP attack statistics:
  Attack name                               #Hits
  HTTP:OVERFLOW:PI3WEB-SLASH-OF             1

```

## show security idp counters application-ddos

<b>Syntax</b>	show security idp counters application-ddos
<b>Release Information</b>	Command introduced in Junos OS Release 10.0.
<b>Description</b>	Display the status of all IDP application-ddos counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Application-Level Distributed Denial of Service Feature Guide for Security Devices</i></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters application-ddos on page 2222</a>
<b>Output Fields</b>	Table 286 on page 2221 lists the output fields for the <b>show security idp counters application-ddos</b> command. Output fields are listed in the approximate order in which they appear.

**Table 286: show security idp counters application-ddos Output Fields**

Field Name	Field Description
App-DDOS inspected flows	Number of client-to-server flows inspected for application-ddos.
App-DDOS failed flows	Number of client-to-server flows that failed during application-ddos processing.
App-DDOS ignored flows	Number of client-to-server flows ignored for application-ddos.
App-DDOS first path failed	Number of client-to-server flow initialization failures during first path.
App-DDOS first path succeeded	Number of successful client-to-server flow initialization during first path.
App-DDOS dropped packets	Number of packets dropped in the application-level DDoS module.
App-DDOS processed packets	Number of total packets processed in the application-level DDoS module.
App-DDOS connection table process succeeded	Number of times connection processing succeeded.
App-DDOS connection table process failed	Number of times connection processing failed.
App-DDOS context process succeeded	Number of times the context processing succeeded.
App-DDOS context process failed	Number of times context processing failed.
App-DDOS ignore context	Number of contexts ignored if the flow is not client-to-server or if the application-level DDoS module is disabled.

Table 286: show security idp counters application-ddos Output Fields (*continued*)

Field Name	Field Description
App-DDOS context values excluded	Number of context values excluded for actions, reporting, or both.
App-DDOS context value process succeeded	Number of times context value processing succeeded, including action and logging events if configured.
App-DDOS context value process failed	Number of times context value processing failed, including action and logging events if configured.
App-DDOS context value prune failed	Number of times context value pruning failed.
App-DDOS no action	Number of times an attack is detected and no action is taken.
App-DDOS drop connection action	Number of times an attack is detected and a drop connection action is taken.
App-DDOS drop packet action	Number of times an attack is detected and a drop packet action is taken.
App-DDOS close server action	Number of times an attack is detected and a close server action is taken.
App-DDOS IP Action block	Number of times an ip-action block entry is created and installed.
App-DDOS IP Action close	Number of times an ip-action close entry is created and installed.
App-DDOS Action notify	Number of times an ip-action notify entry is created and installed.
App-DDOS logs sent	Number of attack logs sent.
App-DDOS logs report failed	Number of attack log reports that failed.

## Sample Output

### show security idp counters application-ddos

```
user@host> show security idp counters application-ddos
```

```

App-DDOS inspected flows          447172
App-DDOS failed flows             0
App-DDOS ignored flows            12267
App-DDOS first path failed        0
App-DDOS first path succeeded     459439
App-DDOS dropped packets          0
App-DDOS processed packets        449118
App-DDOS connection table process succeeded 459439
App-DDOS connection table process failed 0
App-DDOS context process succeeded 449118
App-DDOS context process failed 0
App-DDOS ignore context           0
App-DDOS context values excluded 0
App-DDOS context value process succeeded 449118
App-DDOS context value process failed 0
App-DDOS context value prune failed 0

```

App-DDOS no action	275996
App-DDOS drop connection action	0
App-DDOS drop packet action	0
App-DDOS close server action	0
App-DDOS IP Action block	0
App-DDOS IP Action close	0
App-DDOS IP Action notify	275996
App-DDOS logs sent	238
App-DDOS logs report failed	0

## show security idp counters application-identification

<b>Syntax</b>	show security idp counters application-identification
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Modified in Junos OS Release 12.1.
<b>Description</b>	Display the status of all IDP application identification (AI) counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp counters application-identification on page 2189</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters application-identification on page 2225</a>
<b>Output Fields</b>	<a href="#">Table 287 on page 2224</a> lists the output fields for the <b>show security idp counters application-identification</b> command. Output fields are listed in the approximate order in which they appear.

**Table 287: show security idp counters application-identification Output Fields**

Field Name	Field Description
AI matches	Number of sessions with an AI signature match.
AI no-matches	Number of sessions with no AI signature match.
AI-enabled sessions	Number of sessions with AI enabled.
AI-disabled sessions	Number of sessions with AI disabled.
AI-disabled sessions due to ssl encapsulated flows	Number of sessions with AI disabled due to SSL encapsulated flows.
AI-disabled sessions due to cache hit	Number of sessions with AI disabled due to a cache match.
AI-disabled sessions due to configuration	Number of sessions with AI disabled because the configured session limit was reached.
AI-disabled sessions due to protocol remapping	Number of sessions with AI disabled due to protocol remapping.
AI-disabled sessions due to RPC match	Number of sessions with AI disabled due to an RPC match.
AI-disabled sessions due to non-TCP/UDP flows	Number of sessions with AI disabled due to non-TCP or non-UDP flows.

Table 287: show security idp counters application-identification Output Fields (*continued*)

Field Name	Field Description
AI-disabled sessions due to session limit	Number of sessions with AI disabled because the maximum session limit was reached.
AI-disabled sessions due to session packet memory limit	Number of sessions with AI disabled because the memory usage limit per session was reached.
AI-disabled sessions due to global packet memory limit	Number of sessions with AI disabled because the global memory usage limit was reached.
Packets cloned for AI	Number of packets cloned for application identification.
Policy update	Number of times the IDP policy has been updated.

## Sample Output

### show security idp counters application-identification

```

user@host> show security idp counters application-identification
IDP counters:
IDP counter type                                Value
AI matches                                       4
AI no-matches                                   0
AI-enabled sessions                             4
AI-disabled sessions                            0
AI-disabled sessions due to gate match           0
AI-disabled sessions due to ssl encapsulated flows 0
AI-disabled sessions due to cache hit            0
AI-disabled sessions due to configuration        0
AI-disabled sessions due to protocol remapping   0
AI-disabled sessions due to RPC match            0
AI-disabled sessions due to non-TCP/UDP flows    0
AI-disabled sessions due to session limit        0
AI-disabled sessions due to session packet memory limit 0
AI-disabled sessions due to global packet memory limit 0
Packets cloned for AI                           12
Policy update                                   0

```

## show security idp counters dfa

<b>Syntax</b>	show security idp counters dfa
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display the status of all DFA counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp counters dfa on page 2190</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters dfa on page 2226</a>
<b>Output Fields</b>	<a href="#">Table 288 on page 2226</a> lists the output fields for the <b>show security idp counters dfa</b> command. Output fields are listed in the approximate order in which they appear.

**Table 288: show security idp counters dfa Output Fields**

Field Name	Field Description
DFA Group Merged Usage	Number of DFA groups merged.
DFA Matches	Number of DFA matches found.

## Sample Output

### show security idp counters dfa

```

user@host> show security idp counters dfa
IDP counters:
IDP counter type
DFA Group Merged Usage      Value
DFA Matches                  0
                             1

```

## show security idp counters flow

<b>Syntax</b>	show security idp counters flow
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display the status of all IDP flow counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">flow (Security IDP) on page 2068</a></li> <li>• <a href="#">clear security idp counters flow on page 2191</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters flow on page 2231</a>
<b>Output Fields</b>	<a href="#">Table 289 on page 2227</a> lists the output fields for the <b>show security idp counters flow</b> command. Output fields are listed in the approximate order in which they appear.

**Table 289: show security idp counters flow Output Fields**

Field Name	Description
Fast-path packets	Number of packets that are set through fast path after completing IDP policy lookup.
Slow-path packets	Number of packets that are sent through slow path during IDP policy lookup.
Session construction failed (Unsupported)	Number of times the packet failed to establish the session.
Session limit reached	Number of sessions that reached IDP sessions limit.
Session inspection depth reached	Number of sessions that reached inspection depth.
Memory limit reached	Number of sessions that reached memory limit.
Not a new session (Unsupported)	Number of sessions that extended beyond time limit.
Invalid index at age-out (Unsupported)	Invalid session index in session age-out message.
Packet logging	Number of packets saved for packet logging.
Policy cache hits	Number of sessions that matched policy cache.
Policy cache misses	Number of sessions that did not match policy cache.

Table 289: show security idp counters flow Output Fields (*continued*)

Field Name	Description
Policy cache entries	Number of policy cache entries.
Maximum flow hash collisions	Maximum number of packets, of one flow, that share the same hash value.
Flow hash collisions	Number of packets that share the same hash value.
Gates added	Number of gate entries added for dynamic port identification.
Gate matches (Unsupported)	Number of times a gate is matched.
Sessions deleted	Number of sessions deleted.
Sessions aged-out (Unsupported)	Number of sessions that are aged out if no traffic is received within session timeout value.
Sessions in-use while aged-out (Unsupported)	Number of sessions in use during session age-out.
TCP flows marked dead on RST/FIN	Number of sessions marked dead on TCP RST/FIN.
policy init failed	Policy initiation failed.
Number of times Sessions exceed high mark	Number of times sessions exceeded the high mark.
Number of sessions exceeds high mark	Number of sessions that exceed high mark.
Number of sessions drops below low mark	Number of sessions that fall below low mark.
Memory of sessions exceeds high mark	Session memory exceeds high mark.
Memory of sessions drops below low mark	Session memory drops below low mark.
SM Sessions encountered memory failures	Number of SM sessions that encountered memory failures.
SM Packets on sessions with memory failures	Number of SM packets that encountered memory failures.
Sessions constructed	Number of sessions established.

Table 289: show security idp counters flow Output Fields (*continued*)

Field Name	Description
SM Sessions dropped	Number of SM sessions dropped.
SM sessions ignored	Number of sessions ignored in Security Module (SM).
SM sessions interested	Number of SM sessions interested.
SM sessions not interested	Number of SM sessions not interested.
SM sessions interest error	Number of errors created for SM sessions interested.
Sessions destructed	Number of sessions destructed.
SM Session Create	Number of SM sessions created.
SM Packet Process	Number of packets processed from SM.
SM FTP data session ignored by IDP	Number of SM FTP data sessions that are ignored by IDP.
SM Session close	Number of SM sessions closed.
SM client-to-server packets	Number of SM client-to-server packets.
SM server-to-client packets	Number of SM server-to-client packets.
SM client-to-server L7 bytes	Number of SM client-to-server Layer 7 bytes.
SM server-to-client L7 bytes	Number of SM server-to-client Layer 7 bytes.
Client-to-server flows ignored	Number of client-to-server flow sessions that are ignored.
Server-to-client flows ignored	Number of server-to-client flow sessions that are ignored.
Server-to-client flows tcp optimized	Number of server-to-client flow TCP sessions that are optimized
Client-to-server flows tcp optimized	Number of client-to-server flow TCP sessions that are optimized
Both directions flows ignored	Number of server-to-client and client-to-server flow sessions that are ignored.
Fail-over sessions dropped	Number of failover sessions dropped.
Sessions dropped due to no policy	Number of sessions dropped because there was no active IDP policy.
IDP Stream Sessions dropped due to memory failure	Number of IDP stream sessions that are dropped because of memory failure.
IDP Stream Sessions ignored due to memory failure	Number of IDP stream sessions that are ignored because of memory failure.

Table 289: show security idp counters flow Output Fields (*continued*)

Field Name	Description
<b>IDP Stream Sessions closed due to memory failure</b>	Number of IDP stream sessions that are closed because of memory failure.
<b>IDP Stream Sessions accepted</b>	Number of IDP stream sessions that are accepted.
<b>IDP Stream Sessions constructed</b>	Number of IDP stream sessions that are constructed.
<b>IDP Stream Sessions destructed</b>	Number of IDP stream sessions that are destructed.
<b>IDP Stream Move Data</b>	Number of Stream data events handled by IDP.
<b>IDP Stream Sessions ignored on JSF SSL Event</b>	Number of IDP stream sessions that are ignored because of a JSF SSL proxy event.
<b>IDP Stream Sessions not processed for no matching rules</b>	Number of IDP stream sessions that are not processed for no matching rules.
<b>IDP Stream stbuf dropped</b>	Number of IDP stream plugin buffers dropped.
<b>IDP Stream stbuf reinjected</b>	Number of IDP stream plugin buffers injected.
<b>Busy packets from stream plugin</b>	Number of packets saved as one or more packets of this session from stream plugin.
<b>Busy packets from packets plugin</b>	Number of saved packets for IDP stream plugin sessions.
<b>Bad kpp</b>	Number of internal marked packets logged for IDP processing.
<b>Lsys policy id lookup failed sessions</b>	Number of sessions that failed logical systems policy lookup
<b>Busy packets</b>	Number of packets saved as one or more packets of this session are handed off for asynchronous processing.
<b>Busy packet errors</b>	Number of packets found with IP checksum error after asynchronous processing is completed.
<b>Dropped queued packets (async mode)</b>	Number of queued packets dropped based on policy action, reinjection failures, or if the session is marked to destruct.
<b>Dropped queued packets failed (async mode)</b>	Not used currently.
<b>Reinjected packets (async mode)</b>	Number of packets reinjected into the queue.
<b>Reinjected packets failed (async mode)</b>	Number of failed reinjected packets.
<b>AI saved processed packet</b>	Number of AI packets saved for which the asynchronous processing is completed.

Table 289: show security idp counters flow Output Fields (*continued*)

Field Name	Description
<b>Busy packet count incremented</b>	Number of times the busy packet count incremented in asynchronous processing.
<b>busy packet count decremented</b>	Number of times the busy packet count decremented in asynchronous processing.
<b>session destructed in pme</b>	Number of sessions destructed as a part of asynchronous result processing.
<b>session destruct set in pme</b>	Number of sessions set to be destructed as a result of asynchronous processing.
<b>KQ op</b>	Number of sessions with one of the following status: <ul style="list-style-type: none"> <li>• KQ op hold—number of times packets held by IDP.</li> <li>• KQ op drop—number of times packets dropped by IDP.</li> <li>• KQ op route—number of times IDP decided to be route the packet directly.</li> <li>• KQ op Continue—number of times IDP decided to continue to process the packet.</li> <li>• KQ op error—number of times error occurred while IPD processing packet.</li> <li>• KQ op stop—number of times IDP decided to stop processing the packet.</li> </ul>
<b>PME wait not set</b>	Number of AI saved packets given for signature matching.
<b>PME wait set</b>	Number of packets given for signature matching without AI save.
<b>PME KQ run not called</b>	Number of times signature matching results processed out of packet receiving order.

## Sample Output

### show security idp counters flow

```
user@host> show security idp counters flow
IDP counters:
```

IDP counter type	Value
Fast-path packets	40252
Slow-path packets	127
Session construction failed	0
Session limit reached	0
Session inspection depth reached	0
Memory limit reached	0
Not a new session	0
Invalid index at ageout	0
Packet logging	0
Policy cache hits	92
Policy cache misses	67
Policy cache entries	67
Maximum flow hash collisions	0
Flow hash collisions	0
Gates added	0
Gate matches	0
Sessions deleted	127
Sessions aged-out	0
Sessions in-use while aged-out	0
TCP flows marked dead on RST/FIN	13

Policy init failed	0
Number of times Sessions exceed high mark	0
Number of times Sessions drop below low mark	0
Memory of Sessions exceeds high mark	0
Memory of Sessions drops below low mark	0
SM Sessions encountered memory failures	0
SM Packets on sessions with memory failures	0
IDP session gate creation requests	0
IDP session gate creation acknowledgements	0
IDP session gate hits	0
IDP session gate timeouts	0
Number of times Sessions crossed the CPU threshold value that is set	0
Number of times Sessions crossed the CPU upper threshold	0
Sessions constructed	127
SM Sessions ignored	0
SM Sessions dropped	0

## show security idp counters http-decoder

<b>Syntax</b>	show security idp counters http-decoder
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Display the status of all HTTP decoders.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp counters http-decoder on page 2192</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters http-decoder on page 2234</a>
<b>Output Fields</b>	Table 290 on page 2234 lists the output fields for the <b>show security idp counters http-decoder</b> command. Output fields are listed in the approximate order in which they appear.

**Table 290: show security idp counters http-decoder Output Fields**

Field Name	Field Description
No of file-decoder requests from MIME over HTTP	Number of active file decoder requests sent over HTTP from MIME.
No of pending file-decoder requests from MIME over HTTP	Number of pending file decoder requests sent over HTTP from MIME.
No of completed file-decoder requests from MIME over HTTP	Number of completed file decoder requests sent over HTTP from MIME.
No of unrecognized file type from MIME over HTTP	Number of unrecognized file types sent over HTTP from MIME.
No of compressed payload transferred over HTTP	Number of compressed files transferred over HTTP from MIME.

## Sample Output

### show security idp counters http-decoder

```

user@host> show security idp counters http-decoder
IDP counters:
IDP counter type                                     Value
No of file-decoder requests from MIME over HTTP      0
No of pending file-decoder requests from MIME over HTTP 0
No of completed file-decoder requests from MIME over HTTP 0
No of unrecognized file type from MIME over HTTP      0
No of compressed payload transferred over HTTP        0

```

## show security idp counters ips

<b>Syntax</b>	show security idp counters ips
<b>Release Information</b>	Command modified in Junos OS Release 11.2.
<b>Description</b>	Display the status of all IPS counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">ips on page 2088</a></li> <li>• <a href="#">clear security idp counters ips on page 2193</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters ips on page 2236</a>
<b>Output Fields</b>	<p><a href="#">Table 291 on page 2235</a> lists the output fields for the <b>show security idp counters ips</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 291: show security idp counters ips Output Fields**

Field Name	Field Description
TCP fast path	Number of TCP packets skipped for IDS processing.
Layer-4 anomalies	Number of Layer-4 protocol error or anomaly.
Anomaly hash misses	Number of times look failed on anomaly hash.
Line context matches	Number of attempts to match line based attacks in traffic stream.
Stream256 context matches	Number of attempts to match stream based attacks in first 256 bytes of traffic stream.
Stream context matches	Number of attempts to match stream based attacks in traffic stream.
Packet context matches	Number of attempts to match packet based attacks in traffic packet.
Packet header matches	Number of attempts to match packet header based attacks in traffic packet.
Context matches	Number of attempts to match protocol context based attacks in traffic stream.
Regular expression matches	Number of attempts to match PCRE expressions in traffic stream.
Tail DFAs	Number of attempts to match an attack on tail DFA group matches.
Exempted attacks	Number of attacks exempted from match as per exempt rulebase.
Out of order chains	Number of times attack is excluded from match due to member attacks in an attack group did not complete chain.

Table 291: show security idp counters ips Output Fields (*continued*)

Field Name	Field Description
Partial chain matches	Number of attacks in partial chain match with attack scope as transaction.
IDS device FIFO size	Number of IDS contexts in virtual IDS device.
IDS device FIFO overflows	Number of times an IDS context can not be written as the IDS device is full.
Brute force queue size	Number of entries in the brute force queue.
IDS cache hits (Unsupported)	Number of sessions those found attack instance in IDS cache.
IDS cache misses (Unsupported)	Number of sessions those did not find attack instance in IDS cache.
Shellcode detection invocations	Number of times shell code match is attempted.
Wrong offsets	Number of times attack's offset is not within the service offset range.
No peer MAC (Unsupported)	Number of times flow peer MAC address is not available.

## Sample Output

### show security idp counters ips

```

user@host> show security idp counters ips
IDP counters:
  IDP counter type                               Value
  TCP fast path                                  15
  Layer-4 anomalies                              0
  Anomaly hash misses                            3
  Line context matches                           5
  Stream256 context matches                      5
  Stream context matches                        5
  Packet context matches                        0
  Packet header matches                         0
  Context matches                               12
  Regular expression matches                     0
  Tail DFAs                                     0
  Exempted attacks                              0
  Out of order chains                           0

## show security idp counters log

<b>Syntax</b>	show security idp counters log
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display the status of all IDP log counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">event-rate on page 1672</a></li> <li>• <i>clear security idp counters log</i></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters log on page 2240</a>
<b>Output Fields</b>	<a href="#">Table 292 on page 2238</a> lists the output fields for the <b>show security idp counters log</b> command. Output fields are listed in the approximate order in which they appear.

**Table 292: show security idp counters log Output Fields**

Field Name	Field Description
Logs dropped	Number of logs that are dropped.
Suppressed log count	Number of logs that are suppressed.
Logs waiting for post-window packets (Unsupported)	Number of logs waiting for post-window packets.
Logs ready to be sent (Unsupported)	Number of logs ready to be sent.
Logs in suppression list (Unsupported)	Number of logs considered for suppression list.
Log timers created	Number of times the log timer is created.
Log timers expired	Number of times the log timer is expired.
Log timers cancelled	Number of times the log timer is canceled.
Logs ready to be sent high watermark (Unsupported)	Number of packets that are ready to be sent with high degree watermark.

Table 292: show security idp counters log Output Fields (*continued*)

Field Name	Field Description
<b>Log receive buffer full</b> (Unsupported)	Number of times the buffer is full.
<b>Packet log too big</b> (Unsupported)	Number of packet logs that exceeded allowed packet log size.
<b>Reads per second</b> (Unsupported)	Number of packets that are read per second.
<b>Logs in read buffer high watermark</b> (Unsupported)	Number of high watermark packets that are in read buffer.
<b>Packets logged</b>	Number of packets that are logged,
<b>Packets lost</b> (Unsupported)	Number of packets that are failed to log.
<b>Packets copied</b> (Unsupported)	Number of packets copied during packet log.
<b>Packets held</b> (Unsupported)	Number of packets held for packet log.
<b>Packets released</b>	Number of packets that are released from hold.
<b>IP Action Messages</b> (Unsupported)	Number of IP action messages.
<b>IP Action Drops</b> (Unsupported)	Number of IP action messages dropped.
<b>IP Action Exists</b> (Unsupported)	Number of exits during IP action creation.
<b>NWaits</b> (Unsupported)	Number of logs waiting for post window packets.
<b>Match vectors</b>	Number of attacks in IDS match vector.
<b>Supercedes</b>	Number of attacks in supercede vector.

## Sample Output

### show security idp counters log

```
user@host> show security idp counters log
IDP counters:
IDP counter type                               Value
Logs dropped                                   0
Suppressed log count                           0
Logs waiting for post-window packets           0
Logs ready to be sent                          0
Logs in suppression list                       0
Log timers created                             0
Logs timers expired                            0
Log timers cancelled                           0
Logs ready to be sent high watermark            0
Log receive buffer full                        0
Packet log too big                             0
Reads per second                               1
Logs in read buffer high watermark              0
Log Bytes in read buffer high watermark         0
Packets logged                                 0
Packets lost                                   0
Packets copied                                 0
Packets held                                   0
Packets released                               0
IP Action Messages                             0
IP Action Drops                                0
IP Action Exists                               0
Nwaits                                          0
Match vectors                                  0
Supercedes                                     0
Kpacket too big                                0
```

## show security idp counters packet

<b>Syntax</b>	show security idp counters packet
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. The fields <b>Dropped by IDP policy</b> and <b>Dropped by Error</b> added in Junos OS Release 10.1.
<b>Description</b>	Display the status of all IDP packet counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp counters packet on page 2195</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters packet on page 2243</a>
<b>Output Fields</b>	Table 293 on page 2241 lists the output fields for the <b>show security idp counters packet</b> command. Output fields are listed in the approximate order in which they appear.

**Table 293: show security idp counters packet Output Fields**

Field Name	Field Description
Processed packets	Number of packets processed by the IDP service.
Dropped packets	Number of packets dropped by the IDP service.
Dropped by IDP policy	Number of packets dropped by the IDP policy.
Dropped by Error	Number of packets dropped by error.
Dropped sessions (Unsupported)	Number of sessions dropped.
Bad IP headers	Number of packets that fail IP header length validity check.
Packets with IP options	Number of packets that contain the optional header fields.
Decapsulated packets	Number of packets that are decapsulated.
GRE decapsulations (Unsupported)	Number of packets that are generic routing encapsulation (GRE) decapsulated.
PPP decapsulations (Unsupported)	Number of packets that are Point-to-Point Protocol (PPP) decapsulated.

Table 293: show security idp counters packet Output Fields (*continued*)

Field Name	Field Description
<b>GTP decapsulations</b> (Unsupported)	Number of packets that are GPRS tunneling protocol (GTP) decapsulated.
<b>GTP flows</b> (Unsupported)	Number of GTP flows.
<b>TCP decompression uncompressed IP</b> (Unsupported)	Number of uncompressed IP headers that are to be TCP decompressed.
<b>TCP decompression compressed IP</b> (Unsupported)	Number of compressed IP headers that are to be TCP decompressed.
<b>Deferred-send packets</b> (Unsupported)	Number of deferred IP packets that are sent out.
<b>IP-in-IP packets</b> (Unsupported)	Number of packets that are IP-in-IP encapsulated.
<b>TTL errors</b> (Unsupported)	Number of packets with TTL error in the header.
<b>Routing loops</b> (Unsupported)	Number of packets that continue to be routed in an endless circle due to an inconsistent routing state.
<b>No-route packets</b> (Unsupported)	Number of packets that could not be routed further.
<b>Flood IP</b> (Unsupported)	Number of packets that are identified as IP flood packets.
<b>Invalid ethernet headers</b> (Unsupported)	Number of packets that are identified with an invalid Ethernet header.
<b>Packets attached</b>	Number of packets attached.
<b>Packets cloned</b>	Number of packets that are cloned.
<b>Packets allocated</b>	Number of packets allocated.
<b>Packets destructed</b>	Number of packets destructed.

## Sample Output

### show security idp counters packet

```
user@host> show security idp counters packet
IDP counters:
IDP counter type                               Value
Processed packets                             27
Dropped packets                               0
Dropped by IDP policy                         0
Dropped by error                             0
Dropped sessions                             0
Bad IP headers                                0
Packets with IP options                       0
Decapsulated packets                          0
GRE decapsulations                           0
PPP decapsulations                           0
GTP decapsulations                           0
GTP flows                                    0
TCP decompression uncompressed IP             0
TCP decompression compressed IP              0
Deferred-send packets                         0
IP-in-IP packets                             0
TTL errors                                    0
Routing loops                                0
STP drops                                    0
No-route packets                             0
Flood IP                                     0
Invalid ethernet headers                     0
Packets attached                             28
Packets cloned                               28
Packets allocated                            0
Packets destructed                           55
```

## show security idp counters packet-log

**Syntax** show security idp counters packet-log

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display the values of all IDP packet-log counters.

**Required Privilege Level** view

**Related Documentation** • *IDP Policies Feature Guide for Security Devices*

**Output Fields** The following table lists the output fields for the **show security idp counters packet-log** command. Output fields are listed in the approximate order in which they appear.

Field Name	Field Description
Total packets captured since packet capture was activated	Number of packets captured by the device by the IDP service.
Total sessions enabled since packet capture was activated	Number of sessions that have performed packet capture since the capture facility was activated.
Sessions currently enabled for packet capture	Number of sessions that are actively capturing packets at this time.
Packets currently captured for enabled sessions	Number of packets that have been captured by active sessions.
Packet clone failures	Number of packet capture failures due to cloning error.
Session log object failures	Number of objects containing log messages generated during packet capture that were not successfully transmitted to the host.
Session packet log object failures	Number of objects containing captured packets that were not successfully transmitted to the host.
Sessions skipped because session limit exceeded	Number of sessions that could not initiate packet capture because the maximum number of sessions specified for the device were conducting captures at that time.
Packets skipped because packet limit exceeded	Number of packets not captured because the packet limit specified for this device was reached.
Packets skipped because total memory limit exceeded	Number of packets not captured because the memory allocated for packet capture on this device was exceeded.

## Sample Output

### show security idp counters packet-log

```
user@host> show security idp counters packet-log
IDP counters:
Total packets captured since packet capture was activated      0
Total sessions enabled since packet capture was activated      0
Sessions currently enabled for packet capture                  0
Packets currently captured for enabled sessions                0
Packet clone failures                                         0
Session log object failures                                    0
Session packet log object failures                             0
Sessions skipped because session limit exceeded                0
Packets skipped because packet limit exceeded                  0
Packets skipped because total memory limit exceeded            0
```

## show security idp counters policy-manager

<b>Syntax</b>	show security idp counters policy-manager
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display the status of all IDP policies counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp counters policy-manager on page 2196</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters policy-manager on page 2246</a>
<b>Output Fields</b>	Table 294 on page 2246 lists the output fields for the <b>show security idp counters policy-manager</b> command. Output fields are listed in the approximate order in which they appear.

Table 294: show security idp counters policy-manager Output Fields

Field Name	Field Description
Number of policies	Number of policies installed.
Number of aged out policies	Number of IDP policies that are expired.

## Sample Output

### show security idp counters policy-manager

```

user@host> show security idp counters policy-manager
IDP counters:
  IDP counter type                Value
  Number of policies              0
  Number of aged out policies     0

```

## show security idp counters tcp-reassembler

<b>Syntax</b>	show security idp counters tcp-reassembler
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display the status of all TCP reassembler counter values.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">re-assembler on page 2118</a></li> <li>• <a href="#">clear security idp counters tcp-reassembler on page 2197</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp counters tcp-reassembler on page 2248</a>
<b>Output Fields</b>	<a href="#">Table 295 on page 2247</a> lists the output fields for the <b>show security idp counters tcp-reassembler</b> command. Output fields are listed in the approximate order in which they appear.

**Table 295: show security idp counters tcp-reassembler Output Fields**

Field Name	Field Description
Bad TCP checksums (Unsupported)	Number of packets that have incorrect TCP checksums.
Bad TCP headers	Number of bad TCP headers detected.
Slow path segments	Number of segments that are sent through the slow path if the TCP segment does not pass fast-path segment validation.
Fast path segments	Number of segments that are sent through the fast path after passing a predefined TCP validation sequence.
Sequence number wrap around errors	Number of packets that wrap around of the sequence number.
Session reuses	Number of sessions that reused an already established TCP session.
SYN retransmissions	Number of SYN packets that are retransmitted.
Bad three way handshake acknowledgements	Number of packets that have incorrect three-way handshake acknowledgements (ACK packet).
Sequence number out of sync flows	Number of packets that have out-of-sync sequence numbers.
Fast path pattern matches in queued up streams	Number of queued packets that have fast path pattern match.

Table 295: show security idp counters tcp-reassembler Output Fields (*continued*)

Field Name	Field Description
New segments with no overlaps with old segment	Number of new segments that do not overlap with old segment.
New segment overlaps with beginning of old segment	Number of new segments that overlap with beginning of old segment.
New segment overlaps completely with old segment	Number of new segments that overlap completely with old segment.
New segment is contained in old segment	Number of new segments contained in old segment.
New segment overlaps with end of old segment	Number of new segments that overlap with the end of old segment.
New segment begins after end of old segment	Number of new segments that overlap after the end of old segment.
Memory consumed by new segment	Memory that is consumed by the new segment.
Segments in memory	Number of segments that are stored in memory for processing.
Per-flow memory overflows	Number of segments dropped after reaching per flow memory limit.
Global memory overflows	Number of segments dropped after reaching reassembler global memory limit.
Overflow drops	Number of packets that are dropped due to memory overflow.
Copied packets (Unsupported)	Number of packets copied in reassembler.
Closed Acks	Number of Ack packets seen without having seen SYN on the same session.

## Sample Output

### show security idp counters tcp-reassembler

```

user@host> show security idp counters tcp-reassembler
IDP counters:
IDP counter type                               Value
Bad TCP checksums                             0
Bad TCP headers                               0
Slow path segments                             4
Fast path segments                             23
Sequence number wrap around errors             0
Session reuses                                0
SYN retransmissions                           0
Bad three way handshake acknowledgements       0
Sequence number out of sync flows             0

```

Fast path pattern matches in queued up streams	0
New segments with no overlaps with old segment	0
New segment overlaps with beginning of old segment	0
New segment overlaps completely with old segment	0
New segment is contained in old segment	0
New segment overlaps with end of old segment	0
New segment begins after end of old segment	0
Memory consumed by new segment	0
Segments in memory	0
Per-flow memory overflows	0
Global memory overflows	0
Overflow drops	0
Copied packets	0
Closed Acks	0

## show security idp logical-system policy-association

<b>Syntax</b>	show security idp logical-system policy-association
<b>Release Information</b>	Command introduced in Junos OS Release 11.3.
<b>Description</b>	Display the IDP policy assigned to a logical system. The IDP policy is assigned to a logical system through the security profile.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>security-profile</i></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>Master Administrator for Logical Systems Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp logical-system policy-association on page 2250</a>
<b>Output Fields</b>	<a href="#">Table 296 on page 2250</a> lists the output fields for the <b>show security idp logical-system policy-association</b> command.

**Table 296: show security idp logical-system policy-association Output Fields**

Field Name	Field Description
Logical system	Name of the logical system to which an IDP policy is assigned.
IDP policy	Name of the IDP policy that is specified in the security profile that is bound to the logical system.

## Sample Output

### show security idp logical-system policy-association

```

user@host> show security idp logical-system policy-association
Logical system      IDP policy
root-logical-system idp-policy1
lsys1               idp-policy2

```

## show security idp memory

<b>Syntax</b>	show security idp memory
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Percentage outputs added in Junos OS Release 10.1.
<b>Description</b>	Display the status of all IDP data plane memory.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp memory on page 2251</a>
<b>Output Fields</b>	<a href="#">Table 297 on page 2251</a> lists the output fields for the <b>show security idp memory</b> command. Output fields are listed in the approximate order in which they appear.

**Table 297: show security idp memory Output Fields**

Field Name	Field Description
PIC	Name of the PIC.
Total IDP data plane memory	Total memory space that is allocated for the IDP data plane.  <i>NOTE:</i> IDP requires a minimum of 5 MB of memory for session inspection.
Used	Used memory space in the data plane.
Available	Available memory space in the data plane.

## Sample Output

### show security idp memory

```

user@host> show security idp memory
  IDP data plane memory statistics:
    PIC : FPC 0 PIC 0:
Total IDP data plane memory : 196 MB
    Used : 8 MB ( 8192 KB ) ( 4.08% )
    Available : 188 MB ( 192512 KB ) (95.91%)

```

## show security idp policies

---

<b>Syntax</b>	show security idp policies
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	Display the list of currently installed policies.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp active-policy on page 99</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li><li>• <i>IDP Application Identification Feature Guide for Security Devices</i></li><li>• <i>IDP Class of Service Action Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	user@host> show security idp policies

## Sample Output

```
Subscriber: s0,          Installed policies: 1

  ID      Name      Sessions      Memory      detector
  0       new1       0            10179       9.2.160090324
```

## show security idp policy-commit-status

---

<b>Syntax</b>	show security idp policy-commit-status
<b>Release Information</b>	Command introduced in JUNOS OS Release 10.4.
<b>Description</b>	Display the IDP policy commit status. For example, status of policy compilation or load.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp status on page 100</a></li><li>• <a href="#">show security idp policy-commit-status clear on page 2254</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>

### Sample Output

```
user@host> show security idp policy-commit-status
Reading prereq sensor config...
```

## [show security idp policy-commit-status clear](#)

---

<b>Syntax</b>	show security idp policy-commit-status clear
<b>Release Information</b>	Command introduced in Junos OS Release 10.4.
<b>Description</b>	Clear the IDP policy commit status.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp policy-commit-status on page 2253</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## show security idp policy-templates

---

<b>Syntax</b>	show security idp policy-templates
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	Display the list of available policy templates.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security idp active-policy on page 99</a></li><li>• <i>IDP Policies Feature Guide for Security Devices</i></li></ul>
<b>Output Fields</b>	user@host> show security idp policy-templates

### Sample Output

```
DMZ_Services
DNS_Service
File_Server
Getting_Started
IDP_Default
Recommended
Web_Server
```

## show security idp predefined-attacks

---

<b>Syntax</b>	show security idp predefined-attacks filters ( category   severity   direction)
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	Display information about predefined attacks using optional filters.
<b>Options</b>	filters (Optional) <ul style="list-style-type: none"><li>• <b>category</b>—Show predefined attacks in different categories.</li><li>• <b>severity</b>—Show predefined attacks based on different severities.<ul style="list-style-type: none"><li>• critical</li><li>• info</li><li>• major</li><li>• minor</li><li>• warning</li></ul></li><li>• <b>direction</b> — Show predefined attacks for different directions.<ul style="list-style-type: none"><li>• any</li><li>• client-to-server</li><li>• exclude-any</li><li>• exclude-client-to-server</li><li>• exclude-server-to-client</li><li>• server-to-client</li></ul></li></ul>

## show security idp security-package-version

<b>Syntax</b>	show security idp security-package-version
<b>Release Information</b>	Command introduced in Junos OS Release 9.2.
<b>Description</b>	Display information of the currently installed security package version and detector version.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> <li>• <i>IDP Signature Database Feature Guide for Security Devices</i></li> <li>• <a href="#">security-package on page 2132</a></li> <li>• <a href="#">request security idp security-package download on page 2200</a></li> <li>• <a href="#">request security idp security-package install on page 2202</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp security-package-version on page 2258</a>
<b>Output Fields</b>	<a href="#">Table 298 on page 2258</a> lists the output fields for the <b>show security idp security-package-version</b> command. Output fields are listed in the approximate order in which they appear.

**Table 298: show security idp security-package-version Output Fields**

Field Name	Field Description
Attack database version	Attack database version number that are currently installed on the system.
Detector version	Detector version number that are currently installed on the system.
Policy template version	Policy template version that are currently installed on the system.

## Sample Output

### show security idp security-package-version

```

user@host> show security idp security-package-version
Attack database version:1154(Mon Apr 28 15:08:42 2008)
Detector version :9.1.140080400
Policy template version :7

```

## show security idp ssl-inspection key

<b>Syntax</b>	<code>show security idp ssl-inspection key [&lt;key-name&gt; [server &lt;server-ip&gt;]]</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	Display SSL keys added to the system along with their associated server IP addresses.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>key-name</b> —(Optional) Name of SSL private key.</li> <li>• <b>server server-ip</b> —(Optional) Server IP address associated for specified key.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp ssl-inspection key on page 2259</a> <a href="#">show security idp ssl-inspection key key2 on page 2259</a>
<b>Output Fields</b>	Table 299 on page 2259 lists the output fields for the <b>show security idp ssl-inspection key</b> command. Output fields are listed in the approximate order in which they appear.

Table 299: show security idp ssl-inspection key Output Fields

Field Name	Field Description
Total SSL keys	Total number of SSL keys.
key	Name of the SSL private key.
server	Server IP address associated with the SSL keys.

## Sample Output

### show security idp ssl-inspection key

```

user@host> show security idp ssl-inspection key
Total SSL keys : 4

SSL Server key and ip address:

Key : key1, server : 1.1.0.1
Key : key1, server : 1.1.0.2
Key : key2, server : 2.2.0.1
key : key3

```

## Sample Output

### show security idp ssl-inspection key key2

```

user@host> show security idp ssl-inspection key key2

```

SSL Server key and ip address:

Key : key2, server : 2.2.0.1

## show security idp ssl-inspection session-id-cache

<b>Syntax</b>	show security idp ssl-inspection session-id-cache
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	Display all the SSL session IDs in the session ID cache. Each cache entry is 32 bytes long.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security idp ssl-inspection session-id-cache on page 2198</a></li> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp ssl-inspection session-id-cache on page 2261</a>
<b>Output Fields</b>	<a href="#">Table 300 on page 2261</a> lists the output fields for the <b>show security idp ssl-inspection session-id-cache</b> command. Output fields are listed in the approximate order in which they appear.

**Table 300: show security idp ssl-inspection session-id-cache Output Fields**

Field Name	Field Description
Total SSL session identifiers	Total number of SSL session identifiers stored in the session ID cache.

## Sample Output

### show security idp ssl-inspection session-id-cache

```

user@host> show security idp ssl-inspection session-id-cache
SSL session identifiers :

c98396c768f983b515d93bb7c421fb6b8ce5c2c5c230b8739b7fcf8ce9c0de4e
a211321a3242233243c3dc0d421fb6b8ce5e4e983b515d932c5c230b87392c

Total SSL session identifiers : 2

```

## show security idp status

<b>Syntax</b>	show security idp status
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Multiple detector information introduced in Junos OS Release 10.1. Output changed to support IDP dedicated mode in Junos OS Release 11.2.
<b>Description</b>	Display the status of the current IDP policy.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IDP Policies Feature Guide for Security Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security idp status on page 2263</a>
<b>Output Fields</b>	<a href="#">Table 13 on page 100</a> lists the output fields for the <b>show security idp status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 301: show security idp status Output Fields**

Field Name	Field Description
State of IDP	Status of current IDP policy.
Packets/second	The aggregated throughput (packets per second) for the system.
KBits/second	The aggregated throughput (kilobits per second) for the system.
Latency	<ul style="list-style-type: none"> <li>• min—Minimum delay for a packet to receive and return by a node in microseconds.</li> <li>• max—Maximum delay for a packet to receive and return by a node in microseconds.</li> <li>• ave—Average delay for a packet to receive and return by a node in microseconds.</li> </ul>
Packet Statistics	Statistics for ICMP, TCP, and UDP packets.
Flow Statistics	Flow-related system statistics for ICMP, TCP, and UDP packets.
Session Statistics	Session-related system statistics for ICMP, TCP, and UDP packets.
Number of SSL Sessions	Number of current SSL sessions.
Policy Name	Name of the running policy. If IDP is configured for logical systems, <b>idp-policy-combined</b> is displayed.
Running Detector Version	Current version of the running detector.
Forwarding process mode	IDP dedicated mode: <b>default</b> , <b>equal</b> , <b>idp</b> , or <b>firewall</b> .

## Sample Output

### Accessing Standards Documents

---

- [Accessing Standards Documents on the Internet on page 2269](#)

#### Accessing Standards Documents on the Internet

The following information about the location of standards on the Internet is accurate as of February 2011. It is subject to change and is provided only as a courtesy to the reader.

Information about accessing MIBs is provided in the entry for each MIB.

- ANSI standards are published by the American National Standards Institute. You can search for specific standards at <http://webstore.ansi.org>.
- FRF (Frame Relay Forum) standards are published by the Broadband Forum. They can be accessed at <http://www.broadband-forum.org>.
- GR (Generic Requirements) standards are published by Telcordia. Information about them can be accessed by clicking the “Document Center” link at <http://telecom-info.telcordia.com/site-cgi/ido/>.
- IEEE standards are published by the Institute of Electrical and Electronics Engineers. They can be accessed at <http://standards.ieee.org/getieee802/index.html>.
- ISO/IEC standards are published by the International Organization for Standardization/International Electrotechnical Commission. They can be accessed at [http://www.iso.org/iso/iso\\_catalogue/catalogue\\_tc/](http://www.iso.org/iso/iso_catalogue/catalogue_tc/).
- INCITS standards are published by the InterNational Committee for Information Technology Standards. They can be accessed at <https://standards.incits.org/>.
- Internet drafts are published by the Internet Engineering Task Force (IETF). They can be accessed at <http://tools.ietf.org/id/>.
- ITU–T Recommendations are published by the International Telecommunication Union. They can be accessed at <http://www.itu.int/rec/T-REC>.
- RFCs are published by the IETF. They can be accessed at <http://www.ietf.org/rfc.html>.

- [Supported System Access Standards on page 2283](#)
- [Supported Time Synchronization Standard on page 2283](#)

## Supported BOOTP and DHCP Standards

The Junos OS substantially supports the following RFCs, which define standards for bootstrap protocol (BOOTP) and Dynamic Host Control Protocol (DHCP).

- RFC 951, *BOOTSTRAP PROTOCOL (BOOTP)*
- RFC 1001, *PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: CONCEPTS AND METHODS*
- RFC 1002, *PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: DETAILED SPECIFICATIONS*
- RFC 1035, *DOMAIN NAMES - IMPLEMENTATION AND SPECIFICATION*
- RFC 1534, *Interoperation Between DHCP and BOOTP*
- RFC 1700, *ASSIGNED NUMBERS*

- RFC 2131, *Dynamic Host Configuration Protocol*  
DHCP over virtual LAN (VLAN)-tagged interfaces is not supported.
- RFC 2132, *DHCP Options and BOOTP Vendor Extensions*
- RFC 3046, *DHCP Relay Agent Information Option*
- RFC 3118, *Authentication for DHCP Messages*  
Only Section 4, "Configuration token," is supported.
- RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*  
Address assignment is supported with IP version 4 (IPv4) but not IP version 6 (IPv6).
- RFC 3397, *Dynamic Host Configuration Protocol (DHCP) Domain Search Option*
- RFC 3633, *IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6*
- RFC 3925, *Vendor-Identifying Vendor Options for Dynamic Host Configuration Protocol version 4 (DHCPv4)*
- RFC 4649, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Relay Agent Remote-ID Option*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Mobile IP Standards

The Junos OS supports only static configuration of home agent addresses and IP tunnels; dynamic configuration is not supported. The Junos OS does not support the Mobile IP foreign agent, accounting, QoS, policy, data path, or logical interfaces per mobile node (for a mobile subscriber).

The Junos OS substantially supports the following RFCs, which define standards for Mobile IP.

- RFC 2794, *Mobile IP Network Access Identifier Extension for IPv4*
- RFC 3024, *Reverse Tunneling for Mobile IP, revised*
- RFC 3344, *IP Mobility Support for IPv4*  
Only the Mobile IP home agent is supported.
- RFC 3543, *Registration Revocation in Mobile IPv4*
- RFC 4433, *Mobile IPv4 Dynamic Home Agent (HA) Assignment*

The following RFC does not define a standard, but provides information about Mobile IP. The IETF classifies it as “Informational.”

- RFC 2977, *Mobile IP Authentication, Authorization, and Accounting Requirements*

Accounting is not supported.

#### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Network Management Standards

The Junos OS supports the majority of network management features defined in the following standards documents.

- Extended Security Options (ESO) Consortium, *ESO Consortium MIB*.

As of February 2011, the text of this MIB is accessible at <http://www.snmp.com/eso/esoConsortiumMIB.txt>.

- Institute of Electrical and Electronics Engineers (IEEE) Standard 802.3ad, *Aggregation of Multiple Link Segments* (published as Clause 43 in Section 3 of the 802.3 specification)

Only the following MIB objects are supported:

- dot3adAggPortDebugActorChangeCount
- dot3adAggPortDebugActorSyncTransitionCount
- dot3adAggPortDebugMuxState
- dot3adAggPortDebugPartnerChangeCount
- dot3adAggPortDebugPartnerSyncTransitionCount
- dot3adAggPortDebugRxState
- dot3adAggPortListTable
- dot3adAggPortStatsTable
- dot3adAggPortTable
- dot3adAggTable
- dot3adTablesLastChanged

Gigabit Ethernet interfaces on J Series Services Routers do not support the 802.3ad MIB.

- Integrated Local Management Interface (ILMI) MIB in the *Integrated Local Management Interface (ILMI) Specification, Version 4.0*.

As of February 2011, this document is accessible at <http://www.broadband-forum.org/ftp/pub/approved-specs/af-ilmi-0065.000.pdf>.

Only the `atmfMYIPNmAddress` and `atmfPortMyIfname` objects are supported.

- Internet Assigned Numbers Authority (IANA), *IANAiftype Textual Convention MIB* (referenced by RFC 2863, *The Interfaces Group MIB*)

As of February 2011, the text of this MIB is accessible at

<http://www.iana.org/assignments/ianaiftype-mib>.

- RFC 1122, *Requirements for Internet Hosts -- Communication Layers*
- RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
- RFC 1156, *Management Information Base for Network Management of TCP/IP-based internets*
- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*

Only the following MIB objects are supported:

- **isisAdjIPAddr**
- **isisAreaAddr**
- **isisCirc**
- **isisCircLevel**
- **isisIPRA**
- **isisISAdj**
- **isisISAdjAreaAddr**
- **isisISAdjProtSupp**
- **isisMANAreaAddr**
- **isisPacketCount**
- **isisRa**
- **isisSysProtSupp**
- **isisSummAddr**
- **isisSystem**
- RFC 1212, *Concise MIB Definitions*

- RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*

Only the following features are supported:

- Junos-specific secured access list
- Master configuration keywords
- MIB II and its SNMP version 2 derivatives, including the following:
  - Interface management
  - IP (except for the **ipRouteTable** object, which has been replaced by **ipCidrRouteTable** [RFC 2096, *IP Forwarding Table MIB*])
  - SNMP management
  - Statistics counters
- Reconfigurations upon receipt of the SIGHUP signal
- SNMP version 1 **Get** and **GetNext** requests and version 2 **GetBulk** requests

- RFC 1215, *A Convention for Defining Traps for use with the SNMP*

Only MIB II SNMP version 1 traps and version 2 notifications are supported.

- RFC 1406, *Definitions of Managed Objects for the DS1 and E1 Interface Types* (obsoleted by RFC 2495)

The T1 MIB is supported.

- RFC 1407, *Definitions of Managed Objects for the DS3/E3 Interface Type* (obsoleted by RFC 2496)

The T3 MIB is supported.

- RFC 1472, *The Definitions of Managed Objects for the Security Protocols of the Point-to-Point Protocol*
- RFC 1473, *The Definitions of Managed Objects for the IP Network Control Protocol of the Point-to-Point Protocol*
- RFC 1657, *Definitions of Managed Objects for the Fourth Version of the Border Gateway Protocol (BGP-4) using SMIv2*

The **bgpBackwardTransition** and **bgpEstablished** notifications are not supported.

- RFC 1695, *Definitions of Managed Objects for ATM Management Version 8.0 Using SMIv2* (obsoleted by RFC 2515)
- RFC 1724, *RIP Version 2 MIB Extension*

- RFC 1850, *OSPF Version 2 Management Information Base*

The following features are not supported:

- Host Table
- **ospfLsdbApproachingOverflow** trap
- **ospfLsdbOverflow** trap
- **ospfOriginateLSA** trap
- **ospfOriginateNewLsas** MIB object
- **ospfRxNewLsas** MIB object
- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)* (obsoleted by RFC 3416)
- RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)* (obsoleted by RFC 3418)
- RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol using SMIv2*
- RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol using SMIv2*
- RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol using SMIv2*
- RFC 2068, *Hypertext Transfer Protocol -- HTTP/1.1*
- RFC 2096, *IP Forwarding Table MIB*

The **ipCidrRouteTable** object is extended to include the tunnel name when the next hop is through an RSVP-signaled label-switched path (LSP).

- RFC 2115, *Management Information Base for Frame Relay DTEs Using SMIv2*

Only the **frDlcmiTable** object is supported.

- RFC 2233, *The Interfaces Group MIB using SMIv2* (obsoleted by RFC 2863)
- RFC 2287, *Definitions of System-Level Managed Objects for Applications*

Only the following MIB objects are supported:

- **sysApplElmtRunTable**
- **sysApplInstallElmtTable**
- **sysApplInstallPkgTable**
- **sysApplMapTable**
- RFC 2465, *Management Information Base for IP Version 6: Textual Conventions and General Group*

IP version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) statistics are not supported.

- RFC 2466, *Management Information Base for IP Version 6: ICMPv6 Group*

- RFC 2495, *Definitions of Managed Objects for the DS1, E1, DS2 and E2 Interface Types*

The following MIB objects are not supported:

- **dsx1FarEndConfigTable**
- **dsx1FarEndCurrentTable**
- **dsx1FarEndIntervalTable**
- **dsx1FarEndTotalTable**
- **dsx1FracTable**

- RFC 2496, *Definitions of Managed Objects for the DS3/E3 Interface Type*

The following MIB objects are not supported:

- **dsx3FarEndConfigTable**
- **dsx3FarEndCurrentTable**
- **dsx3FarEndIntervalTable**
- **dsx3FarEndTotalTable**
- **dsx3FracTable**

- RFC 2515, *Definitions of Managed Objects for ATM Management*

The following MIB objects are not supported:

- **aal5VccTable**
- **atmVcCrossConnectTable**
- **atmVpCrossConnectTable**

- RFC 2558, *Definitions of Managed Objects for the SONET/SDH Interface Type* (obsoleted by RFC 3592)

- RFC 2571, *An Architecture for Describing SNMP Management Frameworks*

Only read-only access is supported.

- RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (obsoleted by RFC 3412)

Only read-only access is supported.

- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2579, *Textual Conventions for SMIv2*
- RFC 2580, *Conformance Statements for SMIv2*
- RFC 2662, *Definitions of Managed Objects for the ADSL Lines*

Supported on J Series Services Routers. All MIB tables, objects, and traps applicable to the asymmetric digital subscriber line (ADSL) transceiver unit-remote (ATU-R) agent are supported.

- RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*
- RFC 2667, *IP Tunnel MIB*
- RFC 2787, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol*

The following features are not supported:

- Row creation
- **Set** operation
- **vrpStatsPacketLengthErrors** MIB object
- RFC 2790, *Host Resources MIB*

Only the following MIB objects are supported:

- **hrStorageTable** object. The file systems **/**, **/config**, **/var**, and **/tmp** always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change.
- Objects in the **hrSystem** group.
- Objects in the **hrSWInstalled** group.

- RFC 2819, *Remote Network Monitoring Management Information Base*

Only the following MIB objects are supported:

- **alarmTable**
- **etherStatsTable** object for Ethernet interfaces
- **eventTable**
- **logTable**
- RFC 2863, *The Interfaces Group MIB*
- RFC 2864, *The Inverted Stack Table Extension to the Interfaces Group MIB*
- RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*

Only the following MIB objects are supported:

- **pingCtlTable**
- **pingMaxConcurrentRequests**
- **pingProbeHistoryTable**
- **pingResultsTable**
- **traceRouteCtlTable**
- **traceRouteHopsTable**
- **traceRouteProbeHistoryTable**
- **traceRouteResultsTable**

- RFC 2932, *IPv4 Multicast Routing MIB*
- RFC 2933, *Internet Group Management Protocol MIB*
- RFC 2981, *Event MIB*
- RFC 3014, *Notification Log MIB*
- RFC 3019, *IP Version 6 Management Information Base for The Multicast Listener Discovery Protocol*
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications*  
The proxy MIB is not supported.
- RFC 3414, *User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)*
- RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*
- RFC 3498, *Definitions of Managed Objects for Synchronous Optical Network (SONET) Linear Automatic Protection Switching (APS) Architectures*  
Support is implemented under the Juniper Networks enterprise branch.
- RFC 3592, *Definitions of Managed Objects for the Synchronous Optical Network/Synchronous Digital Hierarchy (SONET/SDH) Interface Type*
- RFC 3811, *Definitions of Textual Conventions (TCs) for Multiprotocol Label Switching (MPLS) Management*

- RFC 3812, *Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base (MIB)*

Only read-only access is supported, and the following features and MIB objects are not supported:

- MPLS tunnels as interfaces
- **mplsTunnelCRLDPResTable** object
- **mplsTunnelPerfTable** object
- The following objects in the **TunnelResource** table:
  - **mplsTunnelResourceExBurstSize**
  - **mplsTunnelResourceMaxBurstSize**
  - **mplsTunnelResourceMeanBurstSize**
  - **mplsTunnelResourceMeanRate**
  - **mplsTunnelResourceWeight**

The **mplsTunnelCHopTable** object is supported on ingress routers only.

**NOTE:** The branch used by the proprietary LDP MIB (**ldpmib.mib**) conflicts with RFC 3812. **ldpmib.mib** has been deprecated and replaced by **jnx-mpls-ldp.mib**.

- RFC 3813, *Multiprotocol Label Switching (MPLS) Label Switching Router (LSR) Management Information Base (MIB)*

Only read-only access is supported, and the following MIB objects are not supported:

- **mplsInSegmentMapTable**
- **mplsInSegmentPerfTable**
- **mplsInterfacePerfTable**
- **mplsOutSegmentPerfTable**
- **mplsXCDown**
- **mplsXCUp**
- RFC 3815, *Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)*

Only the following MIB objects are supported:

- **mplsLdpLsrID**
- **mplsLdpSesPeerAddrTable**
- RFC 3826, *The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model*

- RFC 4188, *Definitions of Managed Objects for Bridges*
- Internet draft draft-ietf-bfd-mib-02.txt, *Bidirectional Forwarding Detection Management Information Base*

Only read-only access is supported, and the **bfdSessDown** and **bfdSessUp** traps are supported. Objects in the **bfdSessMapTable** and **bfdSessPerfTable** tables are not supported. The MIB that supports this draft is **mib-jnx-bfd-exp.txt** under the Juniper Networks Enterprise **jnxExperiment** branch.

- Internet draft draft-ietf-idr-bgp4-mibv2-04.txt, *Definitions of Managed Objects for the Fourth Version of Border Gateway Protocol (BGP-4), Second Version*

Only the following MIB objects are supported:

- **jnxBgpM2PrefixInPrefixes**
- **jnxBgpM2PrefixInPrefixesAccepted**
- **jnxBgpM2PrefixInPrefixesRejected**
- Internet draft draft-ietf-isis-wg-mib-07.txt, *Management Information Base for IS-IS*

Only the following tables are supported:

- **isisISAdjAreaAddrTable**
- **isisISAdjIPAddrTable**
- **isisISAdjProtSuppTable**
- **isisISAdjTable**
- Internet draft draft-ietf-msdp-mib-08.txt, *Multicast Source Discovery protocol MIB*

The following MIB objects are not supported:

- **msdpBackwardTransition**
- **msdpEstablished**
- **msdpRequestsTable**
- Internet draft draft-ietf-ospf-ospfv3-mib-11.txt, *Management Information Base for OSPFv3*

Only read-only access is supported, and only for the **ospfv3NbrTable** table. The MIB that supports this draft is **mib-jnx-ospfv3mib.txt** under the Juniper Networks Enterprise **jnxExperiment** branch; MIB object names are prefixed with **jnx** (for example, **jnxOspfv3NbrAddressType**).

- Internet draft draft-reeder-snmpv3-usm-3desede-00.txt, *Extension to the User-Based Security Model (USM) to Support Triple-DES EDE in "Outside" CBC Mode*

The following RFCs do not define standards, but provide information about network management. The IETF classifies them variously as “Best Current Practice,” “Experimental” or “Informational.”

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 2330, *Framework for IP Performance Metrics*
- RFC 2934, *Protocol Independent Multicast MIB for IPv4*
- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*
- RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*

**Related  
Documentation**

## Supported RADIUS and TACACS+ Standards for User Authentication

For validation of the identity of users who attempt to access a router, the Junos OS supports RADIUS authentication, TACACS+ authentication, and authentication by means of Junos user accounts configured on the router. The Junos OS supports the configuration of Juniper Networks-specific RADIUS and TACACS+ attributes, and the creation of template accounts.

All users who can log in to the router must already be assigned to a Junos login class. A *login class* defines its members' access privileges during a login session, the commands they can and cannot issue, the configuration statements they can and cannot view or change, and the idle time before a member's login session is terminated.

The Junos OS substantially supports the following RFCs, which define standards for RADIUS and TACACS+.

- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 3162, *RADIUS and IPv6*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*

The following Internet drafts do not define standards, but provide information about RADIUS. The IETF classifies them as “Informational.”

- RFC 2866, *RADIUS Accounting*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*

- Related Documentation**
- [Supported System Access Standards on page 2283](#)
  - [Accessing Standards Documents on the Internet on page 2269](#)

## Supported System Access Standards

The Junos OS substantially supports the following protocols and applications for remote access to routers: telnet, FTP, rlogin, and finger. In addition, the Canada and U.S. version of the Junos OS substantially supports SSH as an access protocol.

The Junos OS substantially supports RFC 1994, *PPP Challenge Handshake Authentication Protocol (CHAP)*.

The Canada and U.S. version of the Junos OS substantially supports the following RFCs, which define standards for technologies used with Secure Sockets Layer (SSL):

- RFC 1319, *The MD2 Message-Digest Algorithm*
- RFC 1321, *The MD5 Message-Digest Algorithm*
- RFC 2246, *The TLS Protocol Version 1.0*
- RFC 3280, *Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile*

The following RFCs provide information about TFTP, which Junos OS supports as a remote access protocol. The IETF does not include the RFCs in its Standards track, instead assigning them status “Unknown (Legacy Stream)”.

- RFC 783, *THE TFTP PROTOCOL (REVISION 2)*.
- RFC 906, *Bootstrap Loading using TFTP*.

- Related Documentation**
- [Supported RADIUS and TACACS+ Standards for User Authentication on page 2282](#)
  - [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Time Synchronization Standard

The Junos OS substantially supports RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*.

RFC 2030, *Simple Network Time Protocol (SNTP) Version 4 for IPv4, IPv6 and OSI*, does not define a standard, but provides information about time synchronization technology. The IETF classifies it as “Informational.”

In CLI operational mode, you can set the current date and time on the router manually or from an NTP server.

## Interface Standards

---

- [Supported ATM Interface Standards on page 2284](#)
- [Supported Ethernet Interface Standards on page 2284](#)
- [Supported Frame Relay Interface Standards on page 2285](#)
- [Supported GRE and IP-IP Interface Standards on page 2286](#)
- [Supported PPP Interface Standards on page 2286](#)
- [Supported SDH and SONET Interface Standards on page 2287](#)
- [Supported Serial Interface Standards on page 2288](#)
- [Supported T3 Interface Standard on page 2288](#)

### Supported ATM Interface Standards

The Junos OS substantially supports the following standards for Asynchronous Transfer Mode (ATM) interfaces.

- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation I.432.3, *B-ISDN user-network interface - Physical layer specification: 1544 kbit/s and 2048 kbit/s operation*
- RFC 1483, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*

Only routed protocol data units (PDUs) are supported.

- RFC 2225, *Classical IP and ARP over ATM*

Only responses are supported.

- RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*

Only routed PDUs and Ethernet bridged PDUs are supported.

#### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

### Supported Ethernet Interface Standards

The Junos OS substantially supports the following standards for Ethernet interfaces.

- Institute of Electrical and Electronics Engineers (IEEE) Standard 802.1ag, *IEEE Standard for Local and metropolitan area networks—Virtual Bridged Local Area Networks, Amendment 5: Connectivity Fault Management*
- IEEE Standard 802.1ah, *IEEE Standard for Local and metropolitan area networks—Virtual Bridged Local Area Networks, Amendment 7: Provider Backbone Bridges*
- IEEE Standard 802.1Q, *IEEE Standard for Local and metropolitan area networks—Virtual Bridged Local Area Networks*
- IEEE Standard 802.1Qbb, *IEEE Standard for Local and Metropolitan Area Networks—Virtual Bridged Local Area Networks - Amendment: Enhanced Transmission Selection*

- IEEE Standard 802.1Qbb, *IEEE Standard for Local and Metropolitan Area Networks---Virtual Bridged Local Area Networks - Amendment: Priority-based Flow Control*
- IEEE Standard 802.1s, *IEEE Standard for Multiple Instances of Spanning Tree Protocol (MSTP)---Virtual Bridged Local Area Networks*
- IEEE Standard 802.3, *IEEE Standard for Information technology—Telecommunications and information exchange between systems—Local and metropolitan area networks—Specific requirements, Part 3: Carrier sense multiple access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications*
- IEEE Standard 802.3ab, *1000BASE-T* (published as Clause 40 in Section 3 of the 802.3 specification)
- IEEE Standard 802.3ad, *Aggregation of Multiple Link Segments* (published as Clause 43 in Section 3 of the 802.3 specification)
- IEEE Standard 802.3ae, *10-Gigabit Ethernet* (published as Clauses 44-53 in Section 4 of the 802.3 specification)
- IEEE Standard 802.3ah, *Operations, Administration, and Maintenance (OAM)* (published as Clause 57 in Section 5 of the 802.3 specification)
- IEEE Standard 802.3z, *1000BASE-X* (published as Clauses 34-39, 41-42 in Section 3 of the 802.3 specification)
- InterNational Committee for Information Technology Standards (INCITS) T11, *Fibre Channel Interfaces*
- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation Y.1731, *OAM functions and mechanisms for Ethernet based networks*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Frame Relay Interface Standards

The Junos OS substantially supports the following standards for Frame Relay interfaces.

- American National Standards Institute (ANSI), *Annex D, Additional Procedures for Permanent Virtual Connections (PVCs) Using Unnumbered Information Frames* to T1.617-1991, *Integrated Services Digital Network (ISDN)—Signaling Specification for Frame Relay Bearer Service for Digital Subscriber Signaling System Number 1 (DSS1)*
- Broadband Forum standard FRF.12, *Frame Relay Fragmentation Implementation Agreement*
- FRF.15, *End-to-End Multilink Frame Relay Implementation Agreement*
- FRF.16.1, *Multilink Frame Relay UNI/NNI Implementation Agreement*
- International Telecommunication Union–Telecommunication Standardization (ITU–T), *Annex A, Additional procedures for Permanent Virtual Connection (PVC) status management (using Unnumbered Information frames)* to Recommendation Q.933,

*ISDN Digital Subscriber Signalling System No. 1 (DSS1) - Signalling specifications for frame mode switched and permanent virtual connection control and status monitoring*

- RFC 1973, *PPP in Frame Relay*
- RFC 2390, *Inverse Address Resolution Protocol*
- RFC 2427, *Multiprotocol Interconnect over Frame Relay* (obsoletes RFC 1490)
- RFC 2590, *Transmission of IPv6 Packets over Frame Relay Networks Specification*
- Internet draft draft-martini-frame-encap-mpls-01.txt, *Frame Relay Encapsulation over Pseudo-Wires* (expires December 2002)

Translation of the command/response bit and sequence numbers and padding are not supported.

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported GRE and IP-IP Interface Standards

The Junos OS substantially supports the following RFCs, which define standards for generic routing encapsulation (GRE) and IP-IP interfaces.

- RFC 2003, *IP Encapsulation within IP*
- RFC 2784, *Generic Routing Encapsulation (GRE)*
- RFC 2890, *Key and Sequence Number Extensions to GRE*

The key field is supported, but the sequence number field is not.

The following RFCs do not define standards, but provide information about GRE, IP-IP, and related technologies. The IETF classifies them as “Informational.”

- RFC 1701, *Generic Routing Encapsulation (GRE)*
- RFC 1702, *Generic Routing Encapsulation over IPv4 networks*
- RFC 2547, *BGP/MPLS VPNs* (over GRE tunnels)

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported PPP Interface Standards

The Junos OS substantially supports the following RFCs, which define standards for Point-to-Point Protocol (PPP) interfaces.

- RFC 1332, *The PPP Internet Protocol Control Protocol (IPCP)*
- RFC 1334, *PPP Authentication Protocols*
- RFC 1661, *The Point-to-Point Protocol (PPP)*
- RFC 1662, *PPP in HDLC-like Framing*

- RFC 1989, *PPP Link Quality Monitoring*
- RFC 1990, *The PPP Multilink Protocol (MP)*
- RFC 2364, *PPP Over AAL5*
- RFC 2615, *PPP over SONET/SDH*
- RFC 2686, *The Multi-Class Extension to Multi-Link PPP*

The following features are not supported:

- Negotiation of address field compression and protocol field compression PPP NCP options; instead, a full 4-byte PPP header is always sent
- Prefix elision
- RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*

The following RFCs do not define standards, but provide information about PPP. The IETF classifies them as “Informational.”

- RFC 1877, *PPP Internet Protocol Control Protocol Extensions for Name Server Addresses*
- RFC 2153, *PPP Vendor Extensions*

#### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported SDH and SONET Interface Standards

The Junos OS substantially supports the following standards for SDH and SONET interfaces.

- American National Standards Institute (ANSI) standard T1.105-2001, *Synchronous Optical Network (SONET) – Basic Description including Multiplex Structure, Rates, and Formats*
- ANSI standard T1.105.02-2001, *Synchronous Optical Network (SONET) – Payload Mappings*
- ANSI standard T1.105.06-2002, *Synchronous Optical Network (SONET): Physical Layer Specifications*
- GR-253-CORE (Telcordia Generic Requirements standard), *Synchronous Optical Network (SONET) Transport Systems: Common Generic Criteria* (replaces GR-1377-CORE, *SONET OC-192 Transport System Generic Criteria*)
- GR-499-CORE, *Transport Systems Generic Requirements (TSGR): Common Requirements*
- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation G.691, *Optical interfaces for single channel STM-64 and other SDH systems with optical amplifiers*
- ITU–T Recommendation G.707 (1996), *Network node interface for the synchronous digital hierarchy (SDH)*

- ITU–T Recommendation G.783 (1994), *Characteristics of synchronous digital hierarchy (SDH) equipment functional blocks*
- ITU–T Recommendation G.813 (1996), *Timing characteristics of SDH equipment slave clocks (SEC)*
- ITU–T Recommendation G.825 (1993), *The control of jitter and wander within digital networks which are based on the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.826 (1999), *Error performance parameters and objectives for international, constant bit-rate digital paths at or above the primary rate*
- ITU–T Recommendation G.831 (1993), *Management capabilities of transport networks based on the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.957 (1995), *Optical interfaces for equipments and systems relating to the synchronous digital hierarchy*
- ITU–T Recommendation G.958 (1994), *Digital line systems based on the synchronous digital hierarchy for use on optical fibre cables*
- ITU–T Recommendation I.432 (1993), *B-ISDN user-network interface – Physical layer specification*
- RFC 1619, *PPP over SONET/SDH*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Serial Interface Standards

The Junos OS substantially supports the following standards for serial interfaces.

- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation V.35, *Data transmission at 48 kilobits per second using 60-108 kHz group band circuits*
- ITU–T Recommendation X.21 (1992), *Interface between Data Terminal Equipment and Data Circuit-terminating Equipment for synchronous operation on public data networks*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported T3 Interface Standard

The Junos OS substantially supports International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation G.703, *Physical/electrical characteristics of hierarchical digital interfaces*.

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Layer 2 Standards

- [Supported Layer 2 Networking Standards on page 2289](#)
- [Supported L2TP Standards on page 2289](#)
- [Supported Layer 2 Circuit Standards on page 2290](#)
- [Supported Layer 2 VPN Standard on page 2290](#)

### Supported Layer 2 Networking Standards

The Junos OS substantially supports the following standards for Layer 2 networking.

- Institute of Electrical and Electronics Engineers (IEEE) Standard 802.1ab, *IEEE Standard for Local and metropolitan area networks—Station and Media Access Control Connectivity Discovery*
- IEEE Standard 802.1D, *IEEE Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges*

This document includes the standard for Rapid Spanning Tree Protocol (RSTP), which is often referred to as 802.1w. It also discusses Quality of Service (QoS) at the MAC level, often referred to as 802.1p.

#### Related Documentation

- [Supported L2TP Standards on page 2289](#)
- [Supported Layer 2 Circuit Standards on page 2290](#)
- [Supported Layer 2 VPN Standard on page 2290](#)
- [Accessing Standards Documents on the Internet on page 2269](#)

### Supported L2TP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFC, which defines the standard for Layer 2 Tunneling Protocol (L2TP).

- RFC 2661, *Layer Two Tunneling Protocol “L2TP”*

The following RFC does not define a standard, but provides information about technology related to L2TP. The IETF classifies it as “Informational.”

- RFC 2866, *RADIUS Accounting*

#### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Layer 2 Circuit Standards

The Junos OS substantially supports the following RFCs, which define standards for Layer 2 circuits.

- RFC 4447, *Pseudowire Setup and Maintenance Using the Label Distribution Protocol (LDP)*

The Junos OS does not support Section 5.3, “The Generalized PWid FEC Element.”

- RFC 4448, *Encapsulation Methods for Transport of Ethernet over MPLS Networks*

The following Internet drafts do not define standards, but provide information about Layer 2 technologies. The IETF classifies them as “Historic.”

- Internet draft draft-martini-l2circuit-encap-mpls-11.txt, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*

The Junos OS differs from the Internet draft in the following ways:

- A packet with a sequence number of 0 (zero) is treated as out of sequence.
- Any packet that does not have the next incremental sequence number is considered out of sequence.
- When out-of-sequence packets arrive, the expected sequence number for the neighbor is set to the sequence number in the Layer 2 circuit control word.
- Internet draft draft-martini-l2circuit-trans-mpls-19.txt, *Transport of Layer 2 Frames Over MPLS*

## MPLS Applications Standards

- [Supported GMPLS Standards on page 2291](#)
- [Supported LDP Standards on page 2292](#)
- [Supported MPLS Standards on page 2293](#)
- [Supported RSVP Standards on page 2295](#)

## Supported GMPLS Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for Generalized MPLS (GMPLS).

- RFC 3471, *Generalized Multi-Protocol [sic] Label Switching (GMPLS) Signaling Functional Description*

Only the following features are supported:

- Bidirectional LSPs (upstream label only)
- Control channel separation
- Generalized label (suggested label only)
- Generalized label request (bandwidth encoding only)
- RFC 3473, *Generalized Multi-Protocol [sic] Label Switching (GMPLS) Signaling Resource ReserVation [sic] Protocol-Traffic Engineering (RSVP-TE) Extensions*

Only Section 9, "Fault Handling," is supported.

- RFC 4206, *Label Switched Paths (LSP) Hierarchy with Generalized Multi-Protocol [sic] Label Switching (GMPLS) Traffic Engineering (TE)*
- Internet draft draft-ietf-ccamp-gmpls-routing-09.txt, *Routing Extensions in Support of Generalized Multi-Protocol [sic] Label Switching*

Only interface switching is supported.

- Internet draft draft-ietf-ccamp-gmpls-rsvp-te-ason-02.txt, *Generalized MPLS (GMPLS) RSVP-TE Signalling in support of Automatically Switched Optical Network (ASON)* (expires January 2005)
- Internet draft draft-ietf-ccamp-gmpls-sonet-sdh-08.txt, *Generalized Multi-Protocol [sic] Label Switching Extensions for SONET and SDH Control*

Only S,U,K,L,M-format labels and SONET traffic parameters are supported.

- Internet draft draft-ietf-ccamp-lmp-10.txt, *Link Management Protocol (LMP)*

- Internet draft draft-ietf-ccamp-ospf-gmpls-extensions-12.txt, *OSPF Extensions in Support of Generalized Multi-Protocol [sic] Label Switching*

The following sub-TLV types for the Link type, link, value (TLV) are not supported:

- Link Local/Remote Identifiers (type 11)
- Link Protection Type (type 14)
- Shared Risk Link Group (SRLG) (type 16)

The features described in Section 2 of the draft, “Implications on Graceful Restart,” are also not supported.

The Interface Switching Capability Descriptor (type 15) sub-TLV type is implemented, but only for packet switching.

- Internet draft draft-ietf-mpls-bundle-04.txt, *Link Bundling in MPLS Traffic Engineering*

**Related  
Documentation**

- [Supported LDP Standards on page 2292](#)
- [Supported MPLS Standards on page 2293](#)
- [Supported RSVP Standards on page 2295](#)
- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported LDP Standards

The Junos OS substantially supports the following RFCs, which define standards for LDP.

- RFC 3212, *Constraint-Based LSP Setup using LDP*
- RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol*

The following RFCs do not define standards, but provide information about LDP. The IETF classifies them as “Informational.”

- RFC 3215, *LDP State Machine*
- RFC 5036, *LDP Specification*

For the following features described in the indicated sections of the RFC, the Junos OS supports one of the possible modes but not the other:

- Label distribution control (section 2.6.1): Ordered mode is supported, but not Independent mode.
- Label retention (section 2.6.2): Liberal mode is supported, but not Conservative mode.
- Label advertisement (section 2.6.3): Downstream Unsolicited mode is supported, but not Downstream on Demand mode.
- RFC 5443, *LDP IGP Synchronization*

## Supported MPLS Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for MPLS and traffic engineering.

- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3032, *MPLS Label Stack Encoding*
- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3270, *Multi-Protocol [sic] Label Switching (MPLS) Support of Differentiated Services*  
Only E-LSPs are supported.
- RFC 3443, *Time To Live (TTL) Processing in Multi-Protocol [sic] Label Switching (MPLS) Networks*
- RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol*
- RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*  
Node protection in facility backup is supported.
- RFC 4124, *Protocol Extensions for Support of Diffserv-aware MPLS Traffic Engineering*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4379, *Detecting Multi-Protocol [sic] Label Switched (MPLS) Data Plane Failures*  
The traceroute functionality is supported only on transit routers.
- RFC 4950, *ICMP Extensions for Multiprotocol Label Switching*
- Internet draft draft-ietf-bfd-mpls-02.txt, *BFD for MPLS LSPs*
- Internet draft draft-ietf-mpls-rsvp-te-p2mp-01.txt, *Extensions to RSVP-TE for Point to Multipoint TE LSPs* (expires June 2005)
- Internet draft draft-ietf-mpls-soft-preemption-02.txt, *MPLS Traffic Engineering Soft preemption*

The following RFCs and Internet drafts do not define standards, but provide information about MPLS, traffic engineering, and related technologies. The IETF classifies them variously as “Experimental,” “Historic,” or “Informational.”

- RFC 2547, *BGP/MPLS VPNs*
- RFC 2702, *Requirements for Traffic Engineering Over MPLS*
- RFC 3063, *MPLS Loop Prevention Mechanism*

- RFC 3208, *PGM Reliable Transport Protocol Specification*

Only the network element is supported.

- RFC 3469, *Framework for Multi-Protocol [sic] Label Switching (MPLS)-based Recovery*
- RFC 3564, *Requirements for Support of Differentiated Services-aware MPLS Traffic Engineering*
- RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- Internet draft draft-martini-l2circuit-encap-mpls-11.txt, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*

The Junos OS differs from the Internet draft in the following ways:

- A packet with a sequence number of 0 is treated as out of sequence.
- Any packet which does not have the next incremental sequence number is considered out of sequence.
- When out-of-sequence packets arrive, the expected sequence number for the neighbor is set to the sequence number in the Layer 2 circuit control word.
- Internet draft draft-martini-l2circuit-trans-mpls-19.txt, *Transport of Layer 2 Frames Over MPLS*
- Internet draft draft-raggarwa-mpls-p2mp-te-02.txt, *Establishing Point to Multipoint MPLS TE LSPs*

The features discussed in the indicated sections of the draft are not supported:

- Nonadjacent signaling for branch LSPs (section 7.1)
- Make-before-break and fast reroute (section 9)
- LSP hierarchy using point-to-point LSPs (section 10)

- [Supported LDP Standards on page 2292](#)
- [Supported RSVP Standards on page 2295](#)
- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported RSVP Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for RSVP.

- RFC 2205, *Resource ReSerVation [sic] Protocol (RSVP)—Version 1 Functional Specification*
- RFC 2210, *The Use of RSVP with IETF Integrated Services*
- RFC 2211, *Specification of the Controlled-Load Network Element Service*
- RFC 2212, *Specification of Guaranteed Quality of Service*
- RFC 2215, *General Characterization Parameters for Integrated Service Network Elements*
- RFC 2745, *RSVP Diagnostic Messages*
- RFC 2747, *RSVP Cryptographic Authentication* (updated by RFC 3097)
- RFC 2961, *RSVP Refresh Overhead Reduction Extensions*
- RFC 3097, *RSVP Cryptographic Authentication—Updated Message Type Value*
- RFC 3209, *RSVP-TE: Extensions to RSVP for LSP Tunnels*

The Null Service Object for maximum transmission unit (MTU) signaling in RSVP is not supported.

- RFC 3473, *Generalized Multi-Protocol [sic] Label Switching (GMPLS) Signaling Resource ReserVation [sic] Protocol-Traffic Engineering (RSVP-TE) Extensions*

Only Section 9, “Fault Handling,” is supported.

- RFC 3477, *Signalling Unnumbered Links in Resource ReSerVation [sic] Protocol - Traffic Engineering (RSVP-TE)*
- RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*

Node protection in facility backup is not supported.

- RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol [sic] Label Switching (GMPLS)*

(OSPF extensions can carry traffic engineering information over unnumbered links.)

- RFC 4558, *Node-ID Based Resource Reservation Protocol (RSVP) Hello: A Clarification Statement*
- RFC 4561, *Definition of a Record Route Object (RRO) Node-Id Sub-Object*

The RRO node ID subobject is for use in inter-AS link and node protection configurations.

- Internet draft draft-ietf-mppls-rsvp-te-p2mp-01.txt, *Extensions to RSVP-TE for Point to Multipoint TE LSPs* (expires June 2005)

The following RFCs do not define standards, but provide information about RSVP and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 2209, *Resource ReSerVation [sic] Protocol (RSVP)—Version 1 Message Processing Rules*
- RFC 2216, *Network Element Service Specification Template*
- RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*

## Packet Processing Standards

- [Supported CoS Standards on page 2296](#)
- [Supported Packet Filtering Standards on page 2297](#)
- [Supported Policing Standard on page 2297](#)

## Supported CoS Standards

The Junos OS substantially supports the following standards for class of service (CoS).

- IEEE Standard 802.1D, *IEEE Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges*

This document discusses Quality of Service (QoS) at the MAC level, often referred to as 802.1p.

- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*

The following RFCs do not define standards, but provide information about CoS and related technologies. The IETF classifies them as “Informational.”

- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2697, *A Single Rate Three Color Marker*
- RFC 2698, *A Two Rate Three Color Marker*
- RFC 2983, *Differentiated Services and Tunnels*

- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Packet Filtering Standards

The Junos OS provides a packet-filtering language that enables you to control the flow of packets being forwarded to a network destination, as well as packets destined for and sent by the router. It substantially supports the following RFCs, which define standards for packet filtering.

- RFC 792, *INTERNET CONTROL MESSAGE PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 4291, *IP Version 6 Addressing Architecture*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*

The following RFCs do not define standards, but provide information about packet filtering and related technologies. The IETF classifies them as “Informational.”

- RFC 2267, *Network Ingress Filtering: Defeating Denial of Service Attacks which employ IP Source Address Spoofing*
- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2983, *Differentiated Services and Tunnels*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Policing Standard

The Junos OS supports policing, or rate limiting, to limit the amount of traffic that passes through an interface. For information about rate limiting, see RFC 2698, *A Two Rate Three Color Marker*.

The Junos implementation of policing uses a token-bucket algorithm and supports the following features:

- Adaptive shaping for Frame Relay traffic
- Virtual channels

- [Supported RIP and RIPng Standards on page 2309](#)

### Supported BGP Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP version 4 (IPv4) BGP.

For a list of supported IP version 6 (IPv6) BGP standards, see “[Supported IPv6 Standards](#)” on page 2303.

Junos BGP supports authentication for protocol exchanges (MD5 authentication).

- RFC 1745, *BGP4/IDRP for IP—OSPF Interaction*
- RFC 1772, *Application of the Border Gateway Protocol in the Internet*
- RFC 1997, *BGP Communities Attribute*
- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2385, *Protection of BGP Sessions via the TCP MD5 Signature Option*
- RFC 2439, *BGP Route Flap Damping*
- RFC 2545, *Use of BGP-4 Multiprotocol Extensions for IPv6 Inter-Domain Routing*
- RFC 2796, *BGP Route Reflection – An Alternative to Full Mesh IBGP*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 2918, *Route Refresh Capability for BGP-4*
- RFC 3065, *Autonomous System Confederations for BGP*

- RFC 3107, *Carrying Label Information in BGP-4*
- RFC 3392, *Capabilities Advertisement with BGP-4*
- RFC 4271, *A Border Gateway Protocol 4 (BGP-4)*
- RFC 4360, *BGP Extended Communities Attribute*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4456, *BGP Route Reflection: An Alternative to Full Mesh Internal BGP (IBGP)*
- RFC 4659, *BGP/MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4486, *Subcodes for BGP Cease Notification Message*
- RFC 4724, *Graceful Restart Mechanism for BGP*
- RFC 4760, *Multiprotocol Extensions for BGP-4*
- RFC 4781, *Graceful Restart Mechanism for BGP with MPLS*
- RFC 4893, *BGP Support for Four-octet AS Number Space*
- RFC 4798, *Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)*

Option 4b (eBGP redistribution of labeled IPv6 routes from AS to neighboring AS) is not supported.

- RFC 5396, *Textual Representation of Autonomous System (AS) Numbers*
- RFC 5668, *4-Octet AS Specific BGP Extended Community*
- Internet draft draft-ietf-idr-flow-spec-00.txt, *Dissemination of flow specification rules*
- Internet draft draft-ietf-idr-link-bandwidth-01.txt, *BGP Link Bandwidth Extended Community* (expires August 2010)
- Internet draft draft-kato-bgp-ipv6-link-local-00.txt, *BGP4+ Peering Using IPv6 Link-local Address*
- Internet draft draft-ietf-idr-add-paths-04.txt, *Advertisement of Multiple Paths in BGP* (expires February 2011)
- Internet draft draft-ietf-idr-aigp-06, *The Accumulated IGP Metric Attribute for BGP* (expires December 2011)

The following RFCs and Internet draft do not define standards, but provide information about BGP and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 1965, *Autonomous System Confederations for BGP*
- RFC 1966, *BGP Route Reflection—An alternative to full mesh IBGP*
- RFC 2270, *Using a Dedicated AS for Sites Homed to a Single Provider*
- Internet draft draft-ietf-ngtrans-bgp-tunnel-04.txt, *Connecting IPv6 Islands across IPv4 Clouds with BGP* (expires July 2002)

- Related Documentation**
- [Supported IPv6 Standards on page 2303](#)
  - [Accessing Standards Documents on the Internet on page 2269](#)

## Supported ES-IS Standards

The Junos OS substantially supports the following standards for End System-to-Intermediate System (ES-IS).

- International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) standard 8473, *Information technology — Protocol for providing the connectionless-mode network service*
- ISO/IEC standard 9542, *Information processing systems — Telecommunications and information exchange between systems — End system to Intermediate system routing [sic] exchange protocol for use in conjunction with the Protocol for providing the connectionless-mode network service (ISO 8473)*

- Related Documentation**
- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported ICMP and Neighbor Discovery Standards

The Junos OS substantially supports the following RFCs, which define standards for Internet Control Message Protocol (ICMP, for IP version 4 [IPv4]) and neighbor discovery (for IP version 6 [IPv6]).

- RFC 1256, *ICMP Router Discovery Messages*
- RFC 4861, *Neighbor Discovery for IP Version 6 (IPv6)*
- RFC 4862, *IPv6 Stateless Address Autoconfiguration*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*

- Related Documentation**
- [Supported IPv4, TCP, and UDP Standards on page 2302](#)
  - [Supported IPv6 Standards on page 2303](#)
  - [Accessing Standards Documents on the Internet on page 2269](#)

## Supported IP Multicast Protocol Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP multicast protocols, including the Distance Vector Multicast Routing Protocol (DVMRP), Internet Group Management Protocol (IGMP), Multicast Listener Discovery (MLD), Multicast Source Discovery Protocol (MSDP), Pragmatic General Multicast (PGM), Protocol Independent Multicast (PIM), Session Announcement Protocol (SAP), and Session Description Protocol (SDP).

- RFC 1112, *Host Extensions for IP Multicasting* (defines IGMP Version 1)
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 2327, *SDP: Session Description Protocol*
- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3376, *Internet Group Management Protocol, Version 3*
- RFC 3590, *Source Address Selection for the Multicast Listener Discovery (MLD) Protocol*
- RFC 4601, *Protocol Independent Multicast – Sparse Mode (PIM-SM): Protocol Specification (Revised)*
- RFC 4607, *Source-Specific Multicast for IP*
- RFC 5015, *Bidirectional Protocol Independent Multicast (BIDIR-PIM)*
- *Using IGMPv3 and MLDv2 for Source-Specific Multicast*
- Internet draft draft-ietf-l3vpn-2547bis-mcast-10.txt, *Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-l3vpn-2547bis-mcast-bgp-08.txt, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-pim-sm-bsr-05.txt, *Bootstrap Router (BSR) Mechanism for PIM*

The scoping mechanism is not supported.

- Internet draft draft-raggarwa-l3vpn-2547-mvpn-00.txt, *Base Specification for Multicast in BGP/MPLS VPNs* (expires December 2004)

The following RFCs and Internet drafts do not define standards, but provide information about multicast protocols and related technologies. The IETF classifies them variously as “Best Current Practice,” “Experimental,” or “Informational.”

- RFC 1075, *Distance Vector Multicast Routing Protocol*
- RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification*
- RFC 2365, *Administratively Scoped IP Multicast*
- RFC 2547, *BGP/MPLS VPNs*
- RFC 2974, *Session Announcement Protocol*

- RFC 3208, *PGM Reliable Transport Protocol Specification*
  - RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*
  - RFC 3569, *An Overview of Source-Specific Multicast (SSM)*
  - RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
  - RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
  - RFC 3973, *Protocol Independent Multicast – Dense Mode (PIM-DM): Protocol Specification (Revised)*
  - RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
  - Internet draft draft-ietf-idmr-dvmrp-v3-11.txt, *Distance Vector Multicast Routing Protocol*
  - Internet draft draft-ietf-mboned-ssm232-08.txt, *Source-Specific Protocol Independent Multicast in 232/8*
  - Internet draft draft-ietf-mmusic-sap-00.txt, *SAP: Session Announcement Protocol*
  - Internet draft draft-rosen-vpn-mcast-07.txt, *Multicast in MPLS/BGP VPNs*
- Only section 7, “Data MDT: Optimizing flooding,” is supported.

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported IPv4, TCP, and UDP Standards

The Junos OS substantially supports the following RFCs, which define standards for IP version 4 (IPv4), Transmission Control Protocol (TCP), and User Datagram Protocol (UDP).

- RFC 768, *User Datagram Protocol*
- RFC 791, *INTERNET PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 792, *INTERNET CONTROL MESSAGE PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 793, *TRANSMISSION CONTROL PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 826, *Ethernet Address Resolution Protocol—or—Converting Network Protocol Addresses to 48.bit Ethernet Address for Transmission on Ethernet Hardware*
- RFC 854, *TELNET PROTOCOL SPECIFICATION*
- RFC 862, *Echo Protocol*
- RFC 863, *Discard Protocol*
- RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*
- RFC 896, *Congestion Control in IP/TCP Internetworks*

- RFC 903, *A Reverse Address Resolution Protocol*
- RFC 919, *BROADCASTING INTERNET DATAGRAMS*
- RFC 922, *BROADCASTING INTERNET DATAGRAMS IN THE PRESENCE OF SUBNETS*
- RFC 959, *FILE TRANSFER PROTOCOL (FTP)*
- RFC 1027, *Using ARP to Implement Transparent Subnet Gateways*
- RFC 1042, *A Standard for the Transmission of IP Datagrams over IEEE 802 Networks*
- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1166, *INTERNET NUMBERS*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 1256, *ICMP Router Discovery Messages*
- RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*
- RFC 1519, *Classless Inter-Domain Routing (CIDR): an Address Assignment and Aggregation Strategy*
- RFC 1812, *Requirements for IP Version 4 Routers*
- RFC 2338, *Virtual Router Redundancy Protocol* (obsoleted by RFC 3768 in April 2004)
- RFC 2873, *TCP Processing of the IPv4 Precedence Field*
- RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*

The following RFCs do not define standards, but provide information about IP, TCP, UDP, and related technologies. The IETF classifies them as “Informational.”

- RFC 1878, *Variable Length Subnet Table For IPv4*
- RFC 1948, *Defending Against Sequence Number Attacks*

#### Related Documentation

## Supported IPv6 Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP version 6 (IPv6).

- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*

- RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*

Only the following features are supported:

- Junos-specific secured access list
- Master configuration keywords
- MIB II and its SNMP version 2 derivatives, including the following:
  - Interface management
  - IP (except for the **ipRouteTable** object, which has been replaced by **ipCidrRouteTable** [RFC 2096, *IP Forwarding Table MIB*])
  - SNMP management
  - Statistics counters
- Reconfigurations upon receipt of the SIGHUP signal
- SNMP version 1 **Get** and **GetNext** requests and version 2 **GetBulk** requests

- RFC 1215, *A Convention for Defining Traps for use with the SNMP*

Only MIB II SNMP version 1 traps and version 2 notifications are supported.

- RFC 1771, *A Border Gateway Protocol 4 (BGP-4)*
- RFC 1772, *Application of the Border Gateway Protocol in the Internet*
- RFC 1902, *Structure of Management Information for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1981, *Path MTU Discovery for IP version 6*
- RFC 2080, *RIPng for IPv6*
- RFC 2081, *RIPng Protocol Applicability Statement*
- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2373, *IP Version 6 Addressing Architecture*
- RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*
- RFC 2464, *Transmission of IPv6 Packets over Ethernet Networks*
- RFC 2465, *Management Information Base for IP Version 6: Textual Conventions and General Group*

IP version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) statistics are not supported.

- RFC 2472, *IP Version 6 over PPP*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*

- RFC 2491, *IPv6 Over Non-Broadcast Multiple Access (NBMA) networks*
  - RFC 2492, *IPv6 over ATM Networks*
  - RFC 2526, *Reserved IPv6 Subnet Anycast Addresses*
  - RFC 2545, *Use of BGP-4 Multiprotocol Extensions for IPv6 Inter-Domain Routing*
  - RFC 2578, *Structure of Management Information Version 2 (SMIPv2)*
  - RFC 2675, *IPv6 Jumbograms*
  - RFC 2711, *IPv6 Router Alert Option*
  - RFC 2740, *OSPF for IPv6*
  - RFC 2878, *PPP Bridging Control Protocol (BCP)*
  - RFC 2893, *Transition Mechanisms for IPv6 Hosts and Routers*
  - RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*
- Address assignment is supported with IP version 4 (IPv4) but not IP version 6 (IPv6).
- RFC 3484, *Default Address Selection for Internet Protocol version 6 (IPv6)*
  - RFC 3513, *Internet Protocol Version 6 (IPv6) Addressing Architecture*
  - RFC 3515, *The Session Initiation Protocol (SIP) Refer Method*
  - RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*
  - draft-ietf-vrrp-unified-spec-02.txt *Virtual Router Redundancy Protocol Version 3 for IPv4 and IPv6*
  - RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
  - RFC 4291, *IP Version 6 Addressing Architecture*
  - RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
  - RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
  - RFC 4861, *Neighbor Discovery for IP Version 6 (IPv6)*
  - RFC 4862, *IPv6 Stateless Address Autoconfiguration*
  - RFC 5095, *Deprecation of Type 0 Routing Headers in IPv6*
  - RFC 5308, *Routing IPv6 with IS-IS*
  - Internet draft draft-ietf-idr-flow-spec-00.txt, *Dissemination of flow specification rules*
  - Internet draft-ietf-softwire-dual-stack-lite-04.txt, *Dual-Stack Lite Broadband Deployments Following IPv4 Exhaustion*
  - Internet draft draft-kato-bgp-ipv6-link-local-00.txt, *BGP4+ Peering Using IPv6 Link-local Address*
  - RFC 4798, *Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)*

Option 4b (eBGP redistribution of labeled IPv6 routes from AS to neighboring AS) is not supported.

The following RFCs and Internet draft do not define standards, but provide information about IPv6 and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 2767, *Dual Stack Hosts using the "Bump-In-the-Stack" Technique (BIS)*
- RFC 3587, *IPv6 Global Unicast Address Format*
- Internet draft-ietf-ngtrans-bgp-tunnel-04.txt, *Connecting IPv6 Islands across IPv4 Clouds with BGP*

Only MP-BGP over IP version 4 (IPv4) approach is supported.

## Supported IS-IS Standards

The Junos OS substantially supports the following standards for IS-IS.

- International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) 8473, *Information technology — Protocol for providing the connectionless-mode network service*
- ISO 9542, *End System to Intermediate System Routing Exchange Protocol for Use in Conjunction with the Protocol for the Provision of the Connectionless-mode Network Service*
- ISO/IEC 10589, *Information technology — Telecommunications and information exchange between systems — Intermediate System to Intermediate System intra-domain routing information exchange protocol for use in conjunction with the protocol for providing the connectionless-mode network service (ISO 8473)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 5120, *M-ISIS: Multi Topology (MT) Routing in Intermediate System to Intermediate Systems (IS-ISs)*
- RFC 5130, *A Policy Control Mechanism in IS-IS Using Administrative Tags*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5301, *Dynamic Hostname Exchange Mechanism for IS-IS*
- RFC 5302, *Domain-wide Prefix Distribution with Two-Level IS-IS*
- RFC 5303, *Three-Way Handshake for IS-IS Point-to-Point Adjacencies*
- RFC 5304, *IS-IS Cryptographic Authentication*
- RFC 5305, *IS-IS Extensions for Traffic Engineering*

- RFC 5306, *Restart Signaling for IS-IS*
- RFC 5307, *IS-IS Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*
- RFC 5308, *Routing IPv6 with IS-IS*
- Internet draft draft-ietf-bfd-base-09.txt, *Bidirectional Forwarding Detection*  
Transmission of echo packets is not supported.
- Internet draft draft-ietf-isis-restart-02.txt, *Restart signaling for IS-IS*

The following RFCs do not define standards, but provide information about IS-IS and related technologies. The IETF classifies them as “Informational.”

- RFC 2973, *IS-IS Mesh Groups*
- RFC 3358, *Optional Checksums in Intermediate System to Intermediate System (ISIS)*
- RFC 3359, *Reserved Type, Length and Value (TLV) Codepoints in Intermediate System to Intermediate System*
- RFC 3373, *Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies*
- RFC 3567, *Intermediate System to Intermediate System (IS-IS) Cryptographic Authentication*
- RFC 3787, *Recommendations for Interoperable IP Networks using Intermediate System to Intermediate System (IS-IS)*
- RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*
- Internet draft draft-ietf-bfd-base-09.txt, *Bidirectional Forwarding Detection* (except for the transmission of echo packets)
- Internet draft draft-ietf-isis-wg-255adj-02.txt, *Maintaining more than 255 circuits in IS-IS*

## Supported OSPF and OSPFv3 Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for OSPF and OSPF version 3 (OSPFv3).

- RFC 1583, *OSPF Version 2*
- RFC 1765, *OSPF Database Overflow*
- RFC 1793, *Extending OSPF to Support Demand Circuits*
- RFC 2154, *OSPF with Digital Signatures*
- RFC 2328, *OSPF Version 2*

- RFC 2370, *The OSPF Opaque LSA Option*

Support is provided by the **update-threshold** configuration statement at the **[edit protocols rsvp interface *interface-name* ]** hierarchy level.

- RFC 2740, *OSPF for IPv6*
- RFC 3101, *The OSPF Not-So-Stubby Area (NSSA) Option*
- RFC 3623, *Graceful OSPF Restart*
- RFC 3630, *Traffic Engineering (TE) Extensions to OSPF Version 2*
- RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol [sic] Label Switching (GMPLS)*

Only interface switching is supported.

- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4811, *OSPF Out-of-Band Link State Database (LSDB) Resynchronization*
- RFC 4812, *OSPF Restart Signaling*
- RFC 4813, *OSPF Link-Local Signaling*
- RFC 4915, *Multi-Topology (MT) Routing in OSPF*
- RFC 5185, *OSPF Multi-Area Adjacency*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- Internet draft draft-ietf-ospf-af-alt-10.txt, *Support of address families in OSPFv3*
- Internet draft draft-katz-ward-bfd-02.txt, *Bidirectional Forwarding Detection*

Transmission of echo packets is not supported.

The following RFCs and Internet drafts do not define standards, but provide information about OSPF and related technologies. The IETF classifies them as “Informational.”

- RFC 3137, *OSPF Stub Router Advertisement*
- RFC 3509, *Alternative Implementations of OSPF Area Border Routers*
- RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*

#### Related Documentation

## Supported RIP and RIPng Standards

Junos OS substantially supports the following RFCs, which define standards for RIP (for IP version 4 [IPv4]) and RIP next generation (RIPng, for IP version 6 [IPv6]).

Junos OS supports authentication for all RIP protocol exchanges (MD5 or simple authentication).

- RFC 1058, *Routing Information Protocol*
- RFC 2080, *RIPng for IPv6*
- RFC 2082, *RIP-2 MD5 Authentication*

Multiple keys using distinct key IDs are not supported.

- RFC 2453, *RIP Version 2*

The following RFC does not define a standard, but provides information about RIPng. The IETF classifies it as “Informational.”

- RFC 2081, *RIPng Protocol Applicability Statement*

## Supported DTCP Standard

The Junos OS substantially supports Internet draft draft-cavuto-dtcp-03.txt, *DTCP: Dynamic Tasking Control Protocol*.

### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Flow Monitoring and Discard Accounting Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions), Monitoring Services PICs, or Multiservices PICs or DPCs, the Junos OS substantially supports the standards for cflowd version 5 and version 8 formats that are maintained by CAIDA and accessible at <http://www.caida.org>.

The following RFC does not define a standard, but provides information about flow monitoring. The IETF classifies it as “Informational.”

- RFC 3954, *Cisco Systems NetFlow Services Export Version 9*

### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported IPsec and IKE Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Canada and U.S. version of the Junos OS substantially supports the following RFCs, which define standards for IP Security (IPsec) and Internet Key Exchange (IKE).

- RFC 2085, *HMAC-MD5 IP Authentication with Replay Prevention*
- RFC 2401, *Security Architecture for the Internet Protocol*
- RFC 2402, *IP Authentication Header*

This RFC is not supported on the ES PIC.

- RFC 2403, *The Use of HMAC-MD5-96 within ESP and AH*
- RFC 2404, *The Use of HMAC-SHA-1-96 within ESP and AH*
- RFC 2405, *The ESP DES-CBC Cipher Algorithm With Explicit IV*
- RFC 2406, *IP Encapsulating Security Payload (ESP)*
- RFC 2407, *The Internet IP Security Domain of Interpretation for ISAKMP*
- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)*
- RFC 2409, *The Internet Key Exchange (IKE)*
- RFC 2410, *The NULL Encryption Algorithm and Its Use With IPsec*
- RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*
- RFC 3948, *UDP Encapsulation of IPsec ESP Packets*
- RFC 4301, *Security Architecture for the Internet Protocol*
- RFC 4302, *IP Authentication Header*

This RFC is not supported on the ES PIC.

- RFC 4303, *IP Encapsulating Security Payload (ESP)*

The following RFCs and Internet draft do not define standards, but provide information about IPsec, IKE, and related technologies. The IETF classifies them as “Informational.”

- RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*
- Internet draft draft-eastlake-sha2-02.txt, *US Secure Hash Algorithms (SHA and HMAC-SHA)* (expires July 2006)

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported L2TP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFC, which defines the standard for Layer 2 Tunneling Protocol (L2TP).

- RFC 2661, *Layer Two Tunneling Protocol “L2TP”*

The following RFC does not define a standard, but provides information about technology related to L2TP. The IETF classifies it as “Informational.”

- RFC 2866, *RADIUS Accounting*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Link Services Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFCs, which define standards for link services.

- RFC 1990, *The PPP Multilink Protocol (MP)*
- RFC 2364, *PPP Over AAL5*
- RFC 2686, *The Multi-Class Extension to Multi-Link PPP*

The following features are not supported:

- Negotiation of address field compression and protocol field compression PPP NCP options; instead, a full 4-byte PPP header is always sent
- Prefix elision

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported NAT and SIP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following Network Address Translation (NAT) and Session Initiation Protocol (SIP) standards. NAT supports SIP dialogs and UDP/IP version 4 (IPv4) transport of SIP messages.

The Junos OS substantially supports the following RFC and Internet draft.

- RFC 3261, *SIP: Session Initiation Protocol*
- Internet draft draft-mrw-behave-nat66-01.txt, *IPv6-to-IPv6 Network Address Translation (NAT66)*

The following RFCs do not define standards, but provide information about NAT. The IETF classifies them variously as “Best Current Practice,” “Historic” or “Informational.”

- RFC 1631, *The IP Network Address Translator (NAT)*
- RFC 2663, *IP Network Address Translator (NAT) Terminology and Considerations*
- RFC 2766, *Network Address Translation - Protocol Translation (NAT-PT)*
- RFC 2993, *Architectural Implications of NAT*
- RFC 3022, *Traditional IP Network Address Translator (Traditional NAT)*
- RFC 4787, *Network Address Translation (NAT) Behavioral Requirements for Unicast UDP*
- RFC 5382, *NAT Behavioral Requirements for TCP*
- RFC 5508, *NAT Behavioral Requirements for ICMP*

### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported RPM Standard

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports real-time performance monitoring (RPM), and provides MIB support with extensions in substantial support of RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

### Related Documentation

- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported Voice Services Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following following RFCs, which define standards for technologies used with voice services.

- RFC 2508, *Compressing IP/UDP/RTP Headers for Low-Speed Serial Links*
- RFC 2509, *IP Header Compression over PPP*

### Related Documentation

- [Supported VPLS Standards on page 2315](#)

## Supported Carrier-of-Carriers and Interprovider VPN Standards

The Junos OS substantially supports the following RFCs and Internet draft, which define standards for carrier-of-carriers and interprovider virtual private networks (VPNs).

- RFC 3107, *Carrying Label Information in BGP-4*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- Internet draft draft-marques-ppvnp-ibgp-00.txt, *RFC2547bis networks using internal BGP as PE-CE protocol*

## Supported Layer 3 VPN Standards

The Junos OS substantially supports the following RFCs, which define standards for Layer 3 virtual private networks (VPNs).

- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2685, *Virtual Private Networks Identifier*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4379, *Detecting Multi-Protocol [sic] Label Switched (MPLS) Data Plane Failures*

The traceroute functionality is supported only on transit routers.

- RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4684, *Constrained Route Distribution for Border Gateway Protocol/MultiProtocol [sic] Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)*

The following RFC does not define a standard, but provides information about technology related to Layer 3 VPNs. The IETF classifies it as a “Best Current Practice.”

- RFC 1918, *Address Allocation for Private Internets*

- Related Documentation**

## Supported Multicast VPN Standards

The Junos OS substantially supports the following Internet drafts, which define standards for multicast virtual private networks (VPNs).

- Internet draft draft-ietf-l3vpn-2547bis-mcast-10.txt, *Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-l3vpn-2547bis-mcast-bgp-08.txt, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*

- [Supported BGP Standards on page 2298](#)
- [Accessing Standards Documents on the Internet on page 2269](#)

## Supported VPLS Standards

The Junos OS substantially supports the following following RFCs, which define standards for virtual private LAN service (VPLS).

- RFC 4761, *Virtual Private LAN Service (VPLS) Using BGP for Auto-Discovery and Signaling*
- RFC 4762, *Virtual Private LAN Service (VPLS) Using Label Distribution Protocol (LDP) Signaling*

FEC 128, FEC 129, control bit 0, the Ethernet pseudowire type 0x0005, and the Ethernet tagged mode pseudowire type 0x0004 are supported.
