- **secret *secret***—(Optional) Public SSH host key of the device running the Junos OS. If this statement is added to the **outbound-ssh** configuration hierarchy, the device running Junos OS will pass its public key to the configuration management server during the initialization of the outbound SSH service. This is the recommended method of maintaining a current copy of the router's public key on the configuration management server.
- **keep-alive**—(Optional) Specify that keepalive messages be sent from the device running Junos OS to the configuration management server. To configure the keepalive message, you must set both the **timeout** and **retry** attributes.
 - **retry *number***—Number of keepalive messages the device running Junos OS sends without receiving a response from the configuration management server before the current SSH connection is terminated. The default is three tries.
 - **timeout *seconds***—Amount of time, in seconds, that the server waits for data before sending a keepalive signal. The default is 15 seconds.
- **reconnect-strategy (*sticky* | *in-order*)**—(Optional) Method that the device running Junos OS uses to reestablish a disconnected outbound SSH connection. Two methods are available:
 - **sticky**—The device attempts to reconnect to the configuration management server to which it was last connected. If the connection is unavailable, the device attempts to establish a connection with the next configuration management server on the list and so forth until a connection is established.
 - **in-order**—The device attempts to establish an outbound SSH session based on the configuration management server address list. The device attempts to establish a session with the first server on the list. If this connection is not available, the device attempts to establish a session with the next server, and so on down the list until a connection is established.

When reconnecting to a client, the device running Junos OS attempts to reconnect to the client based on the **retry** and **timeout** values for each of the clients listed in the configuration management server list..

- **services**—(Required) Specifies the services available for the session. Currently, NETCONF is the only service available.
- **address**—(Required) The host name or the IPv4 address of the configuration management server. You can list multiple clients by adding each client's IP address or host name along with the connection parameters listed below.
 - **port *destination-port***—Outbound SSH port for the client. The default is port 22.
 - **retry *number***— Number of times the device running Junos OS attempts to establish an outbound SSH connection before giving up. The default is three tries.
 - **timeout *seconds***—Amount of time, in seconds, that the device running Junos OS attempts to establish an outbound SSH connection before giving up. The default is 15 seconds.

6. Commit the configuration:

```
[edit]  
user@host# commit
```

To set up the configuration management server:

1. Satisfy the prerequisites discussed in [“Prerequisites for All Access Protocols” on page 797](#).
2. Enable the application to access the SSH software.
 - If the application uses the Junos XML protocol Perl module provided by Juniper Networks, no action is necessary. As part of the installation procedure for the Perl module, you install a prerequisites package that includes the necessary SSH software. For instructions, see [“Downloading the Junos XML Protocol Perl Client and Prerequisites Package” on page 980](#).
 - If the application does not use the Junos XML protocol Perl module, obtain the SSH software and install it on the computer where the application runs. For information about obtaining and installing SSH software, see <http://www.ssh.com/> and <http://www.openssh.com/>.
3. (Optional) Manually install the device's public key for use with the SSH connection.
4. Configure the client system to receive and process initialization broadcast requests. The initialization requests use the following syntax:
 - If the secret attribute is configured, the device running Junos OS will send its public SSH key along with the initialization sequence (recommended method). When the key has been received, the client needs to determine what to do with the device's public key. We recommend that you replace any current public SSH key for the device with the new key. This ensures that the client always has the current key available for authentication.

```
MSG-ID: DEVICE-CONN-INFO\r\n  
MSG-VER: V1\r\n  
DEVICE-ID: <device-id>\r\n  
HOST-KEY: <pub-host-key>\r\n  
HMAC: <HMAC(pub-SSH-host-key, <secret>)>\r\n
```

- If the secret attribute is not configured, the device does not send its public SSH key along with the initialization sequence. You need to manually install the current public SSH key for the device.

```
MSG-ID: DEVICE-CONN-INFO\r\n  
MSG-VER: V1\r\n  
DEVICE-ID: <device-id>\r\n
```

Prerequisites for SSL Connections

To enable a client application to use the SSL protocol to connect to the Junos XML protocol server, perform the following steps:

1. Enable the application to access the SSL software.

If the application uses the Junos XML protocol Perl module provided by Juniper Networks, no action is necessary. As part of the installation procedure for the Perl module, you install a prerequisites package that includes the necessary SSL software. For instructions, see “[Downloading the Junos XML Protocol Perl Client and Prerequisites Package](#)” on page 980.

If the application does not use the Junos XML protocol Perl module, obtain the SSL software and install it on the computer where the application runs. For information about obtaining and installing the SSL software, see <http://www.openssl.org/>.

2. Satisfy the prerequisites discussed in “[Prerequisites for All Access Protocols](#)” on page 797.
3. Use one of the following two methods to obtain an authentication certificate in privacy-enhanced mail (PEM) format:
 - Request a certificate from a certificate authority; these agencies usually charge a fee.
 - Working on the computer where the client application runs, issue the following **openssl** command in a standard command shell (not the Junos OS CLI). The command generates a self-signed certificate and an unencrypted 1024-bit RSA private key, and writes them to the file called **certificate-file.pem** in the working directory. The command appears here on two lines only for legibility:

```
% openssl req -x509 -nodes -newkey rsa:1024 \
  -keyout certificate-file.pem -out certificate-file.pem
```

4. Import the certificate onto the device running Junos OS by including the **local** statement at the **[edit security certificates]** hierarchy level and the **load-key-file** statement at the **[edit security certificates local certificate-name]** hierarchy level.

```
[edit]
user@host# edit security certificates local certificate-name
```

```
[edit security certificates local certificate-name]
user@host# set load-key-file URL-or-path
```

certificate-name is a name you choose to identify the certificate uniquely (for example, **junos-xml-protocol-ssl-client-hostname**, where **hostname** is the computer where the client application runs).

URL-or-path specifies the file that contains the paired certificate and private key (if you issued the **openssl** command in Step 3, the **certificate-name.pem** file). Specify either the URL to its location on the client computer or a pathname on the local disk (if you have already used another method to copy the certificate file to the device's local disk). For more information about specifying URLs and pathnames, see the *CLI User Guide*.

NOTE: The CLI expects the private key in the *URL-or-path* file to be unencrypted. If the key is encrypted, the CLI prompts you for the passphrase associated with it, decrypts it, and stores the unencrypted version.

The *set-load-key-file URL-or-path* command copies the contents of the certificate file into the configuration. When you view the configuration, the CLI displays the string of characters that constitute the private key and certificate, marking them as **SECRET-DATA**. The *load-key-file* keyword is not recorded in the configuration.

5. Configure the device running Junos OS to accept SSL connections from Junos XML protocol client applications on port 3220 by including the *xnm-ssl* statement at the **[edit system services]** hierarchy level.

```
[edit security certificates local certificate-name]
user@host# top
[edit]
user@host# set system services xnm-ssl local-certificate certificate-name
```

certificate-name is the unique name you assigned to the certificate in Step 4.

By default, the Junos XML protocol server supports up to 75 simultaneous SSL sessions and 150 connection attempts per minute. Optionally, you can include either or both the *connection-limit* statement to limit the number of concurrent sessions and the *rate-limit* statement to limit connection attempts. Both statements accept a value from 1 through 250.

```
[edit]
user@host# set system services xnm-ssl connection-limit limit
user@host# set system services xnm-ssl rate-limit limit
```

For more information about the *xnm-ssl* statement, see the *Junos OS System Basics Configuration Guide*.

6. Commit the configuration:

```
[edit]
user@host# commit
```

7. Repeat Step 1 on each computer where the client application runs, and Step 2 through Step 6 on each device to which the client application connects.

Prerequisites for Telnet Connections

To enable a client application to use the Telnet protocol to access the Junos XML protocol server, perform the steps described in this section.

Devices running the Junos-FIPS software do not accept Telnet connections. We recommend that you do not use the Telnet protocol in a Common Criteria environment. For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

1. Verify that the application can access the Telnet software. On most operating systems, Telnet is accessible in the standard distribution.
2. Satisfy the prerequisites discussed in [“Prerequisites for All Access Protocols” on page 797](#).
3. Configure the device running Junos OS to accept Telnet connections by including the **telnet** statement at the **[edit system services]** hierarchy level. This statement enables Telnet access for all users and applications, not just Junos XML protocol client applications.

[edit]
user@host# **set system services telnet**
4. Repeat Step 1 on each computer where the application runs, and Step 2 and Step 3 on each device to which the application connects.

Connecting to the Junos XML Protocol Server

- [Connecting to the Junos XML Protocol Server from the Client Application on page 807](#)
- [Connecting to the Junos XML Protocol Server from the CLI on page 808](#)

Connecting to the Junos XML Protocol Server from the Client Application

For a client application to connect to the Junos XML protocol server and open a session, you must first satisfy the prerequisites described in [“Prerequisites for Establishing a Connection” on page 797](#).

When the prerequisites are satisfied, an application written in Perl can most efficiently establish a connection and open a session by using the Junos XML protocol Perl module provided by Juniper Networks. For more information, see [“Writing Junos XML Protocol Perl Client Applications” on page 979](#).

A client application that does not use the Junos XML protocol Perl module connects to the Junos XML protocol server by opening a socket or other communications channel to the Junos XML protocol server device, invoking one of the remote-connection routines appropriate for the programming language and access protocol that the application uses.

What the client application does next depends on which access protocol it is using:

- If using the clear-text or SSL protocol, the client application performs the following steps:

1. Emits the initialization PI and tag, as described in [“Emitting the Initialization PI and Tag” on page 809](#).
2. Authenticates with the Junos XML protocol server, as described in [“Authenticating with the Junos XML Protocol Server” on page 813](#).
- If using the SSH or Telnet protocol, the client application performs the following steps:
 1. Uses the protocol’s built-in authentication mechanism to authenticate.
 2. Issues the **junoscript** command to request that the Junos XML protocol server convert the connection into a Junos XML protocol session. For a C programming language example, see [“Writing Junos XML Protocol C Client Applications” on page 1009](#).
 3. Emits the initialization PI and tag, as described in [“Emitting the Initialization PI and Tag” on page 809](#).

Connecting to the Junos XML Protocol Server from the CLI

The Junos XML management protocol and Junos XML API are primarily intended for use by client applications; however, for testing purposes you can establish an interactive Junos XML protocol session and type commands in a shell window. To connect to the Junos XML protocol server from the CLI operational mode, issue the **junoscript interactive** command (the **interactive** option causes the Junos XML protocol server to echo what you type):

```
user@host> junoscript interactive
```

To begin a Junos XML protocol session over the connection, emit the initialization PI and tag that are described in [“Emitting the Initialization PI and Tag” on page 809](#). You can then type sequences of tag elements that represent operational and configuration operations, which are described in [“Requesting Information” on page 833](#), [“Changing Configuration Information” on page 623](#), and [“Committing a Configuration” on page 919](#). To eliminate typing errors, save complete tag element sequences in a file and use a cut-and-paste utility to copy the sequences to the shell window.

NOTE: When you close the connection to the Junos XML protocol server (for example, by emitting the `<request-end-session/>` and `</junoscript>` tags), the routing platform completely closes your connection instead of returning you to the CLI operational mode prompt. For more information about ending a Junos XML protocol session, see [“Ending a Junos XML Protocol Session and Closing the Connection” on page 827](#).

Starting the Junos XML Protocol Session

Each Junos XML protocol session begins with a handshake in which the Junos XML protocol server and the client application specify the version of XML and the version of the Junos XML management protocol they are using. Each party parses the version

information emitted by the other, using it to determine whether they can communicate successfully. The following sections describe how to start a Junos XML protocol session:

- [Emitting the Initialization PI and Tag on page 809](#)
- [Parsing the Initialization PI and Tag from the Junos XML Protocol Server on page 811](#)
- [Verifying Software Compatibility on page 813](#)
- [Supported Software Versions on page 813](#)

Emitting the Initialization PI and Tag

When the Junos XML protocol session begins, the client application emits an `<?xml?>` PI and an opening `<junoscript>` tag, as described in the following sections:

- [Emitting the `<?xml?>` PI on page 809](#)
- [Emitting the Opening `<junoscript>` Tag on page 810](#)

Emitting the `<?xml?>` PI

The client application begins by emitting an `<?xml?>` PI.

NOTE: In the following example (and in all examples in this document of tag elements emitted by a client application), bold font is used to highlight the part of the tag sequence that is discussed in the text.

```
<?xml version="version" encoding="encoding"?>
```

The attributes are as follows. For a list of the attribute values that are acceptable in the current version of the Junos XML management protocol, see [“Supported Software Versions” on page 813](#).

- **version**—The version of XML with which tag elements emitted by the client application comply
- **encoding**—The standardized character set that the client application uses and can understand

In the following example of a client application's `<?xml?>` PI, the **version="1.0"** attribute indicates that the application is emitting tag elements that comply with the XML 1.0 specification. The **encoding="us-ascii"** attribute indicates that the client application is using the 7-bit ASCII character set standardized by the American National Standards Institute (ANSI). For more information about ANSI standards, see <http://www.ansi.org/>.

```
<?xml version="1.0" encoding="us-ascii"?>
```

NOTE: If the application fails to emit the `<?xml?>` PI before emitting the opening `<junoscript>` tag, the Junos XML protocol server emits an error message and immediately closes the session and connection. For more information, see [“Emitting the Opening `<junoscript>` Tag” on page 810](#).

Emitting the Opening <junoscript> Tag

The client application then emits its opening **<junoscript>** tag, which has the following syntax (and appears here on two lines only for legibility):

```
<junoscript version="version" hostname="hostname" junos:key="key"
  release="release-code">
```

The attributes are as follows. For a list of the attribute values that are acceptable in the current version of the Junos XML management protocol, see [“Supported Software Versions” on page 813](#).

- **version**—(Required) Specifies the version of the Junos XML management protocol that the client application is using.
- **hostname**—(Optional) Names the machine on which the client application is running. The information is used only when diagnosing problems. The Junos XML protocol does not include support for establishing trusted-host relationships or otherwise altering Junos XML protocol server behavior depending on the client hostname.
- **junos:key**—(Optional) Requests that the Junos XML protocol server indicate whether a child configuration element is an identifier for its parent element. The only acceptable value is **key**. For more information, see [“Requesting an Indicator for Identifiers” on page 844](#).
- **release**—(Optional) Identifies the Junos OS Release (and by implication, the Junos XML API) for which the client application is designed. The value of this attribute indicates that the client application can interoperate successfully with a Junos XML protocol server that also supports that version of the Junos XML API. In other words, it indicates that the client application emits request tag elements from that API and knows how to parse response tag elements from it. If the application does not include this attribute, the Junos XML protocol server emits tag elements from the Junos XML API that it supports. For more information, see [“Verifying Software Compatibility” on page 813](#).

For the value of the **release** attribute, use the standard notation for Junos OS version numbers. For example, the value **12.1R1** represents the initial version of Junos OS Release 12.1.

In the following example of a client application's opening **<junoscript>** tag, the **version="1.0"** attribute indicates that it is using Junos XML protocol version 1.0. The **hostname="client1"** attribute indicates that the client application is running on the machine called **client1**. The **release="12.1R1"** attribute indicates that the switch, router, or security device is running the initial version of Junos OS Release 12.1.

```
<junoscript version="1.0" hostname="client1" release="12.1R1">
```

NOTE: If the application fails to emit the `<?xml?>` PI before emitting the opening `<junoscript>` tag, the Junos XML protocol server emits an error message similar to the following and immediately closes the session and connection:

```
<rpc-reply>
  <xnm:error xmlns="http://xml.juniper.net/xnm/1.1/xnm" \
    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm">
    <message>
      communication error while exchanging credentials
    </message>
  </xnm:error>
</rpc-reply>
<!-- session end at YYYY-MM-DD hh:mm:ss TZ -->
</junoscript>
```

For more information about the `<xnm:error>` tag, see [“Handling an Error or Warning” on page 821](#).

Parsing the Initialization PI and Tag from the Junos XML Protocol Server

When the Junos XML protocol session begins, the Junos XML protocol server emits an `<?xml?>` PI and an opening `<junoscript>` tag, as described in the following sections:

- [Parsing the Junos XML Protocol Server's `<?xml?>` PI on page 811](#)
- [Parsing the Junos XML Protocol Server's Opening `<junoscript>` Tag on page 812](#)

Parsing the Junos XML Protocol Server's `<?xml?>` PI

The syntax for the `<?xml?>` PI is as follows:

```
<?xml version="version" encoding="encoding"?>
```

The attributes are as follows. For a list of the attribute values that are acceptable in the current version of the Junos XML management protocol, see [“Supported Software Versions” on page 813](#).

- **version**—The version of XML with which tag elements emitted by the Junos XML protocol server comply
- **encoding**—The standardized character set that the Junos XML protocol server uses and can understand

In the following example of a Junos XML protocol server's `<?xml?>` PI, the **version="1.0"** attribute indicates that the server is emitting tag elements that comply with the XML 1.0 specification. The **encoding="us-ascii"** attribute indicates that the server is using the 7-bit ASCII character set standardized by ANSI. For more information about ANSI standards, see <http://www.ansi.org/>.

```
<?xml version="1.0" encoding="us-ascii"?>
```

Parsing the Junos XML Protocol Server's Opening <junoscript> Tag

After emitting the `<?xml?>PI`, the server then emits its opening `<junoscript>` tag, which has the following form (the tag appears on multiple lines only for legibility):

```
<junoscript xmlns="namespace-URL" xmlns:junos="namespace-URL" \
  schemaLocation="namespace-URL" os="JUNOS" \
  release="release-code" hostname="hostname" version="version">
```

The attributes are as follows:

- **hostname**—The name of the device on which the Junos XML protocol server is running.
- **os**—The operating system of the device on which the Junos XML protocol server is running. The value is always **JUNOS**.
- **release**—The identifier for the version of the Junos OS from which the Junos XML protocol server is derived and that it is designed to understand. It is presumably in use on the device where the Junos XML protocol server is running. The value of the **release** attribute uses the standard notation for Juniper Networks software version numbers. For example, the value **12.1R1** represents the initial version of Junos OS Release 12.1.
- **schemaLocation**—The XML namespace for the XML Schema-language representation of the Junos configuration hierarchy.
- **version**—The version of the Junos XML management protocol that the Junos XML protocol server is using.
- **xmlns**—The XML namespace for the tag elements enclosed by the `<junoscript>` tag element that do not have a prefix on their names (that is, the default namespace for Junos XML tag elements). The value is a URL of the form `http://xml.juniper.net/xnm/version/xnm`, where **version** is a string such as **1.1**.
- **xmlns:junos**—The XML namespace for the tag elements enclosed by the `<junoscript>` tag element that have the **junos:** prefix on their names. The value is a URL of the form `http://xml.juniper.net/junos/release-code/junos`, where **release-code** is the standard string that represents a release of the Junos OS. For example, the value **12.1R1** represents the initial version of Junos OS Release 12.1.

In the following example of a Junos XML protocol server's opening `<junoscript>` tag, the **version** attribute indicates that the server is using Junos XML protocol version 1.0, and the **hostname** attribute indicates that the router's name is **big-device**. The **os** and **release** attributes indicate that the device is running the initial version of Junos OS Release 12.1. The **xmlns** attribute indicate that the default namespace for Junos XML tag elements is `http://xml.juniper.net/xnm/1.1/xnm`. The **xmlns:junos** attribute indicates that the namespace for tag elements that have the **junos:** prefix is `http://xml.juniper.net/junos/12.1R1/junos`. The tag appears on multiple lines only for legibility.

```
<junoscript xmlns="http://xml.juniper.net/xnm/1.1/xnm" \
  xmlns:junos="http://xml.juniper.net/junos/12.1R1/junos" \
  schemaLocation="http://xml.juniper.net/junos/12.1R1/junos" os="JUNOS" \
  release="12.1R1.8" hostname="big-device" version="1.0">
```

Verifying Software Compatibility

Exchanging `<?xml?>` and `<junoscript>` tag elements enables a client application and the Junos XML protocol server to determine if they are running different versions of the software used during a Junos XML protocol session. Different versions are sometimes incompatible, and by Junos XML protocol convention the party running the later version of software determines how to handle any incompatibility. For fully automated performance, include code in the client application that determines if its version of software is later than that of the Junos XML protocol server. Decide which of the following options is appropriate when the application's version is more recent, and implement the corresponding response:

- Ignore differences in Junos version, and do not alter the client application's behavior to accommodate the Junos XML protocol server. A difference in Junos versions does not necessarily make the server and client incompatible, so this is often a valid approach.
- Alter standard behavior to be compatible with the Junos XML protocol server. If the client application is running a later version of the Junos OS, for example, it can choose to emit only tag elements that represent the software features available in the Junos XML protocol server's version of the Junos OS.
- End the Junos XML protocol session and terminate the connection. This is appropriate if you decide that it is not practical to accommodate the Junos XML protocol server's version of software. For instructions, see [“Ending a Junos XML Protocol Session and Closing the Connection” on page 827](#).

Supported Software Versions

[Table 37 on page 813](#) specifies the PI or opening tag and attribute used to convey version information during Junos XML protocol session initialization in version 1.0 of the Junos XML management protocol.

Table 37: Junos XML Protocol version 1.0 PI and Opening Tag

Software and Versions	PI or Tag	Attribute
XML 1.0	<code><?xml?></code>	<code>version="1.0"</code>
ANSI-standardized 7-bit ASCII character set	<code><?xml?></code>	<code>encoding="us-ascii"</code>
Junos XML protocol 1.0	<code><junoscript></code>	<code>version="1.0"</code>
Junos OS Release	<code><junoscript></code>	<code>release="m.nZb"</code> For example: <code>release="10.3R1"</code>

Authenticating with the Junos XML Protocol Server

A client application that uses the clear-text or SSL protocol must now authenticate with the Junos XML protocol server. (Applications that use the SSH or Telnet protocol use

the protocol's built-in authentication mechanism before emitting initialization tag elements, as described in ["Connecting to the Junos XML Protocol Server" on page 807.](#))

See the following sections:

- [Submitting an Authentication Request on page 814](#)
- [Interpreting the Authentication Response on page 815](#)

Submitting an Authentication Request

The client application begins the authentication process by emitting an `<rpc>` tag element enclosing the `<request-login>` tag element. In the `<request-login>` tag element, it encloses the `<username>` tag element to specify the Junos OS account (username) under which to establish the connection. The account must already be configured on the Junos XML protocol server device, as described in ["Prerequisites for All Access Protocols" on page 797.](#) You can choose whether or not the application provides the account password as part of the initial tag sequence.

Providing the Password with the Username

To provide the password along with the username, the application emits the following tag sequence:

```
<rpc>
  <request-login>
    <username>username</username>
    <challenge-response>password</challenge-response>
  </request-login>
</rpc>
```

This tag sequence is appropriate if the application automates access to routing, switching, or security platform information and does not interact with users, or obtains the password from a user before beginning the authentication process.

Providing Only the Username

To omit the password and specify only the username, the application emits the following tag sequence:

```
<rpc>
  <request-login>
    <username>username</username>
  </request-login>
</rpc>
```

This tag sequence is appropriate if the application does not obtain the password until the authentication process has already begun. In this case, the Junos XML protocol server returns the `<challenge>` tag element within an `<rpc-reply>` tag element to request the password associated with the username. The tag element encloses the **Password:** string, which the client application can forward to the screen as a prompt for a user. The `echo="no"` attribute in the opening `<challenge>` tag specifies that the password string typed by the user does not echo on the screen. The tag sequence is as follows:

```
<rpc-reply xmlns:junos="URL">
  <challenge echo="no">Password:</challenge>
</rpc-reply>
```

The client application obtains the password and emits the following tag sequence to forward it to the Junos XML protocol server:

```
<rpc>
  <request-login>
    <username>username</username>
    <challenge-response>password</challenge-response>
  </request-login>
</rpc>
```

Interpreting the Authentication Response

After it receives the username and password, the Junos XML protocol server emits the **<authentication-response>** tag element to indicate whether the authentication attempt is successful.

Server Response When Authentication Succeeds

If the password is correct, the authentication attempt succeeds and the Junos XML protocol server emits the following tag sequence:

```
<rpc-reply xmlns:junos="URL">
  <authentication-response>
    <status>success</status>
    <message>username</message>
    <login-name>remote-username</login-name>
  </authentication-response>
</rpc-reply>
```

The **<message>** tag element contains the Junos username under which the connection is established.

The **<login-name>** tag element contains the username that the client application provided to an authentication utility such as RADIUS or TACACS+. This tag element appears only if the username differs from the username contained in the **<message>** tag element.

The Junos XML protocol session begins, as described in ["Starting the Junos XML Protocol Session" on page 808](#).

Server Response When Authentication Fails

If the password is not correct or the **<request-login>** tag element is otherwise malformed, the authentication attempt fails and the Junos XML protocol server emits the following tag sequence:

```
<rpc-reply xmlns:junos="URL">
  <authentication-response>
    <status>fail</status>
    <message>error-message</message>
  </authentication-response>
</rpc-reply>
```

The **error-message** string in the **<message>** tag element explains why the authentication attempt failed. The Junos XML protocol server emits the **<challenge>** tag element up to two more times before rejecting the authentication attempt and closing the connection.

Exchanging Information with the Junos XML Protocol Server

The session continues when the client application sends a request to the Junos XML protocol server. The Junos XML protocol server does not emit any tag elements after session initialization except in response to the client application's requests. The following sections describe the exchange of tagged data:

- [Sending a Request to the Junos XML Protocol Server on page 816](#)
- [Parsing the Junos XML Protocol Server Response on page 819](#)
- [Handling an Error or Warning on page 821](#)
- [Halting a Request on page 822](#)

Sending a Request to the Junos XML Protocol Server

To initiate a request to the Junos XML protocol server, a client application emits the opening `<rpc>` tag, followed by one or more tag elements that represent the particular request, and the closing `</rpc>` tag, in that order:

```
<rpc>  
  <!--tag elements representing a request-->  
</rpc>
```

The application encloses each request in a separate pair of opening `<rpc>` and closing `</rpc>` tags. The `<rpc>` tag element can occur only within the `<junoscript>` tag element. For an example of emitting an `<rpc>` tag element in the context of a complete Junos XML protocol session, see [“Example of a Junos XML Protocol Session” on page 829](#).

The Junos XML protocol server ignores any newline characters, spaces, or other white space characters that occur between tag elements in the tag stream, but does preserve white space within tag elements. For more information, see [“XML and Junos XML Management Protocol Conventions Overview” on page 781](#).

See the following sections for further information:

- [Request Classes on page 816](#)
- [Including Attributes in the Opening `<rpc>` Tag on page 818](#)

Request Classes

A client application can make three classes of requests:

- [Operational Requests on page 817](#)
- [Configuration Information Requests on page 817](#)
- [Configuration Change Requests on page 818](#)

NOTE: Although operational and configuration requests conceptually belong to separate classes, a Junos XML protocol session does not have distinct modes that correspond to CLI operational and configuration modes. Each request tag element is enclosed within its own `<rpc>` tag element, so a client application can freely alternate operational and configuration requests.

Operational Requests

Operational requests are requests for information about the status of a device running Junos OS. Operational requests correspond to the CLI operational mode commands listed in the Junos OS command references. The Junos XML API defines a request tag element for many CLI commands. For example, the `<get-interface-information>` tag element corresponds to the **show interfaces** command, and the `<get-chassis-inventory>` tag element requests the same information as the **show chassis hardware** command.

The following sample request is for detailed information about the interface **ge-2/3/0**:

```
<rpc>
  <get-interface-information>
    <interface-name>ge-2/3/0</interface-name>
    <detail/>
  </get-interface-information>
</rpc>
```

For more information, see [“Requesting Operational Information” on page 834](#). For information about the Junos XML request tag elements available in the current Junos OS Release, see the *Junos XML API Operational Developer Reference*.

Configuration Information Requests

Configuration information requests are requests for information about the device's candidate configuration, a private configuration, or the committed configuration (the one currently in active use on the switching, routing, or security platform). The candidate and committed configurations diverge when there are uncommitted changes to the candidate configuration.

The Junos XML protocol defines the `<get-configuration>` operation for retrieving configuration information. The Junos XML API defines a tag element for every container and leaf statement in the configuration hierarchy.

The following example shows how to request information about the **[edit system login]** hierarchy level in the candidate configuration:

```
<rpc>
  <get-configuration>
    <configuration>
      <system>
        <login/>
      </system>
    </configuration>
  </get-configuration>
</rpc>
```

For more information, see [“Requesting Configuration Information” on page 838](#). For a summary of Junos XML configuration tag elements, see the *Junos XML API Configuration Developer Reference*.

Configuration Change Requests

Configuration change requests are requests to change the candidate configuration, or to commit those changes to put them into active use on the device running Junos OS. The Junos XML protocol defines the `<load-configuration>` operation for changing configuration information. The Junos XML API defines a tag element for every CLI configuration statement described in the Junos OS configuration guides.

The following example shows how to create a new Junos OS user account called **admin** at the **[edit system login]** hierarchy level in the candidate configuration:

```
<rpc>
  <load-configuration>
    <configuration>
      <system>
        <login>
          <user>
            <name>admin</name>
            <full-name>Administrator</full-name>
            <class>superuser</class>
          </user>
        </login>
      </system>
    </configuration>
  </load-configuration>
</rpc>
```

For more information, see [“Changing Configuration Information” on page 623](#) and [“Committing a Configuration” on page 919](#). For a summary of Junos XML configuration tag elements, see the *Junos XML API Configuration Developer Reference*.

Including Attributes in the Opening `<rpc>` Tag

Optionally, a client application can include one or more attributes of the form ***attribute-name="value"*** in the opening `<rpc>` tag for each request. The Junos XML protocol server echoes each attribute, unchanged, in the opening `<rpc-reply>` tag in which it encloses its response. A client application can use this feature to associate requests and responses by including an attribute in each opening `<rpc>` request tag that assigns a unique identifier. The Junos XML protocol server echoes the attribute in its opening `<rpc-reply>` tag, making it easy to map the response to the initiating request. The client application can freely define attribute names, except as described in the following note.

NOTE: The `xmlns:junos` attribute name is reserved. The Junos XML protocol server sets the attribute to an appropriate value on the opening `<rpc-reply>` tag, so client applications must not emit it on the opening `<rpc>` tag. For more information, see [“xmlns:junos Attribute” on page 819](#).

Parsing the Junos XML Protocol Server Response

The Junos XML protocol server encloses its response to each client request in a separate pair of opening `<rpc-reply>` and closing `</rpc-reply>` tags. Each response constitutes a well-formed XML document.

```
<rpc-reply xmlns:junos="URL">
  <!-- tag elements representing a response -->
</rpc-reply>
```

The `xmlns:junos` attribute in the opening `<rpc-reply>` tag defines the default namespace for the enclosed tag elements that have the `junos:` prefix in their names, as discussed further in [“xmlns:junos Attribute” on page 819](#). The `<rpc-reply>` tag element occurs only within the `<junoscript>` tag element. Client applications must include code for parsing the stream of response tag elements coming from the Junos XML protocol server, either processing them as they arrive or storing them until the response is complete. See the following sections for further information:

- [xmlns:junos Attribute on page 819](#)
- [Junos XML Protocol Server Response Classes on page 819](#)
- [Using a Standard API to Parse Response Tag Elements on page 821](#)

For an example of parsing the `<rpc-reply>` tag element in the context of a complete Junos XML protocol session, see [“Example of a Junos XML Protocol Session” on page 829](#).

xmlns:junos Attribute

The Junos XML protocol server includes the `xmlns:junos` attribute in the opening `<rpc-reply>` tag to define the XML namespace for the enclosed Junos XML tag elements that have the `junos:` prefix on their names. The namespace is a URL of the form `http://xml.juniper.net/junos/release-code/junos`, where *release-code* is the standard string that represents the release of the Junos OS running on the Junos XML protocol server machine.

In the following example, the namespace corresponds to the initial version of Junos OS Release 12.1:

```
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/12.1R1/junos">
```

Junos XML Protocol Server Response Classes

The Junos XML protocol server returns three classes of responses:

- [Operational Responses on page 819](#)
- [Configuration Information Responses on page 820](#)
- [Configuration Change Responses on page 821](#)

Operational Responses

Operational responses are responses to requests for information about the status of a switching, routing, or security platform. They correspond to the output from CLI operational commands as described in the Junos OS command references.

The Junos XML API defines response tag elements for all defined operational request tag elements. For example, the Junos XML protocol server returns the information requested by the `<get-interface-information>` tag element in a response tag element called `<interface-information>`, and returns the information requested by the `<get-chassis-inventory>` tag element in a response tag element called `<chassis-inventory>`. Operational responses also can be returned in formatted ASCII, which is enclosed in an `output` tag element. For more information about formatting operational responses see [“Specifying the Output Format for Operational Information Requests in a Junos XML Protocol Session” on page 836](#).

The following sample response includes information about the interface `ge-2/3/0`. The namespace indicated by the `xmlns` attribute contains interface information for the initial version of Junos OS Release 12.1.

```
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/12.1R1/junos">
  <interface-information xmlns="http://xml.juniper.net/junos/12.1R1/junos-interface">
    <physical-interface>
      <name>ge-2/3/0</name>
      <!-- other data tag elements for the ge-2/3/0 interface -??->
    </physical-interface>
  </interface-information>
</rpc-reply>
```

For more information about the `xmlns` attribute and contents of operational response tag elements, see [“Requesting Operational Information” on page 834](#). For a summary of operational response tag elements, see the *Junos XML API Operational Developer Reference*.

Configuration Information Responses

Configuration information responses are responses to requests for information about the device's current configuration. The Junos XML API defines a tag element for every container and leaf statement in the configuration hierarchy.

The following sample response includes the information at the `[edit system login]` hierarchy level in the configuration hierarchy. For brevity, the sample shows only one user defined at this level.

```
<rpc-reply xmlns:junos="URL">
  <configuration>
    <system>
      <login>
        <user>
          <name>admin</name>
          <full-name>Administrator</full-name>
          <!-- other data tag elements for the admin user -->
        </user>
      </login>
    </system>
  </configuration>
</rpc-reply>
```

Configuration Change Responses

Configuration change responses are responses to requests that change the state or contents of the device configuration. For commit operations, the Junos XML protocol server encloses an explicit indicator of success or failure within the `<commit-results>` tag element:

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <!-- tag elements for information about the commit -->
  </commit-results>
</rpc-reply>
```

For other operations, the Junos XML protocol server indicates success by returning an opening `<rpc-reply>` and closing `</rpc-reply>` tag with nothing between them, instead of emitting an explicit success indicator:

```
<rpc-reply xmlns:junos="URL">
</rpc-reply>
```

For more information, see “Changing Configuration Information” on page 623 and “Committing a Configuration” on page 919. For a summary of the available configuration tag elements, see the *Junos XML API Configuration Developer Reference*.

Using a Standard API to Parse Response Tag Elements

Client applications can handle incoming XML tag elements by feeding them to a parser that implements a standard API such as the Document Object Model (DOM) or Simple API for XML (SAX). Describing how to implement and use a parser is beyond the scope of this document.

Routines in the DOM accept incoming XML and build a tag hierarchy in the client application’s memory. There are also DOM routines for manipulating an existing hierarchy. DOM implementations are available for several programming languages, including C, C++, Perl, and Java. For detailed information, see the *Document Object Model (DOM) Level 1 Specification* from the World Wide Web Consortium (W3C) at <http://www.w3.org/TR/REC-DOM-Level-1/>. Additional information is available from the Comprehensive Perl Archive Network (CPAN) at <http://search.cpan.org/~tjmathier/XML-DOM/lib/XML/DOM.pm>.

One potential drawback with DOM is that it always builds a hierarchy of tag elements, which can become very large. If a client application needs to handle only one subhierarchy at a time, it can use a parser that implements SAX instead. SAX accepts XML and feeds the tag elements directly to the client application, which must build its own tag hierarchy. For more information, see the official SAX website at <http://sax.sourceforge.net/>.

Handling an Error or Warning

If the Junos XML protocol server encounters an error condition, it emits an `<xnm:error>` tag element, which encloses child tag elements that describe the nature of the error. Client applications must be prepared to receive and handle an `<xnm:error>` tag element at any time. The information in any response tag elements already received and related to the current request might be incomplete. The client application can include logic for deciding whether to discard or retain the information.

The syntax of the `<xnm:error>` tag element is as follows. The opening tag appears on multiple lines only for legibility:

```
<xnm:error xmlns="http://xml.juniper.net/xnm/1.1/xnm" \
  xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm">
  <!-- tag elements describing the error -->
</xnm:error>
```

The attributes are as follows:

- **xmlns**—The XML namespace for the tag elements enclosed by the `<xnm:error>` tag element that do not have a prefix in their names (that is, the default namespace for Junos XML tag elements). The value is a URL of the form `http://xml.juniper.net/xnm/version/xnm`, where *version* is a string such as 1.1.
- **xmlns:xnm**—The XML namespace for the `<xnm:error>` tag element and for the enclosed tag elements that have the `xnm:` prefix in their names. The value is a URL of the form `http://xml.juniper.net/xnm/version/xnm`, where *version* is a string such as 1.1.

The set of child tag elements enclosed in the `<xnm:error>` tag element depends on the operation that server was performing when the error occurred. An error can occur while the server is performing any of the following operations, and the server can send a different combination of child tag elements in each case:

- Processing an operational request submitted by a client application (discussed in [“Requesting Information” on page 833](#))
- Opening, locking, committing, or closing a configuration as requested by a client application (discussed in [“Exchanging Information with the Junos XML Protocol Server” on page 816](#), [“Committing a Configuration” on page 919](#), and [“Ending a Junos XML Protocol Session and Closing the Connection” on page 827](#))
- Parsing configuration data submitted by a client application in a `<load-configuration>` tag element (discussed in [“Changing Configuration Information” on page 623](#))

If the Junos XML protocol server encounters a less serious problem, it can emit an `<xnm:warning>` tag element instead. The usual response for the client application in this case is to log the warning or pass it to the user, but to continue parsing the server’s response.

For a description of the child tag elements that can appear within an `<xnm:error>` or `<xnm:warning>` tag element to specify the nature of the problem, see [“<xnm:error>” on page 959](#) and [“<xnm:warning>” on page 961](#).

Halting a Request

To request that the Junos XML protocol server stop processing the current request, a client application emits the `<abort/>` tag directly after the closing `</rpc>` tag for the operation to be halted:

```
<rpc>
  <!-- tag elements for the request -->
</rpc>
<abort/>
```

The Junos XML protocol server responds with the `<abort-acknowledgement/>` tag:

```
<rpc-reply xmlns:junos="URL">
  <abort-acknowledgement/>
</rpc-reply>
```

Depending on the operation being performed, response tag elements already sent by the Junos XML protocol server for the halted request are possibly invalid. The application can include logic for deciding whether to discard or retain them as appropriate.

For more information, see “`<abort/>`” on page 935 and “`<abort-acknowledgement/>`” on page 935.

Locking and Unlocking the Candidate Configuration or Creating a Private Copy

When a client application is requesting or changing configuration information, it can use one of three methods to access the configuration:

- Lock the candidate configuration, which prevents other users or applications from changing the configuration until the application releases the lock (equivalent to the CLI **configure exclusive** command).
- Create a private copy of the candidate configuration, which enables the application to view or change configuration data without affecting the candidate or active configuration until the private copy is committed (equivalent to the CLI **configure private** command).
- Change the candidate configuration without locking it. We do not recommend this method, because of the potential for conflicts with changes made by other applications or users that are editing the configuration at the same time.

If an application is simply requesting configuration information and not changing it, locking the configuration or creating a private copy is not required. However, it is appropriate to lock the configuration if it is important that the information being returned not change during the session. The information from a private copy is guaranteed not to change, but can diverge from the candidate configuration if other users or applications are changing the candidate.

The restrictions on, and interactions between, operations on the locked regular candidate configuration and a private copy are the same as for the CLI **configure exclusive** and **configure private** commands. For more information, see “[Committing a Private Copy of the Configuration](#)” on page 921 and the *CLI User Guide*.

For more information about locking and unlocking the candidate configuration or creating a private copy, see the following sections:

- [Locking the Candidate Configuration on page 824](#)
- [Unlocking the Candidate Configuration on page 825](#)
- [Terminating Another Junos XML Protocol Session on page 825](#)
- [Creating a Private Copy of the Configuration on page 826](#)

Locking the Candidate Configuration

To lock the candidate configuration, a client application emits the `<lock-configuration/>` tag within an `<rpc>` tag element:

```
<rpc>
  <lock-configuration/>
</rpc>
```

Emitting this tag prevents other users or applications from changing the candidate configuration until the lock is released (equivalent to the CLI **configure exclusive** command). Locking the configuration is recommended, particularly on devices where multiple users are authorized to change the configuration. A commit operation applies to all changes in the candidate configuration, not just those made by the user or application that requests the commit. Allowing multiple users or applications to make changes simultaneously can lead to unexpected results.

When the Junos XML protocol server locks the configuration, it returns an opening `<rpc-reply>` and closing `</rpc-reply>` tag with nothing between them:

```
<rpc-reply xmlns:junos="URL">
</rpc-reply>
```

If the Junos XML protocol server cannot lock the configuration, the `<rpc-reply>` tag element instead encloses an `<xnm:error>` tag element explaining the reason for the failure. Reasons for the failure can include the following:

- Another user or application has already locked the candidate configuration. The error message reports the login identity of the user or application.
- The candidate configuration already includes changes that have not yet been committed. To commit the changes, see [“Committing a Configuration” on page 919](#). To roll back to a previous version of the configuration (and lose the uncommitted changes), see [“Rolling Back to a Previous or Rescue Configuration” on page 888](#).

Only one application can hold the lock on the candidate configuration at a time. Other users and applications can read the candidate configuration while it is locked, or can change their private copies. The lock persists until either the Junos XML protocol session ends or the client application unlocks the configuration by emitting the `<unlock-configuration/>` tag, as described in [“Unlocking the Candidate Configuration” on page 825](#).

If the candidate configuration is not committed before the client application unlocks it, or if the Junos XML protocol session ends for any reason before the changes are committed, the changes are automatically discarded. The candidate and committed configurations remain unchanged.

Unlocking the Candidate Configuration

As long as a client application holds a lock on the candidate configuration, other applications and users cannot change the candidate. To unlock the candidate configuration, the client application includes the `<unlock-configuration/>` tag in an `<rpc>` tag element:

```
<rpc>
  <unlock-configuration/>
</rpc>
```

To confirm that it has successfully unlocked the configuration, the Junos XML protocol server returns an opening `<rpc-reply>` and closing `</rpc-reply>` tag with nothing between them:

```
<rpc-reply xmlns:junos="URL">
</rpc-reply>
```

If the Junos XML protocol server cannot unlock the configuration, the `<rpc-reply>` tag element instead encloses an `<xnm:error>` tag element explaining the reason for the failure.

Terminating Another Junos XML Protocol Session

A client application's attempt to lock the candidate configuration can fail because another user or application already holds the lock, as mentioned in ["Locking the Candidate Configuration" on page 824](#). In this case, the Junos XML protocol server returns an error message that includes the username and process ID (PID) for the entity that holds the existing lock:

```
<rpc-reply xmlns="URN" xmlns:junos="URL">
  <xnm:error>
    <message>
      configuration database locked by:
      user terminal (pid PID) on since YYYY-MM-DD hh:mm:ss TZ, idle hh:mm:ss
      exclusive [edit]
    </message>
  </xnm:error>
</rpc-reply>
```

If the client application has the Junos **maintenance** permission, it can end the session that holds the lock by emitting the `<kill-session>` and `<session-id>` tag elements in an `<rpc>` tag element. The `<session-id>` tag element specifies the PID obtained from the error message:

```
<rpc>
  <kill-session>
    <session-id>PID</session-id>
  </kill-session>
</rpc>
```

The Junos XML protocol server confirms that it has terminated the other session by returning the `<ok/>` tag in the `<rpc-reply>` tag element:

```
<rpc-reply xmlns="URN" xmlns:junos="URL">
  <ok/>
</rpc-reply>
```

We recommend that the application include logic for determining whether it is appropriate to terminate another session, based on factors such as the identity of the user or application that holds the lock, or the length of idle time.

When a session is terminated, the Junos XML protocol server that is servicing the session rolls back all uncommitted changes that have been made during the session. If a confirmed commit is pending (changes have been committed but not yet confirmed), the Junos XML protocol server restores the configuration to its state before the confirmed commit instruction was issued. (For information about the confirmed commit operation, see [“Committing the Candidate Configuration Only After Confirmation” on page 923.](#))

Creating a Private Copy of the Configuration

To create a private copy of the candidate configuration, a client application emits the `<private/>` tag enclosed in `<rpc>` and `<open-configuration>` tag elements:

```
<rpc>
  <open-configuration>
    <private/>
  </open-configuration>
</rpc>
```

The client application can then perform the same operations on the private copy as on the regular candidate configuration, as described in [“Changing Configuration Information” on page 623.](#)

After making changes to the private copy, the client application can commit the changes to the active configuration on the device running Junos OS by emitting the `<commit-configuration>` tag element, as for the regular candidate configuration. However, there are some restrictions on the commit operation for a private copy. For more information, see [“Committing a Private Copy of the Configuration” on page 921.](#)

To discard the private copy without committing it, a client application emits the `<close-configuration/>` tag enclosed in an `<rpc>` tag element:

```
<rpc>
  <close-configuration/>
</rpc>
```

Any changes to the private copy are lost. Changes to the private copy are also lost if the Junos XML protocol session ends for any reason before the changes are committed. It is not possible to save changes to a private copy other than by emitting the `<commit-configuration>` tag element.

The following example shows how to create a private copy of the configuration. The Junos XML protocol server includes a reminder in its confirmation response that changes are discarded from a private copy if they are not committed before the session ends.

Client Application	Junos XML Protocol Server
<pre> <rpc> <open-configuration> <private/> </open-configuration> </rpc> </pre>	<pre> <rpc-reply xmlns:junos="URL"> <xnm:warning xmlns="http://xml.juniper.net/xnm/1.1/xnm" \ xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"> <message>uncommitted changes will be discarded on exit</message> </xnm:warning> </rpc-reply> </pre>

T1172

Ending a Junos XML Protocol Session and Closing the Connection

When a client application is finished making requests, it ends the Junos XML protocol session by emitting the `<request-end-session/>` tag within an `<rpc>` tag element:

```

<rpc>
  <request-end-session/>
</rpc>

```

In response, the Junos XML protocol server emits the `<end-session/>` tag enclosed in an `<rpc-reply>` tag element and a closing `</junoscript>` tag:

```

<rpc-reply xmlns:junos="URL">
  <end-session/>
</rpc-reply>
</junoscript>

```

The client application waits to receive this reply before emitting its closing `</junoscript>` tag:

```

</junoscript>

```

For an example of the exchange of closing tags, see [“Closing the Junos XML Protocol Session” on page 832](#).

The client application can then close the SSH, SSL, or other connection to the Junos XML protocol server machine. Client applications written in Perl can close the Junos XML protocol session and connection by using the Junos XML protocol Perl module described in [“Writing Junos XML Protocol Perl Client Applications” on page 979](#). For more information, see that chapter.

Client applications that do not use the Junos XML protocol Perl module use the routine provided for closing a connection in the standard library for their programming language.

Displaying CLI Output as XML Tag Elements

To display the output from a CLI command as Junos XML protocol tag elements and Junos XML tag elements instead of as the default formatted ASCII text, pipe the output from the command to the **display xml** command. The tag elements that describe Junos OS configuration or operational data belong to the Junos XML API, which defines the Junos content that can be retrieved and manipulated by the Junos XML management protocol operations.

The following example shows the output from the **show chassis hardware** command issued on an M20 router that is running the initial version of Junos OS Release 12.1 (the opening **<chassis-inventory>** tag appears on two lines only for legibility):

```
user@host> show chassis hardware | display xml
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/12.1R1/junos">
  <chassis-inventory \
    xmlns="http://xml.juniper.net/junos/12.1R1/junos-chassis">
    <chassis junos:style="inventory">
      <name>Chassis</name>
      <serial-number>00118</serial-number>
      <description>M20</description>
      <chassis-module>
        <name>Backplane</name>
        <version>REV 06</version>
        <part-number>710-001517</part-number>
        <serial-number>AB5911</serial-number>
      </chassis-module>
      <chassis-module>
        <name>Power Supply A</name>
        <!-- other child tags of <chassis-module> -->
      </chassis-module>
      <!-- other child tags of <chassis> -->
    </chassis>
  </chassis-inventory>
</rpc-reply>
```

Displaying the RPC Tags for a Command

To display the remote procedure call (RPC) XML tags for an operational mode command, enter **display xml rpc** after the pipe symbol (|).

The following example displays the RPC tags for the **show route** command:

```
user@host> show route | display xml rpc
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/10.1I0/junos">
  <rpc>
    <get-route-information>
      </get-route-information>
    </rpc>
  <cli>
    <banner></banner>
  </cli>
</rpc-reply>
```

Example of a Junos XML Protocol Session

This section describes the sequence of tag elements in a sample Junos XML protocol session. The client application begins by establishing a connection to a Junos XML protocol server. See the following sections:

- [Exchanging Initialization PIs and Tag Elements on page 829](#)
- [Sending an Operational Request on page 829](#)
- [Locking the Configuration on page 830](#)
- [Changing the Configuration on page 830](#)
- [Committing the Configuration on page 831](#)
- [Unlocking the Configuration on page 831](#)
- [Closing the Junos XML Protocol Session on page 832](#)

Exchanging Initialization PIs and Tag Elements

After the client application establishes a connection to a Junos XML protocol server, the two exchange initialization PIs and tag elements, as shown in the following example. Note that the Junos XML protocol server's opening `<junoscript>` tag appears on multiple lines for legibility only. Neither the Junos XML protocol server nor client applications insert a newline character into the list of attributes. Also, in an actual exchange, the *JUNOS-release* variable is replaced by a value such as **12.1R1** for the initial version of Junos OS Release 12.1. For a detailed discussion of the `<?xml?>` PI and opening `<junoscript>` tag, see ["Starting the Junos XML Protocol Session" on page 808](#).

Client Application

```
<?xml version="1.0" encoding="us-ascii"?>
<junoscript version="1.0" release="JUNOS-release">
```

Junos XML Protocol Server

```
<?xml version="1.0" encoding="us-ascii"?>
<junoscript version="1.0" hostname="router1" \
  os="JUNOS" release="JUNOS-release" \
  xmlns="URL" xmlns:junos="URL" \
  xmlns:xnm="URL">
```

T1173

Sending an Operational Request

The client application now emits the `<get-chassis-inventory>` tag element to request information about the device's chassis hardware. The Junos XML protocol server returns the requested information in the `<chassis-inventory>` tag element.

Client Application	Junos XML Protocol Server
<pre> <rpc> <get-chassis-inventory> <detail/> </get-chassis-inventory> </rpc> </pre>	<pre> <rpc-reply xmlns:junos="URL"> <chassis-inventory xmlns="URL"> <chassis> <name>Chassis</name> <serial-number>1122</serial-number> <description>M320</description> <chassis-module> <name>Midplane</name> <!-- other child tags for the Midplane - -> </chassis-module> <!-- tags for other chassis modules - -> </chassis> </chassis-inventory> </rpc-reply> </pre>

T1102

Locking the Configuration

The client application then prepares to create a new privilege class called **network-mgmt** at the **[edit system login class]** hierarchy level. It begins by using the **<lock-configuration/>** tag to prevent any other users or applications from altering the candidate configuration at the same time. To confirm that the candidate configuration is locked, the Junos XML protocol server returns an **<rpc-reply>** and an **</rpc-reply>** tag with nothing between them.

Client Application	Junos XML Protocol Server
<pre> <rpc> <lock-configuration/> </rpc> </pre>	<pre> <rpc-reply xmlns:junos="URL"> </rpc-reply> </pre>

T1103

Changing the Configuration

The client application emits the tag elements that add the new **network-mgmt** privilege class to the candidate configuration. The Junos XML protocol server returns the **<load-configuration-results>** tag element to enclose a tag element that reports the outcome of the load operation. (Understanding the meaning of these tag elements is not necessary for the purposes of this example, but for information about them, see [“Changing Configuration Information” on page 623.](#))

Client Application

```

<rpc>
  <load-configuration>
    <configuration>
      <system>
        <login>
          <class>
            <name>network-mgmt</name>
            <permissions>configure</permissions>
            <permissions>snmp</permissions>
            <permissions>system</permissions>
          </class>
        </login>
      </system>
    </configuration>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1104

Committing the Configuration

The client application commits the candidate configuration. The Junos XML protocol server returns the **<commit-results>** tag element to enclose tag elements that report the outcome of the commit operation (for information about these tag elements, see [“Committing a Configuration” on page 919](#)).

Client Application

```

<rpc>
  <commit-configuration/>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>re0</name>
      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>

```

T1105

Unlocking the Configuration

The client application unlocks (and by implication closes) the candidate configuration. As when it opens the configuration, the Junos XML protocol server confirms successful closure of the configuration only by returning an opening **<rpc-reply>** and closing **</rpc-reply>** tag with nothing between them.

Client Application	Junos XML Protocol Server
<pre><rpc> <unlock-configuration/> </rpc></pre>	<pre><rpc-reply xmlns:junos="URL"> </rpc-reply></pre>

T1106

Closing the Junos XML Protocol Session

The client application closes the Junos XML protocol session.

Client Application	Junos XML Protocol Server
<pre><rpc> <request-end-session/> </rpc></pre>	<pre><rpc-reply xmlns:junos="URL"> <end-session/> </rpc-reply> </junoscript></pre>

T1165

Requesting Information

This chapter explains how to use the Junos XML management protocol and Junos XML API to request information about the status and the current configuration of a routing, switching, or security platform running Junos OS.

The tag elements for operational requests are defined in the Junos XML API and correspond to Junos OS command-line interface (CLI) operational commands, which are described in the Junos OS command references. There is a request tag element for many commands in the CLI **show** family of commands.

The tag element for configuration requests is the Junos XML protocol **<get-configuration>** tag element. It corresponds to the CLI configuration mode **show** command, which is described in the *CLI User Guide*. The Junos XML tag elements that make up the content of both the client application's requests and the Junos XML protocol server's responses correspond to CLI configuration statements, which are described in the Junos OS configuration guides.

In addition to information about the current configuration, client applications can request other configuration-related information, including an XML schema representation of the configuration hierarchy, information about previously committed (rollback) configurations, or information about the rescue configuration.

This chapter discusses the following topics:

- [Overview of the Request Procedure on page 834](#)
- [Requesting Operational Information on page 834](#)
- [Specifying the Output Format for Operational Information Requests in a Junos XML Protocol Session on page 836](#)
- [Requesting Configuration Information on page 838](#)
- [Specifying the Source and Output Format of Configuration Information on page 839](#)
- [Specifying the Scope of Configuration Information to Return on page 859](#)
- [Requesting an XML Schema for the Configuration Hierarchy on page 873](#)
- [Requesting a Previous \(Rollback\) Configuration on page 876](#)
- [Comparing Two Previous \(Rollback\) Configurations on page 878](#)
- [Requesting the Rescue Configuration on page 879](#)

Overview of the Request Procedure

To request information from the Junos XML protocol server, a client application performs the procedures described in the indicated sections:

1. Establishes a connection to the Junos XML protocol server on the routing, switching, or security platform, as described in [“Connecting to the Junos XML Protocol Server” on page 807](#).
2. Opens a Junos XML protocol session, as described in [“Starting the Junos XML Protocol Session” on page 808](#).
3. If making configuration requests, optionally locks the candidate configuration or creates a private copy, as described in [“Locking the Candidate Configuration” on page 824](#) and [“Creating a Private Copy of the Configuration” on page 826](#).
4. Makes any number of requests one at a time, freely intermingling operational and configuration requests. See [“Requesting Operational Information” on page 834](#) and [“Requesting Configuration Information” on page 838](#).

The application can also intermix requests with configuration changes, which are described in [“Changing Configuration Information” on page 623](#).

5. Accepts the tag stream emitted by the Junos XML protocol server in response to each request and extracts its content, as described in [“Parsing the Junos XML Protocol Server Response” on page 819](#).
6. Unlocks the candidate configuration if it is locked, as described in [“Unlocking the Candidate Configuration” on page 825](#). Other users and applications cannot change the configuration while it remains locked.
7. Ends the Junos XML protocol session and closes the connection to the device, as described in [“Ending a Junos XML Protocol Session and Closing the Connection” on page 827](#).

Requesting Operational Information

To request information about the current status of a device running Junos OS, a client application emits the specific tag element from the Junos XML API that returns the desired information. For example, the `<get-interface-information>` tag element corresponds to the `show interfaces` command, the `<get-chassis-inventory>` tag element requests the same information as the `show chassis hardware` command, and the `<get-system-inventory>` tag element requests the same information as the `show software information` command.

For complete information about the operational request tag elements available in the current Junos OS release, see “Mapping Between Operational Tag Elements, Perl Methods, and CLI Commands” and “Summary of Operational Request Tag Elements” in the *Junos XML API Operational Developer Reference*.

The application encloses the request tag element in an **<rpc>** tag element. The syntax depends on whether the corresponding CLI command has any options:

```
<rpc>
  <!-- If the command does not have options -->
  <operational-request/>

  <!-- If the command has options -->
  <operational-request>
    <!-- tag elements representing the options -->
  </operational-request>
</rpc>
```

The client application can specify the formatting of the information returned by the Junos XML protocol server. By setting an optional attribute in the opening operational request tag, a client application can specify the format of the response as either XML-tagged format, which is the default, or formatted ASCII text.

If the client application requests the output in formatted ASCII text, the Junos XML protocol server encloses its response in an **<output>** tag element, which is enclosed in an **<rpc-reply>** tag element.

```
<rpc-reply xmlns:junos="URL">
  <output>
    operational-response
  </output>
</rpc-reply>
```

If the client application requests the output in XML-tagged format, the Junos XML protocol server encloses its response in the specific response tag element that corresponds to the request tag element, enclosed in an **<rpc-reply>** tag element.

```
<rpc-reply xmlns:junos="URL">
  <operational-response xmlns="URL-for-DTD">
    <!-- Junos XML tag elements for the requested information -->
  </operational-response>
</rpc-reply>
```

For XML-tagged format, the opening tag for each operational response includes the **xmlns** attribute to define the XML namespace for the enclosed tag elements that do not have a prefix (such as **junos:**) in their names. The namespace indicates which Junos XML document type definition (DTD) defines the set of tag elements in the response. The Junos XML API defines separate DTDs for operational responses from different software modules. For instance, the DTD for interface information is called **junos-interface.dtd** and the DTD for chassis information is called **junos-chassis.dtd**. The division into separate DTDs and XML namespaces means that a tag element with the same name can have distinct functions depending on which DTD it is defined in.

The namespace is a URL of the following form:

```
http://xml.juniper.net/junos/release-code/junos-category
```

release-code is the standard string that represents the release of the Junos OS running on the Junos XML protocol server device.

category specifies the DTD.

The *Junos XML API Operational Developer Reference* includes the text of the Junos XML DTDs for operational responses.

Specifying the Output Format for Operational Information Requests in a Junos XML Protocol Session

In a Junos XML protocol session, to request information about a routing, switching, or security platform running Junos OS, a client application encloses a Junos XML request tag element in an `<rpc>` tag element. By setting the optional **format** attribute in the opening operational request tag, the client application can specify the formatting of the output returned by the Junos XML protocol server. Information can be returned as XML-tagged format or formatted ASCII text. The basic syntax is as follows:

```
<rpc>
  <operational-request [format="(xml | text | ascii)"]>
    <!-- tag elements for options -->
  </operational-request>
</rpc>
```

XML Format By default, the Junos XML protocol server returns operational information in XML-tagged format. If the value of the **format** attribute is set to **xml**, or if the **format** attribute is omitted, the server returns the response in XML. The following example requests information for the **ge-0/3/0** interface. The **format** attribute is omitted.

```
<rpc>
  <get-interface-information>
    <brief/>
    <interface-name>ge-0/3/0</interface-name>
  </get-interface-information>
</rpc>
```

The Junos XML protocol server returns the information in XML-tagged format, which is identical to the output displayed in the CLI when you include the **| display xml** option after the operational mode command.

```
<rpc-reply xmlns:junos="http://xml.juniper.net/junos/11.4R1/junos">
  <interface-information
    xmlns="http://xml.juniper.net/junos/11.4R1/junos-interface" junos:style="brief">

    <physical-interface>
      <name>ge-0/3/0</name>
      <admin-status junos:format="Enabled">up</admin-status>
      <oper-status>down</oper-status>
      <link-level-type>Ethernet</link-level-type>
      <mtu>1514</mtu>
      <source-filtering>disabled</source-filtering>
      <speed>1000mbps</speed>
      <bpdu-error>none</bpdu-error>
      <l2pt-error>none</l2pt-error>
      <loopback>disabled</loopback>
      <if-flow-control>enabled</if-flow-control>
      <if-auto-negotiation>enabled</if-auto-negotiation>
      <if-remote-fault>online</if-remote-fault>
      <if-device-flags>
        <ifdf-present/>
        <ifdf-running/>
      </if-device-flags>
    </physical-interface>
  </interface-information>
</rpc-reply>
```

```

        <ifdf-down/>
    </if-device-flags>
    <if-config-flags>
        <iff-hardware-down/>
        <iff-snmp-traps/>
        <internal-flags>0x4000</internal-flags>
    </if-config-flags>
    <if-media-flags>
        <ifmf-none/>
    </if-media-flags>
</physical-interface>
</interface-information>
</rpc-reply>

```

ASCII Format To request that the Junos XML protocol server return operational information as formatted ASCII text instead of tagging it with Junos XML tag elements, the client application includes the **format="text"** or **format="ascii"** attribute in the opening request tag. The client application encloses the request in an **<rpc>** tag element.

```

<rpc>
  <get-interface-information [format="(text | ascii)]>
    <brief/>
    <interface-name>ge-0/3/0</interface-name>
  </get-interface-information>
</rpc>

```

When the client application includes the **format="text"** or **format="ascii"** attribute in the request tag, the Junos XML protocol server formats the reply as ASCII text and encloses it in an **<output>** tag element. The **format="text"** and **format="ascii"** attributes produce identical output.

```

<rpc-reply xmlns:junos="http://xml.juniper.net/junos/11.4R1/junos">
  <output>
Physical interface: ge-0/3/0, Enabled, Physical link is Down
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
  </output>
</rpc-reply>

```

The following example shows the equivalent operational mode command executed in the CLI:

```

user@host> show interfaces ge-0/3/0 brief
Physical interface: ge-0/3/0, Enabled, Physical link is Down
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, Loopback: Disabled,
Source filtering: Disabled,
  Flow control: Enabled, Auto-negotiation: Enabled, Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None

```

The formatted ASCII text returned by the Junos XML protocol server is identical to the CLI output except in cases where the output includes disallowed characters such as '<'

(less-than sign), '>' (greater-than sign), and '&' (ampersand). The Junos XML protocol server substitutes these characters with the equivalent predefined entity reference of '<', '>', and '&' respectively.

If the Junos XML API does not define a response tag element for the type of output requested by a client application, the Junos XML protocol server returns the reply as formatted ASCII text enclosed in an **<output>** tag element even if XML-tagged output is requested.

For information about the **<output>** tag element, see the *Junos XML API Operational Developer Reference*.

NOTE: The content and formatting of data within an **<output>** tag element are subject to change, so client applications must not depend on them.

Requesting Configuration Information

To request information about a configuration on a routing, switching, or security platform, a client application encloses the **<get-configuration>** tag element in an **<rpc>** tag element. By setting optional attributes, the client application can specify the source and formatting of the configuration information returned by the Junos XML protocol server. By including the appropriate optional child tag elements, the application can request the entire configuration or specific portions of the configuration. The basic syntax is as follows:

```
<rpc>
  <!-- If requesting the complete configuration -->
  <get-configuration [optional attributes]/>

  <!-- If requesting part of the configuration -->
  <get-configuration [optional attributes]>
    <configuration>
      <!-- tag elements representing the data to return -->
    </configuration>
  </get-configuration>
</rpc>
```

NOTE: If the client application locks the candidate configuration before making requests, it needs to unlock it after making its read requests. Other users and applications cannot change the configuration while it remains locked. For more information, see [“Exchanging Information with the Junos XML Protocol Server” on page 816](#).

The Junos XML protocol server encloses its reply in an **<rpc-reply>** tag element. It includes attributes with the **junos:** prefix in the opening **<configuration>** tag to indicate when the configuration was last changed or committed and who committed it (the attributes appear on multiple lines in the syntax statement only for legibility). For more information about them, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#):

```
<rpc-reply xmlns:junos="URL">
```

```

<!-- If the application requests Junos XML tag elements -->
<configuration junos:(changed | commit)-seconds="seconds" \
  junos:(changed | commit)-localtime="YYYY-MM-DD hh:mm:ss TZ" \
  [junos:commit-user="username"]>
  <!-- Junos XML tag elements representing configuration elements -->
</configuration>

<!-- If the application requests formatted ASCII text -->
<configuration-text>
  <!-- formatted ASCII configuration statements -->
</configuration-text>
</rpc-reply>

```

If a Junos XML tag element is returned within an **<undocumented>** tag element, the corresponding configuration element is not documented in the Junos OS configuration guides or officially supported by Juniper Networks. Most often, the enclosed element is used for debugging only by support personnel. In a smaller number of cases, the element is no longer supported or has been moved to another area of the configuration hierarchy, but appears in the current location for backward compatibility.

For reference pages for the **<configuration>**, **<configuration-text>**, and **<undocumented>** tag elements, see the *Junos XML API Operational Developer Reference*.

Applications can also request other configuration-related information, including an XML schema representation of the configuration hierarchy or information about previously committed configurations. For more information, see the following sections:

- [Requesting an XML Schema for the Configuration Hierarchy on page 873](#)
- [Requesting a Previous \(Rollback\) Configuration on page 876](#)
- [Comparing Two Previous \(Rollback\) Configurations on page 878](#)
- [Requesting the Rescue Configuration on page 879](#)

The following sections describe how a client application specifies the source, format, and amount of information returned by the Junos XML protocol server:

- [Specifying the Source and Output Format of Configuration Information on page 839](#)
- [Specifying the Scope of Configuration Information to Return on page 859](#)

Specifying the Source and Output Format of Configuration Information

By including optional attributes when requesting configuration information, a client application can specify the source and formatting of the output returned by the Junos XML protocol server, as described in the following sections:

- [Requesting Information from the Committed or Candidate Configuration on page 840](#)
- [Requesting Output as Formatted ASCII Text or Junos XML Tag Elements on page 842](#)
- [Requesting an Indicator for Identifiers on page 844](#)
- [Requesting a Change Indicator for Configuration Elements on page 846](#)
- [Displaying Commit-Script-Style XML Data on page 849](#)

- [Specifying the Output Format for Configuration Groups and Interface Ranges on page 850](#)
- [Comparing Configuration Changes with a Prior Version on page 858](#)

Requesting Information from the Committed or Candidate Configuration

To request information from the candidate configuration, the application either includes the **database="candidate"** attribute or omits the attribute completely (information from the candidate configuration is the default):

```
<rpc>
  <get-configuration/>

<!-- OR -->

  <get-configuration>
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

To request information from the active configuration—the one most recently committed on the device—a client application includes the **database="committed"** attribute in the **<get-configuration/>** tag or opening **<get-configuration>** tag:

```
<rpc>
  <get-configuration database="committed"/>

<!-- OR -->

  <get-configuration database="committed">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

For information about the tag elements to enclose in the **<get-configuration>** tag element, see ["Specifying the Scope of Configuration Information to Return" on page 859](#).

The Junos XML protocol server encloses its response in the **<rpc-reply>** tag element and either the **<configuration>** tag element (for Junos XML-tagged output) or **<configuration-text>** tag element (for formatted ASCII output).

When returning information from the candidate configuration as Junos XML tag elements, the Junos XML protocol server includes attributes in the opening **<configuration>** tag that indicate when the configuration last changed (they appear on multiple lines here only for legibility):

```
<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds="seconds" \
    junos:changed-localtime="YYYY-MM-DD hh:mm:ss TZ">
    <!-- Junos XML tag elements representing configuration elements -->
  </configuration>
</rpc-reply>
```

junos:changed-localtime represents the time of the last change as the date and time in the device's local time zone.

junos:changed-seconds represents the time of the last change as the number of seconds since midnight on 1 January 1970.

When returning information from the active configuration as Junos XML tag elements, the Junos XML protocol server includes attributes in the opening **<configuration>** tag that indicate when the configuration was committed (they appear on multiple lines here only for legibility):

```
<rpc-reply xmlns:junos="URL">
  <configuration junos:commit-seconds="seconds" \
    junos:commit-localtime="YYYY-MM-DD hh:mm:ss TZ" \
    junos:commit-user="username">
    <!-- Junos XML tag elements representing configuration elements -->
  </configuration>
</rpc-reply>
```

junos:commit-localtime represents the commit time as the date and time in the device's local time zone.

junos:commit-seconds represents the commit time as the number of seconds since midnight on 1 January 1970.

junos:commit-user specifies the Junos OS username of the user who requested the commit operation.

The **database** attribute in the application's request can be combined with one or more of the following attributes in the **<get-configuration/>** tag or opening **<get-configuration>** tag:

- **changed**, which is described in [“Requesting a Change Indicator for Configuration Elements” on page 846](#)
- **commit-scripts**, which is described in [“Displaying Commit-Script-Style XML Data” on page 849](#)
- **compare**, which is described in [“Comparing Configuration Changes with a Prior Version” on page 858](#)
- **format**, which is described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#)
- **inherit** and optionally **groups** and **interface-ranges**, which are described in [“Specifying the Output Format for Configuration Groups and Interface Ranges” on page 850](#)

The application can also include the **database** attribute after requesting an indicator for identifiers (as described in [“Requesting an Indicator for Identifiers” on page 844](#)).

The following example shows how to request the entire committed configuration. In actual output, the **Junos-version** variable is replaced by a value such as **12.1R1** for the initial version of Junos OS Release 12.1.

Client Application

```
<rpc>
  <get-configuration database="committed"/>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <configuration \
    junos:commit-seconds="seconds" \
    junos:commit-localtime="timestamp" \
    junos:commit-user="username">
    <version>Junos-version</version>
    <system>
      <host-name>big-router</host-name>
      <!-- other children of <system>- ->
    </system>
    <!-- other children of <configuration>- ->
  </configuration>
</rpc-reply>
```

T1185

Requesting Output as Formatted ASCII Text or Junos XML Tag Elements

To request that the Junos XML protocol server return configuration information in Junos XML-tagged output, the client application either includes the **format="xml"** attribute in the **<get-configuration/>** tag or opening **<get-configuration>** tag or omits the attribute completely. The Junos XML protocol server returns Junos XML-tagged output by default, except when the **compare** attribute is included.

```
<rpc>
  <get-configuration/>

<!-- OR -->

  <get-configuration>
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

To request that the Junos XML protocol server return configuration information as formatted ASCII text instead of tagging it with Junos XML tag elements, the client application includes the **format="text"** attribute in the **<get-configuration/>** tag or opening **<get-configuration>** tag. It encloses the request in an **<rpc>** tag element:

```
<rpc>
  <get-configuration format="text"/>

<!-- OR -->

  <get-configuration format="text">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

For information about the tag elements to enclose in the **<get-configuration>** tag element, see [“Specifying the Scope of Configuration Information to Return” on page 859](#).

NOTE: Regardless of which output format they request, client applications use Junos XML tag elements to represent the configuration element to display. The **format** attribute controls the format of the Junos XML protocol server's output only.

When the application requests Junos XML tag elements, the Junos XML protocol server encloses its output in `<rpc-reply>` and `<configuration>` tag elements. For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- Junos XML tag elements representing configuration elements -->
  </configuration>
</rpc-reply>
```

When the application requests formatted ASCII output, the Junos XML protocol server formats its response in the same way that the CLI **show configuration** command displays configuration data—it uses the newline character, tabs, braces, and square brackets to indicate the hierarchical relationships between configuration statements. The server encloses formatted ASCII configuration statements in `<rpc-reply>` and `<configuration-text>` tag elements:

```
<rpc-reply xmlns:junos="URL">
  <configuration-text>
    <!-- formatted ASCII configuration statements -->
  </configuration-text>
</rpc-reply>
```

The **format** attribute can be combined with one or more of the following other attributes in the `<get-configuration/>` tag or opening `<get-configuration>` tag:

- **database**, which is described in [“Requesting Information from the Committed or Candidate Configuration” on page 840](#)
- **inherit** and optionally **groups** and **interface-ranges**, which are described in [“Specifying the Output Format for Configuration Groups and Interface Ranges” on page 850](#)

It does not make sense to combine the **format="text"** attribute with the **changed** attribute (described in [“Requesting a Change Indicator for Configuration Elements” on page 846](#)) or to include it after requesting an indicator for identifiers (described in [“Requesting an Indicator for Identifiers” on page 844](#)). The change and identifier indicators appear only in Junos XML-tagged output, which is the default output format. The **commit scripts** attribute returns Junos XML-tagged output by default, even if the **format="text"** attribute is included, since this is the format that is input to commit script. The **format="xml"** attribute cannot be used with the **compare** attribute, which produces only formatted ASCII output.

An application can request Junos-XML tagged output or formatted ASCII text for the entire configuration or any portion of it. For instructions on specifying the amount of data to return, see [“Specifying the Scope of Configuration Information to Return” on page 859](#).

The following example shows how to request formatted ASCII output from the **[edit policy-options]** hierarchy level in the candidate configuration.

Client Application

```

<rpc>
  <get-configuration format="text">
    <configuration>
      <policy-options/>
    </configuration>
  </get-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <configuration-text>
    policy-options {
      policy-statement load-balancing-policy {
        from {
          route-filter 192.168.10/24 orlonger;
          route-filter 10.114/16 orlonger;
        }
        then {
          load-balance per-packet;
        }
      }
    }
  </configuration-text>
</rpc-reply>

```

T1121

Requesting an Indicator for Identifiers

To request that the Junos XML protocol server indicate whether a child configuration element is an identifier for its parent element, a client application includes the **junos:key="key"** attribute in the opening **<junoscript>** tag for the Junos XML protocol session, which appears here on two lines for legibility only:

```

<junoscript version="version" hostname="hostname" junos:key="key"
  release="release-code">

```

For more information about the **<junoscript>** tag, see [“Emitting the Opening <junoscript> Tag” on page 810](#).

When the identifier indicator is requested, the Junos XML protocol server includes the **junos:key="key"** attribute in the opening tag for each identifier. As always, the Junos XML protocol server encloses its response in **<rpc-reply>** and **<configuration>** tag elements. For information about the attributes in the opening **<configuration>** tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#). In the following, the identifier tag element is called **<name>**:

```

<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- opening tag for each parent of the object -->

    <!-- For each configuration object with an identifier -->
    <object>
      <name junos:key="key">identifier</name>
      <!-- additional children of object -->
    </object>
    <!-- closing tag for each parent of the object -->

  </configuration>
</rpc-reply>

```

The client application can include one or more of the following other attributes in the `<get-configuration/>` tag or opening `<get-configuration>` tag when the `junos:key` attribute is included in the opening `<junoscript>` tag:

- **changed**, which is described in [“Requesting a Change Indicator for Configuration Elements” on page 846](#)
- **commit-scripts**, which is described in [“Displaying Commit-Script-Style XML Data” on page 849](#)
- **database**, which is described in [“Requesting Information from the Committed or Candidate Configuration” on page 840](#)
- **inherit** and optionally **groups** and **interface-ranges**, which are described in [“Specifying the Output Format for Configuration Groups and Interface Ranges” on page 850](#)

When requesting an indicator for identifiers, it does not make sense to include the `format="text"` attribute in the `<get-configuration>` tag element (as described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#)). The `junos:key="key"` attribute appears only in Junos XML-tagged output, which is the default output format. The `compare` attribute produces only text output, so when this attribute is included in the `<get-configuration>` tag, the `junos:key="key"` attribute does not appear in the output.

The following example shows how indicators for identifiers appear on configuration elements at the `[edit interfaces]` hierarchy level in the candidate configuration when the `junos:key="key"` attribute is included in the opening `<junoscript>` tag emitted by the client application for the session. The two opening `<junoscript>` tags appear on multiple lines for legibility only. Neither client applications nor the Junos XML protocol server insert newline characters within tags. Also, for brevity the output includes just one interface, the loopback interface `lo0`.

Client Application

```
<?xml version="1.0" encoding="us-ascii"?>
<junoscript version="1.0" \
  junos:key="key" \
  release="JUNOS-release">

<rpc>
  <get-configuration>
    <configuration>
      <interfaces/>
    </configuration>
  </get-configuration>
</rpc>
```

Junos XML Protocol Server

```
<?xml version="1.0" encoding="us-ascii"?>
<junoscript version="1.0" hostname="router1" \
  os="JUNOS" release="JUNOS-release">
  xmlns="URL"xmlns:junos="URL" \
  xmlns:xnm="URL">

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp'>
    <interfaces>
      <!-- tag elements for other interfaces - -->
      <interface>
        <name junos:key="key">lo0</name>
        <unit>
          <name junos:key="key">0</name>
          <family>
            <inet>
              <address>
                <name junos:key="key">127.0.0.1/32</name>
              </address>
            </inet>
          </family>
        </unit>
      </interface>
      <!-- tag elements for other interfaces - -->
    </interfaces>
  </configuration>
</rpc-reply>
```

T1187

Requesting a Change Indicator for Configuration Elements

To request that the Junos XML protocol server indicate which configuration elements have changed since the last commit, a client application includes the **changed="changed"** attribute in the **<get-configuration/>** tag or opening **<get-configuration>** tag. It encloses the request in an **<rpc>** tag element:

```
<rpc>
  <get-configuration changed="changed"/>

<!-- OR -->

  <get-configuration changed="changed">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

For information about the tag elements to enclose in the **<get-configuration>** tag element, see ["Specifying the Scope of Configuration Information to Return" on page 859](#).

The Junos XML protocol server indicates which elements have changed by including the **junos:changed="changed"** attribute in the opening tag of every parent tag element in the path to the changed configuration element. If the changed configuration element is represented by a single (empty) tag, the **junos:changed="changed"** attribute appears in the tag. If the changed element is represented by a container tag element, the

`junos:changed="changed"` attribute appears in the opening container tag and also in the opening tag for each child tag element enclosed in the container tag element.

The Junos XML protocol server encloses its response in `<rpc-reply>` and `<configuration>` tag elements. For information about the standard attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration standard-attributes junos:changed="changed">
    <!-- opening-tag-for-each-parent-level junos:changed="changed" -->

    <!-- For each changed element, EITHER -->
    <element junos:changed="changed"/>

    <!-- OR -->

    <element junos:changed="changed">
      <first-child-of-element junos:changed="changed">
        <second-child-of-element junos:changed="changed">
          <!-- additional children of element -->
        </element>

      <!-- closing-tag-for-each-parent-level -->
    </configuration>
  </rpc-reply>
```

NOTE: When a commit operation succeeds, the Junos XML protocol server removes the `junos:changed="changed"` attribute from all tag elements. However, if warnings are generated during the commit, the attribute is not removed. In this case, the `junos:changed="changed"` attribute appears on tag elements that changed before the commit as well as those that changed after the commit.

An example of a commit-time warning is the message explaining that a configuration element will not actually apply until the device is rebooted. The warning appears in the tag string that the Junos XML protocol server returns to confirm the success of the commit, enclosed in an `<xnm:warning>` tag element.

To remove the `junos:changed="changed"` attribute from elements that changed before the commit, the client application must take any action necessary to eliminate the cause of the warning, and commit the configuration again.

The **changed** attribute can be combined with one or more of the following other attributes in the `<get-configuration/>` tag or opening `<get-configuration>` tag:

- **database**, which is described in [“Requesting Information from the Committed or Candidate Configuration” on page 840](#). Request change indicators in either the candidate or active configuration:

- When the **database="candidate"** attribute is included or the **database** attribute is omitted, the output is from the candidate configuration. Elements added to the candidate configuration after the last commit operation are marked with the **junos:changed="changed"** attribute.
- When the **database="committed"** attribute is included, the output is from the active configuration. Elements added to the active configuration by the most recent commit are marked with the **junos:changed="changed"** attribute.
- **inherit** and optionally **groups** and **interface-ranges**, which are described in [“Specifying the Output Format for Configuration Groups and Interface Ranges” on page 850](#).

It does not make sense to combine the **changed** attribute with the **format="text"** attribute or with the **compare** attribute, which produces only text output. The **junos:changed="changed"** attribute appears only in Junos XML-tagged output, which is the default output format. When the **commit-scripts="view"** attribute is included in the **<get-configuration>** tag, the **junos:changed="changed"** attribute is automatically included in the output, and you do not need to explicitly include this attribute in the **<get-configuration>** request.

The application can also include the **changed** attribute after requesting an indicator for identifiers (as described in [“Requesting an Indicator for Identifiers” on page 844](#)).

The following example shows how to request change indicators for configuration elements at the **[edit system syslog]** hierarchy level in the candidate configuration. The output indicates that a log file called **interactive-commands** has been configured since the last commit.

Client Application Junos XML Protocol Server

```

<rpc>
  <get-configuration changed="changed">
    <configuration>
      <system>
        <syslog/>
      </system>
    </configuration>
  </get-configuration>
</rpc>

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds="seconds" \
    junos:changed-localtime="timestamp" junos:changed="changed">
    <system junos:changed="changed">
      <syslog junos:changed="changed">
        <file>
          <name>messages</name>
          <contents>
            <name>any</name>
            <info/>
          </contents>
        </file>
        <file junos:changed="changed">
          <name junos:changed="changed">interactive-commands</name>
          <contents>
            <name junos:changed="changed">interactive-commands</name>
            <notice junos:changed="changed"/>
          </contents>
        </file>
      </syslog>
    </system>
  </configuration>
</rpc-reply>

```

T1186

Displaying Commit-Script-Style XML Data

To view the device's current configuration in Extensible Markup Language (XML) using the command-line interface's (CLI) operational mode, you issue the **show configuration | display xml** command. To view your configuration in commit-script-style XML, you use the **show configuration | display commit-scripts view** command. This command displays the configuration in the format that would be input to a commit script.

To request that the Junos XML protocol server display the configuration as commit-script-style XML data, a client application includes the **commit-scripts="view"** attribute in the **<get-configuration/>** tag or opening **<get-configuration>** tag. It encloses the request in an **<rpc>** tag element:

```

<rpc>
  <get-configuration commit-scripts="view"/>

  <!-- OR -->

  <get-configuration commit-scripts="view">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>

```

The **commit-scripts** attribute can be combined with one or more of the following other attributes in the **<get-configuration/>** tag or opening **<get-configuration>** tag:

- **database**, which is described in “Requesting Information from the Committed or Candidate Configuration” on page 840.
- **interface-ranges**, which is described in “Specifying the Output Format for Configuration Groups and Interface Ranges” on page 850.

You do not need to include the **changed** or the **inherit** attributes with the **commit-scripts="view"** attribute. The **commit-scripts-style** XML view includes the **junos:changed="changed"** attribute in the XML tags, and it displays the output with inheritance. That is, the output displays tag elements inherited from user-defined groups or interface ranges within the inheriting tag elements, and the XML tags already include the **junos:group** attribute. To explicitly display the **junos:interface-range** attribute in the **commit-scripts-style** view, you must include the **interface-ranges="interface-ranges"** attribute in the **<get-configuration>** tag.

Specifying the Output Format for Configuration Groups and Interface Ranges

The **<groups>** tag element corresponds to the **[edit groups]** configuration hierarchy. It encloses tag elements representing *configuration groups*, each of which contains a set of configuration statements that are appropriate at multiple locations in the hierarchy. Use the **apply-groups** configuration statement or **<apply-groups>** tag element to insert a configuration group at the appropriate location, achieving the same effect as directly inserting the statements defined in the group. The section of configuration hierarchy to which a configuration group is applied is said to *inherit* the group's statements.

In addition to the groups defined at the **[edit groups]** hierarchy level, the Junos OS predefines a group called **junos-defaults**. This group includes configuration statements judged appropriate for basic operations on any routing, switching, or security platform. By default, the statements in this group do not appear in the output of CLI commands that display the configuration, nor in the output returned by the Junos XML protocol server for the **<get-configuration>** tag element. For more information about user-defined configuration groups and the **junos-defaults** group, see the *CLI User Guide*.

The **<interface-range>** tag element corresponds to the **[edit interfaces interface-range]** configuration hierarchy. When you configure an interface range, you specify a set of identical interfaces as an interface group, to which you can apply a common configuration to the entire set of interfaces. If an interface is a member of an interface range, it inherits the configuration statements set for that range.

The following sections explain how to specify the output format for configuration elements that are defined in configuration groups or interface ranges:

- [Specifying Whether Configuration Groups and Interface Ranges Are Displayed Separately on page 851](#)
- [Displaying the Source Group for Inherited Configuration Elements on page 852](#)
- [Examples: Specifying Output Format for Configuration Groups on page 854](#)
- [Displaying the Source Interface Range for Inherited Configuration Elements on page 857](#)

Specifying Whether Configuration Groups and Interface Ranges Are Displayed Separately

By default, the Junos XML protocol server displays the tag element for each user-defined configuration group as a child of the `<groups>` tag element, instead of displaying them as children of the elements to which they are applied. Similarly, the server displays the tag elements for each user-defined interface range as a child of the `<interface-range>` tag element, instead of displaying them as children of the interface elements that are members of the interface range. This display mode parallels the default behavior of the CLI configuration mode `show` command, which displays the `[edit groups]` and `[edit interfaces interface-range]` hierarchies as separate hierarchies in the configuration.

To request that the Junos XML protocol server not display the `<groups>`, `<apply-groups>`, or `<interface-range>` tag elements separately, but instead enclose tag elements inherited from user-defined groups or interface ranges within the inheriting tag elements, a client application includes the `inherit="inherit"` attribute in the `<get-configuration/>` tag or opening `<get-configuration>` tag. It encloses the request in an `<rpc>` tag element:

```
<rpc>
  <get-configuration inherit="inherit"/>

  <!-- OR -->

  <get-configuration inherit="inherit">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

To request that the Junos XML protocol server include tag elements that are inherited from the `junos-defaults` group as well as user-defined configuration groups and interface-ranges, the client application includes the `inherit="defaults"` attribute in the `<get-configuration/>` tag or opening `<get-configuration>` tag:

```
<rpc>
  <get-configuration inherit="defaults"/>

  <!-- OR -->

  <get-configuration inherit="defaults">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

For information about the tag elements to enclose in the `<get-configuration>` tag element, see ["Specifying the Scope of Configuration Information to Return" on page 859](#).

When the client includes the `inherit="inherit"` attribute, the output includes the same information as the output from the following CLI configuration mode command, and does not include configuration elements inherited from the `junos-defaults` group:

```
user@host# show | display inheritance | except ##
```

When the client includes the `inherit="defaults"` attribute, the output includes the same information as the output from the following CLI configuration mode command:

```
user@host# show | display inheritance defaults | except ##
```

In both cases, the Junos XML protocol server encloses its output in the `<rpc-reply>` tag element and either the `<configuration>` tag element (for Junos XML-tagged output) or `<configuration-text>` tag element (for formatted ASCII output). For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <!-- EITHER -->
    <configuration attributes>
      <!-- Junos XML tag elements representing configuration elements -->
    </configuration>

  <!-- OR -->

    <configuration-text>
      <!-- formatted ASCII configuration statements -->
    </configuration-text>
</rpc-reply>
```

The `inherit` attribute can be combined with one or more of the following attributes in the `<get-configuration/>` tag or opening `<get-configuration>` tag:

- **changed**, which is described in [“Requesting a Change Indicator for Configuration Elements” on page 846](#)
- **database**, which is described in [“Requesting Information from the Committed or Candidate Configuration” on page 840](#)
- **format**, which is described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#)
- **groups**, which is described in [“Displaying the Source Group for Inherited Configuration Elements” on page 852](#)
- **interface-ranges**, which is described in [“Displaying the Source Interface Range for Inherited Configuration Elements” on page 857](#)

The application can also include the `inherit` attribute after requesting an indicator for identifiers (as described in [“Requesting an Indicator for Identifiers” on page 844](#)).

Displaying the Source Group for Inherited Configuration Elements

To request that the Junos XML protocol server indicate the configuration group from which configuration elements are inherited, a client application combines the `groups="groups"` attribute with the `inherit` attribute in the `<get-configuration/>` tag or opening `<get-configuration>` tag. It encloses the request in an `<rpc>` tag element:

```
<rpc>
  <get-configuration inherit="(defaults | inherit)" groups="groups"/>

  <!-- OR -->

  <get-configuration inherit="(defaults | inherit)" groups="groups">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
```

```
</rpc>
```

For information about the tag elements to enclose in the `<get-configuration>` tag element, see [“Specifying the Scope of Configuration Information to Return” on page 859](#).

When the `groups="groups"` attribute is combined with the `inherit="inherit"` attribute, the output includes the same information as the output from the following CLI configuration mode command, and does not include configuration elements inherited from the `junos-defaults` group:

```
user@host# show | display inheritance | display xml groups
```

When the `groups="groups"` attribute is combined with the `inherit="defaults"` attribute, the output includes the same information as the output from the following CLI configuration mode command:

```
user@host# show | display inheritance defaults
```

The `inherit` and `groups` attributes can be combined with one or more of the following other attributes in the `<get-configuration/>` tag or opening `<get-configuration>` tag:

- **changed**, which is described in [“Requesting a Change Indicator for Configuration Elements” on page 846](#).
- **database**, which is described in [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).
- **format**, which is described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#). The application can request either Junos XML-tagged or formatted ASCII output:
 - If the output is tagged with Junos XML tag elements (the `format="xml"` attribute is included or the `format` attribute is omitted), the Junos XML protocol server includes the `junos:group="source-group"` attribute in the opening tags of configuration elements that are inherited from configuration groups and encloses its response in `<configuration>` and `<rpc-reply>` tag elements. For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- For each inherited element -->
    <!-- opening-tags-for-parents-of-the-element -->
    <inherited-element junos:group="source-group">
      <inherited-child-of-inherited-element junos:group="source-group">
        <!-- inherited-children-of-child junos:group="source-group" -->
        </inherited-child-of-inherited-element>
      </inherited-element>
    <!-- closing-tags-for-parents-of-the-element -->
  </configuration>
</rpc-reply>
```

- If the output is formatted ASCII text (the `format="text"` attribute is included), the Junos XML protocol server encloses its response in `<configuration-text>` and `<rpc-reply>` tag elements, and inserts three commented lines immediately above each inherited element, as in the following:

```
<rpc-reply xmlns:junos="URL">
```

```

<configuration-text>
*/ For each inherited element */
/* parent levels for the element */
##
## 'inherited-element' was inherited from group 'source-group'
##
inherited-element {
##
## 'inherited-child' was inherited from group 'source-group'
##
inherited-child {
... child statements of inherited-child ...
}
}
/* closing braces for parent levels for the element */
</configuration-text>
</rpc-reply>

```

- **interface-ranges**, which is described in [“Displaying the Source Interface Range for Inherited Configuration Elements”](#) on page 857

The application can also include the **inherit** and **groups** attributes after requesting an indicator for identifiers (as described in [“Requesting an Indicator for Identifiers”](#) on page 844).

Examples: Specifying Output Format for Configuration Groups

The following sample configuration hierarchy defines a configuration group called **interface-group**. The **apply-groups** statement applies the statements in the group at the **[edit interfaces]** hierarchy level:

```

[edit]
groups {
  interface-group {
    interfaces {
      so-1/1/1 {
        encapsulation ppp;
      }
    }
  }
}
apply-groups interface-group;
interfaces {
  fxp0 {
    unit 0 {
      family inet {
        address 192.168.4.207/24;
      }
    }
  }
}
}

```

When the **inherit** attribute is not included in the **<get-configuration/>** tag, the output includes the **<groups>** and **<apply-groups>** tag elements as separate items. The **<groups>** tag element encloses the tag elements defined in the **interface-group** configuration group. The placement of the **<apply-groups>** tag element directly above the **<interfaces>** tag

element indicates that the **[edit interfaces]** hierarchy inherits the statements defined in the **interface-group** configuration group.

Client Application Junos XML Protocol Server

```
<rpc>
  <get-configuration/>
</rpc>

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp'>
    <groups>
      <name>interface-group</name>
      <interfaces>
        <interface>
          <name>so-1/1/1</name>
          <encapsulation>ppp</encapsulation>
        </interface>
      </interfaces>
    </groups>
    <apply-groups>interface-group</apply-groups>
    <interfaces>
      <interface>
        <name>fxp0</name>
        <unit>
          <name>0</name>
          <family>
            <inet>
              <address>
                <name>192.168.4.207/24</name>
              </address>
            </inet>
          </family>
        </unit>
      </interface>
    </interfaces>
  </configuration>
</rpc-reply>
```

T1188

When the **inherit** attribute is included in the **<get-configuration/>** tag, the **<interfaces>** tag element encloses the tag elements defined in the **interface-group** configuration group. The **<groups>** and **<apply-groups>** tag elements are not displayed.

Client Application Junos XML Protocol Server

```

<rpc>
  <get-configuration inherit="inherit"/>
</rpc>

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp'>
    <interfaces>
      <interface>
        <name>fxp0</name>
        <unit>
          <name>0</name>
          <family>
            <inet>
              <address>
                <name>192.168.4.207/24</name>
              </address>
            </inet>
          </family>
        </unit>
      </interface>
      <interface>
        <name>so-1/1/1</name>
        <encapsulation>ppp</encapsulation>
      </interface>
    </interfaces>
  </configuration>
</rpc-reply>

```

T1189

When the **groups="groups"** attribute is combined with the **inherit** attribute in the **<get-configuration/>** tag, the **<interfaces>** tag element encloses the tag elements defined in the **interface-group** configuration group, which are marked with the **junos:group="interface-group"** attribute.

Client Application Junos XML Protocol Server

```

<rpc>
  <get-configuration inherit="inherit" groups="groups"/>
</rpc>

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp'>
    <interfaces>
      <interface>
        <name>fxp0</name>
        <unit>
          <name>0</name>
          <family>
            <inet>
              <address>
                <name>192.168.4.207/24</name>
              </address>
            </inet>
          </family>
        </unit>
      </interface>
      <interface junos:group="interface-group">
        <name junos:group="interface-group">so-1/1/1</name>
        <encapsulation junos:group="interface-group">ppp</encapsulation>
      </interface>
    </interfaces>
  </configuration>
</rpc-reply>

```

T1190

Displaying the Source Interface Range for Inherited Configuration Elements

To request that the Junos XML protocol server indicate the interface range from which configuration elements are inherited, a client application combines the **interface-ranges="interface-ranges"** attribute with the **inherit** attribute in the **<get-configuration/>** tag or opening **<get-configuration>** tag. It encloses the request in an **<rpc>** tag element:

```
<rpc>
  <get-configuration inherit="inherit" interface-ranges="interface-ranges"/>

<!-- OR -->

  <get-configuration inherit="inherit" interface-ranges="interface-ranges">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

For information about the tag elements to enclose in the **<get-configuration>** tag element, see [“Specifying the Scope of Configuration Information to Return” on page 859](#).

When the **interface-ranges="interface-ranges"** attribute is combined with the **inherit="inherit"** attribute, the output includes the same information as the output from the following CLI configuration mode command:

```
user@host# show | display inheritance | display xml interface-ranges
```

The **inherit** and **interface-ranges** attributes can be combined with one or more of the following other attributes in the **<get-configuration/>** tag or opening **<get-configuration>** tag:

- **changed**, which is described in [“Requesting a Change Indicator for Configuration Elements” on page 846](#).
- **database**, which is described in [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).
- **format**, which is described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#). The application can request either Junos XML-tagged or formatted ASCII output:
 - If the output is tagged with Junos XML tag elements (the **format="xml"** attribute is included or the **format** attribute is omitted), the Junos XML protocol server includes the **junos:interface-range="source-interface-range"** attribute in the opening tags of configuration elements that are inherited from an interface range and encloses its response in **<configuration>** and **<rpc-reply>** tag elements. For information about the attributes in the opening **<configuration>** tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <interfaces>
      <!-- For each inherited element -->
      <interface junos:interface-range="source-interface-range">
        <inherited-element junos:interface-range="source-interface-range">
```

```

    <inherited-child-of-inherited-element
      junos:interface-range="source-interface-range">
    <!-- inherited-children-of-child
      junos:interface-range="source-interface-range" -->
    </inherited-child-of-inherited-element>
  </inherited-element>
</interface>
</interfaces>
</configuration>
</rpc-reply>

```

- If the output is formatted ASCII text (the **format="text"** attribute is included), the Junos XML protocol server encloses its response in **<configuration-text>** and **<rpc-reply>** tag elements:

```

<rpc-reply xmlns:junos="URL">
  <configuration-text>
    interfaces {
      <!-- For each inherited element -->
      interface-name {
        inherited-element {
          inherited-child {
            ... child statements of inherited-child ...
          }
        }
      }
    }
  </configuration-text>
</rpc-reply>

```

- **groups**, which is described in [“Displaying the Source Group for Inherited Configuration Elements” on page 852](#)

The application can also include the **inherit** and **interface-ranges** attributes after requesting an indicator for identifiers (as described in [“Requesting an Indicator for Identifiers” on page 844](#)).

Comparing Configuration Changes with a Prior Version

In the CLI, when you want to compare the active or candidate configuration to a previously committed configuration, you use the **compare** command. In operational mode, you compare the active configuration to a prior version using the **show configuration | compare rollback rollback-number** command. In configuration mode, you compare the candidate configuration to a previously committed configuration using the **show | compare rollback rollback-number** command.

The **compare rollback rollback-number** command compares the selected configuration with a previously committed configuration and displays the differences between the two. The **rollback-number** for the most recently saved configuration is 0, and the oldest saved configuration is 49.

To request that the Junos XML protocol server display the differences between the active or candidate configuration and a previously committed configuration, a client application includes the **compare** and **rollback** attributes in the `<get-configuration/>` tag or opening `<get-configuration>` tag. It encloses the request in an `<rpc>` tag element:

```
<rpc>
  <get-configuration compare="rollback" rollback="[0-49]" format="text"/>

  <!-- OR -->

  <get-configuration compare="rollback" rollback="[0-49]" format="text">
    <!-- tag elements for the configuration elements to return -->
  </get-configuration>
</rpc>
```

The client application can include the **database** attribute to specify whether to compare the active or candidate configuration to the previously committed configuration. If the **database** attribute is omitted, the candidate configuration is used. If the **rollback="rollback-number"** attribute is not included, rollback configuration number 0 is used for comparison.

By default, the `<get-configuration>` operation returns Junos XML-tagged output. However, when the **compare** attribute is included, the `<get-configuration>` operation returns the output formatted as ASCII text even if the **format="text"** attribute is not present. If the client application attempts to include the **format="xml"** attribute when the **compare="rollback"** attribute is present, the protocol server will return an `<xnm:error>` element indicating an error.

The comparison output is enclosed in the `<configuration-information>` and `<configuration-output>` tags. The output uses the following conventions to specify the differences between configurations:

- Statements that are only in the active or candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (–).
- Statements that are unchanged are prefixed with a single blank space ().

Specifying the Scope of Configuration Information to Return

By including the appropriate optional child tag elements in the `<get-configuration>` tag element, a client application can request the entire configuration or specific portions of the configuration, as described in the following sections:

- [Requesting the Complete Configuration on page 860](#)
- [Requesting a Hierarchy Level or Container Object Without an Identifier on page 861](#)
- [Requesting All Configuration Objects of a Specified Type on page 862](#)
- [Requesting a Specified Number of Configuration Objects on page 863](#)
- [Requesting Identifiers Only on page 865](#)
- [Requesting One Configuration Object on page 867](#)

- [Requesting a Subset of Objects by Using Regular Expressions on page 869](#)
- [Requesting Multiple Configuration Elements Simultaneously on page 872](#)

Requesting the Complete Configuration

To request the entire configuration, a client application encloses the `<get-configuration/>` tag in an `<rpc>` tag element:

```
<rpc>
  <get-configuration/>
</rpc>
```

When the application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested configuration in `<configuration>` and `<rpc-reply>` tag elements. For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- Junos XML tag elements for all configuration elements -->
  </configuration>
</rpc-reply>
```

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the `<get-configuration/>` tag, its opening `<junoscript>` tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839](#).

The following example shows how to request the complete candidate configuration tagged with Junos XML tag elements (the default). In actual output, the *JUNOS-version* variable is replaced by a value such as 12.1R1 for the initial version of Junos OS Release 12.1.

Client Application Junos XML Protocol Server

```
<rpc>
  <get-configuration/>
</rpc>

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp">
    <version>JUNOS-version</version>
    <system>
      <host-name>big-router</host-name>
      <!-- other children of <system>-->
    </system>
    <!-- other children of <configuration>-->
  </configuration>
</rpc-reply>
```

T1191

Requesting a Hierarchy Level or Container Object Without an Identifier

To request complete information about all child configuration elements at a hierarchy level or in a container object that does not have an identifier, a client application emits a `<get-configuration>` tag element that encloses the tag elements representing all levels in the configuration hierarchy from the root (represented by the `<configuration>` tag element) down to the level's immediate parent level. An empty tag represents the requested level. The entire request is enclosed in an `<rpc>` tag element.

```
<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the level -->
      <requested-level/>
      <!-- closing tags for each parent of the level -->
    </configuration>
  </get-configuration>
</rpc>
```

When the application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested section of the configuration in `<configuration>` and `<rpc-reply>` tag elements. For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- opening tags for each parent of the level -->
    <hierarchy-level>
      <!-- child tag elements of the level -->
    </hierarchy-level>
    <!-- closing tags for each parent of the level -->
  </configuration>
</rpc-reply>
```

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the opening `<get-configuration>` tag, its opening `<junoscript>` tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839](#).

The application can also request additional configuration elements of the same or other types by including the appropriate tag elements in the same `<get-configuration>` tag element. For more information, see [“Requesting Multiple Configuration Elements Simultaneously” on page 872](#).

The following example shows how to request the contents of the `[edit system login]` hierarchy level in the candidate configuration. The output is tagged with Junos XML tag elements (the default).

Client Application

```

<rpc>
  <get-configuration>
    <configuration>
      <system>
        <login/>
      </system>
    </configuration>
  </get-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp'>
    <system>
      <login>
        <user>
          <name>barbara</name>
          <full-name>Barbara Anderson</full-name>
          <!-- other child tags for this user - -->
        </user>
        <!-- other children of <login> - -->
      </login>
    </system>
  </configuration>
</rpc-reply>

```

T1192

Requesting All Configuration Objects of a Specified Type

To request complete information about all configuration objects of a specified type in a hierarchy level, a client application emits a **<get-configuration>** tag element that encloses the tag elements representing all levels of the configuration hierarchy from the root (represented by the **<configuration>** tag element) down to the immediate parent level for the object type. An empty tag represents the requested object type. The entire request is enclosed in an **<rpc>** tag element.

This type of request is useful when the object's parent hierarchy level has child objects of multiple types and the application is requesting just one of the types. If the requested object is the only possible child type, then this type of request yields the same output as a request for the complete parent hierarchy (described in [“Requesting a Hierarchy Level or Container Object Without an Identifier” on page 861](#)).

```

<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the object type -->
      <object-type/>
      <!-- closing tags for each parent of the object type -->
    </configuration>
  </get-configuration>
</rpc>

```

When the application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested objects in **<configuration>** and **<rpc-reply>** tag elements. For information about the attributes in the opening **<configuration>** tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```

<rpc-reply xmlns:junos="URL">

```

```

<configuration attributes>
  <!-- opening tags for each parent of the object type -->
  <first-object>
    <!-- child tag elements for the first object -->
  </first-object>
  <second-object>
    <!-- child tag elements for the second object -->
  </second-object>
  <!-- additional instances of the object -->
  <!-- closing tags for each parent of the object type -->
</configuration>
</rpc-reply>

```

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the opening **<get-configuration>** tag, its opening **<junoscript>** tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839](#).

The application can also request additional configuration elements of the same or other types by including the appropriate tag elements in the same **<get-configuration>** tag element. For more information, see [“Requesting Multiple Configuration Elements Simultaneously” on page 872](#).

Requesting a Specified Number of Configuration Objects

To request information about a specific number of configuration objects of a specific type, a client application emits the **<get-configuration>** tag element and encloses the tag elements that represent all levels of the configuration hierarchy from the root (represented by the **<configuration>** tag element) down to the immediate parent level for the object type. An empty tag represents the requested object type, and the following attributes are included in it:

- **count**, to specify the number of objects to return
- **start**, to specify the index number of the first object to return (1 for the first object, 2 for the second, and so on)

(If the application is requesting only the first object in the hierarchy, it includes the **count="1"** attribute and omits the **start** attribute.) The application encloses the entire request in an **<rpc>** tag element:

```

<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the object -->
      <object-type count="count" start="index"/>
      <!-- closing tags for each parent of the object -->
    </configuration>
  </get-configuration>
</rpc>

```

When the application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested objects in **<configuration>** and **<rpc-reply>** tag elements, starting with the object specified by the **start** attribute and running consecutively. In the opening container tag for each object, it includes two attributes:

- **junos:position**, to specify the object's numerical index
- **junos:total**, to report the total number of such objects that exist in the hierarchy

In the following, the identifier tag element is called **<name>**. (For information about the attributes in the opening **<configuration>** tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840.](#))

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- opening tags for each parent of the object type -->
    <first-object junos:position="index1" junos:total="total">
      <name>identifier-for-first-object</name>
      <!-- other child tag elements of the first object -->
    </first-object>
    <second-object junos:position="index2" junos:total="total">
      <name>identifier-for-second-object</name>
      <!-- other child tag elements of the second object -->
    </second-object>
    <!-- additional objects -->
    <!-- closing tags for each parent of the object type -->
  </configuration>
</rpc-reply>
```

The **junos:position** and **junos:total** attributes do not appear if the client requests formatted ASCII output by including the **format="text"** attribute in the **<get-configuration>** tag element (as described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842.](#))

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the opening **<get-configuration>** tag, its opening **<junoscript>** tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839.](#)

The application can also request additional configuration elements of the same or other types by including the appropriate tag elements in the same **<get-configuration>** tag element. For more information, see [“Requesting Multiple Configuration Elements Simultaneously” on page 872.](#)

The following example shows how to request the third and fourth Junos user accounts at the **[edit system login]** hierarchy level. The output is from the candidate configuration and is tagged with Junos XML tag elements (the default).

Client Application

```

<rpc>
  <get-configuration>
    <configuration>
      <system>
        <login>
          <user count="2" start="3"/>
        </login>
      </system>
    </configuration>
  </get-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp'>
    <system>
      <login>
        <user junos:position="3" junos:total="22">
          <name>barbara</name>
          <uid>1423</uid>
          <class>operator</class>
        </user>
        <user junos:position="4" junos:total="22">
          <name>carlo</name>
          <uid>1426</uid>
          <class>operator</class>
        </user>
      </login>
    </system>
  </configuration>
</rpc-reply>

```

T1193

Requesting Identifiers Only

To request just the identifier tag element for configuration objects of a specified type in a hierarchy, a client application emits a **<get-configuration>** tag element that encloses the tag elements representing all levels of the configuration hierarchy from the root (represented by the **<configuration>** tag element) down to the immediate parent level for the object type. An empty tag represents the requested object type, and the **recurse="false"** attribute is included. The entire request is enclosed in an **<rpc>** tag element.

To request the identifier for all objects of a specified type, the client application includes only the **recurse="false"** attribute:

```

<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the object type -->
      <object-type recurse="false"/>
      <!-- closing tags for each parent of the object type -->
    </configuration>
  </get-configuration>
</rpc>

```

To request the identifier for a specified number of objects, the client application combines the `recurse="false"` attribute with the `count` and `start` attributes discussed in [“Requesting a Specified Number of Configuration Objects” on page 863](#):

```
<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the object type -->
      <object-type recurse="false" count="count" start="index"/>
      <!-- closing tags for each parent of the object type -->
    </configuration>
  </get-configuration>
</rpc>
```

When the application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested objects in `<configuration>` and `<rpc-reply>` tag elements. If the application has requested a specified number of objects, the `junos:position` and `junos:total` attributes are included in the opening tag for each object, as described in [“Requesting a Specified Number of Configuration Objects” on page 863](#). In the following, the identifier tag element is called `<name>`. (For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).)

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- opening tags for each parent of the object type -->
    <first-object [junos:position="index1" junos:total="total"]>
      <name>identifier-for-first-object</name>
    </first-object>
    <second-object [junos:position="index2" junos:total="total"]>
      <name>identifier-for-second-object</name>
    </second-object>
    <!-- additional instances of the object -->
    <!-- closing tags for each parent of the object type -->
  </configuration>
</rpc-reply>
```

The `junos:position` and `junos:total` attributes do not appear if the client requests formatted ASCII output by including the `format="text"` attribute in the `<get-configuration>` tag element (as described in [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#)).

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the opening `<get-configuration>` tag, its opening `<junoscript>` tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839](#).

The application can also request additional configuration elements of the same or other types by including the appropriate tag elements in the same `<get-configuration>` tag element. For more information, see [“Requesting Multiple Configuration Elements Simultaneously” on page 872](#).

The following example shows how to request the identifier for each interface configured at the **[edit interfaces]** hierarchy level. The output is from the candidate configuration and is tagged with Junos XML tag elements (the default).

Client Application	Junos XML Protocol Server
<pre> <rpc> <get-configuration> <configuration> <interfaces> <interface recurse="false"/> </interfaces> </configuration> </get-configuration> </rpc> </pre>	<pre> <rpc-reply xmlns:junos="URL"> <configuration junos:changed-seconds='seconds' \ junos:changed-localtime='timestamp"> <interfaces> <interface> <name>fe-0/0/0</name> </interface> <interface> <name>fxp0</name> </interface> <interface> <name>lo0</name> </interface> </interfaces> </configuration> </rpc-reply> </pre>

T1194

Requesting One Configuration Object

To request information about a single configuration object, a client application emits the **<get-configuration>** tag element and encloses the tag elements that represent the entire statement path down to the object, starting with the **<configuration>** tag element. To represent the requested object, the application emits only the container tag element and identifier tag elements (each complete with the identifier value) for the object. It does not emit tag elements that represent other object characteristics. It encloses the entire request in an **<rpc>** tag element. In the following, the identifier tag element is called **name**:

```

<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the object -->
      <object>
        <name>identifier</name>
      </object>
      <!-- closing tags for each parent of the object -->
    </configuration>
  </get-configuration>
</rpc>

```

When the client application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested object in **<configuration>** and **<rpc-reply>** tag elements. For information about the attributes in the opening **<configuration>** tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- opening tags for each parent of the object -->
    <object>
      <!-- child tag elements of the object -->
    </object>
    <!-- closing tags for each parent of the object -->
  </configuration>
</rpc-reply>
```

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the opening **<get-configuration>** tag, its opening **<junoscript>** tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839](#).

The application can also request additional configuration elements of the same or other types by including the appropriate tag elements in the same **<get-configuration>** tag element. For more information, see [“Requesting Multiple Configuration Elements Simultaneously” on page 872](#).

The following example shows how to request the contents of one multicasting scope called **local**, which is at the **[edit routing-options multicast]** hierarchy level. To specify the desired object, the client application emits the **<name>local</name>** identifier tag element as the innermost tag element. The output is from the candidate configuration and is tagged with Junos XML tag elements (the default).

Client Application

```

<rpc>
  <get-configuration>
    <configuration>
      <routing-options>
        <multicast>
          <scope>
            <name>local</name>
          </scope>
        </multicast>
      </routing-options>
    </configuration>
  </get-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds='seconds' \
    junos:changed-localtime='timestamp">
    <routing-options>
      <multicast>
        <scope>
          <name>local</name>
          <prefix>239.255.0.0/16</prefix>
          <interface>ip-f/p/0</interface>
        </scope>
      </multicast>
    </routing-options>
  </configuration>
</rpc-reply>

```

T1195

Requesting a Subset of Objects by Using Regular Expressions

To request information about only those instances of a configuration object type that have a specified set of characters in their identifier names, a client application includes the **matching** attribute with a regular expression that matches the identifier name. For example, the application can request information about just the SONET/SDH interfaces at the **[edit interfaces]** hierarchy level by specifying the characters **so-** at the start of the regular expression.

Using the **matching** attribute enables the application to represent the objects to return in a form similar to the XML Path Language (XPath) representation, which is described in *XML Path Language (XPath) Version 1.0*, available from the World Wide Web Consortium (W3C) at <http://www.w3.org/TR/xpath>. In an XPath representation, an object and its parent levels are an ordered series of tag element names separated by forward slashes. The angle brackets around tag element names are omitted, and the opening tag is used to represent the entire tag element. For example, the following XPath:

```
configuration/system/radius-server/name
```

is equivalent to the following tagged representation:

```

<configuration>
  <system>
    <radius-server>
      <name/>
    </radius-server>
  </system>
</configuration>

```

The application includes the **matching** attribute in the empty tag that represents a parent level for the object type. As with all requests for configuration information, the client emits a **<get-configuration>** tag element that encloses the tag elements representing all levels of the configuration hierarchy from the root (represented by the **<configuration>** tag element) down to the level at which the **matching** attribute is included. The entire request is enclosed in an **<rpc>** tag element:

```
<rpc>
  <get-configuration>
    <configuration>
      <!-- opening tags for each parent of the level -->
      <level matching="matching-expression"/>
      <!-- closing tags for each parent of the level -->
    </configuration>
  </get-configuration>
</rpc>
```

In the value for the **matching** attribute, each level in the XPath-like representation can be either a full level name or a regular expression that matches the identifier name of one or more instances of an object type:

```
object-type[name='regular-expression']"
```

The regular expression uses the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but [Table 38 on page 870](#) specifies which character or characters are matched by some of the regular expression operators that can be used in the expression. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

NOTE: The **matching** attribute is not case-sensitive.

Table 38: Regular Expression Operators for the matching Attribute

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
(pipe)	One of the terms that appear on either side of the pipe operator.
^ (caret)	The start of a line, when the caret appears outside square brackets. One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.

Table 38: Regular Expression Operators for the matching Attribute
(continued)

Operator	Matches
\$ (dollar sign)	The end of a line.
[] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
() (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

When the application requests Junos XML-tagged output (the default), the Junos XML protocol server returns the requested object in `<configuration>` and `<rpc-reply>` tag elements. For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```

<rpc-reply xmlns:junos="URL">
  <configuration attributes>
    <!-- opening tags for each parent of the parent level -->
    <parent-level>
      <first-matching-object>
        <!-- child tag elements for the first object -->
      </first-matching-object>
      <second-matching-object>
        <!-- child tag elements for the second object -->
      </second-matching-object>
      <!-- additional instances of the object -->
    </parent-level>
    <!-- closing tags for each parent of the object type -->
  </configuration>
</rpc-reply>

```

The application can combine one or more of the **count**, **start**, and **recurse** attributes along with the **matching** attribute, to limit the set of possible matches to a specific range of objects, to request only identifiers, or both. For more information about those attributes, see [“Requesting a Specified Number of Configuration Objects” on page 863](#) and [“Requesting Identifiers Only” on page 865](#).

To specify the source of the output (candidate or active configuration) and request special formatting of the output (for example, formatted ASCII text or an indicator for identifiers), the application can include attributes in the opening `<get-configuration>` tag, its opening `<junoscript>` tag, or both. For more information, see [“Specifying the Source and Output Format of Configuration Information” on page 839](#).

The application can request additional configuration elements of the same or other types in the same `<get-configuration>` tag element by including the appropriate tag elements. For more information, see [“Requesting Multiple Configuration Elements Simultaneously” on page 872](#).

The following example shows how to request just the identifier for the first two SONET/SDH interfaces configured at the **[edit interfaces]** hierarchy level.

Client Application Junos XML Protocol Server

```
<rpc>
  <get-configuration>
    <configuration>
      <interfaces matching="interface[name='so-.*']" count="2" recurse="false">
      </configuration>
    </get-configuration>
  </rpc>

  <rpc-reply xmlns:junos="URL">
    <configuration junos:changed-seconds='seconds' \
      junos:changed-localtime='timestamp'>
      <interfaces>
        <interface junos:position="41" junos:total="65">
          <name>so-0/0/0</name>
        </interface>
        <interface junos:position="42" junos:total="65">
          <name>so-0/0/1</name>
        </interface>
      </interfaces>
    </configuration>
  </rpc-reply>
```

T1196

Requesting Multiple Configuration Elements Simultaneously

Within a **<get-configuration>** tag element, a client application can request multiple configuration elements of the same type or different types. The request includes only one **<configuration>** tag element (the Junos XML protocol server returns an error if there is more than one).

If two requested objects have the same parent hierarchy level, the client can either include both requests within one parent tag element, or repeat the parent tag element for each request. As an example, at the **[edit system]** hierarchy level the client can request the list of configured services and the identifier tag element for RADIUS servers in either of the following two ways:

```
<!-- both requests in one parent tag element -->
<rpc>
  <get-configuration>
    <configuration>
      <system>
        <services/>
        <radius-server>
          <name/>
        </radius-server>
      </system>
    </configuration>
  </get-configuration>
</rpc>

<!-- separate parent tag element for each request -->
<rpc>
  <get-configuration>
    <configuration>
```

```

    <system>
      <services/>
    </system>
    <system>
      <radius-server>
        <name/>
      </radius-server>
    </system>
  </configuration>
</get-configuration>
</rpc>

```

The client can combine requests for any of the types of information discussed in the following sections:

- [Requesting a Hierarchy Level or Container Object Without an Identifier on page 861](#)
- [Requesting All Configuration Objects of a Specified Type on page 862](#)
- [Requesting a Specified Number of Configuration Objects on page 863](#)
- [Requesting Identifiers Only on page 865](#)
- [Requesting One Configuration Object on page 867](#)
- [Requesting a Subset of Objects by Using Regular Expressions on page 869](#)

Requesting an XML Schema for the Configuration Hierarchy

To request an XML Schema-language representation of the entire configuration hierarchy, a client application emits the Junos XML **<get-xnm-information>** tag element and its **<type>**, and **<namespace>** child tag elements with the indicated values in an **<rpc>** tag element:

```

<rpc>
  <get-xnm-information>
    <type>xml-schema</type>
    <namespace>junos-configuration</namespace>
  </get-xnm-information>
</rpc>

```

The Junos XML protocol server encloses the XML schema in **<rpc-reply>** and **<xsd:schema>** tag elements:

```

<rpc-reply xmlns:junos="URL">
  <xsd:schema>
    <!-- tag elements for the Junos schema -->
  </xsd:schema>
</rpc-reply>

```

The schema represents all configuration elements available in the version of the Junos OS that is running on a device. (To determine the Junos OS version, emit the **<get-software-information>** operational request tag, which is documented in the *Junos XML API Operational Developer Reference*.)

Client applications can use the schema to validate the configuration on a device, or simply to learn which configuration statements are available in the version of the Junos OS

running on the device. The schema does not indicate which elements are actually configured, or even that an element can be configured on that type of device (some configuration statements are available only on certain device types). To request the set of currently configured elements and their settings, emit the `<get-configuration>` tag element instead, as described in [“Requesting Configuration Information” on page 838](#).

Explaining the structure and notational conventions of the XML Schema language is beyond the scope of this document. For information, see *XML Schema Part 0: Primer*, available from the World Wide Web Consortium (W3C) at <http://www.w3.org/TR/xmlschema-0/>. The primer provides a basic introduction and lists the formal specifications where you can find detailed information.

For further information, see the following sections:

- [Creating the junos.xsd File on page 874](#)
- [Example: Requesting an XML Schema on page 875](#)

Creating the junos.xsd File

Most of the tag elements defined in the schema returned in the `<xsd:schema>` tag belong to the default namespace for Junos OS configuration elements. However, at least one tag, `<junos:comment>`, belongs to a different namespace:

<http://xml.juniper.net/junos/Junos-version/junos>. By XML convention, a schema describes only one namespace, so schema validators need to import information about any additional namespaces before they can process the schema.

Starting with Junos OS Release 6.4, the `<xsd:import>` tag element is enclosed in the `<xsd:schema>` tag element and references the file `junos.xsd`, which contains the required information about the `junos` namespace. For example, the following `<xsd:import>` tag element specifies the file for Junos OS Release 12.1R1 (and appears on two lines for legibility only):

```
<xsd:import schemaLocation="junos.xsd" \
  namespace="http://xml.juniper.net/junos/12.1R1/junos"/>
```

To enable the schema validator to interpret the `<xsd:import>` tag element, you must manually create a file called `junos.xsd` in the directory where you place the `.xsd` file that contains the complete Junos configuration schema. Include the following text in the file. Do not use line breaks in the list of attributes in the opening `<xsd:schema>` tag. Line breaks appear in the following example for legibility only. For the `Junos-version` variable, substitute the release number of the Junos OS running on the device (for example, `12.1R1` for the first release of Junos OS 12.1).

```
<?xml version="1.0" encoding="us-ascii"?>
<xsd:schema elementFormDefault="qualified" \
  attributeFormDefault="unqualified" \
  xmlns:xsd="http://www.w3.org/2001/XMLSchema" \
  targetNamespace="http://xml.juniper.net/junos/Junos-version/junos">
  <xsd:element name="comment" type="xsd:string"/>
</xsd:schema>
```

NOTE: Schema validators might not be able to process the schema if they cannot locate or open the `junos.xsd` file.

Whenever you change the version of Junos OS running on the device, remember to update the *Junos-version* variable in the `junos.xsd` file to match.

Example: Requesting an XML Schema

The following examples show how to request the Junos configuration schema. In the Junos XML protocol server's response, the first `<xsd:element>` statement defines the `<undocumented>` Junos XML tag element, which can be enclosed in most other container tag elements defined in the schema (container tag elements are defined as `<xsd:complexType>`).

The attributes in the opening tags of the Junos XML protocol server's response appear on multiple lines for legibility only. The Junos XML protocol server does not insert newline characters within tags or tag elements. Also, in actual output the *JUNOS-version* variable is replaced by a value such as 12.1R1 for the initial version of Junos OS Release 12.1.

Client Application Junos XML Protocol Server

```
<rpc>
  <get-xnm-information>
    <type>xml-schema</type>
    <namespace>junos-configuration</namespace>
  </get-xnm-information>
</rpc>

<rpc-reply xmlns:junos="URL">
  <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema" \
    elementFormDefault="qualified">
    <xsd:import schemaLocation="junos.xsd" \
      namespace="http://xml.juniper.net/junos/ Junos-version/junos"/>
    <xsd:element name="undocumented">
      <xsd:complexType>
        <xsd:sequence>
          <xsd:any namespace="##any" processContents="skip"/>
        </xsd:sequence>
      </xsd:complexType>
    </xsd:element>
    <xsd:complexType name="hostname">
      <xsd:simpleContent>
        <xsd:extension base="xsd:string"/>
      </xsd:simpleContent>
    </xsd:complexType>
  </xsd:schema>
</rpc-reply>
```

T1177

Another `<xsd:element>` statement near the beginning of the schema defines the Junos XML `<configuration>` tag element. It encloses the `<xsd:element>` statement that defines the `<system>` tag element, which corresponds to the **[edit system]** hierarchy level. The statements corresponding to other hierarchy levels are omitted for brevity.

Client Application Junos XML Protocol Server

```

</xsd:element>
<xsd:element name="configuration">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:choice minOccurs="0" maxOccurs="unbounded">
        <xsd:element ref="undocumented"/>
        <xsd:element ref="comment"/>
        <xsd:element name="system" minOccurs="0">
          <xsd:complexType>
            <xsd:sequence>
              <xsd:choice minOccurs="0" maxOccurs="unbounded">
                <xsd:element ref="undocumented"/>
                <xsd:element ref="comment"/>
                <!-- child elements of <system> -->
              </xsd:choice>
            </xsd:sequence>
          </xsd:complexType>
        </xsd:element>
        <!-- definitions for other hierarchy levels -->
      </xsd:choice>
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>
<!-- definitions for other hierarchy levels -->
</xsd:choice>
</xsd:sequence>
</xsd:complexType>
</xsd:element>
</xsd:schema>
</rpc-reply>

```

T1178

Requesting a Previous (Rollback) Configuration

To request a previously committed (rollback) configuration, a client application emits the Junos XML **<get-rollback-information>** tag element and its child **<rollback>** tag element in an **<rpc>** tag element. This operation is equivalent to the **show system rollback** operational mode command. The **<rollback>** tag element specifies the index number of the previous configuration to display; its value can be from **0** (zero, for the most recently committed configuration) through **49**.

To request Junos XML-tagged output, the application either includes the **<format>** tag element with the value **xml** or omits the **<format>** tag element (Junos XML tag elements are the default):

```

<rpc>
  <get-rollback-information>
    <rollback>index-number</rollback>
  </get-rollback-information>
</rpc>

```

The Junos XML protocol server encloses its response in **<rpc-reply>**, **<rollback-information>**, and **<configuration>** tag elements. The **<load-success/>** tag is a side effect of the implementation and does not affect the results. For information about the attributes in the opening **<configuration>** tag, see ["Requesting Information from the Committed or Candidate Configuration" on page 840](#).

```

<rpc-reply xmlns:junos="URL">
  <rollback-information>
    <load-success/>
    <configuration attributes>
      <!-- tag elements representing the complete previous configuration -->
    </configuration>
  </rollback-information>
</rpc-reply>

```

```

    </rollback-information>
  </rpc-reply>

```

To request formatted ASCII output, the application includes the `<format>` tag element with the value `text`:

```

<rpc>
  <get-rollback-information>
    <rollback>index-number</rollback>
    <format>text</format>
  </get-rollback-information>
</rpc>

```

The Junos XML protocol server encloses its response in `<rpc-reply>`, `<rollback-information>`, `<configuration-information>`, and `<configuration-output>` tag elements. For more information about how ASCII output is formatted, see [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#).

```

<rpc-reply xmlns:junos="URL">
  <rollback-information>
    <load-success/>
    <configuration-information>
      <configuration-output>
        <!-- formatted ASCII text for the complete previous configuration -->
      </configuration-output>
    </configuration-information>
  </rollback-information>
</rpc-reply>

```

The following example shows how to request Junos XML-tagged output for the rollback configuration that has an index of 2. In actual output, the *JUNOS-version* variable is replaced by a value such as 12.1R1 for the initial version of Junos OS Release 12.1.

Client Application

```

<rpc>
  <get-rollback-information>
    <rollback>2</rollback>
  </get-rollback-information>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <rollback-information>
    <load-success/>
    <configuration junos:changed-seconds='seconds' \
      junos:changed-localtime='timestamp'>
      <version>JUNOS-version</version>
      <system>
        <host-name>big-router</host-name>
        <!-- other children of <system> -->
      </system>
      <!-- other children of <configuration> -->
    </configuration>
  </rollback-information>
</rpc-reply>

```

T1197

Comparing Two Previous (Rollback) Configurations

To compare the contents of two previously committed (rollback) configurations, a client application emits the Junos XML `<get-rollback-information>` tag element and its child `<rollback>` and `<compare>` tag elements in an `<rpc>` tag element. This operation is equivalent to the `show system rollback` operational mode command with the `compare` option. The `<rollback>` tag element specifies the index number of the configuration that is the basis for comparison. The `<compare>` tag element specifies the index number of the configuration to compare with the base configuration. Valid values in both tag elements range from 0 (zero, for the most recently committed configuration) through 49:

```
<rpc>
  <get-rollback-information>
    <rollback>index-number</rollback>
    <compare>index-number</compare>
  </get-rollback-information>
</rpc>
```

NOTE: The output corresponds more logically to the chronological order of changes if the older configuration (the one with the higher index number) is the base configuration. Its index number is enclosed in the `<rollback>` tag element, and the index of the more recent configuration is enclosed in the `<compare>` tag element.

The Junos XML protocol server encloses its response in `<rpc-reply>`, `<rollback-information>`, `<configuration-information>`, and `<configuration-output>` tag elements. The `<load-success/>` tag is a side effect of the implementation and does not affect the results.

```
<rpc-reply xmlns:junos="URL">
  <rollback-information>
    <load-success/>
    <configuration-information>
      <configuration-output>
        <!-- formatted ASCII text representing the changes -->
      </configuration-output>
    </configuration-information>
  </rollback-information>
</rpc-reply>
```

The information in the `<configuration-output>` tag element is formatted ASCII text and includes a banner line (such as `[edit interfaces]`) for each hierarchy level at which the two configurations differ. Each line between banner lines begins with either a plus sign (+) or a minus sign (–). The plus sign indicates that adding the statement to the base configuration results in the second configuration, whereas a minus sign means that removing the statement from the base configuration results in the second configuration.

The following example shows how to request a comparison of the rollback configurations that have indexes of 20 and 4.

Client Application	Junos XML Protocol Server
<pre> <rpc> <get-rollback-information> <rollback>20</rollback> <compare>4</compare> </get-rollback-information> </rpc> </pre>	<pre> <rpc-reply xmlns:junos="URL"> <rollback-information> <load-success/> <configuration-information> <configuration-output> [edit interfaces] - ge-0/2/0 { - stacked-vlan-tagging; - mac 00.01.02.03.04.05; - gigether-options { - loopback; - } - } [edit] + services { + l2tp { + tunnel-group 12 { + local-gateway; + } + } + } </configuration-output> </configuration-information> </rollback-information> </rpc-reply> </pre>

T1170

Requesting the Rescue Configuration

To request the rescue configuration, a client application emits the Junos XML **<get-rescue-information>** tag element in an **<rpc>** tag element. This operation is equivalent to the **show system configuration rescue** operational mode command.

The rescue configuration is a configuration saved in case it is necessary to restore a valid, nondefault configuration. (To create a rescue configuration, use the Junos XML **<request-save-rescue-configuration>** tag element or the **request system configuration rescue save** CLI operational mode command. For more information, see the *Junos XML API Operational Developer Reference* or the [CLI Explorer](#).)

To request Junos XML-tagged output, the application either includes the **<format>** tag element with the value **xml** or omits the **<format>** tag element (Junos XML tag elements are the default):

```

<rpc>
  <get-rescue-information/>
</rpc>

```

The Junos XML protocol server encloses its response in `<rpc-reply>`, `<rescue-information>`, and `<configuration>` tag elements. The `<load-success/>` tag is a side effect of the implementation and does not affect the results. For information about the attributes in the opening `<configuration>` tag, see [“Requesting Information from the Committed or Candidate Configuration” on page 840](#).

```
<rpc-reply xmlns:junos="URL">
  <rescue-information>
    <load-success/>
    <configuration attributes>
      <!-- tag elements representing the rescue configuration -->
    </configuration>
  </rescue-information>
</rpc-reply>
```

To request formatted ASCII output, the application includes the `<format>` tag element with the value `text`:

```
<rpc>
  <get-rescue-information>
    <format>text</format>
  </get-rescue-information>
</rpc>
```

The Junos XML protocol server encloses its response in `<rpc-reply>`, `<rescue-information>`, `<configuration-information>`, and `<configuration-output>` tag elements. For more information about how ASCII output is formatted, see [“Requesting Output as Formatted ASCII Text or Junos XML Tag Elements” on page 842](#).

```
<rpc-reply xmlns:junos="URL">
  <rescue-information>
    <load-success/>
    <configuration-information>
      <configuration-output>
        <!-- formatted ASCII text representing the rescue configuration -->
      </configuration-output>
    </configuration-information>
  </rescue-information>
</rpc-reply>
```

Changing Configuration Information

This chapter explains how to use the Junos XML management protocol along with Junos XML or command-line interface (CLI) configuration statements to change the configuration on a routing, switching, or security platform configuration. The Junos XML protocol **<load-configuration>** tag element and its attributes correspond to configuration mode commands in the Junos OS CLI, which are described in the *CLI User Guide*. The Junos XML tag elements described here correspond to configuration statements, which are described in the Junos OS configuration guides.

This chapter discusses the following topics:

- [Overview of Configuration Changes on page 881](#)
- [Specifying the Source and Format of New Configuration Data on page 883](#)
- [Replacing the Entire Configuration on page 887](#)
- [Creating, Modifying, or Deleting Configuration Elements on page 888](#)
- [Reordering Elements in Configuration Objects on page 903](#)
- [Renaming a Configuration Object on page 906](#)
- [Protecting or Unprotecting a Configuration Object on page 908](#)
- [Changing a Configuration Element's Activation State on page 910](#)
- [Changing a Configuration Element's Activation State Simultaneously with Other Changes on page 913](#)

Overview of Configuration Changes

To change configuration information, the client application performs the procedures described in the indicated sections:

1. Establishes a connection to the Junos XML protocol server on the routing, switching, or security platform, as described in [“Connecting to the Junos XML Protocol Server” on page 807](#).
2. Opens a Junos XML protocol session, as described in [“Starting the Junos XML Protocol Session” on page 808](#).
3. (Optional) Locks the candidate configuration or creates a private copy, as described in [“Locking the Candidate Configuration” on page 824](#) and [“Creating a Private Copy of the Configuration” on page 826](#). Locking the configuration prevents other users or

applications from changing it at the same time. Creating a private copy enables the application to make changes without affecting the candidate or active configuration until the copy is committed.

4. Encloses the **<load-configuration>** tag element in an **<rpc>** tag element. By including various attributes in the **<load-configuration/>** tag or opening **<load-configuration>** tag, the application can provide the configuration data either in a file or as a directly loaded tag stream, and as Junos XML tag elements, formatted ASCII text, or a set of Junos OS configuration mode commands. The client application can specify that the configuration data completely replace the existing configuration, or the application can specify the manner in which the Junos XML protocol server loads the data into the existing candidate or copy. The basic syntax is as follows:

```
<rpc>
  <!-- If providing configuration data in a file -->
    <load-configuration url="file" [optional attributes] />

  <!-- If providing configuration data in a data stream -->
    <load-configuration [optional attributes]>
      <!-- configuration data -->
    </load-configuration>
</rpc>
```

5. Accepts the tag stream emitted by the Junos XML protocol server in response to each request and extracts its content, as described in [“Parsing the Junos XML Protocol Server Response” on page 819](#).

The Junos XML protocol server confirms that it incorporated the configuration data by returning the **<load-configuration-results>** tag element and **<load-success/>** tag in the **<rpc-reply>** tag element:

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

If the load operation fails, the **<load-configuration-results>** tag element instead encloses the **<load-error-count>** tag element, which indicates the number of errors that occurred. In this case, the application or an administrator must eliminate the errors before committing the configuration.

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-error-count>count</load-error-count>
  </load-configuration-results>
</rpc-reply>
```

6. (Optional) Verifies the syntactic correctness of a configuration before attempting to commit it, as described in [“Verifying a Configuration Before Committing It” on page 919](#).
7. Commits changes made to the configuration, as described in [“Committing a Configuration” on page 919](#).

8. Unlocks the candidate configuration if it is locked, as described in [“Unlocking the Candidate Configuration” on page 825](#). Other users and applications cannot change the configuration while it remains locked.
9. Ends the Junos XML protocol session and closes the connection to the device, as described in [“Ending a Junos XML Protocol Session and Closing the Connection” on page 827](#).

Specifying the Source and Format of New Configuration Data

A client application can provide new configuration data either in a file or as a data stream, and as Junos XML tag elements, formatted ASCII text, or a set of Junos OS configuration mode commands. See the following sections:

- [Providing Configuration Data in a File on page 883](#)
- [Providing Configuration Data as a Data Stream on page 884](#)
- [Defining the Configuration Data Format on page 885](#)

Providing Configuration Data in a File

To provide new configuration data in a file, a client application encloses the `<load-configuration/>` tag with the `url` attribute in an `<rpc>` tag element.

If the data is Junos XML tag elements, either include the `format="xml"` attribute or omit the `format` attribute, which defaults to XML.

```
<rpc>
  <load-configuration url="file-location"/>
</rpc>
```

If the data is formatted ASCII text, include the `format="text"` attribute.

```
<rpc>
  <load-configuration url="file-location" format="text"/>
</rpc>
```

If the data is a set of configuration mode commands, include the `action="set"` and `format="text"` attributes.

```
<rpc>
  <load-configuration url="file-location" action="set" format="text"/>
</rpc>
```

Before loading the file, the client application or an administrator saves the configuration data as the contents of the file. Enclose Junos XML tag elements in a `<configuration>` tag element. Formatted ASCII text and sets of configuration mode commands are not enclosed in `<configuration-text>` or `<configuration-set>` tag elements in the file. For information about the syntax for the data in the file, see [“Defining the Configuration Data Format” on page 885](#).

The value of the `url` attribute can be a local file path, an FTP location, or a Hypertext Transfer Protocol (HTTP) URL:

- A local filename can have one of the following forms:

- **/path/filename**—File on a mounted file system, either on the local flash disk or on hard disk.
- **a:filename** or **a:path/filename**—File on the local drive. The default path is / (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- A filename on an FTP server has the following form:
`ftp://username:password@hostname/path/filename`
- A filename on an HTTP server has the following form:
`http://username:password@hostname/path/filename`

In each case, the default value for the **path** variable is the home directory for the username. To specify an absolute path, the application starts the path with the characters **%2F**; for example, `ftp://username:password@hostname/%2Fpath/filename`.

The **url** attribute can be combined with one or more of the following attributes in the `<load-configuration/>` tag:

- **format**, which is described in [“Defining the Configuration Data Format” on page 885](#).
- **action**, which is described in [“Replacing the Entire Configuration” on page 887](#) and the subsections of [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

The following example shows how to incorporate Junos XML-tagged configuration data stored in the file `/var/configs/user-accounts` on the FTP server called `cfg-server.mycompany.com`. The opening `<load-configuration>` tag appears on two lines for legibility only.

Client Application

```
<rpc>
  <load-configuration \
    url="ftp://admin:AdminPwd@cfg-server.mycompany.com/var/configs/user-accounts"/>
</rpc>

    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1179

Providing Configuration Data as a Data Stream

To provide new configuration data as a data stream, a client application encloses the `<load-configuration>` tag element in an `<rpc>` tag element.

To define the configuration elements to change as Junos XML tag elements, the application emits the tag elements representing all levels of the configuration hierarchy from the root (represented by the `<configuration>` tag element) down to each element to change.

```
<rpc>
  <load-configuration>
    <configuration>
      <!-- tag elements representing the configuration data -->
    </configuration>
  </load-configuration>
```

```
</rpc>
```

To define the configuration elements to change as formatted ASCII text, the application encloses them in a **<configuration-text>** tag element and includes the **format="text"** attribute in the opening **<load-configuration>** tag.

```
<rpc>
  <load-configuration format="text">
    <configuration-text>
      /* formatted ASCII configuration data */
    </configuration-text>
  </load-configuration>
</rpc>
```

To define the configuration elements to change as a set of Junos OS configuration mode commands, the application encloses them in a **<configuration-set>** tag element and includes the **action="set"** and **format="text"** attributes in the opening **<load-configuration>** tag.

```
<rpc>
  <load-configuration action="set" format="text">
    <configuration-set>
      /* configuration mode commands */
    </configuration-set>
  </load-configuration>
</rpc>
```

For information about the syntax for Junos XML tag elements, formatted ASCII text, and configuration mode commands see [“Defining the Configuration Data Format” on page 885](#).

Defining the Configuration Data Format

As discussed in [“Providing Configuration Data in a File” on page 883](#) and [“Providing Configuration Data as a Data Stream” on page 884](#), a client application can provide new configuration data to the Junos XML protocol server either in a file or as a data stream emitted during the Junos XML protocol session. In both cases, it can use Junos XML tag elements, formatted ASCII text, or sets of configuration mode commands to define the new configuration data.

If the application uses Junos XML tag elements, it includes the tag elements representing all levels of the configuration hierarchy from the root (the **<configuration>** tag element) down to each new or changed element. The notation is the same as that used to request configuration information, and is described in detail in [“Overview of Configuration Changes” on page 881](#).

```
<configuration>
  <!-- tag elements representing the configuration data -->
</configuration>
```

If the application provides the new data as formatted ASCII text, it uses the standard Junos OS CLI notation to indicate the hierarchical relationships between configuration statements—the newline character, tabs and other white space, braces, and square brackets. For each new or changed element, the complete statement path is specified, starting with the top-level statement that appears directly under the **[edit]** hierarchy level.

When ASCII text is provided as a data stream, it is enclosed in the `<configuration-text>` tag element:

```
<configuration-text>
  /* formatted ASCII configuration statements */
</configuration-text>
```

When ASCII text is provided in a previously saved file, the `<configuration-text>` tag element is not included in the file.

When providing new data as ASCII text, the application also includes the `format="text"` attribute in the `<load-configuration/>` tag or opening `<load-configuration>` tag.

```
<rpc>
  <load-configuration url="file-location" format="text"/>
</rpc>

<rpc>
  <load-configuration format="text">
    <configuration-text>
      /* formatted ASCII configuration data */
    </configuration-text>
  </load-configuration>
</rpc>
```

Starting with Junos OS Release 11.4, you can provide the data as a set of configuration mode commands. Junos OS executes these configuration instructions line by line. For each element, you can specify the complete statement path in the command, or you can use navigation commands, such as **edit** and **up**, to move around the configuration hierarchy as you would in CLI configuration mode.

When a set of configuration mode commands is provided as a data stream, it is enclosed in the `<configuration-set>` tag element.

```
<configuration-set>
  /* configuration mode commands */
</configuration-set>
```

When a set of configuration mode commands is provided in a previously saved file, the `<configuration-set>` tag element is not included in the file.

When providing new data as a set of configuration mode commands, the application also includes the `action="set"` and `format="text"` attributes in the `<load-configuration/>` tag or opening `<load-configuration>` tag.

```
<rpc>
  <load-configuration url="file-location" action="set" format="text"/>
</rpc>

<rpc>
  <load-configuration action="set" format="text">
    <configuration-set>
      /* configuration mode commands to load */
    </configuration-set>
  </load-configuration>
</rpc>
```

The **format** attribute can be combined with one or more of the following attributes:

- **url**, which is discussed in [“Providing Configuration Data in a File” on page 883](#).
- **action**, which is discussed in [“Replacing the Configuration with New Data” on page 887](#) and the subsections of [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

For reference pages for the `<configuration>`, `<configuration-text>`, and `<configuration-set>` tag elements, see the *Junos XML API Operational Developer Reference*.

Replacing the Entire Configuration

A client application can completely replace the current candidate configuration or a private copy of it, either with new data or by rolling back to a previous configuration. See the following sections:

- [Replacing the Configuration with New Data on page 887](#)
- [Rolling Back to a Previous or Rescue Configuration on page 888](#)

For instructions about modifying individual configuration elements, see [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

Replacing the Configuration with New Data

To discard the entire candidate configuration or private copy and replace it with new configuration data, a client application includes the **action="override"** attribute in the `<load-configuration/>` tag or opening `<load-configuration>` tag:

```
<rpc>
  <!-- For a file -->
    <load-configuration action="override" url="file" [format="text"]/>

  <!-- For a data stream -->
    <load-configuration action="override" [format="text"]>
      <!-- configuration data -->
    </load-configuration>
</rpc>
```

For more information about the **url** and **format** attributes and the syntax for the new configuration data, see [“Specifying the Source and Format of New Configuration Data” on page 883](#).

The following example shows how to specify that the contents of the file `/tmp/new.conf` replace the entire candidate configuration. The file contains Junos XML tag elements (the default), so the **format** attribute is omitted.

Client Application

```
<rpc>
  <load-configuration action="override" url="/tmp/new.conf"/>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T113

Rolling Back to a Previous or Rescue Configuration

The routing, switching, or security platform stores a copy of the most recently committed configuration and up to 49 additional previous configurations. To replace the candidate configuration or private copy with a previously committed configuration, a client application includes the **rollback="index"** attribute in the **<load-configuration/>** tag, where **index** is the numerical index of the appropriate previous configuration. The index for the most recently committed configuration is **0** (zero), and the index for the oldest possible previous configuration is **49**.

```
<rpc>
  <load-configuration rollback="index">
</rpc>
```

To replace the configuration with the rescue configuration, include the **rescue="rescue"** attribute in the **<load-configuration/>** tag.

```
<rpc>
  <load-configuration rescue="rescue"/>
</rpc>
```

For more information about rollback and rescue configurations, see the *CLI User Guide*.

Creating, Modifying, or Deleting Configuration Elements

In addition to replacing the entire configuration (as described in [“Replacing the Entire Configuration” on page 887](#)), a client application can create, modify, or delete one or more configuration elements (hierarchy levels and configuration objects) in the candidate configuration or a private copy.

To use Junos XML tag elements to represent an element, the application includes the tag elements representing all levels in the configuration hierarchy from the root (represented by the **<configuration>** tag element) down to the element's container tag element. Which attributes and child tag elements are included depends on the operation being performed on the element. The syntax applies both to the contents of a file and to a data stream. In the following, the identifier tag element is called **<name>**:

```
<configuration>
  <!-- opening tag for each parent of the element -->
  <container-tag [operation-attribute="value"]>
    <name>identifier</name> <!-- if the element has an identifier -->
    <!-- other child tag elements --> <!-- if appropriate for the operation -->
  </container-tag>
  <!-- closing tag for each parent of the element -->
</configuration>
```

To use formatted ASCII text to represent an element, the application includes the complete statement path, starting with a statement that can appear directly under the **[edit]** hierarchy level. The attributes and child statements to include depend on the operation being performed on the element. The set of statements is enclosed in a **<configuration-text>** tag element when the application provides a data stream. When saving statements to a file for later loading, omit the **<configuration-text>** tag element.

```
<configuration-text>
  /* statements for parent levels of the element */
  operation-to-perform: # if appropriate
  element identifier { # if the element has an identifier
    /* child statements */ # if appropriate for the operation
  }
  /* closing braces for parent levels for the element */
</configuration-text>
```

When loading formatted ASCII text, the application includes the **format="text"** attribute in the **<load-configuration/>** tag or opening **<load-configuration>** tag.

To use a set of configuration mode commands to create, modify, or delete an element, the application includes commands as they would be typed in configuration mode in the CLI. The configuration instructions are executed in the order provided. You can specify the complete statement path in the command, or you can use CLI navigation commands such as **edit** and **up**, to move around the configuration hierarchy.

The set of commands is enclosed in a **<configuration-set>** tag element when the application provides a data stream. When saving statements to a file for later loading, omit the **<configuration-set>** tag element.

```
<configuration-set>
  /* configuration mode commands */
</configuration-set>
```

When loading a set of configuration mode commands, the application includes the **action="set"** and **format="text"** attributes in the **<load-configuration/>** tag or opening **<load-configuration>** tag.

For more information about the source and formatting for configuration elements, see [“Specifying the Source and Format of New Configuration Data” on page 883](#).

For information about the operations a client application can perform on configuration elements, see the following sections:

- [Merging Configuration Elements on page 890](#)
- [Replacing Configuration Elements on page 893](#)
- [Creating New Configuration Elements on page 895](#)
- [Replacing Configuration Elements Only If They Have Changed on page 896](#)
- [Deleting Configuration Elements on page 897](#)

Merging Configuration Elements

By default, the Junos XML protocol server *merges* loaded configuration data into the candidate configuration according to the following rules. (The rules also apply to a private copy of the configuration, but for simplicity the following discussion refers to the candidate configuration only.)

- A configuration element (hierarchy level or configuration object) that exists in the candidate but not in the loaded configuration remains unchanged.
- A configuration element that exists in the loaded configuration but not in the candidate is added to the candidate.
- If a configuration element exists in both configurations, the semantics are as follows:
 - If a child statement of the configuration element (represented by a child tag element) exists in the candidate but not in the loaded configuration, it remains unchanged.
 - If a child statement exists in the loaded configuration but not in the candidate, it is added to the candidate.
 - If a child statement exists in both configurations, the value in the loaded configuration replaces the value in the candidate.

Merge mode is the default mode for new configuration elements, so the application simply emits the `<load-configuration>` tag element in an `<rpc>` tag element:

```
<rpc>
  <!-- For a file -->
    <load-configuration url="file" [format="text"]/>

  <!-- For a data stream -->
    <load-configuration [format="text"]>
      <!-- configuration data -->
    </load-configuration>
</rpc>
```

For more information about the `url` and `format` attributes, see [“Specifying the Source and Format of New Configuration Data” on page 883](#).

To explicitly specify merge mode, the application can include the `action="merge"` attribute in the `<load-configuration/>` tag or opening `<load-configuration>` tag, as shown in the examples at the end of this section.

If using Junos XML tag elements to represent the element to merge into the configuration, the application includes the basic tag elements described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). It does not include any attributes in the element’s container tag. If adding or changing the value of a child element, the application includes the tag elements for it. If a child remains unchanged, it does not need to be included in the loaded configuration. In the following, the identifier tag element is called `<name>`:

```
<configuration>
  <!-- opening tag for each parent of the element -->
  <container-tag>
```

```

    <name>identifier</name> <!-- if the element has an identifier -->
    <!-- tag elements for other children, if any -->
  </container-tag>
<!-- closing tag for each parent of the element -->
</configuration>

```

If using formatted ASCII text, the application includes the statement path described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). It does not include a preceding operator, but does include the element’s identifier if it has one. If adding or changing the value of a child element, the application includes the tag elements for it. If a child remains unchanged, it does not need to be included in the loaded configuration.

```

<configuration-text>
/* statements for parent levels of the element */
  element identifier {
    /* child statements if any */
  }
/* closing braces for parent levels for the element */
</configuration-text>

```

If using configuration mode commands to merge new elements, the application includes the **action="set"** attribute in the **<load-configuration/>** tag or opening **<load-configuration>** tag, as shown in the examples at the end of this section. The application includes the **set** command, the statement path to the element, and the element’s identifier if it has one. If adding or changing the value of a child element, the application includes the child elements or statements in the command. If a child remains unchanged, it does not need to be included.

```

<configuration-set>
  set statement-path-to-element element identifier child-elements-or-statements
</configuration-set>

```

The following example shows how to merge in a new interface called **so-3/0/0** at the **[edit interfaces]** hierarchy level in the candidate configuration. The information is provided as Junos XML tag elements (the default).

Client Application

```

<rpc>
  <load-configuration action="merge">
    <configuration>
      <interfaces>
        <interface>
          <name>so-3/0/0</name>
          <unit>
            <family>
              <inet>
                <address>
                  <name>10.0.0.1/8</name>
                </address>
              </inet>
            </family>
          </unit>
        </interface>
      </interfaces>
    </configuration>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1131

The following example shows how to use formatted ASCII text to define the same new interface.

Client Application

```

<rpc>
  <load-configuration action="merge" format="text">
    <configuration-text>
      interfaces {
        so-3/0/0 {
          unit 0 {
            family inet {
              address 10.0.0.1/8;
            }
          }
        }
      }
    </configuration-text>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1132

The following example shows how to use configuration mode commands to define the same new interface.

Client Application

```

<rpc>
  <load-configuration action="set" format="text">
    <configuration-set>
      set interfaces so-3/0/0 unit 0 family inet address 10.0.0.1/8
    </configuration-set>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1148

Replacing Configuration Elements

To replace individual configuration elements (hierarchy levels or configuration objects), a client application emits the `<load-configuration>` tag element with the `action="replace"` attribute in an `<rpc>` tag element:

```

<rpc>
  <!-- For a file -->
  <load-configuration action="replace" url="file" [format="text"]/>

  <!-- For a data stream -->
  <load-configuration action="replace" [format="text"]>
    <!-- configuration data -->
  </load-configuration>
</rpc>

```

For more information about the `url` and `format` attributes, see [“Providing Configuration Data in a File” on page 883](#).

To use Junos XML tag elements to define the replacement, the application includes the basic tag elements described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). Within the container tag, it includes the same child tag elements as for a new element: each of the replacement’s identifier tag elements (if it has them) and all child tag elements being defined for the replacement element. In the following, the identifier tag element is called `<name>`. The application also includes the `replace=“replace”` attribute in the opening container tag:

```

<configuration>
  <!-- opening tag for each parent of the element -->
  <container-tag replace="replace">
    <name>identifier</name>
    <!-- tag elements for other children, if any -->
  </container-tag>
  <!-- closing tag for each parent of the element -->
</configuration>

```

To use formatted ASCII text to represent the element, the application includes the complete statement path described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). As for a new element, it includes each of the replacement’s identifiers (if it has them) and all child statements (with values if appropriate) that it is defining for the replacement. It places the **replace:** statement above the element’s container statement.

```
<configuration-text>
  /* statements for parent levels of the element */
  replace:
    element identifier {
      /* child statements if any */
    }
  /* closing braces for parent levels for the element */
</configuration-text>
```

The following example shows how to grant new permissions for the object named **operator** at the **[edit system login class]** hierarchy level. The information is provided in Junos XML-tagged format (the default).

Client Application

```
<rpc>
  <load-configuration action="replace">
    <configuration>
      <system>
        <login>
          <class replace="replace">
            <name>operator</name>
            <permissions>configure</permissions>
            <permissions>admin-control</permissions>
          </class>
        </login>
      </system>
    </configuration>
  </load-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1135

The following example shows how to use formatted ASCII text to make the same change.

Client Application

```

<rpc>
  <load-configuration action="replace" format="text">
    <configuration-text>
      system {
        login {
          replace:
            class operator {
              permissions [ configure admin-control ];
            }
        }
      }
    </configuration-text>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1136

Creating New Configuration Elements

To create new configuration elements (hierarchy levels or configuration objects), a client application includes the basic tag elements, formatted ASCII statements, or configuration mode commands described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

For Junos XML tag elements and formatted ASCII text, new elements can be created in either merge mode or replace mode, which are described in [“Merging Configuration Elements” on page 890](#) and [“Replacing Configuration Elements” on page 893](#). In replace mode, the application includes the **action="replace"** attribute in the **<load-configuration/>** tag or opening **<load-configuration>** tag.

To use Junos XML tag elements to represent the element, the application includes each of the element's identifier tag elements (if it has them) and all child tag elements being defined for the element. In the following, the identifier tag element is called **<name>**. The application does not need to include any attributes in the opening container tag for the new element:

```

<configuration>
  <!-- opening tag for each parent of the element -->
  <container-tag>
    <name>identifier</name>
    <!-- tag elements for other children, if any -->
  </container-tag>
  <!-- closing tag for each parent of the element -->
</configuration>

```

To use formatted ASCII text to represent the element, the application includes each of the element's identifiers (if it has them) and all child statements (with values if appropriate) that it is defining for the element. It does not need to include an operator before the new element:

```

<configuration-text>
  /* statements for parent levels of the element */

```

```

    element identifier {
      /* child statements if any */
    }
    /* closing braces for parent levels for the element */
  </configuration-text>

```

To use configuration mode commands to create new elements, the application includes the **action="set"** attribute in the **<load-configuration/>** tag or opening **<load-configuration>** tag. The application includes the **set** command as it would be executed in the CLI. The command includes the statement path to the element, the element's identifier if it has one, and all child statements (with values if appropriate) that it is defining for the element.

```

<configuration-set>
  set statement-path-to-element element identifier child-elements
</configuration-set>

```

Replacing Configuration Elements Only If They Have Changed

To replace configuration elements (hierarchy levels and configuration objects) only if they differ in the loaded configuration and the candidate configuration or private copy, the application emits the **<load-configuration>** tag element with the **action="update"** attribute in an **<rpc>** tag element:

```

<rpc>
  <!-- For a file -->
    <load-configuration action="update" url="file" [format="text"]/>

  <!-- For a data stream -->
    <load-configuration action="update" [format="text"]>
      <!-- configuration data -->
    </load-configuration>
</rpc>

```

For more information about the **url** and **format** attributes, see [“Specifying the Source and Format of New Configuration Data” on page 883](#).

This operation is equivalent to the Junos OS CLI **load update** configuration mode command. The Junos configuration management software compares the two configurations. Each configuration element that is different in the loaded configuration replaces its corresponding element in the existing configuration. Elements that are the same in both configurations, or exist only in the existing configuration, remain unchanged. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration.

To represent the replacement elements, the application uses the same syntax as for new elements, as described in [“Creating New Configuration Elements” on page 895](#). In the following, the identifier tag element is called **<name>**:

```

<configuration>
  <!-- opening tag for each parent of the element -->
    <container-tag>
      <name>identifier</name>
      <!-- tag elements for other children, if any -->
    </container-tag>
  <!-- closing tag for each parent of the element -->
</configuration>

```

OR

```
<configuration-text>
  /* statements for parent levels of the element */
  element identifier {
    /* child statements if any */
  }
  /* closing braces for parent levels for the element */
</configuration-text>
```

The following example shows how to update the candidate configuration with the contents of the file `/tmp/new.conf` (which resides on the device). The file contains a complete configuration represented as Junos XML tag elements (the default), so the `format` attribute is omitted.

Client Application

```
<rpc>
  <load-configuration action="update" url="/tmp/new.conf"/>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1134

Deleting Configuration Elements

To delete configuration elements (hierarchy levels or configuration objects) from the candidate configuration or private copy, a client application emits the basic tag elements described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). When using Junos XML tag elements to represent the elements to delete, the client application includes the `delete="delete"` attribute in the opening tag for each element. When using configuration mode commands to delete elements, the client application uses the `delete` command and specifies the path to the element. When using formatted ASCII text, the client application precedes each element to delete with the `delete:` operator. The placement of the attribute or operator depends on the type of element being deleted, as described in the following sections:

- [Deleting a Hierarchy Level or Container Object on page 897](#)
- [Deleting a Configuration Object That Has an Identifier on page 898](#)
- [Deleting a Single-Value or Fixed-Form Option from a Configuration Object on page 900](#)
- [Deleting Values from a Multivalue Option of a Configuration Object on page 901](#)

Deleting a Hierarchy Level or Container Object

To delete a hierarchy level and all of its children (or a container object that has children but no identifier), a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

If using Junos XML tag elements, the application includes the **delete="delete"** attribute in the empty tag that represents the level or container object:

```
<configuration>
  <!-- opening tag for each parent level -->
  <level-or-object delete="delete"/>
  <!-- closing tag for each parent level -->
</configuration>
```

If using formatted ASCII text, the application places the **delete:** statement above the level to be removed, which is followed by a semicolon (even though in the existing configuration it is followed by curly braces that enclose its child statements):

```
<configuration-text>
  /* statements for parent levels */
  delete:
  object-or-level;
  /* closing braces for parent levels */
</configuration-text>
```

If using configuration mode commands, the application specifies the **delete** command and the statement path to the hierarchy level to be removed.

```
<configuration-set>
  delete statement-path-to-hierarchy
</configuration-set>
```

The following example shows how to remove the **[edit protocols ospf]** hierarchy level from the candidate configuration using Junos XML tag elements:

Client Application

```
<rpc>
  <load-configuration>
    <configuration>
      <protocols>
        <ospf delete="delete"/>
      </protocols>
    </configuration>
  </load-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1137

Deleting a Configuration Object That Has an Identifier

To delete a configuration object that has an identifier, a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

If using Junos XML tag elements, the application includes the **delete="delete"** attribute in the opening tag for the object. In the container tag element for the object, it encloses only the identifier tag element, not tag elements that represent any other characteristics of the object. In the following, the identifier tag element is called **<name>**:

```
<configuration>
  <!-- opening tag for each parent of the object -->
  <object delete="delete">
    <name>identifier</name>
  </object>
  <!-- closing tag for each parent of the object -->
</configuration>
```

NOTE: The **delete** attribute appears in the opening container tag, not in the identifier tag element. The presence of the identifier tag element results in the removal of the specified object, not in the removal of the entire hierarchy level represented by the container tag element.

If using formatted ASCII text, the application places the **delete:** statement above the object and its identifier:

```
<configuration-text>
/* statements for parent levels of the object */
delete:
  object identifier;
/* closing braces for parent levels of the object */
</configuration-text>
```

If using configuration mode commands, the application specifies the **delete** command, the statement path to the object, and the object and its identifier.

```
<configuration-set>
  delete statement-path-to-object object identifier
</configuration-set>
```

The following example uses Junos XML tag elements to remove the user object **barbara** from the **[edit system login user]** hierarchy level in the candidate configuration.

Client Application

```

<rpc>
  <load-configuration>
    <configuration>
      <system>
        <login>
          <user delete="delete">
            <name>barbara</name>
          </user>
        </login>
      </system>
    </configuration>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1138

Deleting a Single-Value or Fixed-Form Option from a Configuration Object

To delete from a configuration object either a fixed-form option or an option that takes just one value, a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). (For information about deleting an option that can take multiple values, see [“Deleting Values from a Multivalue Option of a Configuration Object” on page 901](#).)

If using Junos XML tag elements, the application includes the **delete="delete"** attribute in the empty tag for each option. It does not include tag elements for children that are to remain in the configuration. In the following, the identifier tag element for the object is called **<name>**:

```

<configuration>
  <!-- opening tag for each parent of the object -->
  <object>
    <name>identifier</name> <!-- if the object has an identifier -->
    <option1 delete="delete"/>
    <option2 delete="delete"/>
    <!-- tag elements for other options to delete -->
  </object>
  <!-- closing tag for each parent of the object -->
</configuration>

```

If using formatted ASCII text, the application places the **delete:** statement above each option:

```

<configuration-text>
/* statements for parent levels of the object */
  object identifier;
  delete:
    option1;
  delete:
    option2;
/* closing braces for parent levels of the object */

```

```
</configuration-text>
```

If using configuration mode commands, the application specifies the **delete** command, the statement path to the option, and the option to be removed. You can specify the full path to the option statement or navigate to the hierarchy level of the object and delete the option statement from that location. Use a separate command to delete each option.

```
<configuration-set>
  delete statement-path-to-object object identifier option1
  delete statement-path-to-object object identifier option2
</configuration-set>
```

```
<configuration-set>
  edit statement-path-to-object object identifier
  delete option1
  delete option2
</configuration-set>
```

The following example shows how to remove the fixed-form **disable** option at the **[edit forwarding-options sampling]** hierarchy level using Junos XML tag elements.

Client Application

Junos XML Protocol Server

```
<rpc>
  <load-configuration>
    <configuration>
      <forwarding-options>
        <sampling>
          <disable delete="delete"/>
        </sampling>
      </forwarding-options>
    </configuration>
  </load-configuration>
</rpc>
```

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1140

Deleting Values from a Multivalue Option of a Configuration Object

As described in ["Mapping Configuration Statements to Junos XML Tag Elements" on page 552](#), some Junos configuration objects are leaf statements that have multiple values. In the formatted ASCII CLI representation, the values are enclosed in square brackets following the name of the object:

```
object [value1 value2 value3 ...];
```

The Junos XML representation does not use a parent tag for the object, but instead uses a separate instance of the object tag element for each value. In the following, the identifier tag element is called **<name>**:

```
<parent-object>
  <name>identifier</name>
  <object>value1</object>
  <object>value2</object>
  <object>value3</object>
</parent-object>
```

To remove one or more values for such an object, a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). If using Junos XML tag elements, the application includes the **delete="delete"** attribute in the opening tag for each value. It does not include tag elements that represent values to be retained. In the following, the identifier tag element for the parent object is called **<name>**:

```
<configuration>
  <!-- opening tag for each parent of the parent object -->
  <parent-object>
    <name>identifier</name>
    <object delete="delete">value1</object>
    <object delete="delete">value2</object>
  </parent-object>
  <!-- closing tag for each parent of the parent object -->
</configuration>
```

If using formatted ASCII text, the application repeats the parent statement for each value and places the **delete:** statement above each paired statement and value:

```
<configuration-text>
  /* statements for parent levels of the parent object */
  parent-object identifier;
  delete:
    object value1;
  delete:
    object value2;
  /* closing braces for parent levels of the parent object */
</configuration-text>
```

If using configuration mode commands, the application specifies the **delete** command, the statement path to each value, and the value to be removed. You can specify the full path to the value or navigate to the hierarchy level of the object and delete the value from that location. Use a separate command to delete each value.

```
<configuration-set>
  delete statement-path-to-parent-object parent-object identifier object value1
  delete statement-path-to-parent-object parent-object identifier object value2
</configuration-set>

<configuration-set>
  edit statement-path-to-parent-object parent-object identifier object
  delete value1
  delete value2
</configuration-set>
```

The following example shows how to remove two of the permissions granted to the **user-accounts** login class.

Client Application

```

<rpc>
  <load-configuration>
    <configuration>
      <system>
        <login>
          <class>
            <name>user-accounts</name>
            <permissions delete="delete">configure</permissions>
            <permissions delete="delete">control</permissions>
          </class>
        </login>
      </system>
    </configuration>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1139

Reordering Elements in Configuration Objects

For most configuration objects, the order in which the object or its children are created is not significant, because the Junos configuration management software stores and displays configuration objects in predetermined positions in the configuration hierarchy. However, some configuration objects—such as routing policies and firewall filters—consist of elements that must be processed and analyzed sequentially in order to produce the intended routing behavior. When a client application uses the Junos XML management protocol to add a new element to an ordered set, the element is appended to the existing list of elements. The client application can then reorder the elements, if appropriate.

To change the order of configuration elements in an ordered set, a client application includes the tag elements described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). If using Junos XML tag elements, the application emits the container tag element that represents the ordered set, and encloses the tag element for each identifier of the configuration element that is moving. In the following, the identifier tag element is called **<name>**. In the opening container tag, it includes the **insert="before"** or **insert="after"** attribute to indicate the new position of the moving element relative to another reference element in the set. To identify the reference element, it includes each of the reference element's identifiers as an attribute in the opening container tag for the ordered set.

In the following, the elements in the set have one identifier, called **<name>**:

```

<configuration>
  <!-- opening tag for each parent of the set -->
  <ordered-set insert="(before | after)" name="referent-value">
    <name>identifier-for-moving-object</name>
  </ordered-set>
  <!-- closing tag for each parent of the set -->
</configuration>

```

In the following, each element in the set has two identifiers. The opening tag appears on two lines for legibility only:

```
<configuration>
  <!-- opening tag for each parent of the set -->
    <ordered-set insert="(before | after)" identifier1="referent-value" \
      identifier2="referent-value">
      <identifier1>value-for-moving-object</identifier1>
      <identifier2>value-for-moving-object</identifier2>
    </ordered-set>
  <!-- closing tag for each parent of the set -->
</configuration>
```

The **insert** attribute can be combined with the **inactive** or **active** attribute to deactivate or reactivate the configuration element as it is reordered. For more information, see [“Changing a Configuration Element’s Activation State Simultaneously with Other Changes” on page 913](#).

The reordering operation is not available when formatted ASCII text is used to represent the configuration data.

If using configuration mode commands, the application specifies the **insert** command equivalent to the CLI configuration mode command.

```
<configuration-set>
  insert statement-path-to-object identifier-for-moving-object (before | after)
  referent-value
</configuration-set>
```

The following example shows how to move a firewall filter called **older-filter**, defined at the **[edit firewall filter]** hierarchy level, and place it after another filter called **newer-filter** using Junos XML tag elements. This operation is equivalent to the following configuration mode command:

```
[edit]
user@host# insert firewall family inet filter older-filter after filter newer-filter
```

Client Application

```

<rpc>
  <load-configuration>
    <configuration>
      <firewall>
        <family>
          <inet>
            <filter insert="after" name="newer-filter">
              <name>older-filter</name>
            </filter>
          </inet>
        </family>
      </firewall>
    </configuration>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1141

The following example shows how to move a firewall filter called **older-filter**, defined at the **[edit firewall filter]** hierarchy level, and place it after another filter called **newer-filter** using configuration mode commands:

```

<rpc>
  <load-configuration action="set" format="text">
    <configuration-set>
      insert firewall family inet filter older-filter after filter newer-filter
    </configuration-set>
  </load-configuration>
</rpc>

```

The following example shows how to move an OSPF virtual link defined at the **[edit protocols ospf area area]** hierarchy level. The link with identifiers **neighbor-id 192.168.0.3** and **transit-area 1.1.1.1** moves before the link with identifiers **neighbor-id 192.168.0.5** and **transit-area 1.1.1.2**. This operation is equivalent to the following configuration mode command (which appears on two lines for legibility only):

```

[edit protocols ospf area area]
user@host# insert virtual-link neighbor-id 192.168.0.3 transit-area 1.1.1.1 \
  before virtual-link neighbor-id 192.168.0.5 transit-area 1.1.1.2

```

Client Application

```

<rpc>
  <load-configuration>
    <configuration>
      <protocols>
        <ospf>
          <area>
            <filter insert="before" neighbor-id="192.168.0.5" transit-area="1.1.1.2">
              <neighbor-id>192.168.0.3</neighbor-id>
              <transit-area>1.1.1.1</transit-area>
            </filter>
          </area>
        </ospf>
      </protocols>
    </configuration>
  </load-configuration>
</rpc>

```

Junos XML Protocol Server

```

<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>

```

T1180

Renaming a Configuration Object

To change the name of one or more of a configuration object's identifiers, a client application includes the tag elements described in ["Creating, Modifying, or Deleting Configuration Elements" on page 888](#). When using Junos XML tag elements, the client application includes the **rename="rename"** attribute and an attribute named after the identifier keyword in the object's opening tag. The value of the attribute is the new identifier value. The application includes the identifier tag element to specify the current name. In the following, the identifier tag element is called **<name>**:

```

<configuration>
  <!-- opening tag for each parent of the object -->
  <object rename="rename" name="new-name">
    <name>current-name</name>
  </object>
  <!-- closing tag for each parent of the object -->
</configuration>

```

If the object has multiple identifiers, for each one the application includes both an attribute in the opening tag and an identifier tag element. If one or more of the identifiers is not changing, the attribute value for it is set to its current name. The opening tag appears on two lines for legibility only:

```

<configuration>
  <!-- opening tag for each parent of the object -->
  <object rename="rename" changing-identifier="new-name" \
    unchanging-identifier="current-name">
    <changing-identifier>current-name</changing-identifier>
    <unchanging-identifier>current-name</unchanging-identifier>
  </object>
  <!-- closing tag for each parent of the object -->
</configuration>

```

The renaming operation is not available when formatted ASCII text is used to represent the configuration data.

If using configuration mode commands to rename an object, the application specifies the **rename** command equivalent to the CLI configuration mode command. If the object has multiple identifiers, the application includes a separate **rename** command for each identifier.

```
<configuration-set>
  rename statement-path-to-object object current-name to object new-name
</configuration-set>
```

For Junos XML tag elements the **rename** attribute can be combined with the **inactive** or **active** attribute to deactivate or reactivate the configuration element as it is renamed.

For more information, see [“Changing a Configuration Element’s Activation State Simultaneously with Other Changes”](#) on page 913.

The following example shows how to change the name of a firewall filter from **access-control** to **new-access-control** using Junos XML tag elements. This operation is equivalent to the following configuration mode command:

```
[edit firewall family inet]
user@host# rename filter access-control to filter new-access-control
```

Client Application

Junos XML Protocol Server

```
<rpc>
  <load-configuration>
    <configuration>
      <firewall>
        <family>
          <inet>
            <filter rename="rename" name="new-access-control">
              <name>access-control</name>
            </filter>
          </inet>
        </family>
      </firewall>
    </configuration>
  </load-configuration>
</rpc>
```

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1143

The following example shows how to change the name of a firewall filter from **access-control** to **new-access-control** using configuration mode commands:

```
<rpc>
  <load-configuration action="set" format="text">
    <configuration-set>
      rename firewall family inet filter access-control to filter new-access-control
    </configuration-set>
  </load-configuration>
</rpc>
```

The following example shows how to change the identifiers for an OSPF virtual link (defined at the `[edit protocols ospf area area]` hierarchy level) from **neighbor-id 192.168.0.3** and **transit-area 1.1.1** to **neighbor-id 192.168.0.7** and **transit-area 1.1.1.5**. This operation is equivalent to the following configuration mode command (which appears on two lines for legibility only):

```
[edit protocols ospf area area]
user@host# rename filter virtual-link neighbor-id 192.168.0.3 transit-area \
1.1.1 to virtual-link neighbor-id 192.168.0.7 transit-area 1.1.1.5
```

Client Application

```
<rpc>
  <load-configuration>
    <configuration>
      <protocols>
        <ospf>
          <area>
            <filter rename="rename" neighbor-id="192.168.0.7" transit-area="1.1.1.5">
              <neighbor-id>192.168.0.3</neighbor-id>
              <transit-area>1.1.1</transit-area>
            </filter>
          </area>
        </ospf>
      </protocols>
    </configuration>
  </load-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1181

Protecting or Unprotecting a Configuration Object

The **protect** attribute prevents changes to a configuration element or statement. You cannot alter a protected element either manually through the CLI or automatically using commit scripts or remote procedure calls. If you attempt to make configuration changes to a protected statement or within a protected hierarchy, the Junos OS issues a warning, and the configuration change fails.

If a configuration hierarchy or statement is protected, users cannot perform the following activities:

- Deleting or modifying the hierarchy or a statement or identifier within the protected hierarchy (Deletion of an unprotected hierarchy that contains protected elements deletes all unprotected child elements and preserves all protected child elements.)
- Inserting a new configuration statement or an identifier within the protected hierarchy
- Renaming the protected statement or a statement or identifier within the protected hierarchy
- Copying a configuration into the protected hierarchy

- Activating or deactivating the protected statements or statements within the protected hierarchy
- Annotating the protected statement or hierarchy, or statements within the protected hierarchy

If you protect a configuration statement or hierarchy that does not exist, Junos OS first creates the configuration element and then protects it. If you unprotect a statement or element that is not protected, no action is taken.

You can identify protected elements when you display the configuration. If you display the configuration in text format, protected elements are preceded by **protect:**. If you display the configuration in XML format using the **| display xml** option, the opening tag of the protected element contains the **protect="protect"** attribute.

NOTE: A user or client application must have permission to modify the configuration in order to protect or unprotect configuration objects.

To protect a configuration element from changes or unprotect a previously protected element, a client application includes the tag elements described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). If using Junos XML tag elements, the client application includes the **protect="protect"** or **unprotect="unprotect"** attribute in the object's opening tag. The application includes any necessary identifier tag element. In the following sample RPC, the identifier tag element is called **<name>**:

```
<configuration>
  <!-- opening tag for each parent of the object -->
  <object (protect="protect" | unprotect="unprotect")>
    <name>identifier</name>
  </object>
  <!-- closing tag for each parent of the object -->
</configuration>
```

If using formatted ASCII text to protect or unprotect an object, the application precedes the element with the **protect:** or **unprotect:** operator as appropriate. If you are protecting a hierarchy level and no additional child elements under that hierarchy, add a semicolon after the element statement.

```
<configuration-text>
  /* statements for parent levels */

  /* For an object with an identifier */
  (protect: | unprotect:)
  object identifier {
    /* Child configuration statements */
  }

  /* For a hierarchy level or object without an identifier */
  (protect: | unprotect:)
  element {
    /* Child configuration statements */
  }

  /* closing braces for parent levels */
```

```
</configuration-text>
```

If using configuration mode commands to protect an object, the application specifies the **protect** or **unprotect** command equivalent to the CLI configuration mode command. You can protect both hierarchies and individual statements.

```
<configuration-set>
  (protect | unprotect) statement-path-to-hierarchy
  (protect | unprotect) statement-path-to-object object identifier
</configuration-set>
```

The following example protects the **[edit access]** hierarchy level of the configuration using Junos XML tag elements:

```
<rpc>
  <load-configuration>
    <configuration>
      <access protect="protect"/>
    </configuration>
  </load-configuration>
</rpc>
```

Once protected, any attempt to modify the **[edit access]** hierarchy level produces a warning. The following RPC attempts to delete the **[edit access]** hierarchy level. Because that hierarchy level is protected, the RPC returns a warning that the hierarchy is protected, and the configuration change fails.

```
<rpc>
  <load-configuration>
    <configuration>
      <access delete="delete"/>
    </configuration>
  </load-configuration>
</rpc>

<xnm:warning xmlns="http://xml.juniper.net/xnm/1.1/xnm"
xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm">
  <message>
    [access] is protected, 'access' cannot be deleted
  </message>
</xnm:warning>
```

Related Documentation

- *Example: Protecting the Junos OS Configuration from Modification or Deletion*

Changing a Configuration Element's Activation State

When a configuration element (hierarchy level or configuration object) is deactivated, it remains in the candidate configuration or private copy, but when the configuration is later committed, the element does not affect the functioning of the routing platform. A client application can deactivate an element immediately as it creates it, or can deactivate an existing element. It can also reactivate an existing deactivated element so that when the configuration is committed, the element again has an effect on routing platform functioning.

See the following sections:

- [Deactivating a Newly Created Element on page 911](#)
- [Deactivating or Reactivating an Existing Element on page 912](#)

Deactivating a Newly Created Element

To define an element and immediately deactivate it, a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

If using Junos XML tag elements to define the new element, the application includes the **inactive="inactive"** attribute in the opening tag for the element. It includes tag elements for all children being defined for the element. In the following, the identifier tag element is called **<name>**:

```
<configuration>
  <!-- opening tag for each parent of the element -->
  <element inactive="inactive">
    <name>identifier</name> <!-- if the element has an identifier -->
    <!-- tag elements for each child of the element -->
  </element>
  <!-- closing tag for each parent of the element -->
</configuration>
```

If using formatted ASCII text to define the new element, the application precedes the element with the **inactive:** operator. It includes all child statements that it is defining for all children of the element:

```
<configuration-text>
/* statements for parent levels */

/* For an object with an identifier */
inactive:
object identifier {
  /* Child configuration statements */
}

/* For a hierarchy level or object without an identifier */
inactive:
element {
  /* Child configuration statements */
}

/* closing braces for parent levels */
</configuration-text>
```

If using configuration mode commands to create an inactive element, the application first creates the element with the **set** command and then uses the **deactivate** command equivalent to the CLI configuration mode command.

```
<configuration-set>
  set statement-path-to-object object identifier
  deactivate statement-path-to-object object identifier
</configuration-set>
```

Deactivating or Reactivating an Existing Element

To deactivate an existing element, or reactivate a previously deactivated one, a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#).

If using Junos XML tag elements to represent a configuration object that has an identifier, the application includes the `inactive="inactive"` or `active="active"` attribute in the object's opening container tag and also emits the identifier tag element and value. In the following, the identifier tag element is called `<name>`. To represent a hierarchy level or container object that has children but not an identifier, the application uses an empty tag:

```
<configuration>
  <!-- opening tag for each parent of the element -->
  <!-- For an object with an identifier -->
  <object (inactive="inactive" | active="active")>
    <name>identifier</name>
  </object>

  <!-- For a hierarchy level or object without an identifier -->
  <level-or-container (inactive="inactive" | active="active")/>
  <!-- closing tag for each parent of the element -->
</configuration>
```

If using formatted ASCII text to represent the element, the application precedes the element with the `inactive:` or `active:` operator. The name of a hierarchy level or container object is followed by a semicolon (even though in the existing configuration it is followed by curly braces that enclose its child statements):

```
<configuration-text>
/* statements for parent levels */

/* For an object with an identifier */
(inactive | active):
object identifier;

/* For a hierarchy level or object without an identifier */
(inactive | active):
object-or-level;

/* closing braces for parent levels */
</configuration-text>
```

If using configuration mode commands to activate or deactivate an object, the application specifies the `activate` or `deactivate` command equivalent to the CLI configuration mode command.

```
<configuration-set>
/* For an object with an identifier */
activate statement-path-to-object object identifier
deactivate statement-path-to-object object identifier

/* For a hierarchy level or object without an identifier */
activate statement-path-to-object-or-level object-or-level
deactivate statement-path-to-object-or-level object-or-level
```

```
</configuration-set>
```

The following example shows how to deactivate the `isis` hierarchy level at the `[edit protocols]` hierarchy level in the candidate configuration using Junos XML tag elements.

Client Application

```
<rpc>
  <load-configuration>
    <configuration>
      <protocols>
        <isis inactive="inactive"/>
      </protocols>
    </configuration>
  </load-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1145

Changing a Configuration Element's Activation State Simultaneously with Other Changes

A client application can deactivate or reactivate an element at the same time it performs other operations on it (except deletion), by combining the appropriate attributes or operators with the **inactive** or **active** attribute or operator. For basic information about activating or deactivating an element, see [“Changing a Configuration Element's Activation State” on page 910](#).

To define the element to deactivate or activate, a client application includes the basic tag elements or configuration statements for its parent levels, as described in [“Creating, Modifying, or Deleting Configuration Elements” on page 888](#). When using Junos XML tag elements to represent the element, the application includes the **inactive="inactive"** or **active="active"** attribute along with the appropriate other attribute in the `<load-configuration/>` tag or opening `<load-configuration>` tag. When using formatted ASCII text, the application combines the **inactive** or **active** operator with the other operator.

For instructions, see the following sections:

- [Replacing an Element and Setting Its Activation State on page 913](#)
- [Reordering an Element and Setting Its Activation State on page 915](#)
- [Renaming an Object and Setting Its Activation State on page 915](#)
- [Example: Replacing an Object and Deactivating It on page 916](#)

Replacing an Element and Setting Its Activation State

To replace (completely reconfigure) an element and simultaneously deactivate or activate it, a client application includes the tag elements or statements that represent all of the element's characteristics (for complete information about the syntax for defining elements, see [“Replacing Configuration Elements” on page 893](#)). The client application

uses the attributes and operators discussed in the following sections to indicate which element is being replaced and activated or deactivated:

- [Using Junos XML Tag Elements for the Replacement Element on page 914](#)
- [Using Formatted ASCII Text for the Replacement Element on page 914](#)

Using Junos XML Tag Elements for the Replacement Element

If using Junos XML tag elements to represent the element, a client application includes the **action="replace"** attribute in the **<load-configuration>** tag element:

```
<rpc>
  <!-- For a file -->
    <load-configuration action="replace" url="file"/>

  <!-- For a data stream -->
    <load-configuration action="replace">
      <!-- Junos XML tag elements -->
    </load-configuration>
</rpc>
```

In the opening tag for the replacement element, the application includes two attributes—the **replace="replace"** attribute and either the **inactive="inactive"** or **active="active"** attribute. It includes tag elements for all children being defined for the element. In the following, the identifier tag element is called **<name>**:

```
<configuration>
  <!-- opening tag for each parent of the element -->
  <element replace="replace" (inactive="inactive" | active="active")>
    <name>identifier</name> <!-- if the element has an identifier -->
    <!-- tag elements for each child of the element -->
  </element>
  <!-- closing tag for each parent of the element -->
</configuration>
```

Using Formatted ASCII Text for the Replacement Element

If using formatted ASCII text to represent the element, a client application includes the **action="replace"** and **format="text"** attributes in the **<load-configuration/>** tag or opening **<load-configuration>** tag:

```
<rpc>
  <!-- For a file -->
    <load-configuration action="replace" format="text" url="file"/>

  <!-- For a data stream -->
    <load-configuration action="replace" format="text">
      <!-- formatted ASCII configuration statements -->
    </load-configuration>
</rpc>
```

The application places the **inactive:** or **active:** operator on the line above the new element and the **replace:** operator directly before the new element. It includes all child statements that it is defining for all children of the element:

```
<configuration-text>
/* statements for parent levels */
```

```

/* For an object with an identifier */
(inactive | active):
replace: object identifier {
  /* Child configuration statements */
}

/* For a hierarchy level or object without an identifier */
(inactive | active):
replace: element {
  /* Child configuration statements */
}

/* closing braces for parent levels */
</configuration-text>

```

Reordering an Element and Setting Its Activation State

To reorder an element in an ordered list and simultaneously deactivate or activate it, the application combines the **insert** attribute and identifier attribute for the reference element with the **inactive** or **active** attribute. In the following, the identifier tag element for the moving element is called **<name>**. The opening tag appears on two lines for legibility only:

```

<configuration>
  <!-- opening tag for each parent of the set -->
    <ordered-set insert="(before | after)" reference-identifier="value" \
      (inactive="inactive" | active="active")>
      <name>identifier-for-moving-object</name>
    </ordered-set>
  <!-- closing tag for each parent of the set -->
</configuration>

```

The reordering operation is not available when formatted ASCII text is used to represent the configuration data. For complete information about reordering elements, see [“Reordering Elements in Configuration Objects” on page 903](#).

Renaming an Object and Setting Its Activation State

To rename an object (change the value of one or more of its identifiers) and simultaneously deactivate or activate it, the application combines the **rename** attribute and identifier attribute for the new name with the **inactive** or **active** attribute.

If the object has one identifier (here called **<name>**), the syntax is as follows (the opening tag appears on two lines for legibility only):

```

<configuration>
  <!-- opening tag for each parent of the object -->
    <object rename="rename" name="new-name" \
      (inactive="inactive" | active="active")>
      <name>current-name</name>
    </object>
  <!-- closing tag for each parent of the object -->
</configuration>

```

If the object has multiple identifiers and only one is changing, the syntax is as follows (the opening tag appears on multiple lines for legibility only):

```
<configuration>
  <!-- opening tag for each parent of the object -->
  <object rename="rename" changing-identifier="new-name" \
    unchanging-identifier="current-name" \
    (inactive="inactive" | active="active")>
    <changing-identifier>current-name</changing-identifier>
    <unchanging-identifier>current-name</unchanging-identifier>
  </object>
  <!-- closing tag for each parent of the object -->
</configuration>
```

The renaming operation is not available when formatted ASCII text is used to represent the configuration data. For complete information about renaming elements, see [“Renaming a Configuration Object” on page 906](#).

Example: Replacing an Object and Deactivating It

The following example shows how to replace the information at the **[edit protocols bgp]** hierarchy level in the candidate configuration for the group called **G3**, and also deactivate the group so that it is not used in the actual configuration when the candidate is committed:

Client Application

```
<rpc>
  <load-configuration action="replace">
    <configuration>
      <protocols>
        <bgp>
          <group replace="replace" inactive="inactive">
            <name>G3</name>
            <type>external</type>
            <peer-as>58</peer-as>
            <neighbor>
              <name>10.0.20.1</name>
            </neighbor>
          </group>
        </bgp>
      </protocols>
    </configuration>
  </load-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1146

The following example shows how to use formatted ASCII text to make the same changes:

Client Application

```
<rpc>
  <load-configuration action="replace" format="text">
    <configuration-text>
      protocols {
        bgp {
          replace:
            inactive: group G3 {
              type external;
              peer-as 58;
              neighbor 10.0.20.1;
            }
        }
      }
    </configuration-text>
  </load-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
  </load-configuration-results>
</rpc-reply>
```

T1147

CHAPTER 22

Committing a Configuration

This chapter explains how to commit a configuration so that it becomes the active configuration on the routing, switching, or security platform. For more detailed information about commit operations, including a discussion of the interaction among different variants of the operation, see the *CLI User Guide*.

- [Verifying a Configuration Before Committing It on page 919](#)
- [Committing the Candidate Configuration on page 920](#)
- [Committing a Private Copy of the Configuration on page 921](#)
- [Committing a Configuration at a Specified Time on page 922](#)
- [Committing the Candidate Configuration Only After Confirmation on page 923](#)
- [Committing and Synchronizing a Configuration on Redundant Control Planes on page 926](#)
- [Logging a Message About a Commit Operation on page 932](#)

Verifying a Configuration Before Committing It

During the process of committing the candidate configuration or a private copy, the Junos XML protocol server confirms that it is syntactically correct. If the syntax check fails, the server does not commit the candidate. To avoid the potential complications of such a failure, it often makes sense to confirm the candidate's correctness before actually committing it. The client application encloses the empty `<check/>` tag in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <check/>
  </commit-configuration>
</rpc>
```

The Junos XML protocol server encloses its response in `<rpc-reply>`, `<commit-results>`, and `<routing-engine>` tag elements. If the syntax check succeeds, the `<routing-engine>` tag element encloses the `<commit-check-success/>` tag and the `<name>` tag element, which reports the name of the Routing Engine on which the check succeeded (`re0` on routing platforms that use a single Routing Engine, and either `re0` or `re1` on routing platforms that can have two Routing Engines):

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>(re0 | re1)</name>
```

```
        <commit-check-success/>
    </routing-engine>
</commit-results>
</rpc-reply>
```

If the syntax check fails, an **<xnm:error>** tag element encloses tag elements that describe the error.

The **<check/>** tag can be combined with the **<synchronize/>** tag, which is described in [“Verifying the Configuration on Both Routing Engines” on page 930](#).

Committing the Candidate Configuration

To commit the candidate configuration, a client application encloses the empty **<commit-configuration/>** tag in an **<rpc>** tag element:

```
<rpc>
  <commit-configuration/>
</rpc>
```

We recommend that the application lock the candidate configuration before changing it and emit the **<commit-configuration/>** tag while the configuration is still locked. Doing so avoids inadvertent commit of changes made by other users or applications. After committing the configuration, the application must unlock it for other users and applications to be able to make changes. For instructions, see [“Exchanging Information with the Junos XML Protocol Server” on page 816](#) and [“Changing Configuration Information” on page 623](#).

The Junos XML protocol server reports the results of the commit operation in **<rpc-reply>**, **<commit-results>**, and **<routing-engine>** tag elements. If the commit operation succeeds, the **<routing-engine>** tag element encloses the **<commit-success/>** tag and the **<name>** tag element, which reports the name of the Routing Engine on which the commit operation succeeded (**re0** on devices that use a single Routing Engine, and either **re0** or **re1** on devices that can have two Routing Engines):

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>(re0 | re1)</name>
      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

If the commit operation fails, an **<xnm:error>** tag element encloses tag elements that describe the error. The most common causes of failure are semantic or syntactic errors in the candidate configuration.

Committing a Private Copy of the Configuration

To commit a private copy of the configuration so that it becomes the active configuration on the routing, switching, or security platform, a client application encloses the empty `<commit-configuration/>` tag in an `<rpc>` tag element (just as for the candidate configuration):

```
<rpc>
  <commit-configuration/>
</rpc>
```

The Junos XML protocol server creates a copy of the current regular candidate configuration, merges in the changes made to the private copy, and commits the combined candidate to make it the active configuration on the device. The server reports the results of the commit operation in `<rpc-reply>` and `<commit-results>` tag elements.

If the private copy does not include any changes, the server emits the `<commit-results>` and `</commit-results>` tags with nothing between them:

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
</commit-results>
</rpc-reply>
```

If the private copy includes changes and the commit operation succeeds, the server emits the `<load-success/>` tag when it merges the changes in the private copy into the candidate configuration. The subsequent `<routing-engine>` tag element encloses the `<commit-success/>` tag and the `<name>` tag element, which reports the name of the Routing Engine on which the commit operation succeeded (`re0` on devices that use a single Routing Engine, and either `re0` or `re1` on devices that can have two Routing Engines):

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <load-success/>
    <routing-engine>
      <name>(re0 | re1)</name>
    <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

If the private copy includes changes that conflict with the regular candidate configuration, the commit fails. The `<load-error-count>` tag element reports the number of errors and an `<xnm:error>` tag element encloses tag elements that describe the error.

There are restrictions on committing a private copy. For example, the commit fails if the regular candidate configuration is locked by another user or application, or if it includes uncommitted changes made since the private copy was created. For more information, see the *CLI User Guide*.

Most of the variants of the commit operation are available for a private copy. The variants are described in subsequent sections in this chapter:

- Scheduling the commit for a later time, as described in [“Committing a Configuration at a Specified Time” on page 922](#).

- Synchronizing the configuration on both Routing Engines, as described in [“Committing and Synchronizing a Configuration on Redundant Control Planes”](#) on page 926.
- Logging a commit-time message, as described in [“Logging a Message About a Commit Operation”](#) on page 932.

NOTE: The confirmed-commit operation is not available for a private copy. For information about using that operation for the regular candidate configuration, see [“Committing the Candidate Configuration Only After Confirmation”](#) on page 923.

Committing a Configuration at a Specified Time

To commit a configuration at a specified time in the future, a client application encloses the `<at-time>` tag element in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <at-time>time</at-time>
  </commit-configuration>
</rpc>
```

To indicate when to perform the commit operation, the application includes one of three types of values in the `<at-time>` tag element:

- The string **reboot**, to commit the configuration the next time the device reboots.
- A time value of the form **hh:mm[:ss]** (hours, minutes, and optionally seconds), to commit the configuration at the specified time, which must be after the time at which the application emits the `<commit-configuration>` tag element, but before 11:59:59 PM on the current day. For example, if the `<at-time>` tag element encloses the value **02:00** (2:00 AM) and the application emits the `<commit-configuration>` tag element at 2:10 AM, the commit will never take place, because the scheduled time has already passed for that day.

Use 24-hour time; for example, **04:30:00** means 4:30:00 AM and **20:00** means 8:00 PM. The time is interpreted relative to the clock and time zone settings on the device..

- A date and time value of the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and optionally seconds), to commit the configuration at the specified day and time, which must be after the `<commit-configuration>` tag element is emitted. Use 24-hour time. For example, **2006-08-21 15:30:00** means 3:30 PM on August 21, 2006. The time is interpreted relative to the clock and time zone settings on the device.

NOTE: The specified time must be more than 1 minute later than the current time on the device.

The Junos XML protocol server immediately checks the configuration for syntactic correctness and returns `<rpc-reply>`, `<commit-results>`, and `<routing-engine>` tag elements. If the syntax check succeeds, the `<routing-engine>` tag element encloses the `<commit-check-success/>` tag and the `<name>` tag element, which reports the name of the Routing Engine on which the check succeeded (`re0` on devices that use a single Routing Engine, and either `re0` or `re1` on devices that can have two Routing Engines). It also encloses an `<output>` tag element that reports the time at which the commit will occur:

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>(re0 | re1)</name>
      <commit-check-success/>
      <output>commit at will be executed at timestamp</output>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

The configuration is scheduled for commit at the specified time. The Junos XML protocol server does not emit additional tag elements when it performs the actual commit operation.

If the configuration is not syntactically correct, an `<xnm:error>` tag element encloses tag elements that describe the error. The commit operation is not scheduled.

The `<at-time>` tag element can be combined with the `<synchronize/>` tag, the `<log/>` tag element, or both. For more information, see [“Committing and Synchronizing a Configuration on Redundant Control Planes” on page 926](#) and [“Logging a Message About a Commit Operation” on page 932](#).

The following example shows how to schedule a commit operation for 10:00 PM on the current day.

Client Application Junos XML Protocol Server

```
<rpc>
  <commit-configuration>
    <at-time>22:00</at-time>
  </commit-configuration>
</rpc>

<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>re1</name>
      <commit-check-success/>
      <output>commit at will be executed at date 22:00:00 timezone</output>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

T1182

Committing the Candidate Configuration Only After Confirmation

To commit the candidate configuration but require an explicit confirmation for the commit to become permanent, a client application encloses the empty `<confirmed/>` tag in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
```

```

    <commit-configuration>
      <confirmed/>
    </commit-configuration>
  </rpc>

```

If the commit is not confirmed within a certain amount of time (600 seconds [10 minutes] by default), the Junos XML protocol server automatically retrieves and commits (rolls back to) the previously committed configuration. To specify a different number of minutes for the rollback deadline, the application encloses a positive integer value in the **<confirm-timeout>** tag element:

```

<rpc>
  <commit-configuration>
    <confirmed/>
    <confirm-timeout>rollback-delay</confirm-timeout>
  </commit-configuration>
</rpc>

```

NOTE: You cannot perform this commit operation on a private copy of the configuration.

In either case, the Junos XML protocol server confirms that it committed the candidate configuration temporarily by returning the **<ok/>** tag in the **<rpc-reply>** tag element:

```

<rpc-reply xmlns:junos="URL">
  <ok/>
</rpc-reply>

```

If the Junos XML protocol server cannot commit the candidate, the **<rpc-reply>** tag element instead encloses an **<xnm:error>** tag element explaining the reason for the failure. The most common causes are semantic or syntactic errors in the candidate configuration.

The confirmed commit operation is useful for verifying that a configuration change works correctly and does not prevent management access to the device. If the change prevents access or causes other errors, the automatic rollback to the previous configuration restores access after the rollback deadline passes.

In response to a confirmed commit operation, the Junos XML protocol server returns **<rpc-reply>**, **<commit-results>**, and **<routing-engine>** tag elements. If the commit operation succeeds, the **<routing-engine>** tag element encloses the **<commit-success/>** tag and the **<name>** tag element, which reports the name of the Routing Engine on which the commit operation succeeded (**re0** on devices that use a single Routing Engine, and either **re0** or **re1** on devices that can have two Routing Engines):

```

<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>(re0 | re1)</name>
      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>

```

If the Junos XML protocol server cannot commit the candidate, the `<rpc-reply>` tag element instead encloses an `<xnm:error>` tag element explaining the reason for the failure. The most common causes are semantic or syntactic errors in the candidate configuration.

To delay the rollback to a time later than the current rollback deadline, the application emits the `<confirmed/>` tag in a `<commit-configuration>` tag element again before the deadline passes. It can include the `<confirm-timeout>` tag element to specify how long to delay the next rollback; omit that tag element to delay the rollback by the default of 10 minutes. The client application can delay the rollback indefinitely by emitting the `<confirmed/>` tag repeatedly in this way.

To cancel the rollback completely (and commit a configuration permanently), the client application emits one of the following tag sequences before the rollback deadline passes:

- The empty `<commit-configuration/>` tag enclosed in an `<rpc>` tag element. The rollback is canceled and the candidate configuration is committed immediately, as described in [“Committing the Candidate Configuration” on page 920](#). If the candidate configuration is still the same as the temporarily committed configuration, this effectively recommits the temporarily committed configuration:

```
<rpc>
  <commit-configuration/>
</rpc>
```

- The `<synchronize/>` tag enclosed in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
  </commit-configuration>
</rpc>
```

The rollback is canceled and the candidate configuration is checked and committed immediately on both Routing Engines, as described in [“Committing and Synchronizing a Configuration on Redundant Control Planes” on page 926](#). If a confirmed commit operation has been performed on both Routing Engines, then emitting the `<synchronize/>` tag cancels the rollback on both.

- The `<at-time>` tag element enclosed in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <at-time>time</at-time>
  </commit-configuration>
</rpc>
```

The rollback is canceled and the configuration is checked immediately for syntactic correctness, then committed at the scheduled time, as described in [“Committing a Configuration at a Specified Time” on page 922](#).

The `<confirmed/>` and `<confirm-timeout>` tag elements can be combined with the `<synchronize/>` tag, the `<log/>` tag element, or both. For more information, see [“Committing and Synchronizing a Configuration on Redundant Control Planes” on page 926](#) and [“Logging a Message About a Commit Operation” on page 932](#).

If another application uses the `<kill-session/>` tag element to terminate this application's session while a confirmed commit is pending (this application has committed changes but not yet confirmed them), the Junos XML protocol server that is servicing this session restores the configuration to its state before the confirmed commit instruction was issued. For more information about session termination, see [“Terminating Another NETCONF Session” on page 586](#).

The following example shows how to commit the candidate configuration on Routing Engine 1 with a rollback deadline of 20 minutes.

Client Application

```
<rpc>
  <commit-configuration>
    <confirmed/>
    <confirm-timeout>20</confirm-timeout>
  </commit-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>re1</name>
      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

T1182

Committing and Synchronizing a Configuration on Redundant Control Planes

A Routing Engine resides within a control plane. For single-chassis configurations, there is one control plane. In redundant systems, there are two control planes, the master plane and the backup plane. In multichassis configurations, the control plane includes all Routing Engines with the same Routing Engine designation. For example, all master Routing Engines reside within the *master* control plane, and all backup Routing Engines reside within the *backup* control plane.

Committing a configuration applies a new configuration to the device Engine. In a multichassis configuration, once a change to the configuration has been committed to the system, this change is propagated throughout the control plane using the distribution function.

In a redundant architecture, you can issue the **synchronize** command to commit the new configuration to both the master and the slave control planes. When issued, this command will save the current configuration to both device Engines and commit the new configuration to both control planes. On a multichassis system, once the configuration has been committed on both planes, the distribution function will distribute the new configuration across both planes.

NOTE: In a multichassis architecture with redundant control planes, there is a difference between synchronizing the two planes and distributing the configuration throughout each plane. Synchronization only occurs between the Routing Engines within the same chassis. Once this synchronization is complete, the new configuration is distributed to all other Routing Engines within each plane as a separate distribution function.

Because synchronization happens across two separate control planes, synchronizing configurations is only valid on redundant Routing Engine architectures. Further, **re0** and **re1** configuration groups must be defined on each routing, switching, or security platform. For more information about configuration groups, see the *CLI User Guide*.

NOTE: If you issue the **synchronize** command on a nonredundant Routing Engine system, the Junos XML protocol server will commit the configuration on the one control plane.

For more information about synchronizing configurations, see the following sections:

- [Synchronizing the Configuration on Both Routing Engines on page 927](#)
- [Forcing a Synchronized Commit Operation on page 929](#)
- [Synchronizing Configurations Simultaneously with Other Operations on page 930](#)

Synchronizing the Configuration on Both Routing Engines

To synchronize a configuration on a redundant Routing Engine system, a client application needs to enclose the empty **<synchronize/>** tag in **<commit-configuration>** and **<rpc>** tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
  </commit-configuration>
</rpc>
```

The Junos XML protocol server verifies the configuration's syntactic correctness on the Routing Engine where the **<synchronize/>** tag is emitted (referred to as the local Routing Engine), copies the configuration to the remote Routing Engine and verifies its syntactic correctness there, and then commits the configuration on both Routing Engines.

The Junos XML protocol server encloses its response in **<rpc-reply>** and **<commit-results>** tag elements. It emits a separate **<routing-engine>** tag element for each operation on each Routing Engine:

- If the syntax check succeeds on a Routing Engine, the **<routing-engine>** tag element encloses the **<commit-check-success/>** tag and the **<name>** tag element, which reports the name of the Routing Engine on which the check succeeded (**re0** or **re1**):

```
<routing-engine>
  <name>(re0 | re1)</name>
```

```
<commit-check-success/>
</routing-engine>
```

If the configuration is incorrect, an `<xnm:error>` tag element encloses a description of the error.

- If the commit operation succeeds on a Routing Engine, the `<routing-engine>` tag element encloses the `<commit-success/>` tag and the `<name>` tag element, which reports the name of the Routing Engine on which the commit operation succeeded:

```
<routing-engine>
  <name>(re0 | re1)</name>
  <commit-success/>
</routing-engine>
```

If the commit operation fails, an `<xnm:error>` tag element encloses a description of the error. The most common causes of failure are semantic or syntactic errors in the configuration.

Example: Synchronizing the Configuration on Both Routing Engines

The following example shows how to commit and synchronize the candidate configuration on both Routing Engines.

Client Application

```
<rpc>
  <commit-configuration>
    <synchronize/>
  </commit-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>re0</name>
      <commit-check-success/>

      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

T1153

Forcing a Synchronized Commit Operation

The synchronize operation fails if the second Routing Engine's configuration is locked. If a synchronization failure occurs, it is best to determine the cause of the failure, take corrective action, and then synchronize the two Routing Engines again. However, when necessary, you can use the `<force-synchronize/>` command to override a locked configuration and force the synchronization.

NOTE: When you use a `force-synchronize` command, any uncommitted changes to the configuration will be lost.

To force a synchronization, enclose the empty `<synchronize/>` and `<force-synchronize/>` tags in the `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
    <force-synchronize/>
  </commit-configuration>
</rpc>
```

NOTE: In a multichassis environment, synchronization occurs between Routing Engines on the same chassis. Once the synchronization occurs, the configuration changes are propagated across each control plane using the distribution function. If one or more Routing Engines are locked during the distribution of the configuration, the distribution and thus the synchronization will fail. You will need to clear the error in the remote chassis and run the `synchronize` command again.

Example: Forcing a Synchronization

The following example shows how to force a synchronization across both Routing Engine planes:

Client Application

```
<rpc>

  <commit-configuration>
    <synchronize/>
    <force-synchronize/>

  </commit-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos=
  "http://xml.juniper.net/junos/9.010/junos">
  <commit-results>
    <routing-engine junos:style="show-name">
      <name>re0</name>
      <commit-check-success/>
    </routing-engine>
    <routing-engine junos:style="show-name">
      <name>re1</name>
      <commit-success/>
    </routing-engine>
    <routing-engine junos:style="show-name">
      <name>re0</name>
      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

Synchronizing Configurations Simultaneously with Other Operations

The **<synchronize/>** tag can be combined with the other tag elements that can occur within the **<commit-configuration>** tag element. The Junos XML protocol server checks, copies, and commits the configuration, and emits the same response tag elements as when the **<synchronize/>** tag is used by itself. The possible combinations are described in the following sections.

Verifying the Configuration on Both Routing Engines

To check the syntactic correctness of a local configuration on both Routing Engines without committing it, the application encloses the **<synchronize/>** and **<check/>** tag elements in **<commit-configuration>** and **<rpc>** tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
    <check/>
  </commit-configuration>
</rpc>
```

The **<force-synchronize/>** tag cannot be combined with the **<check/>** tag elements.

For more information about verifying configurations, see [“Verifying a Configuration Before Committing It” on page 919](#).

Scheduling Synchronization for a Specified Time

To commit a configuration on both Routing Engines at a specified time in the future, the application encloses the `<synchronize/>` and `<at-time>` tag elements in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
    <at-time>time</at-time>
  </commit-configuration>
</rpc>

<rpc>
  <commit-configuration>
    <force-synchronize/>
    <at-time>time</at-time>
  </commit-configuration>
</rpc>
```

As when the `<at-time>` tag element is emitted by itself, the Junos XML protocol server verifies syntactic correctness immediately and does not emit additional tag elements when it actually performs the commit operation on each Routing Engine. For information about how to specify the time in the `<at-time>` tag element, see [“Committing the Candidate Configuration Only After Confirmation” on page 923](#).

Synchronizing Configurations but Requiring Confirmation

To commit the candidate configuration on both Routing Engines but require confirmation for the commit to become permanent, the application encloses the `<synchronize/>`, `<confirmed/>`, and (optionally) `<confirm-timeout>` tag elements in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
    <confirmed/>
    [ <confirm-timeout>minutes</confirm-timeout> ]
  </commit-configuration>
</rpc>
```

The same rollback deadline applies to both Routing Engines and can be extended on both at once by again emitting the `<synchronize/>`, `<confirmed/>`, and (optionally) `<confirm-timeout>` tag elements on the Routing Engine where the tag elements were emitted the first time.

The `<force-synchronize/>` tag cannot be combined with the `<confirmed/>` and `<confirm-timeout>` tag elements.

For more information about confirmed commit operations, see [“Committing the Candidate Configuration Only After Confirmation” on page 923](#).

Logging a Message About Synchronized Configurations

To synchronize configurations and record a log message when the commit succeeds on each Routing Engine, the application encloses the `<synchronize/>` and `<log/>` tag elements in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <synchronize/>
    <log>message</log>
  </commit-configuration>
</rpc>
<rpc>
  <commit-configuration>
    <force-synchronize/>
    <log>message</log>
  </commit-configuration>
</rpc>
```

The commit operation proceeds as previously described in the `<synchronize/>` or `<force-synchronize/>` tag descriptions. The message for each Routing Engine is recorded in the separate `/var/log/commits` file maintained by that Routing Engine. For more information about logging, see [“Logging a Message About a Commit Operation” on page 932](#).

Logging a Message About a Commit Operation

To record a message in the `/var/log/commits` file when a commit operation succeeds, a client application encloses the `<log>` tag element in `<commit-configuration>` and `<rpc>` tag elements:

```
<rpc>
  <commit-configuration>
    <log>message</log>
  </commit-configuration>
</rpc>
```

The `<log>` tag element can be combined with other tag elements within the `<commit-configuration>` tag element (the `<at-time>`, `<confirmed/>`, and `<confirm-timeout>`, or `<synchronize/>` tag elements) and does not change the effect of the operation. When the `<log>` tag element is emitted by itself, the associated commit operation begins immediately.

The following example shows how to log a message as the candidate configuration is committed.

Client Application

```
<rpc>
  <commit-configuration>
    <log>Enable xnm-ssl service</log>
  </commit-configuration>
</rpc>
```

Junos XML Protocol Server

```
<rpc-reply xmlns:junos="URL">
  <commit-results>
    <routing-engine>
      <name>re0</name>
      <commit-success/>
    </routing-engine>
  </commit-results>
</rpc-reply>
```

T1154

The `/var/log/commits` file includes an entry for each pending commit and up to 50 previous commits. To request the contents of the file, a client application encloses the `<get-commit-information/>` tag in `<rpc>` tag elements:

```
<rpc>
  <get-commit-information/>
</rpc>
```

(The equivalent operational mode CLI command is `show system commit`.) The Junos XML protocol server encloses the information in `<commit-information>` and `<rpc-reply>` tag elements. For information about the child tag elements of the `<commit-information>` tag element, see its entry in the *Junos XML API Operational Developer Reference*.

```
<rpc-reply xmlns:junos="URL">
  <commit-information>
    <!-- tag elements representing the commit log -->
  </commit-information>
</rpc-reply>
```

The following example shows how to request the commit log.

Client Junos XML Protocol Server Application

```

<rpc>
  <get-commit-information/>
</rpc>

<rpc-reply xmlns:junos="URL">
  <commit-information>
    <commit-history>
      <sequence-number>0</sequence-number>
      <user>barbara</user>
      <client>other</client>
      <date-time junos:seconds="1058370173">2003-07-16 08:42:53 PDT</date-time>
      <log>Enable xnm-ssl service</log>
    </commit-history>
    <commit-history>
      <sequence-number>1</sequence-number>
      <user>root</user>
      <client>other</client>
      <date-time junos:seconds="1058322166">2003-07-15 19:22:46 PDT</date-time>
    </commit-history>
    <commit-history>
      <sequence-number>2</sequence-number>
      <user>root</user>
      <client>cli</client>
      <date-time junos:seconds="1058219717">2003-07-14 14:55:17 PDT</date-time>
    </commit-history>
    .
    .
    .
  </commit-information>
</rpc-reply>

```

T1183

CHAPTER 23

Summary of Junos XML Protocol Tag Elements

This chapter lists the tag elements that client applications and the Junos XML protocol server use to control the Junos XML protocol session and to exchange configuration information. The entries are in alphabetical order. For information about the notational conventions used in this chapter, see [Table 2 on page ccxciii](#).

<abort/>

Usage	<pre><rpc> <!-- child tag elements --> </rpc> <abort/></pre>
Description	Direct the Junos XML protocol server to stop processing the request that is currently outstanding. The server responds by returning the <abort-acknowledgment/> tag, but might already have sent tagged data in response to the request. The client application must discard those tag elements.
Usage Guidelines	See “Halting a Request” on page 822.
Related Documentation	<ul style="list-style-type: none">• <abort-acknowledgement/> on page 935• <rpc> on page 957

<abort-acknowledgement/>

Usage	<pre><rpc-reply xmlns:junos="URL"> <any-child-of-rpc-reply> <abort-acknowledgement/> </any-child-of-rpc-reply> </rpc-reply></pre>
Description	Indicate that the Junos XML protocol server has received the <abort/> tag and has stopped processing the current request. If the client application receives any tag elements related to the request between sending the <abort/> tag and receiving this tag, it must discard them.

Usage Guidelines See [“Halting a Request” on page 822](#).

- Related Documentation**
- [<rpc-reply> on page 958](#)
 - [<xnm:error> on page 959](#)

<authentication-response>

Usage

```
<rpc-reply xmlns:junos="URL">
  <authentication-response>
    <status>authentication-outcome</status>
    <message>message</message>
    <login-name>remote-username</login-name>
  </authentication-response>
</rpc-reply>
```

Description Indicate whether an authentication attempt succeeded. The Junos XML protocol server returns the tag element in response to the **<request-login>** tag element emitted by a client application that uses the clear-text or Secure Sockets Layer (SSL) access protocol.

Contents **<login-name>**—Specifies the username that the client application provided to an authentication utility such as RADIUS or TACACS+. This tag element appears only if the username that it contains differs from the username contained in the **<message>** tag element.

<message>—Names the account under which a connection to the Junos XML protocol server is established, if authentication succeeds. If authentication fails, explains the reason for the failure.

<status>—Indicates whether the authentication attempt succeeded. There are two possible values:

- **fail**—The attempt failed. The Junos XML protocol server also emits the **<challenge>** tag element to request the password again, up to a maximum of three attempts.
- **success**—The attempt succeeded. An authenticated connection to the Junos XML protocol server is established.

Usage Guidelines See [“Interpreting the Authentication Response” on page 815](#).

- Related Documentation**
- [<challenge> on page 936](#)
 - [<request-login> on page 956](#)
 - [<rpc-reply> on page 958](#)

<challenge>

Usage

```
<rpc-reply xmlns:junos="URL">
  <challenge echo="no">Password:</challenge>
```

</rpc-reply>

Description	Request the password associated with an account during authentication with a client application that uses the clear-text or SSL access protocol. The Junos XML protocol server emits this tag element when the initial <request-login> tag element emitted by the client application does not enclose a <challenge-response> tag element, and when the password enclosed in a <challenge-response> tag element is incorrect (in the latter case, the server also emits an <authentication-response> tag element enclosing child tag elements that indicate the password is incorrect).
	The tag element encloses the string Password: which the client application can forward to the screen as a prompt for a user.
Attributes	echo —Specifies whether the password string typed by the user appears on the screen. The value no specifies that it does not.
Usage Guidelines	See “Submitting an Authentication Request” on page 814.
Related Documentation	<ul style="list-style-type: none"> • <authentication-response> on page 936 • <request-login> on page 956 • <rpc-reply> on page 958

<checksum-information>

Usage	<pre> <rpc-reply> <checksum-information> <file-checksum> <computation-method>MD5</computation-method> <input-file> <!-- name and path of file--> </input-file> </file-checksum> </checksum-information> </rpc-reply> </pre>
Description	Enclose tag elements that include the file to check, the checksum algorithm used, and the checksum output.
Contents	<p><file-checksum>—Wrapper that holds the resulting <input-file>, <computation-method>, and <checksum> attributes for a particular checksum computation.</p> <p><input-file>—Name and path of the file that the checksum algorithm was run against.</p> <p><computation-method>—Checksum algorithm used. Currently, all checksum computations use the MD5 algorithm; thus, the only possible value is MD5.</p> <p><checksum>—Resulting value from the checksum computation.</p>

Usage Guidelines See the *Junos XML API Operational Developer Reference*.

Related Documentation

- [<get-checksum-information> on page 945](#)

<close-configuration/>

Usage

```
<rpc>
  <close-configuration/>
</rpc>
```

Description Discard a candidate configuration and any changes to it.

This tag element is normally used only to discard a private copy of the candidate configuration without committing it. The application must have previously emitted the `<open-configuration>` tag element. Closing the Junos XML protocol session (by emitting the `<request-end-session/>` tag, for example) has the same effect as emitting this tag element.

Usage Guidelines See “Creating a Private Copy of the Configuration” on page 826.

Related Documentation

- [<open-configuration> on page 954](#)
- [<request-end-session/> on page 956](#)
- [<rpc> on page 957](#)

<commit-configuration>

Usage

```
<rpc>
  <commit-configuration/>

  <commit-configuration>
    <check/>
  </commit-configuration>

  <commit-configuration>
    <log>log-message</log>
  </commit-configuration>

  <commit-configuration>
    <at-time>time-specification</at-time>
    <log>log-message</log>
  </commit-configuration>

  <commit-configuration>
    <confirmed/>
    <confirm-timeout>rollback-delay</confirm-timeout>
    <log>log-message</log>
  </commit-configuration>
```

```

<commit-configuration>
  <synchronize/>
  <log>log-message</log>
</commit-configuration>

<commit-configuration>
  <synchronize/>
  <at-time>time-specification</at-time>
  <log>log-message</log>
</commit-configuration>

<commit-configuration>
  <synchronize/>
  <check/>
  <log>log-message</log>
</commit-configuration>

<commit-configuration>
  <synchronize/>
  <confirmed/>
  <confirm-timeout>rollback-delay</confirm-timeout>
  <log>log-message</log>
</commit-configuration>

<commit-configuration>
  <synchronize/>
  <force-synchronize/>
</commit-configuration>
</rpc>

```

Description Request that the Junos XML protocol server perform one of the variants of the commit operation on either the regular candidate configuration or a private copy of the candidate configuration (if the application emitted the `<open-configuration><private/></open-configuration>` tag sequence before making changes).

Some restrictions apply to the commit operation for a private copy. For example, the commit operation fails if the regular candidate configuration is locked by another user or application, or if it includes uncommitted changes made since the private copy was created. For more information, see the *CLI User Guide*.

Enclose the appropriate tag in the `<commit-configuration>` tag element to specify the type of commit operation:

- To commit the configuration immediately, making it the active configuration on the device, emit the empty `<commit-configuration/>` tag.
- To verify the syntactic correctness of the configuration without actually committing it, enclose the `<check/>` tag in the `<commit-configuration>` tag element.
- To record a message in the `/var/log/commits` file when the associated commit operation succeeds, define the log message string in the `<log>` tag element and enclose the tag element in the `<commit-configuration>` tag element. The `<log>` tag element can be

combined with any other tag element. When the `<log>` tag element is emitted alone, the associated commit operation begins immediately.

- To commit the candidate configuration but roll back to the previous configuration after a short time, enclose the `<confirmed/>` tag in the `<commit-configuration>` tag element.

By default, the rollback occurs after 10 minutes; to set a different rollback delay, also emit the optional `<confirm-timeout>` tag element. To delay the rollback again (past the original rollback deadline), emit the `<confirmed/>` tag (enclosed in the `<commit-configuration>` tag element) before the deadline passes. Include the `<confirm-timeout>` tag element to specify how long to delay the next rollback, or omit that tag element to use the default of 10 minutes. The rollback can be delayed repeatedly in this way.

To commit the configuration immediately and permanently after emitting the `<confirmed/>` tag, emit the empty `<commit-configuration/>` tag before the rollback deadline passes. The Junos XML protocol server commits the candidate configuration and cancels the rollback. If the candidate configuration is still the same as the current committed configuration, the effect is the same as recommitting the current committed configuration.

NOTE: The confirmed commit operation is not available for a private copy of the configuration.

- On a device with two Routing Engines, commit the candidate configuration stored on the local Routing Engine on both Routing Engines. Combine tag elements as indicated in the following:
 - To copy the candidate configuration stored on the local Routing Engine to the other Routing Engine, verify the candidate's syntactic correctness, and commit it immediately on both Routing Engines, enclose the `<synchronize/>` tag in the `<commit-configuration>` tag element.
 - To copy the candidate configuration stored on the local Routing Engine to the other Routing Engine, verify the candidate's syntactic correctness, and commit it on both Routing Engines at a defined future time, enclose the `<synchronize/>` or `<force-synchronize/>` tag and `<at-time>` tag element in the `<commit-configuration>` tag element. Set the value in the `<at-time>` tag element as previously described for use of the `<at-time>` tag element alone.
 - To copy the candidate configuration stored on the local Routing Engine to the other Routing Engine and verify the candidate's syntactic correctness on each Routing Engine, enclose the `<synchronize/>` or `<force-synchronize/>` and `<check/>` tag elements in the `<commit-configuration>` tag element.
 - To copy the candidate configuration stored on the local Routing Engine to the other Routing Engine, verify the candidate's syntactic correctness, and commit it on both Routing Engines but require confirmation, enclose the `<synchronize/>` tag and `<confirmed/>` tag elements, and optionally the `<confirm-timeout>` tag element, in the `<commit-configuration>` tag element. Set the value in the `<confirm-timeout>`

tag element as previously described for use of the `<confirmed/>` tag and `<confirm-timeout>` tag element alone.

- To force the same synchronized commit operation as invoked by the `<synchronize/>` tag to succeed, even if there are open configuration sessions or uncommitted configuration changes on the remote machine, enclose the `<force-synchronize/>` tag in the `<commit-configuration>` tag element.
- To schedule the configuration for commit at a future time, enclose the `<at-time>` tag element in the `<commit-configuration>` tag element. There are three valid types of time specifiers:
 - The string **reboot**, to commit the configuration the next time the device reboots.
 - A time value of the form **hh:mm[:ss]** (hours, minutes, and, optionally, seconds), to commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the `<commit-configuration>` tag element is emitted. Use 24-hour time for the **hh** value; for example, **04:30:00** means 4:30:00 AM and **20:00** means 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the device.
 - A date and time value of the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and, optionally, seconds), to commit the configuration at the specified date and time, which must be after the `<commit-configuration>` tag element is emitted. Use 24-hour time for the **hh** value. For example, **2005-08-21 15:30:00** means 3:30 PM on August 21, 2005. The time is interpreted with respect to the clock and time zone settings on the device.

NOTE: The time you specify must be more than 1 minute later than the current time on the device.

The configuration is checked immediately for syntactic correctness. If the check succeeds, the configuration is scheduled for commit at the specified time. If the check fails, the commit operation is not scheduled.

Contents `<at-time>`—Schedules the commit operation for a specified future time.

`<check>`—Requests verification that the configuration is syntactically correct, but does not actually commit it.

`<confirmed>`—Requests a commit of the candidate configuration and a rollback to the previous configuration after a short time, 10 minutes by default. Use the `<confirm-timeout>` tag element to specify a different amount of time.

`<confirm-timeout>`—Specifies the number of minutes for which the configuration remains active when the `<confirmed/>` tag is enclosed in the `<commit-configuration>` tag element.

`<log>`—Records a message in the file `/var/log/commits` when the commit operation succeeds.

<synchronize>—On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

<force-synchronize>—On dual control plane systems, forces the candidate configuration on one control plane to be copied to the other control plane.

Usage Guidelines See [“Committing a Configuration” on page 919](#).

Related Documentation

- [<commit-results> on page 942](#)
- [<open-configuration> on page 954](#)
- [<rpc> on page 957](#)

<commit-results>

Usage

```
<rpc-reply xmlns:junos="URL">
  <!-- for the candidate configuration -->
  <commit-results>
    <routing-engine>...</routing-engine>
  </commit-results>

  <!-- for a private copy -->
  <commit-results>
    <load-success/>
    <routing-engine>...</routing-engine>
  </commit-results>

  <!-- for a private copy that does not include changes -->
  <commit-results>
  </commit-results>
</rpc-reply>
```

Description Enclose tag elements that contain information about a commit operation performed by the Junos XML protocol server on a particular Routing Engine.

Contents **<load-success/>**—Indicates that the Junos XML protocol server successfully merged changes from the private copy into a copy of the candidate configuration, before committing the combined candidate on the specified Routing Engine.

The **<routing-engine>** tag element is described separately.

Usage Guidelines See [“Committing a Configuration” on page 919](#).

<database-status>

Usage	<pre> <junoscript> <any-child-of-junoscript> <xnm:error> <database-status-information> <database-status> <user>username</user> <terminal>terminal</terminal> <pid>pid</pid> <start-time>start-time</start-time> <idle-time>idle-time</idle-time> <commit-at>time</commit-at> <exclusive/> <edit-path>edit-path</edit-path> </database-status> </database-status-information> </xnm:error> </any-child-of-junoscript> </junoscript> </pre>
Description	Describe a user or Junos XML protocol client application that is logged in to the configuration database. For simplicity, the Contents section uses the term user to refer to both human users and client applications, except where the information differs for the two.
Contents	<p><commit-at/>—Indicates that the user has scheduled a commit operation for a later time.</p> <p><edit-path>—Specifies the user's current location in the configuration hierarchy, in the form of the CLI configuration mode banner.</p> <p><exclusive/>—Indicates that the user or application has an exclusive lock on the configuration database. A user enters exclusive configuration mode by issuing the configure exclusive command in CLI operational mode. A client application obtains the lock by emitting the <lock-configuration/> tag element.</p> <p><idle-time>—Specifies how much time has passed since the user last performed an operation in the database.</p> <p><pid>—Specifies the process ID of the Junos management process (mgd) that is handling the user's login session.</p> <p><start-time>—Specifies the time when the user logged in to the configuration database, in the format YYYY-MM-DD hh:mm:ss TZ (year, month, date, hour in 24-hour format, minute, second, time zone).</p> <p><terminal>—Identifies the UNIX terminal assigned to the user's connection.</p> <p><user>—Specifies the Junos OS login ID of the user whose login to the configuration database caused the error.</p>
Usage Guidelines	See “Handling an Error or Warning” on page 821 .

<get-checksum-information>

Usage	<pre> <rpc> <get-checksum-information> <path> <!-- name and path of file --> </path> </get-checksum-information> </rpc> </pre>
Description	Enclose all tag elements in a request generated by a client application.
Contents	<path> —The name and path of the file to check.
Usage Guidelines	See the <i>Junos XML API Operational Developer Reference</i> .
Related Documentation	<ul style="list-style-type: none"> • <checksum-information> on page 937

<get-configuration>

Usage	<pre> <rpc> <get-configuration [changed="changed"] [commit-scripts="view"] [compare="rollback" [rollback="[0-49]"]] [database="(candidate committed)"] [format="(text xml)"] [inherit="(defaults inherit)" [groups="groups" [interface-ranges="interface-ranges"]]/> <!-- tag elements for the configuration element to display --> </get-configuration> </rpc> </pre>
Description	<p>Request configuration data from the Junos XML protocol server. The attributes specify the source and formatting of the data to display. Either the entire configuration hierarchy or a section can be displayed:</p> <ul style="list-style-type: none"> • To display the entire configuration hierarchy, emit the empty <get-configuration/> tag. • To display a configuration element (hierarchy level or configuration object), emit tag elements within the <get-configuration> tag element to represent all levels of the configuration hierarchy from the root (represented by the <configuration> tag element) down to the level or object to display. To represent a hierarchy level or a configuration object that does not have an identifier, emit it as an empty tag. To represent an object that has one or more identifiers, emit its container tag element and identifier tag elements only, not any tag elements that represent other characteristics.

Attributes **changed**—Specifies that the **junos:changed="changed"**; attribute should appear in the opening tag of each changed configuration element.

The attribute appears in the opening tag of every parent tag element in the path to the changed configuration element, including the top-level opening **<configuration>** tag. If the changed configuration element is represented by a single (empty) tag, the **junos:changed="changed"** attribute appears in the tag. If the changed element is represented by a container tag element, the **junos:changed="changed"** attribute appears in the opening container tag and also in each child tag element enclosed in the container tag element.

The **database** attribute can be combined with the **changed="changed"** attribute to request either the candidate or active configuration:

- When the candidate configuration is requested (the **database="changed"** attribute is included or the **database** attribute is omitted completely), elements added to the candidate configuration after the last commit operation are marked with the **junos:changed="changed"** attribute.
- When the active configuration is requested (the **database="candidate"** attribute is included), elements added to the active configuration by the most recent commit are marked with the **junos:changed="changed"** attribute.

NOTE: When a commit operation succeeds, the Junos XML protocol server removes the **junos:changed="changed"** attribute from all tag elements. However, if warnings are generated during the commit, the attribute is not removed. In this case, the **junos:changed="changed"** attribute appears in tag elements that changed before the commit operation as well as on those that changed after it.

An example of a commit-time warning is the message explaining that a configuration element will not actually apply until the device is rebooted. The warning appears in the tag string that the Junos XML protocol server returns to confirm the success of the commit, enclosed in an **<xnm:warning>** tag element.

To remove the **junos:changed="changed"** attribute from elements that changed before the commit, take the action necessary to eliminate the cause of the warning, and commit the configuration again.

commit-scripts—Requests that the Junos XML protocol server display commit-script-style XML data, which displays the configuration in the XML format that is input to a commit script. The only acceptable value for the **commit-scripts** attribute is **view**. The output is equivalent to the CLI output when using the **| display commit-scripts view** option.

compare—Requests that the Junos XML protocol server display the differences between the active or candidate configuration and a previously committed configuration. The only acceptable value for the **compare** attribute is **rollback**. The compare attribute is combined with the **rollback="rollback-number"** to specify which previously committed configuration

should be used in the comparison. If the **rollback** attribute is omitted, the comparison uses rollback number 0, which is the active configuration.

The **database** attribute can be combined with the **compare="rollback"** attribute to request either the candidate or active configuration. If the **database** attribute is omitted, the candidate configuration is used. When the **compare** attribute is used, the default format for the output is text. If the client application attempts to include the **format="xml"** attribute when the **compare="rollback"** attribute is present, the protocol server will return an **<xnm:error>** element indicating an error.

database—Specifies the version of the configuration from which to display data. There are two acceptable values:

- **candidate**—The candidate configuration
- **committed**—The active configuration (the one most recently committed)

format—Specifies the format in which the Junos XML protocol server returns the configuration data. There are two acceptable values:

- **text**—Configuration statements are formatted as ASCII text, using the newline character, tabs and other white space, braces, and square brackets to indicate the hierarchical relationships between the statements. This is the format used in configuration files stored on a device running Junos OS and displayed by the CLI **show configuration** command.
- **xml**—Configuration statements are represented by the corresponding Junos XML tag elements. This is the default value if the **format** attribute is omitted.

groups—Specifies that the **junos:group="group-name"** attribute appears in the opening tag for each configuration element that is inherited from a configuration group. The **group-name** variable specifies the name of the configuration group.

The **groups** attribute must be combined with the **inherit** attribute, and the one acceptable value for it is **groups**.

inherit—Specifies how the Junos XML protocol server displays statements that are defined in configuration groups and interface ranges. If the **inherit** attribute is omitted, the output uses the **<groups>**, **<apply-groups>**, and **<apply-groups-except>** tag elements to represent user-defined configuration groups and uses the **<interface-range>** tag element to represent user-defined interface ranges; it does not include tag elements for statements defined in the **junos-defaults** group.

There are two acceptable values:

- **defaults**—The output does not include the `<groups>`, `<apply-groups>`, and `<apply-groups-except>` tag elements, but instead displays tag elements that are inherited from user-defined groups and from the `junos-defaults` group as children of the inheriting tag elements.
- **inherit**—The output does not include the `<groups>`, `<apply-groups>`, `<apply-groups-except>`, and `<interface-range>` tag elements, but instead displays tag elements that are inherited from user-defined groups and ranges as children of the inheriting tag elements. The output does not include tag elements for statements defined in the `junos-defaults` group.

interface-ranges—Specifies that the `junos:interface-ranges="source-interface-range"` attribute appears in the opening tag for each configuration element that is inherited from an interface-range. The `source-interface-range` variable specifies the name of the interface-range.

The **interface-ranges** attribute must be combined with the **inherit** attribute, and the one acceptable value for it is **interface-ranges**.

Usage Guidelines See [“Requesting Configuration Information” on page 838](#).

<junoscript>

Usage

```
<!-- emitted by a client application -->
<junoscript version="version" [hostname="hostname"] [junos:key="key"]
    [release="release"]>
    <!-- all tag elements generated by the application during the session -->
</junoscript>

<!-- emitted by the Junos XML protocol server -->
<junoscript xmlns="namespace-URL" xmlns:junos="namespace-URL"
    schemaLocation="namespace-URL" os="os" release="release"
    hostname="hostname" version="version">
    <!-- all tag elements generated by the Junos XML protocol server during the session -->
->
</junoscript>
```

Description	Enclose all tag elements in a Junos XML protocol session (act as the root tag element for the session). The client application and Junos XML protocol server each emit this tag element, enclosing all other tag elements that they emit during a session inside it.
Attributes	<p>hostname—Names the machine on which the tag element's originator is running.</p> <p>junos:key—Requests that the Junos XML protocol server include the junos:key="key" attribute in the opening tag of each tag element that serves as an identifier for a configuration object.</p> <p>os—Specifies the operating system of the machine named by the hostname attribute.</p> <p>release—Identifies the Junos OS Release being run by the tag element's originator. Software modules always set this attribute, but client applications are not required to set it.</p> <p>schemaLocation—Specifies the XML namespace for the XML Schema-language representation of the Junos configuration hierarchy.</p> <p>version—(Required for a client application) Specifies the version of the Junos XML management protocol used for the enclosed set of tag elements.</p> <p>xmlns—Names the XML namespace for the tag elements enclosed by the <junoscript> tag element that do not have a prefix on their names (that is, the default namespace for Junos XML tag elements). The value is a URL of the form http://xml.juniper.net/xnm/version-code/xnm, where version-code is a string such as 1.1.</p> <p>xmlns:junos—Names the XML namespace for the tag elements enclosed by the <junoscript> tag element that have the junos: prefix. The value is a URL of the form http://xml.juniper.net/junos/release-code/junos, where release-code is the standard string that represents a release of the Junos OS, such as 12.1R1 for the initial version of Junos OS Release 12.1.</p>
Usage Guidelines	See “Emitting the Opening <junoscript> Tag” on page 810 , “Parsing the Junos XML Protocol Server's Opening <junoscript> Tag” on page 812 , and “Requesting an Indicator for Identifiers” on page 844 .

<kill-session>

Usage

```
<rpc>
  <kill-session>
    <session-id>PID</session-id>
  </kill-session>
</rpc>
```

Description	<p>Request that the Junos XML protocol server terminate another CLI or Junos XML protocol session. The usual reason to emit this tag is that the user or application for the other session holds a lock on the candidate configuration, preventing the client application from locking the configuration itself.</p> <p>The client application must have the Junos maintenance permission to perform this operation.</p>
Contents	<p><session-id>—The PID of the entity conducting the session to terminate. The PID is reported in the <xnm:error> tag element that the Junos XML protocol server generates when it cannot lock a configuration as requested.</p>
Usage Guidelines	<p>“Terminating Another NETCONF Session” on page 586</p>
Related Documentation	<ul style="list-style-type: none">• <lock-configuration/> on page 954• <xnm:error> on page 959

<load-configuration>

Usage	<pre><rpc> <load-configuration rescue="rescue"/> <load-configuration rollback="index"/> <load-configuration url="url" [action="(merge override replace update)] \ [format="(text xml)"/> <load-configuration url="url" action="set" format="text"/> <load-configuration [action="(merge override replace update)] [format="xml"]> <configuration> <!-- tag elements for configuration elements to load --> </configuration> </load-configuration> <load-configuration [action="(merge override replace update)] format="text"> <configuration-text> <!-- formatted ASCII configuration statements to load --> </configuration-text> </load-configuration> <load-configuration action="set" format="text"> <configuration-set> <!-- configuration mode commands to load --> </configuration-set> </load-configuration> </rpc></pre>
-------	--

Description Request that the Junos XML protocol server load configuration data into the candidate configuration. Provide the data to load in one of the following ways:

- Set the empty `<load-configuration/>` tag's **rescue** attribute to the value **rescue**. The rescue configuration completely replaces the candidate configuration.
- Set the empty `<load-configuration/>` tag's **rollback** attribute to the numerical index of a previous configuration. The routing platform stores a copy of the most recently committed configuration and up to 49 previous configurations. The specified previous configuration completely replaces the candidate configuration.
- Set the empty `<load-configuration/>` tag's **url** attribute to the pathname of a file that contains the configuration data to load. If providing the configuration data as formatted ASCII text, set the **format** attribute to **text**. If providing the configuration data as Junos XML tag elements, either omit the **format** attribute or set the value to **xml**. If providing the configuration data as a set of configuration mode commands, set the **action** attribute to **set**, and either omit the **format** attribute or set the value to **text**.

In the following example, the **url** attribute identifies `/tmp/add.conf` as the file to load.

```
<load-configuration url="/tmp/add.conf"/>
```

- Enclose the configuration data within an opening `<load-configuration>` and closing `</load-configuration>` tag. If providing the configuration data as formatted ASCII text, enclose it in a `<configuration-text>` tag element, and set the **format** attribute to **text**. If providing the configuration data as Junos XML tag elements, enclose it in a `<configuration>` tag element, and either omit the **format** attribute or set the value to **xml**. If providing the configuration data as a set of configuration mode commands, enclose it in a `<configuration-set>` tag element, set the **action** attribute to **set**, and either omit the **format** attribute or set the value to **text**.

Attributes **action**—Specifies how to load the configuration data, particularly when the candidate configuration and loaded configuration contain conflicting statements. The following are acceptable values:

- **merge**—Combines the data in the loaded configuration with the candidate configuration. If statements in the loaded configuration conflict with statements in the candidate configuration, the loaded statements replace the candidate ones. This is the default behavior if the **action** attribute is omitted.
- **override**—Discards the entire candidate configuration and replaces it with the loaded configuration. When the configuration is later committed, all system processes parse the new configuration.
- **replace**—Substitutes each hierarchy level or configuration object defined in the loaded configuration for the corresponding level or object in the candidate configuration.

If providing the configuration data as formatted ASCII text (either in the file named by the **url** attribute or enclosed in a **<configuration-text>** tag element), also place the **replace:** statement on the line directly preceding the statements that represent the hierarchy level or object to replace. For more information, see the discussion of loading a file of configuration data in the *CLI User Guide*.

If providing the configuration data as Junos XML tag elements, also set the **replace** attribute to the value **replace** on the opening tag of the container tag element that represents the hierarchy level or object to replace.

- **set**—Loads a set of Junos OS configuration mode commands. This option executes the configuration instructions line by line as they are stored in a file named by the **url** attribute or enclosed in a **<configuration-set>** tag element. The instructions can contain any configuration mode command, such as **set**, **delete**, **edit**, or **deactivate**. When providing the configuration data as a set of commands, the only acceptable value for the **format** attribute is **text**. If the **action** attribute value is **set**, and the **format** attribute is omitted, the format automatically defaults to **text** rather than **xml**. This option was added in Junos OS Release 11.4.
- **update**—Compares the loaded configuration and candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration.

format—Specifies the format used for the configuration data. There are two acceptable values:

- **text**—Indicates that configuration data is formatted as ASCII text or as a set of configuration mode commands.

ASCII text format uses the newline character, tabs and other white space, braces, and square brackets to indicate the hierarchical relationships between the statements. This is the format used in configuration files stored on the routing platform and is displayed by the CLI **show configuration** command. Set command format consists of a series of Junos OS configuration mode commands and is displayed by the CLI

show configuration | display set command. To import a set of configuration mode commands, you must set the **action** attribute to **set**.

- **xml**—Indicates that configuration statements are represented by the corresponding Junos XML tag elements. If the **format** attribute is omitted, **xml** is the default format for all values of the **action** attribute except **set**, which defaults to format **text**.

rescue—Specifies that the rescue configuration replace the current candidate configuration. The only valid value is **rescue**.

rollback—Specifies the numerical index of the previous configuration to load. Valid values are **0** (zero, for the most recently committed configuration) through one less than the number of stored previous configurations (maximum is **49**).

url—Specifies the full pathname of the file that contains the configuration data to load. The value can be a local file path, an FTP location, or a Hypertext Transfer Protocol (HTTP) URL:

- A local filename can have one of the following forms:
 - **/path/filename**—File on a mounted file system, either on the local flash disk or on hard disk.
 - **a:filename** or **a:path/filename**—File on the local drive. The default path is **/** (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- A filename on an FTP server has the following form:

```
ftp://username:password@hostname/path/filename
```
- A filename on an HTTP server has the following form:

```
http://username:password@hostname/path/filename
```

In each case, the default value for the **path** variable is the home directory for the username. To specify an absolute path, the application starts the path with the characters **%2F**; for example, **ftp://username:password@hostname/%2Fpath/filename**.

Usage Guidelines See “[Changing Configuration Information](#)” on page 623.

[<load-configuration-results>](#)

Usage

```
<rpc-reply xmlns:junos="URL">
  <load-configuration-results>
    <load-success/>
```

```
<load-error-count>errors</load-error-count>
</load-configuration-results>
</rpc-reply>
```

Description	Enclose one of the two following tag elements, which indicate the status of a configuration loading operation performed by the Junos XML protocol server.
Contents	<p><load-error-count>—Specifies the number of errors that occurred when the Junos XML protocol server attempted to load new data into the candidate configuration. The candidate configuration must be restored to a valid state before it is committed.</p> <p><load-success/>—Indicates that the Junos XML protocol server successfully loaded new data into the candidate configuration.</p>
Usage Guidelines	See “ Changing Configuration Information ” on page 623.
Related Documentation	<ul style="list-style-type: none">• <load-configuration> on page 950• <rpc-reply> on page 958

<lock-configuration/>

Usage	<pre><rpc> <lock-configuration/> </rpc></pre>
Description	<p>Request that the Junos XML protocol server open and lock the candidate configuration, enabling the client application both to read and change it, but preventing any other users or applications from changing it. The application must emit the <unlock-configuration/> tag to unlock the configuration.</p> <p>If the Junos XML protocol session ends or the application emits the <unlock-configuration/> tag before the candidate configuration is committed, all changes made to the candidate are discarded.</p>
Usage Guidelines	See “ Locking the Candidate Configuration ” on page 824.
Related Documentation	<ul style="list-style-type: none">• <rpc> on page 957• <unlock-configuration/> on page 959

<open-configuration>

Usage	<pre><rpc> <open-configuration> <private/> </open-configuration> </rpc></pre>
--------------	---

Description Create a private copy of the candidate configuration.

The client application can perform the same operations on the private copy as on the regular candidate configuration, including the commit operation. There are, however, restrictions on the commit operation. For details, see “[<commit-configuration>](#)” on [page 938](#).

To discard the private copy without committing it, emit the empty `<close-configuration/>` tag. Changes to the private copy are also lost if the Junos XML protocol session ends for any reason before the changes are committed. It is not possible to save changes to a private copy other than by emitting the `<commit-configuration/>` tag.

Usage Guidelines See “[Creating a Private Copy of the Configuration](#)” on [page 826](#).

 - [<rpc>](#) on [page 957](#)

[<reason>](#)

Usage

```
<xnm:error | xnm:warning>
  <reason>
    <daemon>process</daemon>
    <process-not-configured/>
    <process-disabled/>
    <process-not-running/>
  </reason>
</xnm:error | xnm:warning>
```

Description Explain why a process could not service a request.

Contents `<daemon>`—Identifies the process.

`<process-disabled>`—Indicates that the process has been explicitly disabled by an administrator.

`<process-not-configured>`—Indicates that the process has been disabled because it is not configured.

`<process-not-running>`—Indicates that the process is not running.

Usage Guidelines See “[Handling an Error or Warning](#)” on [page 821](#).

- Related Documentation**
- [<xnm:error>](#) on [page 959](#)
 - [<xnm:warning>](#) on [page 961](#)

<request-end-session/>

Usage	<pre><rpc> <request-end-session/> </rpc></pre>
Description	Request that the Junos XML protocol server end the current session.
Usage Guidelines	See “ Ending a Junos XML Protocol Session and Closing the Connection ” on page 827.
Related Documentation	<ul style="list-style-type: none">• <end-session/> on page 944• <rpc> on page 957

<request-login>

Usage	<pre><rpc> <request-login> <username>account</username> <challenge-response>password</challenge-response> </request-login> </rpc></pre>
Description	<p>Request authentication by the Junos XML protocol server when using the clear-text or SSL access protocol.</p> <p>Emitting both the <username> and <challenge-response> tag elements is appropriate if the client application automates access to device information and does not interact with users, or obtains the password from a user before beginning the authentication process.</p> <p>Emitting only the <username> tag element is appropriate if the application does not obtain the password until the authentication process has already begun. In this case, the Junos XML protocol server returns the <challenge> tag element to request the password associated with the account.</p>
Contents	<p><challenge-response>—Specifies the password for the account named in the <username> tag element. Omit this tag element to have the Junos XML protocol server emit the <challenge> tag element to request the password.</p> <p><username>—Names the account under which to authenticate with the Junos XML protocol server. The account must already be configured on the device where the Junos XML protocol server is running.</p>
Usage Guidelines	See “ Submitting an Authentication Request ” on page 814.
Related Documentation	<ul style="list-style-type: none">• <challenge> on page 936• <rpc> on page 957

<routing-engine>

Usage	<pre> <rpc-reply xmlns:junos="URL"> <commit-results> <!-- when the candidate configuration is committed --> <routing-engine> <name>reX</name> <commit-success/> </routing-engine> <!-- when the candidate configuration is syntactically valid --> <routing-engine> <name>reX</name> <commit-check-success/> </routing-engine> </commit-results> </rpc-reply> </pre>
Description	Enclose tag elements indicating that the Junos XML protocol server successfully fulfilled a commit request.
Contents	<p><commit-check-success>—Indicates that the candidate configuration is syntactically correct.</p> <p><commit-success>—Indicates that the Junos XML protocol server successfully committed the candidate configuration.</p> <p><name>—Name of the Routing Engine on which the commit operation was performed. Possible values are re0 and re1.</p>
Usage Guidelines	See “Committing a Configuration” on page 919 .
Related Documentation	<ul style="list-style-type: none"> • <commit-results> on page 942 • <rpc-reply> on page 958

<rpc>

Usage	<pre> <junoscript> <rpc [attributes]> <!-- tag elements in a request from a client application --> </rpc> </junoscript> </pre>
Description	Enclose all tag elements in a request generated by a client application.
Attributes	(Optional) One or more attributes of the form attribute-name="value" . This feature can be used to associate requests and responses if the value assigned to an attribute by the

client application is unique in each opening `<rpc>` tag. The Junos XML protocol server echoes the attribute unchanged in its opening `<rpc-reply>` tag, making it simple to map the response to the initiating request.

NOTE: The `xmlns:junos` attribute name is reserved. The Junos XML protocol server sets the attribute to an appropriate value on the opening `<rpc-reply>` tag, so client applications must not emit it on the opening `<rpc>` tag.

Usage Guidelines See [“Sending a Request to the Junos XML Protocol Server” on page 816](#).

Related Documentation

- [<junoscript> on page 948](#)
- [<rpc-reply> on page 958](#)

`<rpc-reply>`

Usage

```
<junoscript>
<rpc-reply xmlns:junos="namespace-URL">
  <!-- tag elements in a reply from the Junos XML protocol server -->
</rpc-reply>
</junoscript>
```

Description Enclose all tag elements in a reply from the Junos XML protocol server. The immediate child tag element is usually one of the following:

- The tag element used to enclose data generated by the Junos XML protocol server or a Junos OS module in response to a client application's request.
- The `<output>` tag element, if the Junos XML API does not define a specific tag element for requested information.

Attributes `xmlns:junos`—Names the XML namespace for the Junos XML tag elements enclosed by the `<rpc-reply>` tag element that have the `junos:` prefix. The value is a URL of the form `http://xml.juniper.net/junos/release-code/junos`, where *release-code* is the standard string that represents a release of the Junos OS, such as `12.1R1` for the initial version of Junos OS Release 12.1.

Usage Guidelines See [“Parsing the Junos XML Protocol Server Response” on page 819](#).

--------------	--

```
</xnm:error>
</any-child-of-junoscript>
</junoscript>
```

- Description** Indicate that the Junos XML protocol server has experienced an error while processing the client application's request. If the server has already emitted the response tag element for the current request, the information enclosed in the response tag element might be incomplete. The client application must include code that discards or retains the information, as appropriate. The child tag elements described in the Contents section detail the nature of the error. The Junos XML protocol server does not necessarily emit all child tag elements; it omits tag elements that are not relevant to the current request.
- Attributes** **xmlns**—Names the XML namespace for the contents of the tag element. The value is a URL of the form `http://xml.juniper.net/xnm/version/xnm`, where *version* is a string such as 1.1.
- xmlns:xnm**—Names the XML namespace for child tag elements that have the **xnm:** prefix on their names. The value is a URL of the form `http://xml.juniper.net/xnm/version/xnm`, where *version* is a string such as 1.1.
- Contents** **<column>**—(Occurs only during loading of a configuration file) Identifies the element that caused the error by specifying its position as the number of characters after the first character in the specified line in the configuration file that was being loaded. The line and file are specified by the accompanying **<line-number>** and **<filename>** tag elements.
- <edit-path>**—(Occurs only during loading of configuration data) Specifies the path to the configuration hierarchy level at which the error occurred, in the form of the CLI configuration mode banner.
- <filename>**—(Occurs only during loading of a configuration file) Names the configuration file that was being loaded.
- <line-number>**—(Occurs only during loading of a configuration file) Specifies the line number where the error occurred in the configuration file that was being loaded, which is named by the accompanying **<filename>** tag element.
- <message>**—Describes the error in a natural-language text string.
- <parse/>**—Indicates that there was a syntactic error in the request submitted by the client application.
- <re-name>**—Names the Routing Engine on which the error occurred.
- <source-daemon>**—Names the Junos OS module that was processing the request in which the error occurred.
- <statement>**—(Occurs only during loading of configuration data) Identifies the configuration statement that was being processed when the error occurred. The accompanying **<edit-path>** tag element specifies the statement's parent hierarchy level.
- <token>**—Names which element in the request caused the error.

The other tag elements are explained separately.

Usage Guidelines See “Handling an Error or Warning” on page 821.

<xnm:warning>

Usage

```
<junoscript>
  <any-child-of-junoscript>
    <xnm:warning xmlns="namespace-URL" xmlns:xnm="namespace-URL">
      <source-daemon>module-name </source-daemon>
      <filename>filename</filename>
      <line-number>line-number</line-number>
      <column>column-number</column>
      <token>input-token-id</token>
      <edit-path>edit-path</edit-path>
      <statement>statement-name</statement>
      <message>error-string</message>
      <reason>...</reason>
    </xnm:warning>
  </any-child-of-junoscript>
</junoscript>
```

Description Indicate that the server has encountered a problem while processing the client application’s request. The child tag elements described in the Contents section detail the nature of the warning.

Attributes

xmlns—Names the XML namespace for the contents of the tag element. The value is a URL of the form <http://xml.juniper.net/xnm/version/xnm>, where *version* is a string such as 1.1.

xmlns:xnm—Names the XML namespace for child tag elements that have the **xnm:** prefix in their names. The value is a URL of the form <http://xml.juniper.net/xnm/version/xnm>, where *version* is a string such as 1.1.

Contents

<column>—(Occurs only during loading of a configuration file) Identifies the element that caused the problem by specifying its position as the number of characters after the first character in the specified line in the configuration file that was being loaded. The line and file are specified by the accompanying **<line-number>** and **<filename>** tag elements.

<edit-path>—(Occurs only during loading of configuration data) Specifies the path to the configuration hierarchy level at which the problem occurred, in the form of the CLI configuration mode banner.

<filename>—(Occurs only during loading of a configuration file) Names the configuration file that was being loaded.

<line-number>—(Occurs only during loading of a configuration file) Specifies the line number where the problem occurred in the configuration file that was being loaded, which is named by the accompanying **<filename>** tag element.

<message>—Describes the warning in a natural-language text string.

<source-daemon>—Names the Junos OS module that was processing the request in which the warning occurred.

<statement>—(Occurs only during loading of configuration data) Identifies the configuration statement that was being processed when the error occurred. The accompanying **<edit-path>** tag element specifies the statement's parent hierarchy level.

<token>—Names which element in the request caused the warning.

The other tag element is explained separately.

Usage Guidelines See [“Handling an Error or Warning” on page 821](#).

Summary of Attributes in Junos XML Tags

This chapter lists the attributes that client applications include in an opening Junos XML tag when performing some operations on configuration elements, such as deletion, renaming, and reordering. It also lists the attributes that the Junos XML protocol server includes in an opening XML tag when returning certain kinds of information. The entries are in alphabetical order. For information about the notational conventions used in this chapter, see [Table 2 on page ccxciii](#).

active

Usage	<pre> <rpc> <load-configuration> <configuration> <!-- opening tag for each parent of the element --> <element active="active"> <name>identifier</name> <!-- if element has an identifier --> </element> <!-- closing tag for each parent of the element --> </configuration> </load-configuration> </rpc> </pre>
Description	<p>Reactivate a previously deactivated configuration element.</p> <p>The active attribute can be combined with one or more of the insert, rename, or replace attributes. To deactivate an element, include the inactive attribute instead.</p>
Usage Guidelines	See “ Changing a Configuration Element’s Activation State ” on page 910 and “ Changing a Configuration Element’s Activation State Simultaneously with Other Changes ” on page 913.
Related Documentation	<ul style="list-style-type: none"> • inactive on page 965 • insert on page 966 • <load-configuration> on page 950 • rename on page 975 • replace on page 976 • <rpc> on page 957

count

Usage	<pre><rpc> <get-configuration> <configuration> <!-- opening tags for each parent of the object --> <object-type count="count"/> <!-- closing tags for each parent of the object --> </configuration> </get-configuration> </rpc></pre>
Description	<p>Specify the number of configuration objects of the specified type about which to return information. If the attribute is omitted, the Junos XML protocol server returns information about all objects of the type.</p> <p>The attribute can be combined with one or more of the matching, recurse, and start attributes.</p> <p>If the application requests Junos XML-tagged output (the default), the Junos XML protocol server includes two attributes in the opening container tag for each returned object:</p> <ul style="list-style-type: none">• junos:position—Specifies the object's numerical index.• junos:total—Reports the total number of such objects that exist in the hierarchy. <p>These attributes do not appear if the application requests formatted ASCII output by including the format="text" attribute in the opening <get-configuration> tag.</p>
Usage Guidelines	See "Requesting a Specified Number of Configuration Objects" on page 863 .
Related Documentation	<ul style="list-style-type: none">• <get-configuration> on page 945• matching on page 973• recurse on page 974• <rpc> on page 957• start on page 977

delete

Usage	<pre><rpc> <load-configuration> <configuration> <!-- opening tag for each parent of the element --> <!-- For a hierarchy level or object without an identifier --> <level-or-object delete="delete"> <!-- For an object with an identifier (here, called <name>) --></pre>
-------	--

```

<object delete="delete">
  <name>identifier</name>
</object>

<!-- For a single-value or fixed-form option of an object -->
<object>
  <name>identifier</name> <!-- if the object has an identifier -->
  <option delete="delete"/>
</object>

<!-- closing tag for each parent of the element -->

<!-- For a value in a multivalued option of an object -->
<!-- opening tag for each parent of the parent object -->
  <parent-object>
    <name>identifier</name>
    <object delete="delete">value</object>
  </parent-object>
<!-- closing tag for each parent of the parent object -->

</configuration>
</load-configuration>
</rpc>

```

Description Specify that the Junos XML protocol server remove the configuration element from the candidate configuration. The only acceptable value for the attribute is **delete**.

Usage Guidelines See [“Deleting Configuration Elements” on page 897](#).

Related Documentation

- [<load-configuration> on page 950](#)
- [<rpc> on page 957](#)

inactive

Usage

```

<rpc>
  <load-configuration>
    <configuration>
      <!-- opening tag for each parent of the element -->

      <!-- if immediately deactivating a newly created element -->
      <element inactive="inactive">
        <name>identifier</name> <!-- if element has an identifier -->
        <!-- tag elements for each child of the element -->
      </element>

      <!-- if deactivating an existing element -->
      <element inactive="inactive">
        <name>identifier</name> <!-- if element has an identifier -->
      </element>
      <!-- closing tag for each parent of the element -->
    </configuration>
  </load-configuration>

```

</rpc>

Description Deactivate a configuration element. The element remains in the candidate configuration or private copy, but when the configuration is later committed, the element does not affect the functioning of the routing, switching, or security platform.

The **inactive** attribute can be combined with one or more of the **insert**, **rename**, or **replace** attributes, as described in [“Changing a Configuration Element’s Activation State Simultaneously with Other Changes” on page 913](#). To reactivate a deactivated element, include the **active** attribute instead.

Usage Guidelines See [“Changing a Configuration Element’s Activation State” on page 910](#).

- Related Documentation**
- [active on page 963](#)
 - [insert on page 966](#)
 - [<load-configuration> on page 950](#)
 - [rename on page 975](#)
 - [<rpc> on page 957](#)

insert

Usage

```
<rpc>
  <load-configuration>
    <configuration>
      <!-- opening tag for each parent of the set -->

      <!-- if each element in the ordered set has one identifier -->
      <ordered-set insert="(before | after)" name="referent-value">
        <name>value-for-moving-object</name>
      </ordered-set>

      <!-- if each element in the ordered set has two identifiers -->
      <ordered-set insert="(before | after)" identifier1="referent-value" \
        identifier2="referent-value">
        <identifier1>value-for-moving-object</identifier1>
        <identifier2>value-for-moving-object</identifier2>
      </ordered-set>

      <!-- closing tag for each parent of the set -->
    </configuration>
  </load-configuration>
</rpc>
```

Description Change the position of a configuration element in an ordered set. The new position is specified relative to a reference element, which is specified by including an attribute named after each of its identifier tags. In the Usage section, the identifier tag element is called **<name>** when each element in the set has one identifier.

The **insert** attribute can be combined with either the **active** or **inactive** attribute, as described in [“Changing a Configuration Element’s Activation State Simultaneously with Other Changes”](#) on page 913.

Usage Guidelines See [“Reordering Elements in Configuration Objects”](#) on page 903.

- Related Documentation**

 - [inactive](#) on page 965
 - [<load-configuration>](#) on page 950
 - [<rpc>](#) on page 957

junos:changed

Usage

```
<rpc-reply xmlns:junos="URL">
  <configuration standard-attributes junos:changed="changed">
    <!-- opening-tag-for-each-parent-level junos:changed="changed" -->

    <!-- If the changed element is an empty tag -->
    <element junos:changed="changed"/>

    <!-- If the changed element has child tag elements -->
    <element junos:changed="changed">
      <first-child-of-element junos:changed="changed">
        <second-child-of-element junos:changed="changed">
          <!-- additional children of element - ->
        </element>

      <!-- closing-tag-for-each-parent-level -->
    </configuration>
  </rpc-reply>
```

Description Indicate that a configuration element has changed since the last commit operation. The Junos XML protocol server includes the attribute when the client application includes the **changed** attribute in the empty **<get-configuration/>** tag or opening **<get-configuration>** tag. The attribute appears in the opening tag of every parent tag element in the path to the changed configuration element, including the opening top-level **<configuration>** tag.

The attribute does not appear if the client requests formatted ASCII output by including the **format="text"** attribute in the empty **<get-configuration/>** tag or opening **<get-configuration>** tag.

For information about the standard attributes in the opening **<configuration>** tag, see [“Requesting Information from the Committed or Candidate Configuration”](#) on page 840.

Usage Guidelines See [“Requesting a Change Indicator for Configuration Elements”](#) on page 846.

- Related Documentation**

  - [<rpc-reply> on page 958](#)
  - [junos:changed-seconds on page 968](#)

---

## junos:changed-seconds

- Usage**
- ```
<rpc-reply xmlns:junos="URL">
  <configuration junos:changed-seconds="seconds" \
    junos:changed-localtime="YYYY-MM-DD hh:mm:ss TZ">
    <!-- Junos XML tag elements for the requested configuration data -->
  </configuration>
</rpc-reply>
```
- Description** (Displayed when the candidate configuration is requested) Specify the time when the configuration was last changed as the number of seconds since midnight on 1 January 1970.
- Usage Guidelines** See ["Requesting Information from the Committed or Candidate Configuration" on page 840](#).
- Related Documentation**
- [<configuration> in the Junos XML API Configuration Developer Reference](#)
 - [<rpc-reply> on page 958](#)
 - [junos:changed-localtime on page 968](#)

junos:commit-localtime

- Usage**
- ```
<rpc-reply xmlns:junos="URL">
 <configuration junos:commit-seconds="seconds" \
```

```

 junos:commit-localtime="YYYY-MM-DD hh:mm:ss TZ" \
 junos:commit-user="username">
 <!-- Junos XML tag elements for the requested configuration data -->
 </configuration>
</rpc-reply>

```

<b>Description</b>	(Displayed when the active configuration is requested) Specify the time when the configuration was committed as the date and time in the device's local time zone.
<b>Usage Guidelines</b>	See <a href="#">"Requesting Information from the Committed or Candidate Configuration" on page 840</a> .
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">&lt;configuration&gt;</a> in the <i>Junos XML API Configuration Developer Reference</i></li> <li>• <a href="#">&lt;rpc-reply&gt;</a> on page 958</li> <li>• <a href="#">junos:commit-user</a> on page 969</li> <li>• <a href="#">junos:commit-seconds</a> on page 969</li> </ul>

## junos:commit-seconds

```

Usage <rpc-reply xmlns:junos="URL">
 <configuration junos:commit-seconds="seconds" \
 junos:commit-localtime="YYYY-MM-DD hh:mm:ss TZ" \
 junos:commit-user="username">
 <!-- Junos XML tag elements for the requested configuration data -->
 </configuration>
 </rpc-reply>

```

<b>Description</b>	(Displayed when the active configuration is requested) Specify the time when the configuration was committed as the number of seconds since midnight on 1 January 1970.

<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">&lt;configuration&gt;</a> in the <i>Junos XML API Configuration Developer Reference</i></li> <li>• <a href="#">&lt;rpc-reply&gt;</a> on page 958</li> <li>• <a href="#">junos:commit-user</a> on page 969</li> <li>• <a href="#">junos:commit-localtime</a> on page 968</li> </ul>

## junos:commit-user

```

Usage <rpc-reply xmlns:junos="URL">
 <configuration junos:commit-seconds="seconds" \
 junos:commit-localtime="YYYY-MM-DD hh:mm:ss TZ" \
 junos:commit-user="username">
 <!-- Junos XML tag elements for the requested configuration data -->
 </configuration>
 </rpc-reply>

```

<b>Description</b>	(Displayed when the active configuration is requested) Specify the Junos OS username of the user who requested the commit operation.
<b>Usage Guidelines</b>	See <a href="#">“Requesting Information from the Committed or Candidate Configuration” on page 840.</a>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">&lt;configuration&gt;</a> in the <i>Junos XML API Configuration Developer Reference</i></li><li>• <a href="#">&lt;rpc-reply&gt;</a> on page 958</li><li>• <a href="#">junos:commit-localtime</a> on page 968</li><li>• <a href="#">junos:commit-seconds</a> on page 969</li></ul>

---

## junos:group

---

<b>Usage</b>	<pre>&lt;rpc-reply xmlns:junos="URL"&gt;   &lt;configuration&gt;     &lt;!-- opening tag for each parent of the element --&gt;     &lt;inherited-element junos:group="source-group"&gt;       &lt;inherited-child-of-inherited-element junos:group="source-group"&gt;         &lt;!-- inherited-children-of-child junos:group="source-group" --&gt;         &lt;/inherited-child-of-inherited-element&gt;       &lt;/inherited-element&gt;     &lt;!-- closing tag for each parent of the element --&gt;   &lt;/configuration&gt; &lt;/rpc-reply&gt;</pre>
<b>Description</b>	<p>Name the configuration group from which each configuration element is inherited. The Junos XML protocol server includes the attribute when the client application includes the <b>groups</b> and <b>inherit</b> attribute in the empty <b>&lt;get-configuration/&gt;</b> tag or opening <b>&lt;get-configuration&gt;</b> tag.</p> <p>The attribute does not appear if the client requests formatted ASCII output by including the <b>format="text"</b> attribute in the empty <b>&lt;get-configuration/&gt;</b> tag or opening <b>&lt;get-configuration&gt;</b> tag. Instead, the Junos XML protocol server provides the information in a comment directly above each inherited element.</p>
<b>Usage Guidelines</b>	See <a href="#">“Displaying the Source Group for Inherited Configuration Elements” on page 852.</a>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">&lt;get-configuration&gt;</a> on page 945</li><li>• <a href="#">&lt;rpc-reply&gt;</a> on page 958</li></ul>

---

## junos:interface-range

---

<b>Usage</b>	<pre>&lt;rpc-reply xmlns:junos="URL"&gt;   &lt;configuration attributes&gt;     &lt;interfaces&gt;       &lt;!-- For each inherited element --&gt;       &lt;interface junos:interface-range="source-interface-range"&gt;</pre>
--------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

```

<inherited-element junos:interface-range="source-interface-range">
 <inherited-child-of-inherited-element
 junos:interface-range="source-interface-range">
 <!-- inherited-children-of-child
 junos:interface-range="source-interface-range" -->
 </inherited-child-of-inherited-element>
 </inherited-element>
 </interface>
</interfaces>
</configuration>
</rpc-reply>

```

**Description** Name the interface range from which each configuration element is inherited. The Junos XML protocol server includes the attribute when the client application includes the **interface-ranges** and **inherit** attributes in the empty **<get-configuration/>** tag or opening **<get-configuration>** tag.

The attribute does not appear if the client requests formatted ASCII output by including the **format="text"** attribute in the empty **<get-configuration/>** tag or opening **<get-configuration>** tag.

**Usage Guidelines** See [“Displaying the Source Interface Range for Inherited Configuration Elements” on page 857](#).

**Related Documentation**

- [<get-configuration> on page 945](#)
- [<rpc-reply> on page 958](#)

## junos:key

**Usage**

```

<rpc-reply xmlns:junos="URL">
 <configuration>
 <!-- opening tag for each parent of the object -->
 <object>
 <name junos:key="key">identifier</name>
 <!-- additional children of object -->
 </object>
 <!-- closing tag for each parent of the object -->
 </configuration>
</rpc-reply>

```

**Description** Indicate that a child configuration tag element is the identifier for its parent tag element. The Junos XML protocol server includes the attribute when the client application requests information about an object type (with the **<get-configuration>** tag element) and has included the **junos:key** attribute in the opening **<junoscript>** tag for the current session.

The attribute does not appear if the client requests formatted ASCII output by including the **format="text"** attribute in the empty **<get-configuration/>** tag or opening **<get-configuration>** tag.

When requesting configuration data with Perl client applications using the `get_configuration()` method, the Junos XML protocol server includes the `junos:key="key"` attribute in the configuration data output when the client application sets the value of the `Junos::Device` constructor argument `junos_key` to 1. The default value is 0.

The attribute does not appear if the Perl client application requests formatted ASCII output by including the `format=>'text'` attribute in the options for the `get_configuration()` method.

**Usage Guidelines** See [“Requesting an Indicator for Identifiers” on page 844](#).

**Related Documentation**

- [<get-configuration> on page 945](#)
- [<junoscript> on page 948](#)
- [<rpc> on page 957](#)

---

## junos:position

---

**Usage**

```
<rpc-reply xmlns:junos="URL">
 <configuration>
 <!-- opening tags for each parent of the object -->
 <object junos:position="index" junos:total="total" >
 <!-- closing tags for each parent of the object -->
 </configuration>
</rpc-reply>
```

**Description** Specify the index number of the configuration object in the list of objects of a specified type about which information is being returned. The Junos XML protocol server includes the attribute when the client application requests information about an object type (with the `<get-configuration>` tag element) and includes the `count` attribute, the `start` attribute, or both, in the opening tag for the object type.

The attribute does not appear if the client requests formatted ASCII output by including the `format="text"` attribute in the opening `<get-configuration>` tag.

**Usage Guidelines** See [“Requesting a Specified Number of Configuration Objects” on page 863](#).

**Related Documentation**

- [count on page 964](#)
- [<get-configuration> on page 945](#)
- [junos:total on page 972](#)
- [<rpc> on page 957](#)
- [start on page 977](#)

---

## junos:total

---

**Usage**

```
<rpc-reply xmlns:junos="URL">
```

```

<configuration>
 <!-- opening tags for each parent of the object -->
 <object junos:position="index" junos:total="total">
 <!-- closing tags for each parent of the object -->
 </object>
 </configuration>
</rpc-reply>

```

**Description** Specify the number of configuration objects of a specified type about which information is being returned. The Junos XML protocol server includes the attribute when the client application requests information about an object type (with the **<get-configuration>** tag element) and includes the **count** attribute, the **start** attribute, or both, in the opening tag for the object type.

The attribute does not appear if the client requests formatted ASCII output by including the **format="text"** attribute in the opening **<get-configuration>** tag.

**Usage Guidelines** See [“Requesting a Specified Number of Configuration Objects” on page 863](#).

**Related Documentation**

- [count on page 964](#)
- [<get-configuration> on page 945](#)
- [junos:position on page 972](#)
- [<rpc> on page 957](#)
- [start on page 977](#)

## matching

**Usage**

```

<rpc>
 <get-configuration>
 <configuration>
 <!-- opening tags for each parent of the level -->
 <level matching="matching-expression"/>
 <!-- closing tags for each parent of the level -->
 </configuration>
 </get-configuration>
</rpc>

```

**Description** Request information about only those instances of a configuration object type at the specified level in the configuration hierarchy that have the specified set of characters in their identifier names (characters that match a regular expression). If the attribute is omitted, the Junos XML protocol server returns the complete set of child tag elements for the specified parent level.

The attribute can be combined with one or more of the **count**, **recurse**, and **start** attributes.

To represent the objects to return, the **matching-expression** value uses a slash-separated list of hierarchy level and object names similar to an XML Path Language (XPath) representation. Each level in the representation can be either a full level name or a regular expression that matches the identifier name of one or more instances of an object type:

*object-type[name='regular-expression']"*

The regular expression uses the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. For details about the notation, see ["Requesting a Subset of Objects by Using Regular Expressions"](#) on page 869.

**Usage Guidelines** See ["Requesting a Subset of Objects by Using Regular Expressions"](#) on page 869.

**Related Documentation**

- [count](#) on page 964
- [<get-configuration>](#) on page 945
- [<rpc>](#) on page 957
- [start](#) on page 977

---

## protect

---

**Usage**

```
<rpc>
 <load-configuration>
 <configuration>
 <!-- opening tag for each parent of the element -->
 <element protect="protect">
 <name>identifier</name> <!-- if element has an identifier -->
 </element>
 <!-- closing tag for each parent of the element -->
 </configuration>
 </load-configuration>
</rpc>
```

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** Protect a configuration element from being modified or deleted. The **protect** attribute can be applied to configuration hierarchies or individual configuration statements. The **protect** attribute can be combined with the **active** and **inactive** attributes. To unprotect a protected element, include the **unprotect** attribute instead.

**Usage Guidelines** See ["Protecting or Unprotecting a Configuration Object"](#) on page 908

**Related Documentation**

- [Example: Protecting the Junos OS Configuration from Modification or Deletion](#)
- [<load-configuration>](#) on page 950
- [<rpc>](#) on page 957
- [unprotect](#) on page 977

---

## recurse

---

**Usage**

```
<rpc>
 <get-configuration>
 <configuration>
```

```

 <!-- opening tags for each parent of the object -->
 <object-type recurse="false"/>
 <!-- closing tags for each parent of the object -->
 </configuration>
</get-configuration>
</rpc>

```

**Description** Request only the identifier tag element for each configuration object of a specified type in the configuration hierarchy. If the attribute is omitted, the Junos XML protocol server returns the complete set of child tag elements for every object. The only acceptable value for the attribute is **false**.

The attribute can be combined with one or more of the **count**, **matching**, and **start** attributes.

**Usage Guidelines** See [“Requesting Identifiers Only” on page 865](#).

**Related Documentation**

- [count on page 964](#)
- [<get-configuration> on page 945](#)
- [<rpc> on page 957](#)
- [start on page 977](#)

## rename

**Usage**

```

<rpc>
 <load-configuration>
 <configuration>
 <!-- opening tag for each parent of the object -->

 <!-- if the object has one identifier -->
 <object rename="rename" name="new-name">
 <name>current-name</name>
 </object>

 <!-- if the object has two identifiers, both changing -->
 <object rename="rename" identifier1="new-name" \
 identifier2=new-name">
 <identifier1>current-name</identifier1>
 <identifier2>current-name</identifier2>
 </object>

 <!-- closing tag for each parent of the object -->
 </configuration>
 </load-configuration>
</rpc>

```

**Description** Change the name of one or more of a configuration object’s identifiers. In the Usage section, the identifier tag element is called **<name>** when the element has one identifier.

The **rename** attribute can be combined with either the **inactive** or **active** attribute.

**Usage Guidelines** See “Renaming a Configuration Object” on page 906.

- Related Documentation**
- [active on page 963](#)
  - [inactive on page 965](#)
  - [<load-configuration> on page 950](#)
  - [<rpc> on page 957](#)

---

## replace

---

**Usage**

```
<rpc>
 <load-configuration action="replace">
 <configuration>
 <!-- opening tag for each parent of the element -->
 <container-tag replace="replace">
 <name>identifier</name>
 <!-- tag elements for other children, if any -->
 </container-tag>
 <!-- closing tag for each parent of the element -->
 </configuration>
 </load-configuration>
</rpc>
```

**Description** Specify that the configuration element completely replace the element in the candidate configuration that has the same identifier (in the Usage section, the identifier tag element is called **<name>**). If the attribute is omitted, the Junos XML protocol server merges the element with the existing element as described in “Merging Configuration Elements” on page 890. The only acceptable value for the attribute is **replace**.

The client application must also include the **action="replace"** attribute in the opening **<load-configuration>** tag.

The **replace** attribute can be combined with either the **active** or **inactive** attribute, as described in “Changing a Configuration Element’s Activation State Simultaneously with Other Changes” on page 913.

**Usage Guidelines** See “Replacing Configuration Elements” on page 893.

- Related Documentation**
- [active on page 963](#)
  - [inactive on page 965](#)
  - [<load-configuration> on page 950](#)
  - [<rpc> on page 957](#)

## start

Usage	<pre> &lt;rpc&gt;   &lt;get-configuration&gt;     &lt;configuration&gt;       &lt;!-- opening tags for each parent of the object --&gt;       &lt;object-type start="index"/&gt;       &lt;!-- closing tags for each parent of the object --&gt;     &lt;/configuration&gt;   &lt;/get-configuration&gt; &lt;/rpc&gt; </pre>
Description	<p>Specify the index number of the first object to return (1 for the first object, 2 for the second, and so on) when requesting information about a configuration object of a specified type. If the attribute is omitted, the returned set of objects starts with the first one in the configuration hierarchy.</p> <p>The attribute can be combined with one or more of the <b>count</b>, <b>matching</b>, and <b>recurse</b> attributes.</p> <p>If the application requests Junos XML-tagged output (the default), the Junos XML protocol server includes two attributes in the opening container tag for each returned object:</p> <ul style="list-style-type: none"> <li>• <b>junos:position</b>—Specifies the object's numerical index.</li> <li>• <b>junos:total</b>—Reports the total number of such objects that exist in the hierarchy.</li> </ul> <p>These attributes do not appear if the client requests formatted ASCII output by including the <b>format="text"</b> attribute in the opening <b>&lt;get-configuration&gt;</b> tag.</p>
Usage Guidelines	See <a href="#">“Requesting a Specified Number of Configuration Objects” on page 863</a> .
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">count on page 964</a></li> <li>• <a href="#">&lt;get-configuration&gt; on page 945</a></li> <li>• <a href="#">recurse on page 974</a></li> <li>• <a href="#">&lt;rpc&gt; on page 957</a></li> </ul>

## unprotect

Usage	<pre> &lt;rpc&gt;   &lt;load-configuration&gt;     &lt;configuration&gt;       &lt;!-- opening tag for each parent of the element --&gt;       &lt;element unprotect="unprotect"&gt;         &lt;name&gt;identifier&lt;/name&gt; &lt;!-- if element has an identifier --&gt;       &lt;/element&gt;       &lt;!-- closing tag for each parent of the element --&gt;     &lt;/configuration&gt;   &lt;/load-configuration&gt; </pre>
-------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

</rpc>

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** Unprotect a previously protected configuration element. The **unprotect** attribute cannot be combined with other attributes such as **active**, **inactive**, **rename**, or **replace**. If an element is protected, a request to simultaneously unprotect and modify the element will unprotect the element, but it will also produce a warning message that the additional modification cannot be completed because the element is protected. You must unprotect the element first and then make the modification.

**Usage Guidelines** See [“Protecting or Unprotecting a Configuration Object” on page 908](#)

**Related Documentation**

---

## xmlns

---

**Usage**

```
<rpc-reply xmlns:junos="URL">
 <operational-response xmlns="URL-for-DTD">
 <!-- Junos XML tag elements for the requested information -->
 </operational-response>
</rpc-reply>
```

**Description** Define the XML namespace for the enclosed tag elements that do not have a prefix (such as **junos:**) in their names. The namespace indicates which Junos XML document type definition (DTD) defines the set of tag elements in the response.

**Usage Guidelines** See [“Requesting Operational Information” on page 834](#).

## CHAPTER 25

# Writing Junos XML Protocol Perl Client Applications

Juniper Networks provides a Perl module **JUNOS::Device** to help you more quickly and easily develop custom Perl scripts for configuring and monitoring switches, routers, and security devices running Junos OS. The module implements a **JUNOS::Device** object that client applications can use to communicate with the Junos XML protocol server on a device running Junos OS. The Perl distribution includes several sample Perl scripts, which illustrate how to use the module in scripts that perform various functions.

This chapter discusses the following topics:

- [Overview of the Junos::Device Perl Module and Sample Scripts on page 979](#)
- [Downloading the Junos XML Protocol Perl Client and Prerequisites Package on page 980](#)
- [Installing the Junos XML Protocol Perl Client and Prerequisites Package on page 981](#)
- [Tutorial: Writing Perl Client Applications on page 984](#)
- [Mapping CLI Commands to Perl Methods on page 1007](#)

## Overview of the Junos::Device Perl Module and Sample Scripts

---

The Junos XML protocol Perl distribution uses the same directory structure for Perl modules as the Comprehensive Perl Archive Network (<http://www.cpan.org>). This includes a **lib** directory for the **JUNOS** module and its supporting files, and an **examples** directory for the sample scripts.

Client applications use the **JUNOS::Device** object to communicate with a Junos XML protocol server. The library contains several modules, but client applications directly invoke only the **JUNOS::Device** object. All of the sample scripts use this object.

The sample scripts illustrate how to perform the following functions:

- **diagnose\_bgp.pl**—Illustrates how to write scripts to monitor device status and diagnose problems. The sample script extracts and displays information about a device's unestablished Border Gateway Protocol (BGP) peers from the full set of BGP configuration data. The script is provided in the **examples/diagnose\_bgp** directory in the Junos XML protocol Perl distribution.

- **get\_chassis\_inventory.pl**—Illustrates how to use a predefined query to request information from a device. The sample script invokes the **get\_chassis\_inventory** method with the **detail** option to request the same information as the Junos XML `<get-chassis-inventory><detail></get-chassis-inventory>` tag sequence and the command-line interface (CLI) **show chassis hardware detail** command. The script is provided in the **examples/get\_chassis\_inventory** directory in the Junos XML protocol Perl distribution.
- **load\_configuration.pl**—Illustrates how to change a device configuration by loading a file that contains configuration data formatted with Junos XML tag elements. The distribution includes two sample configuration files, **set\_login\_class\_bar.xml** and **set\_login\_user\_foo.xml**; however, you can specify another configuration file on the command line. The script is provided in the **examples/load\_configuration** directory in the Junos XML protocol Perl distribution.

The following sample scripts are used together to illustrate how to store and retrieve data from the Junos XML API (or any XML-tagged data set) in a relational database. Although these scripts create and manipulate MySQL tables, the data manipulation techniques that they illustrate apply to any relational database. The scripts are provided in the **examples/RDB** directory in the Perl distribution:

- **get\_config.pl**—Illustrates how to retrieve routing platform configuration information.
- **make\_tables.pl**—Generates a set of Structured Query Language (SQL) statements for creating relational database tables.
- **pop\_tables.pl**—Populates existing relational database tables with data extracted from a specified XML file.
- **unpop\_tables.pl**—Transforms data stored in a relational database table into XML and writes it to a file.

For instructions on running the scripts, see the **README** or **README.html** file included in the Perl distribution.

---

## Downloading the Junos XML Protocol Perl Client and Prerequisites Package

---

To download the compressed tar archives that contain the Junos XML protocol Perl client distribution and the prerequisites package, perform the following steps:

1. Access the Junos XML protocol download page on the Juniper Networks website at <https://www.juniper.net/support/products/junoscript/>.
2. Click the link for the appropriate software release.
3. Select the Software tab.
4. Click the links to download the client distribution and the prerequisites package that support the appropriate access protocols. Customers in the United States and Canada can download the packages that support all access protocols including SSH, SSL, clear-text and Telnet protocols (the domestic package). Customers in other countries can download the packages that support only the clear-text and Telnet protocols (the export package).

**NOTE:** The Junos XML protocol Perl client software should be installed and run on a regular computer with a UNIX-like operating system; it is not meant to be installed on a Juniper Networks device.

Optionally, download the packages containing the document type definitions (DTDs) and the XML Schema language representation of the Junos configuration hierarchy:

1. Access the download page at <https://www.juniper.net/support/products/xmlapi/>.
2. Click the link for the appropriate software release.
3. Select the Software tab.
4. Click the links to download the desired packages.

**Related Documentation**

- [Installing the Junos XML Protocol Perl Client and Prerequisites Package on page 981](#)

## Installing the Junos XML Protocol Perl Client and Prerequisites Package

To install the Junos XML protocol Perl client and the prerequisites package, perform the following procedures:

- [Verifying Installation and Version of Perl on page 981](#)
- [Extracting the Junos XML Protocol Perl Client and Sample Scripts on page 982](#)
- [Extracting and Installing the Junos XML Protocol Perl Client Prerequisites Package on page 982](#)
- [Installing the Junos XML Protocol Perl Client on page 984](#)

### Verifying Installation and Version of Perl

Perl must be installed on your system before you install the Junos XML protocol Perl client prerequisites package or client software. The Junos XML protocol Perl client requires Perl version 5.0004 or later. To confirm whether Perl is installed on your system and to determine which version of Perl is currently running, issue the following commands:

```
% which perl
% perl -v
```

If the issued output indicates that Perl is not installed or the version is older than the required version, you must download and install Perl version 5.0004 or later in order to use the Junos XML protocol Perl client. The Perl source packages are located at:

<http://www.cpan.org/src/>.

After installing a suitable version of Perl, extract the Junos XML protocol Perl client, extract and install the prerequisites package, and then install the Junos XML protocol Perl client application.

## Extracting the Junos XML Protocol Perl Client and Sample Scripts

To uncompress and extract the contents of the compressed tar archive that contains the Junos XML protocol Perl client and sample scripts, perform the following steps:

1. Create the directory where you want to store the Junos XML protocol Perl client application and sample scripts, and move the downloaded client application file into this directory. Then make this directory the working directory:

```
% mkdir parent-directory
% mv junoscript-perl-release-type.tar.gz parent-directory
% cd parent-directory
```

2. Issue the following command to uncompress and extract the contents of the Junos XML protocol Perl client package:

- On FreeBSD and Linux systems:

```
% tar xzf junoscript-perl-release-type.tar.gz
```

- On Solaris systems:

```
% gzip -dc junoscript-perl-release-type.tar.gz | tar xf
```

where *release* is the release code, for example 12.1R1.1, and *type* is **domestic** or **export**.

Step 2 creates a directory called **junoscript-perl-*release*** and extracts the contents of the tar archive to it. For example, a typical filename for the compressed tar archive is **junoscript-perl-9.5R1.8-domestic.tar.gz**. Extracting the contents of this archive creates the directory **junoscript-perl-9.5R1.8** directly under ***parent-directory*** and places the application files and sample scripts into this new directory.

The **junoscript-perl-*release*/README** file contains instructions for extracting and installing the Perl prerequisite modules, creating a **Makefile**, and installing and testing the **JUNOS::Device** module.

## Extracting and Installing the Junos XML Protocol Perl Client Prerequisites Package

The prerequisites package consists of C libraries, executables, and Perl modules. It must be installed on the client machine in order for the Junos XML protocol Perl client and the included examples to work correctly. To uncompress and extract the contents of the compressed tar archive containing the prerequisite files, perform the following steps:

1. Move the downloaded prerequisites package into the ***parent-directory/junoscript-perl-*release**** directory that was created in [“Extracting the Junos XML Protocol Perl Client and Sample Scripts” on page 982](#). The compressed tar archive containing the prerequisite files must be uncompressed, unpacked, and installed in this directory.
2. Issue the following command to uncompress and extract the contents of the package:

- On FreeBSD and Linux systems:

```
% tar xzf junoscript-perl-prereqs-release-type.tar.gz
```

- On Solaris systems:

```
% gzip -dc junoscript-perl-prereqs-release-type.tar.gz | tar xf
```

where **release** is the release code, for example 12.1R1.1, and **type** is **domestic** or **export**. This command creates a directory called **prereqs/** and extracts the contents of the tar archive to it.

By default, the prerequisite Perl modules are installed in the standard directory. The standard directory is normally **/usr/local/lib/**. You need root privileges to access the standard directory. You can opt to install the modules in a private directory.

- To install the required modules in the standard directory:
  1. Go to the **junoscript-perl-release/** directory where you extracted the contents of the prerequisites package.
  2. Issue the following command:

```
% perl install-prereqs.pl -used_by example -force
```

where the **-used\_by example** option is invoked to install only modules used by a specific example, and the **-force** option installs the module even if an older version exists or if the **make test** command fails.

- To install the required modules in a private directory:
  1. Set the **PERL5LIB**, **MANPATH**, and **PATH** environment variables.

```
% setenv PERL5LIB private-directory-path
% setenv MANPATH "$MANPATH/:$PERL5LIB/./man"
% setenv PATH "$PATH/:$PERL5LIB/./bin"
```

For sh, ksh, and bash shells, **\$PERL5LIB** can be set with **EXPORT PERL5LIB=private-directory-path**

2. Go to the **junoscript-perl-release** directory where you extracted the contents of the prerequisites package.
3. Issue the following command:

```
% perl install-prereqs.pl -used_by example -install_directory $PERL5LIB -force
```

where the **-used\_by example** option is invoked to install only modules used by a specific example, and the **-force** option installs the module even if an older version exists or if the **make test** command fails. The **-install\_directory \$PERL5LIB** option installs the prerequisite Perl modules in the private directory that you specified in Step 1.

Installation log files are written to **junoscript-perl-release/tmp/output/**. After installation, you can view any missing dependencies by issuing the following command:

```
% perl required-mod.pl
```

This command lists the modules that still require installation.

## Installing the Junos XML Protocol Perl Client

After installing the prerequisites package as detailed in [“Extracting and Installing the NETCONF Perl Client Prerequisites Package” on page 700](#), install the Junos XML protocol Perl client software. Go to the `junoscript-perl-release/` directory that was created in [“Extracting the Junos XML Protocol Perl Client and Sample Scripts” on page 982](#). Perform the following steps to install the client software:

1. Create the makefile:

- To install the Perl client in the standard directory (generally `/usr/local/lib`):

```
% perl Makefile.PL
```

```
Checking if your kit is complete...
Looks good
Writing Makefile for junoscript-perl
```

- To install the Perl client in a private directory:

Make sure that the `PERL5LIB`, `MANPATH`, and `PATH` environment variables are set as detailed in [“Extracting and Installing the NETCONF Perl Client Prerequisites Package” on page 700](#). Then create the makefile:

```
% perl Makefile.PL LIB=$PERL5LIB INSTALLMAN3DIR=$PERL5LIB/./man/man3
```

2. Test and install the application:

```
% make
% make test
% make install
```

The Junos XML protocol Perl client application is installed and ready for use. For information about the `JUNOS::Device` object and a list of valid queries, consult the man page by invoking the `man` command for the `JUNOS::Device` object:

```
% man JUNOS::Device
```

The sample scripts reside in the `junoscript-perl-release/examples/` directory. You can review and run these examples to acquire some familiarity with the client before writing your own applications.

---

## Tutorial: Writing Perl Client Applications

This tutorial explains how to write a Perl client application that requests operational or configuration information from the Junos XML protocol server or loads configuration information onto a device. The following sections use the sample scripts included in the Junos XML protocol Perl distribution as examples:

- [Import Perl Modules and Declare Constants on page 985](#)
- [Connect to the Junos XML Protocol Server on page 985](#)
- [Submitting a Request to the Junos XML Protocol Server on page 992](#)

- [Parsing and Formatting the Response from the Junos XML Protocol Server on page 1001](#)
- [Closing the Connection to the Junos XML Protocol Server on page 1007](#)

## Import Perl Modules and Declare Constants

Include the following statements at the start of the application. The first statement imports the functions provided by the **JUNOS::Device** object, which the application uses to connect to the Junos XML protocol server on a device. The second statement provides error checking and enforces Perl coding practices such as declaration of variables before use.

```
use JUNOS::Device;
use strict;
```

Include statements to import other Perl modules as appropriate for your application. For example, several of the sample scripts import the following standard Perl modules, which include functions that handle input from the command line:

- **File::Basename**—Includes functions for processing filenames.
- **Getopt::Std**—Includes functions for reading in keyed options from the command line.
- **Term::ReadKey**—Includes functions for controlling terminal modes, for example suppressing onscreen echo of a typed string such as a password.

If the application uses constants, declare their values at this point. For example, the sample **diagnose\_bgp.pl** script includes the following statements to declare constants for formatting output:

```
use constant OUTPUT_FORMAT => "%-20s%-8s%-8s%-11s%-14s%\n";
use constant OUTPUT_TITLE =>
 "\n===== BGP PROBLEM SUMMARY =====\n\n";
use constant OUTPUT_ENDING =>
 "\n===== \n\n";
```

The **load\_configuration.pl** script includes the following statements to declare constants for reporting return codes and the status of the configuration database:

```
use constant REPORT_SUCCESS => 1;
use constant REPORT_FAILURE => 0;
use constant STATE_CONNECTED => 1;
use constant STATE_LOCKED => 2;
use constant STATE_CONFIG_LOADED => 3;
```

## Connect to the Junos XML Protocol Server

The following sections explain how to use the **JUNOS::Device** object to connect to the Junos XML protocol server on a device running Junos OS:

- [Satisfying Protocol Prerequisites on page 986](#)
- [Group Requests on page 986](#)
- [Obtain and Record Parameters Required by the JUNOS::Device Object on page 986](#)
- [Obtaining Application-Specific Parameters on page 989](#)

- [Converting Disallowed Characters on page 990](#)
- [Establishing the Connection on page 992](#)

---

### Satisfying Protocol Prerequisites

The Junos XML protocol server supports several access protocols, listed in [“Supported Access Protocols” on page 797](#). For each connection to the Junos XML protocol server on a device, the application must specify the protocol it is using. Using SSH or Secure Sockets Layer (SSL) is recommended because they provide greater security by encrypting all information before transmission across the network.

Before your application can run, you must satisfy the prerequisites for the protocol it uses. For some protocols this involves activating configuration statements on the device, creating encryption keys, or installing additional software on the device running Junos OS or the machine where the application runs. For instructions, see [“Prerequisites for Establishing a Connection” on page 797](#).

---

### Group Requests

Establishing a connection to the Junos XML protocol server on a device is one of the more time- and resource-intensive functions performed by an application. If the application sends multiple requests to a routing platform, it makes sense to send all of them within the context of one connection. If your application sends the same requests to multiple devices, you can structure the script to iterate through either the set of devices or the set of requests. Keep in mind, however, that your application can effectively send only one request to one Junos XML protocol server at a time. This is because the **JUNOS::Device** object does not return control to the application until it receives the closing `</rpc-reply>` tag that represents the end of the Junos XML protocol server's response to the current request.

---

### Obtain and Record Parameters Required by the JUNOS::Device Object

The **JUNOS::Device** object takes the following parameters, specified as keys in a Perl hash:

- **access**—(Required) The access protocol to use when communicating with the Junos XML protocol server. Acceptable values are "telnet", "ssh", "clear-text", and "ssl". For more information about supported access protocols, see [“Supported Access Protocols” on page 797](#). Before the application runs, satisfy the protocol-specific prerequisites described in [“Prerequisites for Establishing a Connection” on page 797](#).
- **hostname**—(Required) The name of the device to which to connect. For best results, specify either a fully qualified hostname or an IP address.
- **login**—(Required) The username under which to establish the connection to the Junos XML protocol server and issue requests. The username must already exist on the specified device and have the permission bits necessary for making the requests invoked by the application.
- **password**—(Required) The password for the username.
- **junos\_key**—(Optional) When requesting configuration data using the `get_configuration()` method, set the value of the parameter to 1 to include the `junos:key="key"` attribute in

the output of XML-formatted configuration data. The default value of the parameter is 0. The `junos:key="key"` attribute indicates that a child configuration tag element is the identifier for its parent tag element. The attribute does not appear in formatted ASCII output.

The sample scripts record the parameters in a Perl hash called `%deviceinfo`, declared as follows:

```
my %deviceinfo = (
 access => $access,
 login => $login,
 password => $password,
 hostname => $hostname,
 junos_key => $junos_key,
);
```

The sample scripts obtain the parameters from options entered on the command line by a user. Your application can also obtain values for the parameters from a file or database, or you can hardcode one or more of the parameters into the application code if they are constant.

#### *Example: Collecting Parameters Interactively*

Each sample script obtains the parameters required by the `JUNOS::Device` object from command-line options provided by the user who invokes the script. The script records the options in a Perl hash called `%opt`, using the `getopts` function defined in the `Getopt::Std` Perl module to read the options from the command line. (Scripts used in production environments probably do not obtain parameters interactively, so this section is important mostly for understanding the sample scripts.)

In the following example from the `get_chassis_inventory.pl` script, the first parameter to the `getopts` function defines the acceptable options, which vary depending on the application. A colon after the option letter indicates that it takes an argument.

The second parameter, `\%opt`, specifies that the values are recorded in the `%opt` hash. If the user does not provide at least one option, provides an invalid option, or provides the `-h` option, the script invokes the `output_usage` subroutine, which prints a usage message to the screen:

```
my %opt;
getopts('l:p:dx:m:o:h', \%opt) || output_usage();
output_usage() if $opt{h};
```

The following code defines the `output_usage` subroutine for the `get_chassis_inventory.pl` script. The contents of the `my $usage` definition and the `Where` and `Options` sections are specific to the script, and differ for each application.

```
sub output_usage
{
 my $usage = "Usage: $0 [options] <target>

 Where:
 <target> The hostname of the target device.

 Options:
```

```
-l <login> A login name accepted by the target device.
-p <password> The password for the login name.
-m <access> Access method. It can be clear-text, ssl, ssh or telnet.
 Default: telnet.
-x <format> The name of the XSL file to display the response.
 Default: xsl/chassis_inventory_csv.xml
-o <filename> File to which to write output, instead of standard output.
-d Turn on debugging.\n\n";

die $usage;
}
```

The `get_chassis_inventory.pl` script includes the following code to obtain values from the command line for the four parameters required by the `JUNOS::Device` object. A detailed discussion of the various functional units follows the complete code sample.

```
Get the hostname
my $hostname = shift || output_usage();

Get the access method
my $access = $opt{m} || "telnet";
use constant VALID_ACCESSSES => "telnet|ssh|clear-text|ssl";
output_usage() unless (VALID_ACCESSSES =~ /$access/);

Check for login name. If not provided, prompt for it
my $login = "";
if ($opt{l}) {
 $login = $opt{l};
} else {
 print STDERR "login: ";
 $login = ReadLine 0;
 chomp $login;
}

Check for password. If not provided, prompt for it
my $password = "";
if ($opt{p}) {
 $password = $opt{p};
} else {
 print STDERR "password: ";
 ReadMode 'noecho';
 $password = ReadLine 0;
 chomp $password;
 ReadMode 'normal';
}
```

```
 print STDERR "\n";
}
```

In the first line of the preceding code sample, the script uses the Perl **shift** function to read the hostname from the end of the command line. If the hostname is missing, the script invokes the **output\_usage** subroutine to print the usage message, which specifies that a hostname is required:

```
my $hostname = shift || output_usage();
```

The script next determines which access protocol to use, setting the **\$access** variable to the value of the **-m** command-line option or to the value **telnet** if the **-m** option is not provided. If the specified value does not match one of the values defined by the **VALID\_ACSESSES** constant, the script invokes the **output\_usage** subroutine to print the usage message.

```
my $access = $opt{m} || "telnet";
use constant VALID_ACSESSES => "telnet|ssh|clear-text|ssl";
output_usage() unless (VALID_ACSESSES =~ /$access/);
```

The script then determines the username, setting the **\$login** variable to the value of the **-l** command-line option. If the option is not provided, the script prompts for it and uses the **ReadLine** function (defined in the standard Perl **Term::ReadKey** module) to read it from the command line:

```
my $login = "";
if ($opt{l}) {
 $login = $opt{l};
} else {
 print STDERR "login: ";
 $login = ReadLine 0;
 chomp $login;
}
```

The script finally determines the password for the username, setting the **\$password** variable to the value of the **-p** command-line option. If the option is not provided, the script prompts for it. It uses the **ReadMode** function (defined in the standard Perl **Term::ReadKey** module) twice: first to prevent the password from echoing visibly on the screen and then to return the shell to normal (echo) mode after it reads the password:

```
my $password = "";
if ($opt{p}) {
 $password = $opt{p};
} else {
 print STDERR "password: ";
 ReadMode 'noecho';
 $password = ReadLine 0;
 chomp $password;
 ReadMode 'normal';
 print STDERR "\n";
}
```

### Obtaining Application-Specific Parameters

In addition to the parameters required by the **JUNOS::Device** object, applications might need to define other parameters, such as the name of the file to which to write the data returned by the Junos XML protocol server in response to a request, or the name of the

Extensible Stylesheet Transformation Language (XSLT) file to use for transforming the data.

As with the parameters required by the **JUNOS::Device** object, your application can hardcode the values in the application code, obtain them from a file, or obtain them interactively. The sample scripts obtain values for these parameters from command-line options in the same manner as they obtain the parameters required by the **JUNOS::Device** object (discussed in [“Obtain and Record Parameters Required by the JUNOS::Device Object” on page 986](#)). Several examples follow.

The following line enables a debugging trace if the user includes the **-d** command-line option. It invokes the **JUNOS::Trace::init** routine defined in the **JUNOS::Trace** module, which is already imported with the **JUNOS::Device** object.

```
JUNOS::Trace::init(1) if $opt{d};
```

The following line sets the **\$outputfile** variable to the value specified by the **-o** command-line option. It names the local file to which the Junos XML protocol server's response is written. If the **-o** option is not provided, the variable is set to the empty string.

```
my $outputfile = $opt{o} || "" ;
```

The following code from the **diagnose\_bgp.pl** script defines which XSLT file to use to transform the Junos XML protocol server's response. The first line sets the **\$xslfile** variable to the value specified by the **-x** command-line option. If the option is not provided, the script uses the **text.xsl** file supplied with the script, which transforms the data to ASCII text. The **if** statement verifies that the specified XSLT file exists; the script terminates if it does not.

```
Retrieve the XSLT file, default is parsed by perl
my $xslfile = $opt{x} || "xsl/text.xsl";
if ($xslfile && ! -f $xslfile) {
 die "ERROR: XSLT file $xslfile does not exist";
}
```

The following code from the **load\_configuration.pl** script defines whether to merge, replace, update, or overwrite the new configuration data into the configuration database (for more information about these operations, see [“Changing Configuration Information” on page 623](#)). The first two lines set the **\$load\_action** variable to the value of the **-a** command-line option, or to the default value **merge** if the option is not provided. If the specified value does not match one of the valid actions defined in the third line, the script invokes the **output\_usage** subroutine.

```
The default action for load_configuration is 'merge'
my $load_action = "merge";
$load_action = $opt{a} if $opt{a};
use constant VALID_ACTIONS => "merge|replace|override";
output_usage() unless (VALID_ACTIONS =~ /$load_action/);
```

### Converting Disallowed Characters

Scripts that handle configuration data usually accept and output the data either as Junos XML tag elements or as formatted ASCII statements like those used in the Junos OS CLI. As described in [“XML and Junos XML Management Protocol Conventions Overview” on page 781](#), certain characters cannot appear in their regular form in an XML document.

These characters include the apostrophe ( ' ), the ampersand ( & ), the greater-than ( > ) and less-than ( < ) symbols, and the quotation mark ( " ). Because these characters might appear in formatted ASCII configuration statements, the script must convert the characters to the corresponding predefined entity references.

The `load_configuration.pl` script uses the `get_escaped_text` subroutine to substitute predefined entity references for disallowed characters (the `get_configuration.pl` script includes similar code). The script first defines the mappings between the disallowed characters and predefined entity references, and sets the variable `$char_class` to a regular expression that contains all of the entity references, as follows:

```
my %escape_symbols = (
 qq(") => '"',
 qq(>) => '>',
 qq(<) => '<',
 qq(') => ''',
 qq(&) => '&'
);
my $char_class = join ("|", map { "($_)" } keys %escape_symbols);
```

The following code defines the `get_escaped_text` subroutine for the `load_configuration.pl` script. A detailed discussion of the subsections in the routine follows the complete code sample.

```
sub get_escaped_text
{
 my $input_file = shift;
 my $input_string = "";

 open(FH, $input_file) or return undef;

 while(<FH>) {
 my $line = $_;
 $line =~ s/<configuration-text>//g;
 $line =~ s/<\\configuration-text>//g;
 $line =~ s/($char_class)/$escape_symbols{$1}/ge;
 $input_string .= $line;
 }

 return "<configuration-text>$input_string</configuration-text>";
}
```

The first subsection of the preceding code sample reads in a file containing formatted ASCII configuration statements:

```
sub get_escaped_text
{
 my $input_file = shift;
 my $input_string = "";

 open(FH, $input_file) or return undef;
```

In the next subsection, the subroutine temporarily discards the lines that contain the opening `<get-configuration>` and closing `</get-configuration>` tags, then replaces the disallowed characters on each remaining line with predefined entity references and appends the line to the `$input_string` variable:

```

while(<FH>) {
 my $line = $_;
 $line =~ s/<configuration-text>//g;
 $line =~ s/<\/configuration-text>//g;
 $line =~ s/($char_class)/$escape_symbols{$1}/ge;
 $input_string .= $line;
}

```

The subroutine concludes by replacing the opening `<get-configuration>` and closing `</get-configuration>` tags, and returning the converted set of statements:

```

return "<configuration-text>$input_string</configuration-text>";
}

```

### Establishing the Connection

After obtaining values for the parameters for the `JUNOS::Device` object (see [“Obtain and Record Parameters Required by the JUNOS::Device Object” on page 986](#)), each sample script records them in the `%deviceinfo` hash:

```

my %deviceinfo = (
 access => $access,
 login => $login,
 password => $password,
 hostname => $hostname,
 junos_key => $junos_key,
);

```

The script then invokes the Junos XML protocol-specific `new` subroutine to create a `JUNOS::Device` object and establish a connection to the specified routing, switching, or security platform. If the connection attempt fails (as tested by the `ref` operator), the script exits.

```

my $jnx = new JUNOS::Device(%deviceinfo);
unless (ref $jnx) {
 die "ERROR: $deviceinfo{hostname}: failed to connect.\n";
}

```

### Submitting a Request to the Junos XML Protocol Server

After establishing a connection to a Junos XML protocol server (see [“Establishing the Connection” on page 992](#)), your application can submit one or more requests by invoking the Perl methods that are supported in the version of the Junos XML protocol and Junos XML API used by the application:

- Each version of software supports a set of methods that correspond to CLI operational mode commands (later releases generally support more methods). For a list of the operational methods supported in the current version, see [“Mapping CLI Commands to Perl Methods” on page 1007](#) and the files stored in the `lib/JUNOS/release` directory of the Junos XML protocol Perl distribution (*release* is the Junos OS version code, such as `12.1R1` for the initial version of Junos OS Release 12.1). The files have names in the format `package_methods.pl`, where *package* is a software package.
- The set of methods that correspond to operations on configuration objects is defined in the `lib/JUNOS/Methods.pm` file in the Junos XML protocol Perl distribution. For more information about configuration operations, see

[“Changing Configuration Information” on page 623](#) and  
[“Summary of Junos XML Protocol Tag Elements” on page 935](#).

See the following sections for more information:

- [Providing Method Options or Attributes on page 993](#)
- [Submitting a Request on page 995](#)
- [Example: Getting an Inventory of Hardware Components on page 996](#)
- [Example: Loading Configuration Statements on page 997](#)

### Providing Method Options or Attributes

Many Perl methods have one or more options or attributes. The following list describes the notation used to define a method's options in the `lib/JUNOS/Methods.pm` and `lib/JUNOS/release/package_methods.pl` files, and the notation that an application uses when invoking the method:

- A method without options is defined as `$NO_ARGS`, as in the following entry for the `get_system_uptime_information` method:

```
Method : <get-system-uptime-information>
Returns: <system-uptime-information>
Command: "show system uptime"
get_system_uptime_information => $NO_ARGS,
```

To invoke a method without options, follow the method name with an empty set of parentheses as in the following example:

```
$jnx->get_system_uptime_information();
```

- A fixed-form option is defined as type `$TOGGLE`. In the following example, the `get_software_information` method takes two fixed-form options, `brief` and `detail`:

```
Method : <get-software-information>
Returns: <software-information>
Command: "show version"
get_software_information =>
 brief => $TOGGLE,
 detail => $TOGGLE,
},
```

To include a fixed-form option when invoking a method, set it to the value `1` (one) as in the following example:

```
$jnx->get_software_information(brief => 1);
```

- An option with a variable value is defined as type `$STRING`. In the following example, the `get_cos_drop_profile_information` method takes the `profile_name` argument:

```
Method : <get-cos-drop-profile-information>
Returns: <cos-drop-profile-information>
Command: "show class-of-service drop-profile"
get_cos_drop_profile_information => {
```

```
 profile_name => $STRING,
 },
```

To include a variable value when invoking a method, enclose the value in single quotes as in the following example:

```
$jnx->get_cos_drop_profile_information(profile_name => 'user-drop-profile');
```

- An attribute is defined as type **\$ATTRIBUTE**. In the following example, the **load\_configuration** method takes the **rollback** attribute:

```
load_configuration => {
 rollback => $ATTRIBUTE
},
```

To include a numerical attribute value when invoking a method, set it to the appropriate value. The following example rolls the candidate configuration back to the previous configuration that has an index of 2:

```
$jnx->load_configuration(rollback => 2);
```

To include a string attribute value when invoking a method, enclose the value in single quotes as in the following example:

```
$jnx->get_configuration(format => 'text');
```

- A set of configuration statements or corresponding tag elements is defined as type **\$DOM**. In the following example, the **get\_configuration** method takes a set of configuration statements (along with two attributes):

```
get_configuration => {
 configuration => $DOM,
 format => $ATTRIBUTE,
 database => $ATTRIBUTE,
},
```

To include a set of configuration statements when invoking a method, provide a parsed set of statements or tag elements. The following example refers to a set of Junos XML configuration tag elements in the **config-input.xml** file. For further discussion, see [“Example: Loading Configuration Statements” on page 997](#).

```
my $parser = new XML::DOM::Parser;
$jnx->load_configuration(
 format => 'xml',
 action => 'merge',
 configuration => $parser->parsefile(config-input.xml)
);
```

A method can have a combination of fixed-form options, options with variable values, attributes, and a set of configuration statements. For example, the **get\_forwarding\_table\_information** method has four fixed-form options and five options with variable values:

```
Method : <get-forwarding-table-information>
Returns: <forwarding-table-information>
Command: "show route forwarding-table"
get_forwarding_table_information => {
 detail => $TOGGLE,
 extensive => $TOGGLE,
```

```

multicast => $TOGGLE,
family => $STRING,
vpn => $STRING,
summary => $TOGGLE,
matching => $STRING,
destination => $STRING,
label => $STRING,
},

```

### Submitting a Request

The following code is the recommended way to send a request to the Junos XML protocol server and shows how to handle error conditions. The `$jnx` variable is defined to be a `JUNOS::Device` object, as discussed in [“Establishing the Connection” on page 992](#). A detailed discussion of the functional subsections follows the complete code sample.

```

my %arguments = ();
%arguments = (argument1 => value1 ,
 argument2 => value2 , ...);
 argument3 => value3 ,
 ...);

my $res = $jnx-> method (%args);

unless (ref $res) {
 $jnx->request_end_session();
 $jnx->disconnect();
 print "ERROR: Could not send request to $hostname\n";
}

my $err = $res->getFirstError();
if ($err) {
 $jnx->request_end_session();
 $jnx->disconnect();
 print "ERROR: Error for $hostname: " . $err->{message} . "\n";
}

```

The first subsection of the preceding code sample creates a hash called `%arguments` to define values for a method's options or attributes. For each argument, the application uses the notation described in [“Providing Method Options or Attributes” on page 993](#).

```

my %arguments = ();
%arguments = (argument1 => value1 ,
 argument2 => value2 , ...);

```

```
argument3 => value3 ,
...);
```

The application then invokes the method, defining the `$res` variable to point to the `JUNOS::Response` object that the Junos XML protocol server returns in response to the request (the object is defined in the `lib/JUNOS/Response.pm` file in the Junos XML protocol Perl distribution):

```
my $res = $jnx-> method (%args);
```

If the attempt to send the request failed, the application prints an error message and closes the connection:

```
unless (ref $res) {
 $jnx->request_end_session();
 $jnx->disconnect();
 print "ERROR: Could not send request to $hostname\n";
}
```

If there was an error in the Junos XML protocol server's response, the application prints an error message and closes the connection. The `getFirstError` function is defined in the `JUNOS::Response` module (`lib/JUNOS/Response.pm`) in the Junos XML protocol Perl distribution.

```
my $err = $res->getFirstError();
if ($err) {
 $jnx->request_end_session();
 $jnx->disconnect();
 print "ERROR: Error for $hostname: " . $err->{message} . "\n";
}
```

### Example: Getting an Inventory of Hardware Components

The `get_chassis_inventory.pl` script retrieves and displays a detailed inventory of the hardware components installed in a routing, switching, or security platform. It is equivalent to issuing the `show chassis hardware detail` command.

After establishing a connection to the Junos XML protocol server, the script defines `get_chassis_inventory` as the request to send and includes the `detail` argument:

```
my $query = "get_chassis_inventory";
my %queryargs = (detail => 1);
```

The script sends the query and assigns the results to the `$res` variable. It performs two tests on the results, and prints an error message if it cannot send the request or if errors occurred when executing it. If no errors occurred, the script uses XSLT to transform the results. For more information, see [“Parsing and Formatting an Operational Response” on page 1001](#).

```
send the command and receive a XML::DOM object
my $res = $jnx->$query(%queryargs);
unless (ref $res) {
 die "ERROR: $deviceinfo{hostname}: failed to execute command $query.\n";
}
Check and see if there were any errors in executing the command.
my $err = $res->getFirstError();
if ($err) {
 print STDERR "ERROR: $deviceinfo{'hostname'} - ", $err->{message}, "\n";
}
```

```

} else {
 # Now do the transformation using XSLT
 ... code that uses XSLT to process results ...
}

```

### Example: Loading Configuration Statements

The `load_configuration.pl` script loads configuration statements onto a device. It uses the basic structure for sending requests described in “[Submitting a Request](#)” on page 995 but also defines a `graceful_shutdown` subroutine that handles errors in a slightly more elaborate manner than that described in “[Submitting a Request](#)” on page 995. The following sections describe the different functions that the script performs:

- [Handling Error Conditions](#) on page 997
- [Locking the Configuration](#) on page 998
- [Reading In and Parsing the Configuration Data](#) on page 998
- [Loading the Configuration Data](#) on page 1000
- [Committing the Configuration](#) on page 1001

#### Handling Error Conditions

The `graceful_shutdown` subroutine in the `load_configuration.pl` script handles errors in a slightly more elaborate manner than the generic structure described in “[Submitting a Request](#)” on page 995. It employs the following additional constants:

```

use constant REPORT_SUCCESS => 1;
use constant REPORT_FAILURE => 0;
use constant STATE_CONNECTED => 1;
use constant STATE_LOCKED => 2;
use constant STATE_CONFIG_LOADED => 3;

```

The first two `if` statements in the subroutine refer to the `STATE_CONFIG_LOADED` and `STATE_LOCKED` conditions, which apply specifically to loading a configuration in the `load_configuration.pl` script. The `if` statement for `STATE_CONNECTED` is similar to the error checking described in “[Submitting a Request](#)” on page 995. The `eval` statement used in each case ensures that any errors that occur during execution of the enclosed function call are trapped so that failure of the function call does not cause the script to exit.

```

sub graceful_shutdown
{
 my ($jnx, $req, $state, $success) = @_;

 if ($state >= STATE_CONFIG_LOADED) {
 print "Rolling back configuration ... \n";
 eval {
 $jnx->load_configuration(rollback => 0);
 };
 }

 if ($state >= STATE_LOCKED) {
 print "Unlocking configuration database ... \n";
 eval {
 $jnx->unlock_configuration();
 };
 }
}

```

```

}

if ($state >= STATE_CONNECTED) {
 print "Disconnecting from the device ...\n";
 eval {
 $jnx->request_end_session()
 $jnx->disconnect();
 };
}

if ($success) {
 die "REQUEST $req SUCCEEDED\n";
} else {
 die "REQUEST $req FAILED\n";
};
}

```

### ***Locking the Configuration***

The main section of the **load\_configuration.pl** script begins by establishing a connection to a Junos XML protocol server, as described in [“Establishing the Connection” on page 992](#). It then invokes the **lock\_configuration** method to lock the configuration database. In case of error, the script invokes the **graceful\_shutdown** subroutine described in [“Handling Error Conditions” on page 997](#).

```

print "Locking configuration database ...\n";
my $res = $jnx->lock_configuration();
my $err = $res->getFirstError();
if ($err) {
 print "ERROR: $deviceinfo{hostname}: failed to lock configuration. Reason:
 $err->{message}.\n";
 graceful_shutdown($jnx, $xmlfile, STATE_CONNECTED, REPORT_FAILURE);
}

```

### ***Reading In and Parsing the Configuration Data***

In the following code sample, the **load\_configuration.pl** script reads in and parses a file that contains Junos XML configuration tag elements or ASCII-formatted statements. A detailed discussion of the functional subsections follows the complete code sample.

```

Load the configuration from the given XML file
print "Loading configuration from $xmlfile ...\n";
if (! -f $xmlfile) {
 print "ERROR: Cannot load configuration in $xmlfile\n";
 graceful_shutdown($jnx, $xmlfile, STATE_LOCKED, REPORT_FAILURE);
}

my $parser = new XML::DOM::Parser;
...

my $doc;
if ($opt{t}) {
 my $xmlstring = get_escaped_text($xmlfile);
 $doc = $parser->parsestring($xmlstring) if $xmlstring;
} else {

```

```

 $doc = $parser->parsefile($xmlfile);
}

unless (ref $doc) {
 print "ERROR: Cannot parse $xmlfile, check to make sure the XML data is
well-formed\n";
 graceful_shutdown($jnx, $xmlfile, STATE_LOCKED, REPORT_FAILURE);
}

```

The first subsection of the preceding code sample verifies the existence of the file containing configuration data. The name of the file was previously obtained from the command line and assigned to the `$xmlfile` variable. If the file does not exist, the script invokes the `graceful_shutdown` subroutine:

```

print "Loading configuration from $xmlfile ...\n";
if (! -f $xmlfile) {
 print "ERROR: Cannot load configuration in $xmlfile\n";
 graceful_shutdown($jnx, $xmlfile, STATE_LOCKED, REPORT_FAILURE);
}

```

If the `-t` command-line option was included when the `load_configuration.pl` script was invoked, the file referenced by the `$xmlfile` variable should contain formatted ASCII configuration statements like those returned by the CLI configuration-mode `show` command. The script invokes the `get_escaped_text` subroutine described in [“Converting Disallowed Characters” on page 990](#), assigning the result to the `$xmlstring` variable. The script invokes the `parsestring` function to transform the data in the file into the proper format for loading into the configuration hierarchy, and assigns the result to the `$doc` variable. The `parsestring` function is defined in the `XML::DOM::Parser` module, and the first line in the following sample code instantiates the module as an object, setting the `$parser` variable to refer to it:

```

my $parser = new XML::DOM::Parser;
...
my $doc;
if ($opt{t}) {
 my $xmlstring = get_escaped_text($xmlfile);
 $doc = $parser->parsestring($xmlstring) if $xmlstring;
}

```

If the file contains Junos XML configuration tag elements instead, the script invokes the `parsefile` function (also defined in the `XML::DOM::Parser` module) on the file:

```

} else {
 $doc = $parser->parsefile($xmlfile);
}

```

If the parser cannot transform the file, the script invokes the `graceful_shutdown` subroutine described in [“Handling Error Conditions” on page 997](#):

```

unless (ref $doc) {
 print "ERROR: Cannot parse $xmlfile, check to make sure the XML data is
well-formed\n";
}

```

```
 graceful_shutdown($jnx, $xmlfile, STATE_LOCKED, REPORT_FAILURE);
 }

```

### *Loading the Configuration Data*

The script now invokes the **load\_configuration** method to load the configuration onto the device. It places the statement inside an **eval** block to ensure that the **graceful\_shutdown** subroutine is invoked if the response from the Junos XML protocol server has errors.

```
eval {
 $res = $jnx->load_configuration(
 format => $config_format,
 action => $load_action,
 configuration => $doc);
};
if ($?) {
 print "ERROR: Failed to load the configuration from $xmlfile. Reason: $_\n";
 graceful_shutdown($jnx, $xmlfile, STATE_CONFIG_LOADED, REPORT_FAILURE);
 exit(1);
}

```

The variables used to define the method's three arguments were set at previous points in the application file:

- The **\$config\_format** variable was previously set to **xml** unless the **-t** command-line option was included:

```
my $config_format = "xml";
$config_format = "text" if $opt{t};

```

- The **\$load\_action** variable was previously set to **merge** unless the **-a** command-line option was included. The final two lines verify that the specified value is one of the acceptable choices:

```
my $load_action = "merge";
$load_action = $opt{a} if $opt{a};
use constant VALID_ACTIONS => "merge|replace|override";
output_usage() unless ($load_action =~ /VALID_ACTIONS/);

```

- The **\$doc** variable was set to the output from the **parsestring** or **parsefile** function (defined in the **XML::DOM::Parser** module), as described in [“Reading In and Parsing the Configuration Data” on page 998](#).

The script performs two additional checks for errors and invokes the **graceful\_shutdown** subroutine in either case:

```
unless (ref $res) {
 print "ERROR: Failed to load the configuration from $xmlfile\n";
 graceful_shutdown($jnx, $xmlfile, STATE_LOCKED, REPORT_FAILURE);
}
$error = $res->getFirstError();
if ($error) {
 print "ERROR: Failed to load the configuration. Reason: $error->{message}\n";
}

```

```
 graceful_shutdown($jnx, $xmlfile, STATE_CONFIG_LOADED, REPORT_FAILURE);
}
```

### *Committing the Configuration*

If there are no errors, the script invokes the `commit_configuration` method (defined in the file `lib/JUNOS/Methods.pm` in the Junos XML protocol Perl distribution):

```
print "Committing configuration from $xmlfile ...\n";
$res = $jnx->commit_configuration();
$err = $res->getFirstError();
if ($err) {
 print "ERROR: Failed to commit configuration. Reason: $err->{message}.\n";
 graceful_shutdown($jnx, $xmlfile, STATE_CONFIG_LOADED, REPORT_FAILURE);
}
```

## Parsing and Formatting the Response from the Junos XML Protocol Server

As the last step in sending a request, the application verifies that there are no errors with the response from the Junos XML protocol server (see [“Submitting a Request” on page 995](#)). It can then write the response to a file, to the screen, or both. If the response is for an operational query, the application usually uses XSLT to transform the output into a more readable format, such as HTML or formatted ASCII text. If the response consists of configuration data, the application can store it as XML (the Junos XML tag elements generated by default from the Junos XML protocol server) or transform it into formatted ASCII text.

The following sections discuss parsing and formatting options:

- [Parsing and Formatting an Operational Response on page 1001](#)
- [Parsing and Outputting Configuration Data on page 1003](#)

### Parsing and Formatting an Operational Response

The following code sample from the `diagnose_bgp.pl` and `get_chassis_inventory.pl` scripts uses XSLT to transform an operational response from the Junos XML protocol server into a more readable format. A detailed discussion of the functional subsections follows the complete code sample.

```
Get the name of the output file
my $outputfile = $opt{o} || "";

Retrieve the XSLT file
my $xslfile = $opt{x} || "xsl/text.xsl";
if ($xslfile && ! -f $xslfile) {
 die "ERROR: XSLT file $xslfile does not exist";
}

#Get the xmlfile
my $xmlfile = "$deviceinfo{hostname}.xml";
$res->printToFile($xmlfile);

my $nm = $res->translateXSLtoRelease('xmlns:lc', $xslfile, "$xslfile.tmp");

if ($nm) {
 print "Transforming $xmlfile with $xslfile...\n" if $outputfile;
```

```

my $command = "xsltproc $nm $deviceinfo{hostname}.xml";

$command .= "> $outputfile" if $outputfile;
system($command);
print "Done\n" if $outputfile;
print "See $outputfile\n" if $outputfile;
}

else {
 print STDERR "ERROR: Invalid XSL file $xslfile\n";
}

```

The first line of the preceding code sample illustrates how the scripts read the **-o** option from the command line to obtain the name of the file into which to write the results of the XSLT transformation:

```
my $outputfile = $opt{o} || "";
```

From the **-x** command-line option, the scripts obtain the name of the XSLT file to use, setting a default value if the option is not provided. The scripts exit if the specified file does not exist. The following example is from the **diagnose\_bgp.pl** script:

```

my $xslfile = $opt{x} || "xsl/text.xsl";
if ($xslfile && ! -f $xslfile) {
 die "ERROR: XSLT file $xslfile does not exist";
}

```

For examples of XSLT files, see the following directories in the Junos XML protocol Perl distribution:

- The **examples/diagnose\_bpg/xsl** directory contains XSLT files for the **diagnose\_bpg.pl** script: **dhtml.xsl** generates dynamic HTML, **html.xsl** generates HTML, and **text.xsl** generates ASCII text.
- The **examples/get\_chassis\_inventory/xsl** directory contains XSLT files for the **get\_chassis\_inventory.pl** script: **chassis\_inventory\_csv.xsl** generates a list of comma-separated values, **chassis\_inventory\_html.xsl** generates HTML, and **chassis\_inventory\_xml.xsl** generates XML.

The actual parsing operation begins by setting the variable **\$xmlfile** to a filename of the form **device-name.xml** and invoking the **printToFile** function to write the Junos XML protocol server's response into the file (the **printToFile** function is defined in the **XML::DOM::Parser** module):

```

my $xmlfile = "$deviceinfo{hostname}.xml";
$res->printToFile($xmlfile);

```

The next line invokes the **translateXSLtoRelease** function (defined in the **Junos::Response** module) to alter one of the namespace definitions in the XSLT file. This is necessary because the XSLT 1.0 specification requires that every XSLT file define a specific value for each default namespace used in the data being transformed. The **xmlns** attribute in a Junos XML operational response tag element includes a code representing the Junos OS version, such as **12.1R1** for the initial version of Junos OS Release 12.1. Because the same XSLT file can be applied to operational response tag elements from devices running different versions of the Junos OS, the XSLT file cannot predefine an **xmlns** namespace value that matches all versions. The **translateXSLtoRelease** function alters the namespace

definition in the XSLT file identified by the **\$xslfile** variable to match the value in the Junos XML protocol server's response. It assigns the resulting XSLT file to the **\$nm** variable.

```
my $nm = $res->translateXSLtoRelease('xmlns:lc', $xslfile, "$xslfile.tmp");
```

After verifying that the **translateXSLtoRelease** function succeeded, the invokes the **format\_by\_xslt**, which builds a command string and assigns it to the **\$command** variable. The first part of the command string invokes the **xsltproc** command and specifies the names of the XSLT and configuration data files (**\$nm** and **\$deviceinfo{hostname}.xml**):

```
if ($nm) {
 print "Transforming $xmlfile with $xslfile...\n" if $outputfile;
 my $command = "xsltproc $nm $deviceinfo{hostname}.xml";
```

If the **\$outputfile** variable is defined (the file for storing the result of the XSLT transformation exists), the script appends a string to the **\$command** variable to write the results of the **xsltproc** command to the file. (If the file does not exist, the script writes the results to standard out [stdout].) The script then invokes the **system** function to execute the command string and prints status messages to stdout.

```
 $command .= "> $outputfile" if $outputfile;
 system($command);
 print "Done\n" if $outputfile;
 print "See $outputfile\n" if $outputfile;
}
```

If the **translateXSLtoRelease** function fails (the **if (\$nm)** expression evaluates to "false"), the script prints an error:

```
else {
 print STDERR "ERROR: Invalid XSL file $xslfile\n";
}
```

### Parsing and Outputting Configuration Data

The **get\_config.pl** script in the **examples\RDB** directory uses the **outconfig** subroutine to write the configuration data obtained from the Junos XML protocol server to a file either as Junos XML tag elements or as formatted ASCII text.

The **outconfig** subroutine takes four parameters. Three must have defined values: the directory in which to store the output file, device hostname, and the XML DOM tree (the configuration data) returned by the Junos XML protocol server. The fourth parameter indicates whether to output the configuration as formatted ASCII text, and has a null value if the requested output is Junos XML tag elements. In the following code sample, the script obtains values for the four parameters and passes them to the **outconfig** subroutine. A detailed discussion of each line follows the complete code sample.

```
my(%opt,$login,$password);

getopts('!p:dm:hit', \%opt) || output_usage();
output_usage() if $opt{h};

my $basepath = shift || output_usage;

my $hostname = shift || output_usage;
```

```
my $config = getconfig($hostname, $jnx, $opt{t});
```

```
outconfig($basepath, $hostname, $config, $opt{t});
```

In the first lines of the preceding sample code, the **get\_config.pl** script uses the following statements to obtain values for the four parameters to the **outconfig** subroutine:

- If the user provides the **-t** option on the command line, the **getopts** subroutine records it in the **%opt** hash. The value keyed to **\$opt{t}** is passed as the fourth parameter to the **outconfig** subroutine. (For more information about reading options from the command line, see [“Example: Collecting Parameters Interactively” on page 987.](#))

```
getopts('!p:dm:hit', \%opt) || output_usage();
```

- The following line reads the first element of the command line that is not an option preceded by a hyphen. It assigns the value to the **\$basepath** variable, defining the name of the directory in which to store the file containing the output from the **outconfig** subroutine. The variable value is passed as the first parameter to the **outconfig** subroutine.

```
my $basepath = shift || output_usage;
```

- The following line reads the next element on the command line. It assigns the value to the **\$hostname** variable, defining the routing, switching, or security device hostname. The variable value is passed as the second parameter to the **outconfig** subroutine.

```
my $hostname = shift || output_usage;
```

- The following line invokes the **getconfig** subroutine to obtain configuration data from the Junos XML protocol server on the specified device, assigning the resulting XML DOM tree to the **\$config** variable. The variable value is passed as the third parameter to the **outconfig** subroutine.

```
my $config = getconfig($hostname, $jnx, $opt{t});
```

The following code sample invokes and defines the **outconfig** subroutine. A detailed discussion of each functional subsection in the subroutine follows the complete code sample.

```
outconfig($basepath, $hostname, $config, $opt{t});
```

```
sub outconfig($$$$) {
 my $leader = shift;
 my $hostname = shift;
 my $config = shift;
 my $text_mode = shift;
 my $trailer = "xmlconfig";
 my $filename = $leader . "/" . $hostname . "." . $trailer;

 print "# storing configuration for $hostname as $filename\n";

 my $config_node;
 my $top_tag = "configuration";
 $top_tag .= "-text" if $text_mode;
 if ($config->getTagName() eq $top_tag) {
 $config_node = $config;
 } else {
```

```

 print "# unknown response component ", $config->getTagName(), "\n";
}

if ($config_node && $config_node ne "") {
 if (open OUTPUTFILE, ">$filename") {
 if (!$text_mode) {
 print OUTPUTFILE "<?xml version='1.0'?>\n";
 print OUTPUTFILE $config_node->toString(), "\n";
 } else {
 my $buf = $config_node->getFirstChild()->toString();
 $buf =~ s/($char_class)/$escapes{$1}/ge;
 print OUTPUTFILE "$buf\n";
 }
 close OUTPUTFILE;
 }
 else {
 print "ERROR: could not open output file $filename\n";
 }
}
else {
 print "ERROR: empty configuration data for $hostname\n";
}
}

```

The first lines of the **outconfig** subroutine read in the four parameters passed in when the subroutine is invoked, assigning each to a local variable:

```

outconfig($basepath, $hostname, $config, $opt{t});
sub outconfig($$$$) {
 my $leader = shift;
 my $hostname = shift;
 my $config = shift;
 my $text_mode = shift;

```

The subroutine constructs the name of the file to which to write the subroutine's output and assigns the name to the **\$filename** variable. The filename is constructed from the first two parameters (the directory name and hostname) and the **\$trailer** variable, resulting in a name of the form **directory-name/hostname.xmlconfig**:

```

my $trailer = "xmlconfig";
my $filename = $leader . "/" . $hostname . "." . $trailer;

```

```

print "# storing configuration for $hostname as $filename\n";

```

The subroutine checks that the first tag in the XML DOM tree correctly indicates the type of configuration data in the file. If the user included the **-t** option on the command line, the first tag should be **<configuration-text>** because the file contains formatted ASCII configuration statements; otherwise, the first tag should be **<configuration>** because the file contains Junos XML tag elements. The subroutine sets the **\$top\_tag** variable to the appropriate value depending on the value of the **\$text\_mode** variable (which takes its value from **opt{t}**, passed as the fourth parameter to the subroutine). The subroutine invokes the **getTagName** function (defined in the **XML::DOM::Element** module) to retrieve the name of the first tag in the input file, and compares the name to the value of the **\$top\_tag** variable. If the comparison succeeds, the XML DOM tree is assigned to the

**\$config\_node** variable. Otherwise, the subroutine prints an error message because the XML DOM tree is not valid configuration data.

```
my $config_node;
my $top_tag = "configuration";
$top_tag .= "-text" if $text_mode;
if ($config->getTagName() eq $top_tag) {
 $config_node = $config;
} else {
 print "# unknown response component ", $config->getTagName(), "\n";
}
```

The subroutine then uses several nested **if** statements. The first **if** statement verifies that the XML DOM tree exists and contains data:

```
if ($config_node && $config_node ne "") {
 ... actions if XML DOM tree contains data ...
}
else {
 print "ERROR: empty configuration data for $hostname\n";
}
```

If the XML DOM tree contains data, the subroutine verifies that the output file can be opened for writing:

```
if (open OUTPUTFILE, ">$filename") {
 ... actions if output file is writable ...
}
else {
 print "ERROR: could not open output file $filename\n";
}
```

If the output file can be opened for writing, the script writes the configuration data into it. If the user requested Junos XML tag elements—the user did not include the **-t** option on the command line, so the **\$text\_mode** variable does not have a value—the script writes the string **<?xml version=1.0?>** as the first line in the output file, and then invokes the **toString** function (defined in the **XML::DOM** module) to write each Junos XML tag element in the XML DOM tree on a line in the output file:

```
if (!$text_mode) {
 print OUTPUTFILE "<?xml version=\"1.0\"?>\n";
 print OUTPUTFILE $config_node->toString(), "\n";
}
```

If the user requested formatted ASCII text, the script invokes the **getFirstChild** and **toString** functions (defined in the **XML::DOM** module) to write the content of each tag on its own line in the output file. The script substitutes predefined entity references for disallowed characters (which are defined in the **%escapes** hash), writes the output to the output file, and closes the output file. (For information about defining the **%escapes** hash to contain the set of disallowed characters, see [“Converting Disallowed Characters” on page 990](#).)

```
} else {
 my $buf = $config_node->getFirstChild()->toString();
 $buf =~ s/($char_class)/$escapes{$1}/ge;
 print OUTPUTFILE "$buf\n";
}
```

```
}
close OUTPUTFILE;
```

## Closing the Connection to the Junos XML Protocol Server

To end the Junos XML protocol session and close the connection to the device, each sample script invokes the **request\_end\_session** and **disconnect** methods. Several of the scripts do this in standalone statements:

```
$jnx->request_end_session();
$jnx->disconnect();
```

The **load\_configuration.pl** script invokes the **graceful\_shutdown** subroutine instead (for more information, see [“Handling Error Conditions” on page 997](#)):

```
graceful_shutdown($jnx, $xmlfile, STATE_LOCKED, REPORT_SUCCESS);
```

---

## Mapping CLI Commands to Perl Methods

The sample scripts described in [“Overview of the Junos::Device Perl Module and Sample Scripts” on page 979](#) invoke only a small number of the predefined Junos XML Perl methods available in the current version of the Junos OS. There is a Perl method for every Junos XML request tag element. To derive the Perl method name from the request tag element name, replace each hyphen in the tag element name with an underscore and remove the enclosing angle brackets from the tag element name. For example, the **get\_bgp\_group\_information** Perl method corresponds to the **<get-bgp-group-information>** tag element.

For a list of all of the Perl methods available in the current version of the Junos OS, see the chapter in the *Junos XML API Operational Developer Reference* that maps Junos XML request tag elements to CLI commands and Perl methods. For information about optional and required attributes for a particular Perl method, see the entry for the corresponding Junos XML request tag element in the chapter titled “Summary of Operational Request Tags” in the *Junos XML API Operational Developer Reference*.

# Writing Junos XML Protocol C Client Applications

In this section, we offer two examples of using C to create client applications to access routers, switches, and security devices running Junos OS. The first example shows how to establish a Junos XML protocol session. The second example, shows how to retrieve and manipulate device configurations using C.

- [Establishing a Junos XML Protocol Session on page 1009](#)
- [Accessing and Editing Device Configurations on page 1010](#)

## Establishing a Junos XML Protocol Session

---

The following example illustrates how a client application written in C can use the SSH or Telnet protocol to establish a Junos XML protocol connection and session. In the line that begins with the string **execlp**, the client application invokes the **ssh** command. (Substitute the **telnet** command if appropriate.) The **routing-platform** argument to the **execlp** routine specifies the hostname or IP address of the Junos XML protocol server device. The **junoscript** argument is the command that converts the connection to a Junos XML protocol session.

For more information about Junos XML protocol sessions, see [“Controlling the Junos XML Management Protocol Session” on page 795](#).

```
int ipipes[2], opipes[2];
pid_t pid;
int rc;
char buf[BUFSIZ];

if (pipe(ipipes) < 0 || pipe(opipes) < 0)
 err(1, "pipe failed");

pid = fork();
if (pid < 0)
 err(1, "fork failed");

if (pid == 0) {
 dup2(opipes[0], STDIN_FILENO);
 dup2(ipipes[1], STDOUT_FILENO);
 dup2(ipipes[1], STDERR_FILENO);
```

```
close(ipipes[0]); /* close read end of pipe */
close(ipipes[1]); /* close write end of pipe */
close(opipes[0]); /* close read end of pipe */
close(opipes[1]); /* close write end of pipe */

execlp("ssh", "ssh", "-x", routing_platform, "junoscript", NULL);
err(1, "unable to execute: ssh %s junoscript," device);
}

close(ipipes[1]); /* close write end of pipe */
close(opipes[0]); /* close read end of pipe */

if (write(opipes[1], initial_handshake, strlen(initial_handshake)) < 0)
 err(1, "writing initial handshake failed");

rc=read(ipipes[0], buf, sizeof(buf));
if (rc < 0)
 err(1, "read initial handshake failed");
```

---

## Accessing and Editing Device Configurations

This example code shows a script that can be used to access, manipulate and commit device configurations using C.

## PART 5

# Junos XML API Configuration Reference for Security Devices

This section lists the configuration tag elements that are specific to devices belonging to:

- J Series
- SRX Series
- [Tag Elements Beginning with A on page 1021](#)
- [Tag Elements Beginning with B on page 1055](#)
- [Tag Elements Beginning with C on page 1065](#)
- [Tag Elements Beginning with D on page 1099](#)
- [Tag Elements Beginning with E on page 1299](#)
- [Tag Elements Beginning with F on page 1313](#)
- [Tag Elements Beginning with G on page 1419](#)
- [Tag Elements Beginning with H on page 1431](#)
- [Tag Elements Beginning with I on page 1439](#)
- [Tag Elements Beginning with J on page 1489](#)
- [Tag Elements Beginning with K on page 1491](#)
- [Tag Elements Beginning with L on page 1495](#)
- [Tag Elements Beginning with M on page 1509](#)
- [Tag Elements Beginning with N on page 1545](#)
- [Tag Elements Beginning with O on page 1553](#)
- [Tag Elements Beginning with P on page 1555](#)
- [Tag Elements Beginning with Q on page 1679](#)
- [Tag Elements Beginning with R on page 1681](#)
- [Tag Elements Beginning with S on page 1713](#)
- [Tag Elements Beginning with T on page 1775](#)
- [Tag Elements Beginning with U on page 1859](#)
- [Tag Elements Beginning with V on page 1871](#)
- [Tag Elements Beginning with W on page 1897](#)

- [Tag Elements Beginning with X on page 1907](#)
- [Tag Elements Beginning with Z on page 1909](#)

## CHAPTER 27

# Tag Elements Beginning with A

This chapter lists the configuration tag elements that have names beginning with the letter *a*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<access-point>` configuration/wlan

#### Usage

```
<configuration>
 <wlan>
 <access-point>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <mac-address>mac-address</mac-address>
 <location>location</location>
 <external>...</external>
 <access-point-options>...</access-point-options>
 <logging-options>...</logging-options>
 <radio>...</radio>
 </access-point>
 </wlan>
</configuration>
```

**Description** WLAN access point configuration

**Contents** `<name>`—Specify the access point name

<description>—Specify the access point description

<mac-address>—Access point ethernet port MAC address

<location>—Location of the access point

<external>—External type access point

<access-point-options>—Configure access point options

<logging-options>—Configure access point logging options

<radio>—Access point radio settings

---

## <access-point-options> configuration/wlan/access-point

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <access-point-options>
 <country>...</country>
 <station-mac-filter>...</station-mac-filter>
 </access-point-options>
 </access-point>
 </wlan>
</configuration>
```

**Description** Configure access point options

**Contents** <country>—Country name

<station-mac-filter>—

---

## <access-point-queues> configuration/wlan/access-point/radio/quality-of-service

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <voice-queue>...</voice-queue>
 <video-queue>...</video-queue>
 <best-effort-queue>...</best-effort-queue>
 <background-queue>...</background-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
```

</configuration>

**Description** Configure the access point queues

**Contents** <voice-queue>—Configure voice queue  
<video-queue>—Configure video queue  
<best-effort-queue>—Configure best effort queue  
<background-queue>—Configure background queue

---

### <action> configuration/security/gprs/gtp/profile/apn/imsi-prefix

---

#### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<profile>
<apn>
<imsi-prefix>
<action>
<pass/>
<drop/>
<selection>...</selection>
</action>
</imsi-prefix>
</apn>
</profile>
</gtp>
</gprs>
</security>
</configuration>
```

**Description** Configure GTP profile APN action

**Contents** <pass>—Pass all selection modes for this APN  
<drop>—Drop all selection modes for this APN  
<selection>—Allowed selection modes for this APN

---

### <action> configuration/protocols/oam/ethernet/connectivity-fault-management/action-profile

---

#### Usage

```
<configuration>
<protocols>
<oam>
```

```
<ethernet>
 <connectivity-fault-management>
 <action-profile>
 <action>
 <interface-down/>
 </action>
 </action-profile>
 </connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description**

**Contents**   <interface-down>—Mark the interface as down

---

**<action-profile> configuration/security/datapath-debug**

---

**Usage**

```
<configuration>
 <security>
 <datapath-debug>
 <action-profile>
 <profile-name>profile-name</profile-name> <!-- identifier -->
 <preserve-trace-order/>
 <record-pic-history/>
 <event>...</event>
 <module>...</module>
 </action-profile>
 </datapath-debug>
 </security>
</configuration>
```

**Description**   Action profile definitions

**Contents**   <profile-name>—Name of the action profile

              <preserve-trace-order>—Preserve trace order (has performance overhead)

              <record-pic-history>—Record the PIC(s) in which the packet has been processed

              <event>—

              <module>—

---

**<action-profile> configuration/protocols/oam/ethernet/connectivity-fault-management**

---

**Usage**

```
<configuration>
```

```

<protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <action-profile>
 <action-profile-name>action-profile-name</action-profile-name> <!-- identifier
-->
 <event>...</event>
 <action>...</action>
 <default-actions>...</default-actions>
 </action-profile>
 </connectivity-fault-management>
 </ethernet>
 </oam>
</protocols>
</configuration>

```

**Description** Action profiles to use when one or more remote maintenance association endpoints are down

**Contents** <action-profile-name>—Name of action profile

<event>—Events that need to be monitored

<action>—

<default-actions>—Action that needs to be taken

## <address> configuration/security/ike/gateway

### Usage

```

<configuration>
 <security>
 <ike>
 <gateway>
 <address>
 <address/>
 </address>
 </gateway>
 </ike>
 </security>
</configuration>

```

**Description** Addresses or hostnames of peer:1 primary, upto 4 backups

**Contents** <address>—

## **<address> configuration/security/group-vpn/member/ike/gateway**

---

**Usage**

```
<configuration>
<security>
 <group-vpn>
 <member>
 <ike>
 <gateway>
 <address>
 <value>value</value>
 </address>
 </gateway>
 </ike>
 </member>
 </group-vpn>
</security>
</configuration>
```

**Description** Addresses or hostnames of peer:1 primary, upto 4 backups

**Contents** <value>—Addresses or hostnames of peer:1 primary, upto 4 backups

## **<address> configuration/security/gprs/sctp/profile/limit/rate**

---

**Usage**

```
<configuration>
<security>
 <gprs>
 <sctp>
 <profile>
 <limit>
 <rate>
 <address>
 <ip-address>ip-address</ip-address> <!-- identifier -->
 <sccp>sccp</sccp>
 <ssp>ssp</ssp>
 <sst>sst</sst>
 </address>
 </rate>
 </limit>
 </profile>
 </sctp>
 </gprs>
</security>
</configuration>
```

**Description** Rate limit for a list of IP addresses

**Contents** <ip-address>—IP address

<sccp>—SCCP messages rate limit

<ssp>—SSP messages rate limit

<sst>—SST messages rate limit

---

## <address> configuration/security/address-book

---

### Usage

```
<configuration>
 <security>
 <address-book>
 <address>
 <address-name>address-name</address-name> <!-- identifier -->
 <description>description</description>
 <ip-prefix>ip-prefix</ip-prefix>
 <dns-name>...</dns-name>
 <wildcard-address>...</wildcard-address>
 <range-address>...</range-address>
 </address>
 </address-book>
 </security>
</configuration>
```

**Description** Define a security address

**Contents** <address-name>—Security address name

<description>—Text description of address

<ip-prefix>—Numeric IPv4 or IPv6 address with prefix

<dns-name>—DNS address name

<wildcard-address>—Numeric IPv4 wildcard address with in the form of a.d.d.r/netmask

<range-address>—Address range

---

## <address> configuration/security/address-book/address-set

---

### Usage

```
<configuration>
 <security>
 <address-book>
 <address-set>
 <address>
 <address-name>address-name</address-name> <!-- identifier -->
 </address>
 </address-set>
 </address-book>
 </security>
```

</configuration>

**Description** Address to be included in this set

**Contents** <address-name>—Security address name

---

## <address> configuration/security/nat/source/pool

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<pool>
 <address>
 <ipaddr>ipaddr</ipaddr> <!-- identifier -->
 <to>...</to>
 </address>
</pool>
</source>
</nat>
</security>
</configuration>
```

**Description** Add address to pool

**Contents** <ipaddr>—IPv4 or IPv6 address or address range  
<to>—Upper limit of address range

---

## <address> configuration/security/nat/destination/pool

---

### Usage

```
<configuration>
<security>
<nat>
<destination>
<pool>
 <address>
 <ipaddr>ipaddr</ipaddr> <!-- mandatory -->
 <to>...</to>
 <port>port</port>
 </address>
</pool>
</destination>
</nat>
</security>
</configuration>
```

<b>Description</b>	Add address or address range to pool
<b>Contents</b>	<p>&lt;ipaddr&gt;—IPv4 or IPv6 address or address range</p> <p>&lt;to&gt;—Upper limit of address range</p> <p>&lt;port&gt;—Specify the port value</p>

### <address> configuration/security/nat/proxy-arp/interface

---

#### Usage

```

<configuration>
 <security>
 <nat>
 <proxy-arp>
 <interface>
 <address>
 <ipaddr>ipaddr</ipaddr> <!-- identifier -->
 <to>...</to>
 </address>
 </interface>
 </proxy-arp>
 </nat>
 </security>
</configuration>

```

<b>Description</b>	Proxy ARP address
<b>Contents</b>	<p>&lt;ipaddr&gt;—Address or address range</p> <p>&lt;to&gt;—Upper limit of address range</p>

### <address> configuration/security/nat/proxy-ndp/interface

---

#### Usage

```

<configuration>
 <security>
 <nat>
 <proxy-ndp>
 <interface>
 <address>
 <ipv6addr>ipv6addr</ipv6addr> <!-- identifier -->
 <to>...</to>
 </address>
 </interface>
 </proxy-ndp>
 </nat>
 </security>
</configuration>

```

<b>Description</b>	Proxy ndp address
<b>Contents</b>	<ipv6addr>—Address or address range  <to>—Upper limit of address range

---

## <address> configuration/security/zones/security-zone/address-book

---

### Usage

```
<configuration>
<security>
<zones>
<security-zone>
<address-book>
<address>
<address-name>address-name</address-name> <!-- identifier -->
<description>description</description>
<ip-prefix>ip-prefix</ip-prefix>
<dns-name>...</dns-name>
<wildcard-address>...</wildcard-address>
<range-address>...</range-address>
</address>
</address-book>
</security-zone>
</zones>
</security>
</configuration>
```

<b>Description</b>	Define a security address
<b>Contents</b>	<address-name>—Security address name  <description>—Text description of address  <ip-prefix>—Numeric IPv4 or IPv6 address with prefix  <dns-name>—DNS address name  <wildcard-address>—Numeric IPv4 wildcard address with in the form of a.d.d.r/netmask  <range-address>—Address range

---

## <address> configuration/security/zones/security-zone/address-book/address-set

---

### Usage

```
<configuration>
<security>
<zones>
<security-zone>
<address-book>
<address-set>
```

```

 <address>
 <address-name>address-name</address-name> <!-- identifier -->
 </address>
 </address-set>
</address-book>
</security-zone>
</zones>
</security>
</configuration>

```

**Description** Address to be included in this set

**Contents** <address-name>—Security address name

### <address-book> configuration/security

---

#### Usage

```

<configuration>
 <security>
 <address-book>
 <global/>
 <book-name/>
 <description>description</description>
 <address>...</address>
 <address-set>...</address-set>
 <attach>...</attach>
 </address-book>
 </security>
</configuration>

```

**Description** Security address book

**Contents** <global>—Default global address book name

<book-name>—Address book name

<description>—Text description of address book

<address>—Define a security address

<address-set>—Define a security address set

<attach>—Attach this address book to interface, zone or routing-instance

### <address-book> configuration/security/zones/security-zone

---

#### Usage

```

<configuration>
 <security>
 <zones>

```

```
<security-zone>
 <address-book>
 <address>...</address>
 <address-set>...</address-set>
 </address-book>
</security-zone>
</zones>
</security>
</configuration>
```

**Description** Address book entries

**Contents** <address>—Define a security address  
<address-set>—Define a security address set

---

### <address-set> configuration/security/address-book

---

#### Usage

```
<configuration>
 <security>
 <address-book>
 <address-set>
 <address-set-name>address-set-name</address-set-name> <!-- identifier -->
 <description>description</description>
 <address>...</address>
 <address-set>...</address-set>
 </address-set>
 </address-book>
 </security>
</configuration>
```

**Description** Define a security address set

**Contents** <address-set-name>—Security address-set name  
<description>—Text description of address set  
<address>—Address to be included in this set  
<address-set>—Define an address-set name

---

### <address-set> configuration/security/address-book/address-set

---

#### Usage

```
<configuration>
 <security>
 <address-book>
 <address-set>
 <address-set>
```

```

 <address-set-name>address-set-name</address-set-name> <!-- identifier -->
 </address-set>
</address-set>
</address-book>
</security>
</configuration>

```

**Description** Define an address-set name

**Contents** <address-set-name>—

### <address-set> configuration/security/zones/security-zone/address-book

---

#### Usage

```

<configuration>
<security>
<zones>
<security-zone>
<address-book>
<address-set>
 <address-set-name>address-set-name</address-set-name> <!-- identifier -->

 <description>description</description>
 <address>...</address>
 <address-set>...</address-set>
</address-set>
</address-book>
</security-zone>
</zones>
</security>
</configuration>

```

**Description** Define a security address set

**Contents** <address-set-name>—Security address-set name

<description>—Text description of address set

<address>—Address to be included in this set

<address-set>—Define an address-set name

### <address-set> configuration/security/zones/security-zone/address-book/address-set

---

#### Usage

```

<configuration>
<security>
<zones>
<security-zone>

```

```
<address-book>
 <address-set>
 <address-set>
 <address-set-name>address-set-name</address-set-name> <!-- identifier
-->
 </address-set>
 </address-set>
</address-book>
</security-zone>
</zones>
</security>
</configuration>
```

**Description** Define an address-set name

**Contents** <address-set-name>—

---

## <admin-authentication> configuration/wlan

### Usage

```
<configuration>
 <wlan>
 <admin-authentication>
 <encrypted-password>encrypted-password</encrypted-password>
 </admin-authentication>
 </wlan>
</configuration>
```

**Description** Authentication information for WLAN access points

**Contents** <encrypted-password>—Encrypted password

---

## <administrator> configuration/security/pki/ca-profile

### Usage

```
<configuration>
 <security>
 <pki>
 <ca-profile>
 <administrator>
 <email-address>email-address</email-address>
 </administrator>
 </ca-profile>
 </pki>
 </security>
</configuration>
```

**Description** Administrator information

**Contents**    <email-address>—Administrator e-mail to which to send certificate requests

## <aging> configuration/security/flow

---

**Usage**

```
<configuration>
 <security>
 <flow>
 <aging>
 <early-ageout>early-ageout</early-ageout>
 <low-watermark>low-watermark</low-watermark>
 <high-watermark>high-watermark</high-watermark>
 </aging>
 </flow>
 </security>
</configuration>
```

**Description**    Aging configuration

**Contents**    <early-ageout>—Delay before device declares session invalid

                 <low-watermark>—Percentage of session-table capacity at which aggressive aging-out ends

                 <high-watermark>—Percentage of session-table capacity at which aggressive aging-out starts

## <alarms> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <alarms>
 <potential-violation>...</potential-violation>
 </alarms>
 </security>
</configuration>
```

**Description**    Configure security alarms

**Contents**    <potential-violation>—Configure potential security violations

## <alg> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <alg>
```

```
<traceoptions>...</traceoptions>
<alg-manager>...</alg-manager>
<alg-support-lib>...</alg-support-lib>
<dns>...</dns>
<ftp>...</ftp>
<h323>...</h323>
<mgcp>...</mgcp>
<msrpc>...</msrpc>
<sunrpc>...</sunrpc>
<real>...</real>
<rsh>...</rsh>
<rtsp>...</rtsp>
<sccp>...</sccp>
<sip>...</sip>
<sql>...</sql>
<talk>...</talk>
<tftp>...</tftp>
<pptp>...</pptp>
<ike-esp-nat>...</ike-esp-nat>
</alg>
</security>
</configuration>
```

**Description** Configure ALG security options

**Contents**

- <traceoptions>—ALG trace options
- <alg-manager>—Configure ALG-MANAGER
- <alg-support-lib>—Configure ALG-SUPPORT-LIB
- <dns>—Configure DNS ALG
- <ftp>—Configure FTP ALG
- <h323>—Configure H.323 ALG
- <mgcp>—Configure MGCP ALG
- <msrpc>—Configure MSRPC ALG
- <sunrpc>—Configure SUNRPC ALG
- <real>—Configure Real Audio/Video ALG
- <rsh>—Configure RSH ALG
- <rtsp>—Configure RTSP ALG
- <sccp>—Configure SCCP ALG
- <sip>—Configure SIP ALG
- <sql>—Configure SQL ALG

<talk>—Configure Talk ALG

<tftp>—Configure TFTP ALG

<pptp>—Configure PPTP ALG

<ike-esp-nat>—Configure IKE-ESP ALG with NAT

---

### <alg-manager> configuration/security/alg

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <alg-manager>
 <traceoptions>...</traceoptions>
 </alg-manager>
 </alg>
 </security>
</configuration>
```

**Description**    Configure ALG-MANAGER

**Contents**    <traceoptions>—ALG-MANAGER trace options

---

### <alg-support-lib> configuration/security/alg

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <alg-support-lib>
 <traceoptions>...</traceoptions>
 </alg-support-lib>
 </alg>
 </security>
</configuration>
```

**Description**    Configure ALG-SUPPORT-LIB

**Contents**    <traceoptions>—ALG-SUPPORT-LIB trace options

---

### <all-tcp> configuration/security/flow/tcp-mss

---

**Usage**

```
<configuration>
 <security>
 <flow>
 <tcp-mss>
```

```
<all-tcp>
 <mss>mss</mss> <!-- mandatory -->
</all-tcp>
</tcp-mss>
</flow>
</security>
</configuration>
```

**Description** Enable MSS override for all packets

**Contents** <mss>—MSS value

---

### <allow-list> configuration/wlan/access-point/access-point-options/station-mac-filter

---

#### Usage

```
<configuration>
<wlan>
 <access-point>
 <access-point-options>
 <station-mac-filter>
 <allow-list>
 <mac-address>...</mac-address>
 </allow-list>
 </station-mac-filter>
 </access-point-options>
 </access-point>
</wlan>
</configuration>
```

**Description** Allow the MAC addresses

**Contents** <mac-address>—List of allowed MAC addresses

---

### <allowed-mac> configuration/ethernet-switching-options/secure-access-port/interface

---

#### Usage

```
<configuration>
<ethernet-switching-options>
 <secure-access-port>
 <interface>
 <allowed-mac>
 <value>value</value>
 </allowed-mac>
 </interface>
 </secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description** Allowed MAC address on this interface

**Contents** <value>—Allowed MAC address on this interface

## <analysis> configuration/security

---

### Usage

```
<configuration>
 <security>
 <analysis>
 <no-report/>
 </analysis>
 </security>
</configuration>
```

**Description** Configure security analysis

**Contents** <no-report>—Stops security analysis reporting

## <analyzer> configuration/ethernet-switching-options

---

### Usage

```
<configuration>
 <ethernet-switching-options>
 <analyzer>
 <name>name</name> <!-- identifier -->
 <ratio>ratio</ratio>
 <loss-priority>loss-priority</loss-priority>
 <input>...</input>
 <output>...</output>
 </analyzer>
 </ethernet-switching-options>
</configuration>
```

**Description** Analyzer options

**Contents** <name>—Analyzer name

- low - Low loss priority
- high - High loss priority

<ratio>—Packet ratio

- low - Low loss priority
- high - High loss priority

<loss-priority>—Loss priority of mirrored packets

- low - Low loss priority
- high - High loss priority

<input>—Ports and VLANs to monitor

<output>—Outgoing port or VLAN for mirrored packets

---

## <anti-spam> configuration/security/utm/feature-profile

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-spam>
 <address-whitelist>address-whitelist</address-whitelist>
 <address-blacklist>address-blacklist</address-blacklist>
 <traceoptions>...</traceoptions>
 <sbl>...</sbl>
 </anti-spam>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Configure anti-spam feature

**Contents** <address-whitelist>—Anti-spam whitelist

<address-blacklist>—Anti-spam blacklist

<traceoptions>—Trace options for anti-spam feature

<sbl>—SBL settings

---

## <anti-spam> configuration/security/utm/utm-policy

---

### Usage

```
<configuration>
<security>
 <utm>
 <utm-policy>
 <anti-spam>
 <smtp-profile>smtp-profile</smtp-profile>
 </anti-spam>
 </utm-policy>
 </utm>
</security>
</configuration>
```

**Description** Anti-spam profile

**Contents** <smtp-profile>—Anti-spam profile

## <anti-virus> configuration/security/utm/feature-profile

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <mime-whitelist>...</mime-whitelist>
 <url-whitelist>url-whitelist</url-whitelist>
 <type>type</type>
 <traceoptions>...</traceoptions>
 <kaspersky-lab-engine>...</kaspersky-lab-engine>
 <juniper-express-engine>...</juniper-express-engine>
 <sophos-engine>...</sophos-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Configure anti-virus feature

**Contents** <mime-whitelist>—Anti-virus MIME whitelist

- sophos-engine - Anti-virus sophos-engine
- kaspersky-lab-engine - Anti-virus kaspersky-lab-engine type
- juniper-express-engine - Anti-virus juniper-express-engine type

<url-whitelist>—Anti-virus URL white list

- sophos-engine - Anti-virus sophos-engine
- kaspersky-lab-engine - Anti-virus kaspersky-lab-engine type
- juniper-express-engine - Anti-virus juniper-express-engine type

<type>—Anti-virus engine type

- sophos-engine - Anti-virus sophos-engine
- kaspersky-lab-engine - Anti-virus kaspersky-lab-engine type
- juniper-express-engine - Anti-virus juniper-express-engine type

<traceoptions>—Trace options for anti-virus feature

<kaspersky-lab-engine>—Anti-virus kaspersky-lab-engine profile or pattern-update

<juniper-express-engine>—Anti-virus juniper-express-engine profile or pattern update

<sophos-engine>—Anti-virus sophos-engine

---

## <anti-virus> configuration/security/utm/utm-policy

---

### Usage

```
<configuration>
<security>
 <utm>
 <utm-policy>
 <anti-virus>
 <http-profile>http-profile</http-profile>
 <ftp>...</ftp>
 <smtp-profile>smtp-profile</smtp-profile>
 <pop3-profile>pop3-profile</pop3-profile>
 <imap-profile>imap-profile</imap-profile>
 </anti-virus>
 </utm-policy>
 </utm>
</security>
</configuration>
```

**Description** UTM policy anti-virus profile

**Contents** <http-profile>—Anti-virus profile

<ftp>—FTP profile

<smtp-profile>—Anti-virus profile

<pop3-profile>—Anti-virus profile

<imap-profile>—Anti-virus profile

---

## <apn> configuration/security/gprs/gtp/profile

---

### Usage

```
<configuration>
<security>
 <gprs>
 <gtp>
 <profile>
 <apn>
 <pattern-string>pattern-string</pattern-string> <!-- identifier -->
 <imsi-prefix>...</imsi-prefix>
 </apn>
 </profile>
 </gtp>
 </gprs>
</security>
```

</configuration>

**Description** GTP Access Point Name (APN) filter

**Contents** <pattern-string>—Specific APN pattern string  
  
<imsi-prefix>—Specific filter prefix digits for International Mobile Subscriber Identification(IMSI)

---

### <application> configuration/security/alarms/potential-violation/policy

---

#### Usage

```
<configuration>
<security>
<alarms>
<potential-violation>
<policy>
<application>
<threshold>threshold</threshold>
<duration>duration</duration>
<size>size</size>
</application>
</policy>
</potential-violation>
</alarms>
</security>
</configuration>
```

**Description** Configure application type of policy violation

**Contents** <threshold>—Number of application matches to raise alarm  
  
<duration>—Time window matches must occur within  
  
<size>—Total application number that can be done policy violation check concurrently

---

### <application> configuration/applications

---

#### Usage

```
<configuration>
<applications>
<application>
<application-name>application-name</application-name> <!-- identifier -->
<description>description</description>
<term>...</term>
</application>
</applications>
</configuration>
```

**Description** Define an application

**Contents** <application-name>—Application name  
<description>—Text description of application  
<term>—Define individual application protocols

---

## <application> configuration/applications/application-set

### Usage

```
<configuration>
 <applications>
 <application-set>
 <application>
 <application-name>application-name</application-name> <!-- identifier -->
 </application>
 </application-set>
 </applications>
</configuration>
```

**Description** Application to be included in the set

**Contents** <application-name>—Application name

---

## <application-firewall> configuration/security

### Usage

```
<configuration>
 <security>
 <application-firewall>
 <traceoptions>...</traceoptions>
 <rule-sets>...</rule-sets>
 </application-firewall>
 </security>
</configuration>
```

**Description** Configure application-firewall rule-sets

**Contents** <traceoptions>—Rule-sets Tracing Options  
<rule-sets>—Configure application-firewall rule-sets

---

## <application-identification> configuration/services

### Description

## **<application-proxy> configuration/security/utm**

---

**Usage**

```
<configuration>
<security>
<utm>
 <application-proxy>
 <traceoptions>...</traceoptions>
 </application-proxy>
</utm>
</security>
</configuration>
```

**Description** Trace options for application proxy

**Contents** <traceoptions>—Trace options for application proxy

## **<application-screen> configuration/security/alg/h323**

---

**Usage**

```
<configuration>
<security>
<alg>
<h323>
 <application-screen>
 <unknown-message>...</unknown-message>
 <message-flood>...</message-flood>
 </application-screen>
</h323>
</alg>
</security>
</configuration>
```

**Description** Configure application screens

**Contents** <unknown-message>—Configure ALG action on receiving an unknown message  
<message-flood>—Configure Message flood ALG options

## **<application-screen> configuration/security/alg/mgcp**

---

**Usage**

```
<configuration>
<security>
<alg>
<mgcp>
 <application-screen>
 <unknown-message>...</unknown-message>
 <message-flood>...</message-flood>
```

```
<connection-flood>...</connection-flood>
</application-screen>
</mgcp>
</alg>
</security>
</configuration>
```

**Description** Configure application screens

**Contents** <unknown-message>—Configure ALG action on receiving an unknown message

<message-flood>—Set message flood ALG options

<connection-flood>—Set connection flood options

---

### <application-screen> configuration/security/alg/sccp

---

#### Usage

```
<configuration>
<security>
<alg>
<sccp>
<application-screen>
<unknown-message>...</unknown-message>
<call-flood>...</call-flood>
</application-screen>
</sccp>
</alg>
</security>
</configuration>
```

**Description** Configure application screens

**Contents** <unknown-message>—Configure ALG action on receiving an unknown message

<call-flood>—Configure call flood thresholds

---

### <application-screen> configuration/security/alg/sip

---

#### Usage

```
<configuration>
<security>
<alg>
<sip>
<application-screen>
<unknown-message>...</unknown-message>
<protect>...</protect>
</application-screen>
</sip>
</alg>
```

```
</security>
</configuration>
```

**Description** Configure application screens

**Contents** <unknown-message>—Configure ALG action on receiving an unknown message  
<protect>—Configure Protect options

---

## <application-services> configuration/security/forwarding-process

---

### Usage

```
<configuration>
 <security>
 <forwarding-process>
 <application-services>
 <maximize-alg-sessions/>
 <maximize-cp-sessions>...</maximize-cp-sessions>

 <session-distribution-mode>session-distribution-mode</session-distribution-mode>
 <maximize-idp-sessions>...</maximize-idp-sessions>
 </application-services>
 </forwarding-process>
 </security>
</configuration>
```

**Description** Configure application service options

**Contents** <maximize-alg-sessions>—Maximize ALG session capacity

- normal - Normal mode
- hash-based - Hash mode

<maximize-cp-sessions>—Maximize CP session capacity

- normal - Normal mode
- hash-based - Hash mode

<session-distribution-mode>—Session distribution mode

- normal - Normal mode
- hash-based - Hash mode

<maximize-idp-sessions>—Run security services in dedicated processes to maximize IDP session capacity

## **<application-set> configuration/applications**

---

### **Usage**

```
<configuration>
 <applications>
 <application-set>
 <application-set-name>application-set-name</application-set-name> <!--
identifier -->
 <description>description</description>
 <application>...</application>
 <application-set>...</application-set>
 </application-set>
 </applications>
</configuration>
```

**Description** Define an application set

**Contents** <application-set-name>—Application set name

<description>—Text description of application set

<application>—Application to be included in the set

<application-set>—Define an application-set

## **<application-set> configuration/applications/application-set**

---

### **Usage**

```
<configuration>
 <applications>
 <application-set>
 <application-set>
 <application-set-name>application-set-name</application-set-name> <!--
identifier -->
 </application-set>
 </application-set>
 </applications>
</configuration>
```

**Description** Define an application-set

**Contents** <application-set-name>—Define an application-set name

## **<application-tracking> configuration/security**

---

### **Usage**

```
<configuration>
 <security>
 <application-tracking>
```

```
<disable/>
<first-update-interval>first-update-interval</first-update-interval>
<first-update/>
<session-update-interval>session-update-interval</session-update-interval>
</application-tracking>
</security>
</configuration>
```

**Description** Application tracking configuration

**Contents** <disable>—Disable Application tracking

<first-update-interval>—Interval when the first update message is sent

<first-update>—Generate Application tracking initial message when a session is created

<session-update-interval>—Frequency in which Application tracking update messages are generated

---

## <applications> configuration

### Usage

```
<configuration>
 <applications>
 <application>...</application>
 <application-set>...</application-set>
 </applications>
</configuration>
```

**Description** Define applications by protocol characteristics

**Contents** <application>—Define an application

<application-set>—Define an application set

---

## <applications> configuration/protocols/dcbx/interface

### Usage

```
<configuration>
 <protocols>
 <dcbx>
 <interface>
 <applications>
 <fcoe>...</fcoe>
 </applications>
 </interface>
 </dcbx>
 </protocols>
</configuration>
```

**Description** Configure application feature

**Contents** <fcoe>—Configure FCoE application feature

---

## <arp-inspection> configuration/ethernet-switching-options/secure-access-port/vlan

---

### Usage

```
<configuration>
<ethernet-switching-options>
 <secure-access-port>
 <vlan>
 <arp-inspection>
 <forwarding-class>forwarding-class</forwarding-class>
 </arp-inspection>
 </vlan>
 </secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description** Enable Dynamic ARP inspection on this VLAN

**Contents** <forwarding-class>—Forwarding class assigned to re-injected ARP packets

---

## <attach> configuration/security/address-book

---

### Usage

```
<configuration>
<security>
 <address-book>
 <attach>
 <zone>...</zone>
 </attach>
 </address-book>
</security>
</configuration>
```

**Description** Attach this address book to interface, zone or routing-instance

**Contents** <zone>—Define a zone to be attached

---

## <authentication> configuration/security/ipsec/vpn/manual

---

### Usage

```
<configuration>
<security>
 <ipsec>
 <vpn>
 <manual>
```

```

 <authentication>
 <algorithm>algorithm</algorithm> <!-- mandatory -->
 <key>...</key> <!-- mandatory -->
 </authentication>
 </manual>
</vpn>
</ipsec>
</security>
</configuration>

```

**Description** Define authentication parameters

**Contents** <algorithm>—Define authentication algorithm

- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm

<key>—Define an authentication key

## <authentication-source> configuration/security/user-identification

### Usage

```

<configuration>
 <security>
 <user-identification>
 <authentication-source>
 <local-authentication-table/>
 <unified-access-control/>
 <priority>priority</priority>
 <disable/>
 </authentication-source>
 </user-identification>
 </security>
</configuration>

```

**Description** Configure user-identification authentication-source

**Contents** <local-authentication-table>—Local-authentication-table

<unified-access-control>—Unified-access-control

<priority>—User-identification authentication-source priority

<disable>—Table disable

## <authentication-whitelist> configuration/ethernet-switching-options

---

**Usage**

```
<configuration>
 <ethernet-switching-options>
 <authentication-whitelist>
 <mac>mac</mac> <!-- mandatory --> <!-- identifier -->
 <vlan-assignment>vlan-assignment</vlan-assignment>
 <interface>interface</interface>
 </authentication-whitelist>
 </ethernet-switching-options>
</configuration>
```

**Description** MAC authentication-whitelist configuration needed to bypass Authentication

**Contents** <mac>—MAC addresses to bypass authentication

<vlan-assignment>—VLAN name or 802.1q tag for the MAC address

<interface>—Interface on which authentication is bypassed

## <authenticator> configuration/protocols/dot1x

---

**Usage**

```
<configuration>
 <protocols>
 <dot1x>
 <authenticator>

 <authentication-profile-name>authentication-profile-name</authentication-profile-name>

 <no-mac-table-binding/>
 <static>...</static>
 <interface>...</interface>
 </authenticator>
 </dot1x>
 </protocols>
</configuration>
```

**Description** 802.1X authenticator options

**Contents** <authentication-profile-name>—Access profile name to use for authentication

<no-mac-table-binding>—Disable association between mac table and dot1x

<static>—Static MAC configuration needed to bypass 802.1X

<interface>—802.1X interface specific options

## **<auto-re-enrollment> configuration/security/pki**

---

**Usage**

```
<configuration>
 <security>
 <pki>
 <auto-re-enrollment>
 <certificate-id>...</certificate-id>
 </auto-re-enrollment>
 </pki>
 </security>
</configuration>
```

**Description**    Auto re-enroll of certificate

**Contents**      <certificate-id>—Auto re-enrollment configuration for certificate-id

## CHAPTER 28

# Tag Elements Beginning with B

This chapter lists the configuration tag elements that have names beginning with the letter *b*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<background-queue>` configuration/wlan/access-point/radio/quality-of-service/access-point-queues

#### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <background-queue>

 <arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>
 <maximum-burst>maximum-burst</maximum-burst>
 </background-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
```

</configuration>

**Description** Configure background queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames  
<minimum-contention-window>—Minimum contention window size  
<maximum-contention-window>—Maximum contention window size  
<maximum-burst>—Specify maximum burst

## <background-queue> configuration/wlan/access-point/radio/quality-of-service/station-queues

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <background-queue>

 <arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>

 <transmit-opportunity-limit>transmit-opportunity-limit</transmit-opportunity-limit>
 </background-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Configure background queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames  
<minimum-contention-window>—Specify minimum contention window size  
<maximum-contention-window>—Specify maximum contention window size  
<transmit-opportunity-limit>—Specify transmission opportunity limit

## **<backup-options>** configuration/interfaces/interface/unit

### Usage

```

<configuration>
 <interfaces>
 <interface>
 <unit>
 <backup-options>
 <interface>interface</interface>
 </backup-options>
 </unit>
 </interface>
 </interfaces>
</configuration>

```

**Description** Backup interface configuration options

**Contents** <interface>—Backup interface

## **<best-effort-queue>** configuration/wlan/access-point/radio/quality-of-service/access-point-queues

### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <best-effort-queue>

 <arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>
 <maximum-burst>maximum-burst</maximum-burst>
 </best-effort-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>

```

**Description** Configure best effort queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames

<minimum-contention-window>—Minimum contention window size

<maximum-contention-window>—Maximum contention window size

<maximum-burst>—Specify maximum burst

## <best-effort-queue> configuration/wlan/access-point/radio/quality-of-service/station-queues

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <best-effort-queue>

<arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>

<transmit-opportunity-limit>transmit-opportunity-limit</transmit-opportunity-limit>
 </best-effort-queue>
</station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure best effort queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames

<minimum-contention-window>—Specify minimum contention window size

<maximum-contention-window>—Specify maximum contention window size

<transmit-opportunity-limit>—Specify transmission opportunity limit

## <block-content-type> configuration/security/utm/feature-profile/content-filtering/profile

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <content-filtering>
 <profile>
 <block-content-type>
```

```
<activex/>
<java-applet/>
<exe/>
<zip/>
<http-cookie/>
</block-content-type>
</profile>
</content-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Content-filtering feature block content type

**Contents** <activex>—Block activex  
<java-applet>—Block Java-applet  
<exe>—Block Windows/dos exe file  
<zip>—Block zip file  
<http-cookie>—Block HTTP cookie

## <block-message> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced/profile

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<juniper-enhanced>
<profile>
<block-message>
<type>type</type>
<url>url</url>
</block-message>
</profile>
</juniper-enhanced>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Juniper enhanced block message settings

**Contents** <type>—Type of block message desired

- custom-redirect-url - Custom redirect URL server

<url>—URL of block message

---

## <block-mime> configuration/security/utm/feature-profile/content-filtering/profile

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <content-filtering>
 <profile>
 <block-mime>
 <list>list</list>
 <exception>exception</exception>
 </block-mime>
 </profile>
 </content-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Content-filtering feature block MIME

**Contents** <list>—Block MIME list

<exception>—Exception of block MIME list

---

## <bpu-block> configuration/ethernet-switching-options

### Usage

```
<configuration>
 <ethernet-switching-options>
 <bpu-block>
 <interface>...</interface>
 <disable-timeout>disable-timeout</disable-timeout>
 </bpu-block>
 </ethernet-switching-options>
</configuration>
```

**Description** Block BPDU on interface (BPDU Protect)

**Contents** <interface>—Interface name to block BPDU on

<disable-timeout>—Disable timeout for BPDU Protect

## **<bpdutimeout-action> configuration/protocols/stp/interface**

---

**Usage**

```
<configuration>
<protocols>
<stp>
<interface>
 <bpdutimeout-action>
 <block/>
 <log/>
 </bpdutimeout-action>
</interface>
</stp>
</protocols>
</configuration>
```

**Description** Define action on BPDU expiry (Loop Protect)

**Contents** <block>—Block the interface  
  
<log>—Log a message

## **<bpdutimeout-action> configuration/protocols/rstp/interface**

---

**Usage**

```
<configuration>
<protocols>
<rstp>
<interface>
 <bpdutimeout-action>
 <block/>
 <log/>
 </bpdutimeout-action>
</interface>
</rstp>
</protocols>
</configuration>
```

**Description** Define action on BPDU expiry (Loop Protect)

**Contents** <block>—Block the interface  
  
<log>—Log a message

## **<bpdutimeout-action> configuration/protocols/mstp/interface**

---

**Usage**

```
<configuration>
<protocols>
```

```
<mstp>
 <interface>
 <bpdtimeout-action>
 <block/>
 <log/>
 </bpdtimeout-action>
 </interface>
</mstp>
</protocols>
</configuration>
```

**Description** Define action on BPDU expiry (Loop Protect)

**Contents** <block>—Block the interface  
<log>—Log a message

---

### <bpdtimeout-action> configuration/protocols/vstp/vlan-group/group/interface

---

#### Usage

```
<configuration>
 <protocols>
 <vstp>
 <vlan-group>
 <group>
 <interface>
 <bpdtimeout-action>
 <block/>
 <log/>
 </bpdtimeout-action>
 </interface>
 </group>
 </vlan-group>
 </vstp>
 </protocols>
</configuration>
```

**Description** Define action on BPDU expiry (Loop Protect)

**Contents** <block>—Block the interface  
<log>—Log a message

---

### <bpdtimeout-action> configuration/protocols/vstp/vlan/interface

---

#### Usage

```
<configuration>
 <protocols>
 <vstp>
 <vlan>
```

```
<interface>
 <bpdutimeout-action>
 <block/>
 <log/>
 </bpdutimeout-action>
</interface>
</vlan>
</vstp>
</protocols>
</configuration>
```

**Description** Define action on BPDU expiry (Loop Protect)

**Contents** <block>—Block the interface  
          <log>—Log a message

---

## <bridge> configuration/security/flow

### Usage

```
<configuration>
 <security>
 <flow>
 <bridge>
 <block-non-ip-all/>
 <bypass-non-ip-unicast/>
 <no-packet-flooding>...</no-packet-flooding>
 <bpdutimeout-vlan-flooding/>
 </bridge>
 </flow>
 </security>
</configuration>
```

**Description** Bridge configuration for flow

**Contents** <block-non-ip-all>—Block all non-IP and non-ARP traffic including broadcast/multicast  
          <bypass-non-ip-unicast>—Allow all non-IP (including unicast) traffic  
          <no-packet-flooding>—Stop IP flooding, send ARP/ICMP to trigger MAC learning  
          <bpdutimeout-vlan-flooding>—Set 802.1D BPDU flooding based on VLAN

---

## <broadcast-multicast-rate-limit> configuration/wlan/access-point/radio/radio-options

### Usage

```
<configuration>
 <wlan>
 <access-point>
```

```
<radio>
 <radio-options>
 <broadcast-multicast-rate-limit>
 <rate-limit>rate-limit</rate-limit>
 <rate-limit-bursts>rate-limit-bursts</rate-limit-bursts>
 </broadcast-multicast-rate-limit>
 </radio-options>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure rate limit for broadcast and multicast traffic

**Contents** <rate-limit>—Rate limit  
<rate-limit-bursts>—Rate limit bursts

## CHAPTER 29

# Tag Elements Beginning with C

This chapter lists the configuration tag elements that have names beginning with the letter c. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<ca-profile>` configuration/security/pki

#### Usage

```
<configuration>
 <security>
 <pki>
 <ca-profile>
 <ca-profile-name>ca-profile-name</ca-profile-name> <!-- identifier -->
 <ca-identity>ca-identity</ca-identity> <!-- mandatory -->
 <routing-instance>routing-instance</routing-instance>
 <enrollment>...</enrollment>
 <revocation-check>...</revocation-check>
 <administrator>...</administrator>
 </ca-profile>
 </pki>
 </security>
</configuration>
```

**Description** Certificate authority profile configuration

**Contents** `<ca-profile-name>`—Name of certificate authority profile

<ca-identity>—Certificate authority identifier

<routing-instance>—Use specified routing instance

<enrollment>—Enrollment parameters for certificate authority

<revocation-check>—Method for checking certificate revocations

<administrator>—Administrator information

---

## <ca-profile> configuration/services/unified-access-control/infranet-controller

---

### Usage

```
<configuration>
 <services>
 <unified-access-control>
 <infranet-controller>
 <ca-profile>
 <value_keyword>value_keyword</value_keyword> <!-- identifier -->
 </ca-profile>
 </infranet-controller>
 </unified-access-control>
 </services>
</configuration>
```

**Description** Define a list of certificate authority

**Contents** <value\_keyword>—Selected certificate authority

---

## <ca-type> configuration/protocols/lddp-med/interface/location/civic-based

---

### Usage

```
<configuration>
 <protocols>
 <lddp-med>
 <interface>
 <location>
 <civic-based>
 <ca-type>
 <ca-type>ca-type</ca-type> <!-- identifier -->
 <ca-value>ca-value</ca-value>
 </ca-type>
 </civic-based>
 </location>
 </interface>
 </lddp-med>
 </protocols>
</configuration>
```

**Description**

**Contents**    <ca-type>—Address element type  
                  <ca-value>—Address element value

## <cache> configuration/security/utm/feature-profile/web-filtering/surf-control-integrated

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <surf-control-integrated>
 <cache>
 <timeout>timeout</timeout>
 <size>size</size>
 </cache>
 </surf-control-integrated>
 </web-filtering>
 </feature-profile>
 </utm>
</security>
</configuration>
```

### Description

**Contents**    <timeout>—Surf control integrated cache timeout  
                  <size>—Surf control integrated cache size

## <cache> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-enhanced>
 <cache>
 <timeout>timeout</timeout>
 <size>size</size>
 </cache>
 </juniper-enhanced>
 </web-filtering>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description**

**Contents**    <timeout>—Juniper enhanced cache timeout  
                 <size>—Juniper enhanced cache size

---

**<calculation-weight> configuration/protocols/oam/ethernet/connectivity-fault-management/performance-monitoring/sla-iterator-profiles**

---

**Usage**

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<performance-monitoring>
<sla-iterator-profiles>
 <calculation-weight>
 <delay>delay</delay>
 <delay-variation>delay-variation</delay-variation>
 </calculation-weight>
</sla-iterator-profiles>
</performance-monitoring>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description**    Configure delay and delay variation calculation weight

**Contents**    <delay>—Weight used in delay calculation  
                 <delay-variation>—Weight used in delay-variation calculation

---

**<call-flood> configuration/security/alg/sccp/application-screen**

---

**Usage**

```
<configuration>
<security>
<alg>
<sccp>
<application-screen>
 <call-flood>
 <threshold>threshold</threshold>
 </call-flood>
</application-screen>
</sccp>
</alg>
</security>
</configuration>
```

**Description** Configure call flood thresholds

**Contents** <threshold>—Calls per second per client

## <caller> configuration/interfaces/interface/unit/dialer-options/incoming-map

### Usage

```
<configuration>
<interfaces>
 <interface>
 <unit>
 <dialer-options>
 <incoming-map>
 <caller>
 <caller-id>caller-id</caller-id> <!-- identifier -->
 </caller>
 </incoming-map>
 </dialer-options>
 </unit>
 </interface>
</interfaces>
</configuration>
```

**Description** Caller Id to be screened

**Contents** <caller-id>—Caller ID (upto 15 digits)

## <captive-portal> configuration/services/unified-access-control

### Usage

```
<configuration>
<services>
 <unified-access-control>
 <captive-portal>
 <redirect-policy-name>redirect-policy-name</redirect-policy-name> <!-- identifier
-->
 <redirect-traffic>redirect-traffic</redirect-traffic> <!-- mandatory -->
 <redirect-url>redirect-url</redirect-url>
 </captive-portal>
 </unified-access-control>
</services>
</configuration>
```

**Description** Unauthenticated HTTP redirect

**Contents** <redirect-policy-name>—Redirect policy name

- unauthenticated - Redirect unauthenticated traffic
- all - Redirect all traffic

<redirect-traffic>—Traffic to redirect

- unauthenticated - Redirect unauthenticated traffic
- all - Redirect all traffic

<redirect-url>—Redirect URL for unauthenticated users

---

## <captive-portal> configuration/services

---

### Usage

```
<configuration>
 <services>
 <captive-portal>
```

```
<authentication-profile-name>authentication-profile-name</authentication-profile-name>
```

```
 <traceoptions>...</traceoptions>
 <interface>...</interface>
 <secure-authentication>secure-authentication</secure-authentication>
 <custom-options>...</custom-options>
</captive-portal>
</services>
</configuration>
```

**Description** Captive Portal options

**Contents** <authentication-profile-name>—Access profile name to use for authentication

- http - Insecure plain-text HTTP will be used for Captive Portal authentication, username and password can be sniffed
- https - Encrypted HTTPS will be used for Captive Portal authentication

<traceoptions>—Trace options for CAPTIVE PORTAL

- http - Insecure plain-text HTTP will be used for Captive Portal authentication, username and password can be sniffed
- https - Encrypted HTTPS will be used for Captive Portal authentication

<interface>—Captive Portal interface specific options

- http - Insecure plain-text HTTP will be used for Captive Portal authentication, username and password can be sniffed
- https - Encrypted HTTPS will be used for Captive Portal authentication

<secure-authentication>—Set secure authentication using encrypted HTTPS or insecure authentication using plain-text HTTP

- http - Insecure plain-text HTTP will be used for Captive Portal authentication, username and password can be sniffed

- https - Encrypted HTTPS will be used for Captive Portal authentication

<custom-options>—Captive Portal html user interface customization options

## <capture-file> configuration/security/datapath-debug

### Usage

```
<configuration>
 <security>
 <datapath-debug>
 <capture-file>
 <filename>filename</filename> <!-- mandatory -->
 <format>format</format>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 </capture-file>
 </datapath-debug>
 </security>
</configuration>
```

**Description** Packet capture options

### Contents

<filename>—Capture file name

- pcap - PCAP capture format
- internal - Internal capture format

<format>—Capture file format

- pcap - PCAP capture format
- internal - Internal capture format

<size>—Maximum file size

<files>—Maximum number of files

<world-readable>—Allow any user to read packet-capture files

## <category> configuration/security/utm/feature-profile/web-filtering/surf-control-integrated/profile

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <surf-control-integrated>
 <profile>
```

```
<category>
 <name>name</name> <!-- identifier -->
 <action>action</action>
</category>
</profile>
</surf-control-integrated>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Surf control integrated category

**Contents** <name>—Surf control integrated category type name

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

<action>—Surf control integrated category type action

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

## <category> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced/profile

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-enhanced>
 <profile>
 <category>
 <name>name</name> <!-- identifier -->
 <action>action</action>
 </category>
 </profile>
 </juniper-enhanced>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Juniper enhanced category

**Contents** <name>—Name of Juniper enhanced category

- permit -
- log-and-permit -
- block -

<action>—Action to perform when web traffic matches category

- permit -
- log-and-permit -
- block -

---

### <cellular-options> configuration/interfaces/interface

---

**Usage**

```
<configuration>
<interfaces>
<interface>
 <cellular-options>
 <gsm-options>...</gsm-options>
 </cellular-options>
</interface>
</interfaces>
</configuration>
```

**Description** Cellular interface specific options

**Contents** <gsm-options>—Interface specific GSM options

---

### <certificate> configuration/security/ike/policy

---

**Usage**

```
<configuration>
<security>
<ike>
<policy>
 <certificate>
 <local-certificate>local-certificate</local-certificate>
 <peer-certificate-type>peer-certificate-type</peer-certificate-type>
 </certificate>
</policy>
</ike>
</security>
</configuration>
```

**Description** Certificate configuration

**Contents** <local-certificate>—Local certificate identifier

- pkcs7 - PKCS7 encoding
- x509-signature - X509 signature encoding

<peer-certificate-type>—Preferred type of certificate from peer

- pkcs7 - PKCS7 encoding
- x509-signature - X509 signature encoding

---

### <certificate> configuration/security/group-vpn/member/ike/policy

---

**Usage**

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ike>
 <policy>
 <certificate>
 <local-certificate>local-certificate</local-certificate>
 <peer-certificate-type>peer-certificate-type</peer-certificate-type>
 </certificate>
 </policy>
 </ike>
 </member>
 </group-vpn>
 </security>
</configuration>
```

**Description** Certificate configuration

**Contents** <local-certificate>—Local certificate identifier

- pkcs7 - PKCS7 encoding
- x509-signature - X509 signature encoding

<peer-certificate-type>—Preferred type of certificate from peer

- pkcs7 - PKCS7 encoding
- x509-signature - X509 signature encoding

---

### <certificate> configuration/security/group-vpn/server/ike/policy

---

**Usage**

```
<configuration>
```

```

<security>
 <group-vpn>
 <server>
 <ike>
 <policy>
 <certificate>
 <local-certificate>local-certificate</local-certificate>
 <peer-certificate-type>peer-certificate-type</peer-certificate-type>
 </certificate>
 </policy>
 </ike>
 </server>
 </group-vpn>
</security>
</configuration>

```

**Description** Certificate configuration

**Contents** <local-certificate>—Local certificate identifier

- pkcs7 - PKCS7 encoding
- x509-signature - X509 signature encoding

<peer-certificate-type>—Preferred type of certificate from peer

- pkcs7 - PKCS7 encoding
- x509-signature - X509 signature encoding

## <certificate-id> configuration/security/pki/auto-re-enrollment

### Usage

```

<configuration>
 <security>
 <pki>
 <auto-re-enrollment>
 <certificate-id>
 <certificate-id-name>certificate-id-name</certificate-id-name> <!-- mandatory
--> <!-- identifier -->
 <ca-profile-name>ca-profile-name</ca-profile-name> <!-- mandatory -->
 <challenge-password>challenge-password</challenge-password> <!-- mandatory
-->
 <re-enroll-trigger-time-percentage>re-enroll-trigger-time-percentage</re-enroll-trigger-time-percentage>
 <!-- mandatory -->
 <re-generate-keypair/>
 </certificate-id>
 </auto-re-enrollment>
 </pki>
 </security>
</configuration>

```

**Description** Auto re-enrollment configuration for certificate-id

**Contents** <certificate-id-name>—Certificate identifier that needs auto re-enrollment

<ca-profile-name>—Name of certificate authority profile

<challenge-password>—Password used by CA for enrollment and revocation

<re-enroll-trigger-time-percentage>—Re-enrollment trigger time before expiration as percentage

<re-generate-keypair>—Generate new key-pair for auto-re-enrollment

---

## <channel> configuration/wlan/access-point/radio/radio-options

---

### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<radio-options>
 <channel>
 <number>number</number>
 <bandwidth>bandwidth</bandwidth>
 <primary>primary</primary>
 </channel>
</radio-options>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure channel settings

**Contents** <number>—Provide channel selection

- 1 - Channel 1
- 2 - Channel 2
- 3 - Channel 3
- 4 - Channel 4
- 5 - Channel 5
- 6 - Channel 6
- 7 - Channel 7
- 8 - Channel 8
- 9 - Channel 9
- 10 - Channel 10

- 11 - Channel 11
- 12 - Channel 12
- 13 - Channel 13
- 14 - Channel 14
- 36 - Channel 36
- 40 - Channel 40
- 44 - Channel 44
- 48 - Channel 48
- 52 - Channel 52
- 56 - Channel 56
- 60 - Channel 60
- 64 - Channel 64
- 100 - Channel 100
- 108 - Channel 108
- 112 - Channel 112
- 116 - Channel 116
- 120 - Channel 120
- 124 - Channel 124
- 128 - Channel 128
- 132 - Channel 132
- 136 - Channel 136
- 140 - Channel 140
- 149 - Channel 149
- 153 - Channel 153
- 157 - Channel 157
- 161 - Channel 161
- 165 - Channel 165
- auto - Automatically selected
- lower - Set lower channel as primary
- upper - Set upper channel as primary

<bandwidth>—Provide channel bandwidth in MHz(20/40)

- lower - Set lower channel as primary
- upper - Set upper channel as primary

<primary>—Select primary channel

- lower - Set lower channel as primary
- upper - Set upper channel as primary

## <cipher-suites> configuration/wlan/access-point/radio/virtual-access-point/security/wpa-personal

---

### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<virtual-access-point>
<security>
<wpa-personal>
<cipher-suites>
<tkip/>
<ccmp/>
<both/>
</cipher-suites>
</wpa-personal>
</security>
</virtual-access-point>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Select the WPA cipher algorithm

**Contents** <tkip>—TKIP

<ccmp>—CCMP

<both>—Use both TKIP and CCMP cipher suites

## <cipher-suites> configuration/wlan/access-point/radio/virtual-access-point/security/wpa-enterprise

---

### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<virtual-access-point>
<security>
<wpa-enterprise>
<cipher-suites>
<tkip/>
<ccmp/>
```

```

 <both/>
 </cipher-suites>
 </wpa-enterprise>
 </security>
</virtual-access-point>
</radio>
</access-point>
</wlan>
</configuration>

```

**Description** Select the WPA cipher algorithm

**Contents** <tkip>—TKIP

<ccmp>—CCMP

<both>—Use both TKIP and CCMP cipher suites

## <circuit-id> configuration/ethernet-switching-options/secure-access-port/vlan/dhcp-option82

### Usage

```

<configuration>
<ethernet-switching-options>
<secure-access-port>
<vlan>
<dhcp-option82>
<circuit-id>
 <prefix>prefix</prefix>
 <use-interface-description/>
 <use-vlan-id/>
</circuit-id>
</dhcp-option82>
</vlan>
</secure-access-port>
</ethernet-switching-options>
</configuration>

```

**Description** Configure DHCP option 82 circuit id

**Contents** <prefix>—Configure DHCP option 82 circuit id prefix

- hostname - Set hostname as the prefix

<use-interface-description>—Use interface description instead of name

<use-vlan-id>—Use VLAN id instead of name

## **<civic-based> configuration/protocols/lldp-med/interface/location**

---

### **Usage**

```
<configuration>
<protocols>
<lldp-med>
<interface>
<location>
 <civic-based>
 <what>what</what>
 <country-code>country-code</country-code> <!-- mandatory -->
 <ca-type>...</ca-type>
 </civic-based>
</location>
</interface>
</lldp-med>
</protocols>
</configuration>
```

**Description** Postal address

**Contents** <what>—Type of address

<country-code>—Two-letter country code

<ca-type>—

## **<client-identifier> configuration/interfaces/interface/unit/family/inet/dhcp**

---

### **Usage**

```
<configuration>
<interfaces>
<interface>
<unit>
<family>
<inet>
<dhcp>
 <client-identifier>
 <ascii>ascii</ascii>
 <hexadecimal>hexadecimal</hexadecimal>
 </client-identifier>
</dhcp>
</inet>
</family>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description** DHCP Server identifies a client by client-identifier value

- Contents**    <ascii>—Client identifier as an ASCII string
- <hexadecimal>—Client identifier as a hexadecimal string

## <clients> configuration/security/dynamic-vpn

---

### Usage

```
<configuration>
 <security>
 <dynamic-vpn>
 <clients>
 <name>name</name> <!-- identifier -->
 <remote-protected-resources>...</remote-protected-resources> <!-- mandatory
-->
 <remote-exceptions>...</remote-exceptions>
 <ipsec-vpn>ipsec-vpn</ipsec-vpn> <!-- mandatory -->
 <user>...</user> <!-- mandatory -->
 </clients>
 </dynamic-vpn>
 </security>
</configuration>
```

**Description**    Configure for remote access client

- Contents**    <name>—Client config name
- <remote-protected-resources>—IP/mask of remote protected resources
- <remote-exceptions>—Ip/mask of exceptions being passthru
- <ipsec-vpn>—IPSec VPN assigned to remote access client
- <user>—Remote IPSec VPN users

## <clocking> configuration/interfaces/interface

---

### Usage

```
<configuration>
 <interfaces>
 <interface>
 <clocking>
 <external>...</external>
 </clocking>
 </interface>
 </interfaces>
</configuration>
```

**Description**

- Contents**    <external>—

## **<co-ordinate> configuration/protocols/lldp-med/interface/location**

---

**Usage**

```
<configuration>
<protocols>
<lldp-med>
<interface>
<location>
 <co-ordinate>
 <longitude>longitude</longitude>
 <latitude>latitude</latitude>
 </co-ordinate>
</location>
</interface>
</lldp-med>
</protocols>
</configuration>
```

**Description** Address based on longitude and latitude coordinates

**Contents** <longitude>—Longitude vlaue  
<latitude>—Latitude vlaue

## **<connection-flood> configuration/security/alg/mgcp/application-screen**

---

**Usage**

```
<configuration>
<security>
<alg>
<mgcp>
<application-screen>
 <connection-flood>
 <threshold>threshold</threshold>
 </connection-flood>
</application-screen>
</mgcp>
</alg>
</security>
</configuration>
```

**Description** Set connection flood options

**Contents** <threshold>—Connection flood threshold

## **<connectivity-fault-management> configuration/protocols/oam/ethernet**

---

**Usage**

```
<configuration>
```

```

<protocols>
<oam>
 <ethernet>
 <connectivity-fault-management>
 <performance-monitoring>...</performance-monitoring>
 <traceoptions>...</traceoptions>
 <action-profile>...</action-profile>
 <linktrace>...</linktrace>
 <maintenance-domain>...</maintenance-domain>
 </connectivity-fault-management>
 </ethernet>
</oam>
</protocols>
</configuration>

```

**Description** Configurations related to 802.1ag ethernet oam

**Contents** <performance-monitoring>—Configurations related to ethernet performance monitoring

<traceoptions>—Trace options for connectivity fault management

<action-profile>—Action profiles to use when one or more remote maintenance association endpoints are down

<linktrace>—Linktrace protocol global options

<maintenance-domain>—Maintenance domain configuration

## <console> configuration/wlan/access-point/external/system

### Usage

```

<configuration>
<wlan>
 <access-point>
 <external>
 <system>
 <console>
 <baud-rate>baud-rate</baud-rate>
 </console>
 </system>
 </external>
 </access-point>
</wlan>
</configuration>

```

### Description

**Contents** <baud-rate>—Baud-rate values are 9600,19200,38400,57600,115200

## <content-filtering> configuration/security/utm/feature-profile

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <content-filtering>
 <traceoptions>...</traceoptions>
 <profile>...</profile>
 </content-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Configure content filtering feature

**Contents** <traceoptions>—Trace options for content-filtering feature  
<profile>—Content filtering profile

## <content-filtering> configuration/security/utm/utm-policy

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <utm-policy>
 <content-filtering>
 <http-profile>http-profile</http-profile>
 <ftp>...</ftp>
 <smtp-profile>smtp-profile</smtp-profile>
 <pop3-profile>pop3-profile</pop3-profile>
 <imap-profile>imap-profile</imap-profile>
 </content-filtering>
 </utm-policy>
 </utm>
 </security>
</configuration>
```

**Description** Content-filtering profile

**Contents** <http-profile>—Content-filtering profile  
<ftp>—FTP profile  
<smtp-profile>—Content-filtering SMTP profile  
<pop3-profile>—Content-filtering POP3 profile

<imap-profile>—Content-filtering IMAP profile

## <continuity-check> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain/maintenance-association

### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<maintenance-domain>
<maintenance-association>
<continuity-check>
<interval>interval</interval>
<loss-threshold>loss-threshold</loss-threshold>
<hold-interval>hold-interval</hold-interval>
<port-status-tlv/>
<interface-status-tlv/>
</continuity-check>
</maintenance-association>
</maintenance-domain>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Continuity check configuration

**Contents** <interval>—Interval between continuity-check messages

- 10ms -
- 100ms -
- 1s -
- 10s -
- 1m -
- 10m -

<loss-threshold>—Number of continuity-check messages lost before marking endpoint as down

<hold-interval>—Time before flushing MEP database if no updates occur

<port-status-tlv>—Include port status TLV in CCM

<interface-status-tlv>—Include interface status TLV in CCM

## <control-channel> configuration/protocols/protection-group/ethernet-ring/east-interface

---

**Usage**

```
<configuration>
<protocols>
 <protection-group>
 <ethernet-ring>
 <east-interface>
 <control-channel>
 <interface>interface</interface> <!-- mandatory -->
 <vlan>vlan</vlan>
 </control-channel>
 </east-interface>
 </ethernet-ring>
 </protection-group>
</protocols>
</configuration>
```

**Description** Contro channel of ring port

**Contents** <interface>—  
  
<vlan>—Dedicated VLAN identifier

## <control-channel> configuration/protocols/protection-group/ethernet-ring/west-interface

---

**Usage**

```
<configuration>
<protocols>
 <protection-group>
 <ethernet-ring>
 <west-interface>
 <control-channel>
 <interface>interface</interface> <!-- mandatory -->
 <vlan>vlan</vlan>
 </control-channel>
 </west-interface>
 </ethernet-ring>
 </protection-group>
</protocols>
</configuration>
```

**Description** Contro channel of ring port

**Contents** <interface>—  
  
<vlan>—Dedicated VLAN identifier

---

## <country> configuration/wlan/access-point/access-point-options

---

### Usage

```
<configuration>
<wlan>
 <access-point>
 <access-point-options>
 <country>
 <AE/>
 <AG/>
 <AN/>
 <AR/>
 <AS/>
 <AT/>
 <AU/>
 <AW/>

**Description** Country name

**Contents** <AE>—United Arab Emirates  
<AG>—Antigua and Barbuda  
<AN>—Netherlands Antilles  
<AR>—Argentina

<AS>—American Samoa

<AT>—Austria

<AU>—Australia

<AW>—Aruba

<AZ>—Azerbaijan

<BA>—Bosnia

<BB>—Barbados

<BD>—Bangladesh

<BE>—Belgium

<BG>—Bulgaria

<BH>—Bahrain

<BM>—Bermuda

<BN>—Brunei

<BO>—Bolivia

<BR>—Brazil

<BS>—Bahamas

<BT>—Bhutan

<BY>—Belarus

<CA>—Canada

<CH>—Switzerland

<CL>—Chile

<CN>—China

<CO>—Colombia

<CR>—Costa Rica

<CU>—Cuba

<CV>—Cape Verde

<CY>—Cyprus

<CZ>—Czech Republic

<DE>—Germany  
<DK>—Denmark  
<DM>—Dominica  
<DO>—Dominican Republic  
<EC>—Ecuador  
<EE>—Estonia  
<EG>—Egypt  
<ES>—Spain  
<FI>—Finland  
<FK>—Faulkland Islands  
<FM>—Federated States of Micronesia  
<FR>—France  
<GB>—United Kingdom  
<GF>—French Guiana  
<GG>—Guernsey  
<GI>—Gibraltar  
<GP>—Guadeloupe  
<GR>—Greece  
<GT>—Guatemala  
<GU>—Guam  
<HK>—Hong Kong  
<HN>—Honduras  
<HR>—Croatia  
<HT>—Haiti  
<HU>—Hungary  
<ID>—Indonesia  
<IE>—Ireland  
<IL>—Israel

<IM>—Isle of Man  
<IN>—India  
<IR>—Iran  
<IS>—Iceland  
<IT>—Italy  
<JE>—Jersey  
<JM>—Jamaica  
<JO>—Jordan  
<JP>—Japan  
<KE>—Kenya  
<KI>—Kiribati  
<KR>—Korea Republic  
<KW>—Kuwait  
<KY>—Cayman Islands  
<LA>—LAO People's Democratic Republic  
<LB>—Lebanon  
<LI>—Liechtenstein  
<LK>—Sri Lanka  
<LS>—Lesotho  
<LT>—Lithuania

<VI>—Virgin Islands (United States)  
<VN>—Vietnam  
<YT>—Mayotte  
<ZA>—South Africa  
<ZM>—Zambia

---

## <crl> configuration/security/pki/ca-profile/revocation-check

---

### Usage

```
<configuration>
 <security>
 <pki>
 <ca-profile>
```

```

 <revocation-check>
 <crl>
 <disable>...</disable>
 <url>...</url>
 <refresh-interval>refresh-interval</refresh-interval>
 </crl>
 </revocation-check>
</ca-profile>
</pki>
</security>
</configuration>

```

**Description** Certificate revocation list configuration

**Contents** <disable>—  
 <url>—  
 <refresh-interval>—CRL refresh interval

## <custom-objects> configuration/security/utm

### Usage

```

<configuration>
<security>
<utm>
 <custom-objects>
 <mime-pattern>...</mime-pattern>
 <filename-extension>...</filename-extension>
 <url-pattern>...</url-pattern>
 <custom-url-category>...</custom-url-category>
 <protocol-command>...</protocol-command>
 </custom-objects>
</utm>
</security>
</configuration>

```

**Description** Trace options for custom-objects

**Contents** <mime-pattern>—Configure mime-list object  
 <filename-extension>—Configure extension-list object  
 <url-pattern>—Configure url-list object  
 <custom-url-category>—Configure category-list object  
 <protocol-command>—Configure command-list object

## <custom-options> configuration/services/captive-portal

### Usage

```

<configuration>
 <services>
 <captive-portal>
 <custom-options>
 <header-logo>header-logo</header-logo>
 <header-bgcolor>header-bgcolor</header-bgcolor>
 <header-text-color>header-text-color</header-text-color>
 <header-message>header-message</header-message>
 <banner-message>banner-message</banner-message>
 <form-header-message>form-header-message</form-header-message>
 <form-header-bgcolor>form-header-bgcolor</form-header-bgcolor>
 <form-header-text-color>form-header-text-color</form-header-text-color>
 <form-submit-label>form-submit-label</form-submit-label>
 <form-reset-label>form-reset-label</form-reset-label>
 <footer-message>footer-message</footer-message>
 <footer-bgcolor>footer-bgcolor</footer-bgcolor>
 <footer-text-color>footer-text-color</footer-text-color>
 <post-authentication-url>post-authentication-url</post-authentication-url>
 </custom-options>
 </captive-portal>
 </services>
</configuration>

```

**Description** Captive Portal html user interface customization options

**Contents**

- <header-logo>—Path to logo image file
- <header-bgcolor>—Background color of the html header in hex html format
- <header-text-color>—Text color of the html header in hex html format
- <header-message>—Message to be displayed in the html header
- <banner-message>—Terms and Conditions of usage message
- <form-header-message>—Message to be displayed in the login form header
- <form-header-bgcolor>—Background color of the login form header in hex html format
- <form-header-text-color>—Text color of the login form header in hex html format
- <form-submit-label>—Label to be displayed for the login form submit button
- <form-reset-label>—Label to be displayed for the login form reset button
- <footer-message>—Message to be displayed in the html footer
- <footer-bgcolor>—Background color of the html footer in hex html format
- <footer-text-color>—Text color of the footer in hex html format

<post-authentication-url>—Post authentication redirection URL

---

## <custom-url-category> configuration/security/utm/custom-objects

---

### Usage

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <custom-url-category>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <value>...</value>
 </custom-url-category>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure category-list object

**Contents** <name>—Configure name of category-list object  
<value>—Configure value of category-list object

---

## <customer-vlans> configuration/vlans/vlan/dot1q-tunneling

---

### Usage

```
<configuration>
 <vlans>
 <vlan>
 <dot1q-tunneling>
 <customer-vlans>
 <native/>
 <range/>
 </customer-vlans>
 </dot1q-tunneling>
 </vlan>
 </vlans>
</configuration>
```

### Description

**Contents** <native>—Untagged and priority tagged packets  
<range>—Customer VLAN ranges or IDs [<vlan-range> or <vlan-id>]

## CHAPTER 30

# Tag Elements Beginning with D

This chapter lists the configuration tag elements that have names beginning with the letter *d*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<daily>` configuration/schedulers/scheduler

---

#### Usage

```
<configuration>
 <schedulers>
 <scheduler>
 <daily>
 <start-time>...</start-time>
 <exclude/>
 <all-day/>
 </daily>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Everyday; can be overwritten by specific weekday

**Contents** `<start-time>`—Time range for day  
`<exclude>`—Exclude day from week  
`<all-day>`—Include complete day

## <data-channel> configuration/protocols/protection-group/ethernet-ring

---

**Usage**

```
<configuration>
<protocols>
 <protection-group>
 <ethernet-ring>
 <data-channel>
 <vlan>...</vlan> <!-- mandatory -->
 </data-channel>
 </ethernet-ring>
 </protection-group>
</protocols>
</configuration>
```

**Description** Ring instance data channel

**Contents** <vlan>—VLAN ID or VLAN ID range [1..4094]

## <data-forwarding> configuration/protocols/igmp-snooping/vlan

---

**Usage**

```
<configuration>
<protocols>
 <igmp-snooping>
 <vlan>
 <data-forwarding>
 <source>...</source>
 <receiver>...</receiver>
 </data-forwarding>
 </vlan>
 </igmp-snooping>
</protocols>
</configuration>
```

**Description** Data forwarding

**Contents** <source>—Source

<receiver>—Receiver

## <datapath-debug> configuration/security

---

**Usage**

```
<configuration>
<security>
 <datapath-debug>
 <traceoptions>...</traceoptions>
 <capture-file>...</capture-file>
```

```
<maximum-capture-size>maximum-capture-size</maximum-capture-size>
<action-profile>...</action-profile>
<packet-filter>...</packet-filter>
</datapath-debug>
</security>
</configuration>
```

**Description** Datapath debug options

**Contents** <traceoptions>—End to end debug trace options

<capture-file>—Packet capture options

<maximum-capture-size>—Max packet capture length

<action-profile>—Action profile definitions

<packet-filter>—Packet filter configuration

---

## <dcbx> configuration/protocols

### Usage

```
<configuration>
<protocols>
<dcbx>
<disable/>
<interface>...</interface>
</dcbx>
</protocols>
</configuration>
```

**Description** DCBX Protocol

**Contents** <disable>—Disable DCBX

<interface>—Interface configuration

---

## <dead-peer-detection> configuration/security/ike/gateway

### Usage

```
<configuration>
<security>
<ike>
<gateway>
<dead-peer-detection>
<always-send/>
<interval>interval</interval>
<threshold>threshold</threshold>
</dead-peer-detection>
</gateway>
```

```
</ike>
</security>
</configuration>
```

**Description** Enable RFC-3706 DPD

**Contents** <always-send>—Send DPD messages periodically, regardless of traffic  
<interval>—The interval at which to send DPD messages  
<threshold>—Maximum number of DPD retransmissions

---

### <decryption-failures> configuration/security/alarms/potential-violation

---

#### Usage

```
<configuration>
<security>
<alarms>
<potential-violation>
<decryption-failures>
<threshold>threshold</threshold>
</decryption-failures>
</potential-violation>
</alarms>
</security>
</configuration>
```

**Description** No. of decryption failures before which an alarm needs to be raised

**Contents** <threshold>—Threshold value [default is 1000]

---

### <default> configuration/services/server-load-balance/virtual-server/policy

---

#### Usage

```
<configuration>
<services>
<server-load-balance>
<virtual-server>
<policy>
<default>
<real-server-group>real-server-group</real-server-group> <!-- mandatory -->

<backup-real-server-group>backup-real-server-group</backup-real-server-group>
<failover-threshold>failover-threshold</failover-threshold>
<failback-threshold>failback-threshold</failback-threshold>
</default>
</policy>
</virtual-server>
</server-load-balance>
</services>
```

</configuration>

**Description** Default rule

**Contents** <real-server-group>—Default real server group name  
<backup-real-server-group>—Backup real server group name  
<failover-threshold>—Failover percentage threshold  
<failback-threshold>—Failback percentage threshold

---

### <default-actions> configuration/protocols/oam/ethernet/connectivity-fault-management/action-profile

---

**Usage**

```
<configuration>
<protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <action-profile>
 <default-actions>
 <interface-down/>
 </default-actions>
 </action-profile>
 </connectivity-fault-management>
 </ethernet>
 </oam>
</protocols>
</configuration>
```

**Description** Action that needs to be taken

**Contents** <interface-down>—Bring the interface down

---

### <default-rule> configuration/security/application-firewall/rule-sets

---

**Usage**

```
<configuration>
<security>
 <application-firewall>
 <rule-sets>
 <default-rule>
 <permit/>
 <deny/>
 </default-rule>
 </rule-sets>
 </application-firewall>
</security>
```

</configuration>

**Description** Specify default rule for a rule-set

**Contents** <permit>—Permit packets  
<deny>—Deny packets

---

### <deny> configuration/security/alg/sip/application-screen/protect

---

#### Usage

```
<configuration>
<security>
<alg>
<sip>
<application-screen>
<protect>
<deny>
<destination-ip>...</destination-ip>
<all/>
<timeout>timeout</timeout>
</deny>
</protect>
</application-screen>
</sip>
</alg>
</security>
</configuration>
```

**Description** Protect deny options

**Contents** <destination-ip>—List of protected destination server IP  
<all>—Enable attack protection for all servers  
<timeout>—Timeout value for SIP INVITE attack table entry

---

### <deny-list> configuration/wlan/access-point/access-point-options/station-mac-filter

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<access-point-options>
<station-mac-filter>
<deny-list>
<mac-address>...</mac-address>
</deny-list>
</station-mac-filter>
```

```
</access-point-options>
</access-point>
</wlan>
</configuration>
```

**Description** Deny the MAC addresses

**Contents** <mac-address>—List of denied MAC addresses

---

## <destination> configuration/security/nat

---

### Usage

```
<configuration>
<security>
<nat>
 <destination>
 <pool>...</pool>
 <rule-set>...</rule-set>
 </destination>
</nat>
</security>
</configuration>
```

**Description** Configure Destination NAT

**Contents** <pool>—Define a destination address pool

<rule-set>—Configure a set of rules

---

## <destination-address> configuration/security/screen/ids-option/tcp/syn-flood/white-list

---

### Usage

```
<configuration>
<security>
<screen>
<ids-option>
<tcp>
<syn-flood>
<white-list>
 <destination-address>
 <address>address</address> <!-- identifier -->
 </destination-address>
</white-list>
</syn-flood>
</tcp>
</ids-option>
</screen>
</security>
```

</configuration>

**Description** Destination address

**Contents** <address>—IPv4 or IPv6 destination address

---

### <destination-address> configuration/security/nat/source/rule-set/rule/match

---

#### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<match>
<destination-address>
<dst-addr>dst-addr</dst-addr> <!-- identifier -->
</destination-address>
</match>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Destination address

**Contents** <dst-addr>—IPv4 or IPv6 destination address

---

### <destination-address> configuration/security/nat/destination/rule-set/rule/match

---

#### Usage

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
<match>
<destination-address>
<dst-addr>dst-addr</dst-addr>
</destination-address>
</match>
</rule>
</rule-set>
</destination>
</nat>
</security>
```

```
</configuration>
```

**Description** Destination address

**Contents** <dst-addr>—IPv4 or IPv6 destination address

### <destination-address> configuration/security/nat/static/rule-set/rule/match

#### Usage

```
<configuration>
<security>
<nat>
<static>
<rule-set>
<rule>
<match>
<destination-address>
<dst-addr>dst-addr</dst-addr> <!-- mandatory -->
</destination-address>
</match>
</rule>
</rule-set>
</static>
</nat>
</security>
</configuration>
```

**Description** Destination address

**Contents** <dst-addr>—IPv4 or IPv6 Destination address prefix

### <destination-address-name> configuration/security/nat/source/rule-set/rule/match

#### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<match>
<destination-address-name>
<dst-addr-name>dst-addr-name</dst-addr-name> <!-- identifier -->
</destination-address-name>
</match>
</rule>
</rule-set>
</source>
</nat>
</security>
```

```
</configuration>
```

**Description** Address/address-set from address book

**Contents** <dst-addr-name>—Address/address-set from address book

---

### <destination-address-name> configuration/security/nat/destination/rule-set/rule/match

---

#### Usage

```
<configuration>
 <security>
 <nat>
 <destination>
 <rule-set>
 <rule>
 <match>
 <destination-address-name>
 <dst-addr-name>dst-addr-name</dst-addr-name>
 </destination-address-name>
 </match>
 </rule>
 </rule-set>
 </destination>
 </nat>
 </security>
</configuration>
```

**Description** Address from address book

**Contents** <dst-addr-name>—Address from address book

---

### <destination-address-name> configuration/security/nat/static/rule-set/rule/match

---

#### Usage

```
<configuration>
 <security>
 <nat>
 <static>
 <rule-set>
 <rule>
 <match>
 <destination-address-name>
 <dst-addr-name>dst-addr-name</dst-addr-name> <!-- mandatory -->
 </destination-address-name>
 </match>
 </rule>
 </rule-set>
 </static>
 </nat>
```

```

 </security>
 </configuration>

```

**Description** Address from address book

**Contents** <dst-addr-name>—Address from address book

## <destination-ip> configuration/security/alarms/potential-violation/policy

### Usage

```

<configuration>
<security>
 <alarms>
 <potential-violation>
 <policy>
 <destination-ip>
 <threshold>threshold</threshold>
 <duration>duration</duration>
 <size>size</size>
 </destination-ip>
 </policy>
 </potential-violation>
 </alarms>
</security>
</configuration>

```

**Description** Configure destination address type of policy violation

**Contents** <threshold>—Number of destination IP address matches to raise alarm

<duration>—Time window matches must occur within

<size>—Total destination IP address number that can be done policy violation check concurrently

## <destination-ip> configuration/security/alg/sip/application-screen/protect/deny

### Usage

```

<configuration>
<security>
 <alg>
 <sip>
 <application-screen>
 <protect>
 <deny>
 <destination-ip>
 <dest-ip-entry>dest-ip-entry</dest-ip-entry> <!-- identifier -->
 </destination-ip>
 </deny>
 </protect>
 </application-screen>
 </sip>
 </alg>
</security>
</configuration>

```

```
 </application-screen>
 </sip>
</alg>
</security>
</configuration>
```

**Description** List of protected destination server IP

**Contents** <dest-ip-entry>—Protected destination server IP entry

---

## <destination-nat> configuration/security/nat/destination/rule-set/rule/then

---

### Usage

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
<then>
 <destination-nat>
 <off/>
 <pool>...</pool>
 </destination-nat>
</then>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** Destination NAT action

**Contents** <off>—No action

<pool>—Use Destination NAT pool

---

## <destination-port> configuration/security/nat/source/rule-set/rule/match

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<match>
 <destination-port>
 <low>low</low> <!-- mandatory -->
```

```
<to>...</to>
</destination-port>
</match>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Destination port

**Contents** <low>—Port or lower limit of port range  
<to>—Port range upper limit

---

### <destination-port> configuration/security/nat/destination/rule-set/rule/match

---

#### Usage

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
<match>
<destination-port>
<dst-port>dst-port</dst-port>
</destination-port>
</match>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** Destination port

**Contents** <dst-port>—Destination port

---

### <dhcp> configuration/interfaces/interface/unit/family/inet

---

#### Usage

```
<configuration>
<interfaces>
<interface>
<unit>
<family>
<inet>
```

```

<dhcp>
 <client-identifier>...</client-identifier>
 <lease-time>lease-time</lease-time>
 <retransmission-attempt>retransmission-attempt</retransmission-attempt>

 <retransmission-interval>retransmission-interval</retransmission-interval>
 <server-address>server-address</server-address>
 <update-server/>
 <vendor-id>vendor-id</vendor-id>
</dhcp>
</inet>
</family>
</unit>
</interface>
</interfaces>
</configuration>

```

**Description** Configure DHCP Client

**Contents**

- <client-identifier>—DHCP Server identifies a client by client-identifier value
  - infinite - Lease never expires
  - length - Number of seconds
- <lease-time>—Default lease time requested in
  - infinite - Lease never expires
  - length - Number of seconds
- <retransmission-attempt>—Number of attempts to retransmit the DHCP client protocol packet
- <retransmission-interval>—Number of seconds between successive retransmission
- <server-address>—DHCP Server-address
- <update-server>—Propagate TCP/IP settings to DHCP server
- <vendor-id>—Vendor class id for the DHCP Client

## [<dhcp-option82> configuration/ethernet-switching-options/secure-access-port/vlan](#)

### Usage

```

<configuration>
 <ethernet-switching-options>
 <secure-access-port>
 <vlan>
 <dhcp-option82>
 <disable/>
 <circuit-id>...</circuit-id>
 <remote-id>...</remote-id>

```

```

 <vendor-id>...</vendor-id>
 </dhcp-option82>
</vlan>
</secure-access-port>
</ethernet-switching-options>
</configuration>

```

**Description** Configure DHCP option 82 on this VLAN

**Contents** <disable>—Disable DHCP option 82 on this VLAN

<circuit-id>—Configure DHCP option 82 circuit id

<remote-id>—Configure DHCP option 82 remote id

<vendor-id>—Configure DHCP option 82 vendor id

### <dhcp-snooping-file> configuration/ethernet-switching-options/secure-access-port

**Usage**

```

<configuration>
<ethernet-switching-options>
<secure-access-port>
 <dhcp-snooping-file>
 <location>location</location> <!-- mandatory -->
 <write-interval>write-interval</write-interval> <!-- mandatory -->
 <timeout>timeout</timeout>
 </dhcp-snooping-file>
</secure-access-port>
</ethernet-switching-options>
</configuration>

```

**Description** Configure DHCP snooping persistence file, write-interval and timeout

**Contents** <location>—Location of DHCP snooping entries file

<write-interval>—Time interval for writing DHCP snooping entries

<timeout>—Timeout for remote read and write operations

### <dial-string> configuration/interfaces/interface/unit/dialer-options

**Usage**

```

<configuration>
<interfaces>
<interface>
<unit>
 <dialer-options>
 <dial-string>
 <value>value</value>

```

```
</dial-string>
</dialer-options>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description** String to dial out

**Contents** <value>—String to dial out

---

## <dialer-options> configuration/interfaces/interface/unit

---

### Usage

```
<configuration>
<interfaces>
<interface>
<unit>
 <dialer-options>
 <pool>pool</pool> <!-- mandatory -->
 <dial-string>...</dial-string>
 <incoming-map>...</incoming-map>
 <callback/>
 <callback-wait-period>callback-wait-period</callback-wait-period>
 <redial-delay>redial-delay</redial-delay>
 <idle-timeout>idle-timeout</idle-timeout>
 <watch-list>...</watch-list>
 <load-threshold>load-threshold</load-threshold>
 <load-interval>load-interval</load-interval>
 <activation-delay>activation-delay</activation-delay>
 <deactivation-delay>deactivation-delay</deactivation-delay>
 <initial-route-check>initial-route-check</initial-route-check>
 </dialer-options>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description** Dialer options

**Contents** <pool>—Dialer pool

<dial-string>—String to dial out

<incoming-map>—Map incoming call to dialer

<callback>—Call back on any incoming call to the dialer

<callback-wait-period>—Time to wait before calling back

<redial-delay>—Time to wait before redialing

<idle-timeout>—Delay before taking down the interface

<watch-list>—Dialer watch list

<load-threshold>—Load threshold for adding interfaces

<load-interval>—Interval used to calculate average load

<activation-delay>—Activation delay

<deactivation-delay>—Deactivation delay

<initial-route-check>—Delay to check primary after the router is up

---

### <dialer-options> configuration/interfaces/interface

---

**Usage**

```
<configuration>
<interfaces>
<interface>
 <dialer-options>
 <pool>...</pool>
 </dialer-options>
</interface>
</interfaces>
</configuration>
```

**Description** Dialer options

**Contents** <pool>—Dialer pool

---

### <disable> configuration/security/pki/ca-profile/revocation-check/crl

---

**Usage**

```
<configuration>
<security>
<pki>
 <ca-profile>
 <revocation-check>
 <crl>
 <disable>
 <on-download-failure/>
 </disable>
 </crl>
 </revocation-check>
 </ca-profile>
</pki>
</security>
</configuration>
```

**Description**

**Contents**    <on-download-failure>—Disable revocation check if failed to download CRL

---

**<distinguished-name> configuration/security/ike/gateway/dynamic**

---

**Usage**

```
<configuration>
<security>
 <ike>
 <gateway>
 <dynamic>
 <distinguished-name>
 <container>container</container>
 <wildcard>wildcard</wildcard>
 </distinguished-name>
 </dynamic>
 </gateway>
 </ike>
</security>
</configuration>
```

**Description**    Use a distinguished name:

**Contents**    <container>—Specify the container string  
              <wildcard>—Specify the wildcard string

---

**<distinguished-name> configuration/security/ike/gateway/remote-identity**

---

**Usage**

```
<configuration>
<security>
 <ike>
 <gateway>
 <remote-identity>
 <distinguished-name>
 <container>container</container>
 <wildcard>wildcard</wildcard>
 </distinguished-name>
 </remote-identity>
 </gateway>
 </ike>
</security>
</configuration>
```

**Description**    Use a distinguished name:

**Contents**    <container>—Specify the container string

<wildcard>—Specify the wildcard string

## <distinguished-name> configuration/security/group-vpn/server/ike/gateway/dynamic

### Usage

```
<configuration>
<security>
 <group-vpn>
 <server>
 <ike>
 <gateway>
 <dynamic>
 <distinguished-name>
 <container>container</container>
 <wildcard>wildcard</wildcard>
 </distinguished-name>
 </dynamic>
 </gateway>
 </ike>
 </server>
 </group-vpn>
</security>
</configuration>
```

**Description** Use a distinguished name:

**Contents** <container>—Specify the container string

<wildcard>—Specify the wildcard string

## <dns> configuration/security/alg

### Usage

```
<configuration>
<security>
 <alg>
 <dns>
 <disable/>

 <maximum-message-length>maximum-message-length</maximum-message-length>

 <doctoring>...</doctoring>
 <traceoptions>...</traceoptions>
 </dns>
 </alg>
</security>
</configuration>
```

**Description** Configure DNS ALG

- Contents**
- <disable>—Disable DNS ALG
  - <maximum-message-length>—Set maximum message length
  - <doctoring>—Configure DNS ALG doctoring
  - <traceoptions>—DNS ALG trace options

---

## <dns-name> configuration/security/address-book/address

---

### Usage

```
<configuration>
<security>
<address-book>
<address>
 <dns-name>
 <domain-name>domain-name</domain-name> <!-- identifier -->
 <ipv4-only/>
 <ipv6-only/>
 </dns-name>
</address>
</address-book>
</security>
</configuration>
```

**Description** DNS address name

- Contents**
- <domain-name>—Fully qualified hostname
  - <ipv4-only>—IPv4 dns address
  - <ipv6-only>—IPv6 dns address

---

## <dns-name> configuration/security/zones/security-zone/address-book/address

---

### Usage

```
<configuration>
<security>
<zones>
 <security-zone>
 <address-book>
 <address>
 <dns-name>
 <domain-name>domain-name</domain-name> <!-- identifier -->
 <ipv4-only/>
 <ipv6-only/>
 </dns-name>
 </address>
 </address-book>
 </security-zone>
</zones>
</security>
```

```
</configuration>
```

<b>Description</b>	DNS address name
<b>Contents</b>	<p>&lt;domain-name&gt;—Fully qualified hostname</p> <p>&lt;ipv4-only&gt;—IPv4 dns address</p> <p>&lt;ipv6-only&gt;—IPv6 dns address</p>

## <doctoring> configuration/security/alg/dns

### Usage

```
<configuration>
 <security>
 <alg>
 <dns>
 <doctoring>
 <none/>
 <sanity-check/>
 </doctoring>
 </dns>
 </alg>
 </security>
</configuration>
```

<b>Description</b>	Configure DNS ALG doctoring
<b>Contents</b>	<p>&lt;none&gt;—Disable all DNS ALG Doctoring</p> <p>&lt;sanity-check&gt;—Perform only DNS ALG sanity checks</p>

## <dot1q-tunneling> configuration/ethernet-switching-options

### Usage

```
<configuration>
 <ethernet-switching-options>
 <dot1q-tunneling>
 <ether-type>ether-type</ether-type>
 </dot1q-tunneling>
 </ethernet-switching-options>
</configuration>
```

<b>Description</b>	Dot1q tunneling global options
<b>Contents</b>	<p>&lt;ether-type&gt;—Dot1q Ether-type value</p> <ul style="list-style-type: none"> <li>0x8100 - Dot1q ether-type value 0x8100</li> </ul>

- 0x9100 - Dot1q ether-type value 0x9100
- 0x88a8 - Dot1q ether-type value 0x88a8

---

## <dot1q-tunneling> configuration/vlans/vlan

---

### Usage

```
<configuration>
 <vlans>
 <vlan>
 <dot1q-tunneling>
 <customer-vlans>...</customer-vlans>
 <layer2-protocol-tunneling>...</layer2-protocol-tunneling>
 </dot1q-tunneling>
 </vlan>
 </vlans>
</configuration>
```

**Description** Dot1q-tunneling parameters

**Contents** <customer-vlans>—  
<layer2-protocol-tunneling>—Layer2 protocol tunneling configuration

---

## <dot1x> configuration/protocols

---

### Usage

```
<configuration>
 <protocols>
 <dot1x>
 <traceoptions>...</traceoptions>
 <authenticator>...</authenticator>
 </dot1x>
 </protocols>
</configuration>
```

**Description** 802.1X options

**Contents** <traceoptions>—Trace options for 802.1X  
<authenticator>—802.1X authenticator options

---

## <dot1x> configuration/wlan/access-point/radio/virtual-access-point/security

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
```

```
<radio>
 <virtual-access-point>
 <security>
 <dot1x>
 <radius-server>radius-server</radius-server>
 <radius-key>radius-key</radius-key>

 <broadcast-key-refresh-rate>broadcast-key-refresh-rate</broadcast-key-refresh-rate>

 <session-key-refresh-rate>session-key-refresh-rate</session-key-refresh-rate>

 </dot1x>
 </security>
</virtual-access-point>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Dot1x configuration

**Contents** <radius-server>—Set RADIUS server IP address

<radius-key>—Secret RADIUS key

<broadcast-key-refresh-rate>—Broadcast key refresh rate

<session-key-refresh-rate>—Session key refresh rate

---

## <dot1x-suppliant> configuration/wlan/access-point/external

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <external>
 <dot1x-suppliant>
 <username>username</username>
 <password>password</password>
 </dot1x-suppliant>
 </external>
 </access-point>
 </wlan>
</configuration>
```

### Description

**Contents** <username>—Username

<password>—Dot1x suppliant mode password

## <drop> configuration/security/gprs/gtp/profile

## <drop> configuration/security/gprs/sctp/profile

### Usage

```
<configuration>
<security>
<gprs>
<sctp>
<profile>
<drop>
 <m3ua-service>...</m3ua-service>
 <payload-protocol>...</payload-protocol>
</drop>
</profile>
</sctp>
</gprs>
</security>
</configuration>
```

**Description** Disallowed sctp payload message

**Contents** <m3ua-service>—MTP level 3 (MTP3) user adaptation layer service  
<payload-protocol>—SCTP payload protocol identifier

---

## <dscp-rewrite> configuration/security/alg/h323

### Usage

```
<configuration>
<security>
<alg>
<h323>
<dscp-rewrite>
 <code-point>code-point</code-point>
</dscp-rewrite>
</h323>
</alg>
</security>
</configuration>
```

**Description** DSCP code rewrite

**Contents** <code-point>—Set dscp codepoint 6-bit string

## **<dscp-rewrite> configuration/security/alg/mgcp**

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <mgcp>
 <dscp-rewrite>
 <code-point>code-point</code-point>
 </dscp-rewrite>
 </mgcp>
 </alg>
 </security>
</configuration>
```

**Description** DSCP code rewrite

**Contents** <code-point>—Set dscp codepoint 6-bit string

## **<dscp-rewrite> configuration/security/alg/sccp**

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <sccp>
 <dscp-rewrite>
 <code-point>code-point</code-point>
 </dscp-rewrite>
 </sccp>
 </alg>
 </security>
</configuration>
```

**Description** DSCP code rewrite

**Contents** <code-point>—Set dscp codepoint 6-bit string

## **<dscp-rewrite> configuration/security/alg/sip**

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <sip>
 <dscp-rewrite>
 <code-point>code-point</code-point>
 </dscp-rewrite>
 </sip>
 </alg>
 </security>
</configuration>
```

```
</alg>
</security>
</configuration>
```

**Description** DSCP code rewrite

**Contents** <code-point>—Set dscp codepoint 6-bit string

---

## <dynamic> configuration/security/ike/gateway

---

### Usage

```
<configuration>
<security>
<ike>
<gateway>
<dynamic>
<distinguished-name>...</distinguished-name>
<hostname>hostname</hostname>
<inet>inet</inet>
<inet6>inet6</inet6>
<user-at-hostname>user-at-hostname</user-at-hostname>
<connections-limit>connections-limit</connections-limit>
<ike-user-type>ike-user-type</ike-user-type>
</dynamic>
</gateway>
</ike>
</security>
</configuration>
```

**Description** Site to site peer with dynamic IP address

**Contents** <distinguished-name>—Use a distinguished name:

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users
- shared-ike-id - Email address shared as IKED ID by multiple users

<hostname>—Use a fully-qualified domain name

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users
- shared-ike-id - Email address shared as IKED ID by multiple users

<inet>—Use an IPV4 address to identify the dynamic peer

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users
- shared-ike-id - Email address shared as IKED ID by multiple users

<inet6>—Use an IPV6 address to identify the dynamic peer

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users

- shared-ike-id - Email address shared as IKED ID by multiple users

<user-at-hostname>—Use an e-mail address

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users
- shared-ike-id - Email address shared as IKED ID by multiple users

<connections-limit>—Maximum number of users connected to gateway

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users
- shared-ike-id - Email address shared as IKED ID by multiple users

<ike-user-type>—Type of the IKE ID

- group-ike-id - Email address or FQDN shared as IKED ID by multiple users
- shared-ike-id - Email address shared as IKED ID by multiple users

## <dynamic> configuration/security/group-vpn/server/ike/gateway

### Usage

```
<configuration>
<security>
<group-vpn>
<server>
<ike>
<gateway>
<dynamic>
<distinguished-name>...</distinguished-name>
<hostname>hostname</hostname>
<inet>inet</inet>
<user-at-hostname>user-at-hostname</user-at-hostname>
</dynamic>
</gateway>
</ike>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Site to site peer with dynamic IP address

**Contents** <distinguished-name>—Use a distinguished name:

<hostname>—Use a fully-qualified domain name

<inet>—Use an IPV4 address to identify the dynamic peer

<user-at-hostname>—Use an e-mail address

## **<dynamic-application> configuration/security/application-firewall/rule-sets/rule/match**

---

### **Usage**

```
<configuration>
<security>
<application-firewall>
<rule-sets>
<rule>
<match>
<dynamic-application>
<system-applications/>
<junos:UNKNOWN/>
</dynamic-application>
</match>
</rule>
</rule-sets>
</application-firewall>
</security>
</configuration>
```

**Description** Dynamic application

**Contents** <system-applications>—Specify dynamic application name to match  
<junos:UNKNOWN>—Unknown application

## **<dynamic-application-group> configuration/security/application-firewall/rule-sets/rule/match**

---

### **Usage**

```
<configuration>
<security>
<application-firewall>
<rule-sets>
<rule>
<match>
<dynamic-application-group>
<system-application-groups/>
<junos:unassigned/>
</dynamic-application-group>
</match>
</rule>
</rule-sets>
</application-firewall>
</security>
</configuration>
```

**Description** Dynamic application group

- Contents**    <system-application-groups>—Specify dynamic application group name to match
- <junos:unassigned>—Unassigned group

---

### <dynamic-call-admission-control> configuration/interfaces/interface/unit

---

**Usage**

```
<configuration>
 <interfaces>
 <interface>
 <unit>
 <dynamic-call-admission-control>
 <bearer-bandwidth-limit>bearer-bandwidth-limit</bearer-bandwidth-limit> <!--
mandatory -->
 <activation-priority>activation-priority</activation-priority>
 </dynamic-call-admission-control>
 </unit>
 </interface>
 </interfaces>
</configuration>
```

**Description**    Dynamic call admission control configuration

- Contents**    <bearer-bandwidth-limit>—Bearer bandwidth limit
- <activation-priority>—Priority assigned to bearer bandwidth limit

---

### <dynamic-vpn> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <dynamic-vpn>
 <force-upgrade/>
 <access-profile>access-profile</access-profile> <!-- mandatory -->
 <clients>...</clients>
 </dynamic-vpn>
 </security>
</configuration>
```

**Description**    Configure dynamic VPN

- Contents**    <force-upgrade>—Force Upgrade
- <access-profile>—Configure access
- <clients>—Configure for remote access client

## CHAPTER 31

# Tag Elements Beginning with E

This chapter lists the configuration tag elements that have names beginning with the letter e. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<east-interface>` configuration/protocols/protection-group/ethernet-ring

---

#### Usage

```
<configuration>
 <protocols>
 <protection-group>
 <ethernet-ring>
 <east-interface>
 <control-channel>...</control-channel> <!-- mandatory -->
 <ring-protection-link-end/>
 <interface-none/>
 </east-interface>
 </ethernet-ring>
 </protection-group>
 </protocols>
</configuration>
```

**Description** East interface configuration

**Contents** `<control-channel>`—Contro channel of ring port  
`<ring-protection-link-end>`—Port is connecting to ring protection link

<interface-none>—Port is not used

## <edge-virtual-bridging> configuration/protocols

---

### Usage

```
<configuration>
 <protocols>
 <edge-virtual-bridging>
 <traceoptions>...</traceoptions>
 <vsi-discovery>...</vsi-discovery>
 </edge-virtual-bridging>
 </protocols>
</configuration>
```

**Description** Edge Virtual Bridging options

**Contents** <traceoptions>—Trace options for Edge Virtual Bridging

<vsi-discovery>—

## <egress> configuration/ethernet-switching-options/analyzer/input

---

### Usage

```
<configuration>
 <ethernet-switching-options>
 <analyzer>
 <input>
 <egress>
 <interface>...</interface>
 <vlan>...</vlan>
 </egress>
 </input>
 </analyzer>
 </ethernet-switching-options>
</configuration>
```

**Description** Ports and VLANs to monitor outgoing traffic

**Contents** <interface>—Port to monitor outgoing traffic

<vlan>—VLAN to monitor outgoing traffic

## <email-notify> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/pattern-update

---

### Usage

```
<configuration>
 <security>
 <utm>
```

```

 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <pattern-update>
 <email-notify>
 <admin-email>admin-email</admin-email>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </email-notify>
 </pattern-update>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
</utm>
</security>
</configuration>

```

**Description** Virus pattern file updated notification

**Contents** <admin-email>—Admin emails to be notified about pattern file update

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

## <email-notify> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/pattern-update

### Usage

```

<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <juniper-express-engine>
 <pattern-update>
 <email-notify>
 <admin-email>admin-email</admin-email>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </email-notify>
 </pattern-update>
 </juniper-express-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>

```

**Description** Virus pattern file updated notification

**Contents** <admin-email>—Admin emails to be notified about pattern file update  
<custom-message>—Custom message for notification  
<custom-message-subject>—Custom message subject for notification

### **<email-notify> configuration/security/utm/feature-profile/anti-virus/sophos-engine/pattern-update**

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <sophos-engine>
 <pattern-update>
 <email-notify>
 <admin-email>admin-email</admin-email>
 <custom-message>custom-message</custom-message>
 <custom-message-subject>custom-message-subject</custom-message-subject>
 </email-notify>
 </pattern-update>
 </sophos-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Virus pattern file updated notification

**Contents** <admin-email>—Admin emails to be notified about pattern file update  
<custom-message>—Custom message for notification  
<custom-message-subject>—Custom message subject for notification

### **<encryption> configuration/security/ipsec/internal/security-association/manual**

---

**Usage**

```
<configuration>
 <security>
 <ipsec>
 <internal>
 <security-association>
 <manual>
 <encryption>
```

```

 <algorithm>algorithm</algorithm> <!-- mandatory -->
 <key>...</key> <!-- mandatory -->
 </encryption>
</manual>
</security-association>
</internal>
</ipsec>
</security>
</configuration>

```

**Description** Define encryption parameters

**Contents** <algorithm>—Define encryption algorithm

- 3des-cbc - 3DES-CBC encryption algorithm

<key>—Define an encryption key

## <encryption> configuration/security/ipsec/vpn/manual

### Usage

```

<configuration>
<security>
<ipsec>
<vpn>
<manual>
 <encryption>
 <algorithm>algorithm</algorithm> <!-- mandatory -->
 <key>...</key> <!-- mandatory -->
 </encryption>
</manual>
</vpn>
</ipsec>
</security>
</configuration>

```

**Description** Define encryption parameters

**Contents** <algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<key>—Define an encryption key

## **<encryption-failures> configuration/security/alarms/potential-violation**

---

**Usage**

```
<configuration>
 <security>
 <alarms>
 <potential-violation>
 <encryption-failures>
 <threshold>threshold</threshold>
 </encryption-failures>
 </potential-violation>
 </alarms>
 </security>
</configuration>
```

**Description** No. of encryption failures before which an alarm needs to be raised

**Contents** <threshold>—Threshold value [default is 1000]

## **<enhanced-transmission-selection> configuration/protocols/dcbx/interface**

---

**Usage**

```
<configuration>
 <protocols>
 <dcbx>
 <interface>
 <enhanced-transmission-selection>
 <no-auto-negotiation/>
 </enhanced-transmission-selection>
 </interface>
 </dcbx>
 </protocols>
</configuration>
```

**Description** Configure enhanced transmission selection feature

**Contents** <no-auto-negotiation>—Enable ETS manually

## **<enrollment> configuration/security/pki/ca-profile**

---

**Usage**

```
<configuration>
 <security>
 <pki>
 <ca-profile>
 <enrollment>
 <url>url</url>
 <retry>retry</retry>
 <retry-interval>retry-interval</retry-interval>
 </enrollment>
 </ca-profile>
 </pki>
 </security>
</configuration>
```

```

 </enrollment>
 </ca-profile>
</pki>
</security>
</configuration>

```

**Description** Enrollment parameters for certificate authority

**Contents** <url>—Enrollment URL of certificate authority

<retry>—Number of enrollment retry attempts before aborting

<retry-interval>—Interval in seconds between the enrollment retries

## <esw-interface> configuration/ethernet-switching-options/interfaces

### Usage

```

<configuration>
 <ethernet-switching-options>
 <interfaces>
 <esw-interface>
 <interface-name>interface-name</interface-name> <!-- identifier -->
 <no-mac-learning/> <!-- mandatory -->
 </esw-interface>
 </interfaces>
 </ethernet-switching-options>
</configuration>

```

**Description** Interface name

**Contents** <interface-name>—Interface name

<no-mac-learning>—Disable mac learning for this interface

## <ethernet> configuration/protocols/oam

### Usage

```

<configuration>
 <protocols>
 <oam>
 <ethernet>
 <link-fault-management>...</link-fault-management>
 <connectivity-fault-management>...</connectivity-fault-management>
 </ethernet>
 </oam>
 </protocols>
</configuration>

```

**Description** OAM configuration for ethernet

**Contents** <link-fault-management>—

<connectivity-fault-management>—Configurations related to 802.1ag ethernet oam

## <ethernet> configuration/wlan/access-point/external/system/ports

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <external>
 <system>
 <ports>
 <ethernet>
 <management-vlan>management-vlan</management-vlan>
 <untagged-vlan>untagged-vlan</untagged-vlan>
 <static>...</static>
 <name-server>...</name-server> <!-- mandatory -->
 </ethernet>
 </ports>
 </system>
 </external>
 </access-point>
 </wlan>
</configuration>
```

**Description** Ethernet settings

**Contents** <management-vlan>—Management VLAN identifier

<untagged-vlan>—Untagged VLAN identifier

<static>—Specify static parameters

<name-server>—Domain name server IP address

## <ethernet-ring> configuration/protocols/protection-group

### Usage

```
<configuration>
 <protocols>
 <protection-group>
 <ethernet-ring>
 <name>name</name> <!-- identifier -->
 <node-id>node-id</node-id>
 <ring-protection-link-owner/>
 <restore-interval>restore-interval</restore-interval>
 <guard-interval>guard-interval</guard-interval>
 <hold-interval>hold-interval</hold-interval>
 <east-interface>...</east-interface> <!-- mandatory -->
 <west-interface>...</west-interface> <!-- mandatory -->
 <control-vlan>control-vlan</control-vlan>
```

```

 <data-channel>...</data-channel>
 </ethernet-ring>
</protection-group>
</protocols>
</configuration>

```

**Description** Ethernet ring

**Contents**

- <name>—Name of Ethernet Ring protection group
- <node-id>—Node ID of the protection group which should be the bridge MAC address
- <ring-protection-link-owner>—Ring protection link owner flag, one ring should have only one node as a ring protection link owner
- <restore-interval>—Wait to restore interval
- <guard-interval>—Guard timer interval in 10ms
- <hold-interval>—Hold off timer interval in 100ms steps
- <east-interface>—East interface configuration
- <west-interface>—West interface configuration
- <control-vlan>—Dedicated VLAN identifier - VLAN id or VLAN name
- <data-channel>—Ring instance data channel

## <ethernet-switching> configuration/interfaces/interface/unit/family

**Description**

## <ethernet-switching-options> configuration

**Usage**

```

<configuration>
 <ethernet-switching-options>
 <traceoptions>...</traceoptions>
 <voip>...</voip>
 <unknown-unicast-forwarding>...</unknown-unicast-forwarding>
 <dot1q-tunneling>...</dot1q-tunneling>
 <mac-notification>...</mac-notification>
 <interfaces>...</interfaces>
 <mac-table-aging-time>...</mac-table-aging-time>
 <nonstop-bridging/>
 <static>...</static>
 <secure-access-port>...</secure-access-port>
 <authentication-whitelist>...</authentication-whitelist>
 <analyzer>...</analyzer>
 <port-error-disable>...</port-error-disable>
 <bpdu-block>...</bpdu-block>
 <redundant-trunk-group>...</redundant-trunk-group>
 </ethernet-switching-options>
</configuration>

```

```
<storm-control>...</storm-control>
</ethernet-switching-options>
</configuration>
```

**Description** Ethernet-switching configuration options

**Contents**

- <traceoptions>—Global tracing options for access security
- <voip>—Voice-over-IP configuration
- <unknown-unicast-forwarding>—Set interface for forwarding of unknown unicast packets
- <dot1q-tunneling>—Dot1q tunneling global options
- <mac-notification>—MAC notification options
- <interfaces>—Ethernet switching family interface names
- <mac-table-aging-time>—MAC aging time configuration
- <nonstop-bridging>—Enable Non stop operation
- <static>—Static forwarding entries
- <secure-access-port>—Access port security options
- <authentication-whitelist>—MAC authentication-whitelist configuration needed to bypass Authentication
- <analyzer>—Analyzer options
- <port-error-disable>—Port error disable options
- <bpdv-block>—Block BPDV on interface (BPDV Protect)
- <redundant-trunk-group>—Redundant trunk group
- <storm-control>—Storm control configuration

---

## <event> configuration/security/datapath-debug/action-profile

---

### Usage

```
<configuration>
 <security>
 <datapath-debug>
 <action-profile>
 <event>
 <np-ingress/>
 <np-egress/>
 <mac-ingress/>
 <mac-egress/>
 <lbt/>
 <pot/>
```

```

 <jexec/>
 <lt-enter/>
 <lt-leave/>
 <trace/>
 <count/>
 <packet-summary/>
 <packet-dump/>
 </event>
</action-profile>
</datapath-debug>
</security>
</configuration>

```

## Description

**Contents**

- <np-ingress>—NP ingress
- <np-egress>—NP egress
- <mac-ingress>—A2/A10 IOC Mac(broadcom) ingress
- <mac-egress>—A2/A10 IOC Mac(broadcom) egress
- <lbt>—Load-Balance-Thread
- <pot>—Packet-Order-Thread
- <jexec>—JExec
- <lt-enter>—LT(Logical Tunnel) enter
- <lt-leave>—LT(Logical Tunnel) leave
- <trace>—Trace action
- <count>—Count action
- <packet-summary>—Packet summary action
- <packet-dump>—Packet dump action

## <event> configuration/protocols/oam/ethernet/connectivity-fault-management/action-profile

### Usage

```

<configuration>
 <protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <action-profile>
 <event>
 <adjacency-loss/>
 </event>
 </action-profile>
 </ethernet>
 </oam>
 </protocols>
 </configuration>

```

```
</action-profile>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Events that need to be monitored

**Contents** <adjacency-loss>—Connectivity is lost

### <examine-dhcp> configuration/ethernet-switching-options/secure-access-port/vlan

#### Usage

```
<configuration>
<ethernet-switching-options>
<secure-access-port>
<vlan>
 <examine-dhcp>
 <forwarding-class>forwarding-class</forwarding-class>
 </examine-dhcp>
</vlan>
</secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description** Enable DHCP snooping on this VLAN

**Contents** <forwarding-class>—Forwarding class assigned to re-injected DHCP packets

### <examine-fip> configuration/ethernet-switching-options/secure-access-port/vlan

#### Usage

```
<configuration>
<ethernet-switching-options>
<secure-access-port>
<vlan>
 <examine-fip>
 <fc-map>fc-map</fc-map>
 </examine-fip>
</vlan>
</secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description** Enable FIP snooping on this VLAN

**Contents** <fc-map>—FCoE MAC address prefix

## <external> configuration/interfaces/interface/clocking

---

### Usage

```
<configuration>
 <interfaces>
 <interface>
 <clocking>
 <external>
 <interface>interface</interface>
 </external>
 </clocking>
 </interface>
 </interfaces>
</configuration>
```

### Description

**Contents**    <interface>—Interface that acts as clock source

## <external> configuration/wlan/access-point

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <external>
 <system>...</system>
 <dot1x-supPLICANT>...</dot1x-supPLICANT>
 </external>
 </access-point>
 </wlan>
</configuration>
```

**Description**    External type access point

**Contents**    <system>—System information

                 <dot1x-supPLICANT>—

## <external-manager> configuration/services/server-load-balance

---

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <external-manager>
 <ext-manager-name>ext-manager-name</ext-manager-name> <!-- identifier
-->
 <protocol>protocol</protocol>
```

```
<address>address</address> <!-- mandatory -->
<port>port</port>
<disable/>
</external-manager>
</server-load-balance>
</services>
</configuration>
```

**Description** Configure external manager

**Contents** <ext-manager-name>—Name of the external manager

- sasp - SASP manager (RFC4678)

<protocol>—Protocol of external manager

- sasp - SASP manager (RFC4678)

<address>—External manager IP address

<port>—External manager TCP port

<disable>—Disable external manager

## CHAPTER 32

# Tag Elements Beginning with F

This chapter lists the configuration tag elements that have names beginning with the letter *f*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<fallback-block>` configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/profile/notification-options

---

#### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <profile>
 <notification-options>
 <fallback-block>
 <type>type</type>
 <display-host/>
 <allow-email/>
 <administrator-email>administrator-email</administrator-email>
 <notify-mail-sender/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </fallback-block>
 </notification-options>
 </profile>
```

```
</kaspersky-lab-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Fallback block notification

**Contents** <type>—Fallback block notification type

- protocol-only - Notification in protocol level only
- message - Notification in message

<display-host>—Display hostname

<allow-email>—Administrator e-mail address

<administrator-email>—Administrator e-mail address

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

---

### <fallback-block> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/profile/notification-options

---

#### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<juniper-express-engine>
<profile>
<notification-options>
 <fallback-block>
 <type>type</type>
 <display-host/>
 <allow-email/>
 <administrator-email>administrator-email</administrator-email>
 <notify-mail-sender/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </fallback-block>
</notification-options>
</profile>
</juniper-express-engine>
</anti-virus>
```

```

 </feature-profile>
 </utm>
</security>
</configuration>

```

**Description** Fallback block notification

**Contents** <type>—Fallback block notification type

- protocol-only - Notification in protocol level only
- message - Notification in message

<display-host>—Display hostname

<allow-email>—Administrator e-mail address

<administrator-email>—Administrator e-mail address

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

## <fallback-block> configuration/security/utm/feature-profile/anti-virus/sophos-engine/profile/notification-options

### Usage

```

<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <sophos-engine>
 <profile>
 <notification-options>
 <fallback-block>
 <type>type</type>
 <display-host/>
 <allow-email/>
 <administrator-email>administrator-email</administrator-email>
 <notify-mail-sender/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </fallback-block>
 </notification-options>
 </profile>
 </sophos-engine>
 </anti-virus>
 </feature-profile>
 </utm>

```

```
</security>
</configuration>
```

**Description** Fallback block notification

**Contents** <type>—Fallback block notification type

- protocol-only - Notification in protocol level only
- message - Notification in message

<display-host>—Display hostname

<allow-email>—Administrator e-mail address

<administrator-email>—Administrator e-mail address

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

### [\*\*<fallback-non-block> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/profile/notification-options\*\*](#)

---

**Usage**

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <profile>
 <notification-options>
 <fallback-non-block>
 <notify-mail-recipient/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>

<password-file>—Fallback action for password file

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<decompress-layer>—Fallback action for over decompress layer limit

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

- log-and-permit -
- block -

<content-size>—Fallback action for content over size limit

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<engine-not-ready>—Fallback action for engine not ready

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<timeout>—Fallback action for engine scan timeout

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<out-of-resources>—Fallback action for out of resources

- log-and-permit -
- block -

- log-and-permit -
- block -

<too-many-requests>—Fallback action for requests exceed engine limit

- log-and-permit -
- block -

## <fallback-options> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/profile

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <juniper-express-engine>
 <profile>
 <fallback-options>
 <default>default</default>
 <content-size>content-size</content-size>
 <engine-not-ready>engine-not-ready</engine-not-ready>
 <timeout>timeout</timeout>
 <out-of-resources>out-of-resources</out-of-resources>
 <too-many-requests>too-many-requests</too-many-requests>
 </fallback-options>
 </profile>
 </juniper-express-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Anti-virus juniper-express-engine fallback options

**Contents** <default>—Default action

<too-many-requests>—Fallback action for requests exceed engine limit

- permit -
- log-and-permit -

- block -

## <fallback-settings> configuration/security/utm/feature-profile/web-filtering/surf-control-integrated/profile

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<surf-control-integrated>
<profile>
<fallback-settings>
<default>default</default>
<server-connectivity>server-connectivity</server-connectivity>
<timeout>timeout</timeout>
<too-many-requests>too-many-requests</too-many-requests>
</fallback-settings>
</profile>
</surf-control-integrated>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Surf control integrated fallback settings

**Contents** <default>—Fallback default settings

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<server-connectivity>—Fallback action when device cannot connect to server

- log-and-permit -
- block -
- log-and-permit -
- block -

- log-and-permit -
- block -

<timeout>—Fallback action when connection to server timeout

- log-and-permit -
- block -
- log-and-permit -
- block -

<too-many-requests>—Fallback action when requests exceed the limit of engine

- log-and-permit -
- block -

---

## <fallback-settings> configuration/security/utm/feature-profile/web-filtering/web-sense-redirect/profile

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<websense-redirect>
<profile>
<fallback-settings>
<default>default</default>
<server-connectivity>server-connectivity</server-connectivity>
<timeout>timeout</timeout>
<too-many-requests>too-many-requests</too-many-requests>
</fallback-settings>
</profile>
</websense-redirect>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Websense redirect fallback settings

**Contents** <default>—Fallback default settings

- log-and-permit -
- block -
- log-and-permit -

- log-and-permit -
- block -
- log-and-permit -
- block -

<server-connectivity>—Fallback action when device cannot connect to server

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<timeout>—Fallback action when connection to server timeout

- log-and-permit -
- block -
- log-and-permit -
- block -

<too-many-requests>—Fallback action when requests exceed the limit of engine

- log-and-permit -
- block -

---

## <fallback-settings> configuration/security/utm/feature-profile/web-filtering/juniper-local/profile

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-local>
 <profile>
 <fallback-settings>
 <default>default</default>
 <server-connectivity>server-connectivity</server-connectivity>
 <timeout>timeout</timeout>
 <too-many-requests>too-many-requests</too-many-requests>
 </fallback-settings>
 </profile>
```

```
</juniper-local>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Juniper local fallback settings

**Contents** <default>—Fallback default settings

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<server-connectivity>—Fallback action when device cannot connect to server

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<timeout>—Fallback action when connection to server timeout

- log-and-permit -
- block -
- log-and-permit -
- block -

<too-many-requests>—Fallback action when requests exceed the limit of engine

- log-and-permit -
- block -

## **<fallback-settings> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced/profile**

### **Usage**

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-enhanced>
 <profile>
 <fallback-settings>
 <default>default</default>
 <server-connectivity>server-connectivity</server-connectivity>
 <timeout>timeout</timeout>
 <too-many-requests>too-many-requests</too-many-requests>
 </fallback-settings>
 </profile>
 </juniper-enhanced>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Juniper enhanced fallback settings

**Contents** <default>—Fallback default settings

- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -
- log-and-permit -
- block -

<server-connectivity>—Fallback action when device cannot connect to server

- log-and-permit -
- block -
- log-and-permit -
- block -

- log-and-permit -
- block -

<timeout>—Fallback action when connection to server timeout

- log-and-permit -
- block -
- log-and-permit -
- block -

<too-many-requests>—Fallback action when requests exceed the limit of engine

- log-and-permit -
- block -

---

## <family> configuration/security/forwarding-options

---

### Usage

```
<configuration>
<security>
<forwarding-options>
<family>
 <inet6>...</inet6>
 <mpls>...</mpls>
 <iso>...</iso>
</family>
</forwarding-options>
</security>
</configuration>
```

**Description** Security forwarding-options for family

**Contents** <inet6>—Family IPv6

<mpls>—Family MPLS

<iso>—Family ISO

---

## <family> configuration/interfaces/interface/unit

---

### Usage

```
<configuration>
<interfaces>
<interface>
 <unit>
 <family>
 <inet>...</inet>
 <inet6>...</inet6>
```

```
<mpls>...</mpls>
<ethernet-switching/>
</family>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description**

**Contents**   <inet>—

              <inet6>—

              <mpls>—

              <ethernet-switching>—

---

**<fcoe> configuration/protocols/dcbx/interface/applications**

---

**Usage**

```
<configuration>
<protocols>
<dcbx>
<interface>
<applications>
<fcoe>
 <no-auto-negotiation/>
</fcoe>
</applications>
</interface>
</dcbx>
</protocols>
</configuration>
```

**Description**   Configure FCoE application feature

**Contents**   <no-auto-negotiation>—Enable FCoE Application manually

---

**<feature-profile> configuration/security/utm**

---

**Usage**

```
<configuration>
<security>
<utm>
<feature-profile>
 <anti-virus>...</anti-virus>
 <web-filtering>...</web-filtering>
 <anti-spam>...</anti-spam>
 <content-filtering>...</content-filtering>
</feature-profile>
```

```
</utm>
</security>
</configuration>
```

**Description** Feature-profile settings

**Contents** <anti-virus>—Configure anti-virus feature

<web-filtering>—Configure web-filtering feature

<anti-spam>—Configure anti-spam feature

<content-filtering>—Configure content filtering feature

---

## <file> configuration/security/ike/traceoptions

---

### Usage

```
<configuration>
<security>
 <ike>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </ike>
</security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

---

## <file> configuration/security/group-vpn/server/traceoptions

---

### Usage

```
<configuration>
<security>
```

```

<group-vpn>
 <server>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </server>
</group-vpn>
</security>
</configuration>

```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

### <file> configuration/security/pki/traceoptions

#### Usage

```

<configuration>
 <security>
 <pki>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </pki>
 </security>
</configuration>

```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <world-readable>—Allow any user to read the log file
- <match>—Regular expression for lines to be logged

---

## <file> configuration/security/gprs/gtp/traceoptions

---

### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<traceoptions>
<file>
<filename>filename</filename>
<size>size</size>
<files>files</files>
<world-readable/>
<match>match</match>
</file>
</traceoptions>
</gtp>
</gprs>
</security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <world-readable>—Allow any user to read the log file
- <match>—Regular expression for lines to be logged

---

## <file> configuration/security/gprs/sctp/traceoptions

---

### Usage

```
<configuration>
<security>
<gprs>
<sctp>
<traceoptions>
<file>
<filename>filename</filename>
<size>size</size>
```

```

 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
</traceoptions>
</sctp>
</gprs>
</security>
</configuration>

```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

## <file> configuration/security/alg/traceoptions

### Usage

```

<configuration>
<security>
 <alg>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </alg>
</security>
</configuration>

```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

## <file> configuration/security/application-firewall/traceoptions

---

### Usage

```
<configuration>
 <security>
 <application-firewall>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </application-firewall>
 </security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

## <file> configuration/security/softwires/traceoptions

---

### Usage

```
<configuration>
 <security>
 <softwires>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </softwires>
 </security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

---

### <file> configuration/security/flow/traceoptions

---

**Usage**

```
<configuration>
 <security>
 <flow>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </flow>
 </security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

---

### <file> configuration/security/screen/traceoptions

---

**Usage**

```
<configuration>
 <security>
 <screen>
 <traceoptions>
 <file>
```

```
<filename>filename</filename>
<size>size</size>
<files>files</files>
<world-readable/>
<match>match</match>
</file>
</traceoptions>
</screen>
</security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

---

## <file> configuration/security/nat/traceoptions

---

### Usage

```
<configuration>
<security>
<nat>
<traceoptions>
<file>
<filename>filename</filename>
<size>size</size>
<files>files</files>
<world-readable/>
<match>match</match>
</file>
</traceoptions>
</nat>
</security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

## <file> configuration/security/log

---

### Usage

```
<configuration>
 <security>
 <log>
 <file>
 <name>name</name>
 <size>size</size>
 <path>path</path>
 <files>files</files>
 </file>
 </log>
 </security>
</configuration>
```

**Description** Security log file options for logs in binary format

**Contents** <filename>—Name of binary log file

<size>—Maximum size of binary log file in megabytes (1..10)

<path>—Path to binary log files

<files>—Maximum number of binary log files (2..10)

## <file> configuration/security/log/traceoptions

---

### Usage

```
<configuration>
 <security>
 <log>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </log>
 </security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <world-readable>—Allow any user to read the log file
- <match>—Regular expression for lines to be logged

---

## <file> configuration/security/traceoptions

---

### Usage

```
<configuration>
<security>
<traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
</traceoptions>
</security>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <world-readable>—Allow any user to read the log file
- <match>—Regular expression for lines to be logged

---

## <file> configuration/security/datapath-debug/traceoptions

---

### Usage

```
<configuration>
<security>
 <datapath-debug>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
```

```

 </datapath-debug>
 </security>
</configuration>

```

**Description** Trace file information

**Contents**

- <filename>—Name of file in which to write trace information
- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <world-readable>—Allow any user to read the log file
- <match>—Regular expression for lines to be logged

### <file> configuration/security/user-identification/traceoptions

---

**Usage**

```

<configuration>
 <security>
 <user-identification>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </user-identification>
 </security>
</configuration>

```

**Description** Trace file information

**Contents**

- <filename>—Name of file in which to write trace information
- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <world-readable>—Allow any user to read the log file
- <match>—Regular expression for lines to be logged

## <file> configuration/services/ip-monitoring/traceoptions

---

### Usage

```
<configuration>
 <services>
 <ip-monitoring>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </ip-monitoring>
 </services>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

## <file> configuration/services/unified-access-control/traceoptions

---

### Usage

```
<configuration>
 <services>
 <unified-access-control>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </unified-access-control>
 </services>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

---

### <file> configuration/services/server-load-balance/traceoptions

---

#### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <traceoptions>
 <file>
 <filename>filename</filename>
 <size>size</size>
 <files>files</files>
 <world-readable/>
 <match>match</match>
 </file>
 </traceoptions>
 </server-load-balance>
 </services>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

---

### <file> configuration/services/captive-portal/traceoptions

---

#### Usage

```
<configuration>
 <services>
 <captive-portal>
 <traceoptions>
 <file>
```

```
<filename>filename</filename> <!-- mandatory -->
<replace/>
<size>size</size>
<files>files</files>
<no-stamp/>
<world-readable/>
</file>
</traceoptions>
</captive-portal>
</services>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

---

## <file> configuration/interfaces/interface/traceoptions

---

### Usage

```
<configuration>
<interfaces>
<interface>
<traceoptions>
<file>
<filename>filename</filename> <!-- mandatory -->
<size>size</size>
<files>files</files>
<world-readable/>
</file>
</traceoptions>
</interface>
</interfaces>
</configuration>
```

**Description** Trace file information for ISDN decoded frames

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/oam/ethernet/connectivity-fault-management/trace-options

---

### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<traceoptions>
<file>
<filename>filename</filename>
<size>size</size>
<files>files</files>
<world-readable/>
<match>match</match>
</file>
</traceoptions>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Trace file information

**Contents** <filename>—Name of file in which to write trace information

<size>—Maximum trace file size

<files>—Maximum number of trace files

<world-readable>—Allow any user to read the log file

<match>—Regular expression for lines to be logged

## <file> configuration/protocols/lldp/traceoptions

---

### Usage

```
<configuration>
<protocols>
<lldp>
<traceoptions>
<file>
<filename>filename</filename> <!-- mandatory -->
<replace/>
<size>size</size>
<files>files</files>
<no-stamp/>
```

```
<world-readable/>
</file>
</traceoptions>
</lldp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

---

### <file> configuration/protocols/dot1x/traceoptions

---

#### Usage

```
<configuration>
<protocols>
<dot1x>
<traceoptions>
<file>
<filename>filename</filename> <!-- mandatory -->
<replace/>
<size>size</size>
<files>files</files>
<no-stamp/>
<world-readable/>
</file>
</traceoptions>
</dot1x>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/gvrp/traceoptions

---

### Usage

```
<configuration>
<protocols>
<gvrp>
<traceoptions>
 <file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
 </file>
</traceoptions>
</gvrp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/mvrp/traceoptions

---

### Usage

```
<configuration>
<protocols>
<mvrp>
<traceoptions>
 <file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
```

```
</file>
</traceoptions>
</mvrp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

---

### <file> configuration/protocols/protection-group/traceoptions

---

#### Usage

```
<configuration>
<protocols>
<protection-group>
<traceoptions>
<file>
<filename>filename</filename> <!-- mandatory -->
<replace/>
<size>size</size>
<files>files</files>
<no-stamp/>
<world-readable/>
</file>
</traceoptions>
</protection-group>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/stp/traceoptions

### Usage

```
<configuration>
<protocols>
<stp>
<traceoptions>
<file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
</file>
</traceoptions>
</stp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/rstp/traceoptions

### Usage

```
<configuration>
<protocols>
<rstp>
<traceoptions>
<file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
</file>
</traceoptions>
```

```
</rstp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

---

### <file> configuration/protocols/mstp/traceoptions

---

#### Usage

```
<configuration>
<protocols>
<mstp>
<traceoptions>
<file>
<filename>filename</filename> <!-- mandatory -->
<replace/>
<size>size</size>
<files>files</files>
<no-stamp/>
<world-readable/>
</file>
</traceoptions>
</mstp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/vstp/vlan-group/group/traceoptions

### Usage

```
<configuration>
<protocols>
<vstp>
<vlan-group>
<group>
<traceoptions>
<file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
</file>
</traceoptions>
</group>
</vlan-group>
</vstp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents**

- <filename>—Name of file in which to write trace information
- <replace>—Replace trace file rather than appending to it
- <size>—Maximum trace file size
- <files>—Maximum number of trace files
- <no-stamp>—Do not timestamp trace file
- <world-readable>—Allow any user to read the log file

## <file> configuration/protocols/vstp/vlan/traceoptions

### Usage

```
<configuration>
<protocols>
<vstp>
<vlan>
<traceoptions>
<file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
```

```
<world-readable/>
</file>
</traceoptions>
</vlan>
</vstp>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

---

## <file> configuration/protocols/edge-virtual-bridging/traceoptions

---

### Usage

```
<configuration>
<protocols>
<edge-virtual-bridging>
<traceoptions>
<file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
</file>
</traceoptions>
</edge-virtual-bridging>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/igmp-snooping/traceoptions

---

### Usage

```
<configuration>
<protocols>
<igmp-snooping>
<traceoptions>
 <file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
 </file>
</traceoptions>
</igmp-snooping>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## <file> configuration/protocols/mld-snooping/traceoptions

---

### Usage

```
<configuration>
<protocols>
<mld-snooping>
<traceoptions>
 <file>
 <filename>filename</filename> <!-- mandatory -->
 <replace/>
 <size>size</size>
 <files>files</files>
 <no-stamp/>
 <world-readable/>
```

```
</file>
</traceoptions>
</mld-snooping>
</protocols>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

---

## <file> configuration/ethernet-switching-options/traceoptions

---

### Usage

```
<configuration>
<ethernet-switching-options>
<traceoptions>
<file>
<filename>filename</filename> <!-- mandatory -->
<replace/>
<size>size</size>
<files>files</files>
<no-stamp/>
<world-readable/>
</file>
</traceoptions>
</ethernet-switching-options>
</configuration>
```

**Description** Trace file options

**Contents** <filename>—Name of file in which to write trace information

<replace>—Replace trace file rather than appending to it

<size>—Maximum trace file size

<files>—Maximum number of trace files

<no-stamp>—Do not timestamp trace file

<world-readable>—Allow any user to read the log file

## **<filename-extension> configuration/security/utm/custom-objects**

---

### **Usage**

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <filename-extension>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <value>...</value>
 </filename-extension>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure extension-list object

**Contents** <name>—Configure name of extension-list object

<value>—Configure value of extension-list object

## **<filter> configuration/interfaces/interface/unit/family/inet**

---

### **Usage**

```
<configuration>
 <interfaces>
 <interface>
 <unit>
 <family>
 <inet>
 <filter>
 <dialer>dialer</dialer>
 </filter>
 </inet>
 </family>
 </unit>
 </interface>
 </interfaces>
</configuration>
```

**Description**

**Contents** <dialer>—Name of filter applied on dialer

## **<filter> configuration/interfaces/interface/unit/family/inet6**

---

### **Usage**

```
<configuration>
```

```
<interfaces>
<interface>
 <unit>
 <family>
 <inet6>
 <filter>
 <dialer>dialer</dialer>
 </filter>
 </inet6>
 </family>
 </unit>
</interface>
</interfaces>
</configuration>
```

**Description**

**Contents**    <dialer>—Name of filter applied on dialer

---

**<filter> configuration/interfaces/interface/unit/family/mpls**

---

**Usage**

```
<configuration>
<interfaces>
<interface>
 <unit>
 <family>
 <mpls>
 <filter>
 <dialer>dialer</dialer>
 </filter>
 </mpls>
 </family>
 </unit>
</interface>
</interfaces>
</configuration>
```

**Description**

**Contents**    <dialer>—Name of filter applied on dialer

---

**<filter> configuration/vlans/vlan**

---

**Usage**

```
<configuration>
<vlans>
 <vlan>
 <filter>
 <input>input</input>
 <output>output</output>
 </filter>
```

```
</vlan>
</vlans>
</configuration>
```

**Description** Packet filtering

**Contents** <input>—Name of filter applied to received packets  
<output>—Name of filter applied to transmitted packets

---

### <firewall-authentication> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <firewall-authentication>
 <traceoptions>...</traceoptions>
 </firewall-authentication>
 </security>
</configuration>
```

**Description** Firewall authentication parameters

**Contents** <traceoptions>—Data-plane firewall authentication tracing options

---

### <flag> configuration/security/ike/traceoptions

---

**Usage**

```
<configuration>
 <security>
 <ike>
 <traceoptions>
 <flag>
 <timer/>
 <routing-socket/>
 <parse/>
 <config/>
 <ike/>
 <policy-manager/>
 <general/>
 <database/>
 <certificates/>
 <snmp/>
 <thread/>
 <high-availability/>
 <next-hop-tunnels/>
 <all/>
 </flag>
 </traceoptions>
 </ike>
```

```
</security>
</configuration>
```

**Description** Tracing parameters for IKE

**Contents**

- <timer>—Trace internal timer events
- <routing-socket>—Trace routing socket messages
- <parse>—Trace configuration processing
- <config>—Trace configuration download processing
- <ike>—Trace IKE module processing
- <policy-manager>—Trace policy manager processing
- <general>—Trace general events
- <database>—Trace security associations database events
- <certificates>—Trace certificate events
- <snmp>—Trace SNMP operations
- <thread>—Trace thread processing
- <high-availability>—Trace high-availability operations
- <next-hop-tunnels>—Trace next-hop-tunnels operations
- <all>—Trace everything

---

## <flag> configuration/security/ipsec/traceoptions

---

### Usage

```
<configuration>
<security>
<ipsec>
<traceoptions>
<flag>
<packet-processing/>
<packet-drops/>
<security-associations/>
<next-hop-tunnel-binding/>
<all/>
</flag>
</traceoptions>
</ipsec>
</security>
</configuration>
```

**Description** Events to include in data-plane IPSec trace output

**Contents** <packet-processing>—Trace data packet processing events  
 <packet-drops>—Trace packet drops  
 <security-associations>—Trace security association management events  
 <next-hop-tunnel-binding>—Trace next-hop tunnel binding events  
 <all>—Trace with all flags enabled

## <flag> configuration/security/group-vpn/server/traceoptions

### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <traceoptions>
 <flag>
 <timer/>
 <routing-socket/>
 <parse/>
 <config/>
 <ike/>
 <policy-manager/>
 <general/>
 <database/>
 <certificates/>
 <snmp/>
 <thread/>
 <high-availability/>
 <next-hop-tunnels/>
 <all/>
 </flag>
 </traceoptions>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Tracing parameters for GKSD

**Contents** <timer>—Trace internal timer events  
 <routing-socket>—Trace routing socket messages  
 <parse>—Trace configuration processing  
 <config>—Trace configuration download processing

<ike>—Trace IKE module processing

<policy-manager>—Trace policy manager processing

<general>—Trace general events

<database>—Trace security associations database events

<certificates>—Trace certificate events

<snmp>—Trace SNMP operations

<thread>—Trace thread processing

<high-availability>—Trace high-availability operations

<next-hop-tunnels>—Trace next-hop-tunnels operations

<all>—Trace everything

---

## <flag> configuration/security/pki/traceoptions

---

### Usage

```
<configuration>
<security>
 <pki>
 <traceoptions>
 <flag>
 <certificate-verification/>
 <online-crl-check/>
 <enrollment/>
 <all/>
 </flag>
 </traceoptions>
 </pki>
</security>
</configuration>
```

**Description** Tracing parameters

**Contents** <certificate-verification>—PKI certificate verification tracing

<online-crl-check>—PKI online crl tracing

<enrollment>—PKI certificate enrollment tracing

<all>—Trace with all flags enabled

---

## <flag> configuration/security/gprs/gtp/traceoptions

---

### Usage

```
<configuration>
```

```

<security>
 <gprs>
 <gtp>
 <traceoptions>
 <flag>
 <configuration/>
 <flow/>
 <parser/>
 <chassis-cluster/>
 <all/>
 </flag>
 </traceoptions>
 </gtp>
 </gprs>
</security>
</configuration>

```

**Description** Tracing parameters

**Contents** <configuration>—Trace configuration events

<flow>—Trace flow events

<parser>—Trace parser events

<chassis-cluster>—Trace chassis cluster events

<all>—Trace everything

### <flag> configuration/security/gprs/sctp/traceoptions

#### Usage

```

<configuration>
 <security>
 <gprs>
 <sctp>
 <traceoptions>
 <flag>
 <configuration/>
 <flow/>
 <parser/>
 <chassis-cluster/>
 <all/>
 </flag>
 </traceoptions>
 </sctp>
 </gprs>
 </security>
</configuration>

```

**Description** Tracing parameters

**Contents**    <configuration>—Trace configuration events  
                 <flow>—Trace flow events  
                 <parser>—Trace parser events  
                 <chassis-cluster>—Trace chassis cluster events  
                 <all>—Trace everything

---

## <flag> configuration/security/alg/alg-manager/traceoptions

---

### Usage

```
<configuration>
 <security>
 <alg>
 <alg-manager>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </alg-manager>
 </alg>
 </security>
</configuration>
```

**Description**    ALG-MANAGER trace flags

**Contents**    <all>—Trace everything  
                 <extensive>—Set trace verbosity level to extensive

---

## <flag> configuration/security/alg/alg-support-lib/traceoptions

---

### Usage

```
<configuration>
 <security>
 <alg>
 <alg-support-lib>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </alg-support-lib>
 </alg>
 </security>
</configuration>
```

**Description** ALG-SUPPORT-LIB trace flags

**Contents** <all>—Trace everything  
<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/dns/traceoptions

---

**Usage**

```
<configuration>
<security>
 <alg>
 <dns>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </dns>
 </alg>
</security>
</configuration>
```

**Description** DNS ALG trace flags

**Contents** <all>—Trace everything  
<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/ftp/traceoptions

---

**Usage**

```
<configuration>
<security>
 <alg>
 <ftp>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </ftp>
 </alg>
</security>
</configuration>
```

**Description** FTP ALG trace flags

**Contents**    <all>—Trace everything  
                 <extensive>—Set trace verbosity level to extensive

---

## <flag> configuration/security/alg/h323/traceoptions

---

### Usage

```
<configuration>
<security>
 <alg>
 <h323>
 <traceoptions>
 <flag>
 <q931/>
 <h245/>
 <ras/>
 <h225-asn1/>
 <h245-asn1/>
 <ras-asn1/>
 <chassis-cluster/>
 <all/>
 <terse/>
 <detail/>
 <extensive/>
 </flag>
 </traceoptions>
 </h323>
 </alg>
</security>
</configuration>
```

**Description**    H.323 ALG trace flags

**Contents**    <q931>—Enable tracing for Q.931 processing  
                 <h245>—Enable tracing for H.245 processing  
                 <ras>—Enable tracing for RAS processing  
                 <h225-asn1>—Enable tracing for H.225 ASN.1 processing  
                 <h245-asn1>—Enable tracing for H.245 ASN.1 processing  
                 <ras-asn1>—Enable tracing for RAS ASN.1 processing  
                 <chassis-cluster>—Enable tracing for H.323 chassis cluster functions  
                 <all>—Trace everything  
                 <terse>—Set trace verbosity level to terse  
                 <detail>—Set trace verbosity level to detail

<extensive>—Set trace verbosity level to extensive

## <flag> configuration/security/alg/mgcp/traceoptions

### Usage

```
<configuration>
<security>
<alg>
<mgcp>
<traceoptions>
<flag>
<call/>
<decode/>
<error/>
<chassis-cluster/>
<nat/>
<packet/>
<rm/>
<all/>
<extensive/>
</flag>
</traceoptions>
</mgcp>
</alg>
</security>
</configuration>
```

**Description** MGCP ALG trace flags

**Contents**

- <call>—Enable tracing for MGCP call processing
- <decode>—Enable tracing for MGCP decoder operations
- <error>—Enable tracing for MGCP processing errors
- <chassis-cluster>—Enable tracing for MGCP chassis cluster functions
- <nat>—Enable tracing for MGCP Network Address Translation (NAT) processing
- <packet>—Enable tracing for MGCP protocol packet processing
- <rm>—Enable tracing MGCP Resource Management (Resmgr) functions
- <all>—Trace everything
- <extensive>—Set trace verbosity level to extensive

## <flag> configuration/security/alg/msrpc/traceoptions

### Usage

```
<configuration>
<security>
```

```
<alg>
 <msrpc>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </msrpc>
</alg>
</security>
</configuration>
```

**Description** MSRPC ALG trace flags

**Contents** <all>—Trace everything  
<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/sunrpc/traceoptions

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <sunrpc>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </sunrpc>
 </alg>
 </security>
</configuration>
```

**Description** SUNRPC ALG trace flags

**Contents** <all>—Trace everything  
<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/real/traceoptions

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <real>
```

```
<traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
</traceoptions>
</real>
</alg>
</security>
</configuration>
```

**Description** REAL ALG trace flags

**Contents** <all>—Trace everything  
<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/rsh/traceoptions

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <rsh>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </rsh>
 </alg>
 </security>
</configuration>
```

**Description** RSH ALG trace flags

**Contents** <all>—Trace everything  
<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/rtsp/traceoptions

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <rtsp>
 <traceoptions>
 <flag>
```

```
<all/>
<extensive/>
</flag>
</traceoptions>
</rtsp>
</alg>
</security>
</configuration>
```

**Description** RTSP ALG trace flags

**Contents** <all>—Trace everything

<extensive>—Set trace verbosity level to extensive

---

### <flag> configuration/security/alg/sccp/traceoptions

---

#### Usage

```
<configuration>
<security>
<alg>
<sccp>
<traceoptions>
<flag>
<call/>
<cli/>
<decode/>
<error/>
<chassis-cluster/>
<init/>
<nat/>
<rm/>
<all/>
<extensive/>
</flag>
</traceoptions>
</sccp>
</alg>
</security>
</configuration>
```

**Description** SCCP ALG trace flags

**Contents** <call>—Enable tracing SCCP call processing

<cli>—Enable tracing SCCP cli processing

<decode>—Enable tracing for SCCP decoder operations

<error>—Enable tracing for SCCP processing errors

<chassis-cluster>—Enable tracing for SCCP chassis cluster functions

<init>—Enable tracing for SCCP initialization errors

<nat>—Enable tracing for SCCP Network Address Translation (NAT) processing

<rm>—Enable tracing SCCP Resource Management (Resmgr) functions

<all>—Trace everything

<extensive>—Set trace verbosity level to extensive

## <flag> configuration/security/alg/sip/traceoptions

### Usage

```
<configuration>
<security>
 <alg>
 <sip>
 <traceoptions>
 <flag>
 <call/>
 <chassis-cluster/>
 <nat/>
 <parser/>
 <rm/>
 <all/>
 <terse/>
 <detail/>
 <extensive/>
 </flag>
 </traceoptions>
 </sip>
 </alg>
</security>
</configuration>
```

**Description** SIP ALG trace flags

**Contents**

<call>—Enable tracing for SIP call processing

<chassis-cluster>—Enable tracing for SIP chassis cluster functions

<nat>—Enable tracing for SIP Network Address Translation (NAT) processing

<parser>—Enable tracing for SIP parser operations

<rm>—Enable tracing SIP Resource Management (Resmgr) functions

<all>—Trace everything

<terse>—Set trace verbosity level to terse

<detail>—Set trace verbosity level to detail

<extensive>—Set trace verbosity level to extensive

---

## <flag> configuration/security/alg/sql/traceoptions

---

### Usage

```
<configuration>
 <security>
 <alg>
 <sql>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </sql>
 </alg>
 </security>
</configuration>
```

**Description** SQL ALG trace flags

**Contents** <all>—Trace everything

<extensive>—Set trace verbosity level to extensive

---

## <flag> configuration/security/alg/talk/traceoptions

---

### Usage

```
<configuration>
 <security>
 <alg>
 <talk>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </talk>
 </alg>
 </security>
</configuration>
```

**Description** TALK ALG trace flags

**Contents** <all>—Trace everything

<extensive>—Set trace verbosity level to extensive

## <flag> configuration/security/alg/tftp/traceoptions

### Usage

```
<configuration>
<security>
 <alg>
 <tftp>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </tftp>
 </alg>
</security>
</configuration>
```

**Description** TFTP ALG trace flags

**Contents** <all>—Trace everything

<extensive>—Set trace verbosity level to extensive

## <flag> configuration/security/alg/pptp/traceoptions

### Usage

```
<configuration>
<security>
 <alg>
 <pptp>
 <traceoptions>
 <flag>
 <all/>
 <extensive/>
 </flag>
 </traceoptions>
 </pptp>
 </alg>
</security>
</configuration>
```

**Description** PPTP ALG trace flags

**Contents** <all>—Trace everything

<extensive>—Set trace verbosity level to extensive

## **<flag> configuration/security/alg/ike-esp-nat/traceoptions**

---

**Usage**

```
<configuration>
<security>
<alg>
<ike-esp-nat>
<traceoptions>
<flag>
<all/>
<extensive/>
</flag>
</traceoptions>
</ike-esp-nat>
</alg>
</security>
</configuration>
```

**Description** IKE-ESP ALG trace flags

**Contents** <all>—Trace everything

<extensive>—Set trace verbosity level to extensive

## **<flag> configuration/security/application-firewall/traceoptions**

---

**Usage**

```
<configuration>
<security>
<application-firewall>
<traceoptions>
<flag>
<configuration/>
<lookup/>
<compilation/>
<ipc/>
<all/>
</flag>
</traceoptions>
</application-firewall>
</security>
</configuration>
```

**Description** Tracing parameters

**Contents** <configuration>—Trace configuration events

<lookup>—Trace lookup events

<compilation>—Rule-sets compilation events

<ipc>—Inter-process communication events

<all>—Trace everything

## <flag> configuration/security/utm/traceoptions

### Usage

```
<configuration>
<security>
<utm>
<traceoptions>
<flag>
<cli/>
<daemon/>
<ipc/>
<pfe/>
<all/>
</flag>
</traceoptions>
</utm>
</security>
</configuration>
```

**Description** Tracing UTM information

**Contents** <cli>—Trace CLI

<daemon>—Trace daemon information

<ipc>—Trace IPC information

<pfe>—Trace pfe information

<all>—Enable all utm trace options

## <flag> configuration/security/utm/application-proxy/traceoptions

### Usage

```
<configuration>
<security>
<utm>
<application-proxy>
<traceoptions>
<flag>
<abort/>
<application-objects/>
<utm-realtime/>
<anti-virus/>
<basic/>
<buffer/>
<detail/>
<ftp-data/>
```

```
<ftp-control/>
<http/>
<imap/>
<memory/>
<parser/>
<pfe/>
<pop3/>
<queue/>
<smtp/>
<tcp/>
<timer/>
<connection-rating/>
<express-anti-virus/>
<mime/>
<regex-engine/>
<sophos-anti-virus/>
<all/>
</flag>
</traceoptions>
</application-proxy>
</utm>
</security>
</configuration>
```

**Description** Tracing parameters for utm application proxy

**Contents**

- <abort>—Trace application-proxy session abort
- <application-objects>—Trace application-proxy objects information
- <utm-realtime>—Trace application-proxy realtime-thread information
- <anti-virus>—Trace anti-virus information
- <basic>—Trace application-proxy basic information
- <buffer>—Trace application-proxy data buffer information
- <detail>—Trace application-proxy detailed information
- <ftp-data>—Trace FTP data connection information
- <ftp-control>—Trace FTP control connection information
- <http>—Trace HTTP protocol information
- <imap>—Trace IMAP protocol information
- <memory>—Trace memory usage
- <parser>—Trace protocol parser
- <pfe>—Trace communication with PFE

<pop3>—Trace POP3 protocol information  
 <queue>—Trace queue information  
 <smtp>—Trace SMTP protocol information  
 <tcp>—Trace TCP level information  
 <timer>—Trace timer processing  
 <connection-rating>—Trace connection rating information  
 <express-anti-virus>—Trace anti-virus express engine information  
 <mime>—Trace MIME parser information  
 <regex-engine>—Trace Pattern Match Engine (PME) information  
 <sophos-anti-virus>—Trace anti-virus sophos engine information  
 <all>—Enable all application-proxy trace options

## <flag> configuration/security/utm/ipc/traceoptions

### Usage

```

<configuration>
 <security>
 <utm>
 <ipc>
 <traceoptions>
 <flag>
 <basic/>
 <detail/>
 <connection-manager/>
 <connection-status/>
 <pfe/>
 <utm-realtime/>
 <all/>
 </flag>
 </traceoptions>
 </ipc>
 </utm>
 </security>
</configuration>

```

**Description** Traceoptions for utm IPC flag

**Contents**

- <basic>—Trace basic IPC related information
- <detail>—Trace detail IPC related information
- <connection-manager>—Trace IPC connection manager

<connection-status>—Trace IPC connection status

<pfe>—Trace communication with pfe

<utm-realtime>—Trace IPC realtime-thread information

<all>—Enable all IPC trace options

---

## <flag> configuration/security/utm/feature-profile/anti-virus/traceoptions

---

### Usage

```
<configuration>
<security>
<utm>
 <feature-profile>
 <anti-virus>
 <traceoptions>
 <flag>
 <basic/>
 <detail/>
 <engine/>
 <pattern/>
 <updater/>
 <manager/>
 <worker/>
 <sendmail/>
 <ipc/>
 <event/>
 <statistics/>
 <all/>
 </flag>
 </traceoptions>
 </anti-virus>
 </feature-profile>
</utm>
</security>
</configuration>
```

**Description** Trace options for anti-virus feature flag

**Contents**

- <basic>—Trace anti-virus module generic basic information
- <detail>—Trace anti-virus module generic detail information
- <engine>—Trace scan engine information
- <pattern>—Trace detail information of pattern loading
- <updater>—Trace pattern updater process activities
- <manager>—Trace anti-virus manager process activities
- <worker>—Trace anti-virus worker process activities

- <sendmail>—Trace mail notifier process activities
- <ipc>—Trace communication events with PFE
- <event>—Trace communication events between RE side processes
- <statistics>—Trace statistics information
- <all>—Enable trace all anti-virus trace options

## <flag> configuration/security/utm/feature-profile/web-filtering/traceoptions

### Usage

```

<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <traceoptions>
 <flag>
 <basic/>
 <session-manager/>
 <heartbeat/>
 <packet/>
 <profile/>
 <requests/>
 <response/>
 <socket/>
 <timer/>
 <ipc/>
 <cache/>
 <enhanced/>
 <all/>
 </flag>
 </traceoptions>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>

```

**Description** Trace options for web-filtering feature trace flag

**Contents**

- <basic>—Trace web-filtering module generic basic information
- <session-manager>—Trace session management information
- <heartbeat>—Trace connectivity information with web-filter server
- <packet>—Trace packet information from session management
- <profile>—Trace profile config information

<requests>—Trace requests sent to web-filter server

<response>—Trace response received from web-filter server

<socket>—Trace communication socket with web-filter server

<timer>—Trace aging information for requests sent to server

<ipc>—Trace communication events with PFE

<cache>—Trace category cache operations

<enhanced>—Trace Juniper enhanced web-filtering operations

<all>—Enable trace all anti-virus trace options

---

## <flag> configuration/security/utm/feature-profile/anti-spam/traceoptions

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-spam>
 <traceoptions>
 <flag>
 <manager/>
 <sbl/>
 <all/>
 </flag>
 </traceoptions>
 </anti-spam>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Trace options for anti-spam feature flag

**Contents** <manager>—Trace anti-spam manager information

<sbl>—Trace SBL server information

<all>—Enable trace all anti-spam trace options

---

## <flag> configuration/security/utm/feature-profile/content-filtering/traceoptions

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
```

```

<content-filtering>
 <traceoptions>
 <flag>
 <basic/>
 <detail/>
 <all/>
 </flag>
 </traceoptions>
</content-filtering>
</feature-profile>
</utm>
</security>
</configuration>

```

**Description** Trace options for content-filtering feature flag

**Contents** <basic>—Trace content-filtering basic information  
 <detail>—Trace content-filtering detail information  
 <all>—Enable trace all content-filtering trace options

## <flag> configuration/security/softwires/traceoptions

### Usage

```

<configuration>
 <security>
 <softwires>
 <traceoptions>
 <flag>
 <configuration/>
 <flow/>
 <all/>
 </flag>
 </traceoptions>
 </softwires>
 </security>
</configuration>

```

**Description** Tracing parameters

**Contents** <configuration>—Trace configuration events  
 <flow>—Trace flow events  
 <all>—Trace everything

## <flag> configuration/security/flow/traceoptions

---

**Usage**

```
<configuration>
 <security>
 <flow>
 <traceoptions>
 <flag>
 <all/>
 <basic-datapath/>
 <packet-drops/>
 </flag>
 </traceoptions>
 </flow>
 </security>
</configuration>
```

**Description** Events and other information to include in trace output

**Contents** <all>—All events

<basic-datapath>—Basic packet flow

<packet-drops>—Packet drops

## <flag> configuration/security/firewall-authentication/traceoptions

---

**Usage**

```
<configuration>
 <security>
 <firewall-authentication>
 <traceoptions>
 <flag>
 <authentication/>
 <proxy/>
 <all/>
 <terse/>
 <detail/>
 <extensive/>
 </flag>
 </traceoptions>
 </firewall-authentication>
 </security>
</configuration>
```

**Description** Events to include in trace output

**Contents** <authentication>—Data-plane firewall authentication events

<proxy>—Data-plane firewall authentication proxy events

- <all>—All events
- <terse>—Include terse amount of output in trace
- <detail>—Include detailed amount of output in trace
- <extensive>—Include extensive amount of output in trace

## <flag> configuration/security/screen/traceoptions

---

### Usage

```
<configuration>
<security>
<screen>
<traceoptions>
<flag>
<configuration/>
<flow/>
<all/>
</flag>
</traceoptions>
</screen>
</security>
</configuration>
```

**Description** Tracing parameters

**Contents** <configuration>—Trace configuration events

<flow>—Trace flow events

<all>—Trace everything

## <flag> configuration/security/nat/traceoptions

---

### Usage

```
<configuration>
<security>
<nat>
<traceoptions>
<flag>
<configuration/>
<flow/>
<routing-socket/>
<routing-protocol/>
<all/>
<source-nat-re/>
<source-nat-rt/>
<source-nat-pfe/>
<destination-nat-re/>
<destination-nat-rt/>
<destination-nat-pfe/>
```

```
<static-nat-re/>
<static-nat-rt/>
<static-nat-pfe/>
<syslog/>
</flag>
</traceoptions>
</nat>
</security>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <configuration>—Trace configuration events
- <flow>—Trace flow events
- <routing-socket>—Trace routing socket events
- <routing-protocol>—Trace routing protocol events
- <all>—Trace everything
- <source-nat-re>—Trace source nat events on RE side
- <source-nat-rt>—Trace source nat events on PFE-RT side
- <source-nat-pfe>—Trace source nat events on PFE-ukernel side
- <destination-nat-re>—Trace destination nat events on RE side
- <destination-nat-rt>—Trace destination nat events on PFE-RT side
- <destination-nat-pfe>—Trace destination nat events on PFE-ukernel side
- <static-nat-re>—Trace static nat events on RE side
- <static-nat-rt>—Trace static nat events on PFE-RT side
- <static-nat-pfe>—Trace static nat events on PFE-ukernel side
- <syslog>—Write NAT flow traces to system log also

---

## <flag> configuration/security/resource-manager/traceoptions

---

### Usage

```
<configuration>
<security>
 <resource-manager>
 <traceoptions>
 <flag>
 <client/>
 <group/>
 <resource/>
```

```

 <gate/>
 <session/>
 <chassis cluster/>
 <messaging/>
 <service pinhole/>
 <error/>
 <all/>
 <terse/>
 <detail/>
 <extensive/>
 </flag>
</traceoptions>
</resource-manager>
</security>
</configuration>

```

**Description** Resource manager objects and events to include in trace

**Contents**

- <client>—Trace resource manager client
- <group>—Trace resource manager group
- <resource>—Trace resource manager resource
- <gate>—Trace resource manager created gates
- <session>—Trace resource manager created session
- <chassis cluster>—Trace resource manager's chassis cluster events
- <messaging>—Trace resource manager messaging
- <service pinhole>—Trace resource manager created service pinholes
- <error>—Trace all resource manager errors
- <all>—Trace all resource manager objects and events
- <terse>—Set trace verbosity level to terse
- <detail>—Set trace verbosity level to detail
- <extensive>—Set trace verbosity level to extensive

## <flag> configuration/security/log/traceoptions

### Usage

```

<configuration>
 <security>
 <log>
 <traceoptions>
 <flag>
 <source/>

```

```
<configuration/>
<all/>
<report/>
<hpl/>
</flag>
</traceoptions>
</log>
</security>
</configuration>
```

**Description** List of things to include in trace

**Contents** <source>—Communication with security log forwarder

<configuration>—Reading of configuration

<all>—Everything

<report>—Trace report

<hpl>—Trace HPL logging

---

## <flag> configuration/security/traceoptions

---

### Usage

```
<configuration>
<security>
<traceoptions>
<flag>
<configuration/>
<routing-socket/>
<compilation/>
<all/>
</flag>
</traceoptions>
</security>
</configuration>
```

**Description** Tracing parameters

**Contents** <configuration>—Trace configuration events

<routing-socket>—Trace routing socket events

<compilation>—Trace compilation events

<all>—Trace everything

## <flag> configuration/security/datapath-debug/action-profile/module

---

**Usage**

```
<configuration>
 <security>
 <datapath-debug>
 <action-profile>
 <module>
 <flag>
 <all/>
 </flag>
 </module>
 </action-profile>
 </datapath-debug>
 </security>
</configuration>
```

**Description** Events and other information to include in trace output

**Contents** <all>—All flow trace

## <flag> configuration/security/user-identification/traceoptions

---

**Usage**

```
<configuration>
 <security>
 <user-identification>
 <traceoptions>
 <flag>
 <all/>
 </flag>
 </traceoptions>
 </user-identification>
 </security>
</configuration>
```

**Description** Tracing parameters

**Contents** <all>—Trace everything

## <flag> configuration/services/ip-monitoring/traceoptions

---

**Usage**

```
<configuration>
 <services>
 <ip-monitoring>
 <traceoptions>
 <flag>
 <debug/>
 </flag>
 </traceoptions>
 </ip-monitoring>
 </services>
</configuration>
```

```
<configuration/>
<errors/>
<memory/>
<event/>
<all/>
</flag>
</traceoptions>
</ip-monitoring>
</services>
</configuration>
```

**Description** Tracing parameters

**Contents** <debug>—Trace debug

<configuration>—Trace configuration events

<errors>—Trace errors

<memory>—Trace memory allocation or deallocation messages

<event>—Trace events

<all>—Trace events

---

### <flag> configuration/services/unified-access-control/traceoptions

---

**Usage**

```
<configuration>
<services>
<unified-access-control>
<traceoptions>
<flag>
<all/>
<ipc/>
<config/>
<connect/>
</flag>
</traceoptions>
</unified-access-control>
</services>
</configuration>
```

**Description** Tracing parameters

**Contents** <all>—Trace with all flags enabled

<ipc>—IPC tracing

<config>—Configuration tracing

<connect>—Communication with infranet controller tracing

## <flag> configuration/services/server-load-balance/traceoptions

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <traceoptions>
 <flag>
 <init/>
 <config/>
 <rtsock/>
 <interface/>
 <eventlib/>
 <misc/>
 <sasp/>
 <daemon-all/>
 <datapath-init/>
 <datapath-config/>
 <datapath-data/>
 <datapath-all/>
 <health-monitor-init/>
 <health-monitor-config/>
 <health-monitor-control/>
 <health-monitor-thread/>
 <health-monitor-all/>
 <all/>
 </flag>
 </traceoptions>
 </server-load-balance>
 </services>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <init>—Trace daemon initialization events
- <config>—Trace daemon configuration events
- <rtsock>—Trace daemon routing socket events
- <interface>—Trace daemon interface events
- <eventlib>—Trace daemon eventlib events
- <misc>—Trace daemon miscellaneous events
- <sasp>—Trace SASP events
- <daemon-all>—Trace all daemon events
- <datapath-init>—Trace datapath initialization events

<datapath-config>—Trace datapath configuration events

<datapath-data>—Trace datapath data events

<datapath-all>—Trace all datapath events

<health-monitor-init>—Trace health monitor initialization events

<health-monitor-config>—Trace health monitor configuration events

<health-monitor-control>—Trace health monitor control events

<health-monitor-thread>—Trace health monitor thread events

<health-monitor-all>—Trace all health monitor events

<all>—Trace all events

---

## <flag> configuration/services/captive-portal/traceoptions

---

### Usage

```
<configuration>
 <services>
 <captive-portal>
 <traceoptions>
 <flag>
 <dot1x-debug/>
 <parse/>
 <esw-if/>
 <config-internal/>
 <normal/>
 <general/>
 <state/>
 <task/>
 <timer/>
 <all/>
 <disable/>
 </flag>
 </traceoptions>
 </captive-portal>
 </services>
</configuration>
```

**Description** Tracing parameters

**Contents** <dot1x-debug>—Trace dot1x events

<parse>—Trace configuration parsing

<esw-if>—Trace ESW Interactions

<config-internal>—Trace configuration internals

<normal>—Trace normal events

<general>—Trace general events

<state>—Trace state transitions

<task>—Trace task processing

<timer>—Trace task timer processing

<all>—Trace everything

<disable>—Disable this trace flag

---

### <flag> configuration/interfaces/interface/traceoptions

---

#### Usage

```
<configuration>
<interfaces>
<interface>
<traceoptions>
<flag>
<q921/>
<q931/>
</flag>
</traceoptions>
</interface>
</interfaces>
</configuration>
```

#### Description

**Contents** <q921>—Trace ISDN Q.921 frames

<q931>—Trace ISDN Q.931 frames

---

### <flag> configuration/protocols/oam/ethernet/connectivity-fault-management/traceoptions

---

#### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<traceoptions>
<flag>
<configuration/>
<routing-socket/>
<protocol/>
<init/>
<error/>
```

```
<issu/>
<all/>
</flag>
</traceoptions>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <configuration>—Trace configuration events
- <routing-socket>—Trace routing socket events
- <protocol>—Trace protocol processing events
- <init>—Trace events related to protocol daemon start-up
- <error>—Trace events related to catastrophic errors in daemon
- <issu>—Trace ISSU related events
- <all>—Trace everything

---

## <flag> configuration/protocols/lldp/traceoptions

---

### Usage

```
<configuration>
<protocols>
<lldp>
<traceoptions>
<flag>
<all/>
<configuration/>
<rtsock/>
<packet/>
<interface/>
<vlan/>
<snmp/>
<netbios/>
<disable/>
</flag>
</traceoptions>
</lldp>
</protocols>
</configuration>
```

**Description** Tracing parameters

<b>Contents</b>	<all>—Trace configuration events
	<configuration>—Log configuration events
	<rtsock>—Trace rtsock message events
	<packet>—Trace packet information
	<interface>—Trace interface update events
	<vlan>—Trace VLAN update events
	<snmp>—Trace SNMP events
	<netbios>—Trace NetBIOS events
	<disable>—Disable this trace flag

## <flag> configuration/protocols/dot1x/traceoptions

### Usage

```

<configuration>
<protocols>
<dot1x>
<traceoptions>
<flag>
<dot1x-debug/>
<parse/>
<esw-if/>
<eapol/>
<config-internal/>
<normal/>
<general/>
<state/>
<task/>
<timer/>
<vlan/>
<all/>
<disable/>
</flag>
</traceoptions>
</dot1x>
</protocols>
</configuration>

```

**Description** Tracing parameters

<b>Contents</b>	<dot1x-debug>—Trace dot1x events
	<parse>—Trace configuration parsing
	<esw-if>—Trace ESW Interactions

<eapol>—Trace EAPOL Transmit/Receive

<config-internal>—Trace configuration internals

<normal>—Trace normal events

<general>—Trace general events

<state>—Trace state transitions

<task>—Trace routing protocol task processing

<timer>—Trace routing protocol task timer processing

<vlan>—Trace VLAN transactions

<all>—Trace everything

<disable>—Disable this trace flag

---

## <flag> configuration/protocols/gvrp/traceoptions

---

### Usage

```
<configuration>
<protocols>
 <gvrp>
 <traceoptions>
 <flag>
 <event/>
 <receive/>
 <transmit/>
 <eswd/>
 <error/>
 <state/>
 <all/>
 <disable/>
 </flag>
 </traceoptions>
 </gvrp>
</protocols>
</configuration>
```

**Description** Tracing parameters for GVRP protocol

**Contents**

<event>—Trace GVRP events

<receive>—Trace GVRP packet receive

<transmit>—Trace GVRP packet sent

<eswd>—Trace ESWD notification handling by GVRP

<error>—Trace GVRP errors

<state>—Trace GVRP state machine changes

<all>—Trace everything

<disable>—Disable this trace flag

## <flag> configuration/protocols/mvrp/traceoptions

### Usage

```
<configuration>
<protocols>
<mvrp>
<traceoptions>
<flag>
<eswd/>
<event/>
<receive/>
<transmit/>
<error/>
<timer/>
<all/>
<disable/>
</flag>
</traceoptions>
</mvrp>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <eswd>—Trace eswd notifications
- <event>—Trace MVRP state machine events
- <receive>—Trace MVRP packet receive
- <transmit>—Trace MVRP packet sent
- <error>—Trace MVRP errors
- <timer>—Trace MVRP timer processing
- <all>—Trace everything
- <disable>—Disable this trace flag

## <flag> configuration/protocols/protection-group/traceoptions

### Usage

```
<configuration>
<protocols>
<protection-group>
```

```
<traceoptions>
 <flag>
 <config/>
 <debug/>
 <normal/>
 <events/>
 <pdu/>
 <timers/>
 <state-machine/>
 <periodic-packet-management/>
 <all/>
 </flag>
</traceoptions>
</protection-group>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <config>—Trace configuration messages
- <debug>—Trace debug messages
- <normal>—Trace normal messages
- <events>—Trace events to the protocol state machine
- <pdu>—Trace R-APS PDU reception and transmission
- <timers>—Trace protocol timers
- <state-machine>—Trace R-APS state machine
- <periodic-packet-management>—Trace periodic packet management state and events
- <all>—Trace all

---

## <flag> configuration/protocols/stp/traceoptions

---

### Usage

```
<configuration>
 <protocols>
 <stp>
 <traceoptions>
 <flag>
 <events/>
 <bpdu/>
 <timers/>
 <port-information-state-machine/>
 <port-receive-state-machine/>
 <port-role-select-state-machine/>
 <port-role-transit-state-machine/>
 <port-state-transit-state-machine/>
```

```

 <port-migration-state-machine/>
 <port-transmit-state-machine/>
 <topology-change-state-machine/>
 <bridge-detection-state-machine/>
 <state-machine-variables/>
 <ppmd/>
 <all-failures/>
 <all/>
 <disable/>
 </flag>
</traceoptions>
</stp>
</protocols>
</configuration>

```

**Description** Tracing parameters

**Contents**

- <events>—Trace events to the protocol state machine
- <bpd>—Trace BPDU reception and transmission
- <timers>—Trace protocol timers
- <port-information-state-machine>—Trace port information state machine
- <port-receive-state-machine>—Trace port receive state machine
- <port-role-select-state-machine>—Trace port role selection state machine
- <port-role-transit-state-machine>—Trace port role transit state machine
- <port-state-transit-state-machine>—Trace port state transit state machine
- <port-migration-state-machine>—Trace port migration state machine
- <port-transmit-state-machine>—Trace port transmit state machine
- <topology-change-state-machine>—Trace topology change state machine
- <bridge-detection-state-machine>—Trace bridge detection state machine
- <state-machine-variables>—Trace when state machine variables change
- <ppmd>—Trace state and events for ppm process
- <all-failures>—Trace all failure conditions
- <all>—Trace all
- <disable>—Disable this trace flag

## <flag> configuration/protocols/rstp/traceoptions

### Usage

```

<configuration>
<protocols>
 <rstp>
 <traceoptions>
 <flag>
 <events/>
 <bpdu/>
 <timers/>
 <port-information-state-machine/>
 <port-receive-state-machine/>
 <port-role-select-state-machine/>
 <port-role-transit-state-machine/>
 <port-state-transit-state-machine/>
 <port-migration-state-machine/>
 <port-transmit-state-machine/>
 <topology-change-state-machine/>
 <bridge-detection-state-machine/>
 <state-machine-variables/>
 <ppmd/>
 <all-failures/>
 <all/>
 <disable/>
 </flag>
 </traceoptions>
 </rstp>
</protocols>
</configuration>

```

**Description** Tracing parameters

**Contents**

- <events>—Trace events to the protocol state machine
- <bpdu>—Trace BPDU reception and transmission
- <timers>—Trace protocol timers
- <port-information-state-machine>—Trace port information state machine
- <port-receive-state-machine>—Trace port receive state machine
- <port-role-select-state-machine>—Trace port role selection state machine
- <port-role-transit-state-machine>—Trace port role transit state machine
- <port-state-transit-state-machine>—Trace port state transit state machine
- <port-migration-state-machine>—Trace port migration state machine
- <port-transmit-state-machine>—Trace port transmit state machine

<topology-change-state-machine>—Trace topology change state machine  
 <bridge-detection-state-machine>—Trace bridge detection state machine  
 <state-machine-variables>—Trace when state machine variables change  
 <ppmd>—Trace state and events for ppm process  
 <all-failures>—Trace all failure conditions  
 <all>—Trace all  
 <disable>—Disable this trace flag

## <flag> configuration/protocols/mstp/traceoptions

### Usage

```

<configuration>
<protocols>
<mstp>
<traceoptions>
 <flag>
 <events/>
 <bpdu/>
 <timers/>
 <port-information-state-machine/>
 <port-receive-state-machine/>
 <port-role-select-state-machine/>
 <port-role-transit-state-machine/>
 <port-state-transit-state-machine/>
 <port-migration-state-machine/>
 <port-transmit-state-machine/>
 <topology-change-state-machine/>
 <bridge-detection-state-machine/>
 <state-machine-variables/>
 <ppmd/>
 <all-failures/>
 <all/>
 <disable/>
 </flag>
</traceoptions>
</mstp>
</protocols>
</configuration>

```

**Description** Tracing parameters

**Contents**

- <events>—Trace events to the protocol state machine
- <bpdu>—Trace BPDU reception and transmission
- <timers>—Trace protocol timers

<port-information-state-machine>—Trace port information state machine

<port-receive-state-machine>—Trace port receive state machine

<port-role-select-state-machine>—Trace port role selection state machine

<port-role-transit-state-machine>—Trace port role transit state machine

<port-state-transit-state-machine>—Trace port state transit state machine

<port-migration-state-machine>—Trace port migration state machine

<port-transmit-state-machine>—Trace port transmit state machine

<topology-change-state-machine>—Trace topology change state machine

<bridge-detection-state-machine>—Trace bridge detection state machine

<state-machine-variables>—Trace when state machine variables change

<ppmd>—Trace state and events for ppm process

<all-failures>—Trace all failure conditions

<all>—Trace all

<disable>—Disable this trace flag

---

## <flag> configuration/protocols/vstp/vlan-group/group/traceoptions

---

### Usage

```
<configuration>
<protocols>
<vstp>
<vlan-group>
<group>
<traceoptions>
<flag>
<events/>
<bpdu/>
<timers/>
<port-information-state-machine/>
<port-receive-state-machine/>
<port-role-select-state-machine/>
<port-role-transit-state-machine/>
<port-state-transit-state-machine/>
<port-migration-state-machine/>
<port-transmit-state-machine/>
<topology-change-state-machine/>
<bridge-detection-state-machine/>
<state-machine-variables/>
<ppmd/>
<all-failures/>
<all/>
<disable/>
```

```

 </flag>
 </traceoptions>
</group>
</vlan-group>
</vstp>
</protocols>
</configuration>

```

**Description** Tracing parameters

**Contents**

- <events>—Trace events to the protocol state machine
- <bpdud>—Trace BPDU reception and transmission
- <timers>—Trace protocol timers
- <port-information-state-machine>—Trace port information state machine
- <port-receive-state-machine>—Trace port receive state machine
- <port-role-select-state-machine>—Trace port role selection state machine
- <port-role-transit-state-machine>—Trace port role transit state machine
- <port-state-transit-state-machine>—Trace port state transit state machine
- <port-migration-state-machine>—Trace port migration state machine
- <port-transmit-state-machine>—Trace port transmit state machine
- <topology-change-state-machine>—Trace topology change state machine
- <bridge-detection-state-machine>—Trace bridge detection state machine
- <state-machine-variables>—Trace when state machine variables change
- <ppmd>—Trace state and events for ppm process
- <all-failures>—Trace all failure conditions
- <all>—Trace all
- <disable>—Disable this trace flag

## <flag> configuration/protocols/vstp/vlan/traceoptions

### Usage

```

<configuration>
 <protocols>
 <vstp>
 <vlan>
 <traceoptions>
 <flag>

```

```
<events/>
<bpdu/>
<timers/>
<port-information-state-machine/>
<port-receive-state-machine/>
<port-role-select-state-machine/>
<port-role-transit-state-machine/>
<port-state-transit-state-machine/>
<port-migration-state-machine/>
<port-transmit-state-machine/>
<topology-change-state-machine/>
<bridge-detection-state-machine/>
<state-machine-variables/>
<ppmd/>
<all-failures/>
<all/>
<disable/>
</flag>
</traceoptions>
</vlan>
</vstp>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <events>—Trace events to the protocol state machine
- <bpdu>—Trace BPDU reception and transmission
- <timers>—Trace protocol timers
- <port-information-state-machine>—Trace port information state machine
- <port-receive-state-machine>—Trace port receive state machine
- <port-role-select-state-machine>—Trace port role selection state machine
- <port-role-transit-state-machine>—Trace port role transit state machine
- <port-state-transit-state-machine>—Trace port state transit state machine
- <port-migration-state-machine>—Trace port migration state machine
- <port-transmit-state-machine>—Trace port transmit state machine
- <topology-change-state-machine>—Trace topology change state machine
- <bridge-detection-state-machine>—Trace bridge detection state machine
- <state-machine-variables>—Trace when state machine variables change
- <ppmd>—Trace state and events for ppm process

<all-failures>—Trace all failure conditions

<all>—Trace all

<disable>—Disable this trace flag

## <flag> configuration/protocols/edge-virtual-bridging/traceoptions

### Usage

```
<configuration>
<protocols>
<edge-virtual-bridging>
<traceoptions>
<flag>
 <parse/>
 <ecp/>
 <evb-tlv/>
 <vdp/>
 <policy/>
 <all/>
</flag>
</traceoptions>
</edge-virtual-bridging>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <parse>—Trace configuration parsing
- <ecp>—Trace Edge Control Protocol events
- <evb-tlv>—Trace EVB TLV events
- <vdp>—Trace VDP events
- <policy>—Trace policy events
- <all>—Trace everything

## <flag> configuration/protocols/igmp-snooping/traceoptions

### Usage

```
<configuration>
<protocols>
<igmp-snooping>
<traceoptions>
<flag>
 <packets/>
 <query/>
 <report/>
 <leave/>
```

```
<vlan/>
<nexthop/>
<krt/>
<route/>
<normal/>
<general/>
<state/>
<policy/>
<task/>
<timer/>
<all/>
<send/>
<receive/>
<detail/>
<disable/>
</flag>
</traceoptions>
</igmp-snooping>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <packets>—Trace all IGMP packets
- <query>—Trace IGMP membership query messages
- <report>—Trace membership report messages
- <leave>—Trace leave group messages (IGMPv2 only)
- <vlan>—Trace VLAN related events
- <nexthop>—Trace nexthop related events
- <krt>—Trace communication over routing socket
- <route>—Trace routing information
- <normal>—Trace normal events
- <general>—Trace general events
- <state>—Trace state transitions
- <policy>—Trace policy processing
- <task>—Trace routing protocol task processing
- <timer>—Trace routing protocol timer processing
- <all>—Trace everything
- <send>—Trace transmitted packets

<receive>—Trace received packets

<detail>—Trace detailed information

<disable>—Disable this trace flag

## <flag> configuration/protocols/mld-snooping/traceoptions

### Usage

```
<configuration>
<protocols>
<mld-snooping>
<traceoptions>
<flag>
 <packets/>
 <query/>
 <report/>
 <leave/>
 <vlan/>
 <nexthop/>
 <krt/>
 <route/>
 <normal/>
 <general/>
 <state/>
 <policy/>
 <task/>
 <timer/>
 <all/>
 <send/>
 <receive/>
 <detail/>
 <disable/>
</flag>
</traceoptions>
</mld-snooping>
</protocols>
</configuration>
```

**Description** Tracing parameters

**Contents**

<packets>—Trace all MLD packets

<query>—Trace MLD membership query messages

<report>—Trace membership report messages

<leave>—Trace leave group messages (MLDv1 only)

<vlan>—Trace VLAN related events

<nexthop>—Trace nexthop related events

<krt>—Trace communication over routing socket

<route>—Trace routing information

<normal>—Trace normal events

<general>—Trace general events

<state>—Trace state transitions

<policy>—Trace policy processing

<task>—Trace routing protocol task processing

<timer>—Trace routing protocol timer processing

<all>—Trace everything

<send>—Trace transmitted packets

<receive>—Trace received packets

<detail>—Trace detailed information

<disable>—Disable this trace flag

---

## <flag> configuration/smtp/traceoptions

---

### Usage

```
<configuration>
 <smtp>
 <traceoptions>
 <flag>
 <IPC/>
 <protocol-exchange/>
 <configuration/>
 <send-request/>
 <all/>
 </flag>
 </traceoptions>
 </smtp>
</configuration>
```

**Description** Tracing parameters

**Contents** <IPC>—Trace inter-process communication

<protocol-exchange>—Trace SMTP protocol exchanges

<configuration>—Trace configuration event

<send-request>—Trace send mail request event

<all>—Trace everything

## <flag> configuration/ethernet-switching-options/traceoptions

### Usage

```
<configuration>
<ethernet-switching-options>
<traceoptions>
 <flag>
 <parse/>
 <regex-parse/>
 <config-internal/>
 <normal/>
 <general/>
 <state/>
 <task/>
 <timer/>
 <krt/>
 <vlan/>
 <forwarding-database/>
 <nexthop/>
 <interface/>
 <lib/>
 <stp/>
 <filter/>
 <access-security/>
 <rtg/>
 <ip-source-guard/>
 <analyzer/>
 <layer2-protocol-tunneling/>
 <unknown-unicast-forwarding/>
 <all/>
 <disable/>
 </flag>
</traceoptions>
</ethernet-switching-options>
</configuration>
```

**Description** Tracing parameters

**Contents**

- <parse>—Trace configuration parsing
- <regex-parse>—Trace regular-expression parsing
- <config-internal>—Trace configuration internals
- <normal>—Trace normal events
- <general>—Trace general events
- <state>—Trace state transitions
- <task>—Trace Ethernet-switching task processing

<timer>—Trace Ethernet-switching task timer processing

<krt>—Trace communication over routing socket

<vlan>—Trace VLAN events

<forwarding-database>—Trace forwarding database events

<nexthop>—Trace next-hop events

<interface>—Trace interface events

<lib>—Trace library calls

<stp>—Trace spanning tree events

<filter>—Trace filter transaction events

<access-security>—Trace access security events

<rtg>—Trace redundant trunk group events

<ip-source-guard>—Trace IP Source Guard events

<analyzer>—Trace analyzer events

<layer2-protocol-tunneling>—Layer2 protocol tunneling events

<unknown-unicast-forwarding>—Trace unknown unicast forwarding events

<all>—Trace everything

<disable>—Disable this trace flag

---

## <flag> configuration/vlans/traceoptions

---

### Usage

```
<configuration>
 <vlans>
 <traceoptions>
 <flag>
 <all/>
 <kernel/>
 <change-events/>
 <kernel-detail/>
 <config-states/>
 <disable/>
 </flag>
 </traceoptions>
 </vlans>
</configuration>
```

**Description**    Tracing parameters

<b>Contents</b>	<code>&lt;all&gt;</code> —Trace everything
	<code>&lt;kernel&gt;</code> —Trace kernel information
	<code>&lt;change-events&gt;</code> —Trace change events
	<code>&lt;kernel-detail&gt;</code> —Trace kernel information
	<code>&lt;config-states&gt;</code> —Trace configuration state-machine changes
	<code>&lt;disable&gt;</code> —Disable this trace flag

---

### `<flood>` configuration/security/screen/ids-option/icmp

---

**Usage**

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <icmp>
 <flood>
 <threshold>threshold</threshold>
 </flood>
 </icmp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure icmp flood ids option

**Contents** `<threshold>`—Threshold

---

### `<flood>` configuration/security/screen/ids-option/udp

---

**Usage**

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <udp>
 <flood>
 <threshold>threshold</threshold>
 </flood>
 </udp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure UDP flood ids option

**Contents** <threshold>—Threshold

---

## <flow> configuration/security

---

### Usage

```
<configuration>
 <security>
 <flow>
 <traceoptions>...</traceoptions>

 <pending-sess-queue-length>pending-sess-queue-length</pending-sess-queue-length>

 <allow-dns-reply/>
 <route-change-timeout>route-change-timeout</route-change-timeout>

 <syn-flood-protection-mode>syn-flood-protection-mode</syn-flood-protection-mode>

 <aging>...</aging>
 <bridge>...</bridge>
 <tcp-mss>...</tcp-mss>
 <tcp-session>...</tcp-session>
 <force-ip-reassembly/>
 </flow>
 </security>
</configuration>
```

**Description** FLOW configuration

**Contents** <traceoptions>—Trace options for flow services

- normal - Normal number of sessions queued
- moderate - Allow more queued sessions than normal
- high - Maximum number of queued sessions
- syn-cookie - Enable SYN cookie protection
- syn-proxy - Enable SYN proxy protection

<pending-sess-queue-length>—Maximum queued length per pending session

- normal - Normal number of sessions queued
- moderate - Allow more queued sessions than normal
- high - Maximum number of queued sessions
- syn-cookie - Enable SYN cookie protection
- syn-proxy - Enable SYN proxy protection

<allow-dns-reply>—Allow unmatched incoming DNS reply packet

- syn-cookie - Enable SYN cookie protection
- syn-proxy - Enable SYN proxy protection

<route-change-timeout>—Timeout value for route change to nonexistent route

- syn-cookie - Enable SYN cookie protection
- syn-proxy - Enable SYN proxy protection

<syn-flood-protection-mode>—TCP SYN flood protection mode

- syn-cookie - Enable SYN cookie protection
- syn-proxy - Enable SYN proxy protection

<aging>—Aging configuration

<bridge>—Bridge configuration for flow

<tcp-mss>—TCP maximum segment size configuration

<tcp-session>—Transmission Control Protocol session configuration

<force-ip-reassembly>—Force to reassemble ip fragments

---

## <forwarding-options> configuration/security

---

### Usage

```
<configuration>
 <security>
 <forwarding-options>
 <family>...</family>
 </forwarding-options>
 </security>
</configuration>
```

**Description** Security-forwarding-options configuration

**Contents** <family>—Security forwarding-options for family

---

## <forwarding-process> configuration/security

---

### Usage

```
<configuration>
 <security>
 <forwarding-process>
 <application-services>...</application-services> <!-- mandatory -->
 </forwarding-process>
 </security>
</configuration>
```

**Description** Configure security forwarding-process options

**Contents** <application-services>—Configure application service options

---

## <fpc> configuration/poe/notification-control

---

### Usage

```
<configuration>
 <poe>
 <notification-control>
 <fpc>
 <number>number</number> <!-- identifier -->
 <disable/>
 </fpc>
 </notification-control>
 </poe>
</configuration>
```

**Description** FPC slot number

**Contents** <number>—FPC slot number

<disable>—Disable Power over Ethernet notification

---

## <fpc> configuration/poe

---

### Usage

```
<configuration>
 <poe>
 <fpc>
 <number>number</number> <!-- identifier -->
 <maximum-power>maximum-power</maximum-power>
 <priority>priority</priority>
 </fpc>
 </poe>
</configuration>
```

**Description** FPC configuration for power over ethernet

**Contents** <number>—FPC slot number

- low - Priority low
- high - Priority high

<maximum-power>—Maximum power(watts)

- low - Priority low
- high - Priority high

<priority>—Priority level(high/low)

- low - Priority low
- high - Priority high

---

## <friday> configuration/schedulers/scheduler

---

### Usage

```
<configuration>
<schedulers>
<scheduler>
<friday>
<start-time>...</start-time>
<exclude/>
<all-day/>
</friday>
</scheduler>
</schedulers>
</configuration>
```

**Description** Every Friday

**Contents** <start-time>—Time range for day

<exclude>—Exclude day from week

<all-day>—Include complete day

---

## <from> configuration/security/nat/source/rule-set

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<from>
<routing-instance>...</routing-instance>
<zone>...</zone>
<interface>...</interface>
</from>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Where is the traffic from

**Contents**    <routing-instance>—Source routing instance list  
                 <zone>—Source zone list  
                 <interface>—Source interface list

---

## <from> configuration/security/nat/destination/rule-set

---

### Usage

```
<configuration>
<security>
 <nat>
 <destination>
 <rule-set>
 <from>
 <routing-instance>...</routing-instance>
 <zone>...</zone>
 <interface>...</interface>
 </from>
 </rule-set>
 </destination>
 </nat>
</security>
</configuration>
```

**Description**    Where is the traffic from

**Contents**    <routing-instance>—Source routing instance list  
                 <zone>—Source zone list  
                 <interface>—Source interface list

---

## <from> configuration/security/nat/static/rule-set

---

### Usage

```
<configuration>
<security>
 <nat>
 <static>
 <rule-set>
 <from>
 <routing-instance>...</routing-instance>
 <zone>...</zone>
 <interface>...</interface>
 </from>
 </rule-set>
 </static>
 </nat>
</security>
</configuration>
```

<b>Description</b>	Where is the traffic from
<b>Contents</b>	<code>&lt;routing-instance&gt;</code> —Source routing instance list <code>&lt;zone&gt;</code> —Source zone list <code>&lt;interface&gt;</code> —Source interface list

---

## `<ftp> configuration/security/alg`

### Usage

```
<configuration>
 <security>
 <alg>
 <ftp>
 <disable/>
 <ftps-extension/>
 <line-break-extension/>
 <allow-mismatch-ip-address/>
 <traceoptions>...</traceoptions>
 </ftp>
 </alg>
 </security>
</configuration>
```

<b>Description</b>	Configure FTP ALG
<b>Contents</b>	<code>&lt;disable&gt;</code> —Disable FTP ALG <code>&lt;ftps-extension&gt;</code> —Enable secure FTP and FTP-ssl protocols <code>&lt;line-break-extension&gt;</code> —Enable CR+LF line termination <code>&lt;allow-mismatch-ip-address&gt;</code> —Pass FTP packets with mismatched ip address headers and payload <code>&lt;traceoptions&gt;</code> —FTP ALG trace options

---

## `<ftp> configuration/security/utm/utm-policy/anti-virus`

### Usage

```
<configuration>
 <security>
 <utm>
 <utm-policy>
 <anti-virus>
 <ftp>
 <upload-profile>upload-profile</upload-profile>
 <download-profile>download-profile</download-profile>
 </ftp>
 </anti-virus>
 </utm-policy>
 </utm>
 </security>
</configuration>
```

```
</utm-policy>
</utm>
</security>
</configuration>
```

**Description** FTP profile

**Contents** <upload-profile>—Anti-virus profile  
<download-profile>—Anti-virus profile

---

## <ftp> configuration/security/utm/utm-policy/content-filtering

---

### Usage

```
<configuration>
<security>
<utm>
<utm-policy>
<content-filtering>
<ftp>
<upload-profile>upload-profile</upload-profile>
<download-profile>download-profile</download-profile>
</ftp>
</content-filtering>
</utm-policy>
</utm>
</security>
</configuration>
```

**Description** FTP profile

**Contents** <upload-profile>—Content-filtering FTP upload profile  
<download-profile>—Content-filtering FTP download profile

---

## <functional-zone> configuration/security/zones

---

### Usage

```
<configuration>
<security>
<zones>
<functional-zone>
<management>...</management>
</functional-zone>
</zones>
</security>
</configuration>
```

**Description** Functional zone

**Contents**    <management>—Host for out of band management interfaces

## CHAPTER 33

# Tag Elements Beginning with G

This chapter lists the configuration tag elements that have names beginning with the letter *g*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<gatekeeper>` configuration/security/alg/h323/application-screen/message-flood

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <h323>
 <application-screen>
 <message-flood>
 <gatekeeper>
 <threshold>threshold</threshold>
 </gatekeeper>
 </message-flood>
 </application-screen>
 </h323>
 </alg>
 </security>
</configuration>
```

**Description** Set options for gatekeeper messages

**Contents** `<threshold>`—Message flood gatekeeper threshold

## <gateway> configuration/security/ike

### Usage

```

<configuration>
 <security>
 <ike>
 <gateway>
 <gateway_name>gateway_name</gateway_name> <!-- identifier -->
 <ike-policy>ike-policy</ike-policy> <!-- mandatory -->
 <address>...</address>
 <dynamic>...</dynamic>
 <dead-peer-detection>...</dead-peer-detection>
 <no-nat-traversal/>
 <nat-keepalive>nat-keepalive</nat-keepalive>
 <local-identity>...</local-identity>
 <remote-identity>...</remote-identity>
 <external-interface>external-interface</external-interface> <!-- mandatory -->
 <xauth>...</xauth>
 <general-ikeid/>
 <version>version</version>
 </gateway>
 </ike>
 </security>
</configuration>

```

**Description** Define an IKE gateway

- Contents**
- <gateway\_name>—Label for the remote (peer) gateway
    - v1-only - The connection must be initiated using IKE version 1
    - v2-only - The connection must be initiated using IKE version 2
  - <ike-policy>—Name of the IKE policy
    - v1-only - The connection must be initiated using IKE version 1
    - v2-only - The connection must be initiated using IKE version 2
  - <address>—Addresses or hostnames of peer:1 primary, upto 4 backups
    - v1-only - The connection must be initiated using IKE version 1
    - v2-only - The connection must be initiated using IKE version 2
  - <dynamic>—Site to site peer with dynamic IP address
    - v1-only - The connection must be initiated using IKE version 1
    - v2-only - The connection must be initiated using IKE version 2
  - <dead-peer-detection>—Enable RFC-3706 DPD
    - v1-only - The connection must be initiated using IKE version 1

- v2-only - The connection must be initiated using IKE version 2

<no-nat-traversal>—Disable IPSec NAT traversal

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<nat-keepalive>—Interval at which to send NAT keepalives

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<local-identity>—Set the local IKE identity

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<remote-identity>—Set the remote IKE identity

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<external-interface>—External interface for IKE negotiations

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<xauth>—Use extended authentication

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<general-ikeid>—Accept peer IKE-ID in general

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

<version>—Negotiate using either IKE v1 or IKE v2 protocol

- v1-only - The connection must be initiated using IKE version 1
- v2-only - The connection must be initiated using IKE version 2

---

## <gateway> configuration/security/group-vpn/member/ike

### Usage

```
<configuration>
 <security>
 <group-vpn>
```

```
<member>
 <ike>
 <gateway>
 <gateway_name>gateway_name</gateway_name> <!-- identifier -->
 <ike-policy>ike-policy</ike-policy> <!-- mandatory -->
 <address>...</address>
 <local-identity>...</local-identity>
 <local-address>local-address</local-address> <!-- mandatory -->
 </gateway>
 </ike>
</member>
</group-vpn>
</security>
</configuration>
```

**Description** Define an IKE gateway

**Contents** <gateway\_name>—Label for the remote (peer) gateway

<ike-policy>—Name of the IKE policy

<address>—Addresses or hostnames of peer:1 primary, upto 4 backups

<local-identity>—Set the local IKE identity

<local-address>—Local IPv4 address for group member

---

### <gateway> configuration/security/group-vpn/server/ike

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <ike>
 <gateway>
 <gateway_name>gateway_name</gateway_name> <!-- identifier -->
 <ike-policy>ike-policy</ike-policy> <!-- mandatory -->
 <address>address</address>
 <dynamic>...</dynamic>
 <local-identity>...</local-identity>
 </gateway>
 </ike>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Define an IKE gateway

**Contents** <gateway\_name>—Label for the remote (peer) gateway

<ike-policy>—Name of the IKE policy

<address>—Address or hostname of peer

<dynamic>—Site to site peer with dynamic IP address

<local-identity>—Set the local IKE identity

---

### <global-layer2-domainid-range> configuration/vlans/vlan

---

#### Usage

```
<configuration>
<vlans>
<vlan>
 <global-layer2-domainid-range>
 <range-string>range-string</range-string> <!-- identifier -->
 </global-layer2-domainid-range>
</vlan>
</vlans>
</configuration>
```

**Description** Global layer2 domain ID range

**Contents** <range-string>—Global layer2 domain ID range in form of '<low>-<high>'

---

### <gprs> configuration/security

---

#### Usage

```
<configuration>
<security>
 <gprs>
 <gtp>...</gtp>
 <sctp>...</sctp>
 </gprs>
</security>
</configuration>
```

**Description** GPRS configuration

**Contents** <gtp>—GPRS tunneling protocol configuration

<sctp>—GPRS stream control transmission protocol configuration

---

### <gre-in> configuration/security/flow/tcp-mss

---

#### Usage

```
<configuration>
<security>
 <flow>
```

```
<tcp-mss>
 <gre-in>
 <mss>mss</mss>
 </gre-in>
</tcp-mss>
</flow>
</security>
</configuration>
```

**Description** Enable MSS override for all GRE packets coming out of an IPSec tunnel

**Contents** <mss>—MSS value

---

### <gre-out> configuration/security/flow/tcp-mss

---

#### Usage

```
<configuration>
 <security>
 <flow>
 <tcp-mss>
 <gre-out>
 <mss>mss</mss>
 </gre-out>
 </tcp-mss>
 </flow>
 </security>
</configuration>
```

**Description** Enable MSS override for all GRE packets entering an IPsec tunnel

**Contents** <mss>—MSS value

---

### <group> configuration/security/group-vpn/server

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <group>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <group-id>group-id</group-id> <!-- mandatory -->
 <ike-gateway>...</ike-gateway> <!-- mandatory -->
 <activation-time-delay>activation-time-delay</activation-time-delay>
 <anti-replay-time-window>anti-replay-time-window</anti-replay-time-window>

 <no-anti-replay/>
 <server-address>server-address</server-address> <!-- mandatory -->
 <server-member-communication>...</server-member-communication>
```

```
<ipsec-sa>...</ipsec-sa>
</group>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Define a Group VPN group

**Contents**

- <name>—Name of the group
- <description>—Text description of Group VPN group
- <group-id>—Enable Group VPN by defining group id
- <ike-gateway>—Name of the IKE gateway
- <activation-time-delay>—Configure delay in seconds for Group VPN key activation
- <anti-replay-time-window>—Configure Anti Replay time in seconds
- <no-anti-replay>—Disable Anti Replay
- <server-address>—Specify server IP address
- <server-member-communication>—Configure Server to Member communication parameters
- <ipsec-sa>—Define a Group VPN group SA

---

## <group> configuration/protocols/vstp/vlan-group

---

### Usage

```
<configuration>
<protocols>
<vstp>
<vlan-group>
<group>
<group-name>group-name</group-name> <!-- identifier -->
<vlan>...</vlan> <!-- mandatory -->
<bridge-priority>bridge-priority</bridge-priority>
<max-age>max-age</max-age>
<hello-time>hello-time</hello-time>
<forward-delay>forward-delay</forward-delay>
<traceoptions>...</traceoptions>
<interface>...</interface>
</group>
</vlan-group>
</vstp>
</protocols>
</configuration>
```

**Description** Name of VLAN group

**Contents** <group-name>—VLAN group name

<vlan>—VLAN ID or VLAN ID range [1..4094]

<bridge-priority>—Priority of the bridge (in increments of 4k - 0,4k,8k,..60k)

<max-age>—Maximum age of received protocol bpdu

<hello-time>—Time interval between configuration BPDUs

<forward-delay>—Time spent in listening or learning state

<traceoptions>—Tracing options for debugging protocol operation

<interface>—

---

### <group> configuration/protocols/igmp-snooping/vlan/interface/static

---

#### Usage

```
<configuration>
<protocols>
<igmp-snooping>
<vlan>
<interface>
<static>
 <group>
 <group-address>group-address</group-address> <!-- identifier -->
 </group>
</static>
</interface>
</vlan>
</igmp-snooping>
</protocols>
</configuration>
```

**Description** IP multicast group address

**Contents** <group-address>—IP multicast group address

---

### <group> configuration/protocols/mld-snooping/vlan/interface/static

---

#### Usage

```
<configuration>
<protocols>
<mld-snooping>
<vlan>
<interface>
<static>
 <group>
```

```
<group-address>group-address</group-address> <!-- identifier -->
</group>
</static>
</interface>
</vlan>
</mld-snooping>
</protocols>
</configuration>
```

**Description** IP multicast group address

**Contents** <group-address>—IP multicast group address

---

## <group> configuration/ethernet-switching-options/redundant-trunk-group

---

### Usage

```
<configuration>
<ethernet-switching-options>
<redundant-trunk-group>
 <group>
 <rtg-name>rtg-name</rtg-name> <!-- identifier -->
 <preempt-cutover-timer>preempt-cutover-timer</preempt-cutover-timer>
 <description>description</description>
 <interface>...</interface>
 </group>
</redundant-trunk-group>
</ethernet-switching-options>
</configuration>
```

**Description** Name of Redundant trunk group

**Contents** <rtg-name>—RTG name

<preempt-cutover-timer>—Hold timer for primary interface before preempting secondary interface

<description>—Text description of the RTG

<interface>—Interfaces that are part of this redundant trunk group

---

## <group-vpn> configuration/security

---

### Usage

```
<configuration>
<security>
 <group-vpn>
 <member>...</member>
 <server>...</server>
 <co-location/>
 </group-vpn>
```

```
</security>
</configuration>
```

**Description** Group VPN configuration

**Contents** <member>—Group VPN member configuration  
<server>—Group VPN server configuration  
<co-location>—Configure server & member in the same box

---

## <gsm-options> configuration/interfaces/interface/cellular-options

---

### Usage

```
<configuration>
<interfaces>
<interface>
<cellular-options>
<gsm-options>
<select-profile>...</select-profile>

<encrypted-sim-unlock-code>encrypted-sim-unlock-code</encrypted-sim-unlock-code>

</gsm-options>
</cellular-options>
</interface>
</interfaces>
</configuration>
```

**Description** Interface specific GSM options

**Contents** <select-profile>—Profile to be applied  
<encrypted-sim-unlock-code>—Encrypted PIN

---

## <gtp> configuration/security/gprs

---

### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<enable/>
<profile>...</profile>
<traceoptions>...</traceoptions>
</gtp>
</gprs>
</security>
</configuration>
```

**Description** GPRS tunneling protocol configuration

**Contents** <enable>—Enable GPRS tunneling protocol functionality  
<profile>—Configure GTP Profile  
<traceoptions>—Trace options for GPRS tunneling protocol

---

## <gvrp> configuration/protocols

---

### Usage

```
<configuration>
 <protocols>
 <gvrp>
 <disable/>
 <join-timer>join-timer</join-timer>
 <leave-timer>leave-timer</leave-timer>
 <leaveall-timer>leaveall-timer</leaveall-timer>
 <interface>...</interface>
 <traceoptions>...</traceoptions>
 </gvrp>
 </protocols>
</configuration>
```

**Description** GVRP configuration

**Contents** <disable>—Disable GVRP  
<join-timer>—Join timer interval  
<leave-timer>—Leave timer interval  
<leaveall-timer>—LeaveAll timer interval  
<interface>—Configure interface options  
<traceoptions>—Tracing options for GVRP protocol

# Tag Elements Beginning with H

This chapter lists the configuration tag elements that have names beginning with the letter *h*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

## `<h323>` configuration/security/alg

### Usage

```
<configuration>
 <security>
 <alg>
 <h323>
 <disable/>

 <endpoint-registration-timeout>endpoint-registration-timeout</endpoint-registration-timeout>

 <media-source-port-any/>
 <application-screen>...</application-screen>
 <dscp-rewrite>...</dscp-rewrite>
 <traceoptions>...</traceoptions>
 </h323>
 </alg>
 </security>
</configuration>
```

**Description**    Configure H.323 ALG

<b>Contents</b>	<code>&lt;disable&gt;</code> —Disable H.323 ALG
	<code>&lt;endpoint-registration-timeout&gt;</code> —Timeout for endpoints
	<code>&lt;media-source-port-any&gt;</code> —Permit media from any source port on the endpoint
	<code>&lt;application-screen&gt;</code> —Configure application screens
	<code>&lt;dscp-rewrite&gt;</code> —DSCP code rewrite
	<code>&lt;traceoptions&gt;</code> —H.323 ALG trace options

---

## `<host>` configuration/security/log/stream

---

### Usage

```
<configuration>
<security>
<log>
<stream>
<host>
 <ipaddr>ipaddr</ipaddr> <!-- mandatory -->
 <port>port</port>
</host>
</stream>
</log>
</security>
</configuration>
```

**Description** Destination to send security logs to

**Contents** `<ipaddr>`—IP address

`<port>`—UDP port number

---

## `<host-address-base>` configuration/security/nat/source/pool

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<pool>
 <host-address-base>
 <ipaddr>ipaddr</ipaddr>
 </host-address-base>
</pool>
</source>
</nat>
</security>
</configuration>
```

**Description** The base of host address

**Contents** <ipaddr>—IPv4 or IPv6 base address

## <host-inbound-traffic> configuration/security/zones/functional-zone/management/interfaces

### Usage

```
<configuration>
<security>
<zones>
<functional-zone>
<management>
<interfaces>
<host-inbound-traffic>
 <system-services>...</system-services>
 <protocols>...</protocols>
</host-inbound-traffic>
</interfaces>
</management>
</functional-zone>
</zones>
</security>
</configuration>
```

### Description

**Contents** <system-services>—Type of incoming system-service traffic to accept

<protocols>—Protocol type of incoming traffic to accept

## <host-inbound-traffic> configuration/security/zones/functional-zone/management

### Usage

```
<configuration>
<security>
<zones>
<functional-zone>
<management>
<host-inbound-traffic>
 <system-services>...</system-services>
 <protocols>...</protocols>
</host-inbound-traffic>
</management>
</functional-zone>
</zones>
</security>
</configuration>
```

**Description** Allowed system services & protocols

**Contents**    <system-services>—Type of incoming system-service traffic to accept  
                 <protocols>—Protocol type of incoming traffic to accept

---

## <host-inbound-traffic> configuration/security/zones/security-zone

---

### Usage

```
<configuration>
<security>
<zones>
<security-zone>
<host-inbound-traffic>
 <system-services>...</system-services>
 <protocols>...</protocols>
</host-inbound-traffic>
</security-zone>
</zones>
</security>
</configuration>
```

**Description**    Allowed system services & protocols

**Contents**    <system-services>—Type of incoming system-service traffic to accept  
                 <protocols>—Protocol type of incoming traffic to accept

---

## <host-inbound-traffic> configuration/security/zones/security-zone/interfaces

---

### Usage

```
<configuration>
<security>
<zones>
<security-zone>
<interfaces>
 <host-inbound-traffic>
 <system-services>...</system-services>
 <protocols>...</protocols>
 </host-inbound-traffic>
</interfaces>
</security-zone>
</zones>
</security>
</configuration>
```

### Description

**Contents**    <system-services>—Type of incoming system-service traffic to accept  
                 <protocols>—Protocol type of incoming traffic to accept

## <hostname> configuration/security/ike/gateway/local-identity

### Usage

```
<configuration>
 <security>
 <ike>
 <gateway>
 <local-identity>
 <hostname>
 <identity-hostname>identity-hostname</identity-hostname>
 </hostname>
 </local-identity>
 </gateway>
 </ike>
 </security>
</configuration>
```

**Description** Use a fully-qualified domain name

**Contents** <identity-hostname>—The local hostname

## <hostname> configuration/security/ike/gateway/remote-identity

### Usage

```
<configuration>
 <security>
 <ike>
 <gateway>
 <remote-identity>
 <hostname>
 <identity-hostname>identity-hostname</identity-hostname>
 </hostname>
 </remote-identity>
 </gateway>
 </ike>
 </security>
</configuration>
```

**Description** Use a fully-qualified domain name

**Contents** <identity-hostname>—The remote hostname

## <hostname> configuration/security/group-vpn/member/ike/gateway/local-identity

### Usage

```
<configuration>
 <security>
 <group-vpn>
 <member>
```

```
<ike>
 <gateway>
 <local-identity>
 <hostname>
 <identity-hostname>identity-hostname</identity-hostname>
 </hostname>
 </local-identity>
 </gateway>
</ike>
</member>
</group-vpn>
</security>
</configuration>
```

**Description** Use a fully-qualified domain name

**Contents** <identity-hostname>—The local hostname

---

### <hostname> configuration/security/group-vpn/server/ike/gateway/local-identity

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <ike>
 <gateway>
 <local-identity>
 <hostname>
 <identity-hostname>identity-hostname</identity-hostname>
 </hostname>
 </local-identity>
 </gateway>
 </ike>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Use a fully-qualified domain name

**Contents** <identity-hostname>—The local hostname

---

### <http-redirect> configuration/wlan/access-point/radio/virtual-access-point

---

#### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
```

```
<virtual-access-point>
 <http-redirect>
 <redirect-url>redirect-url</redirect-url>
 </http-redirect>
</virtual-access-point>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure HTTP redirect setting

**Contents** <redirect-url>—Set the HTTP redirect URL address

# Tag Elements Beginning with I

This chapter lists the configuration tag elements that have names beginning with the letter *i*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

## `<icmp>` configuration/security/screen/ids-option

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <icmp>
 <ip-sweep>...</ip-sweep>
 <fragment/>
 <large/>
 <flood>...</flood>
 <ping-death/>
 </icmp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure ICMP ids options

**Contents** `<ip-sweep>`—Configure ip sweep ids option

- <fragment>—Enable ICMP fragment ids option
- <large>—Enable large ICMP packet (size > 1024) ids option
- <flood>—Configure icmp flood ids option
- <ping-death>—Enable ping of death ids option

## <idp> configuration/security/forwarding-process/application-services/maximize-idp-sessions/weight

---

### Usage

```
<configuration>
 <security>
 <forwarding-process>
 <application-services>
 <maximize-idp-sessions>
 <weight>
 <idp>
 </idp>
 </weight>
 </maximize-idp-sessions>
 </application-services>
 </forwarding-process>
 </security>
</configuration>
```

**Description** IDP has more resources than firewall

### Contents

## <idp> configuration/security

---

### Usage

```
<configuration>
 <security>
 <idp>
 <processes>...</processes>
 </idp>
 </security>
</configuration>
```

**Description** Configure IDP

**Contents** <processes>—Configure IDP Processes

## <ids-option> configuration/security/screen

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <alarm-without-drop/>
 <icmp>...</icmp>
 <ip>...</ip>
 <tcp>...</tcp>
 <udp>...</udp>
 <limit-session>...</limit-session>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure ids-option

**Contents**

- <name>—Screen object name
- <description>—Text description of screen
- <alarm-without-drop>—Do not drop packet, only generate alarm
- <icmp>—Configure ICMP ids options
- <ip>—Configure IP layer ids options
- <tcp>—Configure TCP Layer ids options
- <udp>—Configure UDP layer ids options
- <limit-session>—Limit sessions

## <igmp-snooping> configuration/protocols

### Usage

```
<configuration>
 <protocols>
 <igmp-snooping>
 <traceoptions>...</traceoptions>
 <vlan>...</vlan>
 </igmp-snooping>
 </protocols>
</configuration>
```

**Description** IGMP Snooping Configuration

**Contents** <traceoptions>—Trace options for IGMP Snooping  
<vlan>—VLAN options

---

## <ike> configuration/security

---

### Usage

```
<configuration>
 <security>
 <ike>
 <traceoptions>...</traceoptions>
 <respond-bad-spi>...</respond-bad-spi>
 <proposal>...</proposal>
 <policy>...</policy>
 <gateway>...</gateway>
 </ike>
 </security>
</configuration>
```

**Description** IKE configuration

**Contents** <traceoptions>—Trace options for IPSec key management  
<respond-bad-spi>—Respond to IPSec packets with bad SPI values  
<proposal>—Define an IKE proposal  
<policy>—Define an IKE policy  
<gateway>—Define an IKE gateway

---

## <ike> configuration/security/ipsec/vpn

---

### Usage

```
<configuration>
 <security>
 <ipsec>
 <vpn>
 <ike>
 <gateway>gateway</gateway> <!-- mandatory -->
 <idle-time>idle-time</idle-time>
 <no-anti-replay/>
 <proxy-identity>...</proxy-identity>
 <ipsec-policy>ipsec-policy</ipsec-policy> <!-- mandatory -->
 <install-interval>install-interval</install-interval>
 </ike>
 </vpn>
 </ipsec>
 </security>
```

```
</configuration>
```

**Description** Define an IKE-keyed IPSec vpn

**Contents**

- <gateway>—Name of remote gateway
- <idle-time>—Idle time to delete SA
- <no-anti-replay>—Disable the anti-replay check
- <proxy-identity>—IPSec proxy-id to use in IKE negotiations
- <ipsec-policy>—Name of the IPSec policy
- <install-interval>—Delay installation of rekeyed outbound SAs on initiator

### <ike> configuration/security/group-vpn/member

---

**Usage**

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ike>
 <proposal>...</proposal>
 <policy>...</policy>
 <gateway>...</gateway>
 </ike>
 </member>
 </group-vpn>
 </security>
</configuration>
```

**Description** Group VPN IKE configuration

**Contents**

- <proposal>—Define an IKE proposal
- <policy>—Define an IKE policy
- <gateway>—Define an IKE gateway

### <ike> configuration/security/group-vpn/server

---

**Usage**

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <ike>
 <proposal>...</proposal>
 </ike>
 </server>
 </group-vpn>
 </security>
</configuration>
```

```
<policy>...</policy>
<gateway>...</gateway>
</ike>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Group VPN IKE configuration

**Contents** <proposal>—Define an IKE proposal

<policy>—Define an IKE policy

<gateway>—Define an IKE gateway

---

### <ike-esp-nat> configuration/security/alg

---

#### Usage

```
<configuration>
<security>
 <alg>
 <ike-esp-nat>
 <enable/>
 <esp-gate-timeout>esp-gate-timeout</esp-gate-timeout>
 <esp-session-timeout>esp-session-timeout</esp-session-timeout>
 <state-timeout>state-timeout</state-timeout>
 <traceoptions>...</traceoptions>
 </ike-esp-nat>
 </alg>
</security>
</configuration>
```

**Description** Configure IKE-ESP ALG with NAT

**Contents** <enable>—Enable IKE-ESP ALG

<esp-gate-timeout>—Set ESP gate timeout

<esp-session-timeout>—Set ESP session timeout

<state-timeout>—Set ALG state timeout

<traceoptions>—IKE-ESP ALG trace options

---

### <ike-gateway> configuration/security/group-vpn/server/group

---

#### Usage

```
<configuration>
<security>
```

```

<group-vpn>
 <server>
 <group>
 <ike-gateway>
 <gw-name>gw-name</gw-name> <!-- identifier -->
 </ike-gateway>
 </group>
 </server>
</group-vpn>
</security>
</configuration>

```

**Description** Name of the IKE gateway

**Contents** <gw-name>—Name of the IKE gateway

---

### <ike-phase1-failures> configuration/security/alarms/potential-violation

---

#### Usage

```

<configuration>
 <security>
 <alarms>
 <potential-violation>
 <ike-phase1-failures>
 <threshold>threshold</threshold>
 </ike-phase1-failures>
 </potential-violation>
 </alarms>
 </security>
</configuration>

```

**Description** No. of IKE Phase-1 failures before which an alarm needs to be raised

**Contents** <threshold>—Threshold value [default is 20]

---

### <ike-phase2-failures> configuration/security/alarms/potential-violation

---

#### Usage

```

<configuration>
 <security>
 <alarms>
 <potential-violation>
 <ike-phase2-failures>
 <threshold>threshold</threshold>
 </ike-phase2-failures>
 </potential-violation>
 </alarms>
 </security>
</configuration>

```

**Description** No. of IKE Phase-2 failures before which an alarm needs to be raised

**Contents** <threshold>—Threshold value [default is 20]

---

### <imsi-prefix> configuration/security/gprs/gtp/profile/apn

---

#### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<profile>
<apn>
<imsi-prefix>
<digit-string>digit-string</digit-string> <!-- identifier -->
<action>...</action> <!-- mandatory -->
</imsi-prefix>
</apn>
</profile>
</gtp>
</gprs>
</security>
</configuration>
```

**Description** Specific filter prefix digits for International Mobile Subscriber Identification(IMSI)

**Contents** <digit-string>—IMSI prefix should be \* or 5-15 digits

<action>—Configure GTP profile APN action

---

### <incoming-called-number> configuration/interfaces/interface/isdn-options

---

#### Usage

```
<configuration>
<interfaces>
<interface>
<isdn-options>
<incoming-called-number>
<called-number>called-number</called-number> <!-- identifier -->
<reject/>
</incoming-called-number>
</isdn-options>
</interface>
</interfaces>
</configuration>
```

**Description** Incoming called number to be screened

**Contents** <called-number>—Number called (upto 15 digits)

<reject>—Reject the called number

## <incoming-map> configuration/interfaces/interface/unit/dialer-options

### Usage

```
<configuration>
<interfaces>
<interface>
<unit>
<dialer-options>
 <incoming-map>
 <caller>...</caller>
 <accept-all/>
 </incoming-map>
</dialer-options>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description** Map incoming call to dialer

**Contents** <caller>—Caller Id to be screened  
 <accept-all>—Accept all incoming calls

## <inet> configuration/security/ike/gateway/local-identity

### Usage

```
<configuration>
<security>
<ike>
<gateway>
<local-identity>
 <inet>
 <identity-ipv4>identity-ipv4</identity-ipv4>
 </inet>
</local-identity>
</gateway>
</ike>
</security>
</configuration>
```

**Description** Use an IPv4 address

**Contents** <identity-ipv4>—The local IPv4 identity

## <inet> configuration/security/ike/gateway/remote-identity

---

**Usage**

```
<configuration>
<security>
 <ike>
 <gateway>
 <remote-identity>
 <inet>
 <identity-ipv4>identity-ipv4</identity-ipv4>
 </inet>
 </remote-identity>
 </gateway>
 </ike>
</security>
</configuration>
```

**Description** Use an IPv4 address

**Contents** <identity-ipv4>—The remote IPv4 identity

## <inet> configuration/security/group-vpn/member/ike/gateway/local-identity

---

**Usage**

```
<configuration>
<security>
 <group-vpn>
 <member>
 <ike>
 <gateway>
 <local-identity>
 <inet>
 <identity-ipv4>identity-ipv4</identity-ipv4>
 </inet>
 </local-identity>
 </gateway>
 </ike>
 </member>
 </group-vpn>
</security>
</configuration>
```

**Description** Use an IPv4 address

**Contents** <identity-ipv4>—The local IPv4 identity

## <inet> configuration/security/group-vpn/server/ike/gateway/local-identity

### Usage

```
<configuration>
<security>
<group-vpn>
<server>
<ike>
<gateway>
<local-identity>
<inet>
<identity-ipv4>identity-ipv4</identity-ipv4>
</inet>
</local-identity>
</gateway>
</ike>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Use an IPv4 address

**Contents** <identity-ipv4>—The local IPv4 identity

## <inet> configuration/security/nat/static/rule-set/rule/then/static-nat

### Usage

```
<configuration>
<security>
<nat>
<static>
<rule-set>
<rule>
<then>
<static-nat>
<inet>
<routing-instance>routing-instance</routing-instance>
</inet>
</static-nat>
</then>
</rule>
</rule-set>
</static>
</nat>
</security>
</configuration>
```

**Description** Translated to IPv4 address

- Contents**    <routing-instance>—Routing instance
- default - Default routing-instance
  - routing-instance - Routing-instance name

---

## <inet> configuration/interfaces/interface/unit/family

---

### Usage

```
<configuration>
<interfaces>
<interface>
 <unit>
 <family>
 <inet>
 <filter>...</filter>
 <dhcp>...</dhcp>
 </inet>
 </family>
 </unit>
</interface>
</interfaces>
</configuration>
```

### Description

- Contents**    <filter>—
- <dhcp>—Configure DHCP Client

---

## <inet6> configuration/security/ike/gateway/local-identity

---

### Usage

```
<configuration>
<security>
 <ike>
 <gateway>
 <local-identity>
 <inet6>
 <identity-ipv6>identity-ipv6</identity-ipv6>
 </inet6>
 </local-identity>
 </gateway>
 </ike>
</security>
</configuration>
```

**Description**    Use an IPv6 address

- Contents**    <identity-ipv6>—The local IPv6 identity

## <inet6> configuration/security/ike/gateway/remote-identity

---

### Usage

```
<configuration>
 <security>
 <ike>
 <gateway>
 <remote-identity>
 <inet6>
 <identity-ipv6>identity-ipv6</identity-ipv6>
 </inet6>
 </remote-identity>
 </gateway>
 </ike>
 </security>
</configuration>
```

**Description** Use an IPv6 address

**Contents** <identity-ipv6>—The remote IPv6 identity

## <inet6> configuration/security/forwarding-options/family

---

### Usage

```
<configuration>
 <security>
 <forwarding-options>
 <family>
 <inet6>
 <mode>mode</mode>
 </inet6>
 </family>
 </forwarding-options>
 </security>
</configuration>
```

**Description** Family IPv6

**Contents** <mode>—Forwarding mode

- packet-based - Enable packet-based forwarding
- flow-based - Enable flow-based forwarding
- drop - Disable forwarding

## **<inet6> configuration/interfaces/interface/unit/family**

---

### **Usage**

```
<configuration>
<interfaces>
<interface>
<unit>
<family>
<inet6>
<filter>...</filter>
</inet6>
</family>
</unit>
</interface>
</interfaces>
</configuration>
```

### **Description**

**Contents**   <filter>—

## **<infranet-controller> configuration/services/unified-access-control**

---

### **Usage**

```
<configuration>
<services>
<unified-access-control>
<infranet-controller>
<host-name>host-name</host-name> <!-- identifier -->
<address>address</address> <!-- mandatory -->
<port>port</port>
<interface>interface</interface> <!-- mandatory -->
<password>password</password> <!-- mandatory -->
<ca-profile>...</ca-profile>
<server-certificate-subject>server-certificate-subject</server-certificate-subject>

</infranet-controller>
</unified-access-control>
</services>
</configuration>
```

**Description**   Configure infranet controller

**Contents**   <host-name>—Infranet controller name  
              <address>—Infranet controller IP address  
              <port>—Infranet controller port  
              <interface>—Outgoing interface

<password>—Infranet controller server password

<ca-profile>—Define a list of certificate authority

<server-certificate-subject>—Subject name of infranet controller certificate to match

## <ingress> configuration/ethernet-switching-options/analyzer/input

### Usage

```
<configuration>
<ethernet-switching-options>
<analyzer>
<input>
<ingress>
 <interface>...</interface>
 <vlan>...</vlan>
</ingress>
</input>
</analyzer>
</ethernet-switching-options>
</configuration>
```

**Description** Ports and VLANs to monitor incoming traffic

**Contents** <interface>—Port to monitor incoming traffic

<vlan>—VLAN to monitor incoming traffic

## <input> configuration/ethernet-switching-options/analyzer

### Usage

```
<configuration>
<ethernet-switching-options>
<analyzer>
<input>
 <ingress>...</ingress>
 <egress>...</egress>
</input>
</analyzer>
</ethernet-switching-options>
</configuration>
```

**Description** Ports and VLANs to monitor

**Contents** <ingress>—Ports and VLANs to monitor incoming traffic

<egress>—Ports and VLANs to monitor outgoing traffic

## <input-vlan-map> configuration/interfaces/interface/unit

---

**Description** VLAN map operation on input

## <interface> configuration/security/nat/source

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<interface>
 <port-overloading>...</port-overloading>
</interface>
</source>
</nat>
</security>
</configuration>
```

**Description** Configure interface port overloading for persistent NAT

**Contents** <port-overloading>—Configure port overloading

## <interface> configuration/security/nat/source/rule-set/from

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<from>
 <interface>
 <if-name>if-name</if-name> <!-- identifier -->
 </interface>
</from>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Source interface list

**Contents** <if-name>—Interface name

## <interface> configuration/security/nat/source/rule-set/to

### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <to>
 <interface>
 <if-name>if-name</if-name> <!-- identifier -->
 </interface>
 </to>
 </rule-set>
 </source>
 </nat>
 </security>
</configuration>

```

**Description** Destination interface list

**Contents** <if-name>—Interface name

## <interface> configuration/security/nat/source/rule-set/rule/then/source-nat

### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule>
 <then>
 <source-nat>
 <interface>
 <persistent-nat>...</persistent-nat>
 </interface>
 </source-nat>
 </then>
 </rule>
 </rule-set>
 </source>
 </nat>
 </security>
</configuration>

```

**Description** Use egress interface address

**Contents** <persistent-nat>—Persistent NAT info

## **<interface> configuration/security/nat/destination/rule-set/from**

---

**Usage**

```
<configuration>
<security>
 <nat>
 <destination>
 <rule-set>
 <from>
 <interface>
 <if-name>if-name</if-name> <!-- identifier -->
 </interface>
 </from>
 </rule-set>
 </destination>
 </nat>
</security>
</configuration>
```

**Description** Source interface list

**Contents** <if-name>—Interface name

## **<interface> configuration/security/nat/static/rule-set/from**

---

**Usage**

```
<configuration>
<security>
 <nat>
 <static>
 <rule-set>
 <from>
 <interface>
 <if-name>if-name</if-name> <!-- identifier -->
 </interface>
 </from>
 </rule-set>
 </static>
 </nat>
</security>
</configuration>
```

**Description** Source interface list

**Contents** <if-name>—Interface name

## <interface> configuration/security/nat/proxy-arp

---

### Usage

```
<configuration>
 <security>
 <nat>
 <proxy-arp>
 <interface>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <address>...</address>
 </interface>
 </proxy-arp>
 </nat>
 </security>
</configuration>
```

**Description** Interface with proxy arp configured

**Contents** <name>—Interface name  
 <address>—Proxy ARP address

## <interface> configuration/security/nat/proxy-ndp

---

### Usage

```
<configuration>
 <security>
 <nat>
 <proxy-ndp>
 <interface>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <address>...</address>
 </interface>
 </proxy-ndp>
 </nat>
 </security>
</configuration>
```

**Description** Interface with proxy arp configured

**Contents** <name>—Interface name  
 <address>—Proxy ndp address

## <interface> configuration/services/captive-portal

---

### Usage

```
<configuration>
 <services>
```

```
<captive-portal>
 <interface>
 <all/>
 <name/>
 <supplicant>supplicant</supplicant>
 <retries>retries</retries>
 <quiet-period>quiet-period</quiet-period>
 <server-timeout>server-timeout</server-timeout>
 <session-expiry>session-expiry</session-expiry>
 </interface>
</captive-portal>
</services>
</configuration>
```

**Description** Captive Portal interface specific options

**Contents**

<all>—All ethernet-switching interfaces

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client
- multiple - Allow multiple clients; authenticate each individually

<name>—Name of ethernet-switching interface

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client
- multiple - Allow multiple clients; authenticate each individually

<supplicant>—Set supplicant mode for this interface

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client
- multiple - Allow multiple clients; authenticate each individually

<retries>—Number of retries after which port is placed into wait state

<quiet-period>—Time to wait after an authentication failure

<server-timeout>—Authentication server timeout interval

<session-expiry>—Session Expiry Timeout

---

## <interface> configuration/interfaces

### Usage

```
<configuration>
 <interfaces>
 <interface>
 <interface_name>interface_name</interface_name> <!-- identifier -->
```

```

<unit>...</unit>
<native-vlan-id>native-vlan-id</native-vlan-id>
<cellular-options>...</cellular-options>
<modem-options>...</modem-options>
<clocking>...</clocking>
<flexible-vlan-tagging/>
<traceoptions>...</traceoptions>
<isdn-options>...</isdn-options>
<dialer-options>...</dialer-options>
<shdsl-options>...</shdsl-options>
</interface>
</interfaces>
</configuration>

```

## Description

**Contents** <interface\_name>—

<unit>—

<native-vlan-id>—Virtual LAN identifier for untagged frames

<cellular-options>—Cellular interface specific options

<modem-options>—MODEM interface-specific options

<clocking>—

<flexible-vlan-tagging>—Support for no tagging, or single and double 802.1q VLAN tagging

<traceoptions>—

<isdn-options>—ISDN interface-specific options

<dialer-options>—Dialer options

<shdsl-options>—

## <interface> configuration/protocols/oam/ethernet/link-fault-management

## Description

<interface> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain/maintenance-association/mep

## Usage

```

<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<maintenance-domain>
<maintenance-association>

```

```
<mep>
 <interface>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <vlan-id>vlan-id</vlan-id>
 </interface>
</mep>
</maintenance-association>
</maintenance-domain>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Name of interface

**Contents** <interface-name>—  
  
<vlan-id>—Trunk port interface VLAN identifier

---

## <interface> configuration/protocols/dcbx

---

### Usage

```
<configuration>
<protocols>
<dcbx>
 <interface>
 <name/>
 <all/>
 <disable/>
 <priority-flow-control>...</priority-flow-control>
 <enhanced-transmission-selection>...</enhanced-transmission-selection>
 <applications>...</applications>
 <application-map>application-map</application-map>
 </interface>
</dcbx>
</protocols>
</configuration>
```

**Description** Interface configuration

**Contents** <name>—Interface name  
  
<all>—Interface all  
  
<disable>—Disable DCBX  
  
<priority-flow-control>—Configure priority flow control feature  
  
<enhanced-transmission-selection>—Configure enhanced transmission selection feature

<applications>—Configure application feature

<application-map>—Application map to be enabled on the interface

## <interface> configuration/protocols/lldp

### Usage

```
<configuration>
<protocols>
<lldp>
 <interface>
 <name/>
 <all/>
 <disable/>
 </interface>
</lldp>
</protocols>
</configuration>
```

**Description** Interface configuration

**Contents** <name>—Interface name

<all>—Interface all

<disable>—Disable LLDP

## <interface> configuration/protocols/lldp-med

### Usage

```
<configuration>
<protocols>
<lldp-med>
 <interface>
 <name/>
 <all/>
 <disable/>
 <location>...</location>
 </interface>
</lldp-med>
</protocols>
</configuration>
```

**Description** Interface configuration

**Contents** <name>—Interface name

<all>—Interface all

<disable>—Disable LLDP

<location>—

## <interface> configuration/protocols/dot1x/authenticator

### Usage

```
<configuration>
<protocols>
<dot1x>
<authenticator>
<interface>
<all/>
<name/>
<disable/>
<supplicant>supplicant</supplicant>
<retries>retries</retries>
<quiet-period>quiet-period</quiet-period>
<transmit-period>transmit-period</transmit-period>
<mac-radius>...</mac-radius>
<no-reauthentication/>
<reauthentication>reauthentication</reauthentication>
<supplicant-timeout>supplicant-timeout</supplicant-timeout>
<server-timeout>server-timeout</server-timeout>
<maximum-requests>maximum-requests</maximum-requests>
<guest-vlan>guest-vlan</guest-vlan>
<server-reject-vlan>...</server-reject-vlan>
<server-fail>...</server-fail>
</interface>
</authenticator>
</dot1x>
</protocols>
</configuration>
```

**Description** 802.1X interface specific options

**Contents** <all>—All ethernet-switching family interfaces

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client
- multiple - Allow multiple clients; authenticate each individually

<name>—Name of Layer 2 interface

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client
- multiple - Allow multiple clients; authenticate each individually

<disable>—Disable 802.1X on this interface

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client

- multiple - Allow multiple clients; authenticate each individually

<supplicant>—Set supplicant mode for this interface

- single - Allow multiple clients; authenticate first client only
- single-secure - Allow and authenticate only a single client
- multiple - Allow multiple clients; authenticate each individually

<retries>—Number of retries after which port is placed into wait state

<quiet-period>—Time to wait after an authentication failure

<transmit-period>—Interval before retransmitting initial EAPOL PDUs

<mac-radius>—Enable MAC-RADIUS

<no-reauthentication>—Disable reauthentication

<reauthentication>—Reauthentication interval

<supplicant-timeout>—Time to wait for a client response

<server-timeout>—Authentication server timeout interval

<maximum-requests>—Number of EAPOL RequestIDs to send before timing out

<guest-vlan>—VLAN name or 802.1q tag for unauthenticated or non-responsive hosts

<server-reject-vlan>—VLAN name or 802.1q tag for authentication rejected clients

<server-fail>—Action to be taken when server is inaccessible

## <interface> configuration/protocols/gvrp

### Usage

```
<configuration>
<protocols>
<gvrp>
 <interface>
 <all/>
 <name/>
 <disable/>
 </interface>
</gvrp>
</protocols>
</configuration>
```

**Description** Configure interface options

**Contents** <all>—All ethernet-switching family interfaces

<name>—Name of Layer 2 interface

<disable>—Disable GVRP on this interface

---

## <interface> configuration/protocols/mvrp

---

### Usage

```
<configuration>
<protocols>
 <mvrp>
 <interface>
 <all/>
 <name/>
 <disable/>
 <join-timer>join-timer</join-timer>
 <leave-timer>leave-timer</leave-timer>
 <leaveall-timer>leaveall-timer</leaveall-timer>
 <registration>registration</registration>
 </interface>
 </mvrp>
</protocols>
</configuration>
```

**Description** Configure interface options

**Contents** <all>—All ethernet-switching family interfaces

- normal - Normal registration mode
- forbidden - Forbidden registration mode

<name>—Name of Layer 2 interface

- normal - Normal registration mode
- forbidden - Forbidden registration mode

<disable>—Disable MVRP on this interface

- normal - Normal registration mode
- forbidden - Forbidden registration mode

<join-timer>—Join timer interval

- normal - Normal registration mode
- forbidden - Forbidden registration mode

<leave-timer>—Leave timer interval

- normal - Normal registration mode
- forbidden - Forbidden registration mode

<leaveall-timer>—LeaveAll timer interval

- normal - Normal registration mode
- forbidden - Forbidden registration mode

<registration>—Registration mode

- normal - Normal registration mode
- forbidden - Forbidden registration mode

## <interface> configuration/protocols/stp

### Usage

```
<configuration>
<protocols>
<stp>
 <interface>
 <all/>
 <name/>
 <priority>priority</priority>
 <cost>cost</cost>
 <disable/>
 <arp-on-stp/>
 <mode>mode</mode>
 <edge/>
 <bpdutimeout-action>...</bpdutimeout-action>
 <no-root-port/>
 </interface>
</stp>
</protocols>
</configuration>
```

### Description

**Contents** <all>—All interfaces

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<name>—Enter interface name

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<priority>—Interface priority (in increments of 16 - 0,16,...,240)

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<cost>—Cost of the interface

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<disable>—Disable Spanning Tree on port

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<arp-on-stp>—Enable ARP on STP

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<mode>—Interface mode (P2P or shared)

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<edge>—Port is an edge port

<bpdutimeout-action>—Define action on BPDU expiry (Loop Protect)

<no-root-port>—Enable root-protect feature on this port

---

## <interface> configuration/protocols/rstp

---

### Usage

```
<configuration>
<protocols>
<rstp>
 <interface>
 <all/>
 <name/>
 <priority>priority</priority>
 <cost>cost</cost>
 <disable/>
 <arp-on-stp/>
 <mode>mode</mode>
 <edge/>
 <bpdutimeout-action>...</bpdutimeout-action>
 <no-root-port/>
 </interface>
</rstp>
</protocols>
</configuration>
```

### Description

#### Contents

<all>—All interfaces

- point-to-point - Interface mode is point-to-point

- shared - Interface mode is shared

<name>—Enter interface name

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<priority>—Interface priority (in increments of 16 - 0,16,..240)

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<cost>—Cost of the interface

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<disable>—Disable Spanning Tree on port

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<arp-on-stp>—Enable ARP on STP

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<mode>—Interface mode (P2P or shared)

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<edge>—Port is an edge port

<bpdutimeout-action>—Define action on BPDU expiry (Loop Protect)

<no-root-port>—Enable root-protect feature on this port

## <interface> configuration/protocols/mstp

### Usage

```
<configuration>
<protocols>
<mstp>
<interface>
<all/>
<name/>
<priority>priority</priority>
<cost>cost</cost>
<disable/>
```

```
<arp-on-stp/>
<mode>mode</mode>
<edge/>
<bpdutimeout-action>...</bpdutimeout-action>
<no-root-port/>
</interface>
</mstp>
</protocols>
</configuration>
```

## Description

- Contents**
- <all>—All interfaces
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <name>—Enter interface name
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <priority>—Interface priority (in increments of 16 - 0,16,..240)
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <cost>—Cost of the interface
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <disable>—Disable Spanning Tree on port
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <arp-on-stp>—Enable ARP on STP
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <mode>—Interface mode (P2P or shared)
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <edge>—Port is an edge port
  - <bpdutimeout-action>—Define action on BPDU expiry (Loop Protect)

<no-root-port>—Enable root-protect feature on this port

## <interface> configuration/protocols/mstp/msti

### Usage

```
<configuration>
<protocols>
 <mstp>
 <msti>
 <interface>
 <name>name</name> <!-- identifier -->
 <priority>priority</priority>
 <cost>cost</cost>
 <disable/>
 <arp-on-stp/>
 </interface>
 </msti>
 </mstp>
</protocols>
</configuration>
```

### Description

**Contents** <name>—

<priority>—Interface priority (in increments of 16 - 0,16,...240)

<cost>—Cost of the interface

<disable>—Disable Spanning Tree on port

<arp-on-stp>—Enable ARP on STP

## <interface> configuration/protocols/vstp/vlan-group/group

### Usage

```
<configuration>
<protocols>
 <vstp>
 <vlan-group>
 <group>
 <interface>
 <all/>
 <name/>
 <priority>priority</priority>
 <cost>cost</cost>
 <disable/>
 <arp-on-stp/>
 <mode>mode</mode>
 <edge/>
 <bpdu-timeout-action>...</bpdu-timeout-action>
 <no-root-port/>
```

```
 </interface>
 </group>
</vlan-group>
</vstp>
</protocols>
</configuration>
```

## Description

- Contents**
- <all>—All interfaces
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <name>—Enter interface name
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <priority>—Interface priority (in increments of 16 - 0,16,..240)
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <cost>—Cost of the interface
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <disable>—Disable Spanning Tree on port
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <arp-on-stp>—Enable ARP on STP
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <mode>—Interface mode (P2P or shared)
    - point-to-point - Interface mode is point-to-point
    - shared - Interface mode is shared
  - <edge>—Port is an edge port
  - <bpdutimeout-action>—Define action on BPDU expiry (Loop Protect)
  - <no-root-port>—Enable root-protect feature on this port

## <interface> configuration/protocols/vstp/vlan

### Usage

```
<configuration>
<protocols>
<vstp>
<vlan>
<interface>
<all/>
<name/>
<priority>priority</priority>
<cost>cost</cost>
<disable/>
<arp-on-stp/>
<mode>mode</mode>
<edge/>
<bpdu-timeout-action>...</bpdu-timeout-action>
<no-root-port/>
</interface>
</vlan>
</vstp>
</protocols>
</configuration>
```

### Description

#### Contents

<all>—All interfaces

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<name>—Enter interface name

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<priority>—Interface priority (in increments of 16 - 0,16,..240)

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<cost>—Cost of the interface

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<disable>—Disable Spanning Tree on port

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<arp-on-stp>—Enable ARP on STP

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<mode>—Interface mode (P2P or shared)

- point-to-point - Interface mode is point-to-point
- shared - Interface mode is shared

<edge>—Port is an edge port

<bpdutimeout-action>—Define action on BPDU expiry (Loop Protect)

<no-root-port>—Enable root-protect feature on this port

---

## <interface> configuration/protocols/edge-virtual-bridging/vsi-discovery

---

### Usage

```
<configuration>
<protocols>
 <edge-virtual-bridging>
 <vsi-discovery>
 <interface>
 <name>name</name> <!-- identifier -->
 </interface>
 </vsi-discovery>
 </edge-virtual-bridging>
</protocols>
</configuration>
```

**Description** Configure VSI Discovery Protocol on this interface

**Contents** <name>—Enter interface name

---

## <interface> configuration/protocols/igmp-snooping/vlan

---

### Usage

```
<configuration>
<protocols>
 <igmp-snooping>
 <vlan>
 <interface>
 <all/>
 <interface-name/>
 <static>...</static>
 <multicast-router-interface/>
 </interface>
 </vlan>
 </igmp-snooping>
```

```

 </protocols>
 </configuration>

```

**Description** Interface options

**Contents** <all>—All interfaces on this VLAN

<interface-name>—Interface name

<static>—Static group or source membership

<multicast-router-interface>—Configure this interface as multicast router

## <interface> configuration/protocols/mld-snooping/vlan

### Usage

```

<configuration>
<protocols>
<mld-snooping>
<vlan>
 <interface>
 <all/>
 <interface-name/>
 <static>...</static>
 <multicast-router-interface/>
 </interface>
</vlan>
</mld-snooping>
</protocols>
</configuration>

```

**Description** Interface options

**Contents** <all>—All interfaces on this VLAN

<interface-name>—Interface name

<static>—Static group or source membership

<multicast-router-interface>—Configure this interface as multicast router

## <interface> configuration/poe

### Usage

```

<configuration>
<poe>
 <interface>
 <all/>
 <interface/>
 <disable/>
 </interface>
</poe>
</configuration>

```

```
<priority>priority</priority>
<maximum-power>maximum-power</maximum-power>
<telemetries>...</telemetries>
</interface>
</poe>
</configuration>
```

**Description** Interface configuration for Power over Ethernet

**Contents** <all>—All interfaces

- low - Low priority
- high - High priority

<interface>—Specific interface

- low - Low priority
- high - High priority

<disable>—Disable interface

- low - Low priority
- high - High priority

<priority>—Priority options

- low - Low priority
- high - High priority

<maximum-power>—Maximum power

<telemetries>—Telemetries settings

---

## <interface> configuration/ethernet-switching-options/voip

### Usage

```
<configuration>
<ethernet-switching-options>
<voip>
 <interface>
 <name/>
 <access-ports/>
 <vlan>vlan</vlan> <!-- mandatory -->
 <forwarding-class>forwarding-class</forwarding-class>
 </interface>
</voip>
</ethernet-switching-options>
</configuration>
```

**Description** Enable voice over IP on this port

**Contents** <name>—Interface name  
 <access-ports>—All ethernet-switching access ports  
 <vlan>—VLAN for voice over IP  
 <forwarding-class>—Forwarding class

## <interface> configuration/ethernet-switching-options/secure-access-port

### Usage

```
<configuration>
 <ethernet-switching-options>
 <secure-access-port>
 <interface>
 <name>name</name> <!-- identifier -->
 <mac-limit>...</mac-limit>
 <static-ip>...</static-ip>
 <allowed-mac>...</allowed-mac>
 <no-allowed-mac-log/>
 <dhcp-trusted/>
 <fcoe-trusted/>
 <persistent-learning/>
 </interface>
 </secure-access-port>
 </ethernet-switching-options>
</configuration>
```

**Description** Configure access port security for this interface

**Contents** <name>—  
 <mac-limit>—Number of MAC addresses allowed on this interface  
 <static-ip>—Static IP address configuration  
 <allowed-mac>—Allowed MAC address on this interface  
 <no-allowed-mac-log>—Do not log violation of allowed MAC on this interface  
 <dhcp-trusted>—Make this interface trusted for DHCP  
 <fcoe-trusted>—Make this interface trusted for FCoE  
 <persistent-learning>—Enable persistent MAC learning on this interface

## <interface> configuration/ethernet-switching-options/analyzer/input/ingress

**Usage**

```
<configuration>
 <ethernet-switching-options>
 <analyzer>
 <input>
 <ingress>
 <interface>
 <name/>
 <all/>
 </interface>
 </ingress>
 </input>
 </analyzer>
 </ethernet-switching-options>
</configuration>
```

**Description** Port to monitor incoming traffic

**Contents** <name>—Name of logical interface  
<all>—All interfaces

## <interface> configuration/ethernet-switching-options/analyzer/input/egress

**Usage**

```
<configuration>
 <ethernet-switching-options>
 <analyzer>
 <input>
 <egress>
 <interface>
 <name/>
 <all/>
 </interface>
 </egress>
 </input>
 </analyzer>
 </ethernet-switching-options>
</configuration>
```

**Description** Port to monitor outgoing traffic

**Contents** <name>—Name of logical interface  
<all>—All interfaces

## <interface> configuration/ethernet-switching-options/analyzer/output

### Usage

```
<configuration>
<ethernet-switching-options>
<analyzer>
<output>
<interface>
 <interface_name>interface_name</interface_name> <!-- identifier -->
</interface>
</output>
</analyzer>
</ethernet-switching-options>
</configuration>
```

**Description** Outgoing port for mirrored packets

**Contents** <interface\_name>—Interface name

## <interface> configuration/ethernet-switching-options/bpdu-block

### Usage

```
<configuration>
<ethernet-switching-options>
<bpdu-block>
<interface>
 <all/>
 <name/>
</interface>
</bpdu-block>
</ethernet-switching-options>
</configuration>
```

**Description** Interface name to block BPDU on

**Contents** <all>—All interfaces

<name>—Enter interface name

## <interface> configuration/ethernet-switching-options/redundant-trunk-group/group

### Usage

```
<configuration>
<ethernet-switching-options>
<redundant-trunk-group>
<group>
<interface>
 <name>name</name> <!-- identifier -->
 <primary/>
```

```
</interface>
</group>
</redundant-trunk-group>
</ethernet-switching-options>
</configuration>
```

**Description** Interfaces that are part of this redundant trunk group

**Contents** <name>—Interface name

<primary>—Set Primary Redundant Trunk Group interface

---

## <interface> configuration/ethernet-switching-options/storm-control

---

### Usage

```
<configuration>
<ethernet-switching-options>
<storm-control>
<interface>
<all/>
<name/>
<bandwidth>bandwidth</bandwidth>
<level>level</level>
<no-broadcast/>
<no-unknown-unicast/>
<multicast/>
<no-registered-multicast/>
<no-unregistered-multicast/>
</interface>
</storm-control>
</ethernet-switching-options>
</configuration>
```

**Description** Configure storm control for this interface

**Contents** <all>—All interfaces

<name>—Enter interface name

<bandwidth>—Link bandwidth

<level>—Percentage of link bandwidth

<no-broadcast>—Disable broadcast storm control

<no-unknown-unicast>—Disable unknown unicast storm control

<multicast>—Enable multicast storm control

<no-registered-multicast>—Disable registered multicast storm control

<no-unregistered-multicast>—Disable unregistered multicast storm control

## <interface> configuration/vlans/vlan

### Usage

```
<configuration>
<vlans>
<vlan>
 <interface>
 <interface_name>interface_name</interface_name> <!-- identifier -->
 <pvlan-trunk/>
 <ingress/>
 <egress/>
 <mapping>...</mapping>
 </interface>
</vlan>
</vlans>
</configuration>
```

**Description** Name of interface that uses this VLAN

**Contents** <interface\_name>—Interface name that uses this VLAN

<pvlan-trunk>—Trunk port connecting neighbouring PVLAN switch

<ingress>—Ingress membership for the interface on this vlan

<egress>—Egress membership for the interface on this vlan

<mapping>—Mapping rules for the interface

## <interfaces> configuration/security/zones/functional-zone/management

### Usage

```
<configuration>
<security>
<zones>
 <functional-zone>
 <management>
 <interfaces>
 <interface-unit>interface-unit</interface-unit> <!-- identifier -->
 <host-inbound-traffic>...</host-inbound-traffic>
 </interfaces>
 </management>
 </functional-zone>
</zones>
</security>
</configuration>
```

**Description** Interfaces that are part of this zone

**Contents**    <interface-unit>—Logical interface  
                 <host-inbound-traffic>—

---

## <interfaces> configuration/security/zones/security-zone

---

### Usage

```
<configuration>
<security>
<zones>
<security-zone>
<interfaces>
 <interface-unit>interface-unit</interface-unit> <!-- identifier -->
 <host-inbound-traffic>...</host-inbound-traffic>
</interfaces>
</security-zone>
</zones>
</security>
</configuration>
```

**Description**    Interfaces that are part of this zone

**Contents**    <interface-unit>—Logical interface  
                 <host-inbound-traffic>—

---

## <interfaces> configuration

---

### Usage

```
<configuration>
<interfaces>
 <interface>...</interface>
</interfaces>
</configuration>
```

### Description

**Contents**    <interface>—

---

## <interfaces> configuration/ethernet-switching-options

---

### Usage

```
<configuration>
<ethernet-switching-options>
<interfaces>
 <esw-interface>...</esw-interface>
</interfaces>
</ethernet-switching-options>
```

```
</configuration>
```

**Description** Ethernet switching family interface names

**Contents** <esw-interface>—Interface name

## <internal> configuration/security/ipsec

---

### Usage

```
<configuration>
<security>
<ipsec>
<internal>
<security-association>...</security-association>
</internal>
</ipsec>
</security>
</configuration>
```

**Description** Define an IPSec SA for internal RE-RE communication

**Contents** <security-association>—Define an IPsec security association

## <ip> configuration/security/screen/ids-option

---

### Usage

```
<configuration>
<security>
<screen>
<ids-option>
<ip>
<bad-option/>
<record-route-option/>
<timestamp-option/>
<security-option/>
<stream-option/>
<spoofing/>
<source-route-option/>
<loose-source-route-option/>
<strict-source-route-option/>
<unknown-protocol/>
<block-frag/>
<tear-drop/>
</ip>
</ids-option>
</screen>
</security>
</configuration>
```

**Description** Configure IP layer ids options

**Contents**

- <bad-option>—Enable ip with bad option ids option
- <record-route-option>—Enable ip with record route option ids option
- <timestamp-option>—Enable ip with timestamp option ids option
- <security-option>—Enable ip with security option ids option
- <stream-option>—Enable ip with stream option ids option
- <spoofing>—Enable IP address spoofing ids option
- <source-route-option>—Enable ip source route ids option
- <loose-source-route-option>—Enable ip with loose source route ids option
- <strict-source-route-option>—Enable ip with strict source route ids option
- <unknown-protocol>—Configure unknown protocol ids option
- <block-frag>—Enable ip fragment blocking ids option
- <tear-drop>—Enable tear drop ids option

---

## <ip-monitoring> configuration/services

### Usage

```
<configuration>
 <services>
 <ip-monitoring>
 <policy>...</policy>
 <traceoptions>...</traceoptions>
 </ip-monitoring>
 </services>
</configuration>
```

**Description** IP monitoring for route action

**Contents**

- <policy>—Policy for route action
- <traceoptions>—IP-Monitoring trace options

---

## <ip-sweep> configuration/security/screen/ids-option/icmp

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
```

```
<icmp>
 <ip-sweep>
 <threshold>threshold</threshold>
 </ip-sweep>
</icmp>
</ids-option>
</screen>
</security>
</configuration>
```

**Description** Configure ip sweep ids option

**Contents** <threshold>—Threshold

---

## <ipc> configuration/security/utm

---

### Usage

```
<configuration>
 <security>
 <utm>
 <ipc>
 <traceoptions>...</traceoptions>
 </ipc>
 </utm>
 </security>
</configuration>
```

**Description** Trace options for IPC

**Contents** <traceoptions>—Trace options for IPC

---

## <ipsec> configuration/security

---

### Usage

```
<configuration>
 <security>
 <ipsec>
 <internal>...</internal>
 <traceoptions>...</traceoptions>
 <vpn-monitor-options>...</vpn-monitor-options>
 <proposal>...</proposal>
 <policy>...</policy>
 <vpn>...</vpn>
 </ipsec>
 </security>
</configuration>
```

**Description** IPSec configuration

- Contents**
- <internal>—Define an IPSec SA for internal RE-RE communication
  - <traceoptions>—Trace options for IPSec data-plane debug
  - <vpn-monitor-options>—Global options for VPN liveliness monitoring
  - <proposal>—Define an IPSec proposal
  - <policy>—Define an IPSec policy
  - <vpn>—Define an IPSec VPN

---

## <ipsec> configuration/security/group-vpn/member

---

### Usage

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ipsec>
 <vpn>...</vpn>
 </ipsec>
 </member>
 </group-vpn>
 </security>
</configuration>
```

**Description** Group VPN IPsec configuration

- Contents**
- <vpn>—Define an IPSec VPN

---

## <ipsec> configuration/security/group-vpn/server

---

### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <ipsec>
 <proposal>...</proposal>
 </ipsec>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Group VPN IPsec configuration

- Contents**
- <proposal>—Define an IPSec proposal

## <ipsec-sa> configuration/security/group-vpn/server/group

---

### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <group>
 <ipsec-sa>
 <name>name</name> <!-- identifier -->
 <proposal>proposal</proposal> <!-- mandatory -->
 <match-policy>...</match-policy>
 </ipsec-sa>
 </group>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Define a Group VPN group SA

**Contents** <name>—Name of the SA

<proposal>—Name of the IPsec proposal

<match-policy>—Configure a Group VPN group SA

## <ipsec-vpn> configuration/security/flow/tcp-mss

---

### Usage

```
<configuration>
 <security>
 <flow>
 <tcp-mss>
 <ipsec-vpn>
 <mss>mss</mss>
 </ipsec-vpn>
 </tcp-mss>
 </flow>
 </security>
</configuration>
```

**Description** Enable MSS override for all packets entering IPsec tunnel

**Contents** <mss>—MSS value

## <isdn-options> configuration/interfaces/interface

### Usage

```

<configuration>
<interfaces>
<interface>
 <isdn-options>
 <switch-type>switch-type</switch-type>
 <media-type>media-type</media-type>
 <spid1>spid1</spid1>
 <spid2>spid2</spid2>
 <calling-number>calling-number</calling-number>
 <incoming-called-number>...</incoming-called-number>
 <tei-option>tei-option</tei-option>
 <static-tei-val>static-tei-val</static-tei-val>
 <t310>t310</t310>
 <bchannel-allocation>bchannel-allocation</bchannel-allocation>
 </isdn-options>
</interface>
</interfaces>
</configuration>

```

**Description** ISDN interface-specific options

**Contents** <switch-type>—ISDN switch type

- ni1 - NI1 BRI variant
- etsi - ETSI variant
- att5e - ATT5E variant
- ntdms100 - NTDMS100 variant
- vn3 - VN3 variant
- ntt - INS NET (NTT) PRI/BRI variant
- ni2 - NI2 PRI variant
- att4e - ATT 4ESS PRI variant
- data - Data
- voice - Voice
- combined - Combined
- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up
- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<media-type>—ISDN media type - voice, data or both

- data - Data
- voice - Voice
- combined - Combined
- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up
- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<spid1>—Service profile identifier

- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up
- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<spid2>—Additional service profile identifier

- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up
- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<calling-number>—Calling number included in outgoing calls

- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up
- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<incoming-called-number>—Incoming called number to be screened

- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up
- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<tei-option>—ISDN terminal endpoint identifier negotiation options

- first-call - Terminal endpoint identifier negotiation during first call
- power-up - Terminal endpoint identifier negotiation during power-up

- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<static-tei-val>—Static TEI value

- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<t310>—Timer T310 value

- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

<bchannel-allocation>—Allocate PRI dialout b-channel in ascending/descending order

- ascending - Allocate b-channel in ascending order
- descending - Allocate b-channel in descending order

---

## <iso> configuration/security/forwarding-options/family

---

### Usage

```
<configuration>
 <security>
 <forwarding-options>
 <family>
 <iso>
 <mode>mode</mode>
 </iso>
 </family>
 </forwarding-options>
 </security>
</configuration>
```

**Description**    Family ISO

**Contents**    <mode>—Forwarding mode

- packet-based - Enable packet-based forwarding

## CHAPTER 36

# Tag Elements Beginning with J

This chapter lists the configuration tag elements that have names beginning with the letter *j*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<juniper-enhanced>` configuration/security/utm/feature-profile/web-filtering

---

#### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-enhanced>
 <cache>...</cache>
 <server>...</server>
 <profile>...</profile>
 </juniper-enhanced>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description**    Configure web-filtering juniper enhanced engine

**Contents**    <cache>—

<server>—Juniper enhanced server

<profile>—Juniper enhanced profile

---

## <juniper-express-engine> configuration/security/utm/feature-profile/anti-virus

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <juniper-express-engine>
 <pattern-update>...</pattern-update>
 <profile>...</profile>
 </juniper-express-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Anti-virus juniper-express-engine profile or pattern update

**Contents** <pattern-update>—Anti-virus juniper-express-engine pattern update  
<profile>—Anti-virus juniper-express-engine profile

---

## <juniper-local> configuration/security/utm/feature-profile/web-filtering

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-local>
 <profile>...</profile>
 </juniper-local>
 </web-filtering>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Configure web-filtering juniper local engine

**Contents** <profile>—Juniper local profile

## CHAPTER 37

# Tag Elements Beginning with K

This chapter lists the configuration tag elements that have names beginning with the letter *k*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<kaspersky-lab-engine>` configuration/security/utm/feature-profile/anti-virus

---

#### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <pattern-update>...</pattern-update>
 <profile>...</profile>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Anti-virus kaspersky-lab-engine profile or pattern-update

**Contents** `<pattern-update>`—Anti-virus kaspersky-lab-engine pattern update

<profile>—Anti-virus kaspersky-lab-engine profile

## <key> configuration/security/ipsec/internal/security-association/manual/encryption

### Usage

```
<configuration>
<security>
<ipsec>
<internal>
<security-association>
<manual>
<encryption>
<key>
<ascii-text>ascii-text</ascii-text>
<hexadecimal>hexadecimal</hexadecimal>
</key>
</encryption>
</manual>
</security-association>
</internal>
</ipsec>
</security>
</configuration>
```

**Description** Define an encryption key

**Contents** <ascii-text>—Format as text  
<hexadecimal>—Format as hexadecimal

## <key> configuration/security/ipsec/vpn/manual/authentication

### Usage

```
<configuration>
<security>
<ipsec>
<vpn>
<manual>
<authentication>
<key>
<ascii-text>ascii-text</ascii-text>
<hexadecimal>hexadecimal</hexadecimal>
</key>
</authentication>
</manual>
</vpn>
</ipsec>
</security>
</configuration>
```

<b>Description</b>	Define an authentication key
<b>Contents</b>	<code>&lt;ascii-text&gt;</code> —Format as text <code>&lt;hexadecimal&gt;</code> —Format as hexadecimal

---

### `<key>` `configuration/security/ipsec/vpn/manual/encryption`

---

#### Usage

```
<configuration>
 <security>
 <ipsec>
 <vpn>
 <manual>
 <encryption>
 <key>
 <ascii-text>ascii-text</ascii-text>
 <hexadecimal>hexadecimal</hexadecimal>
 </key>
 </encryption>
 </manual>
 </vpn>
 </ipsec>
 </security>
</configuration>
```

<b>Description</b>	Define an encryption key
<b>Contents</b>	<code>&lt;ascii-text&gt;</code> —Format as text <code>&lt;hexadecimal&gt;</code> —Format as hexadecimal

## CHAPTER 38

# Tag Elements Beginning with L

This chapter lists the configuration tag elements that have names beginning with the letter *l*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### [<l2pt-protocol> configuration/vlans/vlan/dot1q-tunneling/layer2-protocol-tunneling](#)

#### Usage

```
<configuration>
 <vlans>
 <vlan>
 <dot1q-tunneling>
 <layer2-protocol-tunneling>
 <l2pt-protocol>
 <all/>
 <802.1x/>
 <802.3ah/>
 <cdp/>
 <udld/>
 <e-lmi/>
 <gvrp/>
 <lacp/>
 <lldp/>
 <mmrp/>
 <mvrp/>
 <stp/>
 <vstp/>
 <vtp/>
 <drop-threshold>drop-threshold</drop-threshold>
```

```
<shutdown-threshold>shutdown-threshold</shutdown-threshold>
</l2pt-protocol>
</layer2-protocol-tunneling>
</dot1q-tunneling>
</vlan>
</vlands>
</configuration>
```

**Description** Layer2 protocol tunneling

**Contents**

- <all>—Tunnel all layer-2 protocol PDUs
- <802.1x>—Tunnel 802.1X PDUs
- <802.3ah>—Tunnel 802.3AH (Ethernet Link OAM) PDUs
- <cdp>—Tunnel CDP PDUs
- <udld>—Tunnel UDLD PDUs
- <e-lmi>—Tunnel E-LMI PDUs
- <gvrp>—Tunnel GVRP PDUs
- <lacp>—Tunnel LACP PDUs
- <lldp>—Tunnel LLDP PDUs
- <mmrp>—Tunnel MMRP PDUs
- <mvrp>—Tunnel MVRP PDUs
- <stp>—Tunnel STP PDUs
- <vstp>—Tunnel VSTP PDUs
- <vtp>—Tunnel VTP PDUs
- <drop-threshold>—Drop threshold for the protocol
- <shutdown-threshold>—Shutdown threshold for the protocol

---

## <layer2-protocol-tunneling> configuration/vlands/vlan/dot1q-tunneling

---

### Usage

```
<configuration>
 <vlands>
 <vlan>
 <dot1q-tunneling>
 <layer2-protocol-tunneling>
 <l2pt-protocol>...</l2pt-protocol>
 </layer2-protocol-tunneling>
 </dot1q-tunneling>
```

```
</vlan>
</vlans>
</configuration>
```

**Description** Layer2 protocol tunneling configuration

**Contents** <l2pt-protocol>—Layer2 protocol tunneling

---

### <limit> configuration/security/gprs/sctp/profile

---

#### Usage

```
<configuration>
<security>
<gprs>
<sctp>
<profile>
<limit>
<rate>...</rate>
</limit>
</profile>
</sctp>
</gprs>
</security>
</configuration>
```

**Description** Packet limits

**Contents** <rate>—Rate limit

---

### <limit-session> configuration/security/screen/ids-option

---

#### Usage

```
<configuration>
<security>
<screen>
<ids-option>
<limit-session>
<source-ip-based>source-ip-based</source-ip-based>
<destination-ip-based>destination-ip-based</destination-ip-based>
</limit-session>
</ids-option>
</screen>
</security>
</configuration>
```

**Description** Limit sessions

**Contents** <source-ip-based>—Limit sessions from the same source IP

<destination-ip-based>—Limit sessions to the same destination IP

---

## <link-fault-management> configuration/protocols/oam/ethernet

### Usage

```
<configuration>
<protocols>
 <oam>
 <ethernet>
 <link-fault-management>
 <interface/>
 </link-fault-management>
 </ethernet>
 </oam>
</protocols>
</configuration>
```

### Description

**Contents** <interface>—

---

## <linktrace> configuration/protocols/oam/ethernet/connectivity-fault-management

### Usage

```
<configuration>
<protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <linktrace>
 <path-database-size>path-database-size</path-database-size>
 <age>age</age>
 </linktrace>
 </connectivity-fault-management>
 </ethernet>
 </oam>
</protocols>
</configuration>
```

**Description** Linktrace protocol global options

**Contents** <path-database-size>—Number of linktrace reply entries to be stored per linktrace request

- 10s -
- 30s -
- 1m -
- 10m -
- 30m -

<age>—Time after which a stale request-response entry is deleted

- 10s -
- 30s -
- 1m -
- 10m -
- 30m -

## <lldp> configuration/protocols

### Usage

```
<configuration>
<protocols>
 <lldp>
 <disable/>
 <traceoptions>...</traceoptions>
 <management-address>management-address</management-address>
 <advertisement-interval>advertisement-interval</advertisement-interval>
 <transmit-delay>transmit-delay</transmit-delay>
 <hold-multiplier>hold-multiplier</hold-multiplier>

 <ptopo-configuration-trap-interval>ptopo-configuration-trap-interval</ptopo-configuration-trap-interval>

 <ptopo-configuration-maximum-hold-time>ptopo-configuration-maximum-hold-time</ptopo-configuration-maximum-hold-time>

 <lldp-configuration-notification-interval>lldp-configuration-notification-interval</lldp-configuration-notification-interval>

 <netbios-snooping/>
 <interface>...</interface>
 </lldp>
</protocols>
</configuration>
```

**Description** Link Layer Detection Protocol

**Contents**

- <disable>—Disable LLDP
- <traceoptions>—Trace options for LLDP
- <management-address>—LLDP management address
- <advertisement-interval>—Transmit interval for LLDP messages
- <transmit-delay>—Transmit delay time interval for LLDP messages
- <hold-multiplier>—Hold timer interval for LLDP messages

<ptopo-configuration-trap-interval>—Interval for physical topology configuration change trap

<ptopo-configuration-maximum-hold-time>—Hold time for physical topology connection entries

<lldp-configuration-notification-interval>—Time interval for LLDP notification

<netbios-snooping>—Enable NetBIOS snooping

<interface>—Interface configuration

---

## <lldp-med> configuration/protocols

---

### Usage

```
<configuration>
 <protocols>
 <lldp-med>
 <disable/>
 <fast-start>fast-start</fast-start>
 <interface>...</interface>
 </lldp-med>
 </protocols>
</configuration>
```

**Description** LLDP Media Endpoint Discovery

**Contents** <disable>—Disable LLDP

<fast-start>—Discovery count for MED

<interface>—Interface configuration

---

## <local-identity> configuration/security/ike/gateway

---

### Usage

```
<configuration>
 <security>
 <ike>
 <gateway>
 <local-identity>
 <inet>...</inet>
 <inet6>...</inet6>
 <hostname>...</hostname>
 <user-at-hostname>...</user-at-hostname>
 <distinguished-name/>
 </local-identity>
 </gateway>
 </ike>
 </security>
```

```
</configuration>
```

**Description** Set the local IKE identity

**Contents**

- <inet>—Use an IPv4 address
- <inet6>—Use an IPv6 address
- <hostname>—Use a fully-qualified domain name
- <user-at-hostname>—Use an e-mail address
- <distinguished-name>—Use a distinguished name specified in local certificate

### <local-identity> configuration/security/group-vpn/member/ike/gateway

**Usage**

```
<configuration>
<security>
 <group-vpn>
 <member>
 <ike>
 <gateway>
 <local-identity>
 <inet>...</inet>
 <hostname>...</hostname>
 <user-at-hostname>...</user-at-hostname>
 <distinguished-name/>
 </local-identity>
 </gateway>
 </ike>
 </member>
 </group-vpn>
</security>
</configuration>
```

**Description** Set the local IKE identity

**Contents**

- <inet>—Use an IPv4 address
- <hostname>—Use a fully-qualified domain name
- <user-at-hostname>—Use an e-mail address
- <distinguished-name>—Use a distinguished name specified in local certificate

### <local-identity> configuration/security/group-vpn/server/ike/gateway

**Usage**

```
<configuration>
```

```
<security>
 <group-vpn>
 <server>
 <ike>
 <gateway>
 <local-identity>
 <inet>...</inet>
 <hostname>...</hostname>
 <user-at-hostname>...</user-at-hostname>
 <distinguished-name/>
 </local-identity>
 </gateway>
 </ike>
 </server>
 </group-vpn>
</security>
</configuration>
```

**Description** Set the local IKE identity

**Contents** <inet>—Use an IPv4 address

<hostname>—Use a fully-qualified domain name

<user-at-hostname>—Use an e-mail address

<distinguished-name>—Use a distinguished name specified in local certificate

---

## <location> configuration/protocols/lddp-med/interface

---

### Usage

```
<configuration>
 <protocols>
 <lddp-med>
 <interface>
 <location>
 <civic-based>...</civic-based>
 <elin>elin</elin>
 <co-ordinate>...</co-ordinate>
 </location>
 </interface>
 </lddp-med>
 </protocols>
</configuration>
```

### Description

**Contents** <civic-based>—Postal address

<elin>—Emergency line identification (ELIN) string

<co-ordinate>—Address based on longitude and latitude coordinates

## <log> configuration/security/gprs/gtp/profile

### Usage

```
<configuration>
 <security>
 <gprs>
 <gtp>
 <profile>
 <log>
 <forwarded>forwarded</forwarded>
 <state-invalid>state-invalid</state-invalid>
 <prohibited>prohibited</prohibited>
 <rate-limited>...</rate-limited>
 </log>
 </profile>
 </gtp>
 </gprs>
 </security>
</configuration>
```

**Description** GPRS tunneling protocol logs

**Contents** <forwarded>—Log passed good packets

- basic - Basic logs
- detail - Detailed logs
- basic - Basic logs
- detail - Detailed logs
- basic - Basic logs
- detail - Detailed logs

<state-invalid>—Dropped by state-inspection or sanity failure

- basic - Basic logs
- detail - Detailed logs
- basic - Basic logs
- detail - Detailed logs

<prohibited>—Dropped for type/length/version filtering

- basic - Basic logs
- detail - Detailed logs

<rate-limited>—Dropped for rate-limit

## <log> configuration/security/gprs/sctp

---

### Usage

```
<configuration>
 <security>
 <gprs>
 <sctp>
 <log>
 <configuration/>
 <exceeding-rate-limit/>
 <dropped-packet/>
 <decoding-error/>
 </log>
 </sctp>
 </gprs>
 </security>
</configuration>
```

**Description** GPRS stream control transmission protocol logs

**Contents** <configuration>—Log CLI configuration

<exceeding-rate-limit>—Log exceeding rate limits

<dropped-packet>—Log dropped packets and out of resource errors

<decoding-error>—Log decoding errors

## <log> configuration/security

---

### Usage

```
<configuration>
 <security>
 <log>
 <disable/>
 <utc-timestamp/>
 <mode>mode</mode>
 <event-rate>event-rate</event-rate>
 <format>format</format>
 <source-address>source-address</source-address>
 <stream>...</stream>
 <file>...</file>
 <traceoptions>...</traceoptions>
 </log>
 </security>
</configuration>
```

**Description** Configure security log

**Contents** <disable>—Disable security logging for the device

- stream - Process security logs directly in the forwarding plane
- event - Process security logs in the control plane
- syslog - Traditional syslog
- sd-syslog - Structured syslog
- binary - Binary log

<utc-timestamp>—Use UTC time for security log timestamps

- stream - Process security logs directly in the forwarding plane
- event - Process security logs in the control plane
- syslog - Traditional syslog
- sd-syslog - Structured syslog
- binary - Binary log

<mode>—Controls how security logs are processed and exported

- stream - Process security logs directly in the forwarding plane
- event - Process security logs in the control plane
- syslog - Traditional syslog
- sd-syslog - Structured syslog
- binary - Binary log

<event-rate>—Control plane event rate limit of logs per

- syslog - Traditional syslog
- sd-syslog - Structured syslog
- binary - Binary log

<format>—Set security log format for the device

- syslog - Traditional syslog
- sd-syslog - Structured syslog
- binary - Binary log

<source-address>—Source ip address used when exporting security logs

<stream>—Set security log stream settings (maximum 3 streams)

<file>—Security log file options for logs in binary format

<traceoptions>—Security log daemon trace options

## <logging-options> configuration/wlan/access-point

---

**Usage**

```
<configuration>
<wlan>
 <access-point>
 <logging-options>
 <enable-persistent/>
 <enable-remote/>
 <log-server-address>log-server-address</log-server-address>
 <log-server-port>log-server-port</log-server-port>
 <log-level>log-level</log-level>
 </logging-options>
 </access-point>
</wlan>
</configuration>
```

**Description** Configure access point logging options

**Contents** <enable-persistent>—Turn on persistent logging on the access point

<enable-remote>—Turn on remote logging on the access point

<log-server-address>—Remote log server IP address

<log-server-port>—Remote log server port

<log-level>—Event severity, 0 - Errors, 7 - Info

## <login> configuration/smtp/primary-server

---

**Usage**

```
<configuration>
<smtp>
 <primary-server>
 <login>
 <sender-email>sender-email</sender-email> <!-- identifier -->
 <password>password</password>
 </login>
 </primary-server>
</smtp>
</configuration>
```

**Description** Configure a mail sender account to the server

**Contents** <sender-email>—Default sender email address in user@foo.com format

<password>—Default sender password for user authentication

## <login> configuration/smtp/secondary-server

---

**Usage**

```
<configuration>
 <smtp>
 <secondary-server>
 <login>
 <sender-email>sender-email</sender-email> <!-- identifier -->
 <password>password</password>
 </login>
 </secondary-server>
 </smtp>
</configuration>
```

**Description** Configure a mail sender account to the server

**Contents** <sender-email>—Default sender email address in user@foo.com format  
<password>—Default sender password for user authentication

## CHAPTER 39

# Tag Elements Beginning with M

This chapter lists the configuration tag elements that have names beginning with the letter *m*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<m3ua-service>` configuration/security/gprs/sctp/profile/drop

---

#### Usage

```
<configuration>
 <security>
 <gprs>
 <sctp>
 <profile>
 <drop>
 <m3ua-service>
 <sccp/>
 <tup/>
 <isup/>
 </m3ua-service>
 </drop>
 </profile>
 </sctp>
 </gprs>
 </security>
</configuration>
```

**Description** MTP level 3 (MTP3) user adaptation layer service

**Contents**    <sccp>—Signaling connection control part

                 <tup>—Telephone user part

                 <isup>—ISDN user part

---

## <mac> configuration/ethernet-switching-options/static/vlan

---

### Usage

```
<configuration>
<ethernet-switching-options>
 <static>
 <vlan>
 <mac>
 <mac_address>mac_address</mac_address> <!-- identifier -->
 <next-hop>next-hop</next-hop> <!-- mandatory -->
 </mac>
 </vlan>
 </static>
</ethernet-switching-options>
</configuration>
```

**Description**    Static MAC

**Contents**    <mac\_address>—IEEE 802.2 MAC address

                 <next-hop>—Logical next-hop interface

---

## <mac-address> configuration/wlan/access-point/access-point-options/station-mac-filter/allow-list

---

### Usage

```
<configuration>
<wlan>
 <access-point>
 <access-point-options>
 <station-mac-filter>
 <allow-list>
 <mac-address>
 <value>value</value>
 </mac-address>
 </allow-list>
 </station-mac-filter>
 </access-point-options>
 </access-point>
</wlan>
</configuration>
```

**Description**    List of allowed MAC addresses

**Contents** <value>—List of allowed MAC addresses

## <mac-address> configuration/wlan/access-point/access-point-options/station-mac-filter/deny-list

### Usage

```
<configuration>
<wlan>
<access-point>
<access-point-options>
<station-mac-filter>
<deny-list>
<mac-address>
<value>value</value>
</mac-address>
</deny-list>
</station-mac-filter>
</access-point-options>
</access-point>
</wlan>
</configuration>
```

**Description** List of denied MAC addresses

**Contents** <value>—List of denied MAC addresses

## <mac-limit> configuration/ethernet-switching-options/secure-access-port/interface

### Usage

```
<configuration>
<ethernet-switching-options>
<secure-access-port>
<interface>
<mac-limit>
<limit>limit</limit> <!-- mandatory -->
<action>action</action>
</mac-limit>
</interface>
</secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description** Number of MAC addresses allowed on this interface

**Contents** <limit>—Number of MAC addresses allowed on this interface

- none - Take no action
- drop - Drop the packet and log it

- log - Log a message
- shutdown - Shut down the interface

<action>—Action to take if limit is exceeded

- none - Take no action
- drop - Drop the packet and log it
- log - Log a message
- shutdown - Shut down the interface

---

## <mac-limit> configuration/vlans/vlan

### Usage

```
<configuration>
<vlans>
 <vlan>
 <mac-limit>
 <limit>limit</limit> <!-- mandatory -->
 <action>action</action>
 </mac-limit>
 </vlan>
</vlans>
</configuration>
```

**Description** Number of MAC addresses allowed on this VLAN

**Contents** <limit>—Number of MAC addresses allowed on this VLAN

- log - Log a message

<action>—Action to take if limit is exceeded

- log - Log a message

---

## <mac-move-limit> configuration/ethernet-switching-options/secure-access-port/vlan

### Usage

```
<configuration>
<ethernet-switching-options>
 <secure-access-port>
 <vlan>
 <mac-move-limit>
 <limit>limit</limit> <!-- mandatory -->
 <action>action</action>
 </mac-move-limit>
 </vlan>
 </secure-access-port>
</ethernet-switching-options>
```

</configuration>

**Description** Number of MAC movements allowed on this VLAN

**Contents** <limit>—Number of MAC movements allowed on this VLAN

- none - Take no action
- drop - Drop the packet and log it
- log - Log a message
- shutdown - Shut down the interface
- drop-no-log - Drop but no log

<action>—Action to be taken in case the MAC movement limit is exceeded

- none - Take no action
- drop - Drop the packet and log it
- log - Log a message
- shutdown - Shut down the interface
- drop-no-log - Drop but no log

---

## <mac-notification> configuration/ethernet-switching-options

### Usage

```
<configuration>
<ethernet-switching-options>
 <mac-notification>
 <notification-interval>notification-interval</notification-interval>
 </mac-notification>
</ethernet-switching-options>
</configuration>
```

**Description** MAC notification options

**Contents** <notification-interval>—Interval for sending MAC notifications

---

## <mac-radius> configuration/protocols/dot1x/authenticator/interface

### Usage

```
<configuration>
<protocols>
 <dot1x>
 <authenticator>
 <interface>
 <mac-radius>
```

```
<restrict/>
<flap-on-disconnect/>
</mac-radius>
</interface>
</authenticator>
</dot1x>
</protocols>
</configuration>
```

**Description** Enable MAC-RADIUS

**Contents** <restrict>—Bypass dot1x authentication, use MAC RADIUS only

<flap-on-disconnect>—Reset an interface on receiving a disconnect request

---

### <mac-table-aging-time> configuration/ethernet-switching-options

---

#### Usage

```
<configuration>
<ethernet-switching-options>
 <mac-table-aging-time>
 <time>time</time>
 <unlimited/>
 </mac-table-aging-time>
</ethernet-switching-options>
</configuration>
```

**Description** MAC aging time configuration

**Contents** <time>—Time in seconds

<unlimited>—Disable MAC-aging

---

### <mac-table-aging-time> configuration/vlans/vlan

---

#### Usage

```
<configuration>
<vlans>
 <vlan>
 <mac-table-aging-time>
 <time>time</time>
 <unlimited/>
 </mac-table-aging-time>
 </vlan>
</vlans>
</configuration>
```

**Description** MAC aging time configuration

**Contents**    <time>—Time in seconds

                 <unlimited>—Disable MAC-aging

## <maintenance-association> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain

### Usage

```
<configuration>
<protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <maintenance-domain>
 <maintenance-association>
 <ma-name>ma-name</ma-name> <!-- identifier -->
 <short-name-format>short-name-format</short-name-format>
 <continuity-check>...</continuity-check>
 <mep>...</mep>
 </maintenance-association>
 </maintenance-domain>
 </connectivity-fault-management>
 </ethernet>
 </oam>
</protocols>
</configuration>
```

**Description**    Maintenance association configuration

**Contents**    <ma-name>—Name of maintenance association in IEEE compliant format

- 2octet - An integer in the range 0..65535
- rfc-2685-vpn-id - VPN identifier that complies with RFC 2685
- vlan - Primary VLAN identifier
- character-string - Character string
- icc - ITU Carrier Code

<short-name-format>—Format of Maintenance Association Name

- 2octet - An integer in the range 0..65535
- rfc-2685-vpn-id - VPN identifier that complies with RFC 2685
- vlan - Primary VLAN identifier
- character-string - Character string
- icc - ITU Carrier Code

<continuity-check>—Continuity check configuration

<mep>—Maintenance association endpoint configuration

## <maintenance-domain> configuration/protocols/oam/ethernet/connectivity-fault-management

### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
 <maintenance-domain>
 <default-0/>
 <default-1/>
 <default-2/>
 <default-3/>
 <default-4/>
 <default-5/>
 <default-6/>
 <default-7/>
 <md-name/>
 <vlan-name>...</vlan-name>
 <level>level</level>
 <name-format>name-format</name-format>
 <mip-half-function>mip-half-function</mip-half-function>
 <maintenance-association>...</maintenance-association>
 </maintenance-domain>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Maintenance domain configuration

**Contents** <default-0>—Default domain at level 0

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-1>—Default domain at level 1

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-2>—Default domain at level 2

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-3>—Default domain at level 3

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-4>—Default domain at level 4

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-5>—Default domain at level 5

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-6>—Default domain at level 6

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<default-7>—Default domain at level 7

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<md-name>—Name of maintenance domain in IEEE compliant format

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<vlan-name>—Name of VLAN for the default maintenance domain

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<level>—Level value for maintenance domain

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<name-format>—Format of maintenance domain name

- none - No format specified
- dns - Character string similar to Domain Name System name
- mac+2oct - MAC address with 2 octet integer (xx:xx:xx:xx:xx:xx.Y format)
- character-string - Character string
- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<mip-half-function>—Half function to be implemented by MIP

- none - No MHFs should be created
- default - Create MHF as per IEEE 802.1ag specifications for defMHFDefault
- explicit - Create MHF as per IEEE 802.1ag specifications for defMHFExplicit

<maintenance-association>—Maintenance association configuration

---

## <management> configuration/security/zones/functional-zone

---

### Usage

<configuration>

```
<security>
 <zones>
 <functional-zone>
 <management>
 <interfaces>...</interfaces>
 <screen>screen</screen>
 <host-inbound-traffic>...</host-inbound-traffic>
 <description>description</description>
 </management>
 </functional-zone>
 </zones>
</security>
</configuration>
```

**Description** Host for out of band management interfaces

**Contents** <interfaces>—Interfaces that are part of this zone

<screen>—Name of ids option object applied to the zone

<host-inbound-traffic>—Allowed system services & protocols

<description>—Text description of zone

---

## <manual> configuration/security/ipsec/internal/security-association

---

### Usage

```
<configuration>
 <security>
 <ipsec>
 <internal>
 <security-association>
 <manual>
 <encryption>...</encryption>
 </manual>
 </security-association>
 </internal>
 </ipsec>
 </security>
</configuration>
```

**Description** Define a manual security association

**Contents** <encryption>—Define encryption parameters

---

## <manual> configuration/security/ipsec/vpn

---

### Usage

```
<configuration>
 <security>
```

```
<ipsec>
 <vpn>
 <manual>
 <gateway>gateway</gateway>
 <external-interface>external-interface</external-interface> <!-- mandatory -->

 <protocol>protocol</protocol> <!-- mandatory -->
 <spi>spi</spi> <!-- mandatory -->
 <authentication>...</authentication>
 <encryption>...</encryption>
 </manual>
 </vpn>
</ipsec>
</security>
</configuration>
```

**Description** Define a manual security association

**Contents** <gateway>—Define the IPSec peer

- ah - Authentication header
- esp - Encapsulated Security Payload header

<external-interface>—External interface for the security association

- ah - Authentication header
- esp - Encapsulated Security Payload header

<protocol>—Define an IPSec protocol for the security association

- ah - Authentication header
- esp - Encapsulated Security Payload header

<spi>—Define security parameter index

<authentication>—Define authentication parameters

<encryption>—Define encryption parameters

---

## <mapping> configuration/vlans/vlan/interface

### Usage

```
<configuration>
 <vlans>
 <vlan>
 <interface>
 <mapping>
 <mapping-data>...</mapping-data>
 <policy/>
 </mapping>
 </interface>
```

```
</vlan>
</vlans>
</configuration>
```

**Description** Mapping rules for the interface

**Contents** <mapping-data>—  
<policy>—Mapping rule for policy based VLAN assignment

---

### <mapping-data> configuration/vlans/vlan/interface/mapping

---

#### Usage

```
<configuration>
<vlans>
<vlan>
<interface>
<mapping>
<mapping-data>
<native/>
<tag/>
<push/>
<swap/>
</mapping-data>
</mapping>
</interface>
</vlan>
</vlans>
</configuration>
```

#### Description

**Contents** <native>—Mapping rule for untagged and priority tagged packet  
  
<tag>—Mapping rule for a VLAN tag  
  
<push>—Push additional tag on packet  
  
<swap>—Translate VLAN tag for the packet

---

### <match> configuration/security/application-firewall/rule-sets/rule

---

#### Usage

```
<configuration>
<security>
<application-firewall>
<rule-sets>
<rule>
<match>
<dynamic-application>...</dynamic-application>
<dynamic-application-group>...</dynamic-application-group>
```

```

 </match>
 </rule>
</rule-sets>
</application-firewall>
</security>
</configuration>

```

**Description** Specify security rule match-criteria

**Contents** <dynamic-application>—Dynamic application  
 <dynamic-application-group>—Dynamic application group

## <match> configuration/security/nat/source/rule-set/rule

### Usage

```

<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<match>
<source-address>...</source-address>
<source-address-name>...</source-address-name>
<destination-address>...</destination-address>
<destination-address-name>...</destination-address-name>
<destination-port>...</destination-port>
<protocol>...</protocol>
</match>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>

```

**Description** Specify Source NAT rule match criteria

**Contents** <source-address>—Source address  
 <source-address-name>—Address/address-set from address book  
 <destination-address>—Destination address  
 <destination-address-name>—Address/address-set from address book  
 <destination-port>—Destination port  
 <protocol>—IP Protocol

## **<match> configuration/security/nat/destination/rule-set/rule**

---

**Usage**

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
 <match>
 <source-address>...</source-address>
 <source-address-name>...</source-address-name>
 <destination-address>...</destination-address>
 <destination-address-name>...</destination-address-name>
 <destination-port>...</destination-port>
 <protocol>...</protocol>
 </match>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** Specify Destination NAT rule match criteria

**Contents** <source-address>—Source address

<source-address-name>—Address/address-set from address book

<destination-address>—Destination address

<destination-address-name>—Address from address book

<destination-port>—Destination port

<protocol>—IP Protocol

## **<match> configuration/security/nat/static/rule-set/rule**

---

**Usage**

```
<configuration>
<security>
<nat>
<static>
<rule-set>
<rule>
 <match>
 <destination-address>...</destination-address>
 <destination-address-name>...</destination-address-name>
 </match>
</rule>
```

```
</rule-set>
</static>
</nat>
</security>
</configuration>
```

**Description** Specify Static NAT rule match criteria

**Contents** <destination-address>—Destination address  
<destination-address-name>—Address from address book

---

### <match> configuration/services/ip-monitoring/policy

---

#### Usage

```
<configuration>
<services>
<ip-monitoring>
<policy>
<match>
 <rpm-probe>...</rpm-probe>
</match>
</policy>
</ip-monitoring>
</services>
</configuration>
```

**Description** Matching probing condition

**Contents** <rpm-probe>—RPM probe name

---

### <match-policy> configuration/security/group-vpn/server/group/ipsec-sa

---

#### Usage

```
<configuration>
<security>
<group-vpn>
<server>
<group>
<ipsec-sa>
<match-policy>
 <name>name</name> <!-- identifier -->
 <source>source</source> <!-- mandatory -->
 <destination>destination</destination> <!-- mandatory -->
 <source-port>source-port</source-port> <!-- mandatory -->
 <destination-port>destination-port</destination-port> <!-- mandatory -->
 <protocol>protocol</protocol> <!-- mandatory -->
</match-policy>
</ipsec-sa>
</group>
```

```
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Configure a Group VPN group SA

**Contents**

- <name>—Name of the policy
- <source>—Specify the source IP address to be matched (0.0.0.0/0 for any)
- <destination>—Specify the destination IP address to be matched (0.0.0.0/0 for any)
- <source-port>—Specify the source port to be matched (0 for any)
- <destination-port>—Specify the destination port to be matched (0 for any)
- <protocol>—Specify the protocol number to be matched (0 for any)

---

### <maximize-cp-sessions> configuration/security/forwarding-process/application-services

---

#### Usage

```
<configuration>
<security>
 <forwarding-process>
 <application-services>
 <maximize-cp-sessions>
 </maximize-cp-sessions>
 </application-services>
 </forwarding-process>
</security>
</configuration>
```

**Description** Maximize CP session capacity

#### Contents

---

### <maximize-idp-sessions> configuration/security/forwarding-process/application-services

---

#### Usage

```
<configuration>
<security>
 <forwarding-process>
 <application-services>
 <maximize-idp-sessions>
 <weight>...</weight>
 <inline-tap/>
 </maximize-idp-sessions>
 </application-services>
```

```

 </forwarding-process>
 </security>
</configuration>

```

**Description** Run security services in dedicated processes to maximize IDP session capacity

**Contents** <weight>—Adjust the weighting of the resources available for idp  
 <inline-tap>—Configure IDP in inline tap mode

### [<maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/voice-queue](#)

#### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <voice-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
 </voice-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
</configuration>

```

**Description** Maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

### [<maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/video-queue](#)

#### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <video-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
 </video-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
</configuration>

```

```
</video-queue>
</access-point-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

### [<maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/best-effort-queue](#)

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<access-point-queues>
<best-effort-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
</best-effort-queue>
</access-point-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

### [<maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/background-queue](#)

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<access-point-queues>
<background-queue>
 <maximum-contention-window>
```

```
 <window-size>window-size</window-size>
 </maximum-contention-window>
 </background-queue>
 </access-point-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/station-queues/voice-queue

---

#### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <voice-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
 </voice-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Specify maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/station-queues/video-queue

---

#### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
```

```
<video-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
</video-queue>
</station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Specify maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

### [\*\*<maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/station-queues/best-effort-queue\*\*](#)

---

#### **Usage**

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <best-effort-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
 </best-effort-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Specify maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

### [\*\*<maximum-contention-window> configuration/wlan/access-point/radio/quality-of-service/station-queues/background-queue\*\*](#)

---

#### **Usage**

```
<configuration>
<wlan>
 <access-point>
 <radio>
```

```
<quality-of-service>
 <station-queues>
 <background-queue>
 <maximum-contention-window>
 <window-size>window-size</window-size>
 </maximum-contention-window>
 </background-queue>
 </station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Specify maximum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <member> configuration/security/group-vpn

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ike>...</ike>
 <ipsec>...</ipsec>
 </member>
 </group-vpn>
 </security>
</configuration>
```

**Description** Group VPN member configuration

**Contents** <ike>—Group VPN IKE configuration

<ipsec>—Group VPN IPsec configuration

---

### <mep> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain/maintenance-association

---

#### Usage

```
<configuration>
 <protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <maintenance-domain>
 <maintenance-association>
 <mep>
```

```
<mep-id>mep-id</mep-id> <!-- identifier -->
<interface>...</interface> <!-- mandatory -->
<direction>direction</direction>
<priority>priority</priority>
<auto-discovery/>
<remote-mep>...</remote-mep>
</mep>
</maintenance-association>
</maintenance-domain>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Maintenance association endpoint configuration

**Contents** <mep-id>—Identifier for maintenance association endpoint

- down -

<interface>—Name of interface

- down -

<direction>—Direction of maintenance endpoint

- down -

<priority>—802.1p priority of continuity-check and link-trace packet

<auto-discovery>—Accept continuity-check messages from all remote MEPS

<remote-mep>—Remote maintenance association endpoint configuration

---

## <message-flood> configuration/security/alg/h323/application-screen

---

### Usage

```
<configuration>
 <security>
 <alg>
 <h323>
 <application-screen>
 <message-flood>
 <gatekeeper>...</gatekeeper>
 </message-flood>
 </application-screen>
 </h323>
 </alg>
 </security>
</configuration>
```

**Description** Configure Message flood ALG options

**Contents** <gatekeeper>—Set options for gatekeeper messages

---

### <message-flood> configuration/security/alg/mgcp/application-screen

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <mgcp>
 <application-screen>
 <message-flood>
 <threshold>threshold</threshold>
 </message-flood>
 </application-screen>
 </mgcp>
 </alg>
 </security>
</configuration>
```

**Description** Set message flood ALG options

**Contents** <threshold>—Message flood threshold

---

### <mgcp> configuration/security/alg

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <mgcp>
 <disable/>
 <inactive-media-timeout>inactive-media-timeout</inactive-media-timeout>
 <transaction-timeout>transaction-timeout</transaction-timeout>
 <maximum-call-duration>maximum-call-duration</maximum-call-duration>
 <application-screen>...</application-screen>
 <dscp-rewrite>...</dscp-rewrite>
 <traceoptions>...</traceoptions>
 </mgcp>
 </alg>
 </security>
</configuration>
```

**Description** Configure MGCP ALG

**Contents** <disable>—Disable MGCP ALG

<inactive-media-timeout>—Set inactive media timeout

<transaction-timeout>—Set transaction timeout

<maximum-call-duration>—Set maximum call duration

<application-screen>—Configure application screens

<dscp-rewrite>—DSCP code rewrite

<traceoptions>—MGCP ALG trace options

---

## <mime-pattern> configuration/security/utm/custom-objects

---

### Usage

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <mime-pattern>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <value>...</value>
 </mime-pattern>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure mime-list object

**Contents** <name>—Configure name of mime-list object

<value>—Configure MIME value

---

## <mime-whitelist> configuration/security/utm/feature-profile/anti-virus

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <mime-whitelist>
 <list>list</list>
 <exception>exception</exception>
 </mime-whitelist>
 </anti-virus>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Anti-virus MIME whitelist

**Contents** <list>—MIME list  
<exception>—Exception settings for MIME white list

---

### <minimum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/voice-queue

---

#### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <voice-queue>
 <minimum-contention-window>
 <window-size>window-size</window-size>
 </minimum-contention-window>
 </voice-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <minimum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/video-queue

---

#### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <video-queue>
 <minimum-contention-window>
 <window-size>window-size</window-size>
 </minimum-contention-window>
 </video-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
```

```
</wlan>
</configuration>
```

**Description** Minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <minimum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/best-effort-queue

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<access-point-queues>
<best-effort-queue>
<minimum-contention-window>
<window-size>window-size</window-size>
</minimum-contention-window>
</best-effort-queue>
</access-point-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <minimum-contention-window> configuration/wlan/access-point/radio/quality-of-service/access-point-queues/background-queue

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<access-point-queues>
<background-queue>
<minimum-contention-window>
<window-size>window-size</window-size>
</minimum-contention-window>
</background-queue>
</access-point-queues>
</quality-of-service>
```

```

 </radio>
 </access-point>
</wlan>
</configuration>

```

**Description** Minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

**<minimum-contention-window>** configuration/wlan/access-point/radio/quality-of-service/station-queues/voice-queue

---

**Usage**

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <voice-queue>
 <minimum-contention-window>
 <window-size>window-size</window-size>
 </minimum-contention-window>
 </voice-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
</configuration>

```

**Description** Specify minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

**<minimum-contention-window>** configuration/wlan/access-point/radio/quality-of-service/station-queues/video-queue

---

**Usage**

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <video-queue>
 <minimum-contention-window>
 <window-size>window-size</window-size>
 </minimum-contention-window>
 </video-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
</configuration>

```

```
</station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Specify minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <minimum-contention-window> configuration/wlan/access-point/radio/quality-of-service/station-queues/best-effort-queue

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<station-queues>
<best-effort-queue>
<minimum-contention-window>
<window-size>window-size</window-size>
</minimum-contention-window>
</best-effort-queue>
</station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Specify minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

### <minimum-contention-window> configuration/wlan/access-point/radio/quality-of-service/station-queues/background-queue

---

#### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<station-queues>
<background-queue>
<minimum-contention-window>
<window-size>window-size</window-size>
```

```
</minimum-contention-window>
</background-queue>
</station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Specify minimum contention window size

**Contents** <window-size>—Values are 1,3,7,15,31,63,127,255,511 and 1023

---

## <mld-snooping> configuration/protocols

---

### Usage

```
<configuration>
<protocols>
 <mld-snooping>
 <traceoptions>...</traceoptions>
 <vlan>...</vlan>
 </mld-snooping>
</protocols>
</configuration>
```

**Description** MLD Snooping configuration

**Contents** <traceoptions>—Trace options for MLD Snooping  
<vlan>—VLAN options

---

## <modem-options> configuration/interfaces/interface

---

### Usage

```
<configuration>
<interfaces>
 <interface>
 <modem-options>
 <init-command-string>init-command-string</init-command-string>
 <dialin>dialin</dialin>
 </modem-options>
 </interface>
</interfaces>
</configuration>
```

**Description** MODEM interface-specific options

**Contents** <init-command-string>—AT command string to initialize modem

- console - Management console access
- routable - Routable access

<dialin>—

- console - Management console access
- routable - Routable access

---

## <module> configuration/security/datapath-debug/action-profile

---

### Usage

```
<configuration>
 <security>
 <datapath-debug>
 <action-profile>
 <module>
 <flow/>
 <flag>...</flag>
 </module>
 </action-profile>
 </datapath-debug>
 </security>
</configuration>
```

### Description

**Contents** <flow>—Flow module

<flag>—Events and other information to include in trace output

---

## <monday> configuration/schedulers/scheduler

---

### Usage

```
<configuration>
 <schedulers>
 <scheduler>
 <monday>
 <start-time>...</start-time>
 <exclude/>
 <all-day/>
 </monday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Every Monday

**Contents** <start-time>—Time range for day

<exclude>—Exclude day from week

<all-day>—Include complete day

---

## <mpls> configuration/security/forwarding-options/family

---

### Usage

```
<configuration>
 <security>
 <forwarding-options>
 <family>
 <mpls>
 <mode>mode</mode>
 </mpls>
 </family>
 </forwarding-options>
 </security>
</configuration>
```

**Description** Family MPLS

**Contents** <mode>—Forwarding mode

- packet-based - Enable packet-based forwarding

---

## <mpls> configuration/interfaces/interface/unit/family

---

### Usage

```
<configuration>
 <interfaces>
 <interface>
 <unit>
 <family>
 <mpls>
 <filter>...</filter>
 </mpls>
 </family>
 </unit>
 </interface>
 </interfaces>
</configuration>
```

**Description**

**Contents** <filter>—

## <msrpc> configuration/security/alg

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <msrpc>
 <disable/>
 <traceoptions>...</traceoptions>
 </msrpc>
 </alg>
 </security>
</configuration>
```

**Description** Configure MSRPC ALG

**Contents** <disable>—Disable MSRPC ALG

<traceoptions>—MSRPC ALG trace options

## <msti> configuration/protocols/mstp

---

**Usage**

```
<configuration>
 <protocols>
 <mstp>
 <msti>
 <id>id</id> <!-- identifier -->
 <bridge-priority>bridge-priority</bridge-priority>
 <vlan>...</vlan> <!-- mandatory -->
 <interface>...</interface>
 </msti>
 </mstp>
 </protocols>
</configuration>
```

**Description** Per-MSTI options

**Contents** <id>—

<bridge-priority>—Priority of the bridge (in increments of 4k - 0,4k,8k,..60k)

<vlan>—VLAN ID or VLAN ID range [1..4094]

<interface>—

## <mstp> configuration/protocols

### Usage

```
<configuration>
<protocols>
 <mstp>
 <disable/>
 <configuration-name>configuration-name</configuration-name>
 <revision-level>revision-level</revision-level>
 <max-hops>max-hops</max-hops>
 <max-age>max-age</max-age>
 <hello-time>hello-time</hello-time>
 <forward-delay>forward-delay</forward-delay>
 <traceoptions>...</traceoptions>
 <bridge-priority>bridge-priority</bridge-priority>
 <interface>...</interface>
 <msti>...</msti>
 <bpdu-block-on-edge/>
 </mstp>
</protocols>
</configuration>
```

**Description** Multiple Spanning Tree Protocol options

**Contents** <disable>—Disable MSTP

<configuration-name>—Configuration name (part of MST configuration identifier)

<revision-level>—Revision level (part of MST configuration identifier)

<max-hops>—Maximum number of hops

<max-age>—Maximum age of received protocol bpdu

<hello-time>—Time interval between configuration BPDUs

<forward-delay>—Time spent in listening or learning state

<traceoptions>—Tracing options for debugging protocol operation

<bridge-priority>—Priority of the bridge (in increments of 4k - 0,4k,8k,..60k)

<interface>—

<msti>—Per-MSTI options

<bpdu-block-on-edge>—Block BPDU on all interfaces configured as edge (BPDU Protect)

## **<multicast-outgoing-interface> configuration/security/group-vpn/server/group/server-member-communication**

---

**Usage**

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <group>
 <server-member-communication>
 <multicast-outgoing-interface>
 <multicast-ifname>multicast-ifname</multicast-ifname> <!-- identifier -->
 </multicast-outgoing-interface>
 </server-member-communication>
 </group>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Name of the multicast outgoing interface

**Contents** <multicast-ifname>—Name of the interface

## **<mvrp> configuration/protocols**

---

**Usage**

```
<configuration>
 <protocols>
 <mvrp>
 <disable/>
 <no-dynamic-vlan/>
 <add-attribute-length-in-pdu/>
 <interface>...</interface>
 <traceoptions>...</traceoptions>
 </mvrp>
 </protocols>
</configuration>
```

**Description** MVRP configuration

**Contents** <disable>—Disable MVRP

<no-dynamic-vlan>—Disable dynamic VLAN creation

<add-attribute-length-in-pdu>—Add attribute length while sending pdu

<interface>—Configure interface options

<traceoptions>—Tracing options for MVRP protocol

## CHAPTER 40

# Tag Elements Beginning with N

This chapter lists the configuration tag elements that have names beginning with the letter *n*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<name-server>` configuration/wlan/access-point/external/system/ports/ethernet

---

#### Usage

```
<configuration>
 <wlan>
 <access-point>
 <external>
 <system>
 <ports>
 <ethernet>
 <name-server>
 <value>value</value> <!-- mandatory -->
 </name-server>
 </ethernet>
 </ports>
 </system>
 </external>
 </access-point>
 </wlan>
</configuration>
```

**Description** Domain name server IP address

**Contents**    <value>—Domain name server IP address

## <nat> configuration/security

---

### Usage

```
<configuration>
<security>
 <nat>
 <traceoptions>...</traceoptions>
 <source>...</source>
 <destination>...</destination>
 <static>...</static>
 <proxy-arp>...</proxy-arp>
 <proxy-ndp>...</proxy-ndp>
 </nat>
</security>
</configuration>
```

**Description**    Configure Network Address Translation

**Contents**    <traceoptions>—NAT trace options

                 <source>—Configure Source NAT

                 <destination>—Configure Destination NAT

                 <static>—Configure Static NAT

                 <proxy-arp>—Configure Proxy ARP

                 <proxy-ndp>—Configure Proxy NDP

## <next-hop> configuration/services/ip-monitoring/policy/then/preferred-route/routing-instances/route

---

### Usage

```
<configuration>
<services>
 <ip-monitoring>
 <policy>
 <then>
 <preferred-route>
 <routing-instances>
 <route>
 <next-hop>
 <value>value</value> <!-- mandatory -->
 </next-hop>
 </route>
 </routing-instances>
 </preferred-route>
 </then>
 </policy>
```

```
</ip-monitoring>
</services>
</configuration>
```

**Description** Next hop to destination of route-action

**Contents** <value>—Next hop to destination of route-action

---

### <next-hop> configuration/services/ip-monitoring/policy/then/preferred-route/route

#### Usage

```
<configuration>
<services>
<ip-monitoring>
<policy>
<then>
<preferred-route>
<route>
<next-hop>
<value>value</value> <!-- mandatory -->
</next-hop>
</route>
</preferred-route>
</then>
</policy>
</ip-monitoring>
</services>
</configuration>
```

**Description** Next hop to destination of route-action

**Contents** <value>—Next hop to destination of route-action

---

### <no-packet-flooding> configuration/security/flow/bridge

#### Usage

```
<configuration>
<security>
<flow>
<bridge>
<no-packet-flooding>
<no-trace-route/>
</no-packet-flooding>
</bridge>
</flow>
</security>
</configuration>
```

**Description** Stop IP flooding, send ARP/ICMP to trigger MAC learning

**Contents**    <no-trace-route>—Don't send ICMP to trigger MAC learning

---

## <notification-control> configuration/poe

---

### Usage

```
<configuration>
 <poe>
 <notification-control>
 <fpc>...</fpc>
 </notification-control>
 </poe>
</configuration>
```

**Description**    Notification control for Power over Ethernet traps

**Contents**    <fpc>—FPC slot number

---

## <notification-options> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/profile

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <profile>
 <notification-options>
 <virus-detection>...</virus-detection>
 <fallback-block>...</fallback-block>
 <fallback-non-block>...</fallback-non-block>
 </notification-options>
 </profile>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description**    Anti-virus notification options

**Contents**    <virus-detection>—Virus detection notification

                 <fallback-block>—Fallback block notification

                 <fallback-non-block>—Fallback non block notification

## **<notification-options> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/profile**

---

### **Usage**

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<juniper-express-engine>
<profile>
<notification-options>
<virus-detection>...</virus-detection>
<fallback-block>...</fallback-block>
<fallback-non-block>...</fallback-non-block>
</notification-options>
</profile>
</juniper-express-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus notification options

**Contents** <virus-detection>—Virus detection notification

<fallback-block>—Fallback block notification

<fallback-non-block>—Fallback non block notification

## **<notification-options> configuration/security/utm/feature-profile/anti-virus/sophos-engine/profile**

---

### **Usage**

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<sophos-engine>
<profile>
<notification-options>
<virus-detection>...</virus-detection>
<fallback-block>...</fallback-block>
<fallback-non-block>...</fallback-non-block>
</notification-options>
</profile>
</sophos-engine>
</anti-virus>
```

```
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus notification options

**Contents** <virus-detection>—Virus detection notification

<fallback-block>—Fallback block notification

<fallback-non-block>—Fallback non block notification

---

## <notification-options> configuration/security/utm/feature-profile/content-filtering/profile

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<content-filtering>
<profile>
<notification-options>
<type>type</type>
<notify-mail-sender/>
<custom-message>custom-message</custom-message>
</notification-options>
</profile>
</content-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Notification options

**Contents** <type>—Notification options type

- protocol-only - Notification in protocol level
- message - Notification in message

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom notification message

## **<number> configuration/security/gprs/gtp/profile/remove-ie/version**

---

**Usage**

```
<configuration>
 <security>
 <gprs>
 <gtp>
 <profile>
 <remove-ie>
 <version>
 <number>
 <ie-number>ie-number</ie-number>
 </number>
 </version>
 </remove-ie>
 </profile>
 </gtp>
 </gprs>
 </security>
</configuration>
```

**Description** Remove information elements by number

**Contents** <ie-number>—

# Tag Elements Beginning with O

This chapter lists the configuration tag elements that have names beginning with the letter o. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

## `<oam>` configuration/protocols

### Usage

```
<configuration>
 <protocols>
 <oam>
 <ethernet>...</ethernet>
 </oam>
 </protocols>
</configuration>
```

**Description** Operation, Administration, and Management configuration

**Contents** `<ethernet>`—OAM configuration for ethernet

## `<ospf>` configuration/protocols

### Description

## **<output> configuration/ethernet-switching-options/analyzer**

---

**Usage**

```
<configuration>
<ethernet-switching-options>
<analyzer>
<output>
<interface>...</interface>
<vlan>...</vlan>
</output>
</analyzer>
</ethernet-switching-options>
</configuration>
```

**Description** Outgoing port or VLAN for mirrored packets

**Contents** <interface>—Outgoing port for mirrored packets  
<vlan>—Outgoing VLAN for mirrored packets

## **<output-vlan-map> configuration/interfaces/interface/unit**

---

**Description** VLAN map operation on output

## **<overflow-pool> configuration/security/nat/source/pool**

---

**Usage**

```
<configuration>
<security>
<nat>
<source>
<pool>
<overflow-pool>
<pool-name>pool-name</pool-name>
<interface/>
</overflow-pool>
</pool>
</source>
</nat>
</security>
</configuration>
```

**Description** Specify an overflow pool

**Contents** <pool-name>—Name of source address pool  
<interface>—Allow interface pool to support overflow

## CHAPTER 42

# Tag Elements Beginning with P

This chapter lists the configuration tag elements that have names beginning with the letter *p*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<packet-filter>` configuration/security/flow/traceoptions

---

#### Usage

```
<configuration>
 <security>
 <flow>
 <traceoptions>
 <packet-filter>
 <filter-name>filter-name</filter-name> <!-- identifier -->
 <protocol>protocol</protocol>
 <source-prefix>source-prefix</source-prefix>
 <destination-prefix>destination-prefix</destination-prefix>
 <logical-system>logical-system</logical-system>
 <source-port>source-port</source-port>
 <destination-port>destination-port</destination-port>
 <interface>interface</interface>
 </packet-filter>
 </traceoptions>
 </flow>
 </security>
</configuration>
```

**Description**    Flow packet debug filters

**Contents**    <filter-name>—Name of the filter

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- number - Numeric protocol value (0 .. 255)
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet
- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)
- dhcp - Dynamic Host Configuration Protocol
- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol
- kerberos-sec - Kerberos Security
- pop3 - Post Office Protocol 3
- sunrpc - Sun Microsystems remote procedure call

- ident - Ident
- nntp - Network News Transport Protocol
- ntp - Network Time Protocol
- netbios-ns - NetBIOS name service
- netbios-dgm - NetBIOS DGM
- netbios-ssn - NetBIOS session service
- imap - Internet Message Access Protocol
- snmp - Simple Network Management Protocol
- snmptrap - SNMP traps
- xdmcp - X Display Manager Control Protocol
- bgp - Border Gateway Protocol
- ldap - Lightweight Directory Access Protocol
- mobileip-agent - Mobile IP agent
- mobilip-mn - Mobile IP MN
- msdp - Multicast Source Discovery Protocol
- https - Secure HTTP
- snpp - Simple paging protocol
- biff - Biff/Comsat
- exec - UNIX rexec
- login - UNIX rlogin
- who - UNIX rwho
- cmd - UNIX rsh
- syslog - System log
- printer - Printer
- talk - UNIX Talk
- ntalk - New Talk
- rip - Routing Information Protocol
- timed - UNIX time daemon
- klogin - Kerberos rlogin
- kshell - Kerberos rsh
- ldp - Label Distribution Protocol
- krb-prop - Kerberos database propagation
- krbupdate - Kerberos database update

- kpasswd - Kerberos passwd
- socks - Socks
- afs - AFS
- pptp - Point-to-Point Tunneling Protocol
- radius - RADIUS authentication
- radacct - RADIUS accounting
- zephyr-srv - Zephyr server
- zephyr-clt - Zephyr serv-hm connection
- zephyr-hm - Zephyr hostmanager
- nfsd - Network File System
- eklogin - Encrypted Kerberos rlogin
- ekshell - Encrypted Kerberos rsh
- rkinit - Kerberos remote kinit
- cvspserver - CVS pserver
- range - Range of values
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet
- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)
- dhcp - Dynamic Host Configuration Protocol
- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol

<interface>—Logical interface

---

## <packet-filter> configuration/security/datapath-debug

---

### Usage

```
<configuration>
 <security>
 <datapath-debug>
 <packet-filter>
 <filter-name>filter-name</filter-name> <!-- identifier -->
 <action-profile>action-profile</action-profile> <!-- mandatory -->
 <protocol>protocol</protocol>
 <source-prefix>source-prefix</source-prefix>
```

```
<destination-prefix>destination-prefix</destination-prefix>
<source-port>source-port</source-port>
<destination-port>destination-port</destination-port>
<interface>interface</interface>
</packet-filter>
</datapath-debug>
</security>
</configuration>
```

**Description** Packet filter configuration

**Contents** <filter-name>—Name of the filter

- default - Default actions
- profile - Action profile name
- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- number - Numeric protocol value (0 .. 255)
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet
- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)

- dhcp - Dynamic Host Configuration Protocol
- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol
- kerberos-sec - Kerberos Security
- pop3 - Post Office Protocol 3
- sunrpc - Sun Microsystems remote procedure call
- ident - Ident
- nntp - Network News Transport Protocol
- ntp - Network Time Protocol
- netbios-ns - NetBIOS name service
- netbios-dgm - NetBIOS DGM
- netbios-ssn - NetBIOS session service
- imap - Internet Message Access Protocol
- snmp - Simple Network Management Protocol
- snmptrap - SNMP traps
- xdmcp - X Display Manager Control Protocol
- bgp - Border Gateway Protocol
- ldap - Lightweight Directory Access Protocol
- mobileip-agent - Mobile IP agent
- mobilip-mn - Mobile IP MN
- msdp - Multicast Source Discovery Protocol
- https - Secure HTTP
- snpp - Simple paging protocol
- biff - Biff/Comsat
- exec - UNIX rexec
- login - UNIX rlogin
- who - UNIX rwho
- cmd - UNIX rsh
- syslog - System log
- printer - Printer

- talk - UNIX Talk
- ntalk - New Talk
- rip - Routing Information Protocol
- timed - UNIX time daemon
- klogin - Kerberos rlogin
- kshell - Kerberos rsh
- ldap - Label Distribution Protocol
- krb-prop - Kerberos database propagation
- krbupdate - Kerberos database update
- kpasswd - Kerberos passwd
- socks - Socks
- afs - AFS
- pptp - Point-to-Point Tunneling Protocol
- radius - RADIUS authentication
- radacct - RADIUS accounting
- zephyr-srv - Zephyr server
- zephyr-clt - Zephyr serv-hm connection
- zephyr-hm - Zephyr hostmanager
- nfsd - Network File System
- eklogin - Encrypted Kerberos rlogin
- ekshell - Encrypted Kerberos rsh
- rkinit - Kerberos remote kinit
- cvspserver - CVS pserver
- range - Range of values
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet
- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)
- dhcp - Dynamic Host Configuration Protocol

- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol
- kerberos-sec - Kerberos Security
- pop3 - Post Office Protocol 3
- sunrpc - Sun Microsystems remote procedure call
- ident - Ident
- nntp - Network News Transport Protocol
- ntp - Network Time Protocol
- netbios-ns - NetBIOS name service
- netbios-dgm - NetBIOS DGM
- netbios-ssn - NetBIOS session service
- imap - Internet Message Access Protocol
- snmp - Simple Network Management Protocol
- snmptrap - SNMP traps
- xdmcp - X Display Manager Control Protocol
- bgp - Border Gateway Protocol
- ldap - Lightweight Directory Access Protocol
- mobileip-agent - Mobile IP agent
- mobilip-mn - Mobile IP MN
- msdp - Multicast Source Discovery Protocol

<interface>—Logical interface

---

## <pattern-update> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <pattern-update>
 <email-notify>...</email-notify>
 <proxy>...</proxy>
 <url>url</url>
 <interval>interval</interval>
 <no-autoupdate/>
 </pattern-update>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
```

```
</configuration>
```

**Description** Anti-virus kaspersky-lab-engine pattern update

**Contents** <email-notify>—Virus pattern file updated notification

<proxy>—Pattern update proxy server.

<url>—Server URL

<interval>—Interval to check the update

<no-autoupdate>—Don't automatically update anti-virus pattern

### **<pattern-update>** configuration/security/utm/feature-profile/anti-virus/juniper-express-engine

---

**Usage**

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<juniper-express-engine>
<pattern-update>
<email-notify>...</email-notify>
<proxy>...</proxy>
<url>url</url>
<interval>interval</interval>
<no-autoupdate/>
</pattern-update>
</juniper-express-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus juniper-express-engine pattern update

**Contents** <email-notify>—Virus pattern file updated notification

<proxy>—Pattern update proxy server.

<url>—Server URL

<interval>—Interval to check the update

<no-autoupdate>—Don't automatically update anti-virus pattern

## **<pattern-update> configuration/security/utm/feature-profile/anti-virus/sophos-engine**

---

### **Usage**

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<sophos-engine>
 <pattern-update>
 <email-notify>...</email-notify>
 <proxy>...</proxy>
 <url>url</url>
 <interval>interval</interval>
 <no-autoupdate/>
 </pattern-update>
</sophos-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus sophos-engine pattern update

**Contents** <email-notify>—Virus pattern file updated notification

<proxy>—Pattern update proxy server.

<url>—Server URL

<interval>—Interval to check the update

<no-autoupdate>—Don't automatically update anti-virus pattern

## **<payload-protocol> configuration/security/gprs/sctp/profile/drop**

---

### **Usage**

```
<configuration>
<security>
<gprs>
<sctp>
<profile>
<drop>
 <payload-protocol>
 <reserved/>
 <iua/>
 <m2ua/>
 <m3ua/>
 <sua/>
```

```

 <m2pa/>
 <v5ua/>
 <h248/>
 <bicc/>
 <tali/>
 <dua/>
 <asap/>
 <enrp/>
 <h323/>
 <qipc/>
 <simco/>
 <ddp-segment/>
 <ddp-stream/>
 <all/>
 </payload-protocol>
</drop>
</profile>
</sctp>
</gprs>
</security>
</configuration>

```

**Description** SCTP payload protocol identifier

**Contents** <reserved>—Reserved by SCTP

<iua>—ISDN user adaptation layer

<m2ua>—MTP2 user adaptation layer

<m3ua>—MTP3 user adaptation layer

<sua>—SCCP user adaptation layer

<m2pa>—MTP2 user peer-to-peer adaptation layer

<v5ua>—V5.2 user adaptation layer

<h248>—H.248 protocol

<bicc>—Bearer independent call control

<tali>—Transport adapter layer interface

<dua>—DPNSS/DASS 2 extensions to IUA protocol

<asap>—Aggregate server access protocol

<enrp>—Endpoint handlespace redundancy protocol

<h323>—H.323 protocol

<qipc>—Q.IPC

<simco>—Simple middlebox configuration

<ddp-segment>—Direct data placement segment chunk

<ddp-stream>—Direct data placement stream session control

<all>—All sctp payload protocol identifiers

---

## <perfect-forward-secrecy> configuration/security/ipsec/policy

---

### Usage

```
<configuration>
<security>
 <ipsec>
 <policy>
 <perfect-forward-secrecy>
 <keys>keys</keys>
 </perfect-forward-secrecy>
 </policy>
 </ipsec>
</security>
</configuration>
```

**Description** Define perfect forward secrecy

**Contents** <keys>—Define Diffie-Hellman group

- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14

---

## <performance-monitoring> configuration/protocols/oam/ethernet/connectivity-fault-management

---

### Usage

```
<configuration>
<protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <performance-monitoring>
 <no-delegate-processing/>
 <sla-iterator-profiles>...</sla-iterator-profiles>
 </performance-monitoring>
 </connectivity-fault-management>
 </ethernet>
 </oam>
</protocols>
```

```
</configuration>
```

**Description** Configurations related to ethernet performance monitoring

**Contents** `<no-delegate-processing>`—Do not delegate performance measurement request handling to PFE

`<sla-iterator-profiles>`—Configuration related to an SLA monitoring iterator

## `<permit>` configuration/security/nat/source/rule-set/rule/then/source-nat/pool/persistent-nat

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<then>
<source-nat>
<pool>
<persistent-nat>
<permit>
<any-remote-host/>
<target-host/>
<target-host-port/>
</permit>
</persistent-nat>
</pool>
</source-nat>
</then>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Persistent NAT permit configure

**Contents** `<any-remote-host>`—Permit any remote host

`<target-host>`—Permit target host

`<target-host-port>`—Permit target host port

## **<permit> configuration/security/nat/source/rule-set/rule/then/source-nat/interface/persistent-nat**

---

### **Usage**

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<then>
<source-nat>
<interface>
<persistent-nat>
<permit>
<any-remote-host/>
<target-host/>
<target-host-port/>
</permit>
</persistent-nat>
</interface>
</source-nat>
</then>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Persistent NAT permit configure

**Contents** <any-remote-host>—Permit any remote host  
<target-host>—Permit target host  
<target-host-port>—Permit target host port

## **<persistent-nat> configuration/security/nat/source/rule-set/rule/then/source-nat/pool**

---

### **Usage**

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<then>
<source-nat>
<pool>
```

```

<persistent-nat>
 <permit>...</permit> <!-- mandatory -->
 <address-mapping/>
 <inactivity-timeout>inactivity-timeout</inactivity-timeout>
 <max-session-number>max-session-number</max-session-number>
</persistent-nat>
</pool>
</source-nat>
</then>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>

```

**Description** Persistent NAT info

**Contents**

- <permit>—Persistent NAT permit configure
- <address-mapping>—Address-to-address mapping
- <inactivity-timeout>—Inactivity timeout value
- <max-session-number>—The maximum session number value

## <persistent-nat> configuration/security/nat/source/rule-set/rule/then/source-nat/interface

### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule>
 <then>
 <source-nat>
 <interface>
 <persistent-nat>
 <permit>...</permit> <!-- mandatory -->
 <address-mapping/>
 <inactivity-timeout>inactivity-timeout</inactivity-timeout>
 <max-session-number>max-session-number</max-session-number>
 </persistent-nat>
 </interface>
 </source-nat>
 </then>
 </rule>
 </rule-set>
 </source>
 </nat>
 </security>

```

</configuration>

**Description** Persistent NAT info

**Contents** <permit>—Persistent NAT permit configure  
<address-mapping>—Address-to-address mapping  
<inactivity-timeout>—Inactivity timeout value  
<max-session-number>—The maximum session number value

---

## <pki> configuration/security

---

### Usage

```
<configuration>
 <security>
 <pki>
 <ca-profile>...</ca-profile>
 <auto-re-enrollment>...</auto-re-enrollment>
 <traceoptions>...</traceoptions>
 </pki>
 </security>
</configuration>
```

**Description** PKI service configuration

**Contents** <ca-profile>—Certificate authority profile configuration  
<auto-re-enrollment>—Auto re-enroll of certificate  
<traceoptions>—PKI trace options

---

## <poe> configuration

---

### Usage

```
<configuration>
 <poe>
 <management>management</management>
 <guard-band>guard-band</guard-band>
 <notification-control>...</notification-control>
 <interface>...</interface>
 <fpc>...</fpc>
 </poe>
</configuration>
```

**Description** Power over Ethernet options

- Contents** <management>—Power management mode for Power over Ethernet
- static - Static power allocation method
  - class - Class based power allocation method
- <guard-band>—Guard band for Power over Ethernet
- <notification-control>—Notification control for Power over Ethernet traps
- <interface>—Interface configuration for Power over Ethernet
- <fpc>—FPC configuration for power over ethernet

## <policy> configuration/security/ike

---

### Usage

```
<configuration>
<security>
 <ike>
 <policy>
 <name>name</name> <!-- identifier -->
 <mode>mode</mode>
 <description>description</description>
 <proposals>...</proposals>
 <certificate>...</certificate>
 <proposal-set>proposal-set</proposal-set>
 <pre-shared-key>...</pre-shared-key>
 </policy>
 </ike>
</security>
</configuration>
```

**Description** Define an IKE policy

- Contents** <name>—Name of policy
- main - Main mode
  - aggressive - Aggressive mode
  - basic - IKE proposal-set for basic
  - compatible - IKE proposal-set for compatible
  - standard - IKE proposal-set for standard
- <mode>—Define the IKE mode for Phase 1
- main - Main mode
  - aggressive - Aggressive mode
  - basic - IKE proposal-set for basic

- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<description>—Text description of IKE policy

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<proposals>—Define the set of IKE proposals

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<certificate>—Certificate configuration

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<proposal-set>—Types of default IKE proposal-set

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<pre-shared-key>—Define a preshared key

---

## <policy> configuration/security/ipsec

---

### Usage

```
<configuration>
 <security>
 <ipsec>
 <policy>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <perfect-forward-secrecy>...</perfect-forward-secrecy>
 <proposals>...</proposals>
 <proposal-set>proposal-set</proposal-set>
 </policy>
 </ipsec>
 </security>
</configuration>
```

**Description** Define an IPsec policy

**Contents**

- <name>—Name of the IPsec policy
  - basic - IPSEC basic proposal-set
  - compatible - IPSEC compatible proposal-set
  - standard - IPSEC standard proposal-set
- <description>—Text description of IPsec policy
  - basic - IPSEC basic proposal-set
  - compatible - IPSEC compatible proposal-set
  - standard - IPSEC standard proposal-set
- <perfect-forward-secrecy>—Define perfect forward secrecy
  - basic - IPSEC basic proposal-set
  - compatible - IPSEC compatible proposal-set
  - standard - IPSEC standard proposal-set
- <proposals>—Define the set of IPsec proposals
  - basic - IPSEC basic proposal-set
  - compatible - IPSEC compatible proposal-set
  - standard - IPSEC standard proposal-set
- <proposal-set>—Types of default IPSEC proposal-set
  - basic - IPSEC basic proposal-set
  - compatible - IPSEC compatible proposal-set
  - standard - IPSEC standard proposal-set

## <policy> configuration/security/group-vpn/member/ike

### Usage

```
<configuration>
<security>
 <group-vpn>
 <member>
 <ike>
 <policy>
 <name>name</name> <!-- identifier -->
 <mode>mode</mode>
 <description>description</description>
 <proposals>...</proposals>
 <certificate>...</certificate>
 <proposal-set>proposal-set</proposal-set>
```

```
 <pre-shared-key>...</pre-shared-key>
 </policy>
</ike>
</member>
</group-vpn>
</security>
</configuration>
```

**Description** Define an IKE policy

**Contents** <name>—Name of policy

- main - Main mode
- aggressive - Aggressive mode
- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<mode>—Define the IKE mode for Phase 1

- main - Main mode
- aggressive - Aggressive mode
- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<description>—Text description of IKE policy

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<proposals>—Define the set of IKE proposals

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<certificate>—Certificate configuration

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<proposal-set>—Types of default IKE proposal-set

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<pre-shared-key>—Define a preshared key

## <policy> configuration/security/group-vpn/server/ike

### Usage

```
<configuration>
<security>
 <group-vpn>
 <server>
 <ike>
 <policy>
 <name>name</name> <!-- identifier -->
 <mode>mode</mode>
 <description>description</description>
 <proposals>...</proposals>
 <certificate>...</certificate>
 <proposal-set>proposal-set</proposal-set>
 <pre-shared-key>...</pre-shared-key>
 </policy>
 </ike>
 </server>
 </group-vpn>
</security>
</configuration>
```

**Description** Define an IKE policy

**Contents** <name>—Name of policy

- main - Main mode
- aggressive - Aggressive mode
- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<mode>—Define the IKE mode for Phase 1

- main - Main mode
- aggressive - Aggressive mode
- basic - IKE proposal-set for basic

- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<description>—Text description of IKE policy

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<proposals>—Define the set of IKE proposals

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<certificate>—Certificate configuration

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<proposal-set>—Types of default IKE proposal-set

- basic - IKE proposal-set for basic
- compatible - IKE proposal-set for compatible
- standard - IKE proposal-set for standard

<pre-shared-key>—Define a preshared key

---

## <policy> configuration/security/alarms/potential-violation

---

### Usage

```
<configuration>
 <security>
 <alarms>
 <potential-violation>
 <policy>
 <source-ip>...</source-ip>
 <destination-ip>...</destination-ip>
 <application>...</application>
 <policy-match>...</policy-match>
 </policy>
 </potential-violation>
 </alarms>
 </security>
</configuration>
```

**Description** Raise alarm for flow policy violations

**Contents**

- <source-ip>—Configure source address type of policy violation
- <destination-ip>—Configure destination address type of policy violation
- <application>—Configure application type of policy violation
- <policy-match>—Configure policy type of policy violation

## <policy> configuration/services/ip-monitoring

---

### Usage

```
<configuration>
 <services>
 <ip-monitoring>
 <policy>
 <policy-name>policy-name</policy-name> <!-- identifier -->
 <match>...</match>
 <then>...</then>
 </policy>
 </ip-monitoring>
 </services>
</configuration>
```

**Description** Policy for route action

**Contents**

- <policy-name>—Policy name
- <match>—Matching probing condition
- <then>—Action to be taken

## <policy> configuration/services/server-load-balance/virtual-server

---

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <virtual-server>
 <policy>
 <default>...</default> <!-- mandatory -->
 </policy>
 </virtual-server>
 </server-load-balance>
 </services>
</configuration>
```

**Description** Content based policy

**Contents**    <default>—Default rule

---

## <policy-match> configuration/security/alarms/potential-violation/policy

---

### Usage

```
<configuration>
<security>
 <alarms>
 <potential-violation>
 <policy>
 <policy-match>
 <threshold>threshold</threshold>
 <duration>duration</duration>
 <size>size</size>
 </policy-match>
 </policy>
 </potential-violation>
 </alarms>
</security>
</configuration>
```

**Description**    Configure policy type of policy violation

**Contents**    <threshold>—Number of policy matches to raise alarm  
                 <duration>—Time window matches must occur within  
                 <size>—Total concurrent number of policy check violations

---

## <pool> configuration/security/nat/source

---

### Usage

```
<configuration>
<security>
 <nat>
 <source>
 <pool>
 <pool-name>pool-name</pool-name> <!-- identifier -->
 <description>description</description>
 <routing-instance>...</routing-instance>
 <address>...</address> <!-- mandatory -->
 <host-address-base>...</host-address-base>
 <port>...</port>
 <overflow-pool>...</overflow-pool>
 </pool>
 </source>
 </nat>
</security>
</configuration>
```

<b>Description</b>	Define a source address pool
<b>Contents</b>	<p>&lt;pool-name&gt;—Pool name</p> <p>&lt;description&gt;—Text description of pool</p> <p>&lt;routing-instance&gt;—Routing instance</p> <p>&lt;address&gt;—Add address to pool</p> <p>&lt;host-address-base&gt;—The base of host address</p> <p>&lt;port&gt;—Config port attribute to pool</p> <p>&lt;overflow-pool&gt;—Specify an overflow pool</p>

---

### <pool> configuration/security/nat/source/rule-set/rule/then/source-nat

---

**Usage**

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<then>
<source-nat>
<pool>
<pool-name>pool-name</pool-name>
<persistent-nat>...</persistent-nat>
</pool>
</source-nat>
</then>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

<b>Description</b>	Use Source NAT pool
<b>Contents</b>	<p>&lt;pool-name&gt;—Name of Source NAT pool</p> <p>&lt;persistent-nat&gt;—Persistent NAT info</p>

---

### <pool> configuration/security/nat/destination

---

**Usage**

```
<configuration>
<security>
```

```
<nat>
 <destination>
 <pool>
 <pool-name>pool-name</pool-name> <!-- identifier -->
 <description>description</description>
 <routing-instance>...</routing-instance>
 <address>...</address> <!-- mandatory -->
 </pool>
 </destination>
</nat>
</security>
</configuration>
```

**Description** Define a destination address pool

**Contents** <pool-name>—Pool name

<description>—Text description of pool

<routing-instance>—Routing instance

<address>—Add address or address range to pool

---

### <pool> configuration/security/nat/destination/rule-set/rule/then/destination-nat

---

#### Usage

```
<configuration>
 <security>
 <nat>
 <destination>
 <rule-set>
 <rule>
 <then>
 <destination-nat>
 <pool>
 <pool-name>pool-name</pool-name>
 </pool>
 </destination-nat>
 </then>
 </rule>
 </rule-set>
 </destination>
 </nat>
 </security>
</configuration>
```

**Description** Use Destination NAT pool

**Contents** <pool-name>—Name of Destination NAT pool

## **<pool> configuration/interfaces/interface/dialer-options**

### **Usage**

```
<configuration>
<interfaces>
<interface>
<dialer-options>
<pool>
<pool-identifier>pool-identifier</pool-identifier> <!-- identifier -->
<priority>priority</priority>
</pool>
</dialer-options>
</interface>
</interfaces>
</configuration>
```

**Description** Dialer pool

**Contents** <pool-identifier>—Dialer pool identifier

<priority>—Dialer pool priority

## **<pool-default-port-range> configuration/security/nat/source**

### **Usage**

```
<configuration>
<security>
<nat>
<source>
<pool-default-port-range>
<low>low</low> <!-- mandatory -->
<to>...</to> <!-- mandatory -->
</pool-default-port-range>
</source>
</nat>
</security>
</configuration>
```

**Description** Configure Source NAT default port range

**Contents** <low>—Lower limit of port range

<to>—Port range upper limit

## **<pool-utilization-alarm> configuration/security/nat/source**

### **Usage**

```
<configuration>
<security>
```

```
<nat>
 <source>
 <pool-utilization-alarm>
 <raise-threshold>raise-threshold</raise-threshold> <!-- mandatory -->
 <clear-threshold>clear-threshold</clear-threshold>
 </pool-utilization-alarm>
 </source>
</nat>
</security>
</configuration>
```

**Description** Configure pool utilization alarm

**Contents** <raise-threshold>—Raise threshold for pool utilization alarm  
<clear-threshold>—Clear threshold for pool utilization alarm

---

### <port> configuration/security/nat/source/pool

---

#### Usage

```
<configuration>
 <security>
 <nat>
 <source>
 <pool>
 <port>
 <no-translation/>
 <range>...</range>
 <port-overloading-factor>port-overloading-factor</port-overloading-factor>
 </port>
 </pool>
 </source>
 </nat>
 </security>
</configuration>
```

**Description** Config port attribute to pool

**Contents** <no-translation>—Do not perform port translation  
<range>—Port range  
<port-overloading-factor>—Port overloading factor for each IP

---

### <port-error-disable> configuration/ethernet-switching-options

---

#### Usage

```
<configuration>
 <ethernet-switching-options>
 <port-error-disable>
```

```
<disable-timeout>disable-timeout</disable-timeout>
</port-error-disable>
</ethernet-switching-options>
</configuration>
```

**Description** Port error disable options

**Contents** <disable-timeout>—Timeout for which the port is disabled

---

### <port-overloading> configuration/security/nat/source/interface

---

#### Usage

```
<configuration>
<security>
<nat>
<source>
<interface>
<port-overloading>
<off/>
</port-overloading>
</interface>
</source>
</nat>
</security>
</configuration>
```

**Description** Configure port overloading

**Contents** <off>—Turn off interface port over-loading

---

### <port-randomization> configuration/security/nat/source

---

#### Usage

```
<configuration>
<security>
<nat>
<source>
<port-randomization>
<disable/>
</port-randomization>
</source>
</nat>
</security>
</configuration>
```

**Description** Configure Source NAT port randomization

**Contents** <disable>—Disable Source NAT port randomization

## <port-scan> configuration/security/screen/ids-option/tcp

---

**Usage**

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <tcp>
 <port-scan>
 <threshold>threshold</threshold>
 </port-scan>
 </tcp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure port scan ids option

**Contents** <threshold>—Threshold

## <ports> configuration/wlan/access-point/external/system

---

**Usage**

```
<configuration>
 <wlan>
 <access-point>
 <external>
 <system>
 <ports>
 <ethernet>...</ethernet>
 </ports>
 </system>
 </external>
 </access-point>
 </wlan>
</configuration>
```

**Description** Port configuration

**Contents** <ethernet>—Ethernet settings

## <potential-violation> configuration/security/alarms

---

**Usage**

```
<configuration>
 <security>
 <alarms>
 <potential-violation>
```

```
<decryption-failures>...</decryption-failures>
<encryption-failures>...</encryption-failures>
<ike-phase1-failures>...</ike-phase1-failures>
<ike-phase2-failures>...</ike-phase2-failures>
<policy>...</policy>
</potential-violation>
</alarms>
</security>
</configuration>
```

**Description** Configure potential security violations

**Contents** <decryption-failures>—No. of decryption failures before which an alarm needs to be raised

<encryption-failures>—No. of encryption failures before which an alarm needs to be raised

<ike-phase1-failures>—No. of IKE Phase-1 failures before which an alarm needs to be raised

<ike-phase2-failures>—No. of IKE Phase-2 failures before which an alarm needs to be raised

<policy>—Raise alarm for flow policy violations

---

### <pptp> configuration/security/alg

---

**Usage**

```
<configuration>
<security>
 <alg>
 <pptp>
 <disable/>
 <traceoptions>...</traceoptions>
 </pptp>
 </alg>
</security>
</configuration>
```

**Description** Configure PPTP ALG

**Contents** <disable>—Disable PPTP ALG

<traceoptions>—PPTP ALG trace options

---

### <pre-shared-key> configuration/security/ike/policy

---

**Usage**

```
<configuration>
<security>
 <ike>
```

```
<policy>
 <pre-shared-key>
 <ascii-text>ascii-text</ascii-text>
 <hexadecimal>hexadecimal</hexadecimal>
 </pre-shared-key>
</policy>
</ike>
</security>
</configuration>
```

**Description** Define a preshared key

**Contents** <ascii-text>—Format as text  
            <hexadecimal>—Format as hexadecimal

---

### <pre-shared-key> configuration/security/group-vpn/member/ike/policy

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ike>
 <policy>
 <pre-shared-key>
 <ascii-text>ascii-text</ascii-text>
 <hexadecimal>hexadecimal</hexadecimal>
 </pre-shared-key>
 </policy>
 </ike>
 </member>
 </group-vpn>
 </security>
</configuration>
```

**Description** Define a preshared key

**Contents** <ascii-text>—Format as text  
            <hexadecimal>—Format as hexadecimal

---

### <pre-shared-key> configuration/security/group-vpn/server/ike/policy

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <ike>
```

```
<policy>
 <pre-shared-key>
 <ascii-text>ascii-text</ascii-text>
 <hexadecimal>hexadecimal</hexadecimal>
 </pre-shared-key>
</policy>
</ike>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Define a preshared key

**Contents** <ascii-text>—Format as text  
<hexadecimal>—Format as hexadecimal

---

### <preferred-route> configuration/services/ip-monitoring/policy/then

---

#### Usage

```
<configuration>
 <services>
 <ip-monitoring>
 <policy>
 <then>
 <preferred-route>
 <routing-instances>...</routing-instances>
 <route>...</route>
 </preferred-route>
 </then>
 </policy>
 </ip-monitoring>
 </services>
</configuration>
```

**Description** Preferred route action

**Contents** <routing-instances>—Routing-instance  
<route>—Route

---

### <prefix> configuration/security/nat/static/rule-set/rule/then/static-nat

---

#### Usage

```
<configuration>
 <security>
 <nat>
 <static>
 <rule-set>
```

```
<rule>
 <then>
 <static-nat>
 <prefix>
 <addr-prefix>addr-prefix</addr-prefix>
 <routing-instance>routing-instance</routing-instance>
 </prefix>
 </static-nat>
 </then>
</rule>
</rule-set>
</static>
</nat>
</security>
</configuration>
```

**Description** Address prefix

**Contents** <addr-prefix>—IPv4 or IPv6 address prefix value

- default - Default routing-instance
- routing-instance - Routing-instance name

<routing-instance>—Routing instance

- default - Default routing-instance
- routing-instance - Routing-instance name

---

## <prefix-name> configuration/security/nat/static/rule-set/rule/then/static-nat

---

### Usage

```
<configuration>
 <security>
 <nat>
 <static>
 <rule-set>
 <rule>
 <then>
 <static-nat>
 <prefix-name>
 <addr-prefix-name>addr-prefix-name</addr-prefix-name>
 <routing-instance>routing-instance</routing-instance>
 </prefix-name>
 </static-nat>
 </then>
 </rule>
 </rule-set>
 </static>
 </nat>
 </security>
```

</configuration>

**Description** Address from address book

**Contents** <addr-prefix-name>—Address from address book

- default - Default routing-instance
- routing-instance - Routing-instance name

<routing-instance>—Routing instance

- default - Default routing-instance
- routing-instance - Routing-instance name

---

## <primary-server> configuration/smtp

### Usage

```
<configuration>
 <smtp>
 <primary-server>
 <address>address</address> <!-- mandatory -->
 <login>...</login>
 </primary-server>
 </smtp>
</configuration>
```

**Description** SMTP primary server configuration

**Contents** <address>—SMTP server's IPv4 address

<login>—Configure a mail sender account to the server

---

## <priority-flow-control> configuration/protocols/dcbx/interface

### Usage

```
<configuration>
 <protocols>
 <dcbx>
 <interface>
 <priority-flow-control>
 <no-auto-negotiation/>
 </priority-flow-control>
 </interface>
 </dcbx>
 </protocols>
</configuration>
```

**Description** Configure priority flow control feature

**Contents** <no-auto-negotiation>—Enable PFC manually

---

## <probe-server> configuration/services/rpm

---

**Description**

---

## <processes> configuration/security/idp

---

**Usage**

```
<configuration>
 <security>
 <idp>
 <processes>
 </processes>
 </idp>
 </security>
 </configuration>
```

**Description** Configure IDP Processes

**Contents**

---

## <profile> configuration/security/gprs/gtp

---

**Usage**

```
<configuration>
 <security>
 <gprs>
 <gtp>
 <profile>
 <name>name</name> <!-- identifier -->
 <min-message-length>min-message-length</min-message-length>
 <max-message-length>max-message-length</max-message-length>
 <timeout>timeout</timeout>
 <rate-limit>rate-limit</rate-limit>
 <log>...</log>
 <remove-ie>...</remove-ie>
 <drop>...</drop>
 <apn>...</apn>
 <restart-path>restart-path</restart-path>
 <seq-number-validated/>
 <gtp-in-gtp-denied/>
 </profile>
 </gtp>
 </gprs>
 </security>
</configuration>
```

**Description** Configure GTP Profile

**Contents** <name>—GTP profile name

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<min-message-length>—Minimum message length, from 0 to 65535

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<max-message-length>—Maximum message length, from 1 to 65535

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<timeout>—Tunnel idle timeout

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<rate-limit>—Limit messages per second

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<log>—GPRS tunneling protocol logs

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<remove-ie>—Remove information elements

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<drop>—Drop certain type of messages

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<apn>—GTP Access Point Name (APN) filter

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<restart-path>—Restart GTP paths

- echo - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Echo messages
- create - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in the Create-Session messages
- all - Restart GTP paths by detecting the change of restart number obtained from the Recovery IE in all type of messages

<seq-number-validated>—Sequence number validated

<gtp-in-gtp-denied>—Deny nested GTP

## <profile> configuration/security/gprs/sctp

### Usage

```
<configuration>
 <security>
 <gprs>
 <sctp>
 <profile>
 <name>name</name> <!-- identifier -->
 <association-timeout>association-timeout</association-timeout>
 <handshake-timeout>handshake-timeout</handshake-timeout>
 <drop>...</drop>
 <limit>...</limit>
 </profile>
 </sctp>
 </gprs>
 </security>
</configuration>
```

**Description** Configure stream transmission protocol

**Contents**

- <name>—SCTP configuration name
- <association-timeout>—SCTP association timeout length, in minutes
- <handshake-timeout>—SCTP handshake timeout, in seconds
- <drop>—Disallowed sctp payload message
- <limit>—Packet limits

## <profile> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <profile>
 <name>name</name> <!-- identifier -->
 <fallback-options>...</fallback-options>
 <scan-options>...</scan-options>
 <trickling>...</trickling>
 <notification-options>...</notification-options>
 </profile>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
```

```
</utm>
</security>
</configuration>
```

**Description** Anti-virus kaspersky-lab-engine profile

**Contents** <name>—Anti-virus kaspersky-lab-engine profile name

<fallback-options>—Anti-virus fallback options

<scan-options>—Anti-virus scan options

<trickling>—Anti-virus trickling

<notification-options>—Anti-virus notification options

### <profile> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine

**Usage**

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <juniper-express-engine>
 <profile>
 <name>name</name> <!-- identifier -->
 <fallback-options>...</fallback-options>
 <scan-options>...</scan-options>
 <trickling>...</trickling>
 <notification-options>...</notification-options>
 </profile>
 </juniper-express-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Anti-virus juniper-express-engine profile

**Contents** <name>—Anti-virus juniper-express-engine profile name

<fallback-options>—Anti-virus juniper-express-engine fallback options

<scan-options>—Anti-virus juniper-express-engine scan options

<trickling>—Anti-virus trickling

<notification-options>—Anti-virus notification options

## **<profile> configuration/security/utm/feature-profile/anti-virus/sophos-engine**

### **Usage**

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <sophos-engine>
 <profile>
 <name>name</name> <!-- identifier -->
 <fallback-options>...</fallback-options>
 <scan-options>...</scan-options>
 <trickling>...</trickling>
 <notification-options>...</notification-options>
 </profile>
 </sophos-engine>
 </anti-virus>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Anti-virus sophos-engine profile

**Contents**

- <name>—Anti-virus sophos-engine profile name
- <fallback-options>—Anti-virus sophos-engine fallback options
- <scan-options>—Anti-virus sophos-engine scan options
- <trickling>—Anti-virus trickling
- <notification-options>—Anti-virus notification options

## **<profile> configuration/security/utm/feature-profile/web-filtering/surf-control-integrated**

### **Usage**

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <surf-control-integrated>
 <profile>
 <name>name</name> <!-- identifier -->
 <category>...</category>
 <default>default</default>
 <custom-block-message>custom-block-message</custom-block-message>
```

```
<fallback-settings>...</fallback-settings>
<timeout>timeout</timeout>
</profile>
</surf-control-integrated>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Surf control integrated profile

**Contents** <name>—Surf control integrated profile name

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

<category>—Surf control integrated category

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

<default>—Surf control integrated profile default

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

<custom-block-message>—Surf control integrated custom block message

<fallback-settings>—Surf control integrated fallback settings

<timeout>—Surf control integrated timeout

## [<profile> configuration/security/utm/feature-profile/web-filtering/websense-redirect](#)

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <websense-redirect>
 <profile>
 <name>name</name> <!-- identifier -->
 <server>...</server>
 <custom-block-message>custom-block-message</custom-block-message>
```

```
<fallback-settings>...</fallback-settings>
<timeout>timeout</timeout>
<sockets>sockets</sockets>
<account>account</account>
</profile>
</websense-redirect>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Websense redirect profile

**Contents**

- <name>—Websense redirect profile name
- <server>—Websense redirect server
- <custom-block-message>—Websense redirect custom block message
- <fallback-settings>—Websense redirect fallback settings
- <timeout>—Websense redirect timeout
- <sockets>—Websense redirect sockets number
- <account>—Websense redirect account

---

## <profile> configuration/security/utm/feature-profile/web-filtering/juniper-local

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<juniper-local>
<profile>
<name>name</name> <!-- identifier -->
<default>default</default>
<custom-block-message>custom-block-message</custom-block-message>

<fallback-settings>...</fallback-settings>
<timeout>timeout</timeout>
</profile>
</juniper-local>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description**   Juniper local profile

**Contents**   <name>—Juniper local profile name

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

<default>—Juniper local profile default

- permit - Permit action
- block - Block action
- log-and-permit - Log and permit action

<custom-block-message>—Juniper local custom block message

<fallback-settings>—Juniper local fallback settings

<timeout>—Juniper local timeout

## <profile> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <juniper-enhanced>
 <profile>
 <name>name</name> <!-- identifier -->
 <category>...</category>
 <site-reputation-action>...</site-reputation-action>
 <default>default</default>
 <custom-block-message>custom-block-message</custom-block-message>

 <fallback-settings>...</fallback-settings>
 <timeout>timeout</timeout>
 <no-safe-search/>
 <block-message>...</block-message>
 </profile>
 </juniper-enhanced>
 </web-filtering>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description**   Juniper enhanced profile

<b>Contents</b>	<p><code>&lt;name&gt;</code>—Juniper enhanced profile name</p> <ul style="list-style-type: none"><li>• permit - Permit action</li><li>• block - Block action</li><li>• log-and-permit - Log and permit action</li></ul> <p><code>&lt;category&gt;</code>—Juniper enhanced category</p> <ul style="list-style-type: none"><li>• permit - Permit action</li><li>• block - Block action</li><li>• log-and-permit - Log and permit action</li></ul> <p><code>&lt;site-reputation-action&gt;</code>—Juniper enhanced site reputation action</p> <ul style="list-style-type: none"><li>• permit - Permit action</li><li>• block - Block action</li><li>• log-and-permit - Log and permit action</li></ul> <p><code>&lt;default&gt;</code>—Juniper enhanced profile default</p> <ul style="list-style-type: none"><li>• permit - Permit action</li><li>• block - Block action</li><li>• log-and-permit - Log and permit action</li></ul> <p><code>&lt;custom-block-message&gt;</code>—Juniper enhanced custom block message sent to HTTP client</p> <p><code>&lt;fallback-settings&gt;</code>—Juniper enhanced fallback settings</p> <p><code>&lt;timeout&gt;</code>—Juniper enhanced timeout</p> <p><code>&lt;no-safe-search&gt;</code>—Do not perform safe-search for Juniper enhanced protocol</p> <p><code>&lt;block-message&gt;</code>—Juniper enhanced block message settings</p>

## `<profile>` configuration/security/utm/feature-profile/anti-spam/sbl

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-spam>
 <sbl>
 <profile>
 <name>name</name> <!-- identifier -->
 <sbl-default-server/>
 <spam-action>spam-action</spam-action>
 <custom-tag-string>custom-tag-string</custom-tag-string>
 </profile>
```

```
 </sbl>
 </anti-spam>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** SBL profile

**Contents**

- <name>—SBL profile name
  - block - Block e-mail
  - tag-header - Tag header of e-mail
  - tag-subject - Tag subject of e-mail
- <sbl-default-server>—Default SBL server
  - block - Block e-mail
  - tag-header - Tag header of e-mail
  - tag-subject - Tag subject of e-mail
- <spam-action>—Anti-spam actions
  - block - Block e-mail
  - tag-header - Tag header of e-mail
  - tag-subject - Tag subject of e-mail
- <custom-tag-string>—Custom tag string

---

## <profile> configuration/security/utm/feature-profile/content-filtering

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <content-filtering>
 <profile>
 <name>name</name> <!-- identifier -->
 <permit-command>permit-command</permit-command>
 <block-command>block-command</block-command>
 <block-extension>block-extension</block-extension>
 <block-mime>...</block-mime>
 <block-content-type>...</block-content-type>
 <notification-options>...</notification-options>
 </profile>
 </content-filtering>
 </feature-profile>
 </utm>
```

```

 </security>
 </configuration>

```

**Description** Content filtering profile

**Contents**

- <name>—Content-filtering feature profile name
- <permit-command>—Permit command list
- <block-command>—Block command list
- <block-extension>—Block extension list
- <block-mime>—Content-filtering feature block MIME
- <block-content-type>—Content-filtering feature block content type
- <notification-options>—Notification options

## <proposal> configuration/security/ike

### Usage

```

<configuration>
 <security>
 <ike>
 <proposal>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <authentication-method>authentication-method</authentication-method> <!--
mandatory -->
 <dh-group>dh-group</dh-group>
 <authentication-algorithm>authentication-algorithm</authentication-algorithm>

 <encryption-algorithm>encryption-algorithm</encryption-algorithm>
 <lifetime-seconds>lifetime-seconds</lifetime-seconds>
 </proposal>
 </ike>
 </security>
</configuration>

```

**Description** Define an IKE proposal

**Contents**

- <name>—Name of the IKE proposal
  - pre-shared-keys - Preshared keys
  - rsa-signatures - RSA signatures
  - dsa-signatures - DSA signatures
  - group1 - Diffie-Hellman Group 1
  - group2 - Diffie-Hellman Group 2

- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<description>—Text description of IKE proposal

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-method>—Define authentication method

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2

- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<dh-group>—Define Diffie-Hellman group

- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-algorithm>—Define authentication algorithm

- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<encryption-algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<lifetime-seconds>—Lifetime, in seconds

---

## <proposal> configuration/security/ipsec

---

### Usage

```
<configuration>
<security>
<ipsec>
 <proposal>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <protocol>protocol</protocol>
 <authentication-algorithm>authentication-algorithm</authentication-algorithm>

 <encryption-algorithm>encryption-algorithm</encryption-algorithm>
 <lifetime-seconds>lifetime-seconds</lifetime-seconds>
 <lifetime-kilobytes>lifetime-kilobytes</lifetime-kilobytes>
 </proposal>
</ipsec>
</security>
</configuration>
```

**Description** Define an IPSec proposal

**Contents** <name>—Name of the IPSec proposal

- ah - Authentication header
- esp - Encapsulated Security Payload header
- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<description>—Text description of IPSec proposal

- ah - Authentication header
- esp - Encapsulated Security Payload header
- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<protocol>—Define an IPSec protocol for the proposal

- ah - Authentication header
- esp - Encapsulated Security Payload header
- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-algorithm>—Define authentication algorithm

- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<encryption-algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<lifetime-seconds>—Lifetime, in seconds

<lifetime-kilobytes>—Lifetime, in kilobytes

---

## <proposal> configuration/security/group-vpn/member/ike

---

### Usage

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ike>
 <proposal>
 <name>name</name> <!-- identifier -->

**Description** Define an IKE proposal

**Contents** <name>—Name of the IKE proposal

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14

- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<description>—Text description of IKE proposal

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-method>—Define authentication method

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14

- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<dh-group>—Define Diffie-Hellman group

- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-algorithm>—Define authentication algorithm

- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<encryption-algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<lifetime-seconds>—Lifetime, in seconds

## <proposal> configuration/security/group-vpn/server/ike

### Usage

```
<configuration>
<security>
<group-vpn>
<server>
<ike>
 <proposal>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <authentication-method>authentication-method</authentication-method>
<!-- mandatory -->
 <dh-group>dh-group</dh-group>
 <authentication-algorithm>authentication-algorithm</authentication-algorithm>

 <encryption-algorithm>encryption-algorithm</encryption-algorithm>
 </proposal>
</ike>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Define an IKE proposal

**Contents** <name>—Name of the IKE proposal

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm

- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<description>—Text description of IKE proposal

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-method>—Define authentication method

- pre-shared-keys - Preshared keys
- rsa-signatures - RSA signatures
- dsa-signatures - DSA signatures
- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm

- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<dh-group>—Define Diffie-Hellman group

- group1 - Diffie-Hellman Group 1
- group2 - Diffie-Hellman Group 2
- group5 - Diffie-Hellman Group 5
- group14 - Diffie-Hellman Group 14
- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-algorithm>—Define authentication algorithm

- md5 - MD5 authentication algorithm
- sha1 - SHA1 authentication algorithm
- sha-256 - SHA 256-bit authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<encryption-algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm

- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

---

## <proposal> configuration/security/group-vpn/server/ipsec

---

### Usage

```
<configuration>
<security>
 <group-vpn>
 <server>
 <ipsec>
 <proposal>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <authentication-algorithm>authentication-algorithm</authentication-algorithm>

 <encryption-algorithm>encryption-algorithm</encryption-algorithm>
 <lifetime-seconds>lifetime-seconds</lifetime-seconds>
 </proposal>
 </ipsec>
 </server>
 </group-vpn>
</security>
</configuration>
```

**Description** Define an IPSec proposal

**Contents** <name>—Name of the IPSec proposal

- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<description>—Text description of IPSec proposal

- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<authentication-algorithm>—Define authentication algorithm

- hmac-md5-96 - HMAC-MD5-96 authentication algorithm
- hmac-sha1-96 - HMAC-SHA1-96 authentication algorithm
- hmac-sha-256-128 - HMAC-SHA-256-128 authentication algorithm
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<encryption-algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm

<lifetime-seconds>—Lifetime, in seconds

---

## <proposals> configuration/security/ike/policy

### Usage

```
<configuration>
 <security>
 <ike>
 <policy>
 <proposals>
 <value_keyword>value_keyword</value_keyword> <!-- identifier -->
 </proposals>
 </policy>
 </ike>
 </security>
</configuration>
```

**Description** Define the set of IKE proposals

**Contents** <value\_keyword>—Name of the proposal

---

### <proposals> configuration/security/ipsec/policy

---

#### Usage

```
<configuration>
 <security>
 <ipsec>
 <policy>
 <proposals>
 <value_keyword>value_keyword</value_keyword> <!-- identifier -->
 </proposals>
 </policy>
 </ipsec>
 </security>
</configuration>
```

**Description** Define the set of IPSec proposals

**Contents** <value\_keyword>—Name of the proposal

---

### <proposals> configuration/security/group-vpn/member/ike/policy

---

#### Usage

```
<configuration>
 <security>
 <group-vpn>
 <member>
 <ike>
 <policy>
 <proposals>
 <value_keyword>value_keyword</value_keyword> <!-- identifier -->
 </proposals>
 </policy>
 </ike>
 </member>
 </group-vpn>
 </security>
</configuration>
```

**Description** Define the set of IKE proposals

**Contents** <value\_keyword>—Name of the proposal

## **<proposals>** configuration/security/group-vpn/server/ike/policy

---

**Usage**

```
<configuration>
 <security>
 <group-vpn>
 <server>
 <ike>
 <policy>
 <proposals>
 <value_keyword>value_keyword</value_keyword> <!-- identifier -->
 </proposals>
 </policy>
 </ike>
 </server>
 </group-vpn>
 </security>
</configuration>
```

**Description** Define the set of IKE proposals

**Contents** <value\_keyword>—Name of the proposal

## **<protect>** configuration/security/alg/sip/application-screen

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <sip>
 <application-screen>
 <protect>
 <deny>...</deny>
 </protect>
 </application-screen>
 </sip>
 </alg>
 </security>
</configuration>
```

**Description** Configure Protect options

**Contents** <deny>—Protect deny options

## **<protection-group>** configuration/protocols

---

**Usage**

```
<configuration>
 <protocols>
```

```
<protection-group>
 <traceoptions>...</traceoptions>
 <restore-interval>restore-interval</restore-interval>
 <guard-interval>guard-interval</guard-interval>
 <ethernet-ring>...</ethernet-ring>
 <hold-interval>hold-interval</hold-interval>
</protection-group>
</protocols>
</configuration>
```

**Description** Protection group

**Contents** <traceoptions>—Tracing options for debugging protocol operation

<restore-interval>—Wait to restore interval

<guard-interval>—Guard timer interval in 10ms steps

<ethernet-ring>—Ethernet ring

<hold-interval>—Hold off timer interval in 100ms steps

---

## <protocol> configuration/security/nat/source/rule-set/rule/match

---

### Usage

```
<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule>
 <match>
 <protocol>
 <icmp/>
 <igmp/>
 <ipip/>
 <tcp/>
 <egp/>
 <udp/>
 <rsvp/>
 <gre/>
 <esp/>
 <ah/>
 <icmp6/>
 <ospf/>
 <pim/>
 <sctp/>
 <number/>
 </protocol>
 </match>
 </rule>
 </rule-set>
 </source>
```

```

 </nat>
 </security>
</configuration>

```

**Description** IP Protocol

**Contents**

- <icmp>—Internet Control Message Protocol
- <igmp>—Internet Group Management Protocol
- <ipip>—IP in IP
- <tcp>—Transmission Control Protocol
- <egp>—Exterior gateway protocol
- <udp>—User Datagram Protocol
- <rsvp>—Resource Reservation Protocol
- <gre>—Generic routing encapsulation
- <esp>—IPSec Encapsulating Security Payload
- <ah>—IP Security authentication header
- <icmp6>—Internet Control Message Protocol Version 6
- <ospf>—Open Shortest Path First
- <pim>—Protocol Independent Multicast
- <sctp>—Stream Control Transmission Protocol
- <number>—Numeric protocol value (0 .. 255)

## <protocol> configuration/security/nat/destination/rule-set/rule/match

### Usage

```

<configuration>
 <security>
 <nat>
 <destination>
 <rule-set>
 <rule>
 <match>
 <protocol>
 <icmp/>
 <igmp/>
 <ipip/>
 <tcp/>
 <egp/>
 <udp/>

```

```
<rsvp/>
<gre/>
<esp/>
<ah/>
<icmp6/>
<ospf/>
<pim/>
<sctp/>
<number/>
</protocol>
</match>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** IP Protocol

**Contents**

- <icmp>—Internet Control Message Protocol
- <igmp>—Internet Group Management Protocol
- <ipip>—IP in IP
- <tcp>—Transmission Control Protocol
- <egp>—Exterior gateway protocol
- <udp>—User Datagram Protocol
- <rsvp>—Resource Reservation Protocol
- <gre>—Generic routing encapsulation
- <esp>—IPSec Encapsulating Security Payload
- <ah>—IP Security authentication header
- <icmp6>—Internet Control Message Protocol Version 6
- <ospf>—Open Shortest Path First
- <pim>—Protocol Independent Multicast
- <sctp>—Stream Control Transmission Protocol
- <number>—Numeric protocol value (0 .. 255)

## <protocol-command> configuration/security/utm/custom-objects

### Usage

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <protocol-command>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <value>...</value>
 </protocol-command>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure command-list object

**Contents** <name>—Configure name of command-list object

<value>—Configure value of command-list object

## <protocols> configuration/security/zones/functional-zone/management/interfaces/host-inbound-traffic

### Usage

```
<configuration>
 <security>
 <zones>
 <functional-zone>
 <management>
 <interfaces>
 <host-inbound-traffic>
 <protocols>
 <all/>
 <bfd/>
 <bgp/>
 <dvmrp/>
 <igmp/>
 <ldp/>
 <msdp/>
 <nhrp/>
 <ospf/>
 <ospf3/>
 <pgm/>
 <pim/>
 <rip/>
 <ripng/>
 <router-discovery/>
 <rsvp/>
 <sap/>
```

```
<vrrp/>
<except/>
</protocols>
</host-inbound-traffic>
</interfaces>
</management>
</functional-zone>
</zones>
</security>
</configuration>
```

**Description** Protocol type of incoming traffic to accept

**Contents** <all>—All protocols

<bfd>—Bidirectional Forwarding Detection

<bgp>—Border Gateway Protocol

<dvmrp>—Distance Vector Multicast Routing Protocol

<igmp>—Internet Group Management Protocol

<ldp>—Label Distribution Protocol

<msdp>—Multicast Source Discovery Protocol

<nhrp>—Next Hop Resolution Protocol

<ospf>—Open Shortest Path First

<ospf3>—Open Shortest Path First version 3

<pgm>—Pragmatic General Multicast

<pim>—Protocol Independent Multicast

<rip>—Routing Information Protocol

<ripng>—Routing Information Protocol next generation

<router-discovery>—Router Discovery

<rsvp>—Resource Reservation Protocol

<sap>—Session Announcement Protocol

<vrrp>—Virtual Router Redundancy Protocol

<except>—Protocol type of incoming traffic to disallow

## <protocols> configuration/security/zones/functional-zone/management/host-in-bound-traffic

### Usage

```

<configuration>
 <security>
 <zones>
 <functional-zone>
 <management>
 <host-inbound-traffic>
 <protocols>
 <all/>
 <bfd/>
 <bgp/>
 <dvmrp/>
 <igmp/>
 <ldp/>
 <msdp/>
 <nhrp/>
 <ospf/>
 <ospf3/>
 <pgm/>
 <pim/>
 <rip/>
 <ripng/>
 <router-discovery/>
 <rsvp/>
 <sap/>
 <vrrp/>
 <except/>
 </protocols>
 </host-inbound-traffic>
 </management>
 </functional-zone>
 </zones>
 </security>
</configuration>

```

**Description** Protocol type of incoming traffic to accept

**Contents** <all>—All protocols

<bfd>—Bidirectional Forwarding Detection

<bgp>—Border Gateway Protocol

<dvmrp>—Distance Vector Multicast Routing Protocol

<igmp>—Internet Group Management Protocol

<ldp>—Label Distribution Protocol

<msdp>—Multicast Source Discovery Protocol

<nhrp>—Next Hop Resolution Protocol

<ospf>—Open Shortest Path First

<ospf3>—Open Shortest Path First version 3

<pgm>—Pragmatic General Multicast

<pim>—Protocol Independent Multicast

<rip>—Routing Information Protocol

<ripng>—Routing Information Protocol next generation

<router-discovery>—Router Discovery

<rsvp>—Resource Reservation Protocol

<sap>—Session Announcement Protocol

<vrrp>—Virtual Router Redundancy Protocol

<except>—Protocol type of incoming traffic to disallow

---

## <protocols> configuration/security/zones/security-zone/host-inbound-traffic

---

### Usage

```
<configuration>
 <security>
 <zones>
 <security-zone>
 <host-inbound-traffic>
 <protocols>
 <all/>
 <bfd/>
 <bgp/>
 <dvmrp/>
 <igmp/>
 <ldp/>
 <msdp/>
 <nhrp/>
 <ospf/>
 <ospf3/>
 <pgm/>
 <pim/>
 <rip/>
 <ripng/>
 <router-discovery/>
 <rsvp/>
 <sap/>
 <vrrp/>
 <except/>
 </protocols>
 </host-inbound-traffic>
 </security-zone>
```

```

 </zones>
 </security>
</configuration>

```

**Description** Protocol type of incoming traffic to accept

**Contents**

- <all>—All protocols
- <bfd>—Bidirectional Forwarding Detection
- <bgp>—Border Gateway Protocol
- <dvmrp>—Distance Vector Multicast Routing Protocol
- <igmp>—Internet Group Management Protocol
- <ldp>—Label Distribution Protocol
- <msdp>—Multicast Source Discovery Protocol
- <nhrp>—Next Hop Resolution Protocol
- <ospf>—Open Shortest Path First
- <ospf3>—Open Shortest Path First version 3

<rip>—Routing Information Protocol  
 <ripng>—Routing Information Protocol next generation  
 <router-discovery>—Router Discovery  
 <rsvp>—Resource Reservation Protocol  
 <sap>—Session Announcement Protocol  
 <vrrp>—Virtual Router Redundancy Protocol  
 <except>—Protocol type of incoming traffic to disallow

## <protocols> configuration

### Usage

```

<configuration>
 <protocols>
 <ospf/>
 <oam>...</oam>
 <dcbx>...</dcbx>
 <lldp>...</lldp>
 <lldp-med>...</lldp-med>
 <dot1x>...</dot1x>
 <gvrp>...</gvrp>
 <mvrp>...</mvrp>
 <protection-group>...</protection-group>
 <stp>...</stp>
 <rstp>...</rstp>
 <mstp>...</mstp>
 <vstp>...</vstp>
 <edge-virtual-bridging>...</edge-virtual-bridging>
 <igmp-snooping>...</igmp-snooping>
 <mld-snooping>...</mld-snooping>
 </protocols>
</configuration>

```

### Description

#### Contents

<ospf>—  
 <oam>—Operation, Administration, and Management configuration  
 <dcbx>—DCBX Protocol  
 <lldp>—Link Layer Detection Protocol  
 <lldp-med>—LLDP Media Endpoint Discovery  
 <dot1x>—802.1X options  
 <gvrp>—GVRP configuration

<mvrp>—MVRP configuration

<protection-group>—Protection group

<stp>—Spanning Tree Protocol options

<rstp>—Rapid Spanning Tree Protocol options

<mstp>—Multiple Spanning Tree Protocol options

<vstp>—VLAN Spanning Tree Protocol options

<edge-virtual-bridging>—Edge Virtual Bridging options

<igmp-snooping>—IGMP Snooping Configuration

<mld-snooping>—MLD Snooping configuration

## <proxy> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/pattern-update

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <pattern-update>
 <proxy>
 <server>server</server> <!-- mandatory -->
 <port>port</port>
 <username>username</username>
 <password>password</password>
 </proxy>
 </pattern-update>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Pattern update proxy server.

**Contents** <server>—URL or IP address of the proxy server host

<port>—Proxy server port

<username>—Username for proxy server

<password>—Proxy server password

## <proxy> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/pattern-update

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <juniper-express-engine>
 <pattern-update>
 <proxy>
 <server>server</server> <!-- mandatory -->
 <port>port</port>
 <username>username</username>
 <password>password</password>
 </proxy>
 </pattern-update>
 </juniper-express-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Pattern update proxy server.

**Contents** <server>—URL or IP address of the proxy server host

<port>—Proxy server port

<username>—Username for proxy server

<password>—Proxy server password

## <proxy> configuration/security/utm/feature-profile/anti-virus/sophos-engine/pattern-update

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <sophos-engine>
 <pattern-update>
 <proxy>
 <server>server</server> <!-- mandatory -->
 <port>port</port>
 <username>username</username>
 <password>password</password>
```

```
</proxy>
</pattern-update>
</sophos-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Pattern update proxy server.

**Contents** <server>—URL or IP address of the proxy server host

<port>—Proxy server port

<username>—Username for proxy server

<password>—Proxy server password

---

## <proxy> configuration/protocols/igmp-snooping/vlan

### Usage

```
<configuration>
<protocols>
<igmp-snooping>
<vlan>
<proxy>
<source-address>source-address</source-address>
</proxy>
</vlan>
</igmp-snooping>
</protocols>
</configuration>
```

**Description** Enable proxy mode

**Contents** <source-address>—Source IP address to use for proxy

---

## <proxy-arp> configuration/security/nat

### Usage

```
<configuration>
<security>
<nat>
<proxy-arp>
<interface>...</interface>
</proxy-arp>
</nat>
</security>
```

```
</configuration>
```

**Description** Configure Proxy ARP

**Contents** <interface>—Interface with proxy arp configured

## <proxy-identity> configuration/security/ipsec/vpn/ike

### Usage

```
<configuration>
 <security>
 <ipsec>
 <vpn>
 <ike>
 <proxy-identity>
 <local>local</local>
 <remote>remote</remote>
 <service>service</service>
 </proxy-identity>
 </ike>
 </vpn>
 </ipsec>
 </security>
</configuration>
```

**Description** IPSec proxy-id to use in IKE negotiations

**Contents** <local>—Local IP address/prefix length

<remote>—Remote IP address/prefix length

<service>—Name of service that passes through, any enables all services

## <proxy-ndp> configuration/security/nat

### Usage

```
<configuration>
 <security>
 <nat>
 <proxy-ndp>
 <interface>...</interface>
 </proxy-ndp>
 </nat>
 </security>
</configuration>
```

**Description** Configure Proxy NDP

**Contents**    <interface>—Interface with proxy arp configured

## CHAPTER 43

# Tag Elements Beginning with Q

This chapter lists the configuration tag elements that have names beginning with the letter *q*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<quality-of-service>` configuration/wlan/access-point/radio

---

#### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <no-wifi-multimedia/>
 <no-acknowledgement/>
 <no-auto-power-save/>
 <access-point-queues>...</access-point-queues>
 <station-queues>...</station-queues>
 </quality-of-service>
 </radio>
 </access-point>
 </wlan>
</configuration>
```

**Description** Wireless quality of service configuration

**Contents** `<no-wifi-multimedia>`—Disable WIFI multimedia

<no-acknowledgement>—Disable acknowledgement

<no-auto-power-save>—Disable auto power save delivery

<access-point-queues>—Configure the access point queues

<station-queues>—Configure the station queues

# Tag Elements Beginning with R

This chapter lists the configuration tag elements that have names beginning with the letter *r*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

## `<radio>` configuration/wlan/access-point

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <radio-identifier>radio-identifier</radio-identifier> <!-- mandatory --> <!-- identifier
-->
 <radio-options>...</radio-options>
 <station-isolation/>
 <virtual-access-point>...</virtual-access-point>
 <quality-of-service>...</quality-of-service>
 </radio>
 </access-point>
 </wlan>
</configuration>
```

**Description** Access point radio settings

**Contents** `<radio-identifier>`—Specify radio identifier value

<radio-options>—Configure radio options

<station-isolation>—Isolate the clients connected to the same VAP within a radio

<virtual-access-point>—Virtual access point configuration

<quality-of-service>—Wireless quality of service configuration

## <radio-options> configuration/wlan/access-point/radio

### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <radio-options>
 <radio-off/>
 <disable-dot11d/>
 <mode>mode</mode>
 <channel>...</channel>
 <space-time-block-coding/>
 <protection>protection</protection>
 <beacon-interval>beacon-interval</beacon-interval>
 <dtim-period>dtim-period</dtim-period>
 <rts-threshold>rts-threshold</rts-threshold>
 <no-short-guard-interval/>
 <fragmentation-threshold>fragmentation-threshold</fragmentation-threshold>

 <maximum-stations>maximum-stations</maximum-stations>
 <transmit-power>transmit-power</transmit-power>
 <fixed-multicast-rate>fixed-multicast-rate</fixed-multicast-rate>
 <transmit-rate-sets>...</transmit-rate-sets>
 <broadcast-multicast-rate-limit>...</broadcast-multicast-rate-limit>
 </radio-options>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Configure radio options

**Contents** <radio-off>—Radio is off

- a - Radio Frequency -a
- bg - Radio Frequency -bg
- an - Radio Frequency -an
- bgn - Radio Frequency -bgn
- 5GHz - Radio Frequency -5GHz-n
- 2.4GHz - Radio Frequency -2.4GHz-n

- auto - Protection mode- AUTO
- off - Protection mode- OFF
- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<disable-dot11d>—Disable dot11d regulatory domain support

- a - Radio Frequency -a
- bg - Radio Frequency -bg
- an - Radio Frequency -an
- bgn - Radio Frequency -bgn
- 5GHz - Radio Frequency -5GHz-n
- 2.4GHz - Radio Frequency -2.4GHz-n
- auto - Protection mode- AUTO
- off - Protection mode- OFF
- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps

- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<mode>—Mode for radio operation

- a - Radio Frequency -a
- bg - Radio Frequency -bg
- an - Radio Frequency -an
- bgn - Radio Frequency -bgn
- 5GHz - Radio Frequency -5GHz-n
- 2.4GHz - Radio Frequency -2.4GHz-n
- auto - Protection mode- AUTO
- off - Protection mode- OFF
- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<channel>—Configure channel settings

- auto - Protection mode- AUTO
- off - Protection mode- OFF
- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps

- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<space-time-block-coding>—Enable space time block coding

- auto - Protection mode- AUTO
- off - Protection mode- OFF
- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<protection>—Select protection mode

- auto - Protection mode- AUTO
- off - Protection mode- OFF
- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps

- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<beacon-interval>—Set the beacon interval

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<dtim-period>—Set delivery traffic indication message period (beacon count)

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps

- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<rts-threshold>—Set RTS- threshold

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<no-short-guard-interval>—Disable 802.11n short inter-symbol guard interval

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps

- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<fragmentation-threshold>—Packet fragment size(even numbers)

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<maximum-stations>—Set limit on maximum supported stations

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<transmit-power>—Set transmit power

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<fixed-multicast-rate>—Provide multicast rate

- auto - Auto rate selection
- 1 - Rate-1Mbps
- 2 - Rate-2Mbps
- 5.5 - Rate-5.5Mbps
- 6 - Rate-6Mbps
- 9 - Rate-9Mbps
- 11 - Rate-11Mbps
- 12 - Rate-12Mbps
- 18 - Rate-18Mbps
- 24 - Rate-24Mbps
- 36 - Rate-36Mbps
- 48 - Rate-48Mbps
- 54 - Rate-54Mbps

<transmit-rate-sets>—Specify the transmit rate sets

<broadcast-multicast-rate-limit>—Configure rate limit for broadcast and multicast traffic

---

**<range> configuration/security/nat/source/pool/port**

---

#### Usage

<configuration>

```
<security>
 <nat>
 <source>
 <pool>
 <port>
 <range>
 <low>low</low> <!-- mandatory -->
 <to>...</to> <!-- mandatory -->
 </range>
 </port>
 </pool>
 </source>
 </nat>
</security>
</configuration>
```

**Description** Port range

**Contents** <low>—Lower limit of port range

<to>—Port range upper limit

---

### <range-address> configuration/security/address-book/address

#### Usage

```
<configuration>
 <security>
 <address-book>
 <address>
 <range-address>
 <range-low>range-low</range-low> <!-- mandatory --> <!-- identifier -->
 <to>...</to>
 </range-address>
 </address>
 </address-book>
 </security>
</configuration>
```

**Description** Address range

**Contents** <range-low>—Lower limit of address range

<to>—Port range upper limit

---

### <range-address> configuration/security/zones/security-zone/address-book/address

#### Usage

```
<configuration>
 <security>
 <zones>
```

```

<security-zone>
 <address-book>
 <address>
 <range-address>
 <range-low>range-low</range-low> <!-- mandatory --> <!-- identifier -->
 <to>...</to>
 </range-address>
 </address>
 </address-book>
</security-zone>
</zones>
</security>
</configuration>

```

**Description** Address range

**Contents** <range-low>—Lower limit of address range  
 <to>—Port range upper limit

## **<rate>** configuration/security/gprs/sctp/profile/limit

### Usage

```

<configuration>
 <security>
 <gprs>
 <sctp>
 <profile>
 <limit>
 <rate>
 <sccp>sccp</sccp>
 <ssp>ssp</ssp>
 <sst>sst</sst>
 <address>...</address>
 </rate>
 </limit>
 </profile>
 </sctp>
 </gprs>
 </security>
</configuration>

```

**Description** Rate limit

**Contents** <sccp>—Global SCCP messages rate limit  
 <ssp>—Global SSP messages rate limit  
 <sst>—Global SST messages rate limit  
 <address>—Rate limit for a list of IP addresses

## **<rate-limited> configuration/security/gprs/gtp/profile/log**

---

**Usage**

```
<configuration>
 <security>
 <gprs>
 <gtp>
 <profile>
 <log>
 <rate-limited>
 <basic/>
 <detail/>
 <frequency-number>frequency-number</frequency-number>
 </rate-limited>
 </log>
 </profile>
 </gtp>
 </gprs>
 </security>
</configuration>
```

**Description**   Dropped for rate-limit

**Contents**   <basic>—Basic logs

              <detail>—Detailed logs

              <frequency-number>—Logging frequency over threshold, set by rate-limit

## **<real> configuration/security/alg**

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <real>
 <disable/>
 <traceoptions>...</traceoptions>
 </real>
 </alg>
 </security>
</configuration>
```

**Description**   Configure Real Audio/Video ALG

**Contents**   <disable>—Disable Real Audio/Video ALG

              <traceoptions>—REAL ALG trace options

## <real-server> configuration/services/server-load-balance

---

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <real-server>
 <real-server-name>real-server-name</real-server-name> <!-- identifier -->
 <disable/>
 <pause/>
 <allow-sticky-only/>
 </real-server>
 </server-load-balance>
 </services>
</configuration>
```

**Description** Configure real server

**Contents** <real-server-name>—Name of the server

<disable>—Disable new requests and terminate existing sessions

<pause>—Disable new requests and keep existing sessions

<allow-sticky-only>—Disable new requests except those finding match in sticky table

## <real-server> configuration/services/server-load-balance/real-server-group

---

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <real-server-group>
 <real-server>
 <real-server-name>real-server-name</real-server-name> <!-- identifier -->
 </real-server>
 </real-server-group>
 </server-load-balance>
 </services>
</configuration>
```

**Description** List of real servers

**Contents** <real-server-name>—Real server name

## <real-server-group> configuration/services/server-load-balance

---

### Usage

```
<configuration>
```

```
<services>
 <server-load-balance>
 <real-server-group>
 <real-server-group-name>real-server-group-name</real-server-group-name>
 <!-- identifier -->
 <real-server>...</real-server> <!-- mandatory -->
 <health-monitor>health-monitor</health-monitor>
 <external-manager>external-manager</external-manager>
 </real-server-group>
 </server-load-balance>
</services>
</configuration>
```

**Description** Configure real server group

**Contents** <real-server-group-name>—Name of the real server group

<real-server>—List of real servers

<health-monitor>—Name of the health monitor rule

<external-manager>—Name of the external manager

---

## <receiver> configuration/protocols/igmp-snooping/vlan/data-forwarding

---

### Usage

```
<configuration>
 <protocols>
 <igmp-snooping>
 <vlan>
 <data-forwarding>
 <receiver>
 <source-vlans>...</source-vlans>
 <install/>
 </receiver>
 </data-forwarding>
 </vlan>
 </igmp-snooping>
 </protocols>
</configuration>
```

**Description** Receiver

**Contents** <source-vlans>—Source VLANs

<install>—Install forwarded bridging entities

## **<redundant-trunk-group> configuration/ethernet-switching-options**

### **Usage**

```
<configuration>
 <ethernet-switching-options>
 <redundant-trunk-group>
 <group>...</group>
 </redundant-trunk-group>
 </ethernet-switching-options>
</configuration>
```

**Description** Redundant trunk group

**Contents** <group>—Name of Redundant trunk group

## **<release> configuration/security/gprs/gtp/profile/remove-ie/version**

### **Usage**

```
<configuration>
 <security>
 <gprs>
 <gtp>
 <profile>
 <remove-ie>
 <version>
 <release>
 <R6/>
 <R7/>
 <R8/>
 <R9/>
 </release>
 </version>
 </remove-ie>
 </profile>
 </gtp>
 </gprs>
 </security>
</configuration>
```

**Description** Remove information elements by release

**Contents** <R6>—Release 6

<R7>—Release 7

<R8>—Release 8

<R9>—Release 9

## **<remote-exceptions> configuration/security/dynamic-vpn/clients**

---

**Usage**

```
<configuration>
 <security>
 <dynamic-vpn>
 <clients>
 <remote-exceptions>
 <exception-ip>exception-ip</exception-ip>
 </remote-exceptions>
 </clients>
 </dynamic-vpn>
 </security>
</configuration>
```

**Description** Ip/mask of exceptions being passthru

**Contents** <exception-ip>—Ip/mask of exceptions being passthru

## **<remote-id> configuration/ethernet-switching-options/secure-access-port/vlan/dhcp-option82**

---

**Usage**

```
<configuration>
 <ethernet-switching-options>
 <secure-access-port>
 <vlan>
 <dhcp-option82>
 <remote-id>
 <prefix>prefix</prefix>
 <use-interface-description/>
 <use-string>use-string</use-string>
 </remote-id>
 </dhcp-option82>
 </vlan>
 </secure-access-port>
 </ethernet-switching-options>
</configuration>
```

**Description** Configure DHCP option 82 remote id

**Contents** <prefix>—Configure DHCP option 82 remote id prefix

- none - Set no prefix
- hostname - Set hostname as the prefix
- mac - Set chassis MAC as the prefix

<use-interface-description>—Use interface description instead of name

<use-string>—Use raw string instead of the default remote id

## <remote-identity> configuration/security/ike/gateway

### Usage

```
<configuration>
<security>
<ike>
<gateway>
 <remote-identity>
 <inet>...</inet>
 <inet6>...</inet6>
 <hostname>...</hostname>
 <user-at-hostname>...</user-at-hostname>
 <distinguished-name>...</distinguished-name>
 </remote-identity>
</gateway>
</ike>
</security>
</configuration>
```

**Description** Set the remote IKE identity

**Contents**

- <inet>—Use an IPv4 address
- <inet6>—Use an IPv6 address
- <hostname>—Use a fully-qualified domain name
- <user-at-hostname>—Use an e-mail address
- <distinguished-name>—Use a distinguished name:

## <remote-mep> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain/maintenance-association/mep

### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<maintenance-domain>
<maintenance-association>
<mep>
 <remote-mep>
 <mep-id>mep-id</mep-id> <!-- identifier -->
 <action-profile>action-profile</action-profile>
 <sla-iterator-profile>...</sla-iterator-profile>
 </remote-mep>
</mep>
```

```
</maintenance-association>
</maintenance-domain>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Remote maintenance association endpoint configuration

**Contents** <mep-id>—Identifier for remote maintenance association endpoint

<action-profile>—Name of the action profile

<sla-iterator-profile>—Name of the iterator profile

---

## <remote-protected-resources> configuration/security/dynamic-vpn/clients

---

### Usage

```
<configuration>
<security>
<dynamic-vpn>
<clients>
<remote-protected-resources>
<resource-ip>resource-ip</resource-ip>
</remote-protected-resources>
</clients>
</dynamic-vpn>
</security>
</configuration>
```

**Description** IP/mask of remote protected resources

**Contents** <resource-ip>—IP/mask of remote protected resources

---

## <remove-ie> configuration/security/gprs/gtp/profile

---

### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<profile>
<remove-ie>
<version>...</version>
</remove-ie>
</profile>
</gtp>
</gprs>
</security>
```

</configuration>

**Description** Remove information elements

**Contents** <version>—GTP version

---

### <resource-manager> configuration/security

---

#### Usage

```
<configuration>
 <security>
 <resource-manager>
 <traceoptions>...</traceoptions>
 </resource-manager>
 </security>
</configuration>
```

**Description** Configure resource manager security options

**Contents** <traceoptions>—Traceoptions for resource manager

---

### <respond-bad-spi> configuration/security/ike

---

#### Usage

```
<configuration>
 <security>
 <ike>
 <respond-bad-spi>
 <max-responses>max-responses</max-responses>
 </respond-bad-spi>
 </ike>
 </security>
</configuration>
```

**Description** Respond to IPSec packets with bad SPI values

**Contents** <max-responses>—Maximum number of times to respond

---

### <revocation-check> configuration/security/pki/ca-profile

---

#### Usage

```
<configuration>
 <security>
 <pki>
 <ca-profile>
 <revocation-check>
 <disable/>
 </revocation-check>
 </ca-profile>
 </pki>
 </security>
</configuration>
```

```
<cr>...</cr>
</revocation-check>
</ca-profile>
</pki>
</security>
</configuration>
```

**Description** Method for checking certificate revocations

**Contents** <disable>—Disable revocation check

<cr>—Certificate revocation list configuration

---

## <route> configuration/services/ip-monitoring/policy/then/preferred-route/routing-instances

---

### Usage

```
<configuration>
<services>
<ip-monitoring>
<policy>
<then>
<preferred-route>
<routing-instances>
<route>
<destination>destination</destination> <!-- mandatory --> <!-- identifier -->

<next-hop>...</next-hop> <!-- mandatory -->
</route>
</routing-instances>
</preferred-route>
</then>
</policy>
</ip-monitoring>
</services>
</configuration>
```

**Description** Route

**Contents** <destination>—

<next-hop>—Next hop to destination of route-action

---

## <route> configuration/services/ip-monitoring/policy/then/preferred-route

---

### Usage

```
<configuration>
<services>
<ip-monitoring>
<policy>
```

```

<then>
 <preferred-route>
 <route>
 <destination>destination</destination> <!-- mandatory --> <!-- identifier -->
 <next-hop>...</next-hop> <!-- mandatory -->
 </route>
 </preferred-route>
</then>
</policy>
</ip-monitoring>
</services>
</configuration>

```

**Description** Route

**Contents** <destination>—  
 <next-hop>—Next hop to destination of route-action

## <routing-instance> configuration/security/nat/source/pool

### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <pool>
 <routing-instance>
 <ri-name>ri-name</ri-name>
 </routing-instance>
 </pool>
 </source>
 </nat>
 </security>
</configuration>

```

**Description** Routing instance

**Contents** <ri-name>—Routing instance name

## <routing-instance> configuration/security/nat/source/rule-set/from

### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <from>
 <routing-instance>

```

```
<default/>
<ri-name/>
</routing-instance>
</from>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Source routing instance list

**Contents** <default>—Default routing-instance  
<ri-name>—Routing-instance name

---

### <routing-instance> configuration/security/nat/source/rule-set/to

---

#### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<to>
<routing-instance>
<default/>
<ri-name/>
</routing-instance>
</to>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Destination routing instance list

**Contents** <default>—Default routing-instance  
<ri-name>—Routing-instance name

---

### <routing-instance> configuration/security/nat/destination/pool

---

#### Usage

```
<configuration>
<security>
<nat>
<destination>
<pool>
```

```

 <routing-instance>
 <default/>
 <ri-name/>
 </routing-instance>
</pool>
</destination>
</nat>
</security>
</configuration>

```

**Description** Routing instance

**Contents** <default>—Default routing-instance  
 <ri-name>—Routing-instance name

### <routing-instance> configuration/security/nat/destination/rule-set/from

#### Usage

```

<configuration>
<security>
<nat>
<destination>
<rule-set>
<from>
 <routing-instance>
 <default/>
 <ri-name/>
</routing-instance>
</from>
</rule-set>
</destination>
</nat>
</security>
</configuration>

```

**Description** Source routing instance list

**Contents** <default>—Default routing-instance  
 <ri-name>—Routing-instance name

### <routing-instance> configuration/security/nat/static/rule-set/from

#### Usage

```

<configuration>
<security>
<nat>
<static>
<rule-set>

```

```
<from>
 <routing-instance>
 <default/>
 <ri-name/>
 </routing-instance>
</from>
</rule-set>
</static>
</nat>
</security>
</configuration>
```

**Description** Source routing instance list

**Contents** <default>—Default routing-instance  
<ri-name>—Routing-instance name

---

## <routing-instances> configuration/services/ip-monitoring/policy/then/preferred-route

---

### Usage

```
<configuration>
 <services>
 <ip-monitoring>
 <policy>
 <then>
 <preferred-route>
 <routing-instances>
 <instance-name>instance-name</instance-name> <!-- mandatory --> <!--
identifier -->
 <route>...</route> <!-- mandatory -->
 </routing-instances>
 </preferred-route>
 </then>
 </policy>
 </ip-monitoring>
 </services>
</configuration>
```

**Description** Routing-instance

**Contents** <instance-name>—  
<route>—Route

---

## <routing-instances> configuration

---

### Description

## **<rpm> configuration/services**

---

### **Usage**

```
<configuration>
 <services>
 <rpm>
 <probe-server/>
 </rpm>
 </services>
</configuration>
```

### **Description**

**Contents**    <probe-server>—

## **<rpm-probe> configuration/services/ip-monitoring/policy/match**

---

### **Usage**

```
<configuration>
 <services>
 <ip-monitoring>
 <policy>
 <match>
 <rpm-probe>
 <name>name</name> <!-- identifier -->
 </rpm-probe>
 </match>
 </policy>
 </ip-monitoring>
 </services>
</configuration>
```

**Description**    RPM probe name

**Contents**    <name>—RPM probe name

## **<rsh> configuration/security/alg**

---

### **Usage**

```
<configuration>
 <security>
 <alg>
 <rsh>
 <disable/>
 <traceoptions>...</traceoptions>
 </rsh>
 </alg>
 </security>
```

</configuration>

**Description** Configure RSH ALG

**Contents** <disable>—Disable RSH ALG  
<traceoptions>—RSH ALG trace options

---

## <rstp> configuration/protocols

### Usage

```
<configuration>
 <protocols>
 <rstp>
 <disable/>
 <bridge-priority>bridge-priority</bridge-priority>
 <max-age>max-age</max-age>
 <hello-time>hello-time</hello-time>
 <forward-delay>forward-delay</forward-delay>
 <traceoptions>...</traceoptions>
 <interface>...</interface>
 <bpd-block-on-edge/>
 </rstp>
 </protocols>
</configuration>
```

**Description** Rapid Spanning Tree Protocol options

**Contents** <disable>—Disable STP

<bridge-priority>—Priority of the bridge (in increments of 4k - 0,4k,8k,..60k)

<max-age>—Maximum age of received protocol bpd

<hello-time>—Time interval between configuration BPDUs

<forward-delay>—Time spent in listening or learning state

<traceoptions>—Tracing options for debugging protocol operation

<interface>—

<bpd-block-on-edge>—Block BPD on all interfaces configured as edge (BPD Protect)

---

## <rtsp> configuration/security/alg

### Usage

```
<configuration>
 <security>
 <alg>
```

```

<rtsp>
 <disable/>
 <traceoptions>...</traceoptions>
</rtsp>
</alg>
</security>
</configuration>

```

**Description** Configure RTSP ALG

**Contents** <disable>—Disable RTSP ALG

<traceoptions>—RTSP ALG trace options

## <rule> configuration/security/application-firewall/rule-sets

### Usage

```

<configuration>
 <security>
 <application-firewall>
 <rule-sets>
 <rule>
 <rule-name>rule-name</rule-name> <!-- identifier -->
 <match>...</match> <!-- mandatory -->
 <then>...</then> <!-- mandatory -->
 </rule>
 </rule-sets>
 </application-firewall>
 </security>
</configuration>

```

**Description** Rule

**Contents** <rule-name>—Rule name

<match>—Specify security rule match-criteria

<then>—Specify rule action to take when packet match criteria

## <rule> configuration/security/nat/source/rule-set

### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule>
 <rule-name>rule-name</rule-name> <!-- identifier -->
 <description>description</description>

```

```
<match>...</match> <!-- mandatory -->
<then>...</then> <!-- mandatory -->
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Source NAT rule

**Contents** <rule-name>—Source NAT Rule name

<description>—Text description of rule

<src-nat-rule-match>—Specify Source NAT rule match criteria

<then>—Then action

---

## <rule> configuration/security/nat/destination/rule-set

---

### Usage

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
<rule-name>rule-name</rule-name> <!-- identifier -->
<description>description</description>
<match>...</match> <!-- mandatory -->
<then>...</then> <!-- mandatory -->
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** Destination NAT rule

**Contents** <rule-name>—Rule name

<description>—Text description of rule

<dest-nat-rule-match>—Specify Destination NAT rule match criteria

<then>—Then action

## <rule> configuration/security/nat/static/rule-set

---

### Usage

```
<configuration>
 <security>
 <nat>
 <static>
 <rule-set>
 <rule>
 <rule-name>rule-name</rule-name> <!-- identifier -->
 <description>description</description>
 <match>...</match> <!-- mandatory -->
 <then>...</then> <!-- mandatory -->
 </rule>
 </rule-set>
 </static>
 </nat>
 </security>
</configuration>
```

**Description** Static NAT rule

**Contents** <rule-name>—Rule name

<description>—Text description of rule

<static-nat-rule-match>—Specify Static NAT rule match criteria

<then>—Then action

## <rule-set> configuration/security/nat/source

---

### Usage

```
<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule-set-name>rule-set-name</rule-set-name> <!-- identifier -->
 <description>description</description>
 <from>...</from> <!-- mandatory -->
 <to>...</to> <!-- mandatory -->
 <rule>...</rule>
 </rule-set>
 </source>
 </nat>
 </security>
</configuration>
```

**Description** Configure a set of rules

**Contents**    <rule-set-name>—Rule-set name

                 <description>—Text description of rule set

                 <from>—Where is the traffic from

                 <to>—Where is the traffic to

                 <rule>—Source NAT rule

---

## <rule-set> configuration/security/nat/destination

### Usage

```
<configuration>
 <security>
 <nat>
 <destination>
 <rule-set>
 <rule-set-name>rule-set-name</rule-set-name> <!-- identifier -->
 <description>description</description>
 <from>...</from> <!-- mandatory -->
 <rule>...</rule>
 </rule-set>
 </destination>
 </nat>
 </security>
</configuration>
```

**Description**    Configure a set of rules

**Contents**    <rule-set-name>—Rule-set name

                 <description>—Text description of rule set

                 <from>—Where is the traffic from

                 <rule>—Destination NAT rule

---

## <rule-set> configuration/security/nat/static

### Usage

```
<configuration>
 <security>
 <nat>
 <static>
 <rule-set>
 <rule-set-name>rule-set-name</rule-set-name> <!-- identifier -->
 <description>description</description>
 <from>...</from> <!-- mandatory -->
 <rule>...</rule>
 </rule-set>
 </static>
```

```

 </nat>
 </security>
</configuration>

```

**Description** Configure a set of rules

**Contents**

- <rule-set-name>—Rule-set name
- <description>—Text description of rule set
- <from>—Where is the traffic from
- <rule>—Static NAT rule

## <rule-sets> configuration/security/application-firewall

### Usage

```

<configuration>
 <security>
 <application-firewall>
 <rule-sets>
 <ruleset-name>ruleset-name</ruleset-name> <!-- identifier -->
 <rule>...</rule> <!-- mandatory -->
 <default-rule>...</default-rule> <!-- mandatory -->
 </rule-sets>
 </application-firewall>
 </security>
</configuration>

```

**Description** Configure application-firewall rule-sets

**Contents**

- <ruleset-name>—Application firewall rule-set name
- <rule>—Rule
- <default-rule>—Specify default rule for a rule-set

## CHAPTER 45

# Tag Elements Beginning with S

This chapter lists the configuration tag elements that have names beginning with the letter *s*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<saturday>` configuration/schedulers/scheduler

#### Usage

```
<configuration>
 <schedulers>
 <scheduler>
 <saturday>
 <start-time>...</start-time>
 <exclude/>
 <all-day/>
 </saturday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Every Saturday

**Contents**

- `<start-time>`—Time range for day
- `<exclude>`—Exclude day from week
- `<all-day>`—Include complete day

## <sbl> configuration/security/utm/feature-profile/anti-spam

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-spam>
<sbl>
 <profile>...</profile>
</sbl>
</anti-spam>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** SBL settings

**Contents** <profile>—SBL profile

## <scan-options> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/profile

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<kaspersky-lab-engine>
<profile>
<scan-options>
 <intelligent-prescreening/>
 <scan-mode>scan-mode</scan-mode>
 <scan-extension>scan-extension</scan-extension>
 <content-size-limit>content-size-limit</content-size-limit>
 <timeout>timeout</timeout>
 <decompress-layer-limit>decompress-layer-limit</decompress-layer-limit>
</scan-options>
</profile>
</kaspersky-lab-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus scan options

- Contents**
- <intelligent-prescreening>—Anti-virus intelligent pre-screening
    - all - Scan all files
    - by-extension - Scan files with specified extension
  - <scan-mode>—Anti-virus scan mode
    - all - Scan all files
    - by-extension - Scan files with specified extension
  - <scan-extension>—Scan engine filename extension
  - <content-size-limit>—Content size limit
  - <timeout>—Scan engine timeout
  - <decompress-layer-limit>—Decompress layer limit

## <scan-options> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/profile

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<juniper-express-engine>
<profile>
<scan-options>
 <intelligent-prescreening/>
 <content-size-limit>content-size-limit</content-size-limit>
 <timeout>timeout</timeout>
</scan-options>
</profile>
</juniper-express-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus juniper-express-engine scan options

- Contents**
- <intelligent-prescreening>—Anti-virus intelligent pre-screening
  - <content-size-limit>—Content size limit
  - <timeout>—Scan engine timeout

## **<scan-options> configuration/security/utm/feature-profile/anti-virus/sophos-engine/profile**

---

**Usage**

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <anti-virus>
 <sophos-engine>
 <profile>
 <scan-options>
 <uri-check/>
 <content-size-limit>content-size-limit</content-size-limit>
 <timeout>timeout</timeout>
 </scan-options>
 </profile>
 </sophos-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Anti-virus sophos-engine scan options

**Contents** <uri-check>—Anti-virus uri-check

<content-size-limit>—Content size limit

<timeout>—Scan engine timeout

## **<sccp> configuration/security/alg**

---

**Usage**

```
<configuration>
<security>
 <alg>
 <sccp>
 <disable/>
 <inactive-media-timeout>inactive-media-timeout</inactive-media-timeout>
 <application-screen>...</application-screen>
 <dscp-rewrite>...</dscp-rewrite>
 <traceoptions>...</traceoptions>
 </sccp>
 </alg>
</security>
</configuration>
```

**Description** Configure SCCP ALG

<b>Contents</b>	<disable>—Disable SCCP ALG <inactive-media-timeout>—Set inactive media timeout <application-screen>—Configure application screens <dscp-rewrite>—DSCP code rewrite <traceoptions>—SCCP ALG trace options
-----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## <scheduler> configuration/schedulers

### Usage

```

<configuration>
 <schedulers>
 <scheduler>
 <scheduler-name>scheduler-name</scheduler-name> <!-- identifier -->
 <description>description</description>
 <start-date>...</start-date>
 <daily>...</daily>
 <sunday>...</sunday>
 <monday>...</monday>
 <tuesday>...</tuesday>
 <wednesday>...</wednesday>
 <thursday>...</thursday>
 <friday>...</friday>
 <saturday>...</saturday>
 </scheduler>
 </schedulers>
</configuration>

```

**Description** Scheduler configuration

<b>Contents</b>	<scheduler-name>—Name of security scheduler <description>—Text description of scheduler <start-date>—Start date and time ([YYYY-MM-DD.hh:mm]) <daily>—Everyday; can be overwritten by specific weekday <sunday>—Every Sunday <monday>—Every Monday <tuesday>—Every Tuesday <wednesday>—Every Wednesday <thursday>—Every Thursday <friday>—Every Friday
-----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<saturday>—Every Saturday

---

## <schedulers> configuration

---

### Usage

```
<configuration>
 <schedulers>
 <scheduler>...</scheduler>
 </schedulers>
</configuration>
```

**Description** Security scheduler

**Contents** <scheduler>—Scheduler configuration

---

## <screen> configuration/security

---

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>...</ids-option>
 <traceoptions>...</traceoptions>
 </screen>
 </security>
</configuration>
```

**Description** Configure screen feature

**Contents** <ids-option>—Configure ids-option

<traceoptions>—Trace options for Network Security Screen

---

## <sctp> configuration/security/gprs

---

### Usage

```
<configuration>
 <security>
 <gprs>
 <sctp>
 <profile>...</profile>
 <log>...</log>
 <traceoptions>...</traceoptions>
 </sctp>
 </gprs>
 </security>
</configuration>
```

- Description** GPRS stream control transmission protocol configuration
- Contents** <profile>—Configure stream transmission protocol
- <log>—GPRS stream control transmission protocol logs
- <traceoptions>—Trace options for GPRS stream control transmission protocol

---

### <secondary-server> configuration/smtp

---

**Usage**

```
<configuration>
 <smtp>
 <secondary-server>
 <address>address</address> <!-- mandatory -->
 <login>...</login>
 </secondary-server>
 </smtp>
</configuration>
```

- Description** SMTP secondary server configuration
- Contents** <address>—SMTP server's IPv4 address
- <login>—Configure a mail sender account to the server

---

### <secure-access-port> configuration/ethernet-switching-options

---

**Usage**

```
<configuration>
 <ethernet-switching-options>
 <secure-access-port>
 <interface>...</interface>
 <vlan>...</vlan>
 <dhcp-snooping-file>...</dhcp-snooping-file>
 </secure-access-port>
 </ethernet-switching-options>
</configuration>
```

- Description** Access port security options
- Contents** <interface>—Configure access port security for this interface
- <vlan>—Configure access port security for this VLAN
- <dhcp-snooping-file>—Configure DHCP snooping persistence file, write-interval and timeout

## <security> configuration

### Usage

```

<configuration>
 <security>
 <ike>...</ike>
 <ipsec>...</ipsec>
 <group-vpn>...</group-vpn>
 <alarms>...</alarms>
 <key-protection/>
 <pki>...</pki>
 <gprs>...</gprs>
 <address-book>...</address-book>
 <alg>...</alg>
 <application-firewall>...</application-firewall>
 <application-tracking>...</application-tracking>
 <utm>...</utm>
 <dynamic-vpn>...</dynamic-vpn>
 <softwires>...</softwires>
 <forwarding-options>...</forwarding-options>
 <flow>...</flow>
 <firewall-authentication>...</firewall-authentication>
 <screen>...</screen>
 <nat>...</nat>
 <forwarding-process>...</forwarding-process>
 <resource-manager>...</resource-manager>
 <analysis>...</analysis>
 <log>...</log>
 <traceoptions>...</traceoptions>
 <datapath-debug>...</datapath-debug>
 <user-identification>...</user-identification>
 <zones>...</zones>
 <idp>...</idp>
 </security>
</configuration>

```

**Description** Security configuration

**Contents**

- <ike>—IKE configuration
- <ipsec>—IPSec configuration
- <group-vpn>—Group VPN configuration
- <alarms>—Configure security alarms
- <key-protection>—Common-Criteria key-protection configuration
- <pki>—PKI service configuration
- <gprs>—GPRS configuration
- <address-book>—Security address book

<alg>—Configure ALG security options

<application-firewall>—Configure application-firewall rule-sets

<application-tracking>—Application tracking configuration

<utm>—Content security service configuration

<dynamic-vpn>—Configure dynamic VPN

<softwires>—Configure software feature

<forwarding-options>—Security-forwarding-options configuration

<flow>—FLOW configuration

<firewall-authentication>—Firewall authentication parameters

<screen>—Configure screen feature

<nat>—Configure Network Address Translation

<forwarding-process>—Configure security forwarding-process options

<resource-manager>—Configure resource manager security options

<analysis>—Configure security analysis

<log>—Configure security log

<traceoptions>—Network security daemon tracing options

<datapath-debug>—Datapath debug options

<user-identification>—Configure user-identification

<zones>—Zone configuration

<idp>—Configure IDP

---

## <security> configuration/wlan/access-point/radio/virtual-access-point

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <security>
 <mac-authentication-type>mac-authentication-type</mac-authentication-type>

 <static-wep>...</static-wep>
 <dot1x>...</dot1x>
 <wpa-personal>...</wpa-personal>
 <wpa-enterprise>...</wpa-enterprise>
```

```
<none/>
</security>
</virtual-access-point>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure security settings for the VAP

**Contents** <mac-authentication-type>—Select MAC authentication type

- disabled - Disable MAC authentication
- local - Select local MAC authentication
- radius - Select RADIUS server authentication

<static-wep>—Static WEP configuration

<dot1x>—Dot1x configuration

<wpa-personal>—Set WPA personal settings

<wpa-enterprise>—Set WAP enterprise settings

<none>—Unsecure plain-text communication

---

## <security-association> configuration/security/ipsec/internal

---

### Usage

```
<configuration>
<security>
<ipsec>
<internal>
<security-association>
<manual>...</manual>
</security-association>
</internal>
</ipsec>
</security>
</configuration>
```

**Description** Define an IPsec security association

**Contents** <manual>—Define a manual security association

---

## <security-zone> configuration/security/zones

---

### Usage

```
<configuration>
```

```

<security>
 <zones>
 <security-zone>
 <name>name</name> <!-- identifier -->
 <description>description</description>
 <tcp-rst/>
 <address-book>...</address-book>
 <screen>screen</screen>
 <host-inbound-traffic>...</host-inbound-traffic>
 <interfaces>...</interfaces>
 <application-tracking/>
 </security-zone>
 </zones>
</security>
</configuration>

```

**Description** Security zones

**Contents**

- <name>—Name of the zone
- <description>—Text description of zone
- <tcp-rst>—Send RST for NON-SYN packet not matching TCP session
- <address-book>—Address book entries
- <screen>—Name of ids option object applied to the zone
- <host-inbound-traffic>—Allowed system services & protocols
- <interfaces>—Interfaces that are part of this zone
- <application-tracking>—Enable Application tracking support for this zone

## [\*\*<select-profile> configuration/interfaces/interface/cellular-options/gsm-options\*\*](#)

### Usage

```

<configuration>
 <interfaces>
 <interface>
 <cellular-options>
 <gsm-options>
 <select-profile>
 <profile-id>profile-id</profile-id> <!-- mandatory -->
 </select-profile>
 </gsm-options>
 </cellular-options>
 </interface>
 </interfaces>
</configuration>

```

**Description** Profile to be applied

**Contents**    <profile-id>—Profile to be used for data calls

---

## <selection> configuration/security/gprs/gtp/profile/apn/imsi-prefix/action

---

### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<profile>
<apn>
<imsi-prefix>
<action>
 <selection>
 <ms/>
 <net/>
 <vrf/>
 </selection>
</action>
</imsi-prefix>
</apn>
</profile>
</gtp>
</gprs>
</security>
</configuration>
```

**Description**    Allowed selection modes for this APN

**Contents**    <ms>—Mobile Station selection mode  
                 <net>—Network selection mode  
                 <vrf>—Subscriber verified mode

---

## <server> configuration/security/group-vpn

---

### Usage

```
<configuration>
<security>
<group-vpn>
 <server>
 <traceoptions>...</traceoptions>
 <ike>...</ike>
 <ipsec>...</ipsec>
 <group>...</group>
 </server>
</group-vpn>
</security>
</configuration>
```

<b>Description</b>	Group VPN server configuration
<b>Contents</b>	<code>&lt;traceoptions&gt;</code> —Trace options for Group VPN debug <code>&lt;ike&gt;</code> —Group VPN IKE configuration <code>&lt;ipsec&gt;</code> —Group VPN IPsec configuration <code>&lt;group&gt;</code> —Define a Group VPN group

---

## `<server>` configuration/security/utm/feature-profile/web-filtering/surf-control-integrated

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <surf-control-integrated>
 <server>
 <host>host</host>
 <port>port</port>
 </server>
 </surf-control-integrated>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

<b>Description</b>	Surf control server
<b>Contents</b>	<code>&lt;host&gt;</code> —Server host IP address or string host name <code>&lt;port&gt;</code> —Server port

---

## `<server>` configuration/security/utm/feature-profile/web-filtering/websense-redirect/profile

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <websense-redirect>
 <profile>
 <server>
 <host>host</host>
 <port>port</port>
 </server>
 </profile>
 </websense-redirect>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

```
</server>
</profile>
</websense-redirect>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Websense redirect server

**Contents** <host>—Server host IP address or string host name  
<port>—Server port

---

### [\*\*<server> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced\*\*](#)

#### **Usage**

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<juniper-enhanced>
<server>
<host>host</host>
<port>port</port>
</server>
</juniper-enhanced>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Juniper enhanced server

**Contents** <host>—Server host IP address or string host name  
<port>—Server port

---

### [\*\*<server-fail> configuration/protocols/dot1x/authenticator/interface\*\*](#)

#### **Usage**

```
<configuration>
<protocols>
<dot1x>
<authenticator>
<interface>
<server-fail>
```

```
<deny/>
<permit/>
<vlan-name>vlan-name</vlan-name>
<use-cache/>
</server-fail>
</interface>
</authenticator>
</dot1x>
</protocols>
</configuration>
```

**Description** Action to be taken when server is inaccessible

**Contents** <deny>—Force client authentication to fail

<permit>—Force client authentication to succeed

<vlan-name>—VLAN name or 802.1q tag for unreachable servers

<use-cache>—Use the previous state of the client

---

## <server-load-balance> configuration/services

### Usage

```
<configuration>
<services>
 <server-load-balance>
 <real-server>...</real-server>
 <real-server-group>...</real-server-group>
 <virtual-server>...</virtual-server>
 <traceoptions>...</traceoptions>
 <external-manager>...</external-manager>
 </server-load-balance>
</services>
</configuration>
```

**Description** Configure server load balancing

**Contents** <real-server>—Configure real server

<real-server-group>—Configure real server group

<virtual-server>—Configure virtual server

<traceoptions>—Configure server load balance traceoptions

<external-manager>—Configure external manager

## <server-member-communication> configuration/security/group-vpn/server/group

### Usage

```

<configuration>
 <security>
 <group-vpn>
 <server>
 <group>
 <server-member-communication>
 <communication-type>communication-type</communication-type> <!--
mandatory -->
 <multicast-group>multicast-group</multicast-group>
 <multicast-outgoing-interface>...</multicast-outgoing-interface>
 <lifetime-seconds>lifetime-seconds</lifetime-seconds>
 <retransmission-period>retransmission-period</retransmission-period>

 <number-of-retransmission>number-of-retransmission</number-of-retransmission>
 <heartbeat>heartbeat</heartbeat>
 <encryption-algorithm>encryption-algorithm</encryption-algorithm> <!--
mandatory -->
 <sig-hash-algorithm>sig-hash-algorithm</sig-hash-algorithm> <!-- mandatory
-->
 <certificate>certificate</certificate>
 </server-member-communication>
 </group>
 </server>
 </group-vpn>
 </security>
</configuration>

```

**Description** Configure Server to Member communication parameters

**Contents** <communication-type>—Define type of server member communication

- unicast - Unicast
- multicast - Multicast
- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<multicast-group>—Specify the Multicast group address

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<multicast-outgoing-interface>—Name of the multicast outgoing interface

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<lifetime-seconds>—Configure lifetime in seconds

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<retransmission-period>—Configure retransmission period in seconds

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<number-of-retransmission>—Configure maximum number of retransmission attempts

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<heartbeat>—Configure heartbeat period in seconds

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<encryption-algorithm>—Define encryption algorithm

- des-cbc - DES-CBC encryption algorithm
- 3des-cbc - 3DES-CBC encryption algorithm
- aes-128-cbc - AES-CBC 128-bit encryption algorithm
- aes-192-cbc - AES-CBC 192-bit encryption algorithm
- aes-256-cbc - AES-CBC 256-bit encryption algorithm
- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<sig-hash-algorithm>—Define sig-hash algorithm

- md5 - MD5 sig-hash algorithm
- sha1 - SHA1 sig-hash algorithm

<certificate>—Certificate identifier

---

## <server-reject-vlan> configuration/protocols/dot1x/authenticator/interface

---

### Usage

```
<configuration>
<protocols>
 <dot1x>
```

```

<authenticator>
 <interface>
 <server-reject-vlan>
 <vlan-name>vlan-name</vlan-name> <!-- mandatory -->
 <block-interval>block-interval</block-interval>
 <eapol-block/>
 </server-reject-vlan>
 </interface>
</authenticator>
</dot1x>
</protocols>
</configuration>

```

**Description** VLAN name or 802.1q tag for authentication rejected clients

**Contents** <vlan-name>—VLAN name or VLAN Tag (1..4095)

<block-interval>—Interval for authenticator to ignore the EAP-Start packets.

<eapol-block>—Force the authenticator to ignore EAPOL-Start packets.

## <service-layer-card> configuration/services/traffic-distribution

### Usage

```

<configuration>
 <services>
 <traffic-distribution>
 <service-layer-card>
 <slot>slot</slot> <!-- identifier -->
 <placement>placement</placement> <!-- mandatory -->
 <mode>mode</mode> <!-- mandatory -->
 </service-layer-card>
 </traffic-distribution>
 </services>
</configuration>

```

**Description** Service layer card configuration

**Contents** <slot>—FPC slot number

- internal -
- external -
- bridge -
- server-load-balance -

<placement>—Card placement: internal or external

- internal -
- external -

- bridge -
- server-load-balance -

<mode>—Card operation mode

- bridge -
- server-load-balance -

---

## <services> configuration

### Usage

```
<configuration>
 <services>
 <application-identification/>
 <rpm>...</rpm>
 <ip-monitoring>...</ip-monitoring>
 <unified-access-control>...</unified-access-control>
 <traffic-distribution>...</traffic-distribution>
 <server-load-balance>...</server-load-balance>
 <captive-portal>...</captive-portal>
 </services>
</configuration>
```

**Description** Set services parameters

**Contents** <application-identification>—

<rpm>—

<ip-monitoring>—IP monitoring for route action

<unified-access-control>—Configure Unified Access Control

<traffic-distribution>—JunOS MAG SLC traffic distribution configuration

<server-load-balance>—Configure server load balancing

<captive-portal>—Captive Portal options

---

## <services> configuration/wlan/access-point/external/system

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <external>
 <system>
 <services>
 <ssh/>
 </services>
```

```
</system>
</external>
</access-point>
</wlan>
</configuration>
```

**Description** System services configuration

**Contents** <ssh>—Enable SSH service on the access point

---

### <sessions-per-client> configuration/security/utm/utm-policy/traffic-options

---

**Usage**

```
<configuration>
<security>
<utm>
<utm-policy>
<traffic-options>
 <sessions-per-client>
 <limit>limit</limit>
 <over-limit>over-limit</over-limit>
 </sessions-per-client>
</traffic-options>
</utm-policy>
</utm>
</security>
</configuration>
```

**Description** Sessions per client

**Contents** <limit>—Sessions limit

- log-and-permit -
- block -

<over-limit>—Over limit number

- log-and-permit -
- block -

---

### <shdsl-options> configuration/interfaces/interface

---

**Usage**

```
<configuration>
<interfaces>
<interface>
 <shdsl-options>
 <line-rate>line-rate</line-rate>
```

```
</shdsl-options>
</interface>
</interfaces>
</configuration>
```

**Description**

**Contents** <line-rate>—SHDSL line rate

- value - Enter Line Rate from 192 to 22784 in Kbps

---

**<sip> configuration/security/alg**

---

**Usage**

```
<configuration>
<security>
<alg>
<sip>
<disable/>
<inactive-media-timeout>inactive-media-timeout</inactive-media-timeout>
<maximum-call-duration>maximum-call-duration</maximum-call-duration>
<t1-interval>t1-interval</t1-interval>
<t4-interval>t4-interval</t4-interval>
<c-timeout>c-timeout</c-timeout>
<retain-hold-resource/>
<application-screen>...</application-screen>
<dscp-rewrite>...</dscp-rewrite>
<traceoptions>...</traceoptions>
</sip>
</alg>
</security>
</configuration>
```

**Description** Configure SIP ALG

**Contents** <disable>—Disable SIP ALG

<inactive-media-timeout>—Set inactive media timeout

<maximum-call-duration>—Set maximum call duration

<t1-interval>—Set T1 interval

<t4-interval>—Set T4 interval

<c-timeout>—Set C timeout

<retain-hold-resource>—Retain SDP resources during call hold

<application-screen>—Configure application screens

<dscp-rewrite>—DSCP code rewrite

<traceoptions>—SIP ALG trace options

## <site-reputation-action> configuration/security/utm/feature-profile/web-filtering/juniper-enhanced/profile

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<juniper-enhanced>
<profile>
<site-reputation-action>
<very-safe>very-safe</very-safe>
<moderately-safe>moderately-safe</moderately-safe>
<fairly-safe>fairly-safe</fairly-safe>
<suspicious>suspicious</suspicious>
<harmful>harmful</harmful>
</site-reputation-action>
</profile>
</juniper-enhanced>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Juniper enhanced site reputation action

**Contents** <very-safe>—Action when site reputation is very safe

- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -
- permit -

- log-and-permit -
- block -

<moderately-safe>—Action when site reputation is moderately safe

- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -

<fairly-safe>—Action when site reputation is fairly safe

- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -

<suspicious>—Action when site reputation is suspicious

- permit -
- log-and-permit -
- block -
- permit -
- log-and-permit -
- block -

<harmful>—Action when site reputation is harmful

- permit -
- log-and-permit -
- block -

## <sla-iterator-profile> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain/maintenance-association/mep/remote-mep

### Usage

```
<configuration>
<protocols>
 <oam>
 <ethernet>
 <connectivity-fault-management>
 <maintenance-domain>
 <maintenance-association>
 <mep>
 <remote-mep>
 <sla-iterator-profile>
 <profile-name>profile-name</profile-name> <!-- identifier -->
 <iteration-count>iteration-count</iteration-count>
 <priority>priority</priority>
 <data-tlv-size>data-tlv-size</data-tlv-size>
 </sla-iterator-profile>
 </remote-mep>
 </mep>
 </maintenance-association>
 </maintenance-domain>
 </connectivity-fault-management>
 </ethernet>
 </oam>
</protocols>
</configuration>
```

**Description** Name of the iterator profile

**Contents** <profile-name>—

<iteration-count>—SLA frames sent for this RMEP for this iterator

<priority>—The VLAN priority value to be sent in the Y.1731 frame

<data-tlv-size>—Size of the data TLV portion of Y.1731 frame

## <sla-iterator-profiles> configuration/protocols/oam/ethernet/connectivity-fault-management/performance-monitoring

### Usage

```
<configuration>
```

```
<protocols>
<oam>
 <ethernet>
 <connectivity-fault-management>
 <performance-monitoring>
 <sla-iterator-profiles>
 <iterator-name>iterator-name</iterator-name> <!-- identifier -->
 <passive/>
 <measurement-type>measurement-type</measurement-type> <!-- mandatory
-->
 <cycle-time>cycle-time</cycle-time>
 <iteration-period>iteration-period</iteration-period>
 <calculation-weight>...</calculation-weight>
 </sla-iterator-profiles>
 </performance-monitoring>
 </connectivity-fault-management>
 </ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Configuration related to an SLA monitoring iterator

**Contents** <iterator-name>—

- two-way-delay - Y.1731 2-way DM frames are sent for this profile

<passive>—Stop sending pdu out from iterator

- two-way-delay - Y.1731 2-way DM frames are sent for this profile

<measurement-type>—Choice of the type of Y.1731(SLA measurement) frame to be sent

- two-way-delay - Y.1731 2-way DM frames are sent for this profile

<cycle-time>—Time period of an iterator profile

<iteration-period>—Maximum services under this iterator profile

<calculation-weight>—Configure delay and delay variation calculation weight

---

## <smtp> configuration

### Usage

```
<configuration>
 <smtp>
 <primary-server>...</primary-server>
 <secondary-server>...</secondary-server>
 <traceoptions>...</traceoptions>
 </smtp>
</configuration>
```

<b>Description</b>	Simple Mail Transfer Protocol service configuration
<b>Contents</b>	<p>&lt;primary-server&gt;—SMTP primary server configuration</p> <p>&lt;secondary-server&gt;—SMTP secondary server configuration</p> <p>&lt;traceoptions&gt;—Trace options for SMTP client service</p>

---

### <software-name> configuration/security/softwires

---

**Usage**

```
<configuration>
 <security>
 <softwires>
 <software-name>
 <name>name</name> <!-- identifier -->
 <software-concentrator>software-concentrator</software-concentrator> <!--
mandatory -->
 <software-type>software-type</software-type>
 </software-name>
 </softwires>
 </security>
</configuration>
```

<b>Description</b>	Configure software object
<b>Contents</b>	<p>&lt;name&gt;—DS-Lite object name</p> <ul style="list-style-type: none"><li>• IPv4-in-IPv6 - Ipv4-in-IPv6</li></ul> <p>&lt;software-concentrator&gt;—Concentrator ipv6 address</p> <ul style="list-style-type: none"><li>• IPv4-in-IPv6 - Ipv4-in-IPv6</li></ul> <p>&lt;software-type&gt;—Software-type</p> <ul style="list-style-type: none"><li>• IPv4-in-IPv6 - Ipv4-in-IPv6</li></ul>

---

### <softwires> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <softwires>
 <software-name>...</software-name>
 <traceoptions>...</traceoptions>
 </softwires>
 </security>
</configuration>
```

**Description** Configure software feature

**Contents** <software-name>—Configure software object  
<traceoptions>—Trace options for Network Security DS-Lite

---

## <sophos-engine> configuration/security/utm/feature-profile/anti-virus

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<sophos-engine>
<sxl-timeout>sxl-timeout</sxl-timeout>
<sxl-retry>sxl-retry</sxl-retry>
<pattern-update>...</pattern-update>
<profile>...</profile>
</sophos-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus sophos-engine

**Contents** <sxl-timeout>—Sxl sophos anti-virus engine timeout  
<sxl-retry>—Sxl sophos anti-virus engine query retry (number of times)  
<pattern-update>—Anti-virus sophos-engine pattern update  
<profile>—Anti-virus sophos-engine profile

---

## <source> configuration/security/nat

---

### Usage

```
<configuration>
<security>
<nat>
<source>
<pool>...</pool>
<address-persistent/>
<pool-utilization-alarm>...</pool-utilization-alarm>
<port-randomization>...</port-randomization>
<pool-default-port-range>...</pool-default-port-range>
<interface>...</interface>
<rule-set>...</rule-set>
</source>
```

```
</nat>
</security>
</configuration>
```

**Description** Configure Source NAT

**Contents**

- <pool>—Define a source address pool
- <address-persistent>—Allow source address to maintain same translation
- <pool-utilization-alarm>—Configure pool utilization alarm
- <port-randomization>—Configure Source NAT port randomization
- <pool-default-port-range>—Configure Source NAT default port range
- <interface>—Configure interface port overloading for persistent NAT
- <rule-set>—Configure a set of rules

---

## <source> configuration/protocols/igmp-snooping/vlan/data-forwarding

---

### Usage

```
<configuration>
 <protocols>
 <igmp-snooping>
 <vlan>
 <data-forwarding>
 <source>
 </source>
 </data-forwarding>
 </vlan>
 </igmp-snooping>
 </protocols>
 </configuration>
```

**Description** Source

### Contents

---

## <source-address> configuration/security/screen/ids-option/tcp/syn-flood/white-list

---

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <tcp>
 <syn-flood>
 <white-list>
```

```
<source-address>
 <address>address</address> <!-- identifier -->
</source-address>
</white-list>
</syn-flood>
</tcp>
</ids-option>
</screen>
</security>
</configuration>
```

**Description** Source address

**Contents** <address>—IPv4 or IPv6 source address

---

### <source-address> configuration/security/nat/source/rule-set/rule/match

---

#### Usage

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<rule>
<match>
 <source-address>
 <src-addr>src-addr</src-addr> <!-- identifier -->
 </source-address>
</match>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Source address

**Contents** <src-addr>—IPv4 or IPv6 source address

---

### <source-address> configuration/security/nat/destination/rule-set/rule/match

---

#### Usage

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
<match>
```

```

 <source-address>
 <src-addr>src-addr</src-addr> <!-- identifier -->
 </source-address>
 </match>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>

```

**Description** Source address

**Contents** <src-addr>—IPv4 or IPv6 source address

### <source-address-name> configuration/security/nat/source/rule-set/rule/match

#### Usage

```

<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule>
 <match>
 <source-address-name>
 <src-addr-name>src-addr-name</src-addr-name> <!-- identifier -->
 </source-address-name>
 </match>
 </rule>
 </rule-set>
 </source>
 </nat>
 </security>
</configuration>

```

**Description** Address/address-set from address book

**Contents** <src-addr-name>—Address/address-set from address book

### <source-address-name> configuration/security/nat/destination/rule-set/rule/match

#### Usage

```

<configuration>
 <security>
 <nat>
 <destination>
 <rule-set>
 <rule>
 <match>

```

```
<source-address-name>
 <src-addr-name>src-addr-name</src-addr-name> <!-- identifier -->
</source-address-name>
</match>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** Address/address-set from address book

**Contents** <src-addr-name>—Address/address-set from address book

---

### <source-ip> configuration/security/alarms/potential-violation/policy

---

#### Usage

```
<configuration>
<security>
 <alarms>
 <potential-violation>
 <policy>
 <source-ip>
 <threshold>threshold</threshold>
 <duration>duration</duration>
 <size>size</size>
 </source-ip>
 </policy>
 </potential-violation>
 </alarms>
</security>
</configuration>
```

**Description** Configure source address type of policy violation

**Contents** <threshold>—Number of source IP address matches to raise alarm

<duration>—Time window matches must occur within

<size>—Total source IP address number that can be done policy violation check concurrently

---

### <source-nat> configuration/security/nat/source/rule-set/rule/then

---

#### Usage

```
<configuration>
<security>
 <nat>
 <source>
```

```
<rule-set>
 <rule>
 <then>
 <source-nat>
 <off/>
 <pool>...</pool>
 <interface>...</interface>
 </source-nat>
 </then>
 </rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Source NAT action

**Contents** <off>—No action

<pool>—Use Source NAT pool

<interface>—Use egress interface address

## <source-vlans> configuration/protocols/igmp-snooping/vlan/data-forwarding/receiver

---

### Usage

```
<configuration>
 <protocols>
 <igmp-snooping>
 <vlan>
 <data-forwarding>
 <receiver>
 <source-vlans>
 <vlan-name>vlan-name</vlan-name> <!-- identifier -->
 </source-vlans>
 </receiver>
 </data-forwarding>
 </vlan>
 </igmp-snooping>
 </protocols>
</configuration>
```

**Description** Source VLANs

**Contents** <vlan-name>—VLAN name

## **<sql> configuration/security/alg**

---

**Usage**

```
<configuration>
 <security>
 <alg>
 <sql>
 <disable/>
 <traceoptions>...</traceoptions>
 </sql>
 </alg>
 </security>
</configuration>
```

**Description**    Configure SQL ALG

**Contents**    <disable>—Disable SQL ALG

                 <traceoptions>—SQL ALG trace options

## **<start-date> configuration/schedulers/scheduler**

---

**Usage**

```
<configuration>
 <schedulers>
 <scheduler>
 <start-date>
 <start-date>start-date</start-date> <!-- identifier -->
 <stop-date>stop-date</stop-date> <!-- identifier -->
 </start-date>
 </scheduler>
 </schedulers>
</configuration>
```

**Description**    Start date and time ([YYYY-]MM-DD.hh:mm)

**Contents**    <start-date>—Start date and time ([YYYY-]MM-DD.hh:mm)

                 <stop-date>—Stop date and time ([YYYY-]MM-DD.hh:mm)

## **<start-time> configuration/schedulers/scheduler/daily**

---

**Usage**

```
<configuration>
 <schedulers>
 <scheduler>
 <daily>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 </start-time>
 </daily>
 </scheduler>
 </schedulers>
</configuration>
```

```
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
 </daily>
 </scheduler>
</schedulers>
</configuration>
```

**Description** Time range for day

**Contents** <start-time-value>—Start time for day (hh:mm:ss)

<stop-time>—Stop time for day (hh:mm:ss)

---

### <start-time> configuration/schedulers/scheduler/sunday

---

#### Usage

```
<configuration>
<schedulers>
<scheduler>
<sunday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
</sunday>
</scheduler>
</schedulers>
</configuration>
```

**Description** Time range for day

**Contents** <start-time-value>—Start time for day (hh:mm:ss)

<stop-time>—Stop time for day (hh:mm:ss)

---

### <start-time> configuration/schedulers/scheduler/monday

---

#### Usage

```
<configuration>
<schedulers>
<scheduler>
<monday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
</monday>
</scheduler>
</schedulers>
```

</configuration>

**Description** Time range for day

**Contents** <start-time-value>—Start time for day (hh:mm:ss)  
<stop-time>—Stop time for day (hh:mm:ss)

---

### <start-time> configuration/schedulers/scheduler/tuesday

---

#### Usage

```
<configuration>
 <schedulers>
 <scheduler>
 <tuesday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
 </tuesday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Time range for day

**Contents** <start-time-value>—Start time for day (hh:mm:ss)  
<stop-time>—Stop time for day (hh:mm:ss)

---

### <start-time> configuration/schedulers/scheduler/wednesday

---

#### Usage

```
<configuration>
 <schedulers>
 <scheduler>
 <wednesday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
 </wednesday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Time range for day

**Contents**    <start-time-value>—Start time for day (hh:mm:ss)

                 <stop-time>—Stop time for day (hh:mm:ss)

---

### <start-time> configuration/schedulers/scheduler/thursday

---

**Usage**

```
<configuration>
 <schedulers>
 <scheduler>
 <thursday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
 </thursday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description**    Time range for day

**Contents**    <start-time-value>—Start time for day (hh:mm:ss)

                 <stop-time>—Stop time for day (hh:mm:ss)

---

### <start-time> configuration/schedulers/scheduler/friday

---

**Usage**

```
<configuration>
 <schedulers>
 <scheduler>
 <friday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
 </friday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description**    Time range for day

**Contents**    <start-time-value>—Start time for day (hh:mm:ss)

                 <stop-time>—Stop time for day (hh:mm:ss)

## <start-time> configuration/schedulers/scheduler/saturday

---

**Usage**

```
<configuration>
 <schedulers>
 <scheduler>
 <saturday>
 <start-time>
 <start-time-value>start-time-value</start-time-value> <!-- identifier -->
 <stop-time>stop-time</stop-time> <!-- identifier -->
 </start-time>
 </saturday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Time range for day

**Contents** <start-time-value>—Start time for day (hh:mm:ss)  
<stop-time>—Stop time for day (hh:mm:ss)

## <static> configuration/security/nat

---

**Usage**

```
<configuration>
 <security>
 <nat>
 <static>
 <rule-set>...</rule-set>
 </static>
 </nat>
 </security>
</configuration>
```

**Description** Configure Static NAT

**Contents** <rule-set>—Configure a set of rules

## <static> configuration/protocols/dot1x/authenticator

---

**Usage**

```
<configuration>
 <protocols>
 <dot1x>
 <authenticator>
 <static>
 <mac>mac</mac> <!-- mandatory --> <!-- identifier -->
 <vlan-assignment>vlan-assignment</vlan-assignment>
 </static>
 </authenticator>
 </dot1x>
 </protocols>
</configuration>
```

```
<interface>interface</interface>
</static>
</authenticator>
</dot1x>
</protocols>
</configuration>
```

**Description** Static MAC configuration needed to bypass 802.1X

**Contents** <mac>—MAC addresses to bypass authentication  
<vlan-assignment>—VLAN name or 802.1q tag for the MAC address  
<interface>—Interface on which authentication is bypassed

---

### <static> configuration/protocols/igmp-snooping/vlan/interface

---

#### Usage

```
<configuration>
<protocols>
<igmp-snooping>
<vlan>
<interface>
<static>
<group>...</group>
</static>
</interface>
</vlan>
</igmp-snooping>
</protocols>
</configuration>
```

**Description** Static group or source membership

**Contents** <group>—IP multicast group address

---

### <static> configuration/protocols/mld-snooping/vlan/interface

---

#### Usage

```
<configuration>
<protocols>
<mld-snooping>
<vlan>
<interface>
<static>
<group>...</group>
</static>
</interface>
</vlan>
</mld-snooping>
```

```
</protocols>
</configuration>
```

**Description** Static group or source membership

**Contents** <group>—IP multicast group address

---

## <static> configuration/wlan/access-point/external/system/ports/ethernet

---

### Usage

```
<configuration>
<wlan>
 <access-point>
 <external>
 <system>
 <ports>
 <ethernet>
 <static>
 <address>address</address> <!-- mandatory -->
 <default-gateway>default-gateway</default-gateway> <!-- mandatory -->
 </static>
 </ethernet>
 </ports>
 </system>
 </external>
 </access-point>
</wlan>
</configuration>
```

**Description** Specify static parameters

**Contents** <address>—Static IP address

<default-gateway>—Default gateway IP

---

## <static> configuration/ethernet-switching-options

---

### Usage

```
<configuration>
<ethernet-switching-options>
 <static>
 <vlan>...</vlan>
 </static>
</ethernet-switching-options>
</configuration>
```

**Description** Static forwarding entries

**Contents**    <vlan>—VLAN static MAC entries

---

## <static-ip> configuration/ethernet-switching-options/secure-access-port/interface

---

### Usage

```
<configuration>
<ethernet-switching-options>
 <secure-access-port>
 <interface>
 <static-ip>
 <ip>ip</ip> <!-- identifier -->
 <vlan>vlan</vlan> <!-- mandatory -->
 <mac>mac</mac> <!-- mandatory -->
 </static-ip>
 </interface>
 </secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description**    Static IP address configuration

**Contents**    <ip>—IP address

                 <vlan>—VLAN name or VLAN Tag (1..4095)

                 <mac>—MAC address

---

## <static-nat> configuration/security/nat/static/rule-set/rule/then

---

### Usage

```
<configuration>
<security>
 <nat>
 <static>
 <rule-set>
 <rule>
 <then>
 <static-nat>
 <inet>...</inet>
 <prefix>...</prefix>
 <prefix-name>...</prefix-name>
 </static-nat>
 </then>
 </rule>
 </rule-set>
 </static>
 </nat>
</security>
</configuration>
```

**Description** Static NAT action

**Contents** <inet>—Translated to IPv4 address  
<prefix>—Address prefix  
<prefix-name>—Address from address book

## <static-wep> configuration/wlan/access-point/radio/virtual-access-point/security

### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <security>
 <static-wep>
 <authentication-type>authentication-type</authentication-type>
 <key-length>key-length</key-length>
 <key-type>key-type</key-type>
 <transfer-key-index>transfer-key-index</transfer-key-index>
 <wep-key-1>wep-key-1</wep-key-1>
 <wep-key-2>wep-key-2</wep-key-2>
 <wep-key-3>wep-key-3</wep-key-3>
 <wep-key-4>wep-key-4</wep-key-4>
 </static-wep>
 </security>
 </virtual-access-point>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Static WEP configuration

**Contents** <authentication-type>—Select Static WEP authentication type

- open - Open type
- shared - Shared type
- both - Both open and shared authentication
- 64bits - Use 64 bit key (ASCII:5 chars, HEX:10 chars)
- 128bits - Use 128 bit key (ASCII:13 chars, HEX:26 chars)
- ascii - ASCII key (default key-length is 64 bits)
- hex - HEX key (default key-length is 64 bits)

<key-length>—Specify key length (defaults to 64 bits)

- 64bits - Use 64 bit key (ASCII:5 chars, HEX:10 chars)
- 128bits - Use 128 bit key (ASCII:13 chars, HEX:26 chars)
- ascii - ASCII key (default key-length is 64 bits)
- hex - HEX key (default key-length is 64 bits)

<key-type>—Specify key type (defaults to ASCII)

- ascii - ASCII key (default key-length is 64 bits)
- hex - HEX key (default key-length is 64 bits)

<transfer-key-index>—Specify transfer key index (1-4)

<wep-key-1>—Specify WEP key (defaults to ASCII 64 bits, 5 chars long)

<wep-key-2>—Specify WEP key (defaults to ASCII 64 bits, 5 chars long)

<wep-key-3>—Specify WEP key (defaults to ASCII 64 bits, 5 chars long)

<wep-key-4>—Specify WEP key (defaults to ASCII 64 bits, 5 chars long)

---

## <station-mac-filter> configuration/wlan/access-point/access-point-options

### Usage

```
<configuration>
<wlan>
 <access-point>
 <access-point-options>
 <station-mac-filter>
 <allow-list>...</allow-list>
 <deny-list>...</deny-list>
 </station-mac-filter>
 </access-point-options>
 </access-point>
</wlan>
</configuration>
```

### Description

**Contents**    <allow-list>—Allow the MAC addresses

              <deny-list>—Deny the MAC addresses

---

## <station-queues> configuration/wlan/access-point/radio/quality-of-service

### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
```

```
<quality-of-service>
 <station-queues>
 <voice-queue>...</voice-queue>
 <video-queue>...</video-queue>
 <best-effort-queue>...</best-effort-queue>
 <background-queue>...</background-queue>
 </station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure the station queues

**Contents** <voice-queue>—Configure voice queue

<video-queue>—Configure video queue

<best-effort-queue>—Configure best effort queue

<background-queue>—Configure background queue

---

## <storm-control> configuration/ethernet-switching-options

### Usage

```
<configuration>
 <ethernet-switching-options>
 <storm-control>
 <action-shutdown/>
 <interface>...</interface>
 </storm-control>
 </ethernet-switching-options>
</configuration>
```

**Description** Storm control configuration

**Contents** <action-shutdown>—Port is disabled for excessive storm control errors

<interface>—Configure storm control for this interface

---

## <stp> configuration/protocols

### Usage

```
<configuration>
 <protocols>
 <stp>
 <disable/>
 <bridge-priority>bridge-priority</bridge-priority>
 <max-age>max-age</max-age>
 </stp>
 </protocols>
</configuration>
```

```
<hello-time>hello-time</hello-time>
<forward-delay>forward-delay</forward-delay>
<traceoptions>...</traceoptions>
<interface>...</interface>
<bpdublockonedge/>
</stp>
</protocols>
</configuration>
```

**Description** Spanning Tree Protocol options

**Contents** <disable>—Disable STP

<bridgepriority>—Priority of the bridge (in increments of 4k - 0,4k,8k,..60k)

<maxage>—Maximum age of received protocol bpdub

<hello-time>—Time interval between configuration BPDUs

<forward-delay>—Time spent in listening or learning state

<traceoptions>—Tracing options for debugging protocol operation

<interface>—

<bpdublockonedge>—Block BPDUB on all interfaces configured as edge (BPDUB Protect)

---

## <stream> configuration/security/log

---

### Usage

```
<configuration>
 <security>
 <log>
 <stream>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <severity>severity</severity>
 <format>format</format>
 <category>category</category>
 <host>...</host>
 </stream>
 </log>
 </security>
</configuration>
```

**Description** Set security log stream settings (maximum 3 streams)

**Contents** <name>—Name of security log stream

- emergency - Conditions that cause security functions to stop
- alert - Conditions that require immediate attention

- critical - Critical conditions
- error - General error conditions
- warning - General warning conditions
- notice - Non-error conditions that are of interest
- info - Information about normal security operations
- debug - Information normally used in debugging
- syslog - Traditional syslog
- sd-syslog - Structured syslog
- welf - Web Trends Extended Log Format
- binary - Binary log
- all - All events are logged
- content-security - Only content security events are logged

<severity>—Severity threshold for security logs

- emergency - Conditions that cause security functions to stop
- alert - Conditions that require immediate attention
- critical - Critical conditions
- error - General error conditions
- warning - General warning conditions
- notice - Non-error conditions that are of interest
- info - Information about normal security operations
- debug - Information normally used in debugging
- syslog - Traditional syslog
- sd-syslog - Structured syslog
- welf - Web Trends Extended Log Format
- binary - Binary log
- all - All events are logged
- content-security - Only content security events are logged

<format>—Specify the log stream format

- syslog - Traditional syslog
- sd-syslog - Structured syslog
- welf - Web Trends Extended Log Format
- binary - Binary log

- all - All events are logged
- content-security - Only content security events are logged

<category>—Selects the type of events that may be logged

- all - All events are logged
- content-security - Only content security events are logged

<host>—Destination to send security logs to

---

### <sunday> configuration/schedulers/scheduler

---

#### Usage

```
<configuration>
<schedulers>
<scheduler>
<sunday>
 <start-time>...</start-time>
 <exclude/>
 <all-day/>
</sunday>
</scheduler>
</schedulers>
</configuration>
```

**Description** Every Sunday

**Contents** <start-time>—Time range for day  
<exclude>—Exclude day from week  
<all-day>—Include complete day

---

### <sunrpc> configuration/security/alg

---

#### Usage

```
<configuration>
<security>
<alg>
<sunrpc>
 <disable/>
 <traceoptions>...</traceoptions>
</sunrpc>
</alg>
</security>
</configuration>
```

**Description** Configure SUNRPC ALG

**Contents**    <disable>—Disable SUNRPC ALG  
                 <traceoptions>—SUNRPC ALG trace options

## <supported-basic-rates> configuration/wlan/access-point/radio/radio-options/transmit-rate-sets

---

### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <radio-options>
 <transmit-rate-sets>
 <supported-basic-rates>
 <1/>
 <2/>
 <5.5/>
 <6/>
 <9/>
 <11/>
 <12/>
 <18/>
 <24/>
 <36/>
 <48/>
 <54/>
 </supported-basic-rates>
 </transmit-rate-sets>
 </radio-options>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description**    List of supported basic rates in Mbps

**Contents**    <1>—Rate-1Mbps  
                 <2>—Rate-2Mbps  
                 <5.5>—Rate-5.5Mbps  
                 <6>—Rate-6Mbps  
                 <9>—Rate-9Mbps  
                 <11>—Rate-11Mbps  
                 <12>—Rate-12Mbps  
                 <18>—Rate-18Mbps

<24>—Rate-24Mbps

<36>—Rate-36Mbps

<48>—Rate-48Mbps

<54>—Rate-54Mbps

## <supported-rates> configuration/wlan/access-point/radio/radio-options/transmit-rate-sets

### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <radio-options>
 <transmit-rate-sets>
 <supported-rates>
 <1/>
 <2/>
 <5.5/>
 <6/>
 <9/>
 <11/>
 <12/>
 <18/>
 <24/>
 <36/>
 <48/>
 <54/>
 </supported-rates>
 </transmit-rate-sets>
 </radio-options>
 </radio>
 </access-point>
 </wlan>
</configuration>

```

**Description** List of supported rates in Mbps

**Contents**

<1>—Rate-1Mbps

<2>—Rate-2Mbps

<5.5>—Rate-5.5Mbps

<6>—Rate-6Mbps

<9>—Rate-9Mbps

<11>—Rate-11Mbps

<12>—Rate-12Mbps

<18>—Rate-18Mbps

<24>—Rate-24Mbps

<36>—Rate-36Mbps

<48>—Rate-48Mbps

<54>—Rate-54Mbps

---

## <surf-control-integrated> configuration/security/utm/feature-profile/web-filtering

---

### Usage

```
<configuration>
<security>
 <utm>
 <feature-profile>
 <web-filtering>
 <surf-control-integrated>
 <cache>...</cache>
 <server>...</server>
 <profile>...</profile>
 </surf-control-integrated>
 </web-filtering>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Configure web-filtering surf-control integrated engine

**Contents** <cache>—

<server>—Surf control server

<profile>—Surf control integrated profile

---

## <syn-ack-ack-proxy> configuration/security/screen/ids-option/tcp

---

### Usage

```
<configuration>
<security>
 <screen>
 <ids-option>
 <tcp>
 <syn-ack-ack-proxy>
 <threshold>threshold</threshold>
 </syn-ack-ack-proxy>
 </tcp>
 </ids-option>
```

```
</screen>
</security>
</configuration>
```

**Description** Enable syn-ack-ack proxy ids option

**Contents** <threshold>—Threshold

---

### <syn-flood> configuration/security/screen/ids-option/tcp

---

#### Usage

```
<configuration>
<security>
<screen>
<ids-option>
<tcp>
<syn-flood>
<alarm-threshold>alarm-threshold</alarm-threshold>
<attack-threshold>attack-threshold</attack-threshold>
<source-threshold>source-threshold</source-threshold>
<destination-threshold>destination-threshold</destination-threshold>
<timeout>timeout</timeout>
<white-list>...</white-list>
</syn-flood>
</tcp>
</ids-option>
</screen>
</security>
</configuration>
```

**Description** Enable SYN flood ids option

**Contents** <alarm-threshold>—Alarm threshold

<attack-threshold>—Attack threshold

<source-threshold>—Source threshold

<destination-threshold>—Destination threshold

<timeout>—SYN flood ager timeout

<white-list>—Set of IP addresses that will not trigger a screen

---

### <syslog-options> configuration/wlan

---

#### Usage

```
<configuration>
<wlan>
<syslog-options>
```

```
<log-size>log-size</log-size>
<period>period</period>
</syslog-options>
</wlan>
</configuration>
```

**Description** Configure Access Point Logging options

**Contents** <log-size>—Configure Max log file size  
<period>—Configure log fetch interval

---

## <system> configuration/wlan/access-point/external

---

### Usage

```
<configuration>
<wlan>
<access-point>
<external>
<system>
<ports>...</ports>
<console>...</console>
<services>...</services>
</system>
</external>
</access-point>
</wlan>
</configuration>
```

**Description** System information

**Contents** <ports>—Port configuration  
<console>—  
<services>—System services configuration

---

## <system-services> configuration/security/zones/functional-zone/management/interfaces/host-inbound-traffic

---

### Usage

```
<configuration>
<security>
<zones>
<functional-zone>
<management>
<interfaces>
<host-inbound-traffic>
<system-services>
<all/>
```

```
<bootp/>
<dhcp/>
<dhcpv6/>
<dns/>
<finger/>
<ftp/>
<ident-reset/>
<http/>
<https/>
<ike/>
<netconf/>
<ping/>
<rlogin/>
<reverse-telnet/>
<reverse-ssh/>
<rpm/>
<rsh/>
<snmp/>
<snmp-trap/>
<ssh/>
<telnet/>
<traceroute/>
<xnm-ssl/>
<xnm-clear-text/>
<tftp/>
<lsping/>
<ntp/>
<sip/>
<r2cp/>
<any-service/>
<except/>
</system-services>
</host-inbound-traffic>
</interfaces>
</management>
</functional-zone>
</zones>
</security>
</configuration>
```

**Description** Type of incoming system-service traffic to accept

**Contents** <all>—All system services

<bootp>—Bootp and dhcp relay-agent service

<dhcp>—Dynamic Host Configuration Protocol

<dhcpv6>—Enable Dynamic Host Configuration Protocol for IPv6

<dns>—DNS service

<finger>—Finger service

<ftp>—FTP

<ident-reset>—Send back TCP RST to IDENT request for port 113

<http>—Web management service using HTTP

<https>—Web management service using HTTP secured by SSL

<ike>—Internet Key Exchange

<netconf>—NETCONF service

<ping>—Internet Control Message Protocol echo requests

<rlogin>—Rlogin service

<reverse-telnet>—Reverse telnet service

<reverse-ssh>—Reverse SSH service

<rpm>—Real-time performance monitoring

<rsh>—Rsh service

<snmp>—Simple Network Management Protocol service

<snmp-trap>—Simple Network Management Protocol traps

<ssh>—SSH service

<telnet>—Telnet service

<traceroute>—Traceroute service

<xnm-ssl>—Junos XML management protocol service over SSL

<xnm-clear-text>—Junos XML management protocol for unencrypted traffic over TCP

<tftp>—TFTP

<lsping>—Label Switched Path ping service

<ntp>—Network Time Protocol service

<sip>—Enable Session Initiation Protocol service

<r2cp>—Enable Radio-Router Control Protocol service

<any-service>—Enable services on entire port range

<except>—Type of incoming system-service traffic to disallow

## <system-services> configuration/security/zones/functional-zone/management/host-inbound-traffic

### Usage

```

<configuration>
 <security>
 <zones>
 <functional-zone>
 <management>
 <host-inbound-traffic>
 <system-services>
 <all/>
 <dns/>
 <finger/>
 <ftp/>
 <ident-reset/>
 <http/>
 <https/>
 <ike/>
 <netconf/>
 <ping/>
 <rlogin/>
 <reverse-telnet/>
 <reverse-ssh/>
 <rpm/>
 <rsh/>
 <snmp/>
 <snmp-trap/>
 <ssh/>
 <telnet/>
 <traceroute/>
 <xnm-ssl/>
 <xnm-clear-text/>
 <tftp/>
 <lsping/>
 <ntp/>
 <sip/>
 <r2cp/>
 <any-service/>
 <except/>
 </system-services>
 </host-inbound-traffic>
 </management>
 </functional-zone>
 </zones>
 </security>
</configuration>

```

**Description** Type of incoming system-service traffic to accept

**Contents** <all>—All system services

<dns>—DNS service

<finger>—Finger service

<ftp>—FTP

<ident-reset>—Send back TCP RST to IDENT request for port 113

<http>—Web management service using HTTP

<https>—Web management service using HTTP secured by SSL

<ike>—Internet Key Exchange

<netconf>—NETCONF service

<ping>—Internet Control Message Protocol echo requests

<rlogin>—Rlogin service

<reverse-telnet>—Reverse telnet service

<reverse-ssh>—Reverse SSH service

<rpm>—Real-time performance monitoring

<rsh>—Rsh service

<snmp>—Simple Network Management Protocol service

<snmp-trap>—Simple Network Management Protocol traps

<ssh>—SSH service

<telnet>—Telnet service

<traceroute>—Traceroute service

<xnm-ssl>—Junos XML management protocol service over SSL

<xnm-clear-text>—Junos XML management protocol for unencrypted traffic over TCP

<tftp>—TFTP

<lsping>—Label Switched Path ping service

<ntp>—Network Time Protocol service

<sip>—Enable Session Initiation Protocol service

<r2cp>—Enable Radio-Router Control Protocol service

<any-service>—Enable services on entire port range

<except>—Type of incoming system-service traffic to disallow

## <system-services> configuration/security/zones/security-zone/host-inbound-traffic

### Usage

```

<configuration>
 <security>
 <zones>
 <security-zone>
 <host-inbound-traffic>
 <system-services>
 <all/>
 <dns/>
 <finger/>
 <ftp/>
 <ident-reset/>
 <http/>
 <https/>
 <ike/>
 <netconf/>
 <ping/>
 <rlogin/>
 <reverse-telnet/>
 <reverse-ssh/>
 <rpm/>
 <rsh/>
 <snmp/>
 <snmp-trap/>
 <ssh/>
 <telnet/>
 <traceroute/>
 <xnm-ssl/>
 <xnm-clear-text/>
 <tftp/>
 <lsping/>
 <ntp/>
 <sip/>
 <r2cp/>
 <any-service/>
 <except/>
 </system-services>
 </host-inbound-traffic>
 </security-zone>
 </zones>
 </security>
</configuration>

```

**Description** Type of incoming system-service traffic to accept

**Contents** <all>—All system services

<dns>—DNS service

<finger>—Finger service

<ftp>—FTP

<ident-reset>—Send back TCP RST to IDENT request for port 113

<http>—Web management service using HTTP

<https>—Web management service using HTTP secured by SSL

<ike>—Internet Key Exchange

<netconf>—NETCONF service

<ping>—Internet Control Message Protocol echo requests

<rlogin>—Rlogin service

<reverse-telnet>—Reverse telnet service

<reverse-ssh>—Reverse SSH service

<rpm>—Real-time performance monitoring

<rsh>—Rsh service

<snmp>—Simple Network Management Protocol service

<snmp-trap>—Simple Network Management Protocol traps

<ssh>—SSH service

<telnet>—Telnet service

<traceroute>—Traceroute service

<xnm-ssl>—Junos XML management protocol service over SSL

<xnm-clear-text>—Junos XML management protocol for unencrypted traffic over TCP

<tftp>—TFTP

<lsping>—Label Switched Path ping service

<ntp>—Network Time Protocol service

<sip>—Enable Session Initiation Protocol service

<r2cp>—Enable Radio-Router Control Protocol service

<any-service>—Enable services on entire port range

<except>—Type of incoming system-service traffic to disallow

## <system-services> configuration/security/zones/security-zone/interfaces/host-inbound-traffic

### Usage

```

<configuration>
 <security>
 <zones>
 <security-zone>
 <interfaces>
 <host-inbound-traffic>
 <system-services>
 <all/>
 <bootp/>
 <dhcp/>
 <dhcpv6/>
 <dns/>
 <finger/>
 <ftp/>
 <ident-reset/>
 <http/>
 <https/>
 <ike/>
 <netconf/>
 <ping/>
 <rlogin/>
 <reverse-telnet/>
 <reverse-ssh/>
 <rpm/>
 <rsh/>
 <snmp/>
 <snmp-trap/>
 <ssh/>
 <telnet/>
 <traceroute/>
 <xnm-ssl/>
 <xnm-clear-text/>
 <tftp/>
 <lsping/>
 <ntp/>
 <sip/>
 <r2cp/>
 <any-service/>
 <except/>
 </system-services>
 </host-inbound-traffic>
 </interfaces>
 </security-zone>
 </zones>
 </security>
</configuration>

```

**Description** Type of incoming system-service traffic to accept

<b>Contents</b>	<all>—All system services
	<bootp>—Bootp and dhcp relay-agent service
	<dhcp>—Dynamic Host Configuration Protocol
	<dhcpcv6>—Enable Dynamic Host Configuration Protocol for IPv6
	<dns>—DNS service
	<finger>—Finger service
	<ftp>—FTP
	<ident-reset>—Send back TCP RST to IDENT request for port 113
	<http>—Web management service using HTTP
	<https>—Web management service using HTTP secured by SSL
	<ike>—Internet Key Exchange
	<netconf>—NETCONF service
	<ping>—Internet Control Message Protocol echo requests
	<rlogin>—Rlogin service
	<reverse-telnet>—Reverse telnet service
	<reverse-ssh>—Reverse SSH service
	<rpm>—Real-time performance monitoring
	<rsh>—Rsh service
	<snmp>—Simple Network Management Protocol service
	<snmp-trap>—Simple Network Management Protocol traps
	<ssh>—SSH service
	<telnet>—Telnet service
	<traceroute>—Traceroute service
	<xnm-ssl>—Junos XML management protocol service over SSL
	<xnm-clear-text>—Junos XML management protocol for unencrypted traffic over TCP
	<tftp>—TFTP
	<lsping>—Label Switched Path ping service
	<ntp>—Network Time Protocol service

<sip>—Enable Session Initiation Protocol service

<r2cp>—Enable Radio-Router Control Protocol service

<any-service>—Enable services on entire port range

<except>—Type of incoming system-service traffic to disallow

## Tag Elements Beginning with T

This chapter lists the configuration tag elements that have names beginning with the letter *t*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<talk>` configuration/security/alg

#### Usage

```
<configuration>
 <security>
 <alg>
 <talk>
 <disable/>
 <traceoptions>...</traceoptions>
 </talk>
 </alg>
 </security>
</configuration>
```

**Description** Configure Talk ALG

**Contents** `<disable>`—Disable Talk ALG

`<traceoptions>`—TALK ALG trace options

## <tcp> configuration/security/screen/ids-option

---

### Usage

```
<configuration>
<security>
<screen>
<ids-option>
<tcp>
<syn-fin/>
<fin-no-ack/>
<tcp-no-flag/>
<syn-frag/>
<port-scan>...</port-scan>
<syn-ack-ack-proxy>...</syn-ack-ack-proxy>
<syn-flood>...</syn-flood>
<land/>
<winnuke/>
<tcp-sweep>...</tcp-sweep>
</tcp>
</ids-option>
</screen>
</security>
</configuration>
```

**Description** Configure TCP Layer ids options

**Contents**

- <syn-fin>—Enable SYN and FIN bits set attack ids option
- <fin-no-ack>—Enable Fin bit with no ACK bit ids option
- <tcp-no-flag>—Enable TCP packet without flag ids option
- <syn-frag>—Enable SYN fragment ids option
- <port-scan>—Configure port scan ids option
- <syn-ack-ack-proxy>—Enable syn-ack-ack proxy ids option
- <syn-flood>—Enable SYN flood ids option
- <land>—Enable land attack ids option
- <winnuke>—Enable winnuke attack ids option
- <tcp-sweep>—Configure TCP sweep ids option

## <tcp-mss> configuration/security/flow

---

### Usage

```
<configuration>
<security>
<flow>
```

```

<tcp-mss>
 <all-tcp>...</all-tcp>
 <ipsec-vpn>...</ipsec-vpn>
 <gre-in>...</gre-in>
 <gre-out>...</gre-out>
</tcp-mss>
</flow>
</security>
</configuration>

```

**Description** TCP maximum segment size configuration

**Contents** <all-tcp>—Enable MSS override for all packets

<ipsec-vpn>—Enable MSS override for all packets entering IPSec tunnel

<gre-in>—Enable MSS override for all GRE packets coming out of an IPSec tunnel

<gre-out>—Enable MSS override for all GRE packets entering an IPSec tunnel

### <tcp-session> configuration/security/flow

#### Usage

```

<configuration>
 <security>
 <flow>
 <tcp-session>
 <rst-invalidate-session/>
 <rst-sequence-check/>
 <no-syn-check/>
 <strict-syn-check/>
 <no-syn-check-in-tunnel/>
 <no-sequence-check/>
 <tcp-initial-timeout>tcp-initial-timeout</tcp-initial-timeout>
 <time-wait-state>...</time-wait-state>
 </tcp-session>
 </flow>
 </security>
</configuration>

```

**Description** Transmission Control Protocol session configuration

**Contents** <rst-invalidate-session>—Immediately end session on receipt of reset (RST) segment

<rst-sequence-check>—Check sequence number in reset (RST) segment

<no-syn-check>—Disable creation-time SYN-flag check

<strict-syn-check>—Enable strict syn check

<no-syn-check-in-tunnel>—Disable creation-time SYN-flag check for tunnel packets

<no-sequence-check>—Disable sequence-number checking

<tcp-initial-timeout>—Timeout for TCP session when initialization fails

<time-wait-state>—Session timeout value in time-wait state, default 150 seconds

---

## <tcp-sweep> configuration/security/screen/ids-option/tcp

---

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <tcp>
 <tcp-sweep>
 <threshold>threshold</threshold>
 </tcp-sweep>
 </tcp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure TCP sweep ids option

**Contents** <threshold>—Threshold which specifies the minimum time per TCP packets

---

## <telemetries> configuration/poe/interface

---

### Usage

```
<configuration>
 <poe>
 <interface>
 <telemetries>
 <disable/>
 <interval>interval</interval>
 <duration>duration</duration>
 </telemetries>
 </interface>
 </poe>
</configuration>
```

**Description** Telemetries settings

**Contents** <disable>—Disable telemetries

<interval>—Interval at which data should be recorded

<duration>—Duration to continue recording of data

## <term> configuration/applications/application

### Usage

```

<configuration>
 <applications>
 <application>
 <term>
 <term-name>term-name</term-name> <!-- identifier -->
 <alg>alg</alg>
 <protocol>protocol</protocol>
 <source-port>source-port</source-port>
 <destination-port>destination-port</destination-port>
 <icmp-type>icmp-type</icmp-type>
 <icmp-code>icmp-code</icmp-code>
 <icmp6-type>icmp6-type</icmp6-type>
 <icmp6-code>icmp6-code</icmp6-code>
 <rpc-program-number>rpc-program-number</rpc-program-number>
 <uuid>uuid</uuid>
 <inactivity-timeout>inactivity-timeout</inactivity-timeout>
 </term>
 </application>
 </applications>
</configuration>

```

**Description** Define individual application protocols

**Contents** <term-name>—Term name

- dns - Domain Name Service
- ftp - File Transfer Protocol
- gprs-gtp-c - GPRS Tunneling Control Plane
- gprs-gtp-u - GPRS Tunneling User Plane
- gprs-gtp-v0 - GPRS Tunneling Version 0
- gprs-sctp - GPRS Stream Control Protocol
- ignore - Ignore application type
- mgcp-ca - MGCP-CA
- mgcp-ua - MGCP-UA
- ms-rpc - Microsoft RPC
- pptp - Point-to-Point Tunneling Protocol
- sun-rpc - Sun Microsystems RPC
- q931 - Q.931
- ras - RAS
- realaudio - RealAudio

- rsh - Remote Shell
- rtsp - Real Time Streaming Protocol
- sccp - Skinny Client Control Protocol
- sip - Session Initiation Protocol
- sqlnet-v2 - Oracle SQL\*Net Version 2
- talk - Talk program
- tftp - Trivial File Transfer Protocol
- http - Hyper Text transfer protocol
- https - Secure HyperText Transfer Protocol
- smtp - Simple Mail Transfer Protocol
- imap - Internet Message Access Protocol
- ssh - Secure Shell
- telnet - Telnet Terminal Emulation Protocol
- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- number - Numeric protocol value (0 .. 255)
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet
- smtp - Simple Mail Transfer Protocol

- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)
- dhcp - Dynamic Host Configuration Protocol
- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol
- kerberos-sec - Kerberos Security
- pop3 - Post Office Protocol 3
- sunrpc - Sun Microsystems remote procedure call
- ident - Ident
- nntp - Network News Transport Protocol
- ntp - Network Time Protocol
- netbios-ns - NetBIOS name service
- netbios-dgm - NetBIOS DGM
- netbios-ssn - NetBIOS session service
- imap - Internet Message Access Protocol
- snmp - Simple Network Management Protocol
- snmptrap - SNMP traps
- xdmcp - X Display Manager Control Protocol
- bgp - Border Gateway Protocol
- ldap - Lightweight Directory Access Protocol
- mobileip-agent - Mobile IP agent
- mobilip-mn - Mobile IP MN
- msdp - Multicast Source Discovery Protocol
- https - Secure HTTP
- snpp - Simple paging protocol
- biff - Biff/Comsat
- exec - UNIX rexec
- login - UNIX rlogin
- who - UNIX rwho

- cmd - UNIX rsh
- syslog - System log
- printer - Printer
- talk - UNIX Talk
- ntalk - New Talk
- rip - Routing Information Protocol
- timed - UNIX time daemon
- klogin - Kerberos rlogin
- kshell - Kerberos rsh
- ldp - Label Distribution Protocol
- krb-prop - Kerberos database propagation
- krbupdate - Kerberos database update
- kpasswd - Kerberos passwd
- socks - Socks
- afs - AFS
- pptp - Point-to-Point Tunneling Protocol
- radius - RADIUS authentication
- radacct - RADIUS accounting
- zephyr-srv - Zephyr server
- zephyr-clt - Zephyr serv-hm connection
- zephyr-hm - Zephyr hostmanager
- nfsd - Network File System
- eklogin - Encrypted Kerberos rlogin
- ekshell - Encrypted Kerberos rsh
- rkinit - Kerberos remote kinit
- cvspserver - CVS pserver
- range - Range of values
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet
- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+

- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)
- dhcp - Dynamic Host Configuration Protocol
- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol
- kerberos-sec - Kerberos Security
- pop3 - Post Office Protocol 3
- sunrpc - Sun Microsystems remote procedure call
- ident - Ident
- nntp - Network News Transport Protocol
- ntp - Network Time Protocol
- netbios-ns - NetBIOS name service
- netbios-dgm - NetBIOS DGM
- netbios-ssn - NetBIOS session service
- imap - Internet Message Access Protocol
- snmp - Simple Network Management Protocol
- snmptrap - SNMP traps
- xdmcp - X Display Manager Control Protocol
- bgp - Border Gateway Protocol
- ldap - Lightweight Directory Access Protocol
- mobileip-agent - Mobile IP agent
- mobilip-mn - Mobile IP MN
- msdp - Multicast Source Discovery Protocol
- https - Secure HTTP
- snpp - Simple paging protocol
- biff - Biff/Comsat
- exec - UNIX rexec
- login - UNIX rlogin
- who - UNIX rwho
- cmd - UNIX rsh

- syslog - System log
- printer - Printer
- talk - UNIX Talk
- ntalk - New Talk
- rip - Routing Information Protocol
- timed - UNIX time daemon
- klogin - Kerberos rlogin
- kshell - Kerberos rsh
- ldp - Label Distribution Protocol
- krb-prop - Kerberos database propagation
- krbupdate - Kerberos database update
- kpasswd - Kerberos passwd
- socks - Socks
- afs - AFS
- pptp - Point-to-Point Tunneling Protocol
- radius - RADIUS authentication
- radacct - RADIUS accounting
- zephyr-srv - Zephyr server
- zephyr-clt - Zephyr serv-hm connection
- zephyr-hm - Zephyr hostmanager
- nfsd - Network File System
- eklogin - Encrypted Kerberos rlogin
- ekshell - Encrypted Kerberos rsh
- rkinit - Kerberos remote kinit
- cvspserver - CVS pserver
- range - Range of values
- echo-request - Echo request
- echo-reply - Echo reply
- unreachable - Unreachable
- source-quench - Source quench
- redirect - Redirect
- router-advertisement - Router advertisement
- router-solicit - Router solicit

- time-exceeded - Time exceeded
- parameter-problem - Parameter problem
- timestamp - Timestamp
- timestamp-reply - Timestamp reply
- info-request - Informational request
- info-reply - Informational reply
- mask-request - Mask request
- mask-reply - Mask reply
- number - Numeric type value (0 .. 255)
- network-unreachable - Network unreachable
- host-unreachable - Host unreachable
- protocol-unreachable - Protocol unreachable
- port-unreachable - Port unreachable
- fragmentation-needed - Fragmentation needed
- source-route-failed - Source route failed
- destination-network-unknown - Destination network unknown
- destination-host-unknown - Destination host unknown
- source-host-isolated - Source host isolated
- destination-network-prohibited - Destination network prohibited
- destination-host-prohibited - Destination host prohibited
- network-unreachable-for-tos - Network unreachable for ToS
- host-unreachable-for-tos - Host unreachable for ToS
- communication-prohibited-by-filtering - Communication prohibited by filtering
- host-precedence-violation - Host precedence violation
- precedence-cutoff-in-effect - Precedence cutoff in effect
- redirect-for-network - Redirect for network
- redirect-for-host - Redirect for host
- redirect-for-tos-and-net - Redirect for ToS and net
- redirect-for-tos-and-host - Redirect for ToS and host
- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly
- ip-header-bad - IP header bad
- required-option-missing - Required option missing

- number - Numeric code value (0 .. 255)
- echo-request - Echo request
- echo-reply - Echo reply
- destination-unreachable - Unreachable
- router-advertisement - Router advertisement
- router-solicit - Router solicit
- time-exceeded - Time exceeded
- parameter-problem - Parameter problem
- packet-too-big - Packet too big
- membership-query - Query for multicast listener
- membership-report - Report for multicast listener
- membership-termination - Terminate multicast listener
- redirect - Router informs host of a better first hop for a destination
- neighbor-solicit - Request link-layer address of neighbor
- neighbor-advertisement - Provide link-layer address to neighbor
- router-renumbering - Router renumbering command
- node-information-request - Query for information on address or name
- node-information-reply - Reply to node information request
- number - Numeric type value (0 .. 255)
- no-route-to-destination - Route to destination not found
- administratively-prohibited - Communication with destination prohibited by filter
- address-unreachable - Problem with resolving address or other link-specific problem
- port-unreachable - Port unreachable
- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly
- ip6-header-bad - IP header bad
- unrecognized-next-header - Unrecognized next header type encountered
- unrecognized-option - Unrecognized IPv6 option
- number - Numeric code value (0 .. 255)
- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

<alg>—Application Layer Gateway

- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly
- ip-header-bad - IP header bad
- required-option-missing - Required option missing
- number - Numeric code value (0 .. 255)
- echo-request - Echo request
- echo-reply - Echo reply
- destination-unreachable - Unreachable
- router-advertisement - Router advertisement
- router-solicit - Router solicit
- time-exceeded - Time exceeded
- parameter-problem - Parameter problem
- packet-too-big - Packet too big
- membership-query - Query for multicast listener
- membership-report - Report for multicast listener
- membership-termination - Terminate multicast listener
- redirect - Router informs host of a better first hop for a destination
- neighbor-solicit - Request link-layer address of neighbor
- neighbor-advertisement - Provide link-layer address to neighbor
- router-renumbering - Router renumbering command
- node-information-request - Query for information on address or name
- node-information-reply - Reply to node information request

- number - Numeric type value (0 .. 255)
- no-route-to-destination - Route to destination not found
- administratively-prohibited - Communication with destination prohibited by filter
- address-unreachable - Problem with resolving address or other link-specific problem
- port-unreachable - Port unreachable
- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly
- ip6-header-bad - IP header bad
- unrecognized-next-header - Unrecognized next header type encountered
- unrecognized-option - Unrecognized IPv6 option
- number - Numeric code value (0 .. 255)
- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

<protocol>—Match IP protocol type

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- number - Numeric protocol value (0 .. 255)
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell

- telnet - Telnet
- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS
- domain - Domain Name System (DNS)
- dhcp - Dynamic Host Configuration Protocol
- bootps - Bootstrap protocol server
- bootpc - Bootstrap protocol client
- tftp - Trivial FTP
- finger - Finger
- http - Hypertext Transfer Protocol
- kerberos-sec - Kerberos Security
- pop3 - Post Office Protocol 3
- sunrpc - Sun Microsystems remote procedure call
- ident - Ident
- nntp - Network News Transport Protocol
- ntp - Network Time Protocol
- netbios-ns - NetBIOS name service
- netbios-dgm - NetBIOS DGM
- netbios-ssn - NetBIOS session service
- imap - Internet Message Access Protocol
- snmp - Simple Network Management Protocol
- snmptrap - SNMP traps
- xdmcp - X Display Manager Control Protocol
- bgp - Border Gateway Protocol
- ldap - Lightweight Directory Access Protocol
- mobileip-agent - Mobile IP agent
- mobilip-mn - Mobile IP MN
- msdp - Multicast Source Discovery Protocol
- https - Secure HTTP
- snpp - Simple paging protocol
- biff - Biff/Comsat
- exec - UNIX rexec

- login - UNIX rlogin
- who - UNIX rwho
- cmd - UNIX rsh
- syslog - System log
- printer - Printer
- talk - UNIX Talk
- ntalk - New Talk
- rip - Routing Information Protocol
- timed - UNIX time daemon
- klogin - Kerberos rlogin
- kshell - Kerberos rsh
- ldp - Label Distribution Protocol
- krb-prop - Kerberos database propagation
- krbupdate - Kerberos database update
- kpasswd - Kerberos passwd
- socks - Socks
- afs - AFS
- pptp - Point-to-Point Tunneling Protocol
- radius - RADIUS authentication
- radacct - RADIUS accounting
- zephyr-srv - Zephyr server
- zephyr-clt - Zephyr serv-hm connection
- zephyr-hm - Zephyr hostmanager
- nfsd - Network File System
- eklogin - Encrypted Kerberos rlogin
- ekshell - Encrypted Kerberos rsh
- rkinit - Kerberos remote kinit
- cvspserver - CVS pserver
- range - Range of values
- ftp-data - FTP data
- ftp - FTP
- ssh - Secure shell
- telnet - Telnet

- smtp - Simple Mail Transfer Protocol
- tacacs - TACACS or TACACS+
- tacacs-ds - TACACS-DS

- rkinit - Kerberos remote kinit
- cvspserver - CVS pserver
- range - Range of values
- echo-request - Echo request
- echo-reply - Echo reply
- unreachable - Unreachable
- source-quench - Source quench
- redirect - Redirect

- router-advertisement - Router advertisement
- router-solicit - Router solicit
- time-exceeded - Time exceeded
- parameter-problem - Parameter problem
- timestamp - Timestamp
- timestamp-reply - Timestamp reply
- info-request - Informational request
- info-reply - Informational reply
- mask-request - Mask request
- mask-reply - Mask reply
- number - Numeric type value (0 .. 255)
- network-unreachable - Network unreachable
- host-unreachable - Host unreachable
- protocol-unreachable - Protocol unreachable
- port-unreachable - Port unreachable
- fragmentation-needed - Fragmentation needed
- source-route-failed - Source route failed
- destination-network-unknown - Destination network unknown
- destination-host-unknown - Destination host unknown
- source-host-isolated - Source host isolated
- destination-network-prohibited - Destination network prohibited
- destination-host-prohibited - Destination host prohibited
- network-unreachable-for-tos - Network unreachable for ToS
- host-unreachable-for-tos - Host unreachable for ToS
- communication-prohibited-by-filtering - Communication prohibited by filtering
- host-precedence-violation - Host precedence violation
- precedence-cutoff-in-effect - Precedence cutoff in effect
- redirect-for-network - Redirect for network
- redirect-for-host - Redirect for host
- redirect-for-tos-and-net - Redirect for ToS and net
- redirect-for-tos-and-host - Redirect for ToS and host
- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly

- ip-header-bad - IP header bad
- required-option-missing - Required option missing
- number - Numeric code value (0 .. 255)
- echo-request - Echo request
- echo-reply - Echo reply
- destination-unreachable - Unreachable
- router-advertisement - Router advertisement
- router-solicit - Router solicit
- time-exceeded - Time exceeded
- parameter-problem - Parameter problem
- packet-too-big - Packet too big
- membership-query - Query for multicast listener
- membership-report - Report for multicast listener
- membership-termination - Terminate multicast listener
- redirect - Router informs host of a better first hop for a destination
- neighbor-solicit - Request link-layer address of neighbor
- neighbor-advertisement - Provide link-layer address to neighbor
- router-renumbering - Router renumbering command
- node-information-request - Query for information on address or name
- node-information-reply - Reply to node information request
- number - Numeric type value (0 .. 255)
- no-route-to-destination - Route to destination not found
- administratively-prohibited - Communication with destination prohibited by filter

- membership-query - Query for multicast listener
- membership-report - Report for multicast listener
- membership-termination - Terminate multicast listener
- redirect - Router informs host of a better first hop for a destination
- neighbor-solicit - Request link-layer address of neighbor
- neighbor-advertisement - Provide link-layer address to neighbor
- router-renumbering - Router renumbering command
- node-information-request - Query for information on address or name
- node-information-reply - Reply to node information request
- number - Numeric type value (0 .. 255)
- no-route-to-destination - Route to destination not found
- administratively-prohibited - Communication with destination prohibited by filter
- address-unreachable - Problem with resolving address or other link-specific problem
- port-unreachable - Port unreachable
- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly
- ip6-header-bad - IP header bad

- unrecognized-next-header - Unrecognized next header type encountered
- unrecognized-option - Unrecognized IPv6 option
- number - Numeric code value (0 .. 255)
- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

<icmp6-code>—Match ICMP6 message code

- no-route-to-destination - Route to destination not found
- administratively-prohibited - Communication with destination prohibited by filter
- address-unreachable - Problem with resolving address or other link-specific problem
- port-unreachable - Port unreachable
- ttl-eq-zero-during-transit - TTL eq zero during transit
- ttl-eq-zero-during-reassembly - TTL eq zero during reassembly
- ip6-header-bad - IP header bad
- unrecognized-next-header - Unrecognized next header type encountered
- unrecognized-option - Unrecognized IPv6 option
- number - Numeric code value (0 .. 255)
- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

<rpc-program-number>—Match range of RPC program numbers

- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

<uuid>—Match universal unique identifier for DCE RPC objects

- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

<inactivity-timeout>—Application-specific inactivity timeout

- never - Disables inactivity timeout
- timeout - Number of seconds (4 .. 129600)

---

## <tftp> configuration/security/alg

### Usage

<configuration>

```
<security>
 <alg>
 <tftp>
 <disable/>
 <traceoptions>...</traceoptions>
 </tftp>
 </alg>
</security>
</configuration>
```

**Description** Configure TFTP ALG

**Contents** <disable>—Disable TFTP ALG  
<traceoptions>—TFTP ALG trace options

---

### <then> configuration/security/application-firewall/rule-sets/rule

---

#### Usage

```
<configuration>
 <security>
 <application-firewall>
 <rule-sets>
 <rule>
 <then>
 <permit/>
 <deny/>
 </then>
 </rule>
 </rule-sets>
 </application-firewall>
 </security>
</configuration>
```

**Description** Specify rule action to take when packet match criteria

**Contents** <permit>—Permit packets  
<deny>—Deny packets

---

### <then> configuration/security/nat/source/rule-set/rule

---

#### Usage

```
<configuration>
 <security>
 <nat>
 <source>
 <rule-set>
 <rule>
 <then>
```

```
<source-nat>...</source-nat>
</then>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Then action

**Contents** <source-nat>—Source NAT action

---

## <then> configuration/security/nat/destination/rule-set/rule

---

### Usage

```
<configuration>
<security>
<nat>
<destination>
<rule-set>
<rule>
<then>
<destination-nat>...</destination-nat>
</then>
</rule>
</rule-set>
</destination>
</nat>
</security>
</configuration>
```

**Description** Then action

**Contents** <destination-nat>—Destination NAT action

---

## <then> configuration/security/nat/static/rule-set/rule

---

### Usage

```
<configuration>
<security>
<nat>
<static>
<rule-set>
<rule>
<then>
<static-nat>...</static-nat>
</then>
</rule>
</rule-set>
```

```
</static>
</nat>
</security>
</configuration>
```

**Description** Then action

**Contents** <static-nat>—Static NAT action

---

### <then> configuration/services/ip-monitoring/policy

---

#### Usage

```
<configuration>
<services>
<ip-monitoring>
<policy>
<then>
<preferred-route>...</preferred-route>
</then>
</policy>
</ip-monitoring>
</services>
</configuration>
```

**Description** Action to be taken

**Contents** <preferred-route>—Preferred route action

---

### <thursday> configuration/schedulers/scheduler

---

#### Usage

```
<configuration>
<schedulers>
<scheduler>
<thursday>
<start-time>...</start-time>
<exclude/>
<all-day/>
</thursday>
</scheduler>
</schedulers>
</configuration>
```

**Description** Every Thursday

**Contents** <start-time>—Time range for day  
<exclude>—Exclude day from week

<all-day>—Include complete day

---

## <time-wait-state> configuration/security/flow/tcp-session

---

### Usage

```
<configuration>
<security>
<flow>
<tcp-session>
 <time-wait-state>
 <session-ageout/>
 <session-timeout>session-timeout</session-timeout>
 </time-wait-state>
</tcp-session>
</flow>
</security>
</configuration>
```

**Description** Session timeout value in time-wait state, default 150 seconds

**Contents** <session-ageout>—Allow session to ageout using service based timeout values  
<session-timeout>—Configure session timeout value for time-wait state

---

## <to> configuration/security/address-book/address/range-address

---

### Usage

```
<configuration>
<security>
<address-book>
<address>
 <range-address>
 <to>
 <range-high>range-high</range-high> <!-- mandatory -->
 </to>
 </range-address>
</address>
</address-book>
</security>
</configuration>
```

**Description** Port range upper limit

**Contents** <range-high>—Upper limit of address range

---

## <to> configuration/security/nat/source/pool/address

---

### Usage

```
<configuration>
```

```
<security>
<nat>
 <source>
 <pool>
 <address>
 <to>
 <ipaddr>ipaddr</ipaddr>
 </to>
 </address>
 </pool>
 </source>
</nat>
</security>
</configuration>
```

**Description** Upper limit of address range

**Contents** <ipaddr>—IPv4 or IPv6 upper limit of address range

---

### <to> configuration/security/nat/source/pool/port/range

---

#### Usage

```
<configuration>
<security>
<nat>
 <source>
 <pool>
 <port>
 <range>
 <to>
 <high>high</high> <!-- mandatory -->
 </to>
 </range>
 </port>
 </pool>
 </source>
</nat>
</security>
</configuration>
```

**Description** Port range upper limit

**Contents** <high>—Upper limit of port range

---

### <to> configuration/security/nat/source/pool-default-port-range

---

#### Usage

```
<configuration>
<security>
<nat>
```

```
<source>
 <pool-default-port-range>
 <to>
 <high>high</high> <!-- mandatory -->
 </to>
 </pool-default-port-range>
</source>
</nat>
</security>
</configuration>
```

**Description** Port range upper limit

**Contents** <high>—Upper limit of port range

---

### <to> configuration/security/nat/source/rule-set

---

#### Usage

```
<configuration>
<security>
 <nat>
 <source>
 <rule-set>
 <to>
 <routing-instance>...</routing-instance>
 <zone>...</zone>
 <interface>...</interface>
 </to>
 </rule-set>
 </source>
 </nat>
</security>
</configuration>
```

**Description** Where is the traffic to

**Contents** <routing-instance>—Destination routing instance list

<zone>—Destination zone list

<interface>—Destination interface list

---

### <to> configuration/security/nat/source/rule-set/rule/match/destination-port

---

#### Usage

```
<configuration>
<security>
 <nat>
 <source>
 <rule-set>
```

```
<rule>
 <match>
 <destination-port>
 <to>
 <high>high</high> <!-- mandatory -->
 </to>
 </destination-port>
 </match>
</rule>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Port range upper limit

**Contents** <high>—Upper limit of port range

---

### <to> configuration/security/nat/destination/pool/address

---

#### Usage

```
<configuration>
<security>
<nat>
<destination>
<pool>
<address>
<to>
 <ipaddr>ipaddr</ipaddr>
</to>
</address>
</pool>
</destination>
</nat>
</security>
</configuration>
```

**Description** Upper limit of address range

**Contents** <ipaddr>—IPv4 or IPv6 upper limit of address range

---

### <to> configuration/security/nat/proxy-arp/interface/address

---

#### Usage

```
<configuration>
<security>
<nat>
<proxy-arp>
<interface>
```

```
<address>
 <to>
 <ipaddr>ipaddr</ipaddr>
 </to>
</address>
</interface>
</proxy-arp>
</nat>
</security>
</configuration>
```

**Description** Upper limit of address range

**Contents** <ipaddr>—Upper limit of address range

---

### <to> configuration/security/nat/proxy-ndp/interface/address

---

#### Usage

```
<configuration>
<security>
 <nat>
 <proxy-ndp>
 <interface>
 <address>
 <to>
 <ipv6addr>ipv6addr</ipv6addr>
 </to>
 </address>
 </interface>
 </proxy-ndp>
 </nat>
</security>
</configuration>
```

**Description** Upper limit of address range

**Contents** <ipv6addr>—Upper limit of address range

---

### <to> configuration/security/zones/security-zone/address-book/address/range-address

---

#### Usage

```
<configuration>
<security>
 <zones>
 <security-zone>
 <address-book>
 <address>
 <range-address>
 <to>
```

```
 <range-high>range-high</range-high> <!-- mandatory -->
 </to>
 </range-address>
 </address>
</address-book>
</security-zone>
</zones>
</security>
</configuration>
```

**Description** Port range upper limit

**Contents** <range-high>—Upper limit of address range

---

### <traceoptions> configuration/security/ike

---

#### Usage

```
<configuration>
<security>
<ike>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <rate-limit>rate-limit</rate-limit>
 <flag>...</flag>
 </traceoptions>
</ike>
</security>
</configuration>
```

**Description** Trace options for IPSec key management

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<rate-limit>—Limit the incoming rate of trace messages

<flag>—Tracing parameters for IKE

---

### <traceoptions> configuration/security/ipsec

---

#### Usage

```
<configuration>
<security>
<ipsec>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</ipsec>
```

```
</security>
</configuration>
```

**Description** Trace options for IPSec data-plane debug

**Contents** <flag>—Events to include in data-plane IPSec trace output

---

### <traceoptions> configuration/security/group-vpn/server

---

#### Usage

```
<configuration>
<security>
<group-vpn>
<server>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
</server>
</group-vpn>
</security>
</configuration>
```

**Description** Trace options for Group VPN debug

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters for GKSD

---

### <traceoptions> configuration/security/pki

---

#### Usage

```
<configuration>
<security>
<pki>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
</pki>
</security>
</configuration>
```

**Description** PKI trace options

**Contents**    <no-remote-trace>—Disable remote tracing  
                 <file>—Trace file information  
                 <flag>—Tracing parameters

---

## <traceoptions> configuration/security/gprs/gtp

---

### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
</traceoptions>
</gtp>
</gprs>
</security>
</configuration>
```

**Description**    Trace options for GPRS tunneling protocol

**Contents**    <no-remote-trace>—Disable remote tracing  
                 <file>—Trace file information  
                 <flag>—Tracing parameters

---

## <traceoptions> configuration/security/gprs/sctp

---

### Usage

```
<configuration>
<security>
<gprs>
<sctp>
<traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
</traceoptions>
</sctp>
</gprs>
</security>
</configuration>
```

**Description**    Trace options for GPRS stream control transmission protocol

**Contents**    <no-remote-trace>—Disable remote tracing

                 <file>—Trace file information

                 <flag>—Tracing parameters

---

## <traceoptions> configuration/security/alg

---

### Usage

```
<configuration>
 <security>
 <alg>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <level>level</level>
 </traceoptions>
 </alg>
 </security>
</configuration>
```

**Description**    ALG trace options

**Contents**    <no-remote-trace>—Disable remote tracing

- brief - Brief messages
- detail - Detail messages
- extensive - Extensive messages
- verbose - Verbose messages

<file>—Trace file information

- brief - Brief messages
- detail - Detail messages
- extensive - Extensive messages
- verbose - Verbose messages

<level>—Set level of tracing output

- brief - Brief messages
- detail - Detail messages
- extensive - Extensive messages
- verbose - Verbose messages

## **<traceoptions> configuration/security/alg/alg-manager**

---

### **Usage**

```
<configuration>
 <security>
 <alg>
 <alg-manager>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </alg-manager>
 </alg>
 </security>
</configuration>
```

**Description** ALG-MANAGER trace options

**Contents** <flag>—ALG-MANAGER trace flags

## **<traceoptions> configuration/security/alg/alg-support-lib**

---

### **Usage**

```
<configuration>
 <security>
 <alg>
 <alg-support-lib>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </alg-support-lib>
 </alg>
 </security>
</configuration>
```

**Description** ALG-SUPPORT-LIB trace options

**Contents** <flag>—ALG-SUPPORT-LIB trace flags

## **<traceoptions> configuration/security/alg/dns**

---

### **Usage**

```
<configuration>
 <security>
 <alg>
 <dns>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </dns>
 </alg>
 </security>
</configuration>
```

```
</alg>
</security>
</configuration>
```

**Description** DNS ALG trace options

**Contents** <flag>—DNS ALG trace flags

---

### <traceoptions> configuration/security/alg/ftp

---

#### Usage

```
<configuration>
<security>
<alg>
<ftp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</ftp>
</alg>
</security>
</configuration>
```

**Description** FTP ALG trace options

**Contents** <flag>—FTP ALG trace flags

---

### <traceoptions> configuration/security/alg/h323

---

#### Usage

```
<configuration>
<security>
<alg>
<h323>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</h323>
</alg>
</security>
</configuration>
```

**Description** H.323 ALG trace options

**Contents** <flag>—H.323 ALG trace flags

## **<traceoptions> configuration/security/alg/mgcp**

---

### **Usage**

```
<configuration>
<security>
<alg>
<mgcp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</mgcp>
</alg>
</security>
</configuration>
```

**Description** MGCP ALG trace options

**Contents** <flag>—MGCP ALG trace flags

## **<traceoptions> configuration/security/alg/msrpc**

---

### **Usage**

```
<configuration>
<security>
<alg>
<msrpc>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</msrpc>
</alg>
</security>
</configuration>
```

**Description** MSRPC ALG trace options

**Contents** <flag>—MSRPC ALG trace flags

## **<traceoptions> configuration/security/alg/sunrpc**

---

### **Usage**

```
<configuration>
<security>
<alg>
<sunrpc>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</sunrpc>
```

```
</alg>
</security>
</configuration>
```

**Description** SUNRPC ALG trace options

**Contents** <flag>—SUNRPC ALG trace flags

---

### <traceoptions> configuration/security/alg/real

---

#### Usage

```
<configuration>
<security>
<alg>
<real>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</real>
</alg>
</security>
</configuration>
```

**Description** REAL ALG trace options

**Contents** <flag>—REAL ALG trace flags

---

### <traceoptions> configuration/security/alg/rsh

---

#### Usage

```
<configuration>
<security>
<alg>
<rsh>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</rsh>
</alg>
</security>
</configuration>
```

**Description** RSH ALG trace options

**Contents** <flag>—RSH ALG trace flags

## **<traceoptions> configuration/security/alg/rtsp**

---

### **Usage**

```
<configuration>
<security>
 <alg>
 <rtsp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </rtsp>
 </alg>
</security>
</configuration>
```

**Description** RTSP ALG trace options

**Contents** <flag>—RTSP ALG trace flags

## **<traceoptions> configuration/security/alg/sccp**

---

### **Usage**

```
<configuration>
<security>
 <alg>
 <sccp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </sccp>
 </alg>
</security>
</configuration>
```

**Description** SCCP ALG trace options

**Contents** <flag>—SCCP ALG trace flags

## **<traceoptions> configuration/security/alg/sip**

---

### **Usage**

```
<configuration>
<security>
 <alg>
 <sip>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </sip>
```

```
</alg>
</security>
</configuration>
```

**Description** SIP ALG trace options

**Contents** <flag>—SIP ALG trace flags

---

### <traceoptions> configuration/security/alg/sql

---

#### Usage

```
<configuration>
<security>
<alg>
<sql>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</sql>
</alg>
</security>
</configuration>
```

**Description** SQL ALG trace options

**Contents** <flag>—SQL ALG trace flags

---

### <traceoptions> configuration/security/alg/talk

---

#### Usage

```
<configuration>
<security>
<alg>
<talk>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</talk>
</alg>
</security>
</configuration>
```

**Description** TALK ALG trace options

**Contents** <flag>—TALK ALG trace flags

## **<traceoptions> configuration/security/alg/tftp**

---

**Usage**

```
<configuration>
<security>
 <alg>
 <tftp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </tftp>
 </alg>
</security>
</configuration>
```

**Description** TFTP ALG trace options

**Contents** <flag>—TFTP ALG trace flags

## **<traceoptions> configuration/security/alg/pptp**

---

**Usage**

```
<configuration>
<security>
 <alg>
 <pptp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </pptp>
 </alg>
</security>
</configuration>
```

**Description** PPTP ALG trace options

**Contents** <flag>—PPTP ALG trace flags

## **<traceoptions> configuration/security/alg/ike-esp-nat**

---

**Usage**

```
<configuration>
<security>
 <alg>
 <ike-esp-nat>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </ike-esp-nat>
```

```
</alg>
</security>
</configuration>
```

**Description** IKE-ESP ALG trace options

**Contents** <flag>—IKE-ESP ALG trace flags

---

## <traceoptions> configuration/security/application-firewall

---

### Usage

```
<configuration>
<security>
<application-firewall>
<traceoptions>
<no-remote-trace/>
<file>...</file>
<flag>...</flag>
</traceoptions>
</application-firewall>
</security>
</configuration>
```

**Description** Rule-sets Tracing Options

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

---

## <traceoptions> configuration/security/utm

---

### Usage

```
<configuration>
<security>
<utm>
<traceoptions>
<flag>...</flag>
</traceoptions>
</utm>
</security>
</configuration>
```

**Description** Trace options for utm

**Contents** <flag>—Tracing UTM information

## **<traceoptions> configuration/security/utm/application-proxy**

---

### **Usage**

```
<configuration>
 <security>
 <utm>
 <application-proxy>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </application-proxy>
 </utm>
 </security>
</configuration>
```

**Description** Trace options for application proxy

**Contents** <flag>—Tracing parameters for utm application proxy

## **<traceoptions> configuration/security/utm/ipc**

---

### **Usage**

```
<configuration>
 <security>
 <utm>
 <ipc>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </ipc>
 </utm>
 </security>
</configuration>
```

**Description** Trace options for IPC

**Contents** <flag>—Traceoptions for utm IPC flag

## **<traceoptions> configuration/security/utm/feature-profile/anti-virus**

---

### **Usage**

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </anti-virus>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

```
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Trace options for anti-virus feature

**Contents** <flag>—Trace options for anti-virus feature flag

---

### <traceoptions> configuration/security/utm/feature-profile/web-filtering

---

#### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<web-filtering>
<traceoptions>
<flag>...</flag>
</traceoptions>
</web-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Trace options for web-filtering feature

**Contents** <flag>—Trace options for web-filtering feature trace flag

---

### <traceoptions> configuration/security/utm/feature-profile/anti-spam

---

#### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-spam>
<traceoptions>
<flag>...</flag>
</traceoptions>
</anti-spam>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Trace options for anti-spam feature

**Contents** <flag>—Trace options for anti-spam feature flag

## <traceoptions> configuration/security/utm/feature-profile/content-filtering

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<content-filtering>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
</content-filtering>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Trace options for content-filtering feature

**Contents** <flag>—Trace options for content-filtering feature flag

## <traceoptions> configuration/security/softwires

---

### Usage

```
<configuration>
<security>
<softwires>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
</softwires>
</security>
</configuration>
```

**Description** Trace options for Network Security DS-Lite

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

## **<traceoptions> configuration/security/flow**

---

**Usage**

```
<configuration>
 <security>
 <flow>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 <rate-limit>rate-limit</rate-limit>
 <packet-filter>...</packet-filter>
 </traceoptions>
 </flow>
 </security>
</configuration>
```

**Description** Trace options for flow services

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Events and other information to include in trace output

<rate-limit>—Limit the incoming rate of trace messages

<packet-filter>—Flow packet debug filters

## **<traceoptions> configuration/security/firewall-authentication**

---

**Usage**

```
<configuration>
 <security>
 <firewall-authentication>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </firewall-authentication>
 </security>
</configuration>
```

**Description** Data-plane firewall authentication tracing options

**Contents** <flag>—Events to include in trace output

## <traceoptions> configuration/security/screen

---

### Usage

```
<configuration>
 <security>
 <screen>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </screen>
 </security>
</configuration>
```

**Description** Trace options for Network Security Screen

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

## <traceoptions> configuration/security/nat

---

### Usage

```
<configuration>
 <security>
 <nat>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </nat>
 </security>
</configuration>
```

**Description** NAT trace options

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

## <traceoptions> configuration/security/resource-manager

---

**Usage**

```
<configuration>
 <security>
 <resource-manager>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </resource-manager>
 </security>
</configuration>
```

**Description** Traceoptions for resource manager

**Contents** <flag>—Resource manager objects and events to include in trace

## <traceoptions> configuration/security/log

---

**Usage**

```
<configuration>
 <security>
 <log>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </log>
 </security>
</configuration>
```

**Description** Security log daemon trace options

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—List of things to include in trace

## <traceoptions> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
```

```

 <rate-limit>rate-limit</rate-limit>
 </traceoptions>
</security>
</configuration>

```

**Description** Network security daemon tracing options

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

<rate-limit>—Limit the incoming rate of trace messages

### <traceoptions> configuration/security/datapath-debug

---

**Usage**

```

<configuration>
 <security>
 <datapath-debug>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 </traceoptions>
 </datapath-debug>
 </security>
</configuration>

```

**Description** End to end debug trace options

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

### <traceoptions> configuration/security/user-identification

---

**Usage**

```

<configuration>
 <security>
 <user-identification>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </user-identification>
 </security>
</configuration>

```

**Description** User-identification Tracing Options

**Contents** <no-remote-trace>—Disable remote tracing  
<file>—Trace file information  
<flag>—Tracing parameters

---

### <traceoptions> configuration/services/ip-monitoring

---

**Usage**

```
<configuration>
 <services>
 <ip-monitoring>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </ip-monitoring>
 </services>
</configuration>
```

**Description** IP-Monitoring trace options

**Contents** <no-remote-trace>—Disable remote tracing  
<file>—Trace file information  
<flag>—Tracing parameters

---

### <traceoptions> configuration/services/unified-access-control

---

**Usage**

```
<configuration>
 <services>
 <unified-access-control>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </unified-access-control>
 </services>
</configuration>
```

**Description** UAC trace options

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

## <traceoptions> configuration/services/server-load-balance

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <traceoptions>
 <no-remote-trace/>
 <file>...</file>
 <flag>...</flag>
 <level>level</level>
 </traceoptions>
 </server-load-balance>
 </services>
</configuration>
```

**Description** Configure server load balance traceoptions

**Contents** <no-remote-trace>—Disable remote tracing

- brief - Brief debugging output
- detail - Detailed debugging output
- extensive - Extensive debugging output
- verbose - Verbose debugging output

<file>—Trace file information

- brief - Brief debugging output
- detail - Detailed debugging output
- extensive - Extensive debugging output
- verbose - Verbose debugging output

<flag>—Tracing parameters

- brief - Brief debugging output
- detail - Detailed debugging output
- extensive - Extensive debugging output
- verbose - Verbose debugging output

<level>—Set level of tracing

- brief - Brief debugging output
- detail - Detailed debugging output
- extensive - Extensive debugging output
- verbose - Verbose debugging output

---

## <traceoptions> configuration/services/captive-portal

---

**Usage**

```
<configuration>
<services>
<captive-portal>
<traceoptions>
<file>...</file>
<flag>...</flag>
</traceoptions>
</captive-portal>
</services>
</configuration>
```

**Description** Trace options for CAPTIVE PORTAL

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

## <traceoptions> configuration/interfaces/interface

---

**Usage**

```
<configuration>
<interfaces>
<interface>
<traceoptions>
<flag>...</flag>
<file>...</file>
</traceoptions>
</interface>
</interfaces>
</configuration>
```

**Description**

**Contents** <flag>—  
<file>—Trace file information for ISDN decoded frames

## <traceoptions> configuration/protocols/oam/ethernet/connectivity-fault-management

---

### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<traceoptions>
<no-remote-trace/>
<file>...</file>
<flag>...</flag>
</traceoptions>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Trace options for connectivity fault management

**Contents** <no-remote-trace>—Disable remote tracing

<file>—Trace file information

<flag>—Tracing parameters

## <traceoptions> configuration/protocols/lldp

---

### Usage

```
<configuration>
<protocols>
<lldp>
<traceoptions>
<file>...</file>
<flag>...</flag>
</traceoptions>
</lldp>
</protocols>
</configuration>
```

**Description** Trace options for LLDP

**Contents** <file>—Trace file options

<flag>—Tracing parameters

## <traceoptions> configuration/protocols/dot1x

---

**Usage**

```
<configuration>
<protocols>
<dot1x>
<traceoptions>
<file>...</file>
<flag>...</flag>
</traceoptions>
</dot1x>
</protocols>
</configuration>
```

**Description** Trace options for 802.1X

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

## <traceoptions> configuration/protocols/gvrp

---

**Usage**

```
<configuration>
<protocols>
<gvrp>
<traceoptions>
<file>...</file>
<flag>...</flag>
</traceoptions>
</gvrp>
</protocols>
</configuration>
```

**Description** Tracing options for GVRP protocol

**Contents** <file>—Trace file options  
<flag>—Tracing parameters for GVRP protocol

## <traceoptions> configuration/protocols/mvrp

---

**Usage**

```
<configuration>
<protocols>
<mvrp>
<traceoptions>
<file>...</file>
<flag>...</flag>
```

```

 </traceoptions>
 </mvrp>
</protocols>
</configuration>

```

**Description** Tracing options for MVRP protocol

**Contents** <file>—Trace file options  
 <flag>—Tracing parameters

### <traceoptions> configuration/protocols/protection-group

---

**Usage**

```

<configuration>
 <protocols>
 <protection-group>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </protection-group>
 </protocols>
</configuration>

```

**Description** Tracing options for debugging protocol operation

**Contents** <file>—Trace file options  
 <flag>—Tracing parameters

### <traceoptions> configuration/protocols/stp

---

**Usage**

```

<configuration>
 <protocols>
 <stp>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </stp>
 </protocols>
</configuration>

```

**Description** Tracing options for debugging protocol operation

**Contents** <file>—Trace file options

<flag>—Tracing parameters

---

## <traceoptions> configuration/protocols/rstp

---

### Usage

```
<configuration>
<protocols>
 <rstp>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </rstp>
</protocols>
</configuration>
```

**Description** Tracing options for debugging protocol operation

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

## <traceoptions> configuration/protocols/mstp

---

### Usage

```
<configuration>
<protocols>
 <mstp>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </mstp>
</protocols>
</configuration>
```

**Description** Tracing options for debugging protocol operation

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

## <traceoptions> configuration/protocols/vstp/vlan-group/group

---

### Usage

```
<configuration>
<protocols>
 <vstp>
 <vlan-group>
```

```
<group>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
</group>
</vlan-group>
</vstp>
</protocols>
</configuration>
```

**Description** Tracing options for debugging protocol operation

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

### <traceoptions> configuration/protocols/vstp/vlan

---

#### Usage

```
<configuration>
<protocols>
 <vstp>
 <vlan>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </vlan>
 </vstp>
</protocols>
</configuration>
```

**Description** Tracing options for debugging protocol operation

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

### <traceoptions> configuration/protocols/edge-virtual-bridging

---

#### Usage

```
<configuration>
<protocols>
 <edge-virtual-bridging>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </edge-virtual-bridging>
```

```
</protocols>
</configuration>
```

**Description** Trace options for Edge Virtual Bridging

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

### <traceoptions> configuration/protocols/igmp-snooping

---

**Usage**

```
<configuration>
 <protocols>
 <igmp-snooping>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </igmp-snooping>
 </protocols>
</configuration>
```

**Description** Trace options for IGMP Snooping

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

---

### <traceoptions> configuration/protocols/mld-snooping

---

**Usage**

```
<configuration>
 <protocols>
 <mld-snooping>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </mld-snooping>
 </protocols>
</configuration>
```

**Description** Trace options for MLD Snooping

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

## <traceoptions> configuration/smtp

---

### Usage

```
<configuration>
 <smtp>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </smtp>
</configuration>
```

**Description** Trace options for SMTP client service

**Contents** <flag>—Tracing parameters

## <traceoptions> configuration/ethernet-switching-options

---

### Usage

```
<configuration>
 <ethernet-switching-options>
 <traceoptions>
 <file>...</file>
 <flag>...</flag>
 </traceoptions>
 </ethernet-switching-options>
</configuration>
```

**Description** Global tracing options for access security

**Contents** <file>—Trace file options  
<flag>—Tracing parameters

## <traceoptions> configuration/vlans

---

### Usage

```
<configuration>
 <vlans>
 <traceoptions>
 <flag>...</flag>
 </traceoptions>
 </vlans>
</configuration>
```

**Description** VLAN trace options

**Contents** <flag>—Tracing parameters

## <traffic-distribution> configuration/services

---

**Usage**

```
<configuration>
 <services>
 <traffic-distribution>
 <service-layer-card>...</service-layer-card>
 </traffic-distribution>
 </services>
</configuration>
```

**Description** JunOS MAG SLC traffic distribution configuration

**Contents** <service-layer-card>—Service layer card configuration

## <traffic-options> configuration/security/utm/utm-policy

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <utm-policy>
 <traffic-options>
 <sessions-per-client>...</sessions-per-client>
 </traffic-options>
 </utm-policy>
 </utm>
 </security>
</configuration>
```

**Description** Traffic options

**Contents** <sessions-per-client>—Sessions per client

## <transmit-rate-sets> configuration/wlan/access-point/radio/radio-options

---

**Usage**

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <radio-options>
 <transmit-rate-sets>
 <supported-rates>...</supported-rates>
 <supported-basic-rates>...</supported-basic-rates>
 </transmit-rate-sets>
 </radio-options>
 </radio>
 </access-point>
```

```
</wlan>
</configuration>
```

**Description** Specify the transmit rate sets

**Contents** <supported-rates>—List of supported rates in Mbps

<supported-basic-rates>—List of supported basic rates in Mbps

---

### <trickling> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/profile

---

#### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<kaspersky-lab-engine>
<profile>
<trickling>
 <timeout>timeout</timeout> <!-- mandatory -->
</trickling>
</profile>
</kaspersky-lab-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus trickling

**Contents** <timeout>—Trickling timeout

---

### <trickling> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/profile

---

#### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<juniper-express-engine>
<profile>
<trickling>
 <timeout>timeout</timeout> <!-- mandatory -->
</trickling>
</profile>
```

```
</juniper-express-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus trickling

**Contents** <timeout>—Trickling timeout

---

### <trickling> configuration/security/utm/feature-profile/anti-virus/sophos-engine/profile

---

#### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<sophos-engine>
<profile>
<trickling>
<timeout>timeout</timeout> <!-- mandatory -->
</trickling>
</profile>
</sophos-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Anti-virus trickling

**Contents** <timeout>—Trickling timeout

---

### <tuesday> configuration/schedulers/scheduler

---

#### Usage

```
<configuration>
<schedulers>
<scheduler>
<tuesday>
<start-time>...</start-time>
<exclude/>
<all-day/>
</tuesday>
</scheduler>
</schedulers>
```

`</configuration>`

**Description** Every Tuesday

**Contents** `<start-time>`—Time range for day  
`<exclude>`—Exclude day from week  
`<all-day>`—Include complete day

# Tag Elements Beginning with U

This chapter lists the configuration tag elements that have names beginning with the letter *u*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

## `<udp>` configuration/security/screen/ids-option

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <udp>
 <flood>...</flood>
 <udp-sweep>...</udp-sweep>
 </udp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure UDP layer ids options

**Contents** `<flood>`—Configure UDP flood ids option  
`<udp-sweep>`—Configure UDP sweep ids option

## <udp-sweep> configuration/security/screen/ids-option/udp

---

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <udp>
 <udp-sweep>
 <threshold>threshold</threshold>
 </udp-sweep>
 </udp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Configure UDP sweep ids option

**Contents** <threshold>—Threshold which specifies the minimum time per UDP packets

## <unified-access-control> configuration/services

---

### Usage

```
<configuration>
 <services>
 <unified-access-control>
 <infranet-controller>...</infranet-controller>
 <certificate-verification>certificate-verification</certificate-verification>
 <timeout>timeout</timeout>
 <interval>interval</interval>
 <timeout-action>timeout-action</timeout-action>
 <test-only-mode/>
 <traceoptions>...</traceoptions>
 <captive-portal>...</captive-portal>
 </unified-access-control>
 </services>
</configuration>
```

**Description** Configure Unified Access Control

**Contents** <infranet-controller>—Configure infranet controller

- warning - Warn if certificate is not being verified
- required - Require certificate verification. Most secure
- optional - Make verification optional, no warnings. Least secure
- close - Remove existing sessions and block further traffic

- no-change - Preserve existing connections; block new sessions
- open - Allow traffic for new and existing sessions to go through

<certificate-verification>—Specify certificate verification requirement

- warning - Warn if certificate is not being verified
- required - Require certificate verification. Most secure
- optional - Make verification optional, no warnings. Least secure
- close - Remove existing sessions and block further traffic
- no-change - Preserve existing connections; block new sessions
- open - Allow traffic for new and existing sessions to go through

<timeout>—Timeout for idle infranet controller link in seconds

- close - Remove existing sessions and block further traffic
- no-change - Preserve existing connections; block new sessions
- open - Allow traffic for new and existing sessions to go through

<interval>—Heartbeat interval from infranet controller in seconds

- close - Remove existing sessions and block further traffic
- no-change - Preserve existing connections; block new sessions
- open - Allow traffic for new and existing sessions to go through

<timeout-action>—Specify action when infranet controller timeout occurs

- close - Remove existing sessions and block further traffic
- no-change - Preserve existing connections; block new sessions
- open - Allow traffic for new and existing sessions to go through

<test-only-mode>—Allow all traffic and only log enforcement result

<traceoptions>—UAC trace options

<captive-portal>—Unauthenticated HTTP redirect

---

## <unit> configuration/interfaces/interface

---

### Usage

```
<configuration>
<interfaces>
<interface>
 <unit>
 <dialer-options>...</dialer-options>
 <backup-options>...</backup-options>
 <family>...</family>
```

```
<dynamic-call-admission-control>...</dynamic-call-admission-control>
<input-vlan-map/>
<output-vlan-map/>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description**

**Contents**   <dialer-options>—Dialer options

                  <backup-options>—Backup interface configuration options

                  <family>—

                  <dynamic-call-admission-control>—Dynamic call admission control configuration

                  <input-vlan-map>—VLAN map operation on input

                  <output-vlan-map>—VLAN map operation on output

---

**<unknown-message> configuration/security/alg/h323/application-screen**

---

**Usage**

```
<configuration>
<security>
<alg>
<h323>
<application-screen>
<unknown-message>
<permit-nat-applied/>
<permit-routed/>
</unknown-message>
</application-screen>
</h323>
</alg>
</security>
</configuration>
```

**Description**   Configure ALG action on receiving an unknown message

**Contents**   <permit-nat-applied>—Permit unknown messages on packets that are NATed

                  <permit-routed>—Permit unknown messages on routed packets

---

**<unknown-message> configuration/security/alg/mgcp/application-screen**

---

**Usage**

```
<configuration>
<security>
```

```
<alg>
 <mgcp>
 <application-screen>
 <unknown-message>
 <permit-nat-applied/>
 <permit-routed/>
 </unknown-message>
 </application-screen>
 </mgcp>
</alg>
</security>
</configuration>
```

**Description** Configure ALG action on receiving an unknown message

**Contents** <permit-nat-applied>—Permit unknown messages on packets that are NATed  
<permit-routed>—Permit unknown messages on routed packets

---

### <unknown-message> configuration/security/alg/sccp/application-screen

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <sccp>
 <application-screen>
 <unknown-message>
 <permit-nat-applied/>
 <permit-routed/>
 </unknown-message>
 </application-screen>
 </sccp>
 </alg>
 </security>
</configuration>
```

**Description** Configure ALG action on receiving an unknown message

**Contents** <permit-nat-applied>—Permit unknown messages on packets that are NATed  
<permit-routed>—Permit unknown messages on routed packets

---

### <unknown-message> configuration/security/alg/sip/application-screen

---

#### Usage

```
<configuration>
 <security>
 <alg>
 <sip>
```

```
<application-screen>
 <unknown-message>
 <permit-nat-applied/>
 <permit-routed/>
 </unknown-message>
</application-screen>
</sip>
</alg>
</security>
</configuration>
```

**Description** Configure ALG action on receiving an unknown message

**Contents** <permit-nat-applied>—Permit unknown messages on packets that are NATed  
<permit-routed>—Permit unknown messages on routed packets

---

## <unknown-unicast-forwarding> configuration/ethernet-switching-options

---

### Usage

```
<configuration>
 <ethernet-switching-options>
 <unknown-unicast-forwarding>
 <vlan>...</vlan>
 </unknown-unicast-forwarding>
 </ethernet-switching-options>
</configuration>
```

**Description** Set interface for forwarding of unknown unicast packets

**Contents** <vlan>—VLAN for the unknown unicast packets

---

## <url> configuration/security/pki/ca-profile/revocation-check/crl

---

### Usage

```
<configuration>
 <security>
 <pki>
 <ca-profile>
 <revocation-check>
 <crl>
 <url>
 <url-string>url-string</url-string> <!-- identifier -->
 <password>password</password>
 </url>
 </crl>
 </revocation-check>
 </ca-profile>
 </pki>
 </security>
```

</configuration>

**Description**

**Contents** <url-string>—URL of CRL distribution point for certificate authority  
<password>—Password for authentication with the server

---

**<url-pattern> configuration/security/utm/custom-objects**

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <url-pattern>
 <name>name</name> <!-- mandatory --> <!-- identifier -->
 <value>...</value>
 </url-pattern>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure url-list object

**Contents** <name>—Configure name of url-list object  
<value>—Configure value of url-list object

---

**<user> configuration/security/dynamic-vpn/clients**

---

**Usage**

```
<configuration>
 <security>
 <dynamic-vpn>
 <clients>
 <user>
 <name>name</name>
 </user>
 </clients>
 </dynamic-vpn>
 </security>
</configuration>
```

**Description** Remote IPSec VPN users

**Contents** <name>—User name

## **<user-at-hostname> configuration/security/ike/gateway/local-identity**

---

**Usage**

```
<configuration>
 <security>
 <ike>
 <gateway>
 <local-identity>
 <user-at-hostname>
 <identity-user>identity-user</identity-user>
 </user-at-hostname>
 </local-identity>
 </gateway>
 </ike>
 </security>
</configuration>
```

**Description** Use an e-mail address

**Contents** <identity-user>—The local user-FQDN

## **<user-at-hostname> configuration/security/ike/gateway/remote-identity**

---

**Usage**

```
<configuration>
 <security>
 <ike>
 <gateway>
 <remote-identity>
 <user-at-hostname>
 <identity-user>identity-user</identity-user>
 </user-at-hostname>
 </remote-identity>
 </gateway>
 </ike>
 </security>
</configuration>
```

**Description** Use an e-mail address

**Contents** <identity-user>—The remote user-FQDN

## **<user-at-hostname> configuration/security/group-vpn/member/ike/gateway/local-identity**

---

**Usage**

```
<configuration>
 <security>
```

```

<group-vpn>
 <member>
 <ike>
 <gateway>
 <local-identity>
 <user-at-hostname>
 <identity-user>identity-user</identity-user>
 </user-at-hostname>
 </local-identity>
 </gateway>
 </ike>
 </member>
</group-vpn>
</security>
</configuration>

```

**Description** Use an e-mail address

**Contents** <identity-user>—The local user-FQDN

### <user-at-hostname> configuration/security/group-vpn/server/ike/gateway/local-identity

---

#### Usage

```

<configuration>
 <security>
 <group-vpn>
 <server>
 <ike>
 <gateway>
 <local-identity>
 <user-at-hostname>
 <identity-user>identity-user</identity-user>
 </user-at-hostname>
 </local-identity>
 </gateway>
 </ike>
 </server>
 </group-vpn>
 </security>
</configuration>

```

**Description** Use an e-mail address

**Contents** <identity-user>—The local user-FQDN

### <user-identification> configuration/security

---

#### Usage

```

<configuration>

```

```
<security>
 <user-identification>
 <traceoptions>...</traceoptions>
 <authentication-source>...</authentication-source>
 </user-identification>
</security>
</configuration>
```

**Description** Configure user-identification

**Contents** <traceoptions>—User-identification Tracing Options

<authentication-source>—Configure user-identification authentication-source

---

## <utm> configuration/security

---

### Usage

```
<configuration>
 <security>
 <utm>
 <traceoptions>...</traceoptions>
 <application-proxy>...</application-proxy>
 <ipc>...</ipc>
 <custom-objects>...</custom-objects>
 <feature-profile>...</feature-profile>
 <utm-policy>...</utm-policy>
 </utm>
 </security>
</configuration>
```

**Description** Content security service configuration

**Contents** <traceoptions>—Trace options for utm

<application-proxy>—Trace options for application proxy

<ipc>—Trace options for IPC

<custom-objects>—Trace options for custom-objects

<feature-profile>—Feature-profile settings

<utm-policy>—Configure profile

---

## <utm-policy> configuration/security/utm

---

### Usage

```
<configuration>
 <security>
 <utm>
```

```
<utm-policy>
 <name>name</name> <!-- identifier -->
 <anti-virus>...</anti-virus>
 <content-filtering>...</content-filtering>
 <web-filtering>...</web-filtering>
 <anti-spam>...</anti-spam>
 <traffic-options>...</traffic-options>
</utm-policy>
</utm>
</security>
</configuration>
```

**Description** Configure profile

**Contents**

- <name>—UTM policy name
- <anti-virus>—UTM policy anti-virus profile
- <content-filtering>—Content-filtering profile
- <web-filtering>—Web-filtering profile
- <anti-spam>—Anti-spam profile
- <traffic-options>—Traffic options

## CHAPTER 48

# Tag Elements Beginning with V

This chapter lists the configuration tag elements that have names beginning with the letter v. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the <apply-groups> or <apply-groups-except> tag element and the <apply-macro> tag element as children (the only exceptions are <apply-groups>, <apply-groups-except> and <apply-macro> themselves). For brevity, the reference entries do not list these tag elements as children.

---

### <value> configuration/security/utm/custom-objects/mime-pattern

---

#### Usage

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <mime-pattern>
 <value>
 <value>value</value>
 </value>
 </mime-pattern>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure MIME value

**Contents** <value>—Configure MIME value

## **<value> configuration/security/utm/custom-objects/filename-extension**

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <filename-extension>
 <value>
 <value>value</value>
 </value>
 </filename-extension>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure value of extension-list object

**Contents** <value>—Configure value of extension-list object

## **<value> configuration/security/utm/custom-objects/url-pattern**

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <custom-objects>
 <url-pattern>
 <value>
 <value>value</value>
 </value>
 </url-pattern>
 </custom-objects>
 </utm>
 </security>
</configuration>
```

**Description** Configure value of url-list object

**Contents** <value>—Configure value of url-list object

## **<value> configuration/security/utm/custom-objects/custom-url-category**

---

**Usage**

```
<configuration>
 <security>
 <utm>
 <custom-objects>
```

```

 <custom-url-category>
 <value>
 <value>value</value>
 </value>
 </custom-url-category>
 </custom-objects>
</utm>
</security>
</configuration>

```

**Description** Configure value of category-list object

**Contents** <value>—Configure value of category-list object

---

### <value> configuration/security/utm/custom-objects/protocol-command

---

#### Usage

```

<configuration>
<security>
<utm>
 <custom-objects>
 <protocol-command>
 <value>
 <value>value</value>
 </value>
 </protocol-command>
 </custom-objects>
</utm>
</security>
</configuration>

```

**Description** Configure value of command-list object

**Contents** <value>—Configure value of command-list object

---

### <vendor-id> configuration/ethernet-switching-options/secure-access-port/vlan/dhcp-option82

---

#### Usage

```

<configuration>
<ethernet-switching-options>
<secure-access-port>
 <vlan>
 <dhcp-option82>
 <vendor-id>
 <use-string>use-string</use-string>
 </vendor-id>
 </dhcp-option82>
 </vlan>
</secure-access-port>

```

```
</ethernet-switching-options>
</configuration>
```

**Description** Configure DHCP option 82 vendor id

**Contents** <use-string>—Use raw string instead of the default vendor id

---

## <version> configuration/security/gprs/gtp/profile/remove-ie

---

### Usage

```
<configuration>
<security>
<gprs>
<gtp>
<profile>
<remove-ie>
<version>
<v1/>
<release>...</release>
<number>...</number>
</version>
</remove-ie>
</profile>
</gtp>
</gprs>
</security>
</configuration>
```

**Description** GTP version

**Contents** <v1>—GTP v1

<release>—Remove information elements by release

<number>—Remove information elements by number

---

## <video-queue> configuration/wlan/access-point/radio/quality-of-service/access-point-queues

---

### Usage

```
<configuration>
<wlan>
<access-point>
<radio>
<quality-of-service>
<access-point-queues>
<video-queue>

<arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>
```

```

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>
 <maximum-burst>maximum-burst</maximum-burst>
 </video-queue>
</access-point-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>

```

**Description** Configure video queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames

<minimum-contention-window>—Minimum contention window size

<maximum-contention-window>—Maximum contention window size

<maximum-burst>—Specify maximum burst

## <video-queue> configuration/wlan/access-point/radio/quality-of-service/station-queues

### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <video-queue>

 <arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>

 <transmit-opportunity-limit>transmit-opportunity-limit</transmit-opportunity-limit>
 </video-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>

```

**Description** Configure video queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames

<minimum-contention-window>—Specify minimum contention window size

<maximum-contention-window>—Specify maximum contention window size

<transmit-opportunity-limit>—Specify transmission opportunity limit

---

## <virtual-access-point> configuration/wlan/access-point/radio

---

### Usage

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <identifier>identifier</identifier> <!-- mandatory --> <!-- identifier -->
 <description>description</description>
 <ssid>ssid</ssid>
 <vlan>vlan</vlan>
 <no-broadcast-ssid/>
 <http-redirect>...</http-redirect>
 <security>...</security>
 </virtual-access-point>
 </radio>
 </access-point>
 </wlan>
</configuration>
```

**Description** Virtual access point configuration

**Contents** <identifier>—Specify VAP identifier value

<description>—Specify the virtual access point description

<ssid>—SSID value for the virtual access point

<vlan>—VLAN id for the virtual access point

<no-broadcast-ssid>—Disable broadcast SSID

<http-redirect>—Configure HTTP redirect setting

<security>—Configure security settings for the VAP

---

## <virtual-server> configuration/services/server-load-balance

---

### Usage

```
<configuration>
 <services>
 <server-load-balance>
 <virtual-server>
 <virtual-server-name>virtual-server-name</virtual-server-name> <!-- identifier
-->
```

```

 <destination-address>destination-address</destination-address> <!-- mandatory
-->
 <policy>...</policy> <!-- mandatory -->
 <disable/>
 </virtual-server>
</server-load-balance>
</services>
</configuration>

```

**Description** Configure virtual server

**Contents** <virtual-server-name>—Name of the virtual server

<destination-address>—Virtual server IP address

<policy>—Content based policy

<disable>—Disable virtual server

## <virus-detection> configuration/security/utm/feature-profile/anti-virus/kaspersky-lab-engine/profile/notification-options

### Usage

```

<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <kaspersky-lab-engine>
 <profile>
 <notification-options>
 <virus-detection>
 <type>type</type>
 <notify-mail-sender/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </virus-detection>
 </notification-options>
 </profile>
 </kaspersky-lab-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>

```

**Description** Virus detection notification

**Contents** <type>—Virus detection notification type

- protocol-only - Notification in protocol level only
- message - Notification in message

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

---

## <virus-detection> configuration/security/utm/feature-profile/anti-virus/juniper-express-engine/profile/notification-options

---

### Usage

```
<configuration>
<security>
<utm>
<feature-profile>
<anti-virus>
<juniper-express-engine>
<profile>
<notification-options>
 <virus-detection>
 <type>type</type>
 <notify-mail-sender/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </virus-detection>
</notification-options>
</profile>
</juniper-express-engine>
</anti-virus>
</feature-profile>
</utm>
</security>
</configuration>
```

**Description** Virus detection notification

**Contents** <type>—Virus detection notification type

- protocol-only - Notification in protocol level only
- message - Notification in message

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

## <virus-detection> configuration/security/utm/feature-profile/anti-virus/sophos-engine/profile/notification-options

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <anti-virus>
 <sophos-engine>
 <profile>
 <notification-options>
 <virus-detection>
 <type>type</type>
 <notify-mail-sender/>
 <custom-message>custom-message</custom-message>

 <custom-message-subject>custom-message-subject</custom-message-subject>
 </virus-detection>
 </notification-options>
 </profile>
 </sophos-engine>
 </anti-virus>
 </feature-profile>
 </utm>
</security>
</configuration>
```

**Description** Virus detection notification

**Contents** <type>—Virus detection notification type

- protocol-only - Notification in protocol level only
- message - Notification in message

<notify-mail-sender>—Notify mail sender

<custom-message>—Custom message for notification

<custom-message-subject>—Custom message subject for notification

## <vlan> configuration/protocols/protection-group/ethernet-ring/data-channel

### Usage

```
<configuration>
 <protocols>
 <protection-group>
 <ethernet-ring>
 <data-channel>
 <vlan>
 <value>value</value> <!-- mandatory -->
```

```
</vlan>
</data-channel>
</ethernet-ring>
</protection-group>
</protocols>
</configuration>
```

**Description** VLAN ID or VLAN ID range [1..4094]

**Contents** <value>—VLAN ID or VLAN ID range [1..4094]

---

### <vlan> configuration/protocols/mstp/msti

---

#### Usage

```
<configuration>
<protocols>
<mstp>
<msti>
<vlan>
 <value>value</value> <!-- mandatory -->
</vlan>
</msti>
</mstp>
</protocols>
</configuration>
```

**Description** VLAN ID or VLAN ID range [1..4094]

**Contents** <value>—VLAN ID or VLAN ID range [1..4094]

---

### <vlan> configuration/protocols/vstp/vlan-group/group

---

#### Usage

```
<configuration>
<protocols>
<vstp>
<vlan-group>
<group>
<vlan>
 <value>value</value> <!-- mandatory -->
</vlan>
</group>
</vlan-group>
</vstp>
</protocols>
</configuration>
```

**Description** VLAN ID or VLAN ID range [1..4094]

**Contents** <value>—VLAN ID or VLAN ID range [1..4094]

## <vlan> configuration/protocols/vstp

### Usage

```
<configuration>
<protocols>
<vstp>
 <vlan>
 <id-name/>
 <all/>
 <bridge-priority>bridge-priority</bridge-priority>
 <max-age>max-age</max-age>
 <hello-time>hello-time</hello-time>
 <forward-delay>forward-delay</forward-delay>
 <traceoptions>...</traceoptions>
 <interface>...</interface>
 </vlan>
</vstp>
</protocols>
</configuration>
```

**Description** VLAN spanning tree options

**Contents** <id-name>—VLAN id or name

<all>—All VLANs

<bridge-priority>—Priority of the bridge (in increments of 4k - 0,4k,8k,..60k)

<max-age>—Maximum age of received protocol bpdu

<hello-time>—Time interval between configuration BPDUs

<forward-delay>—Time spent in listening or learning state

<traceoptions>—Tracing options for debugging protocol operation

<interface>—

## <vlan> configuration/protocols/igmp-snooping

### Usage

```
<configuration>
<protocols>
<igmp-snooping>
 <vlan>
 <all/>
 <vlan-name/>
 <disable/>
 <version>version</version>
 <query-interval>query-interval</query-interval>
```

```
<query-last-member-interval>query-last-member-interval</query-last-member-interval>

 <query-response-interval>query-response-interval</query-response-interval>
 <robust-count>robust-count</robust-count>
 <immediate-leave/>
 <no-default-flooding/>
 <proxy>...</proxy>
 <data-forwarding>...</data-forwarding>
 <interface>...</interface>
 </vlan>
</igmp-snooping>
</protocols>
</configuration>
```

**Description** VLAN options

**Contents**

- <all>—All configured VLANs
- <vlan-name>—VLAN name
- <disable>—Disable IGMP snooping on this VLAN
- <version>—Set IGMP version number on this VLAN
- <query-interval>—Query interval
- <query-last-member-interval>—Query last member interval
- <query-response-interval>—Query response interval
- <robust-count>—Robust count
- <immediate-leave>—Immediate leave
- <no-default-flooding>—No default flooding
- <proxy>—Enable proxy mode
- <data-forwarding>—Data forwarding
- <interface>—Interface options

---

## <vlan> configuration/protocols/mld-snooping

---

### Usage

```
<configuration>
 <protocols>
 <mld-snooping>
 <vlan>
 <all/>
 <vlan-name/>
 <disable/>
```

```

<version>version</version>
<query-interval>query-interval</query-interval>

<query-last-member-interval>query-last-member-interval</query-last-member-interval>

<query-response-interval>query-response-interval</query-response-interval>
<robust-count>robust-count</robust-count>
<immediate-leave/>
<interface>...</interface>
</vlan>
</mld-snooping>
</protocols>
</configuration>

```

**Description** VLAN options

**Contents**

- <all>—All configured VLANs
- <vlan-name>—VLAN name
- <disable>—Disable MLD snooping on this VLAN
- <version>—Set MLD version number on this VLAN
- <query-interval>—Query interval
- <query-last-member-interval>—Query last member interval
- <query-response-interval>—Query response interval
- <robust-count>—Robust count
- <immediate-leave>—Immediate leave
- <interface>—Interface options

## <vlan> configuration/ethernet-switching-options/unknown-unicast-forwarding

### Usage

```

<configuration>
 <ethernet-switching-options>
 <unknown-unicast-forwarding>
 <vlan>
 <vlan-name>vlan-name</vlan-name> <!-- identifier -->
 <interface>interface</interface>
 </vlan>
 </unknown-unicast-forwarding>
 </ethernet-switching-options>
</configuration>

```

**Description** VLAN for the unknown unicast packets

**Contents** <vlan-name>—VLAN name or VLAN Tag (1..4095)  
<interface>—Interface to send unknown unicast packets for the VLAN

---

## <vlan> configuration/ethernet-switching-options/static

---

### Usage

```
<configuration>
<ethernet-switching-options>
<static>
 <vlan>
 <vlan_name>vlan_name</vlan_name> <!-- identifier -->
 <mac>...</mac> <!-- mandatory -->
 </vlan>
</static>
</ethernet-switching-options>
</configuration>
```

**Description** VLAN static MAC entries

**Contents** <vlan\_name>—VLAN name  
<mac>—Static MAC

---

## <vlan> configuration/ethernet-switching-options/secure-access-port

---

### Usage

```
<configuration>
<ethernet-switching-options>
<secure-access-port>
 <vlan>
 <all/>
 <vlan-name/>
 <arp-inspection>...</arp-inspection>
 <no-arp-inspection/>
 <examine-dhcp>...</examine-dhcp>
 <no-examine-dhcp/>
 <examine-fip>...</examine-fip>
 <mac-move-limit>...</mac-move-limit>
 <ip-source-guard/>
 <dhcp-option82>...</dhcp-option82>
 </vlan>
</secure-access-port>
</ethernet-switching-options>
</configuration>
```

**Description** Configure access port security for this VLAN

**Contents** <all>—All configured VLANs

<vlan-name>—VLAN name or VLAN Tag (1..4095)

<arp-inspection>—Enable Dynamic ARP inspection on this VLAN

<no-arp-inspection>—Disable Dynamic ARP inspection on this VLAN

<examine-dhcp>—Enable DHCP snooping on this VLAN

<no-examine-dhcp>—Disable DHCP snooping on this VLAN

<examine-fip>—Enable FIP snooping on this VLAN

<mac-move-limit>—Number of MAC movements allowed on this VLAN

<ip-source-guard>—Enable IP source guard on this VLAN

<dhcp-option82>—Configure DHCP option 82 on this VLAN

## <vlan> configuration/ethernet-switching-options/analyzer/input/ingress

### Usage

```
<configuration>
<ethernet-switching-options>
<analyzer>
<input>
<ingress>
<vlan>
 <vlan-name>vlan-name</vlan-name> <!-- identifier -->
</vlan>
</ingress>
</input>
</analyzer>
</ethernet-switching-options>
</configuration>
```

**Description** VLAN to monitor incoming traffic

**Contents** <vlan-name>—VLAN name, VLAN id or VLAN range string

## <vlan> configuration/ethernet-switching-options/analyzer/input/egress

### Usage

```
<configuration>
<ethernet-switching-options>
<analyzer>
<input>
<egress>
<vlan>
 <vlan-name>vlan-name</vlan-name> <!-- identifier -->
</vlan>
</egress>
</input>
```

```

 </analyzer>
 </ethernet-switching-options>
</configuration>

```

**Description** VLAN to monitor outgoing traffic

**Contents** <vlan-name>—VLAN name, VLAN id or VLAN range string

## <vlan> configuration/ethernet-switching-options/analyzer/output

### Usage

```

<configuration>
<ethernet-switching-options>
 <analyzer>
 <output>
 <vlan>
 <vlan_name>vlan_name</vlan_name> <!-- identifier -->
 <no-tag/>
 </vlan>
 </output>
 </analyzer>
</ethernet-switching-options>
</configuration>

```

**Description** Outgoing VLAN for mirrored packets

**Contents** <vlan\_name>—VLAN name or VLAN id

<no-tag>—Removes extra RSAPN tag from mirrored packets

## <vlan> configuration/vlans

### Usage

```

<configuration>
 <vlans>
 <vlan>
 <vlan-name>vlan-name</vlan-name> <!-- identifier -->
 <description>description</description>
 <vlan-id>vlan-id</vlan-id>
 <vlan-range>vlan-range</vlan-range>
 <global-layer2-domainid>global-layer2-domainid</global-layer2-domainid>
 <global-layer2-domainid-range>...</global-layer2-domainid-range>
 <interface>...</interface>
 <filter>...</filter>
 <l3-interface>l3-interface</l3-interface>
 <l3-interface-ingress-counting/>
 <mac-table-aging-time>...</mac-table-aging-time>
 <mac-limit>...</mac-limit>
 <dot1q-tunneling>...</dot1q-tunneling>
 <no-local-switching/>
 </vlan>
 </vlans>
</configuration>

```

```

 <isolation-id>isolation-id</isolation-id>
 <primary-vlan>primary-vlan</primary-vlan>
 <no-mac-learning/>
 </vlan>
</vlangs>
</configuration>

```

**Description** Virtual LAN

**Contents**

- <vlan-name>—VLAN name
- <description>—Text description of the VLAN
- <vlan-id>—802.1q tag
- <vlan-range>—VLAN range in the form '<vlan-id-low>–<vlan-id-high>'
- <global-layer2-domainid>—Global layer2 domain ID
- <global-layer2-domainid-range>—Global layer2 domain ID range
- <interface>—Name of interface that uses this VLAN
- <filter>—Packet filtering
- <l3-interface>—Layer 3 interface for this VLAN
- <l3-interface-ingress-counting>—Enable ingress counting on layer 3 interface for this VLAN
- <mac-table-aging-time>—MAC aging time configuration
- <mac-limit>—Number of MAC addresses allowed on this VLAN
- <dot1q-tunneling>—Dot1q-tunneling parameters
- <no-local-switching>—Disable local switching
- <isolation-id>—Isolation VLAN tag
- <primary-vlan>—Primary VLAN for this community VLAN
- <no-mac-learning>—Disable mac learning

## <vlan-group> configuration/protocols/vstp

### Usage

```

<configuration>
 <protocols>
 <vstp>
 <vlan-group>
 <group>...</group>
 </vlan-group>
 </vstp>
 </protocols>
</configuration>

```

```
</vstp>
</protocols>
</configuration>
```

**Description** Spanning tree options for group of VLANs

**Contents** <group>—Name of VLAN group

---

## <vlan-name> configuration/protocols/oam/ethernet/connectivity-fault-management/maintenance-domain

---

### Usage

```
<configuration>
<protocols>
<oam>
<ethernet>
<connectivity-fault-management>
<maintenance-domain>
<vlan-name>
<value>value</value>
</vlan-name>
</maintenance-domain>
</connectivity-fault-management>
</ethernet>
</oam>
</protocols>
</configuration>
```

**Description** Name of VLAN for the default maintenance domain

**Contents** <value>—Name of VLAN for the default maintenance domain

---

## <vlans> configuration

---

### Usage

```
<configuration>
<vlans>
<traceoptions>...</traceoptions>
<vlan>...</vlan>
</vlans>
</configuration>
```

**Description** VLAN configuration

**Contents** <traceoptions>—VLAN trace options

<vlan>—Virtual LAN

## <voice-queue> configuration/wlan/access-point/radio/quality-of-service/access-point-queues

---

### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <access-point-queues>
 <voice-queue>

 <arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>
 <maximum-burst>maximum-burst</maximum-burst>
 </voice-queue>
 </access-point-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>

```

**Description** Configure voice queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames

<minimum-contention-window>—Minimum contention window size

<maximum-contention-window>—Maximum contention window size

<maximum-burst>—Specify maximum burst

## <voice-queue> configuration/wlan/access-point/radio/quality-of-service/station-queues

---

### Usage

```

<configuration>
 <wlan>
 <access-point>
 <radio>
 <quality-of-service>
 <station-queues>
 <voice-queue>

 <arbitration-inter-frame-space>arbitration-inter-frame-space</arbitration-inter-frame-space>

 <minimum-contention-window>...</minimum-contention-window>
 <maximum-contention-window>...</maximum-contention-window>
 </voice-queue>
 </station-queues>
 </quality-of-service>
 </radio>
 </access-point>
</wlan>
</configuration>

```

```
<transmit-opportunity-limit>transmit-opportunity-limit</transmit-opportunity-limit>
 </voice-queue>
</station-queues>
</quality-of-service>
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Configure voice queue

**Contents** <arbitration-inter-frame-space>—Arbitration space between frames

<minimum-contention-window>—Specify minimum contention window size

<maximum-contention-window>—Specify maximum contention window size

<transmit-opportunity-limit>—Specify transmission opportunity limit

---

## <voip> configuration/ethernet-switching-options

### Usage

```
<configuration>
 <ethernet-switching-options>
 <voip>
 <interface>...</interface>
 </voip>
 </ethernet-switching-options>
</configuration>
```

**Description** Voice-over-IP configuration

**Contents** <interface>—Enable voice over IP on this port

---

## <vpn> configuration/security/ipsec

### Usage

```
<configuration>
 <security>
 <ipsec>
 <vpn>
 <name>name</name> <!-- identifier -->
 <bind-interface>bind-interface</bind-interface>
 <df-bit>df-bit</df-bit>
 <vpn-monitor>...</vpn-monitor>
 <manual>...</manual>
 <ike>...</ike>
 <establish-tunnels>establish-tunnels</establish-tunnels>
 </vpn>
 </ipsec>
 </security>
</configuration>
```

```
</ipsec>
</security>
</configuration>
```

**Description** Define an IPSec VPN

**Contents** <name>—Name of the VPN

- clear - Clear DF bit of outer header
- set - Set DF bit of outer header
- copy - Copy DF bit from inner header
- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

<bind-interface>—Bind to tunnel interface (route-based VPN)

- clear - Clear DF bit of outer header
- set - Set DF bit of outer header
- copy - Copy DF bit from inner header
- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

<df-bit>—Specifies how to handle the Don't Fragment bit

- clear - Clear DF bit of outer header
- set - Set DF bit of outer header
- copy - Copy DF bit from inner header
- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

<vpn-monitor>—Monitor VPN liveliness

- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

<manual>—Define a manual security association

- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

<ike>—Define an IKE-keyed IPSec vpn

- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

<establish-tunnels>—Define the criteria to establish tunnels

- immediately - Establish tunnels immediately
- on-traffic - Establish tunnels on traffic

---

## <vpn> configuration/security/group-vpn/member/ipsec

---

### Usage

```
<configuration>
<security>
 <group-vpn>
 <member>
 <ipsec>
 <vpn>
 <name>name</name> <!-- identifier -->
 <ike-gateway>ike-gateway</ike-gateway> <!-- mandatory -->

 <group-vpn-external-interface>group-vpn-external-interface</group-vpn-external-interface>
 <!-- mandatory -->
 <group>group</group> <!-- mandatory -->
 <heartbeat-threshold>heartbeat-threshold</heartbeat-threshold>
 </vpn>
 </ipsec>
 </member>
 </group-vpn>
</security>
</configuration>
```

**Description** Define an IPSec VPN

**Contents**

<name>—Name of the VPN

<ike-gateway>—Name of IKE gateway

<group-vpn-external-interface>—MPLS-facing interface used for Group VPN

<group>—Enable Group VPN by defining group id

<heartbeat-threshold>—Define heartbeat threshold for Group VPN

---

## <vpn-monitor> configuration/security/ipsec/vpn

---

### Usage

```
<configuration>
<security>
 <ipsec>
 <vpn>
 <vpn-monitor>
 <optimized/>
 <source-interface>source-interface</source-interface>
 <destination-ip>destination-ip</destination-ip>
```

```
</vpn-monitor>
</vpn>
</ipsec>
</security>
</configuration>
```

**Description** Monitor VPN liveliness

**Contents** <optimized>—Optimize for scalability

<source-interface>—Source interface for monitor message

<destination-ip>—Destination IP address for monitor message

---

### <vpn-monitor-options> configuration/security/ipsec

**Usage**

```
<configuration>
<security>
<ipsec>
 <vpn-monitor-options>
 <interval>interval</interval>
 <threshold>threshold</threshold>
 </vpn-monitor-options>
</ipsec>
</security>
</configuration>
```

**Description** Global options for VPN liveliness monitoring

**Contents** <interval>—Monitor interval in seconds

<threshold>—Number of consecutive failures to determine connectivity

---

### <vsi-discovery> configuration/protocols/edge-virtual-bridging

**Usage**

```
<configuration>
<protocols>
<edge-virtual-bridging>
 <vsi-discovery>
 <interface>...</interface>
 <vsi-policy>...</vsi-policy>
 </vsi-discovery>
</edge-virtual-bridging>
</protocols>
</configuration>
```

**Description**

**Contents**    <interface>—Configure VSI Discovery Protocol on this interface  
                 <vsi-policy>—Apply VSI policy

---

## <vsi-policy> configuration/protocols/edge-virtual-bridging/vsi-discovery

---

### Usage

```
<configuration>
<protocols>
 <edge-virtual-bridging>
 <vsi-discovery>
 <vsi-policy>
 <vsi-policy-name>vsi-policy-name</vsi-policy-name> <!-- identifier -->
 </vsi-policy>
 </vsi-discovery>
 </edge-virtual-bridging>
</protocols>
</configuration>
```

**Description**    Apply VSI policy

**Contents**    <vsi-policy-name>—Name of the VSI policy

---

## <vstp> configuration/protocols

---

### Usage

```
<configuration>
<protocols>
 <vstp>
 <disable/>
 <force-version>force-version</force-version>
 <bpdv-block-on-edge/>
 <vlan-group>...</vlan-group>
 <vlan>...</vlan>
 </vstp>
</protocols>
</configuration>
```

**Description**    VLAN Spanning Tree Protocol options

**Contents**    <disable>—Disable VSTP

- stp - Spanning tree protocol
- rstp - Rapid spanning tree protocol

<force-version>—Force protocol version

- stp - Spanning tree protocol
- rstp - Rapid spanning tree protocol

<bpdublockonedge>—Block BPDU on all interfaces configured as edge (BPDU Protect)

<vlangroup>—Spanning tree options for group of VLANs

<vlan>—VLAN spanning tree options

## CHAPTER 49

# Tag Elements Beginning with W

This chapter lists the configuration tag elements that have names beginning with the letter *w*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

---

### `<watch-list>` configuration/interfaces/interface/unit/dialer-options

---

#### Usage

```
<configuration>
<interfaces>
<interface>
<unit>
<dialer-options>
<watch-list>
<prefix>prefix</prefix> <!-- identifier -->
</watch-list>
</dialer-options>
</unit>
</interface>
</interfaces>
</configuration>
```

**Description** Dialer watch list

**Contents** `<prefix>`—Address prefix

## <web-filtering> configuration/security/utm/feature-profile

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <url-whitelist>url-whitelist</url-whitelist>
 <url-blacklist>url-blacklist</url-blacklist>
 <type>type</type>
 <traceoptions>...</traceoptions>
 <surf-control-integrated>...</surf-control-integrated>
 <websense-redirect>...</websense-redirect>
 <juniper-local>...</juniper-local>
 <juniper-enhanced>...</juniper-enhanced>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description**    Configure web-filtering feature

**Contents**    <url-whitelist>—Configure custom URL for whitelist category

- surf-control-integrated -
- websense-redirect -
- juniper-local -
- juniper-enhanced -

<url-blacklist>—Configure custom URL for blacklist category

- surf-control-integrated -
- websense-redirect -
- juniper-local -
- juniper-enhanced -

<type>—Configure web-filtering engine type

- surf-control-integrated -
- websense-redirect -
- juniper-local -
- juniper-enhanced -

<traceoptions>—Trace options for web-filtering feature

<surf-control-integrated>—Configure web-filtering surf-control integrated engine

<websense-redirect>—Configure web-filtering websense redirect engine

<juniper-local>—Configure web-filtering juniper local engine

<juniper-enhanced>—Configure web-filtering juniper enhanced engine

---

## <web-filtering> configuration/security/utm/utm-policy

---

### Usage

```
<configuration>
 <security>
 <utm>
 <utm-policy>
 <web-filtering>
 <http-profile>http-profile</http-profile>
 </web-filtering>
 </utm-policy>
 </utm>
 </security>
</configuration>
```

**Description** Web-filtering profile

**Contents** <http-profile>—Web-filtering HTTP profile

---

## <websense-redirect> configuration/security/utm/feature-profile/web-filtering

---

### Usage

```
<configuration>
 <security>
 <utm>
 <feature-profile>
 <web-filtering>
 <websense-redirect>
 <profile>...</profile>
 </websense-redirect>
 </web-filtering>
 </feature-profile>
 </utm>
 </security>
</configuration>
```

**Description** Configure web-filtering websense redirect engine

**Contents** <profile>—Websense redirect profile

## <wednesday> configuration/schedulers/scheduler

---

**Usage**

```
<configuration>
 <schedulers>
 <scheduler>
 <wednesday>
 <start-time>...</start-time>
 <exclude/>
 <all-day/>
 </wednesday>
 </scheduler>
 </schedulers>
</configuration>
```

**Description** Every Wednesday

**Contents** <start-time>—Time range for day  
<exclude>—Exclude day from week  
<all-day>—Include complete day

## <weight> configuration/security/forwarding-process/application-services/maximize-idp-sessions

---

**Usage**

```
<configuration>
 <security>
 <forwarding-process>
 <application-services>
 <maximize-idp-sessions>
 <weight>
 <equal/>
 <idp>...</idp>
 <firewall/>
 </weight>
 </maximize-idp-sessions>
 </application-services>
 </forwarding-process>
 </security>
</configuration>
```

**Description** Adjust the weighting of the resources available for idp

**Contents** <equal>—Equal resources to IDP and firewall  
<idp>—IDP has more resources than firewall  
<firewall>—Firewall has more resources than IDP

## <west-interface> configuration/protocols/protection-group/ethernet-ring

### Usage

```
<configuration>
 <protocols>
 <protection-group>
 <ethernet-ring>
 <west-interface>
 <control-channel>...</control-channel> <!-- mandatory -->
 <ring-protection-link-end/>
 <interface-none/>
 </west-interface>
 </ethernet-ring>
 </protection-group>
 </protocols>
</configuration>
```

**Description** West interface configuration

**Contents** <control-channel>—Control channel of ring port

<ring-protection-link-end>—Port is connecting to ring protection link

<interface-none>—Port is not used

## <white-list> configuration/security/screen/ids-option/tcp/syn-flood

### Usage

```
<configuration>
 <security>
 <screen>
 <ids-option>
 <tcp>
 <syn-flood>
 <white-list>
 <name>name</name> <!-- identifier -->
 <source-address>...</source-address>
 <destination-address>...</destination-address>
 </white-list>
 </syn-flood>
 </tcp>
 </ids-option>
 </screen>
 </security>
</configuration>
```

**Description** Set of IP addresses that will not trigger a screen

**Contents** <name>—White-list name

<source-address>—Source address

<destination-address>—Destination address

---

## <wildcard-address> configuration/security/address-book/address

---

### Usage

```
<configuration>
 <security>
 <address-book>
 <address>
 <wildcard-address>
 <wildcard-prefix-mask>wildcard-prefix-mask</wildcard-prefix-mask> <!--
identifier -->
 </wildcard-address>
 </address>
 </address-book>
 </security>
</configuration>
```

**Description** Numeric IPv4 wildcard address with in the form of a.d.d.r/netmask

**Contents** <wildcard-prefix-mask>—Numeric IPv4 wildcard address with in the form of a.d.d.r/netmask

---

## <wildcard-address> configuration/security/zones/security-zone/address-book/address

---

### Usage

```
<configuration>
 <security>
 <zones>
 <security-zone>
 <address-book>
 <address>
 <wildcard-address>
 <wildcard-prefix-mask>wildcard-prefix-mask</wildcard-prefix-mask> <!--
identifier -->
 </wildcard-address>
 </address>
 </address-book>
 </security-zone>
 </zones>
 </security>
</configuration>
```

**Description** Numeric IPv4 wildcard address with in the form of a.d.d.r/netmask

**Contents** <wildcard-prefix-mask>—Numeric IPv4 wildcard address with in the form of a.d.d.r/netmask

## <wlan> configuration

### Usage

```
<configuration>
<wlan>
 <admin-authentication>...</admin-authentication>
 <access-point>...</access-point>
 <syslog-options>...</syslog-options>
</wlan>
</configuration>
```

**Description** Wireless access point configuration

**Contents** <admin-authentication>—Authentication information for WLAN access points

<access-point>—WLAN access point configuration

<syslog-options>—Configure Access Point Logging options

## <wpa-enterprise> configuration/wlan/access-point/radio/virtual-access-point/security

### Usage

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <security>
 <wpa-enterprise>
 <wpa-version>...</wpa-version>
 <cipher-suites>...</cipher-suites>
 <pre-authenticate/>
 <radius-server>radius-server</radius-server>
 <radius-key>radius-key</radius-key>

 <broadcast-key-refresh-rate>broadcast-key-refresh-rate</broadcast-key-refresh-rate>

 <session-key-refresh-rate>session-key-refresh-rate</session-key-refresh-rate>

 </wpa-enterprise>
 </security>
 </virtual-access-point>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Set WAP enterprise settings

**Contents** <wpa-version>—Set WPA version  
<cipher-suites>—Select the WPA cipher algorithm  
<pre-authenticate>—Enable pre-authentication  
<radius-server>—Set RADIUS server IP address  
<radius-key>—Secret RADIUS key  
<broadcast-key-refresh-rate>—Broadcast key refresh rate  
<session-key-refresh-rate>—Session key refresh rate

### <wpa-personal> configuration/wlan/access-point/radio/virtual-access-point/security

**Usage**

```
<configuration>
 <wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <security>
 <wpa-personal>
 <wpa-version>...</wpa-version>
 <cipher-suites>...</cipher-suites>
 <key>key</key>

 <broadcast-key-refresh-rate>broadcast-key-refresh-rate</broadcast-key-refresh-rate>

 </wpa-personal>
 </security>
 </virtual-access-point>
 </radio>
 </access-point>
 </wlan>
</configuration>
```

**Description** Set WPA personal settings

**Contents** <wpa-version>—Set WPA version  
<cipher-suites>—Select the WPA cipher algorithm  
<key>—WPA shared key  
<broadcast-key-refresh-rate>—Broadcast key refresh rate

## **<wpa-version> configuration/wlan/access-point/radio/virtual-access-point/security/wpa-personal**

---

### **Usage**

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <security>
 <wpa-personal>
 <wpa-version>
 <v1/>
 <v2/>
 <both/>
 </wpa-version>
 </wpa-personal>
 </security>
 </virtual-access-point>
 </radio>
 </access-point>
</wlan>
</configuration>
```

**Description** Set WPA version

**Contents**

- <v1>—WPA Version 1
- <v2>—WPA Version 2
- <both>—Use both 1 and 2 versions

## **<wpa-version> configuration/wlan/access-point/radio/virtual-access-point/security/wpa-enterprise**

---

### **Usage**

```
<configuration>
<wlan>
 <access-point>
 <radio>
 <virtual-access-point>
 <security>
 <wpa-enterprise>
 <wpa-version>
 <v1/>
 <v2/>
 <both/>
 </wpa-version>
 </wpa-enterprise>
 </security>
 </virtual-access-point>
```

```
</radio>
</access-point>
</wlan>
</configuration>
```

**Description** Set WPA version

**Contents** <v1>—WPA Version 1  
<v2>—WPA Version 2  
<both>—Use both 1 and 2 versions

## CHAPTER 50

# Tag Elements Beginning with X

This chapter lists the configuration tag elements that have names beginning with the letter *x*. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<xauth>` configuration/security/ike/gateway

---

#### Usage

```
<configuration>
 <security>
 <ike>
 <gateway>
 <xauth>
 <access-profile>access-profile</access-profile> <!-- mandatory -->
 </xauth>
 </gateway>
 </ike>
 </security>
</configuration>
```

**Description** Use extended authentication

**Contents** `<access-profile>`—Access profile that contains authentication information

## CHAPTER 51

# Tag Elements Beginning with Z

This chapter lists the configuration tag elements that have names beginning with the letter z. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

For information about the tag elements that client applications use to request, change, and commit configuration information, see the Junos XML Management Protocol Guide and NETCONF XML Management Protocol Guide.

**NOTE:** Every tag element in this chapter optionally accepts the `<apply-groups>` or `<apply-groups-except>` tag element and the `<apply-macro>` tag element as children (the only exceptions are `<apply-groups>`, `<apply-groups-except>` and `<apply-macro>` themselves). For brevity, the reference entries do not list these tag elements as children.

### `<zone>` configuration/security/address-book/attach

---

#### Usage

```
<configuration>
 <security>
 <address-book>
 <attach>
 <zone>
 <zone-name>zone-name</zone-name> <!-- identifier -->
 </zone>
 </attach>
 </address-book>
 </security>
</configuration>
```

**Description** Define a zone to be attached

**Contents** `<zone-name>`—Security zone name

## <zone> configuration/security/nat/source/rule-set/from

---

**Usage**

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<from>
<zone>
 <zone-name>zone-name</zone-name> <!-- identifier -->
</zone>
</from>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Source zone list

**Contents** <zone-name>—Zone name

## <zone> configuration/security/nat/source/rule-set/to

---

**Usage**

```
<configuration>
<security>
<nat>
<source>
<rule-set>
<to>
<zone>
 <zone-name>zone-name</zone-name> <!-- identifier -->
</zone>
</to>
</rule-set>
</source>
</nat>
</security>
</configuration>
```

**Description** Destination zone list

**Contents** <zone-name>—Zone name

## <zone> configuration/security/nat/destination/rule-set/from

### Usage

```

<configuration>
 <security>
 <nat>
 <destination>
 <rule-set>
 <from>
 <zone>
 <zone-name>zone-name</zone-name> <!-- identifier -->
 </zone>
 </from>
 </rule-set>
 </destination>
 </nat>
 </security>
</configuration>

```

**Description** Source zone list

**Contents** <zone-name>—Zone name

## <zone> configuration/security/nat/static/rule-set/from

### Usage

```

<configuration>
 <security>
 <nat>
 <static>
 <rule-set>
 <from>
 <zone>
 <zone-name>zone-name</zone-name> <!-- identifier -->
 </zone>
 </from>
 </rule-set>
 </static>
 </nat>
 </security>
</configuration>

```

**Description** Source zone list

**Contents** <zone-name>—Zone name

## <zones> configuration/security

---

**Usage**

```
<configuration>
 <security>
 <zones>
 <functional-zone>...</functional-zone>
 <security-zone>...</security-zone>
 </zones>
 </security>
</configuration>
```

**Description** Zone configuration

**Contents** <functional-zone>—Functional zone  
<security-zone>—Security zones

## CHAPTER 52

# Mapping Between Operational Tag Elements, Perl Methods, and CLI Commands for J Series and SRX Series

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear arp inspection statistics	<clear-arp-inspection-statistics>	<none>
clear bridge rewrite statistics	<clear-retag-statistics>	<clear-vlan-retag-statistics-information>
clear chassis cluster control-plane statistics	<clear-chassis-cluster-control-plane-statistics>	<none>
clear chassis cluster control-plane statistics	<clear-chassis-cluster-control-plane-statistics>	<none>
clear chassis cluster data-plane statistics	<clear-chassis-cluster-data-plane-statistics>	<none>
clear chassis cluster data-plane statistics	<clear-chassis-cluster-data-plane-statistics>	<none>
clear chassis cluster ethernet-switching statistics	<clear-chassis-cluster-switch-fabric-probe-statistics>	<none>
clear chassis cluster ethernet-switching statistics	<clear-chassis-cluster-switch-fabric-probe-statistics>	<none>
clear chassis cluster failover-count	<clear-chassis-cluster-failover-count>	<none>
clear chassis cluster failover-count	<clear-chassis-cluster-failover-count>	<none>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (continued)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear chassis cluster information	<clear-chassis-cluster-information>	<none>
clear chassis cluster information	<clear-chassis-cluster-information>	<none>
clear chassis cluster ip-monitoring failure-count	<clear-chassis-cluster-ip-monitoring-failure-count>	<none>
clear chassis cluster ip-monitoring failure-count	<clear-chassis-cluster-ip-monitoring-failure-count>	<none>
clear chassis cluster ip-monitoring failure-count ip-address	<clear-chassis-cluster-ip-monitoring-failure-count-ip-address>	<none>
clear chassis cluster ip-monitoring failure-count ip-address	<clear-chassis-cluster-ip-monitoring-failure-count-ip-address>	<none>
clear chassis cluster statistics	<clear-chassis-cluster-statistics>	<none>
clear chassis cluster statistics	<clear-chassis-cluster-statistics>	<none>
clear dhcp snooping binding	<clear-dhcp-snooping>	<none>
clear dhcp snooping statistics	<clear-dhcp-snooping-statistics>	<none>
clear dot1x firewall	<clear-dot1x-firewall>	<dot1x-firewall>
clear dot1x firewall interface	<clear-dot1x-firewall-interface>	<dot1x-firewall-interface>
clear dot1x interface	<clear-dot1x-interface-session>	<dot1x-interface-session>
clear dot1x mac-address	<clear-dot1x-mac-session>	<dot1x-mac-session>
clear dot1x statistics	<clear-dot1x-statistics>	<dot1x-statistics>
clear dot1x statistics interface	<clear-dot1x-statistics-interface>	<dot1x-statistics-interface>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (continued)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear edge-virtual-bridging	<clear-edge-virtual-bridging>	<none>
clear edge-virtual-bridging edge-control-protocol statistics	<clear-edge-virtual-bridging-ecp-statistics>	<none>
clear edge-virtual-bridging firewall	<clear-edge-virtual-bridging-firewall-information>	<none>
clear edge-virtual-bridging firewall interface	<clear-edge-virtual-bridging-firewall-interface>	<none>
clear edge-virtual-bridging vsi-profiles	<clear-edge-virtual-bridging-vsi-profiles>	<none>
clear edge-virtual-bridging vsi-profiles interface	<clear-edge-virtual-bridging-vsi-profiles-interface>	<none>
clear ethernet-switching bpdu-error	<clear-ethernet-switching-bpdu-error>	<none>
clear ethernet-switching layer2-protocol-tunneling error	<clear-l2pt-error>	<none>
clear ethernet-switching layer2-protocol-tunneling statistics	<clear-l2pt-statistics>	<none>
clear ethernet-switching layer2-protocol-tunneling statistics interface	<clear-l2pt-interface-statistics>	<none>
clear ethernet-switching layer2-protocol-tunneling statistics vlan	<clear-l2pt-vlan-statistics>	<none>
clear ethernet-switching mac-learning-log	<clear-ethernet-switching-mac-learning-log>	<none>
clear ethernet-switching port-error	<clear-ethernet-switching-port-error>	<none>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (continued)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear ethernet-switching statistics aging	<clear-ethernet-switching-statistics-aging>	<none>
clear ethernet-switching statistics mac-learning	<clear-ethernet-switching-mac-learning-statistics>	<none>
clear ethernet-switching table	<clear-ethernet-switching-table>	<none>
clear ethernet-switching table management-vlan	<clear-ethernet-switching-table-management-vlan>	<none>
clear ethernet-switching table persistent-mac	<clear-ethernet-switching-table-persistent-mac>	<none>
clear fip snooping enode	<clear-fip-snooping-enode>	<none>
clear fip snooping statistics	<clear-fip-snooping-statistics>	<none>
clear fip snooping vlan	<clear-fip-snooping-vlan>	<none>
clear gvrp statistics	<clear-gvrp-statistics>	<none>
clear igmp-snooping	<clear-igmp-snooping>	<none>
clear igmp-snooping membership	<clear-igmp-snooping-membership>	<none>
clear igmp-snooping statistics	<clear-igmp-snooping-statistics>	<none>
clear isdn q921 statistics	<clear-isdn-q921-statistics>	<none>
clear isdn q931 statistics	<clear-isdn-q931-statistics>	<none>
clear lldp neighbors	<clear-lldp-neighbors>	<none>
clear lldp neighbors interface	<clear-lldp-interface-neighbors>	<none>
clear lldp statistics	<clear-lldp-statistics>	<none>
clear lldp statistics interface	<clear-lldp-interface-statistics>	<none>
clear mld-snooping	<clear-mld-snooping>	<none>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (continued)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear mld-snooping membership	<clear-mld-snooping-membership>	<none>
clear mld-snooping statistics	<clear-mld-snooping-statistics>	<none>
clear multicast route counter	<clear-multicast-route-counter>	<none>
clear mvrp statistics	<clear-mvrp-statistics>	<mvrp-statistics>
clear mvrp statistics interface	<clear-mvrp-statistics-interface>	<mvrp-statistics-interface>
clear protection-group	<clear-protection-group-information>	<none>
clear protection-group ethernet-ring	<clear-ethernet-ring-information>	<none>
clear protection-group ethernet-ring statistics	<clear-ethernet-ring-statistics>	<none>
clear security alg h323 counters	<clear-alg-h323-counters>	<none>
clear security alg ike-esp-nat	<clear-alg-ike-esp-state>	<alg-ike-esp-clear>
clear security alg mgcp calls	<clear-alg-mgcp-calls-information>	<none>
clear security alg mgcp counters	<clear-alg-mgcp-counter-information>	<none>
clear security alg sccp calls	<clear-alg-sccp-calls-information>	<none>
clear security alg sccp counters	<clear-alg-sccp-counters>	<none>
clear security alg sip calls	<clear-alg-sip-calls>	<none>
clear security alg sip counters	<clear-alg-sip-counters>	<none>
clear security application-firewall rule-set statistics	<clear-application-firewall-statistics>	<none>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (continued)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear security application-tracking counters	<clear-avt-counters>	<none>
clear security datapath-debug counters	<clear-eedebg-counters>	<clear-eedebg-counters-result>
clear security dynamic-policies statistics	<clear-security-dynamic-policies-statistics>	<none>
clear security dynamic-vpn all	<clear-all-dvpn-user-connections>	<clear-all-dvpn-user-connection-information>
clear security dynamic-vpn user	<clear-dvpn-user-connection-by-username>	<clear-dvpn-user-connection-information>
clear security firewall-authentication history	<clear-security-firewall-authentication-history>	<none>
clear security firewall-authentication users	<clear-security-firewall-authentication-users>	<none>
clear security flow ip-action	<clear-security-flow-ip-action>	<none>
clear security flow ip-action all	<clear-flow-ipaction-all>	<clear-flow-ipaction-information>
clear security flow session	<clear-flow-session>	<clear-flow-session-information>
clear security flow session all	<clear-flow-session-all>	<clear-flow-session-information>
clear security flow session session-identifier	<clear-flow-session-by-session-identifier>	<clear-flow-session-information>
clear security flow statistics	<clear-security-flow-statistics>	<none>
clear security gprs gtp tunnel	<clear-security-gprs-gtp-tunnel>	<gtp-clear-tunnel>
clear security group-vpn member ike security-associations	<clear-group-vpn-ike-security-associations>	<none>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (continued)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
clear security group-vpn member ipsec security-associations	<clear-gvpn-ipsec-security-association>	<none>
clear security group-vpn member ipsec statistics	<clear-gvpn-ipsec-statistics>	<none>
clear security group-vpn member kek security-associations	<clear-group-vpn-kek-security-associations>	<none>
clear security group-vpn server	<clear-security-group-vpn-server>	<none>

show vlans	<get-vlan-information>	<vlan-information>
show vlans dot1q-tunneling	<get-vlans-dot1q-tunneling-information>	<vlan-information>

**Table 39: Mapping of CLI Commands to Junos XML Operational Tag Elements and Perl Methods (J Series and SRX Series) (*continued*)**

CLI Command	Request Tag Element and Perl Method	Response Tag Element
show vlans management-vlan	<get-management-vlan-information>	<vlan-information>
show wan-acceleration status	<get-wx-status>	<wx-status>
show wlan access-points	<get-wlan-access-points-list>	<wlan-access-points-list>
test security utm anti-spam	<test-anti-spam-profile>	<anti-spam-test>
test security utm anti-virus	<test-anti-virus-profile>	<anti-virus-test>
test security utm web-filtering	<test-web-filtering-profile>	<web-filtering-test>

## CHAPTER 53

# Operational Request Tag Elements Applicable to All Platforms

This chapter lists the Junos Extensible Markup Language (XML) tag elements that a client of the Junos XML protocol or NETCONF server uses to request operational information. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

The tags listed in this chapter are applicable to devices belonging to:

- EX Series
- J Series
- M Series
- MX Series
- T Series
- QFX Series
- SRX Series

### <clear-dhcp-binding-information>

---

#### Usage

```
<rpc>
 <clear-dhcp-binding-information>
 <address>address</address>
 </clear-dhcp-binding-information>
</rpc>
```

**Description** Clear DHCP client binding information

**Contents** <address>—Address of DHCP client binding

## <clear-dhcp-conflict-information>

---

**Usage**

```
<rpc>
 <clear-dhcp-conflict-information>
 <address>address</address>
 </clear-dhcp-conflict-information>
</rpc>
```

**Description** Clear DHCP address conflict

**Contents** <address>—DHCP conflict address

## <clear-dhcp-statistics-information>

---

**Usage**

```
<rpc>
 <clear-dhcp-statistics-information/>
</rpc>
```

**Description** Clear DHCP statistics

## <clear-dot1x-mac-session>

---

**Usage**

```
<rpc>
 <clear-dot1x-mac-session>
 <static-mac-addr>static-mac-addr</static-mac-addr>
 </clear-dot1x-mac-session>
</rpc>
```

**Description** Clear 802.1X session on a MAC address

**Contents** <static-mac-addr>—MAC address to clear

## <clear-ethernet-ring-information>

---

**Usage**

```
<rpc>
 <clear-ethernet-ring-information>
 </clear-ethernet-ring-information>
</rpc>
```

**Description** Clear ethernet ring information

**Contents** <clear-ethernet-ring-statistics>—Clear ethernet ring statistics

---

### <clear-ethernet-ring-statistics>

---

**Usage**

```
<rpc>
 <clear-ethernet-ring-statistics>
 <group-name>group-name</group-name>
 </clear-ethernet-ring-statistics>
</rpc>
```

**Description** Clear ethernet ring statistics

**Contents** <group-name>—Name of protection group

---

### <clear-lldp-neighbors>

---

**Usage**

```
<rpc>
 <clear-lldp-neighbors>
</clear-lldp-neighbors>
</rpc>
```

**Description** Clear LLDP neighbor information

**Contents** <clear-lldp-interface-neighbors>—Clear LLDP interface statistics

---

### <clear-lldp-statistics>

---

**Usage**

```
<rpc>
 <clear-lldp-statistics>
</clear-lldp-statistics>
</rpc>
```

**Description** Clear LLDP statistics

**Contents** <clear-lldp-interface-statistics>—Clear LLDP interface statistics

---

### <clear-protection-group-information>

---

**Usage**

```
<rpc>
 <clear-protection-group-information>
</clear-protection-group-information>
```

</rpc>

**Description** Clear protection group information

**Contents** <clear-ethernet-ring-information>—Clear ethernet ring information

---

## <get-dhcp-binding-information>

---

### Usage

```
<rpc>
 <get-dhcp-binding-information>
 <detail/>
 <address>address</address>
</get-dhcp-binding-information>
</rpc>
```

**Description** Show DHCP client binding information

**Contents** <detail>—Display detailed information  
<address>—Address of DHCP client binding

---

## <get-dhcp-conflict-information>

---

### Usage

```
<rpc>
 <get-dhcp-conflict-information/>
</rpc>
```

**Description** Show DHCP address conflict

---

## <get-dhcp-global-information>

---

### Usage

```
<rpc>
 <get-dhcp-global-information/>
</rpc>
```

**Description** Show DHCP global scope information

---

## <get-dhcp-pool-information>

---

### Usage

```
<rpc>
 <get-dhcp-pool-information>
```

```
<detail/>
<subnet-address>subnet-address</subnet-address>
</get-dhcp-pool-information>
</rpc>
```

**Description** Show DHCP address pool information

**Contents** <detail>—Display detailed information  
              <subnet-address>—Logical subnet of address pool

---

### <get-dhcp-statistics-information>

---

**Usage**

```
<rpc>
<get-dhcp-statistics-information/>
</rpc>
```

**Description** Show DHCP statistics

---

### <get-dot1x-authentication-failed-users>

---

**Usage**

```
<rpc>
<get-dot1x-authentication-failed-users/>
</rpc>
```

**Description** List users who have failed 802.1X authentication

---

### <get-dot1x-interface-information>

---

**Usage**

```
<rpc>
<get-dot1x-interface-information>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name>
</get-dot1x-interface-information>
</rpc>
```

**Description** Show 802.1X interface information

**Contents** <brief>—Display brief output (default)  
              <detail>—Display detailed output

<interface-name>—Name of interface

## <get-dot1x-interface-mac-addresses>

---

### Usage

```
<rpc>
 <get-dot1x-interface-mac-addresses>
 <interface-name>interface-name</interface-name>
 </get-dot1x-interface-mac-addresses>
</rpc>
```

**Description** Show 802.1X static MAC addresses on this interface

**Contents** <interface-name>—Show static MAC addresses of interface

## <get-dot1x-static-mac-addresses>

---

### Usage

```
<rpc>
 <get-dot1x-static-mac-addresses>
 </get-dot1x-static-mac-addresses>
</rpc>
```

**Description** Show 802.1X static MAC addresses

**Contents** <get-dot1x-interface-mac-addresses>—Show 802.1X static MAC addresses on this interface

## <get-lldp-information>

---

### Usage

```
<rpc>
 <get-lldp-information>
 </get-lldp-information>
</rpc>
```

**Description** Show Link Layer Discovery Protocol information

**Contents** <get-lldp-information-detail>—Show detailed LLDP information

<get-lldp-neighbors-information>—Show LLDP neighbor information

<get-lldp-statistics-information>—Show LLDP statistics

<get-lldp-local-info>—Show LLDP information of local device

<get-lldp-remote-global-statistics>—Show LLDP remote global statistics information

### <get-lldp-information-detail>

---

**Usage**

```
<rpc>
 <get-lldp-information-detail/>
</rpc>
```

**Description** Show detailed LLDP information

### <get-lldp-local-info>

---

**Usage**

```
<rpc>
 <get-lldp-local-info/>
</rpc>
```

**Description** Show LLDP information of local device

### <get-lldp-remote-global-statistics>

---

**Usage**

```
<rpc>
 <get-lldp-remote-global-statistics/>
</rpc>
```

**Description** Show LLDP remote global statistics information

### <get-lldp-statistics-information>

---

**Usage**

```
<rpc>
 <get-lldp-statistics-information>
 </get-lldp-statistics-information>
</rpc>
```

**Description** Show LLDP statistics

**Contents** <get-lldp-interface-statistics>—Show LLDP statistics for this interface

### <get-raps-pdu-information>

---

**Usage**

```
<rpc>
 <get-raps-pdu-information>
```

```
<brief/>
<detail/>
<group-name>group-name</group-name>
</get-raps-pdu-information>
</rpc>
```

**Description** Show RAPS PDU information for ethernet ring

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

---

### <get-raps-state-machine-information>

---

**Usage**

```
<rpc>
<get-raps-state-machine-information>
<brief/>
<detail/>
<group-name>group-name</group-name>
</get-raps-state-machine-information>
</rpc>
```

**Description** Show RAPS state machine information for ethernet ring

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

---

### <get-ring-data-channel-information>

---

**Usage**

```
<rpc>
<get-ring-data-channel-information>
<brief/>
<detail/>
<group-name>group-name</group-name>
</get-ring-data-channel-information>
</rpc>
```

**Description** Show data channel for ethernet ring

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

---

## <get-ring-interface-information>

---

### Usage

```
<rpc>
 <get-ring-interface-information>
 <brief/>
 <detail/>
 <group-name>group-name</group-name>
 </get-ring-interface-information>
</rpc>
```

**Description** Show interface information for ethernet ring

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

---

## <get-ring-vlan-information>

---

### Usage

```
<rpc>
 <get-ring-vlan-information>
 <brief/>
 <detail/>
 <group-name>group-name</group-name>
 </get-ring-vlan-information>
</rpc>
```

**Description** Show VLAN information for ethernet ring data channel

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

# Operational Request Tag Elements Common to J Series, EX Series, QFX Series, and SRX Series

This chapter lists the Junos Extensible Markup Language (XML) tag elements that a client of the Junos XML protocol or NETCONF server uses to request operational information. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

The tags listed in this chapter are common to devices belonging to:

- EX Series
- M Series
- MX Series
- T Series
- QFX Series

## <clear-arp-inspection-statistics>

---

### Usage

```
<rpc>
 <clear-arp-inspection-statistics>
 <interface>interface</interface>
 </clear-arp-inspection-statistics>
</rpc>
```

**Description** Clear ARP inspection statistics

**Contents** <interface>—Interface for which statistics are to be cleared

## <clear-dhcp-snooping>

---

### Usage

```
<rpc>
```

```
<clear-dhcp-snooping>
<vlan>vlan</vlan>
<mac>mac</mac>
</clear-dhcp-snooping>
</rpc>
```

**Description** Clear DHCP snooping database

**Contents** <vlan>—Name of VLAN  
  
<mac>—MAC address

---

### <clear-dhcp-snooping-statistics>

---

**Usage**

```
<rpc>
<clear-dhcp-snooping-statistics/>
</rpc>
```

**Description** Clear DHCP snooping statistics

---

### <clear-dot1x-firewall>

---

**Usage**

```
<rpc>
<clear-dot1x-firewall>
<counter-name>counter-name</counter-name>
</clear-dot1x-firewall>
</rpc>
```

**Description** Clear dot1x firewall statistics for a counter

**Contents** <clear-dot1x-firewall-interface>—Clear firewall statistics on this interface  
  
<counter-name>—Clear firewall statistics for this counter

---

### <clear-dot1x-firewall-interface>

---

**Usage**

```
<rpc>
<clear-dot1x-firewall-interface>
<interface-name>interface-name</interface-name>
</clear-dot1x-firewall-interface>
</rpc>
```

**Description** Clear firewall statistics on this interface

**Contents** <interface-name>—Name of interface

---

### <clear-dot1x-interface-session>

---

**Usage**

```
<rpc>
 <clear-dot1x-interface-session>
 <interface-name>interface-name</interface-name>
 </clear-dot1x-interface-session>
</rpc>
```

**Description** Clear 802.1X session on an interface

**Contents** <interface-name>—Name of interface

---

### <clear-dot1x-statistics>

---

**Usage**

```
<rpc>
 <clear-dot1x-statistics>
 </clear-dot1x-statistics>
</rpc>
```

**Description** Clear 802.1X statistics on an interface

**Contents** <clear-dot1x-statistics-interface>—Clear 802.1X statistics on this interface

---

### <clear-dot1x-statistics-interface>

---

**Usage**

```
<rpc>
 <clear-dot1x-statistics-interface>
 <interface-name>interface-name</interface-name>
 </clear-dot1x-statistics-interface>
</rpc>
```

**Description** Clear 802.1X statistics on this interface

**Contents** <interface-name>—Name of interface

---

### <clear-edge-virtual-bridging>

---

**Usage**

```
<rpc>
 <clear-edge-virtual-bridging>
 <interface-name>interface-name</interface-name>
```

```
</clear-edge-virtual-bridging>
</rpc>
```

**Description** Clear Edge Virtual Bridging information

**Contents** <interface-name>—Name of interface

<clear-edge-virtual-bridging-vsi-profiles>—Clear Edge Virtual Bridging VSI profiles information

<edge-control-protocol>—Clear Edge Control Protocol information

<clear-edge-virtual-bridging-firewall-information>—Clear Edge Virtual Bridging firewall information

---

### <clear-edge-virtual-bridging-ecp-statistics>

**Usage**

```
<rpc>
<clear-edge-virtual-bridging-ecp-statistics>
<interface-name>interface-name</interface-name>
</clear-edge-virtual-bridging-ecp-statistics>
</rpc>
```

**Description** Clear Edge Control Protocol ECP statistics

**Contents** <interface-name>—Name of interface

---

### <clear-edge-virtual-bridging-firewall-information>

**Usage**

```
<rpc>
<clear-edge-virtual-bridging-firewall-information>
</clear-edge-virtual-bridging-firewall-information>
</rpc>
```

**Description** Clear Edge Virtual Bridging firewall information

**Contents** <clear-edge-virtual-bridging-firewall-interface>—Clear Edge Virtual Bridging firewall counters on this interface

---

### <clear-edge-virtual-bridging-firewall-interface>

**Usage**

```
<rpc>
<clear-edge-virtual-bridging-firewall-interface>
<interface-name>interface-name</interface-name> <!-- mandatory -->
```

```
</clear-edge-virtual-bridging-firewall-interface>
</rpc>
```

**Description** Clear Edge Virtual Bridging firewall counters on this interface

**Contents** <interface-name>—Name of interface

---

### <clear-edge-virtual-bridging-vsi-profiles>

---

**Usage**

```
<rpc>
<clear-edge-virtual-bridging-vsi-profiles>
</clear-edge-virtual-bridging-vsi-profiles>
</rpc>
```

**Description** Clear Edge Virtual Bridging VSI profiles information

**Contents** <clear-edge-virtual-bridging-vsi-profiles-interface>—Clear Edge Virtual Bridging VSI profiles on this interface

---

### <clear-edge-virtual-bridging-vsi-profiles-interface>

---

**Usage**

```
<rpc>
<clear-edge-virtual-bridging-vsi-profiles-interface>
<summary/>
<brief/>
<detail/>
<interface-name>interface-name</interface-name> <!-- mandatory -->
</clear-edge-virtual-bridging-vsi-profiles-interface>
</rpc>
```

**Description** Clear Edge Virtual Bridging VSI profiles on this interface

**Contents** <summary>—Display summary output

<brief>—Display brief output (default)

<detail>—Display detailed output

<interface-name>—Name of interface

---

### <clear-ethernet-switching-bpdu-error>

---

**Usage**

```
<rpc>
<clear-ethernet-switching-bpdu-error>
```

```
<interface>interface</interface>
</clear-ethernet-switching-bpdu-error>
</rpc>
```

**Description** Clear BPDU error (BPDU Protect)

**Contents** <interface>—Clear BPDU error on an interface (BPDU Protect)

---

## <clear-ethernet-switching-mac-learning-log>

### Usage

```
<rpc>
<clear-ethernet-switching-mac-learning-log/>
</rpc>
```

**Description** Clear all MAC address learning log

---

## <clear-ethernet-switching-mac-learning-statistics>

### Usage

```
<rpc>
<clear-ethernet-switching-mac-learning-statistics>
<interface>interface</interface>
</clear-ethernet-switching-mac-learning-statistics>
</rpc>
```

**Description** Clear media access control learning statistics

**Contents** <interface>—Clear MAC learning statistics for a specified interface

---

## <clear-ethernet-switching-port-error>

### Usage

```
<rpc>
<clear-ethernet-switching-port-error>
<interface>interface</interface>
</clear-ethernet-switching-port-error>
</rpc>
```

**Description** Clear port errors

**Contents** <interface>—Clear port errors on an interface

## <clear-ethernet-switching-statistics-aging>

---

**Usage**

```
<rpc>
 <clear-ethernet-switching-statistics-aging/>
</rpc>
```

**Description** Clear media access control aging statistics

## <clear-ethernet-switching-table>

---

**Usage**

```
<rpc>
 <clear-ethernet-switching-table>
 <interface>interface</interface>
 <vlan>vlan</vlan>
 <mac>mac</mac>
 </clear-ethernet-switching-table>
</rpc>
```

**Description** Clear all learned MAC addresses

**Contents** <interface>—Name of interface

<vlan>—Name of VLAN

<mac>—MAC address

<clear-ethernet-switching-table-persistent-mac>—Clear persistent MAC

<clear-ethernet-switching-table-management-vlan>—Management VLAN

## <clear-ethernet-switching-table-management-vlan>

---

**Usage**

```
<rpc>
 <clear-ethernet-switching-table-management-vlan/>
</rpc>
```

**Description** Management VLAN

## <clear-ethernet-switching-table-persistent-mac>

---

**Usage**

```
<rpc>
 <clear-ethernet-switching-table-persistent-mac>
 <interface>interface</interface>
```

```
<mac>mac</mac>
</clear-ethernet-switching-table-persistent-mac>
</rpc>
```

**Description** Clear persistent MAC

**Contents** <interface>—Name of interface  
            <mac>—MAC address

---

### <clear-fip-snooping-enode>

---

**Usage**

```
<rpc>
<clear-fip-snooping-enode>
 <mac>mac</mac> <!-- mandatory -->
 <vlan>vlan</vlan>
</clear-fip-snooping-enode>
</rpc>
```

**Description** Clear all FIP snooping session for this Enode

**Contents** <mac>—Enode MAC address  
            <vlan>—Name of VLAN

---

### <clear-fip-snooping-statistics>

---

**Usage**

```
<rpc>
<clear-fip-snooping-statistics>
 <vlan>vlan</vlan>
</clear-fip-snooping-statistics>
</rpc>
```

**Description** Clear FIP snooping statistics

**Contents** <vlan>—Name of VLAN

---

### <clear-fip-snooping-vlan>

---

**Usage**

```
<rpc>
<clear-fip-snooping-vlan>
 <vlan>vlan</vlan> <!-- mandatory -->
</clear-fip-snooping-vlan>
```

```
</rpc>
```

**Description** Clear FIP snooping database for this VLAN

**Contents** <vlan>—Name of VLAN

---

### <clear-igmp-snooping>

---

**Usage**

```
<rpc>
 <clear-igmp-snooping>
 </clear-igmp-snooping>
</rpc>
```

**Description** Clear IGMP snooping information

**Contents** <clear-igmp-snooping-membership>—Clear IGMP snooping database  
          <clear-igmp-snooping-statistics>—Clear IGMP snooping statistics

---

### <clear-igmp-snooping-membership>

---

**Usage**

```
<rpc>
 <clear-igmp-snooping-membership>
 <vlan>vlan</vlan>
 </clear-igmp-snooping-membership>
</rpc>
```

**Description** Clear IGMP snooping database

**Contents** <vlan>—Name of VLAN

---

### <clear-igmp-snooping-statistics>

---

**Usage**

```
<rpc>
 <clear-igmp-snooping-statistics/>
</rpc>
```

**Description** Clear IGMP snooping statistics

## <clear-l2pt-error>

---

**Usage**

```
<rpc>
 <clear-l2pt-error>
 <interface>interface</interface>
 </clear-l2pt-error>
</rpc>
```

**Description** Clear layer2 protocol tunneling errors

**Contents** <interface>—Name of interface

## <clear-l2pt-interface-statistics>

---

**Usage**

```
<rpc>
 <clear-l2pt-interface-statistics>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </clear-l2pt-interface-statistics>
</rpc>
```

**Description** Clear Layer2 protocol tunneling statistics for interface

**Contents** <interface-name>—Name of interface

## <clear-l2pt-statistics>

---

**Usage**

```
<rpc>
 <clear-l2pt-statistics>
 </clear-l2pt-statistics>
</rpc>
```

**Description** Clear layer2 protocol tunneling statistics

**Contents** <clear-l2pt-interface-statistics>—Clear Layer2 protocol tunneling statistics for interface  
<clear-l2pt-vlan-statistics>—Clear Layer2 protocol tunneling statistics for vlans

## <clear-l2pt-vlan-statistics>

---

**Usage**

```
<rpc>
 <clear-l2pt-vlan-statistics>
 <vlan-name>vlan-name</vlan-name> <!-- mandatory -->
 </clear-l2pt-vlan-statistics>
</rpc>
```

```
</clear-l2pt-vlan-statistics>
</rpc>
```

**Description** Clear Layer2 protocol tunneling statistics for vlans

**Contents** <vlan-name>—Name of VLAN

---

### <clear-lldp-interface-neighbors>

---

**Usage**

```
<rpc>
<clear-lldp-interface-neighbors>
<interface-name>interface-name</interface-name>
</clear-lldp-interface-neighbors>
</rpc>
```

**Description** Clear LLDP interface statistics

**Contents** <interface-name>—Name of interface

---

### <clear-lldp-interface-statistics>

---

**Usage**

```
<rpc>
<clear-lldp-interface-statistics>
<interface-name>interface-name</interface-name>
</clear-lldp-interface-statistics>
</rpc>
```

**Description** Clear LLDP interface statistics

**Contents** <interface-name>—Name of interface

---

### <clear-mld-snooping>

---

**Usage**

```
<rpc>
<clear-mld-snooping>
</clear-mld-snooping>
</rpc>
```

**Description** Clear MLD snooping information

**Contents** <clear-mld-snooping-membership>—Clear MLD snooping database

<clear-mld-snooping-statistics>—Clear MLD snooping statistics

## <clear-mld-snooping-membership>

---

### Usage

```
<rpc>
<clear-mld-snooping-membership>
<vlan>vlan</vlan>
</clear-mld-snooping-membership>
</rpc>
```

**Description** Clear MLD snooping database

**Contents** <vlan>—Name of VLAN

## <clear-mld-snooping-statistics>

---

### Usage

```
<rpc>
<clear-mld-snooping-statistics/>
</rpc>
```

**Description** Clear MLD snooping statistics

## <clear-multicast-route-counter>

---

### Usage

```
<rpc>
<clear-multicast-route-counter/>
</rpc>
```

**Description** Unbind route from counter

## <clear-mvrp-statistics>

---

### Usage

```
<rpc>
<clear-mvrp-statistics>
</clear-mvrp-statistics>
</rpc>
```

**Description** Clear MVRP statistics on an interface

**Contents** <clear-mvrp-statistics-interface>—Clear MVRP statistics on this interface

## <clear-mvrp-statistics-interface>

---

**Usage**

```
<rpc>
 <clear-mvrp-statistics-interface>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </clear-mvrp-statistics-interface>
</rpc>
```

**Description** Clear MVRP statistics on this interface

**Contents** <interface-name>—Name of interface

## <clear-stp-statistics-interface>

---

**Usage**

```
<rpc>
 <clear-stp-statistics-interface>
 <interface-name>interface-name</interface-name>
 </clear-stp-statistics-interface>
</rpc>
```

**Description** Clear STP interface statistics

**Contents** <interface-name>—Name of interface

## <get-analyzer-information>

---

**Usage**

```
<rpc>
 <get-analyzer-information>
 <analyzer-name>analyzer-name</analyzer-name>
 </get-analyzer-information>
</rpc>
```

**Description** Show analyzer information

**Contents** <analyzer-name>—Name of analyzer

## <get-arp-inspection-statistics>

---

**Usage**

```
<rpc>
 <get-arp-inspection-statistics/>
</rpc>
```

**Description** Show ARP inspection statistics

---

### <get-authentication-whitelist-mac-bypassed-users>

---

**Usage**

```
<rpc>
 <get-authentication-whitelist-mac-bypassed-users/>
</rpc>
```

**Description** List users who have bypassed 802.1X authentication

---

### <get-autoinstallation-status-information>

---

**Usage**

```
<rpc>
 <get-autoinstallation-status-information/>
</rpc>
```

**Description** Show autoinstallation status

---

### <get-dcbx-information>

---

**Usage**

```
<rpc>
 <get-dcbx-information>
 </get-dcbx-information>
</rpc>
```

**Description** Show DCBX protocol information

**Contents** <get-dcbx-neighbor-information>—Show DCBX neighbor information

---

### <get-dcbx-neighbor-information>

---

**Usage**

```
<rpc>
 <get-dcbx-neighbor-information>
 </get-dcbx-neighbor-information>
</rpc>
```

**Description** Show DCBX neighbor information

**Contents** <get-dcbx-neighbor-interface-information>—Show DCBX information for this interface  
<get-dcbx-neighbor-information-terse>—Show DCBX neighbor information

### <get-dcbx-neighbor-information-terse>

---

**Usage**

```
<rpc>
 <get-dcbx-neighbor-information-terse/>
</rpc>
```

**Description** Show DCBX neighbor information

### <get-dcbx-neighbor-interface-information>

---

**Usage**

```
<rpc>
 <get-dcbx-neighbor-interface-information>
 <interface-name>interface-name</interface-name>
 </get-dcbx-neighbor-interface-information>
</rpc>
```

**Description** Show DCBX information for this interface

**Contents** <interface-name>—Show DCBX information for this interface

### <get-dhcp-client-information>

---

**Usage**

```
<rpc>
 <get-dhcp-client-information>
 <statistics/>
 <interface-name>interface-name</interface-name>
 </get-dhcp-client-information>
</rpc>
```

**Description** Show DHCP client information

**Contents** <statistics>—Show DHCP client statistics

<interface-name>—Interface name of DHCP client

### <get-dhcp-helper-statistics>

---

**Usage**

```
<rpc>
 <get-dhcp-helper-statistics/>
</rpc>
```

**Description** Show DHCP relay statistics information

---

### <get-dhcp-snoop-binding>

---

**Usage**

```
<rpc>
<get-dhcp-snoop-binding>
 <interface>interface</interface>
 <vlan>vlan</vlan>
</get-dhcp-snoop-binding>
</rpc>
```

**Description** Show DHCP snooping database

**Contents** <interface>—Name of interface for which to display the entries

<vlan>—Name of VLAN for which to display the entries

---

### <get-dhcp-snooping-statistics>

---

**Usage**

```
<rpc>
<get-dhcp-snooping-statistics/>
</rpc>
```

**Description** Show DHCP snooping statistics

---

### <get-dot1x-firewall-interface>

---

**Usage**

```
<rpc>
<get-dot1x-firewall-interface>
 <interface-name>interface-name</interface-name>
</get-dot1x-firewall-interface>
</rpc>
```

**Description** Show dot1x firewall statistics for an interface

**Contents** <interface-name>—Show firewall statistics for this interface

---

### <get-dot1x-statistics>

---

**Usage**

```
<rpc>
<get-dot1x-statistics>
</get-dot1x-statistics>
```

</rpc>

**Description** Show 802.1X statistics

**Contents** <get-dot1x-statistics-interface>—Show 802.1X statistics on this interface

---

### <get-dot1x-statistics-interface>

---

**Usage**

```
<rpc>
 <get-dot1x-statistics-interface>
 <interface-name>interface-name</interface-name>
 </get-dot1x-statistics-interface>
</rpc>
```

**Description** Show 802.1X statistics on this interface

**Contents** <interface-name>—Show statistics for this interface

---

### <get-edge-virtual-bridging-ecp-interface-statistics>

---

**Usage**

```
<rpc>
 <get-edge-virtual-bridging-ecp-interface-statistics>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-edge-virtual-bridging-ecp-interface-statistics>
</rpc>
```

**Description** Show Edge Virtual Bridging ECP statistics for interface

**Contents** <interface-name>—Name of interface

---

### <get-edge-virtual-bridging-ecp-statistics>

---

**Usage**

```
<rpc>
 <get-edge-virtual-bridging-ecp-statistics>
 </get-edge-virtual-bridging-ecp-statistics>
</rpc>
```

**Description** Show Edge Virtual Bridging ECP statistics

**Contents** <get-edge-virtual-bridging-ecp-interface-statistics>—Show Edge Virtual Bridging ECP statistics for interface

## <get-edge-virtual-bridging-firewall-information>

---

**Usage**

```
<rpc>
 <get-edge-virtual-bridging-firewall-information>
</get-edge-virtual-bridging-firewall-information>
</rpc>
```

**Description** Show Edge Virtual Bridging firewall information

**Contents** <get-edge-virtual-bridging-interface-firewall-information>—Edge Virtual Bridging firewall information for interface

## <get-edge-virtual-bridging-information>

---

**Usage**

```
<rpc>
 <get-edge-virtual-bridging-information>
 <summary/>
 <brief/>
 <detail/>
 </get-edge-virtual-bridging-information>
</rpc>
```

**Description** Show Edge Virtual Bridging Protocol information

**Contents** <summary>—Display summary output

<brief>—Display brief output (default)

<detail>—Display detailed output

<get-edge-virtual-bridging-interface-information>—Show Edge Virtual Bridging interface information

<edge-control-protocol>—Show Edge Control Protocol information

<get-edge-virtual-bridging-vsi-profiles>—Show Edge Virtual Bridging VSI profiles

<get-edge-virtual-bridging-firewall-information>—Show Edge Virtual Bridging firewall information

## <get-edge-virtual-bridging-interface-firewall-information>

---

**Usage**

```
<rpc>
 <get-edge-virtual-bridging-interface-firewall-information>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-edge-virtual-bridging-interface-firewall-information>
</rpc>
```

```
</get-edge-virtual-bridging-interface-firewall-information>
</rpc>
```

**Description** Edge Virtual Bridging firewall information for interface

**Contents** <interface-name>—Name of interface

---

## <get-edge-virtual-bridging-interface-information>

---

### Usage

```
<rpc>
 <get-edge-virtual-bridging-interface-information>
 <summary/>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-edge-virtual-bridging-interface-information>
</rpc>
```

**Description** Show Edge Virtual Bridging interface information

**Contents** <summary>—Display summary output

<brief>—Display brief output (default)

<detail>—Display detailed output

<interface-name>—Name of interface

---

## <get-edge-virtual-bridging-vsi-interface-profiles>

---

### Usage

```
<rpc>
 <get-edge-virtual-bridging-vsi-interface-profiles>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-edge-virtual-bridging-vsi-interface-profiles>
</rpc>
```

**Description** Show VSI profiles for interface

**Contents** <interface-name>—Name of interface

---

## <get-edge-virtual-bridging-vsi-profiles>

---

### Usage

```
<rpc>
 <get-edge-virtual-bridging-vsi-profiles>
```

```
</get-edge-virtual-bridging-vsi-profiles>
</rpc>
```

**Description** Show Edge Virtual Bridging VSI profiles

**Contents** <get-edge-virtual-bridging-vsi-interface-profiles>—Show VSI profiles for interface

---

## <get-erp-statistics-interface-information>

### Usage

```
<rpc>
<get-erp-statistics-interface-information>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name>
 <group-name>group-name</group-name>
</get-erp-statistics-interface-information>
</rpc>
```

**Description** Show ERP interface statistics

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<interface-name>—Name of interface

<group-name>—Name of protection group

---

## <get-ethernet-switching-aging-statistics>

### Usage

```
<rpc>
<get-ethernet-switching-aging-statistics>
 <brief/>
 <detail/>
</get-ethernet-switching-aging-statistics>
</rpc>
```

**Description** Show media access control aging statistics

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

## <get-ethernet-switching-authentication-whitelist-mac>

---

**Usage**

```
<rpc>
 <get-ethernet-switching-authentication-whitelist-mac>
 </get-ethernet-switching-authentication-whitelist-mac>
</rpc>
```

**Description** Show 802.1X White List MAC addresses

**Contents** <get-ethernet-switching-interface-mac-addresses>—Show 802.1X White List MAC addresses on this interface

<get-authentication-whitelist-mac-bypassed-users>—List users who have bypassed 802.1X authentication

## <get-ethernet-switching-interface-information>

---

**Usage**

```
<rpc>
 <get-ethernet-switching-interface-information>
 <summary/>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name>
 </get-ethernet-switching-interface-information>
</rpc>
```

**Description** Display Ethernet-switching interface information

**Contents** <summary>—Display summary output

<brief>—Display brief output (default)

<detail>—Display detailed output

<interface-name>—Name of interface

## <get-ethernet-switching-interface-mac-addresses>

---

**Usage**

```
<rpc>
 <get-ethernet-switching-interface-mac-addresses>
 <interface-name>interface-name</interface-name>
 </get-ethernet-switching-interface-mac-addresses>
</rpc>
```

**Description** Show 802.1X White List MAC addresses on this interface

**Contents** <interface-name>—Show White List MAC addresses of interface

---

### <get-ethernet-switching-log-information>

---

#### Usage

```
<rpc>
 <get-ethernet-switching-log-information/>
</rpc>
```

**Description** Show MAC address learning log

---

### <get-ethernet-switching-mac-learning-statistics>

---

#### Usage

```
<rpc>
 <get-ethernet-switching-mac-learning-statistics>
 <brief/>
 <detail/>
 <interface>interface</interface>
 </get-ethernet-switching-mac-learning-statistics>
</rpc>
```

**Description** Show media access control learning statistics

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<interface>—Display MAC learning statistics for a specified interface

---

### <get-ethernet-switching-mac-notification-information>

---

#### Usage

```
<rpc>
 <get-ethernet-switching-mac-notification-information/>
</rpc>
```

**Description** Display MAC notification information

---

### <get-ethernet-switching-next-hop-information>

---

#### Usage

```
<rpc>
 <get-ethernet-switching-next-hop-information>
```

```
<summary/>
<brief/>
<detail/>
<interface-index>interface-index</interface-index>
</get-ethernet-switching-next-hop-information>
</rpc>
```

**Description** Show next hop information

**Contents** <summary>—Display summary output

<brief>—Display brief output (default)

<detail>—Display detailed output

<interface-index>—Interface index

---

## <get-ethernet-switching-persistent-information>

### Usage

```
<rpc>
<get-ethernet-switching-persistent-information>
<interface>interface</interface>
</get-ethernet-switching-persistent-information>
</rpc>
```

**Description** Show media access control persistent database

**Contents** <interface>—Name of interface for which to display the database

---

## <get-ethernet-switching-table-information>

### Usage

```
<rpc>
<get-ethernet-switching-table-information>
<summary/>
<brief/>
<detail/>
<extensive/>
<sort-by>sort-by</sort-by>
</get-ethernet-switching-table-information>
</rpc>
```

**Description** Show media access control table

**Contents** <summary>—Display summary output

- name - Sort display by VLAN name

- tag - Sort display by VLAN id

<brief>—Display brief output (default)

- name - Sort display by VLAN name
- tag - Sort display by VLAN id

<detail>—Display detailed output

- name - Sort display by VLAN name
- tag - Sort display by VLAN id

<extensive>—Display extensive output

- name - Sort display by VLAN name
- tag - Sort display by VLAN id

<sort-by>—Specify display order

- name - Sort display by VLAN name
- tag - Sort display by VLAN id

<get-interface-ethernet-switching-table>—Display MAC table for a specified interface

<get-vlan-ethernet-switching-table>—Display MAC table for a specified VLAN

<get-ethernet-switching-persistent-information>—Show media access control persistent database

<get-management-vlan-ethernet-switching-table>—Display MAC table for a Management VLAN

---

## <get-fip-snooping>

---

### Usage

```
<rpc>
 <get-fip-snooping>
 <brief/>
 <detail/>
 </get-fip-snooping>
</rpc>
```

**Description** Show FIP snooping information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<get-fip-snooping-vlan>—Show per VLAN information

<get-fip-snooping-fcf>—Show fibre-channel forwarder information

<get-fip-snooping-enode>—Show per enode information

<get-fip-snooping-statistics>—Show FIP snooping statistics

---

## <get-fip-snooping-enode>

### Usage

```
<rpc>
 <get-fip-snooping-enode>
 <brief/>
 <detail/>
 <mac>mac</mac> <!-- mandatory -->
 <vlan>vlan</vlan>
 </get-fip-snooping-enode>
</rpc>
```

**Description** Show per enode information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<mac>—MAC address of Enode

<vlan>—Name of VLAN

---

## <get-fip-snooping-fcf>

### Usage

```
<rpc>
 <get-fip-snooping-fcf>
 <brief/>
 <detail/>
 <mac>mac</mac> <!-- mandatory -->
 <vlan>vlan</vlan>
 </get-fip-snooping-fcf>
</rpc>
```

**Description** Show fibre-channel forwarder information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<mac>—MAC address of FCF

<vlan>—Name of VLAN

## <get-fip-snooping-statistics>

---

**Usage**

```
<rpc>
 <get-fip-snooping-statistics>
 <vlan>vlan</vlan>
 </get-fip-snooping-statistics>
</rpc>
```

**Description** Show FIP snooping statistics

**Contents** <vlan>—Name of VLAN

## <get-fip-snooping-vlan>

---

**Usage**

```
<rpc>
 <get-fip-snooping-vlan>
 <brief/>
 <detail/>
 <vlan-name>vlan-name</vlan-name> <!-- mandatory -->
 </get-fip-snooping-vlan>
</rpc>
```

**Description** Show per VLAN information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<vlan-name>—Name of VLAN

## <get-igmp-snooping-flow-information>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-flow-information>
 <brief/>
 <detail/>
 </get-igmp-snooping-flow-information>
</rpc>
```

**Description** Show igmp-snooping flows

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

## <get-igmp-snooping-membership-information>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-membership-information>
 <brief/>
 <detail/>
 <vlan>vlan</vlan>
 <interface>interface</interface>
</get-igmp-snooping-membership-information>
</rpc>
```

**Description** Show igmp-snooping membership

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<vlan>—Groups on specified VLAN

<interface>—Groups with membership on interface

## <get-igmp-snooping-routing-information>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-routing-information>
 <ethernet-switching/>
 <inet/>
 <brief/>
 <detail/>
 <vlan>vlan</vlan>
</get-igmp-snooping-routing-information>
</rpc>
```

**Description** Show routing information

**Contents** <ethernet-switching>—Ethernet-switching multicast routes

<inet>—Family inet multicast routes

<brief>—Display brief output (default)

<detail>—Display detailed output

<vlan>—Show entries for a specific VLAN

## <get-igmp-snooping-statistics-information>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-statistics-information/>
</rpc>
```

**Description** Show igmp-snooping statistics

## <get-igmp-snooping-task-accounting>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-accounting>
 <brief/>
 <detail/>
 </get-igmp-snooping-task-accounting>
</rpc>
```

**Description** Per-task CPU accounting

**Contents** <brief>—Display brief output (default)  
<detail>—Display detailed output

## <get-igmp-snooping-task-information>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-information>
 <summary/>
 </get-igmp-snooping-task-information>
</rpc>
```

**Description** Show IGMP snooping task information

**Contents** <get-igmp-snooping-task-accounting>—Per-task CPU accounting  
<get-igmp-snooping-task-io>—Show task I/O statistics  
<get-igmp-snooping-task-jobs>—Show scheduled jobs  
<get-igmp-snooping-task-timers>—Task timers  
<get-igmp-snooping-task-statistics>—Task statistics  
<get-igmp-snooping-task-memory>—Show memory utilization of IGMP snooping tasks

<summary>—Display summary output (default)

### <get-igmp-snooping-task-io>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-io/>
</rpc>
```

**Description** Show task I/O statistics

### <get-igmp-snooping-task-jobs>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-jobs/>
</rpc>
```

**Description** Show scheduled jobs

### <get-igmp-snooping-task-memory>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-memory>
 <summary/>
 <brief/>
 <detail/>
 <history/>
 <fragmentation/>
 </get-igmp-snooping-task-memory>
</rpc>
```

**Description** Show memory utilization of IGMP snooping tasks

**Contents**

- <summary>—Display current and maximum memory usage
- <brief>—Display current/maximum/available memory
- <detail>—Display memory usage by individual users
- <history>—Display memory usage in the recent past
- <fragmentation>—Display memory allocator fragmentation

## <get-igmp-snooping-task-statistics>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-statistics/>
</rpc>
```

**Description** Task statistics

## <get-igmp-snooping-task-timers>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-task-timers>
 <brief/>
 <expired/>
 <detail/>
 </get-igmp-snooping-task-timers>
</rpc>
```

**Description** Task timers

**Contents** <brief>—Display brief output (default)

<expired>—Display expired timers

<detail>—Display timer detail

## <get-igmp-snooping-vlan-information>

---

**Usage**

```
<rpc>
 <get-igmp-snooping-vlan-information>
 <brief/>
 <detail/>
 <vlan>vlan</vlan>
 </get-igmp-snooping-vlan-information>
</rpc>
```

**Description** VLAN information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<vlan>—VLAN name

## <get-interface-ethernet-switching-table>

---

**Usage**

```
<rpc>
 <get-interface-ethernet-switching-table>
 <interface-name>interface-name</interface-name>
 </get-interface-ethernet-switching-table>
</rpc>
```

**Description** Display MAC table for a specified interface

**Contents** <interface-name>—Name of interface for which to display the table

## <get-ip-source-guard-information>

---

**Usage**

```
<rpc>
 <get-ip-source-guard-information/>
</rpc>
```

**Description** Show IP source guard information

## <get-l2pt-interface-information>

---

**Usage**

```
<rpc>
 <get-l2pt-interface-information>
 <interface-name>interface-name</interface-name>
 </get-l2pt-interface-information>
</rpc>
```

**Description** Show Layer2 protocol tunneling state for interfaces

**Contents** <interface-name>—Name of interface

## <get-l2pt-interface-statistics>

---

**Usage**

```
<rpc>
 <get-l2pt-interface-statistics>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-l2pt-interface-statistics>
</rpc>
```

**Description** Show Layer2 protocol tunneling statistics for interfaces

**Contents** <interface-name>—Name of interface

---

### <get-l2pt-statistics>

**Usage**

```
<rpc>
 <get-l2pt-statistics>
</get-l2pt-statistics>
</rpc>
```

**Description** Show Layer2 protocol tunneling statistics

**Contents** <get-l2pt-interface-statistics>—Show Layer2 protocol tunneling statistics for interfaces  
<get-l2pt-vlan-statistics>—Show Layer2 protocol tunneling statistics for vlans

---

### <get-l2pt-vlan-information>

**Usage**

```
<rpc>
 <get-l2pt-vlan-information>
 <vlan-name>vlan-name</vlan-name>
 </get-l2pt-vlan-information>
</rpc>
```

**Description** Show Layer2 protocol tunneling state for vlans

**Contents** <vlan-name>—Name of VLAN

---

### <get-l2pt-vlan-statistics>

**Usage**

```
<rpc>
 <get-l2pt-vlan-statistics>
 <vlan-name>vlan-name</vlan-name> <!-- mandatory -->
 </get-l2pt-vlan-statistics>
</rpc>
```

**Description** Show Layer2 protocol tunneling statistics for vlans

**Contents** <vlan-name>—Name of VLAN

---

### <get-lldp-interface-neighbors-information>

**Usage**

```
<rpc>
```

```
<get-lldp-interface-neighbors-information>
 <interface-name>interface-name</interface-name>
</get-lldp-interface-neighbors-information>
</rpc>
```

**Description** Show LLDP neighbors on this interface

**Contents** <interface-name>—Name of interface

---

### <get-lldp-interface-statistics>

---

#### Usage

```
<rpc>
 <get-lldp-interface-statistics>
 <interface-name>interface-name</interface-name>
 </get-lldp-interface-statistics>
</rpc>
```

**Description** Show LLDP statistics for this interface

**Contents** <interface-name>—Show LLDP statistics for this interface

---

### <get-lldp-neighbors-information>

---

#### Usage

```
<rpc>
 <get-lldp-neighbors-information>
 </get-lldp-neighbors-information>
</rpc>
```

**Description** Show LLDP neighbor information

**Contents** <get-lldp-interface-neighbors-information>—Show LLDP neighbors on this interface

---

### <get-management-vlan-ethernet-switching-table>

---

#### Usage

```
<rpc>
 <get-management-vlan-ethernet-switching-table/>
</rpc>
```

**Description** Display MAC table for a Management VLAN

## <get-management-vlan-information>

---

### Usage

```
<rpc>
 <get-management-vlan-information>
 <brief/>
 <detail/>
 <extensive/>
 <summary/>
</get-management-vlan-information>
</rpc>
```

**Description** Show management vlan information

**Contents** <brief>—Display brief output

<detail>—Display detailed output

<extensive>—Display extensive output

<summary>—Display summary output

## <get-mld-snooping-membership-information>

---

### Usage

```
<rpc>
 <get-mld-snooping-membership-information>
 <brief/>
 <detail/>
 <vlan>vlan</vlan>
 <interface>interface</interface>
</get-mld-snooping-membership-information>
</rpc>
```

**Description** Show mld-snooping membership

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<vlan>—Groups on specified VLAN

<interface>—Groups with membership on interface

## <get-mld-snooping-routing-information>

---

### Usage

```
<rpc>
 <get-mld-snooping-routing-information>
```

```
<ethernet-switching/>
<inet6/>
<brief/>
<detail/>
<vlan>vlan</vlan>
</get-mld-snooping-routing-information>
</rpc>
```

**Description** Show routing information

**Contents** <ethernet-switching>—Ethernet-switching multicast routes

<inet6>—Family inet6 multicast routes

<brief>—Display brief output (default)

<detail>—Display detailed output

<vlan>—Show entries for a specific VLAN

---

### <get-mld-snooping-statistics>

**Usage**

```
<rpc>
<get-mld-snooping-statistics/>
</rpc>
```

**Description** Show mld-snooping statistics

---

### <get-mld-snooping-vlan-information>

**Usage**

```
<rpc>
<get-mld-snooping-vlan-information>
<brief/>
<detail/>
<vlan>vlan</vlan>
</get-mld-snooping-vlan-information>
</rpc>
```

**Description** VLAN information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<vlan>—VLAN name

## <get-mstp-bridge-configuration-information>

---

**Usage**

```
<rpc>
 <get-mstp-bridge-configuration-information>
 <brief/>
 <detail/>
</get-mstp-bridge-configuration-information>
</rpc>
```

**Description** Show MSTP configuration

**Contents** <brief>—Display brief output (default)  
  
<detail>—Display detailed output

## <get-mvrp-dynamic-vlan-memberships>

---

**Usage**

```
<rpc>
 <get-mvrp-dynamic-vlan-memberships/>
</rpc>
```

**Description** Show MVRP dynamic VLAN memberships

## <get-mvrp-information>

---

**Usage**

```
<rpc>
 <get-mvrp-information>
 </get-mvrp-information>
</rpc>
```

**Description** Show Multiple VLAN Registration Protocol information

**Contents** <get-mvrp-stats>—Show MVRP statistics  
  
<get-mvrp-dynamic-vlan-memberships>—Show MVRP dynamic VLAN memberships

## <get-mvrp-stats>

---

**Usage**

```
<rpc>
 <get-mvrp-stats>
 </get-mvrp-stats>
```

```
</rpc>
```

**Description** Show MVRP statistics

**Contents** <get-mvrp-stats-intf>—Show MVRP statistics on this interface

---

### <get-mvrp-stats-intf>

---

**Usage**

```
<rpc>
 <get-mvrp-stats-intf>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-mvrp-stats-intf>
</rpc>
```

**Description** Show MVRP statistics on this interface

**Contents** <interface-name>—Show statistics for this interface

---

### <get-ring-configuration>

---

**Usage**

```
<rpc>
 <get-ring-configuration>
 <brief/>
 <detail/>
 <group-name>group-name</group-name>
 </get-ring-configuration>
</rpc>
```

**Description** Show configuration of ethernet ring protection group

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

---

### <get-rtg-information>

---

**Usage**

```
<rpc>
 <get-rtg-information>
 </get-rtg-information>
</rpc>
```

**Description** Show redundant trunk group information

**Contents** <get-rtg-information-pergrp>—Show information for a particular redundant trunk group

---

### <get-rtg-information-pergrp>

---

**Usage**

```
<rpc>
 <get-rtg-information-pergrp>
 <rtg-name>rtg-name</rtg-name> <!-- mandatory -->
 </get-rtg-information-pergrp>
</rpc>
```

**Description** Show information for a particular redundant trunk group

**Contents** <rtg-name>—Name of group

---

### <get-static-mac-bypassed-users>

---

**Usage**

```
<rpc>
 <get-static-mac-bypassed-users/>
</rpc>
```

**Description** List users who have bypassed 802.1X authentication

---

### <get-stp-bridge-information>

---

**Usage**

```
<rpc>
 <get-stp-bridge-information>
 <brief/>
 <detail/>
 <msti-vlan>msti-vlan</msti-vlan>
 <msti>msti</msti>
 <vlan-id>vlan-id</vlan-id>
 </get-stp-bridge-information>
</rpc>
```

**Description** Show STP bridge parameters

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<msti>—MSTP instance ID (0 for CIST; 1..4094 for MSTIs)

<vlan-id>—VLAN ID

---

## <get-stp-bridge-interface-information>

---

### Usage

```
<rpc>
 <get-stp-bridge-interface-information>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name>
 <msti-vlan>msti-vlan</msti-vlan>
 <msti>msti</msti>
 <vlan-id>vlan-id</vlan-id>
 </get-stp-bridge-interface-information>
</rpc>
```

**Description** Show STP interface parameters

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<interface-name>—Name of interface

<msti>—MSTP instance ID (0 for CIST; 1..4094 for MSTIs)

<vlan-id>—VLAN ID

---

## <get-stp-statistics-interface-information>

---

### Usage

```
<rpc>
 <get-stp-statistics-interface-information>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name>
 </get-stp-statistics-interface-information>
</rpc>
```

**Description** Show STP interface statistics

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<interface-name>—Name of interface

## <get-stp-vlan-interface-statistics>

---

### Usage

```
<rpc>
 <get-stp-vlan-interface-statistics>
 <brief/>
 <detail/>
 <vlan-id>vlan-id</vlan-id> <!-- mandatory -->
 </get-stp-vlan-interface-statistics>
</rpc>
```

**Description** Show STP VLAN interface statistics

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<vlan-id>—VLAN ID

## <get-vlan-ethernet-switching-table>

---

### Usage

```
<rpc>
 <get-vlan-ethernet-switching-table>
 <summary/>
 <brief/>
 <detail/>
 <vlan-name>vlan-name</vlan-name>
 </get-vlan-ethernet-switching-table>
</rpc>
```

**Description** Display MAC table for a specified VLAN

**Contents** <summary>—Display summary output

<brief>—Display brief output (default)

<detail>—Display detailed output

<vlan-name>—Name of VLAN for which to display the table

## <get-vlan-information>

---

### Usage

```
<rpc>
 <get-vlan-information>
 <brief/>
 <detail/>
 <extensive/>
```

```
<summary/>
<sort-by>sort-by</sort-by>
<vlan-name>vlan-name</vlan-name>
</get-vlan-information>
</rpc>
```

**Description** Show VLAN information

**Contents** <brief>—Display brief output

- name - Sort display by name
- tag - Sort display by tag

<detail>—Display detailed output

- name - Sort display by name
- tag - Sort display by tag

<extensive>—Display extensive output

- name - Sort display by name
- tag - Sort display by tag

<summary>—Display summary output

- name - Sort display by name
- tag - Sort display by tag

<get-management-vlan-information>—Show management vlan information

- name - Sort display by name
- tag - Sort display by tag

<get-vlans-dot1q-tunneling-information>—Show dot1q-tunneling vlan information

- name - Sort display by name
- tag - Sort display by tag

<sort-by>—Specify display order

- name - Sort display by name
- tag - Sort display by tag

<vlan-name>—Show information for a particular VLAN

## <get-vlans-dot1q-tunneling-information>

---

### Usage

```
<rpc>
 <get-vlans-dot1q-tunneling-information>
 <brief/>
 <detail/>
 <extensive/>
 <summary/>
 <sort-by>sort-by</sort-by>
 </get-vlans-dot1q-tunneling-information>
</rpc>
```

**Description** Show dot1q-tunneling vlan information

**Contents** <brief>—Display brief output

- name - Sort display by name
- tag - Sort display by tag

<detail>—Display detailed output

- name - Sort display by name
- tag - Sort display by tag

<extensive>—Display extensive output

- name - Sort display by name
- tag - Sort display by tag

<summary>—Display summary output

- name - Sort display by name
- tag - Sort display by tag

<sort-by>—Specify display order

- name - Sort display by name
- tag - Sort display by tag

## <load-dhcp-snooping>

---

### Usage

```
<rpc>
 <load-dhcp-snooping>
 <filename>filename</filename> <!-- mandatory -->
 </load-dhcp-snooping>
```

</rpc>

**Description** Load DHCP snooping entries

**Contents** <filename>—Filename (URL, local, remote)

---

### <refresh-edge-virtual-bridging-firewall>

---

**Usage**

```
<rpc>
 <refresh-edge-virtual-bridging-firewall>
</refresh-edge-virtual-bridging-firewall>
</rpc>
```

**Description** Request Edge Virtual Bridging firewall refresh

**Contents** <refresh-edge-virtual-bridging-firewall-interface>—Request Edge Virtual Bridging refresh on this interface

---

### <refresh-edge-virtual-bridging-firewall-interface>

---

**Usage**

```
<rpc>
 <refresh-edge-virtual-bridging-firewall-interface>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </refresh-edge-virtual-bridging-firewall-interface>
</rpc>
```

**Description** Request Edge Virtual Bridging refresh on this interface

**Contents** <interface-name>—Name of interface

---

### <release-dhcp-client>

---

**Usage**

```
<rpc>
 <release-dhcp-client>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </release-dhcp-client>
</rpc>
```

**Description** Request DHCP client release

**Contents** <interface-name>—Interface name of DHCP client

## <renew-dhcp-client>

---

### Usage

```
<rpc>
 <renew-dhcp-client>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </renew-dhcp-client>
</rpc>
```

**Description** Request DHCP client renew

**Contents** <interface-name>—Interface name of DHCP client

## <request-multicast-route-counter>

---

### Usage

```
<rpc>
 <request-multicast-route-counter>
 <source>source</source>
 <group>group</group>
 <instance>instance</instance>
 </request-multicast-route-counter>
</rpc>
```

**Description** Bind route to counter

**Contents** <source>—IP address of source

<group>—IP address of group

<instance>—Name of instance

## <save-dhcp-snooping>

---

### Usage

```
<rpc>
 <save-dhcp-snooping>
 <filename>filename</filename> <!-- mandatory -->
 </save-dhcp-snooping>
</rpc>
```

**Description** Save DHCP snooping entries

**Contents** <filename>—Filename (URL, local, remote)

# Operational Request Tag Elements Specific to J Series and SRX Series

This chapter lists the Junos Extensible Markup Language (XML) tag elements that a client of the Junos XML protocol or NETCONF server uses to request operational information. The tag names are in alphabetical order. For information about the notation used in this chapter, see [Table 2 on page ccxciii](#).

The tags listed in this chapter are specific to devices belonging to:

- J Series
- SRX Series

## <activate-wireless-modem>

---

### Usage

```
<rpc>
 <activate-wireless-modem>
</activate-wireless-modem>
</rpc>
```

**Description**    Activate the modem

**Contents**    <request-modem-wireless-activate-iota>—Internet Over The Air Activation  
                   <request-modem-wireless-activate-otasp>—Over The Air Service Provisioning  
                   <request-modem-wireless-activate-manual>—Manual Activation

## <clear-alg-h323-counters>

---

### Usage

```
<rpc>
 <clear-alg-h323-counters/>
</rpc>
```

**Description** Clear H323 counters

---

### <clear-alg-ike-esp-state>

---

**Usage**

```
<rpc>
 <clear-alg-ike-esp-state/>
</rpc>
```

**Description** Clear all IKE-ESP ALG state information

---

### <clear-alg-mgcp-calls-information>

---

**Usage**

```
<rpc>
 <clear-alg-mgcp-calls-information/>
</rpc>
```

**Description** Clear MGCP calls

---

### <clear-alg-mgcp-counter-information>

---

**Usage**

```
<rpc>
 <clear-alg-mgcp-counter-information/>
</rpc>
```

**Description** Clear MGCP counters

---

### <clear-alg-sccp-calls-information>

---

**Usage**

```
<rpc>
 <clear-alg-sccp-calls-information/>
</rpc>
```

**Description** Clear SCCP calls

---

### <clear-alg-sccp-counters>

---

**Usage**

```
<rpc>
 <clear-alg-sccp-counters/>
</rpc>
```

**Description** Clear SCCP counters

---

### <clear-alg-sip-calls>

---

**Usage**

```
<rpc>
 <clear-alg-sip-calls/>
</rpc>
```

**Description** Clear SIP calls

---

### <clear-alg-sip-counters>

---

**Usage**

```
<rpc>
 <clear-alg-sip-counters/>
</rpc>
```

**Description** Clear SIP counters

---

### <clear-all-dvpn-user-connections>

---

**Usage**

```
<rpc>
 <clear-all-dvpn-user-connections/>
</rpc>
```

**Description** Clear all dynamic VPN user connections

---

### <clear-anti-spam-clear>

---

**Usage**

```
<rpc>
 <clear-anti-spam-clear/>
</rpc>
```

**Description** Clear anti-spam statistics information

---

### <clear-anti-virus>

---

**Usage**

```
<rpc>
 <clear-anti-virus/>
</rpc>
```

**Description** Clear anti-virus statistics information

## **<clear-application-firewall-statistics>**

---

### **Usage**

```
<rpc>
 <clear-application-firewall-statistics>
 <logical-system>logical-system</logical-system>
 </clear-application-firewall-statistics>
</rpc>
```

**Description** Clear statistics of the application-firewall

**Contents** <logical-system>—Flow information of logical systems

- all - All logical systems (default)
- root-logical-system - Root logical system
- logical-system-name - Name of a logical system

## **<clear-avt-counters>**

---

### **Usage**

```
<rpc>
 <clear-avt-counters/>
</rpc>
```

**Description** Clear Application tracking counters

## **<clear-chassis-cluster-control-plane-statistics>**

---

### **Usage**

```
<rpc>
 <clear-chassis-cluster-control-plane-statistics/>
</rpc>
```

**Description** Clear control-plane statistics

## **<clear-chassis-cluster-data-plane-statistics>**

---

### **Usage**

```
<rpc>
 <clear-chassis-cluster-data-plane-statistics/>
</rpc>
```

**Description** Clear data-plane statistics

---

### <clear-chassis-cluster-failover-count>

---

**Usage**

```
<rpc>
 <clear-chassis-cluster-failover-count/>
</rpc>
```

**Description** Clear failover-count for all redundancy-groups

---

### <clear-chassis-cluster-information>

---

**Usage**

```
<rpc>
 <clear-chassis-cluster-information/>
</rpc>
```

**Description** Clear debug information

---

### <clear-chassis-cluster-ip-monitoring-failure-count>

---

**Usage**

```
<rpc>
 <clear-chassis-cluster-ip-monitoring-failure-count>
 </clear-chassis-cluster-ip-monitoring-failure-count>
</rpc>
```

**Description** Clear IP monitoring failure-count

**Contents** <clear-chassis-cluster-ip-monitoring-failure-count-ip-address>—Clear IP monitoring failure-count for a specific IP address

---

### <clear-chassis-cluster-ip-monitoring-failure-count-ip-address>

---

**Usage**

```
<rpc>
 <clear-chassis-cluster-ip-monitoring-failure-count-ip-address>
 <ip-address-identifier>ip-address-identifier</ip-address-identifier> <!-- mandatory
-->
 </clear-chassis-cluster-ip-monitoring-failure-count-ip-address>
</rpc>
```

**Description** Clear IP monitoring failure-count for a specific IP address

**Contents**    <ip-address-identifier>—Clear failure-count of an IP address

---

## <clear-chassis-cluster-statistics>

---

**Usage**

```
<rpc>
 <clear-chassis-cluster-statistics/>
</rpc>
```

**Description**    Clear all statistics

---

## <clear-chassis-cluster-switch-fabric-probe-statistics>

---

**Usage**

```
<rpc>
 <clear-chassis-cluster-switch-fabric-probe-statistics/>
</rpc>
```

**Description**    Clear chassis cluster switch fabric probe statistics

---

## <clear-content-filter>

---

**Usage**

```
<rpc>
 <clear-content-filter/>
</rpc>
```

**Description**    Clear content-filtering statistics information

---

## <clear-destination-nat-pool-information>

---

**Usage**

```
<rpc>
 <clear-destination-nat-pool-information>
 <pool-choice>pool-choice</pool-choice> <!-- mandatory -->
 <pool-name>pool-name</pool-name> <!-- mandatory -->
 <all/>
 </clear-destination-nat-pool-information>
</rpc>
```

**Description**    Clear destination NAT information of this pool

**Contents**    <pool-name>—Address-pool name

          <all>—Clear all destination NAT pool information

## <clear-destination-nat-rule-sets-information>

---

**Usage**

```

<rpc>
 <clear-destination-nat-rule-sets-information>
 <rule-choice>rule-choice</rule-choice> <!-- mandatory -->
 <rule-name>rule-name</rule-name> <!-- mandatory -->
 <all/>
 </clear-destination-nat-rule-sets-information>
</rpc>

```

**Description** Clear destination NAT rule-set information

**Contents** <rule-name>—The name of the destination NAT rule-set

<all>—Clear all destination NAT rule-sets information

## <clear-dvpn-user-connection-by-username>

---

**Usage**

```

<rpc>
 <clear-dvpn-user-connection-by-username>
 <username>username</username> <!-- mandatory -->
 <ike-id>ike-id</ike-id> <!-- mandatory -->
 </clear-dvpn-user-connection-by-username>
</rpc>

```

**Description** Clear Dynamic VPN user connection with specified username

**Contents** <username>—Name of user for the connection

<ike-id>—The IKE ID of this user connection

## <clear-eedebg-counters>

---

**Usage**

```

<rpc>
 <clear-eedebg-counters/>
</rpc>

```

**Description** Clear datapath debug counters

## <clear-flow-ipaction-all>

---

**Usage**

```

<rpc>

```

```
<clear-flow-ipaction-all>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</clear-flow-ipaction-all>
</rpc>
```

**Description** Clear all ip-action entries

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-flow-session>

---

### Usage

```
<rpc>
<clear-flow-session>
<destination-prefix>destination-prefix</destination-prefix>
<source-prefix>source-prefix</source-prefix>
<source-port>source-port</source-port>
<destination-port>destination-port</destination-port>
<protocol>protocol</protocol>
<application>application</application>
<idp/>
<tunnel/>
<nat/>
<services-offload/>
<resource-manager/>
<application-firewall/>
<application-traffic-control/>
<interface>interface</interface>
<family>family</family>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</clear-flow-session>
</rpc>
```

**Description** Clear session table

**Contents** <destination-prefix>—Destination IP prefix or address

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP

- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6

<destination-port>—Destination port

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- dns - Domain Name Service
- ftp - File Transfer Protocol
- gprs-gtp-c - GPRS Tunneling Control Plane
- gprs-gtp-u - GPRS Tunneling User Plane
- gprs-gtp-v0 - GPRS Tunneling Version 0
- gprs-sctp - GPRS Stream Control Protocol
- ignore - Ignore application type
- mgcp-ca - MGCP-CA
- mgcp-ua - MGCP-UA

- ms-rpc - Microsoft RPC
- pptp - Point-to-Point Tunneling Protocol
- sun-rpc - Sun Microsystems RPC
- q931 - Q.931
- ras - RAS
- realaudio - RealAudio
- rsh - Remote Shell
- rtsp - Real Time Streaming Protocol
- sccp - Skinny Client Control Protocol
- sip - Session Initiation Protocol
- sqlnet-v2 - Oracle SQL\*Net Version 2
- talk - Talk program
- tftp - Trivial File Transfer Protocol
- http - Hyper Text transfer protocol
- https - Secure HyperText Transfer Protocol
- smtp - Simple Mail Transfer Protocol
- imap - Internet Message Access Protocol
- ssh - Secure Shell
- telnet - Telnet Terminal Emulation Protocol
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<protocol>—IP protocol number

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload

- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- dns - Domain Name Service
- ftp - File Transfer Protocol
- gprs-gtp-c - GPRS Tunneling Control Plane
- gprs-gtp-u - GPRS Tunneling User Plane
- gprs-gtp-v0 - GPRS Tunneling Version 0
- gprs-sctp - GPRS Stream Control Protocol
- ignore - Ignore application type
- mgcp-ca - MGCP-CA
- mgcp-ua - MGCP-UA
- ms-rpc - Microsoft RPC
- pptp - Point-to-Point Tunneling Protocol
- sun-rpc - Sun Microsystems RPC
- q931 - Q.931
- ras - RAS
- realaudio - RealAudio
- rsh - Remote Shell
- rtsp - Real Time Streaming Protocol
- sccp - Skinny Client Control Protocol
- sip - Session Initiation Protocol
- sqlnet-v2 - Oracle SQL\*Net Version 2
- talk - Talk program
- tftp - Trivial File Transfer Protocol
- http - Hyper Text transfer protocol
- https - Secure HyperText Transfer Protocol
- smtp - Simple Mail Transfer Protocol
- imap - Internet Message Access Protocol
- ssh - Secure Shell

- telnet - Telnet Terminal Emulation Protocol
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<application>—Application protocol name

- dns - Domain Name Service
- ftp - File Transfer Protocol
- gprs-gtp-c - GPRS Tunneling Control Plane
- gprs-gtp-u - GPRS Tunneling User Plane
- gprs-gtp-v0 - GPRS Tunneling Version 0
- gprs-sctp - GPRS Stream Control Protocol
- ignore - Ignore application type
- mgcp-ca - MGCP-CA
- mgcp-ua - MGCP-UA
- ms-rpc - Microsoft RPC
- pptp - Point-to-Point Tunneling Protocol
- sun-rpc - Sun Microsystems RPC
- q931 - Q.931
- ras - RAS
- realaudio - RealAudio
- rsh - Remote Shell
- rtsp - Real Time Streaming Protocol
- sccp - Skinny Client Control Protocol
- sip - Session Initiation Protocol
- sqlnet-v2 - Oracle SQL\*Net Version 2
- talk - Talk program
- tftp - Trivial File Transfer Protocol
- http - Hyper Text transfer protocol
- https - Secure HyperText Transfer Protocol
- smtp - Simple Mail Transfer Protocol
- imap - Internet Message Access Protocol
- ssh - Secure Shell

- telnet - Telnet Terminal Emulation Protocol
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<idp>—IDP sessions

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<tunnel>—Tunnel sessions

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<nat>—Sessions with network address translation

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<services-offload>—Services-offload sessions

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<resource-manager>—Sessions with resource manager

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<application-firewall>—Show application-firewall sessions

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<application-traffic-control>—Show application-traffic-control sessions

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<interface>—Name of incoming or outgoing interface

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<family>—Protocol family

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<clear-flow-session-all>—Clear all sessions

<clear-flow-session-by-session-identifier>—Clear session with specified session identifier

---

## <clear-flow-session-all>

---

### Usage

```
<rpc>
<clear-flow-session-all>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
```

```

 </clear-flow-session-all>
 </rpc>

```

**Description** Clear all sessions

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <clear-flow-session-by-session-identifier>

### Usage

```

<rpc>
 <clear-flow-session-by-session-identifier>
 <session-identifier>session-identifier</session-identifier> <!-- mandatory -->
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </clear-flow-session-by-session-identifier>
</rpc>

```

**Description** Clear session with specified session identifier

**Contents** <session-identifier>—Session identifier

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <clear-group-vpn-ike-security-associations>

### Usage

```

<rpc>
 <clear-group-vpn-ike-security-associations>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 <peer-address>peer-address</peer-address>
 <index>index</index>
 </clear-group-vpn-ike-security-associations>
</rpc>

```

```
</clear-group-vpn-ike-security-associations>
</rpc>
```

**Description** Clear group VPN IKE security associations

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number  
<kmd-instance>—Name of KMD instance or 'all'  
<peer-address>—IP address of the peer  
<index>—Index of security association

---

### <clear-group-vpn-kek-security-associations>

---

**Usage**

```
<rpc>
 <clear-group-vpn-kek-security-associations>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 <index>index</index>
 </clear-group-vpn-kek-security-associations>
</rpc>
```

**Description** Clear group VPN KEK security associations

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number  
<kmd-instance>—Name of KMD instance or 'all'  
<index>—Index of security association

---

### <clear-gvpn-ipsec-security-association>

---

**Usage**

```
<rpc>
 <clear-gvpn-ipsec-security-association>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 <index>index</index>
 </clear-gvpn-ipsec-security-association>
</rpc>
```

**Description** Clear IPSec dynamic security associations

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number  
<kmd-instance>—Name of KMD instance or 'all'  
<index>—Index of security association

---

### <clear-gvpn-ipsec-statistics>

---

**Usage**

```
<rpc>
 <clear-gvpn-ipsec-statistics>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <index>index</index>
 </clear-gvpn-ipsec-statistics>
</rpc>
```

**Description** Clear Group VPN IPSec statistics

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number  
<index>—Index of security association

---

### <clear-gvrp-statistics>

---

**Usage**

```
<rpc>
 <clear-gvrp-statistics/>
</rpc>
```

**Description** Clear GVRP statistics

---

### <clear-ike-respond-bad-spi-count>

---

**Usage**

```
<rpc>
 <clear-ike-respond-bad-spi-count>
 <gw-name>gw-name</gw-name>
 </clear-ike-respond-bad-spi-count>
</rpc>
```

**Description** Clear IKE bad SPI count

**Contents** <gw-name>—Name of the gateway

---

## <clear-ike-security-association>

---

### Usage

```
<rpc>
 <clear-ike-security-association>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 <peer-address>peer-address</peer-address>
 <index>index</index>
 <port>port</port>
 </clear-ike-security-association>
</rpc>
```

**Description** Clear IKE security associations

**Contents** <fpc>—FPC slot number

<pic>—PIC slot number

<kmd-instance>—Name of KMD instance or 'all'

<peer-address>—Name of security association

<index>—Index of security association

<port>—Port number of security association

---

## <clear-incoming-table-information>

---

### Usage

```
<rpc>
 <clear-incoming-table-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </clear-incoming-table-information>
</rpc>
```

**Description** Clear incoming table information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-ipsec-security-association>

---

### Usage

```
<rpc>
 <clear-ipsec-security-association>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 <index>index</index>
 </clear-ipsec-security-association>
</rpc>
```

**Description** Clear IPSec dynamic security associations

**Contents** <fpc>—FPC slot number

<pic>—PIC slot number

<kmd-instance>—Name of KMD instance or 'all'

<index>—Index of security association

---

## <clear-ipsec-statistics>

---

### Usage

```
<rpc>
 <clear-ipsec-statistics>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <index>index</index>
 </clear-ipsec-statistics>
</rpc>
```

**Description** Clear IPSec statistics

**Contents** <fpc>—FPC slot number

<pic>—PIC slot number

<index>—Index of security association

---

## <clear-isdn-q921-statistics>

---

### Usage

```
<rpc>
 <clear-isdn-q921-statistics>
 <interface>interface</interface>
```

```
</clear-isdn-q921-statistics>
</rpc>
```

**Description** Clear Q.921 layer statistics

**Contents** <interface>—Interface name

---

### <clear-isdn-q931-statistics>

---

**Usage**

```
<rpc>
<clear-isdn-q931-statistics>
 <interface>interface</interface>
</clear-isdn-q931-statistics>
</rpc>
```

**Description** Clear Q.931 layer statistics

**Contents** <interface>—Interface name

---

### <clear-persist-nat-all>

---

**Usage**

```
<rpc>
<clear-persist-nat-all>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
</clear-persist-nat-all>
</rpc>
```

**Description** Clear all persistent NAT information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

### <clear-persist-nat-interface-information>

---

**Usage**

```
<rpc>
<clear-persist-nat-interface-information>
 <lsys>lsys</lsys>
```

```
<logical-system>logical-system</logical-system>
<root-logical-system/>
</clear-persist-nat-interface-information>
</rpc>
```

**Description** Clear persistent NAT information of this interface

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-persist-nat-ip-port-information>

---

### Usage

```
<rpc>
<clear-persist-nat-ip-port-information>
<ip>ip</ip> <!-- mandatory -->
<internal-port>internal-port</internal-port>
<internal-protocol>internal-protocol</internal-protocol>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</clear-persist-nat-ip-port-information>
</rpc>
```

**Description** Clear persistent NAT information of internal IP and port

**Contents** <ip>—Internal IP address

- tcp - Transmission Control Protocol
- udp - User Datagram Protocol
- icmp - Internet Control Message Protocol
- icmp6 - Internet Control Message Protocol Version 6
- protocol-number - Numeric protocol value (0 .. 255)
- all - All logical systems
- logical-system-name - Logical system name

<internal-port>—Internal port

- tcp - Transmission Control Protocol
- udp - User Datagram Protocol
- icmp - Internet Control Message Protocol

- icmp6 - Internet Control Message Protocol Version 6
- protocol-number - Numeric protocol value (0 .. 255)
- all - All logical systems
- logical-system-name - Logical system name

<internal-protocol>—Internal protocol

- tcp - Transmission Control Protocol
- udp - User Datagram Protocol
- icmp - Internet Control Message Protocol
- icmp6 - Internet Control Message Protocol Version 6
- protocol-number - Numeric protocol value (0 .. 255)
- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-persist-nat-pool-information>

---

### Usage

```
<rpc>
 <clear-persist-nat-pool-information>
 <pool-name>pool-name</pool-name> <!-- mandatory -->
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </clear-persist-nat-pool-information>
</rpc>
```

**Description** Clear persistent NAT information of this pool

**Contents** <pool-name>—Source NAT pool name

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems

- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <clear-retag-statistics>

### Usage

```
<rpc>
 <clear-retag-statistics>
 <filter>filter</filter> <!-- mandatory -->
 <interface>interface</interface>
 <vlan-id>vlan-id</vlan-id>
 <clear-all/>
 </clear-retag-statistics>
</rpc>
```

**Description** Clear L2 vlan rewrite statistics information

**Contents** <interface>—Rewrite statistics interface

<vlan-id>—Rewrite statistics on vlan-id

<clear-all>—Clear all statistics

## <clear-screen-statistics>

### Usage

```
<rpc>
 <clear-screen-statistics>
 <filter>filter</filter> <!-- mandatory -->
 <zone>zone</zone>
 <interface>interface</interface>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </clear-screen-statistics>
</rpc>
```

**Description** Clear screen attack statistics information

**Contents** <zone>—IDS statistics zone

- all - All logical systems
- logical-system-name - Logical system name

<interface>—IDS statistics interface

- all - All logical systems

- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-security-dynamic-policies-statistics>

---

### Usage

```
<rpc>
<clear-security-dynamic-policies-statistics/>
</rpc>
```

**Description** Clear statistics about the dynamic policies

---

## <clear-security-firewall-authentication-history>

---

### Usage

```
<rpc>
<clear-security-firewall-authentication-history>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <filter>filter</filter>
 <identifier>identifier</identifier>
 <address>address</address>
</clear-security-firewall-authentication-history>
</rpc>
```

**Description** Clear firewall authentication history

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<identifier>—Clear authentication history by id

<address>—Clear authentication history by ip address

## <clear-security-firewall-authentication-users>

### Usage

```
<rpc>
 <clear-security-firewall-authentication-users>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <filter>filter</filter>
 <identifier>identifier</identifier>
 <address>address</address>
 </clear-security-firewall-authentication-users>
</rpc>
```

**Description** Clear current firewall authentication user data

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<identifier>—Clear authentication entry by id

<address>—Clear authentication entry by ip address

## <clear-security-flow-ip-action>

### Usage

```
<rpc>
 <clear-security-flow-ip-action>
 <source-prefix>source-prefix</source-prefix>
 <destination-prefix>destination-prefix</destination-prefix>
 <source-port>source-port</source-port>
 <destination-port>destination-port</destination-port>
 <protocol>protocol</protocol>
 <family>family</family>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </clear-security-flow-ip-action>
</rpc>
```

**Description** Clear ip-action table

**Contents** <source-prefix>—Source IP prefix or address

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<destination-prefix>—Destination IP prefix or address

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast

- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<source-port>—Source port

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<destination-port>—Destination port

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol

- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<protocol>—IP protocol number

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT

- all - All logical systems
- logical-system-name - Logical system name

<family>—Protocol family

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<clear-flow-ipaction-all>—Clear all ip-action entries

## <clear-security-flow-statistics>

### Usage

```
<rpc>
 <clear-security-flow-statistics>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </clear-security-flow-statistics>
</rpc>
```

**Description** Clear flow statistics

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <clear-security-gprs-gtp-tunnel>

### Usage

```
<rpc>
 <clear-security-gprs-gtp-tunnel>
 <tunnel-identifier>tunnel-identifier</tunnel-identifier> <!-- mandatory -->
 <identifier>identifier</identifier>
 <all/>
```

```
</clear-security-gprs-gtp-tunnel>
</rpc>
```

**Description** Clear gtp tunnels

**Contents** <identifier>—GTP clear tunnel with specified identifier number  
<all>—GTP clear all tunnels

---

## <clear-security-group-vpn-server>

---

### Usage

```
<rpc>
 <clear-security-group-vpn-server>
 <group_choice>group_choice</group_choice>

 <clear-security-group-vpn-server-group-name>clear-security-group-vpn-server-group-name</clear-security-group-vpn-server-group-name>

 <clear-security-group-vpn-server-group-id>clear-security-group-vpn-server-group-id</clear-security-group-vpn-server-group-id>

 <clear-security-group-vpn-server-now/>
 </clear-security-group-vpn-server>
</rpc>
```

**Description** Clear group VPN server security information

**Contents** <clear-security-group-vpn-server-group-name>—Clear specified group name  
<clear-security-group-vpn-server-group-id>—Clear specified group id  
<clear-security-group-vpn-server-now>—Clear group immediately

---

## <clear-security-log-hpl-information>

---

### Usage

```
<rpc>
 <clear-security-log-hpl-information/>
</rpc>
```

**Description** Clear security logs in binary format

---

## <clear-security-policies-hit-count>

---

### Usage

```
<rpc>
 <clear-security-policies-hit-count>
 <from-zone>from-zone</from-zone>
```

```
<to-zone>to-zone</to-zone>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</clear-security-policies-hit-count>
</rpc>
```

**Description** Clear hit-count about the policies

**Contents** <from-zone>—Clear the policy hit-count matching the given source zone

- logical-system-name - Logical system name

<to-zone>—Clear the policy hit-count matching the given destination zone

- logical-system-name - Logical system name

<logical-system>—Logical-system name

- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-security-policies-statistics>

### Usage

```
<rpc>
<clear-security-policies-statistics>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</clear-security-policies-statistics>
</rpc>
```

**Description** Clear statistics about the policies

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <clear-source-nat-pool-information>

### Usage

```
<rpc>
<clear-source-nat-pool-information>
<pool-choice>pool-choice</pool-choice> <!-- mandatory -->
```

```
<pool-name>pool-name</pool-name> <!-- mandatory -->
<all/>
</clear-source-nat-pool-information>
</rpc>
```

**Description** Clear source NAT information of this pool

**Contents** <pool-name>—Address-pool name  
<all>—Clear all source NAT pool information

---

### <clear-source-nat-rule-sets-information>

---

**Usage**

```
<rpc>
<clear-source-nat-rule-sets-information>
<rule-choice>rule-choice</rule-choice> <!-- mandatory -->
<rule-name>rule-name</rule-name> <!-- mandatory -->
<all/>
</clear-source-nat-rule-sets-information>
</rpc>
```

**Description** Clear source NAT rule-set information

**Contents** <rule-name>—The name of the source NAT rule-set  
<all>—Clear all source NAT rule-sets information

---

### <clear-ssl-proxy-statistics>

---

**Usage**

```
<rpc>
<clear-ssl-proxy-statistics/>
</rpc>
```

**Description** Clear ssl proxy statistics

---

### <clear-static-nat-rule-sets-information>

---

**Usage**

```
<rpc>
<clear-static-nat-rule-sets-information>
<rule-choice>rule-choice</rule-choice> <!-- mandatory -->
<rule-name>rule-name</rule-name> <!-- mandatory -->
<all/>
</clear-static-nat-rule-sets-information>
</rpc>
```

**Description** Clear static NAT rule-set information

**Contents** <rule-name>—The name of the static NAT rule-set  
<all>—Clear all static NAT rule-sets information

---

### <clear-tgm-media-gateway-controller>

---

**Usage**

```
<rpc>
 <clear-tgm-media-gateway-controller>
 <slot>slot</slot> <!-- mandatory -->
 </clear-tgm-media-gateway-controller>
</rpc>
```

**Description** Clear TGM information for this FPC

**Contents** <slot>—FPC slot number  
<media-gateway-controller>—Name of one or more media gateway controllers

---

### <clear-userfw-local-auth-table>

---

**Usage**

```
<rpc>
 <clear-userfw-local-auth-table/>
</rpc>
```

**Description** Clear local user authentication table information

---

### <clear-web-filter-clear>

---

**Usage**

```
<rpc>
 <clear-web-filter-clear/>
</rpc>
```

**Description** Clear web-filtering statistics information

---

### <clear-wlan-access-points-neighbors>

---

**Usage**

```
<rpc>
 <clear-wlan-access-points-neighbors>
 <wlan-access-point-name>wlan-access-point-name</wlan-access-point-name>
```

```
<!-- mandatory -->
</clear-wlan-access-points-neighbors>
</rpc>
```

**Description** Clear access point neighbor information

**Contents** <wlan-access-point-name>—Name of the access point

---

### <get-alg-h323-counters>

---

**Usage**

```
<rpc>
<get-alg-h323-counters/>
</rpc>
```

**Description** Show H323 counters

---

### <get-alg-mgcp-call-information>

---

**Usage**

```
<rpc>
<get-alg-mgcp-call-information>
<endpoint>endpoint</endpoint>
</get-alg-mgcp-call-information>
</rpc>
```

**Description** Show MGCP calls

**Contents** <endpoint>—Show MGCP call endpoint

---

### <get-alg-mgcp-counter-information>

---

**Usage**

```
<rpc>
<get-alg-mgcp-counter-information/>
</rpc>
```

**Description** Show MGCP counters

---

### <get-alg-mgcp-endpoint-information>

---

**Usage**

```
<rpc>
<get-alg-mgcp-endpoint-information>
<endpoint-name>endpoint-name</endpoint-name>
```

```

 </get-alg-mgcp-endpoint-information>
 </rpc>

```

**Description** Show MGCP endpoints

**Contents** <endpoint-name>—Show MGCP endpoint with identifier

---

### <get-alg-msrpc-uuid2oid-table>

#### Usage

```

 <rpc>
 <get-alg-msrpc-uuid2oid-table/>
 </rpc>

```

**Description** Show MSRPC UUID to OID table

---

### <get-alg-sccp-calls>

#### Usage

```

 <rpc>
 <get-alg-sccp-calls>
 <detail/>
 <brief/>
 </get-alg-sccp-calls>
 </rpc>

```

**Description** Show SCCP calls

**Contents** <detail>—Display detailed call information

<brief>—Display brief call information (default)

---

### <get-alg-sccp-counters>

#### Usage

```

 <rpc>
 <get-alg-sccp-counters/>
 </rpc>

```

**Description** Show SCCP counters

---

### <get-alg-sip-call-information>

#### Usage

```

 <rpc>

```

```
<get-alg-sip-call-information>
<detail/>
<brief/>
</get-alg-sip-call-information>
</rpc>
```

**Description** Show SIP calls

**Contents** <detail>—Display detailed call information  
<brief>—Display brief call information (default)

---

### <get-alg-sip-counter-information>

**Usage**

```
<rpc>
<get-alg-sip-counter-information/>
</rpc>
```

**Description** Show SIP counters

---

### <get-alg-sip-rate-information>

**Usage**

```
<rpc>
<get-alg-sip-rate-information/>
</rpc>
```

**Description** Show SIP rate

---

### <get-alg-status>

**Usage**

```
<rpc>
<get-alg-status/>
</rpc>
```

**Description** Show ALG status

---

### <get-appfw-rule-set>

**Usage**

```
<rpc>
<get-appfw-rule-set>
<rule-set-choice>rule-set-choice</rule-set-choice> <!-- mandatory -->
<rule-set-name>rule-set-name</rule-set-name> <!-- mandatory -->
```

```
<all/>
<logical-system>logical-system</logical-system>
</get-appfw-rule-set>
</rpc>
```

**Description** Show security application firewall rule-set

**Contents** <rule-set-name>—Show the rule-set information matching the given rule-set name

- all - All logical systems (default)
- root-logical-system - Root logical system
- logical-system-name - Name of a logical system

<all>—Show all rule-sets information

- all - All logical systems (default)
- root-logical-system - Root logical system
- logical-system-name - Name of a logical system

<logical-system>—Flow information of logical systems

- all - All logical systems (default)
- root-logical-system - Root logical system
- logical-system-name - Name of a logical system

---

## <get-avt-counters>

---

**Usage**

```
<rpc>
<get-avt-counters/>
</rpc>
```

**Description** Show Application tracking counters

---

## <get-chassis-cluster-control-plane-statistics>

---

**Usage**

```
<rpc>
<get-chassis-cluster-control-plane-statistics/>
</rpc>
```

**Description** Display control-plane statistics

## <get-chassis-cluster-data-plane-interfaces>

---

### Usage

```
<rpc>
 <get-chassis-cluster-data-plane-interfaces/>
</rpc>
```

**Description**    Display data-plane interfaces

## <get-chassis-cluster-data-plane-statistics>

---

### Usage

```
<rpc>
 <get-chassis-cluster-data-plane-statistics/>
</rpc>
```

**Description**    Display data-plane statistics

## <get-chassis-cluster-ethernet-switching-status>

---

### Usage

```
<rpc>
 <get-chassis-cluster-ethernet-switching-status/>
</rpc>
```

**Description**    Display chassis cluster ethernet switching status

## <get-chassis-cluster-interfaces>

---

### Usage

```
<rpc>
 <get-chassis-cluster-interfaces/>
</rpc>
```

**Description**    Display chassis cluster interfaces

## <get-chassis-cluster-ip-monitoring-status>

---

### Usage

```
<rpc>
 <get-chassis-cluster-ip-monitoring-status>
 </get-chassis-cluster-ip-monitoring-status>
</rpc>
```

**Description** Display IP monitoring status

**Contents** <get-chassis-cluster-ip-monitoring-status-redundancy-group>—Display IP monitoring status for a specific redundancy-group

---

### <get-chassis-cluster-ip-monitoring-status-redundancy-group>

**Usage**

```
<rpc>
 <get-chassis-cluster-ip-monitoring-status-redundancy-group>

 <redundancy-group-identifier>redundancy-group-identifier</redundancy-group-identifier>
 <!-- mandatory -->
 </get-chassis-cluster-ip-monitoring-status-redundancy-group>
</rpc>
```

**Description** Display IP monitoring status for a specific redundancy-group

**Contents** <redundancy-group-identifier>—Redundancy-group identifier

---

### <get-chassis-cluster-statistics>

**Usage**

```
<rpc>
 <get-chassis-cluster-statistics/>
</rpc>
```

**Description** Display chassis cluster statistics

---

### <get-chassis-cluster-status>

**Usage**

```
<rpc>
 <get-chassis-cluster-status>
 <redundancy-group>redundancy-group</redundancy-group>
 </get-chassis-cluster-status>
</rpc>
```

**Description** Display chassis cluster status

**Contents** <redundancy-group>—Display chassis cluster status per redundancy-group

---

### <get-chassis-cluster-switch-fabric-link-interfaces>

**Usage**

```
<rpc>
```

```
<get-chassis-cluster-switch-fabric-link-interfaces/>
</rpc>
```

**Description** Display chassis cluster switch fabric link interfaces

---

### <get-chassis-cluster-switch-fabric-probe-statistics>

---

**Usage**

```
<rpc>
 <get-chassis-cluster-switch-fabric-probe-statistics/>
</rpc>
```

**Description** Display chassis cluster switch fabric probe statistics

---

### <get-client-version>

---

**Usage**

```
<rpc>
 <get-client-version/>
</rpc>
```

**Description** Show Dynamic VPN client version

---

### <get-destination-nat-pool-information>

---

**Usage**

```
<rpc>
 <get-destination-nat-pool-information>
 <pool-choice>pool-choice</pool-choice> <!-- mandatory -->
 <pool-name>pool-name</pool-name> <!-- mandatory -->
 </pool-choice>
 <all/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
</get-destination-nat-pool-information>
</rpc>
```

**Description** Show destination NAT address-pool information

**Contents** <pool-name>—The name of the address-pool

- all - All logical systems
- logical-system-name - Logical system name

<all>—Display all destination NAT address-pool information

- all - All logical systems

- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <get-destination-nat-rule-sets-information>

### Usage

```
<rpc>
 <get-destination-nat-rule-sets-information>
 <rule-choice>rule-choice</rule-choice> <!-- mandatory -->
 <rule-name>rule-name</rule-name> <!-- mandatory -->
 <all/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-destination-nat-rule-sets-information>
</rpc>
```

**Description** Show destination NAT rule-set information

**Contents** <rule-name>—The name of the rule-set

- all - All logical systems
- logical-system-name - Logical system name

<all>—Display all destination NAT rule-sets information

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <get-dialer-defaults-information>

### Usage

```
<rpc>
 <get-dialer-defaults-information/>
```

</rpc>

**Description** Show dialer services software defaults

---

### <get-dialer-interface-information>

---

#### Usage

```
<rpc>
 <get-dialer-interface-information>
 <brief/>
 <detail/>
 <interface-name>interface-name</interface-name>
 </get-dialer-interface-information>
</rpc>
```

**Description** Show interface information

**Contents** <brief>—Display brief output

<detail>—Display detailed output

<interface-name>—Name of dialer logical interface

---

### <get-dialer-pool-information>

---

#### Usage

```
<rpc>
 <get-dialer-pool-information>
 <brief/>
 <detail/>
 <pool-name>pool-name</pool-name>
 </get-dialer-pool-information>
</rpc>
```

**Description** Show pool information

**Contents** <brief>—Display brief output

<detail>—Display detailed output

<pool-name>—Dialer pool identifier

---

### <get-download-information>

---

#### Usage

```
<rpc>
 <get-download-information>
 <download-id>download-id</download-id>
```

```

 </get-download-information>
 </rpc>

```

**Description** Show status of downloads

**Contents** <download-id>—ID of the download whose status is to be shown

## <get-eeedebug-action-profile>

---

### Usage

```

 <rpc>
 <get-eeedebug-action-profile/>
 </rpc>

```

**Description** Show current datapath-debug action profile

## <get-eeedebug-counters>

---

### Usage

```

 <rpc>
 <get-eeedebug-counters/>
 </rpc>

```

**Description** Show datapath counters

## <get-eeedebug-events>

---

### Usage

```

 <rpc>
 <get-eeedebug-events/>
 </rpc>

```

**Description** Show current registered data path events

## <get-firewall-authentication-history>

---

### Usage

```

 <rpc>
 <get-firewall-authentication-history>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <filter>filter</filter>
 </get-firewall-authentication-history>
 </rpc>

```

```

<get-firewall-authentication-history-specific>get-firewall-authentication-history-specific</get-firewall-authentication-history-specific>

 <from-zone>from-zone</from-zone>
 <to-zone>to-zone</to-zone>
 </get-firewall-authentication-history>
</rpc>

```

**Description** Show firewall authentication history

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<get-firewall-authentication-history-specific>—Locate authentication history by id

<get-firewall-authentication-history-specific>—Locate authentication history by ip address

<from-zone>—Show authentication history matching the given source zone, null for web-auth

<to-zone>—Show authentication history matching the given destination zone, null for web-auth

## <get-firewall-authentication-users>

### Usage

```

<rpc>
 <get-firewall-authentication-users>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <filter>filter</filter>

 <get-firewall-authentication-users-specific>get-firewall-authentication-users-specific</get-firewall-authentication-users-specific>

 <get-firewall-authentication-users-specific>get-firewall-authentication-users-specific</get-firewall-authentication-users-specific>

 <from-zone>from-zone</from-zone>
 <to-zone>to-zone</to-zone>
 </get-firewall-authentication-users>
</rpc>

```

**Description** Show current firewall authentication users

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<get-firewall-authentication-users-specific>—Locate authentication entry by id

<get-firewall-authentication-users-specific>—Locate authentication entry by ip address

<from-zone>—Show authentication entry matching the given source zone, null for web-auth

<to-zone>—Show authentication entry matching the given destination zone, null for web-auth

## <get-firewall-dynamic-policies>

### Usage

```
<rpc>
 <get-firewall-dynamic-policies>
 <from-zone>from-zone</from-zone>
 <to-zone>to-zone</to-zone>
 <detail/>
 <scope-id>scope-id</scope-id>
 </get-firewall-dynamic-policies>
</rpc>
```

**Description** Show security firewall dynamic policies

**Contents** <from-zone>—Show the policy information matching the given source zone

<to-zone>—Show the policy information matching the given destination zone

<detail>—Show the detailed dynamic policy information

<scope-id>—Show the policy information matching the given scope policy id [4...MAX\_POLICIES]

## <get-firewall-policies>

### Usage

```
<rpc>
 <get-firewall-policies>
 <from-zone>from-zone</from-zone>
 <to-zone>to-zone</to-zone>
 <policy-name>policy-name</policy-name>
 <detail/>
 <zone-context/>
 <start>start</start>
 <count>count</count>
```

```
<application-firewall/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</get-firewall-policies>
</rpc>
```

**Description** Show security firewall policies

**Contents**

<from-zone>—Show the policy information matching the given source zone

- all - All logical systems
- logical-system-name - Logical system name

<to-zone>—Show the policy information matching the given destination zone

- all - All logical systems
- logical-system-name - Logical system name

<get-security-policies-hit-count>—Show the hit count of policies

- all - All logical systems
- logical-system-name - Logical system name

<get-global-firewall-policies>—Show the policy information of global policies

- all - All logical systems
- logical-system-name - Logical system name

<policy-name>—Show the policy information matching the given policy name

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Show the detailed information

- all - All logical systems
- logical-system-name - Logical system name

<zone-context>—Show the count of policies in each context (from-zone and to-zone)

- all - All logical systems
- logical-system-name - Logical system name

<start>—Show the policies from a given position

- all - All logical systems
- logical-system-name - Logical system name

<count>—Number of policies to show

- all - All logical systems
- logical-system-name - Logical system name

<application-firewall>—Show the information of application-firewall

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <get-flow-cp-session>

### Usage

```
<rpc>
 <get-flow-cp-session>
 <source-prefix>source-prefix</source-prefix>
 <destination-prefix>destination-prefix</destination-prefix>
 <source-port>source-port</source-port>
 <destination-port>destination-port</destination-port>
 <protocol>protocol</protocol>
 <family>family</family>
 <summary/>
 <terse/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-flow-cp-session>
</rpc>
```

**Description** Show CP sessions

**Contents** <source-prefix>—Source IP prefix or address

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol

- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<destination-prefix>—Destination IP prefix or address

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<source-port>—Source port

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation

- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<destination-port>—Destination port

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First

- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<protocol>—IP protocol number

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<family>—Protocol family

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<summary>—Show output summary

- all - All logical systems
- logical-system-name - Logical system name

<terse>—Show terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <get-flow-gate-information>

### Usage

```
<rpc>
 <get-flow-gate-information>
 <source-prefix>source-prefix</source-prefix>
 <destination-prefix>destination-prefix</destination-prefix>
 <source-port>source-port</source-port>
 <destination-port>destination-port</destination-port>
 <protocol>protocol</protocol>
 <family>family</family>
 <summary/>
 <brief/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-flow-gate-information>
</rpc>
```

**Description** Show gate information

**Contents** <source-prefix>—Source IP prefix or address

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol

- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload

- telnet - Telnet Terminal Emulation Protocol
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<family>—Protocol family

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATPT
- all - All logical systems
- logical-system-name - Logical system name

<interface>—Name of incoming or outgoing interface

- all - All logical systems
- logical-system-name - Logical system name

<application-firewall-rule-set>—Show application-firewall session by rule-set

- all - All logical systems
- logical-system-name - Logical system name

<application-traffic-control-rule-set>—Show application-traffic-control session by rule-set

- all - All logical systems
- logical-system-name - Logical system name

<dynamic-application>—Dynamic application name

- all - All logical systems
- logical-system-name - Logical system name

<dynamic-application-group>—Dynamic application group name

- all - All logical systems
- logical-system-name - Logical system name

<start-identifier>—Show sessions from this start identifier

- all - All logical systems
- logical-system-name - Logical system name

<count>—Number of entries to show

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<get-flow-session-by-identifier>—Show session with specified session identifier

---

## <get-flow-statistics-all>

---

### Usage

```
<rpc>
 <get-flow-statistics-all>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-flow-statistics-all>
</rpc>
```

**Description** Show flow statistics

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <get-flow-status-all>

---

### Usage

```
<rpc>
 <get-flow-status-all/>
</rpc>
```

**Description** Show flow status

## <get-global-firewall-policies>

---

### Usage

```
<rpc>
 <get-global-firewall-policies>
 <policy-name>policy-name</policy-name>
 <detail/>
 <zone-context/>
 <start>start</start>
 <count>count</count>
 <application-firewall/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-global-firewall-policies>
</rpc>
```

**Description** Show the policy information of global policies

**Contents** <policy-name>—Show the policy information matching the given policy name

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Show the detailed information

- all - All logical systems
- logical-system-name - Logical system name

<zone-context>—Show the count of policies in each context (from-zone and to-zone)

- all - All logical systems
- logical-system-name - Logical system name

<start>—Show the policies from a given position

- all - All logical systems
- logical-system-name - Logical system name

<count>—Number of policies to show

- all - All logical systems
- logical-system-name - Logical system name

<application-firewall>—Show the information of application-firewall

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <get-gvpn-ike-security-associations-information>

---

### Usage

```
<rpc>
 <get-gvpn-ike-security-associations-information>
 <brief/>
 <detail/>
 <peer-address>peer-address</peer-address>
 <index>index</index>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 </get-gvpn-ike-security-associations-information>
</rpc>
```

**Description** Show IKE security association information

**Contents** <brief>—Show brief output (default)

<detail>—Show detailed output

<peer-address>—IP address of the peer

<index>—Index of security association

<fpc>—FPC slot number

<pic>—PIC slot number

<kmd-instance>—Name of KMD instance or 'all'

---

## <get-gvpn-ipsec-statistics-information>

---

### Usage

```
<rpc>
 <get-gvpn-ipsec-statistics-information>
 <fpc>fpc</fpc>
 <pic>pic</pic>

 <show-gvpn-index-ipsec-statistics>show-gvpn-index-ipsec-statistics</show-gvpn-index-ipsec-statistics>

 </get-gvpn-ipsec-statistics-information>
</rpc>
```

**Description** Show IPSec statistics

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number  
<show-gvpn-index-ipsec-statistics>—Index of Security Association

---

## <get-gvpn-kek-security-associations-information>

### Usage

```
<rpc>
 <get-gvpn-kek-security-associations-information>
 <brief/>
 <detail/>
 <peer-address>peer-address</peer-address>
 <index>index</index>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 </get-gvpn-kek-security-associations-information>
</rpc>
```

**Description** Show KEK security association information

**Contents** <brief>—Show brief output (default)  
<detail>—Show detailed output  
<peer-address>—IP address of the peer  
<index>—Index of security association  
<fpc>—FPC slot number  
<pic>—PIC slot number  
<kmd-instance>—Name of KMD instance or 'all'

---

## <get-gvpn-security-associations-information>

### Usage

```
<rpc>
 <get-gvpn-security-associations-information>
 <brief/>
 <detail/>
 <show-gvpn-index-ipsec-statistics>show-gvpn-index-ipsec-statistics</show-gvpn-index-ipsec-statistics>
 <fpc>fpc</fpc>
 <pic>pic</pic>
```

```
<kmd-instance>kmd-instance</kmd-instance>
</get-gvpn-security-associations-information>
</rpc>
```

**Description** Show IPSec security association information

**Contents** <brief>—Display brief output  
<detail>—Display detailed output  
<show-gvpn-index-ipsec-security-association>—Index of security association  
<fpc>—FPC slot number  
<pic>—PIC slot number  
<kmd-instance>—Name of KMD instance or 'all'

---

### <get-gvrp-information>

---

**Usage**

```
<rpc>
<get-gvrp-information>
</get-gvrp-information>
</rpc>
```

**Description** Show Generic VLAN Registration Protocol information

**Contents** <get-gvrp-timers>—Show GVRP protocol timers  
<get-gvrp-statistics>—Show GVRP statistics

---

### <get-gvrp-statistics>

---

**Usage**

```
<rpc>
<get-gvrp-statistics/>
</rpc>
```

**Description** Show GVRP statistics

---

### <get-gvrp-timers>

---

**Usage**

```
<rpc>
<get-gvrp-timers/>
</rpc>
```

**Description** Show GVRP protocol timers

## <get-ids-statistics>

---

### Usage

```
<rpc>
 <get-ids-statistics>
 <filter>filter</filter> <!-- mandatory -->
 <zone>zone</zone>
 <interface>interface</interface>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-ids-statistics>
</rpc>
```

**Description** Show screen attack statistics information

### Contents

- <zone>—IDS statistics zone
- all - All logical systems
  - logical-system-name - Logical system name
- <interface>—IDS statistics interface
- all - All logical systems
  - logical-system-name - Logical system name
- <logical-system>—Logical-system name
- all - All logical systems
  - logical-system-name - Logical system name
- <root-logical-system>—Root logical-system (default)

## <get-ike-active-peers-information>

---

### Usage

```
<rpc>
 <get-ike-active-peers-information>
 <brief/>
 <detail/>
 <peer-address>peer-address</peer-address>
 <port>port</port>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 </get-ike-active-peers-information>
```

```
</rpc>
```

**Description** Show IKE active peers

**Contents**

- <brief>—Display brief output
- <detail>—Display detailed output
- <peer-address>—IP of peer
- <port>—Port number of peer
- <fpc>—FPC slot number
- <pic>—PIC slot number
- <kmd-instance>—Name of KMD instance or 'all'

## <get-ike-security-associations-information>

### Usage

```
<rpc>
 <get-ike-security-associations-information>
 <brief/>
 <detail/>
 <peer-address>peer-address</peer-address>
 <index>index</index>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 <family>family</family>
 </get-ike-security-associations-information>
</rpc>
```

**Description** Show IKE security association information

**Contents**

- <brief>—Show brief output (default)
  - inet - Show IPv4
  - inet6 - Show IPv6
- <detail>—Show detailed output
  - inet - Show IPv4
  - inet6 - Show IPv6
- <peer-address>—IP address of the peer
  - inet - Show IPv4
  - inet6 - Show IPv6

<index>—Index of security association

- inet - Show IPv4
- inet6 - Show IPv6

<fpc>—FPC slot number

- inet - Show IPv4
- inet6 - Show IPv6

<pic>—PIC slot number

- inet - Show IPv4
- inet6 - Show IPv6

<kmd-instance>—Name of KMD instance or 'all'

- inet - Show IPv4
- inet6 - Show IPv6

<family>—Show IKE security association by family

- inet - Show IPv4
- inet6 - Show IPv6

---

## <get-interface-flow-statistics>

---

### Usage

```
<rpc>
 <get-interface-flow-statistics>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </get-interface-flow-statistics>
</rpc>
```

**Description** Show security flow counters and errors

**Contents** <interface-name>—Name of physical or logical interface

---

## <get-interface-nat-ports-information>

---

### Usage

```
<rpc>
 <get-interface-nat-ports-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-interface-nat-ports-information>
```

</rpc>

**Description** Show interface nat ports information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

### <get-ip-monitoring-status>

---

**Usage**

```
<rpc>
 <get-ip-monitoring-status>
 <policy>policy</policy>
 </get-ip-monitoring-status>
</rpc>
```

**Description** Ip monitoring status

**Contents** <policy>—Policy name

---

### <get-ipsec-next-hop-tunnel-information>

---

**Usage**

```
<rpc>
 <get-ipsec-next-hop-tunnel-information>
 <interface-name>interface-name</interface-name>
 </get-ipsec-next-hop-tunnel-information>
</rpc>
```

**Description** Show manual and auto next-hop-tunnel entries

**Contents** <interface-name>—Name of secure tunnel logical interface

---

### <get-ipsec-statistics-information>

---

**Usage**

```
<rpc>
 <get-ipsec-statistics-information>
 <fpc>fpc</fpc>
 <pic>pic</pic>

 <show-index-ipsec-statistics>show-index-ipsec-statistics</show-index-ipsec-statistics>
```

```
</get-ipsec-statistics-information>
</rpc>
```

**Description** Show IPSec statistics

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number  
<show-index-ipsec-statistics>—Index of Security Association

---

## <get-isdn-call-history>

### Usage

```
<rpc>
<get-isdn-call-history/>
</rpc>
```

**Description** History of calls

---

## <get-isdn-calls>

### Usage

```
<rpc>
<get-isdn-calls/>
</rpc>
```

**Description** Information about calls

---

## <get-isdn-q921-statistics>

### Usage

```
<rpc>
<get-isdn-q921-statistics>
 <interface>interface</interface> <!-- mandatory -->
</get-isdn-q921-statistics>
</rpc>
```

**Description** Show Q.921 layer statistics

**Contents** <interface>—Interface name

## <get-isdn-q931-statistics>

---

### Usage

```

<rpc>
 <get-isdn-q931-statistics>
 <interface>interface</interface> <!-- mandatory -->
 </get-isdn-q931-statistics>
</rpc>

```

**Description** Show Q.931 layer statistics

**Contents** <interface>—Interface name

## <get-isdn-status>

---

### Usage

```

<rpc>
 <get-isdn-status>
 <brief/>
 <detail/>
 <interface>interface</interface>
 </get-isdn-status>
</rpc>

```

**Description** Show isdn information

**Contents** <brief>—Display brief output

<detail>—Display detailed output

<interface>—Interface name

## <get-llc2-redundancy>

---

### Usage

```

<rpc>
 <get-llc2-redundancy>
 <brief/>
 <detail/>
 </get-llc2-redundancy>
</rpc>

```

**Description** Show LLC2 redundancy related information

**Contents** <brief>—Display brief output (default)

<detail>—Display detailed output

<get-llc2-redundancy-mac-translation-list>—Show LLC2 redundancy mac translation

<get-llc2-redundancy-track-information>—Show LLC2 redundancy tracking information

<interface>—Show LLC2 redundancy related information

---

## <get-llc2-redundancy-interface-statistics>

---

### Usage

```
<rpc>
<get-llc2-redundancy-interface-statistics/>
</rpc>
```

**Description** Show LLC2 redundancy interface statistics

---

## <get-llc2-redundancy-mac-translation-list>

---

### Usage

```
<rpc>
<get-llc2-redundancy-mac-translation-list/>
</rpc>
```

**Description** Show LLC2 redundancy mac translation

---

## <get-llc2-redundancy-track-information>

---

### Usage

```
<rpc>
<get-llc2-redundancy-track-information>
<interfaces/>
<dsw-remote-peer/>
<dsw-remote-destination/>
</get-llc2-redundancy-track-information>
</rpc>
```

**Description** Show LLC2 redundancy tracking information

**Contents** <interfaces>—Show all LLC2 track interfaces

<dsw-remote-peer>—Show all LLC2 track remote peers

<dsw-remote-destination>—Show all LLC2 track remote destinations

---

## <get-lsys-license-status>

---

### Usage

```
<rpc>
```

```
<get-lsys-license-status>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</get-lsys-license-status>
</rpc>
```

**Description** Show logical system status

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <get-modem-wireless-interface>

### Usage

```
<rpc>
<get-modem-wireless-interface>
<interface-name>interface-name</interface-name> <!-- mandatory -->
<firmware/>
<network/>
<rsi/>
<profiles/>
</get-modem-wireless-interface>
</rpc>
```

**Description** Show wireless interface information

**Contents** <interface-name>—Name of physical interface

<firmware>—Show wireless interface firmware details

<network>—Show wireless Network statistics

<rsi>—Show Received Signal Strength

<profiles>—Show profile details

---

## <get-performance-session-information>

### Usage

```
<rpc>
<get-performance-session-information>
<fpc>fpc</fpc>
<pic>pic</pic>
</get-performance-session-information>
```

</rpc>

**Description** Show security performance session information

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number

---

### <get-performance-spu-information>

---

**Usage**

```
<rpc>
 <get-performance-spu-information>
 <fpc>fpc</fpc>
 <pic>pic</pic>
 </get-performance-spu-information>
</rpc>
```

**Description** Show security performance SPU information

**Contents** <fpc>—FPC slot number  
<pic>—PIC slot number

---

### <get-persist-nat-all>

---

**Usage**

```
<rpc>
 <get-persist-nat-all>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <family>family</family>
 </get-persist-nat-all>
</rpc>
```

**Description** Show all persistent NAT information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name
- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATV6V4

<root-logical-system>—Root logical-system (default)

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATV6V4

<family>—Protocol family

- inet - Show IPv4
- inet6 - Show IPv6/IPv6-NATV6V4

---

## <get-persist-nat-interface-information>

### Usage

```
<rpc>
 <get-persist-nat-interface-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-persist-nat-interface-information>
</rpc>
```

**Description** Show persistent NAT information of this interface

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <get-persist-nat-sum>

### Usage

```
<rpc>
 <get-persist-nat-sum>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-persist-nat-sum>
</rpc>
```

**Description** Show persistent NAT summary information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

### <get-poe-controller-information>

---

**Usage**

```
<rpc>
 <get-poe-controller-information/>
</rpc>
```

**Description** Show Power over Ethernet system information

---

### <get-poe-fpc-information>

---

**Usage**

```
<rpc>
 <get-poe-fpc-information>
 <fpc-slot>fpc-slot</fpc-slot>
 </get-poe-fpc-information>
</rpc>
```

**Description** Show power over ethernet fpc information

**Contents** <fpc-slot>—FPC slot number

---

### <get-poe-interface-information>

---

**Usage**

```
<rpc>
 <get-poe-interface-information>
 <ifname>ifname</ifname>
 </get-poe-interface-information>
</rpc>
```

**Description** Show Power over Ethernet interfaces

**Contents** <ifname>—Name of interface

---

### <get-poe-notifications>

---

**Usage**

```
<rpc>
 <get-poe-notifications/>
</rpc>
```

**Description** Show Power over Ethernet notification information

## <get-pre-shared-key>

---

**Usage**

```

<rpc>
 <get-pre-shared-key>
 <user-id>user-id</user-id>
 <master-key>master-key</master-key> <!-- mandatory -->
 </get-pre-shared-key>
</rpc>

```

**Description** Show IKE pre-shared key information for a particular group-ike-id user

**Contents** <user-id>—IKE user-id value

<master-key>—Master pre-shared key

## <get-resmgr-group-active>

---

**Usage**

```

<rpc>
 <get-resmgr-group-active>
 <group-number>group-number</group-number>
 </get-resmgr-group-active>
</rpc>

```

**Description** Show active resource manager group service information

**Contents** <group-number>—Show active resource manager group

## <get-resmgr-resource-active>

---

**Usage**

```

<rpc>
 <get-resmgr-resource-active>
 <resource-number>resource-number</resource-number>
 </get-resmgr-resource-active>
</rpc>

```

**Description** Show active resource manager resource service information

**Contents** <resource-number>—Show active resource manager resource

## <get-resmgr-settings>

---

**Usage**

```

<rpc>

```

```
<get-resmgr-settings/>
</rpc>
```

**Description** Show resource manager settings information

---

### <get-resource-manager-summary>

---

**Usage**

```
<rpc>
 <get-resource-manager-summary/>
</rpc>
```

**Description** Show resource manager summary information

---

### <get-retag-statistics>

---

**Usage**

```
<rpc>
 <get-retag-statistics>
 <filter>filter</filter> <!-- mandatory -->
 <interface>interface</interface>
 <vlan-id>vlan-id</vlan-id>
 </get-retag-statistics>
</rpc>
```

**Description** Show vlan rewrite statistics information

**Contents** <interface>—Rewrite statistics interface

<vlan-id>—Rewrite statistics on vlan-id

---

### <get-ring-tatistics>

---

**Usage**

```
<rpc>
 <get-ring-tatistics>
 <brief/>
 <detail/>
 <group-name>group-name</group-name>
 </get-ring-tatistics>
</rpc>
```

**Description** Show statistics for ethernet ring

**Contents** <get-erp-statistics-interface-information>—Show ERP interface statistics

<brief>—Display brief output (default)

<detail>—Display detailed output

<group-name>—Name of protection group

## <get-schedulers>

### Usage

```
<rpc>
 <get-schedulers>
 <scheduler-name>scheduler-name</scheduler-name>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-schedulers>
</rpc>
```

**Description** Show the information on one or more schedulers

**Contents** <scheduler-name>—Name of the scheduler

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <get-security-associations-information>

### Usage

```
<rpc>
 <get-security-associations-information>
 <brief/>
 <detail/>
 <family>family</family>

 <show-index-ipsec-security-association>show-index-ipsec-security-association</show-index-ipsec-security-association>

 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 </get-security-associations-information>
</rpc>
```

**Description** Show IPSec security association information

**Contents**

- <brief>—Display brief output
  - inet - Show IPv4
  - inet6 - Show IPv6
- <detail>—Display detailed output
  - inet - Show IPv4
  - inet6 - Show IPv6
- <family>—Show IPSec security association information by family
  - inet - Show IPv4
  - inet6 - Show IPv6
- <show-index-ipsec-security-association>—Index of security association
- <fpc>—FPC slot number
- <pic>—PIC slot number
- <kmd-instance>—Name of KMD instance or 'all'

---

## <get-security-gprs-gtp-tunnels>

### Usage

```
<rpc>
 <get-security-gprs-gtp-tunnels>
 <summary/>
 <brief/>
</get-security-gprs-gtp-tunnels>
</rpc>
```

**Description** Show security gtp tunnels

**Contents**

- <summary>—Show the summary of GTP tunnels
- <brief>—Show a brief of each GTP tunnel (default)

---

## <get-security-group-vpn-server-ike-security-associations-information>

### Usage

```
<rpc>
 <get-security-group-vpn-server-ike-security-associations-information>
 <brief/>
 <detail/>
 <group_index_choice>group_index_choice</group_index_choice>
```

```

<group>group</group>
<group-id>group-id</group-id>
<index>index</index>
<fpc>fpc</fpc>
<pic>pic</pic>
<kmd-instance>kmd-instance</kmd-instance>
</get-security-group-vpn-server-ike-security-associations-information>
</rpc>

```

**Description** Show IKE security association information

**Contents**

- <brief>—Show brief output (default)
- <detail>—Show detailed output
- <group>—Show specified group
- <group-id>—Show specified group id
- <index>—Index of security association
- <fpc>—FPC slot number
- <pic>—PIC slot number
- <kmd-instance>—Name of KMD instance or 'all'

## <get-security-group-vpn-server-kek-sa>

### Usage

```

<rpc>
<get-security-group-vpn-server-kek-sa>
<brief/>
<detail/>
<group_index_choice>group_index_choice</group_index_choice>
<group>group</group>
<group-id>group-id</group-id>
<index>index</index>
<fpc>fpc</fpc>
<pic>pic</pic>
<kmd-instance>kmd-instance</kmd-instance>
</get-security-group-vpn-server-kek-sa>
</rpc>

```

**Description** Show KEK security association information

**Contents**

- <brief>—Show brief output (default)
- <detail>—Show detailed output
- <group>—Show specified group

<group-id>—Show specified group id

<index>—Index of security association

<fpc>—FPC slot number

<pic>—PIC slot number

<kmd-instance>—Name of KMD instance or 'all'

## <get-security-group-vpn-server-registered-members>

### Usage

```
<rpc>
 <get-security-group-vpn-server-registered-members>
 <group_choice>group_choice</group_choice>

 <show-security-group-vpn-server-reg-group-name>show-security-group-vpn-server-reg-group-name</show-security-group-vpn-server-reg-group-name>

 <show-security-group-vpn-server-reg-group-id>show-security-group-vpn-server-reg-group-id</show-security-group-vpn-server-reg-group-id>

 <fpc>fpc</fpc>
 <pic>pic</pic>
 <kmd-instance>kmd-instance</kmd-instance>
 </get-security-group-vpn-server-registered-members>
</rpc>
```

**Description** Show group VPN registered members for group VPN server

**Contents** <show-security-group-vpn-server-reg-group-name>—Show specified group

<show-security-group-vpn-server-reg-group-id>—Show specified group id

<fpc>—FPC slot number

<pic>—PIC slot number

<kmd-instance>—Name of KMD instance or 'all'

## <get-security-group-vpn-server-security-information>

### Usage

```
<rpc>
 <get-security-group-vpn-server-security-information>
 <brief/>
 <detail/>
 <group_choice>group_choice</group_choice>
 <group>group</group>
 <group-id>group-id</group-id>
 <fpc>fpc</fpc>
 <pic>pic</pic>
```

```

 <kmd-instance>kmd-instance</kmd-instance>
 </get-security-group-vpn-server-security-information>
</rpc>

```

**Description** Show IPSec security association information for group VPN server

**Contents** <brief>—Show brief output (default)

<detail>—Show detailed output

<group>—Show specified group

<group-id>—Show specified group id

<fpc>—FPC slot number

<pic>—PIC slot number

<kmd-instance>—Name of KMD instance or 'all'

## <get-security-policies-hit-count>

### Usage

```

<rpc>
 <get-security-policies-hit-count>
 <from-zone>from-zone</from-zone>
 <to-zone>to-zone</to-zone>
 <ascending/>
 <descending/>
 <less-than>less-than</less-than>
 <greater-than>greater-than</greater-than>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-security-policies-hit-count>
</rpc>

```

**Description** Show the hit count of policies

**Contents** <from-zone>—Show the policy hit-count matching the given source zone

- all - All logical systems
- logical-system-name - Logical system name

<to-zone>—Show the policy hit-count matching the given destination zone

- all - All logical systems
- logical-system-name - Logical system name

<ascending>—Ascending order

- all - All logical systems
- logical-system-name - Logical system name

<descending>—Descending order

- all - All logical systems
- logical-system-name - Logical system name

<less-than>—Maximum hit-count

- all - All logical systems
- logical-system-name - Logical system name

<greater-than>—Minimum hit-count

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <get-security-profile-address-book-information>

---

### Usage

```
<rpc>
 <get-security-profile-address-book-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-address-book-information>
</rpc>
```

**Description** Show address-book resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-all-resource-information>

### Usage

```
<rpc>
 <get-security-profile-all-resource-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-all-resource-information>
</rpc>
```

**Description** Show all resources information per logical system

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-appfw-rule-information>

---

### Usage

```
<rpc>
 <get-security-profile-appfw-rule-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 <terse/>
 <detail/>
 </get-security-profile-appfw-rule-information>
</rpc>
```

**Description** Show appfw rule resource information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

<terse>—Display terse output (default)

<detail>—Display detailed output

## <get-security-profile-appfw-rule-set-information>

---

### Usage

```
<rpc>
 <get-security-profile-appfw-rule-set-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 <terse/>
 <detail/>
 </get-security-profile-appfw-rule-set-information>
</rpc>
```

**Description** Show appfw rule-set resource information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

<terse>—Display terse output (default)

<detail>—Display detailed output

---

## <get-security-profile-auth-entry-information>

---

### Usage

```
<rpc>
 <get-security-profile-auth-entry-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-auth-entry-information>
</rpc>
```

**Description** Show authentication resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-cpu-information>

---

### Usage

```
<rpc>
 <get-security-profile-cpu-information>
 <terse/>
 <detail/>
```

```
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
<summary/>
</get-security-profile-cpu-information>
</rpc>
```

**Description** Show CPU utilization information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-dslite-software-initiator-information>

---

### Usage

```
<rpc>
<get-security-profile-dslite-software-initiator-information>
<terse/>
<detail/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
<summary/>
</get-security-profile-dslite-software-initiator-information>
</rpc>
```

**Description** Show security dslite software initiator resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-flow-gate-information>

---

### Usage

```
<rpc>
 <get-security-profile-flow-gate-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-flow-gate-information>
</rpc>
```

**Description** Show flow gate resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-flow-session-information>

---

### Usage

```
<rpc>
 <get-security-profile-flow-session-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-flow-session-information>
</rpc>
```

**Description** Show flow session resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-nat-cone-binding-information>

---

### Usage

```
<rpc>
 <get-security-profile-nat-cone-binding-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-nat-cone-binding-information>
</rpc>
```

**Description** Show nat cone binding resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

### <get-security-profile-nat-destination-pool-information>

---

#### Usage

```
<rpc>
 <get-security-profile-nat-destination-pool-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-nat-destination-pool-information>
</rpc>
```

**Description** Show nat destination pool resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-nat-destination-rule-information>

---

### Usage

```
<rpc>
 <get-security-profile-nat-destination-rule-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-nat-destination-rule-information>
</rpc>
```

**Description** Show nat destination rule resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-nat-nopat-address-information>

---

### Usage

```
<rpc>
 <get-security-profile-nat-nopat-address-information>
 <terse/>
```

```
<detail/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
<summary/>
</get-security-profile-nat-nopat-address-information>
</rpc>
```

**Description** Show nat source nopat address resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-nat-pat-address-information>

---

### Usage

```
<rpc>
<get-security-profile-nat-pat-address-information>
<terse/>
<detail/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
<summary/>
</get-security-profile-nat-pat-address-information>
</rpc>
```

**Description** Show nat source pat address resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-nat-pat-portnum-information>

---

### Usage

```
<rpc>
 <get-security-profile-nat-pat-portnum-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-nat-pat-portnum-information>
</rpc>
```

**Description** Show nat source pat port number resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-nat-port-ol-ipnumber-information>

### Usage

```

<rpc>
 <get-security-profile-nat-port-ol-ipnumber-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-nat-port-ol-ipnumber-information>
</rpc>

```

**Description** Show nat port overloading resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-nat-rule-referenced-prefix-information>

### Usage

```

<rpc>
 <get-security-profile-nat-rule-referenced-prefix-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-nat-rule-referenced-prefix-information>
</rpc>

```

**Description** Show nat rule referenced IP-prefix information

**Contents**

- <terse>—Display terse output (default)
  - all - All logical systems
  - logical-system-name - Logical system name
- <detail>—Display detailed output
  - all - All logical systems
  - logical-system-name - Logical system name
- <logical-system>—Logical-system name
  - all - All logical systems
  - logical-system-name - Logical system name
- <root-logical-system>—Root logical-system
- <summary>—Display summary output

---

## <get-security-profile-nat-source-pool-information>

---

### Usage

```
<rpc>
 <get-security-profile-nat-source-pool-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-nat-source-pool-information>
</rpc>
```

**Description** Show nat source pool resource information

**Contents**

- <terse>—Display terse output (default)
  - all - All logical systems
  - logical-system-name - Logical system name
- <detail>—Display detailed output
  - all - All logical systems
  - logical-system-name - Logical system name
- <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-nat-source-rule-information>

### Usage

```
<rpc>
 <get-security-profile-nat-source-rule-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-nat-source-rule-information>
</rpc>
```

**Description** Show nat source rule resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-nat-static-rule-information>

### Usage

```
<rpc>
 <get-security-profile-nat-static-rule-information>
 <terse/>
```

```
<detail/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
<summary/>
</get-security-profile-nat-static-rule-information>
</rpc>
```

**Description** Show nat static rule resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-policy-information>

---

### Usage

```
<rpc>
<get-security-profile-policy-information>
<terse/>
<detail/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
<summary/>
</get-security-profile-policy-information>
</rpc>
```

**Description** Show policy resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

---

## <get-security-profile-policy-with-count-information>

---

### Usage

```
<rpc>
 <get-security-profile-policy-with-count-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
 </get-security-profile-policy-with-count-information>
</rpc>
```

**Description** Show resource information of policy with count

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-scheduler-information>

---

### Usage

```
<rpc>
 <get-security-profile-scheduler-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-scheduler-information>
</rpc>
```

**Description** Show scheduler resource information

**Contents** <terse>—Display terse output (default)

- all - All logical systems
- logical-system-name - Logical system name

<detail>—Display detailed output

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system

<summary>—Display summary output

## <get-security-profile-zone-information>

---

### Usage

```
<rpc>
 <get-security-profile-zone-information>
 <terse/>
 <detail/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <summary/>
</get-security-profile-zone-information>
</rpc>
```

**Description** Show zone resource information

**Contents**

- <terse>—Display terse output (default)
  - all - All logical systems
  - logical-system-name - Logical system name
- <detail>—Display detailed output
  - all - All logical systems
  - logical-system-name - Logical system name
- <logical-system>—Logical-system name
  - all - All logical systems
  - logical-system-name - Logical system name
- <root-logical-system>—Root logical-system
- <summary>—Display summary output

---

### <get-security-report-threats-recent-activity>

---

**Usage**

```
<rpc>
 <get-security-report-threats-recent-activity/>
</rpc>
```

**Description** Show the most recent threat activities

---

### <get-security-report-threats-statistics>

---

**Usage**

```
<rpc>
 <get-security-report-threats-statistics/>
</rpc>
```

**Description** Show the threat statistics

---

### <get-security-report-threats-summary>

---

**Usage**

```
<rpc>
 <get-security-report-threats-summary/>
</rpc>
```

**Description** Show threat indicator summary

---

### <get-security-report-traffic-statistics>

---

**Usage**

```
<rpc>
 <get-security-report-traffic-statistics/>
</rpc>
```

**Description** Show the traffic statistics

---

### <get-security-screen-ids-status>

---

**Usage**

```
<rpc>
 <get-security-screen-ids-status>
 <screen-name>screen-name</screen-name> <!-- mandatory -->
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-security-screen-ids-status>
</rpc>
```

**Description** Show status of screen object

**Contents** <screen-name>—Screen name

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

### <get-smtp-configuration>

---

**Usage**

```
<rpc>
 <get-smtp-configuration/>
</rpc>
```

**Description** Show SMTP server configuration information

## <get-smtp-statistics>

### Usage

```
<rpc>
 <get-smtp-statistics/>
</rpc>
```

**Description** Show SMTP client service statistics

## <get-source-nat-rule-sets-information>

### Usage

```
<rpc>
 <get-source-nat-rule-sets-information>
 <rule-choice>rule-choice</rule-choice> <!-- mandatory -->
 <rule-name>rule-name</rule-name> <!-- mandatory -->
 <all/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </get-source-nat-rule-sets-information>
</rpc>
```

**Description** Show source NAT rule-set information

**Contents** <rule-name>—The name of the source NAT rule-set

- all - All logical systems
- logical-system-name - Logical system name

<all>—Display all source NAT rule-sets information

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <get-spu-monitoring-information>

### Usage

```
<rpc>
 <get-spu-monitoring-information>
```

```
<fpc-slot>fpc-slot</fpc-slot> <!-- mandatory -->
</get-spu-monitoring-information>
</rpc>
```

**Description** Show the FPC slot security monitoring information

**Contents** <fpc-slot>—FPC slot number

---

## <get-ssl-proxy-statistics>

### Usage

```
<rpc>
<get-ssl-proxy-statistics/>
</rpc>
```

**Description** Show ssl proxy statistics

---

## <get-static-nat-rule-information>

### Usage

```
<rpc>
<get-static-nat-rule-information>
<rule-choice>rule-choice</rule-choice> <!-- mandatory -->
<rule-name>rule-name</rule-name> <!-- mandatory -->
<all/>
<lsys>lsys</lsys>
<logical-system>logical-system</logical-system>
<root-logical-system/>
</get-static-nat-rule-information>
</rpc>
```

**Description** Show static NAT rule information

**Contents** <rule-name>—The name of the rule

- all - All logical systems
- logical-system-name - Logical system name

<all>—Display all static NAT rule information

- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

### <get-system-autorecovery>

---

**Usage**

```
<rpc>
 <get-system-autorecovery>
 </get-system-autorecovery>
</rpc>
```

**Description** Show autorecovery information

**Contents** <get-system-autorecovery-state>—Show saved autorecovery information

### <get-system-autorecovery-state>

---

**Usage**

```
<rpc>
 <get-system-autorecovery-state/>
</rpc>
```

**Description** Show saved autorecovery information

### <get-telemetries-information>

---

**Usage**

```
<rpc>
 <get-telemetries-information>
 <ifname>ifname</ifname> <!-- mandatory -->
 <all/>
 <entries/>
 </get-telemetries-information>
</rpc>
```

**Description** Show telemetries for an interface

**Contents** <ifname>—Name of interface

<all>—Show all entries

<entries>—Number of entries

### <get-tgm-dynamic-cac-information>

---

**Usage**

```
<rpc>
```

```
<get-tgm-dynamic-cac-information/>
</rpc>
```

**Description** Show dynamic call admission control information

---

## <get-tgm-information>

---

### Usage

```
<rpc>
 <get-tgm-information>
 <slot>slot</slot> <!-- mandatory -->
 <media-gateway-controller/>
 <dsp-capacity/>
 </get-tgm-information>
</rpc>
```

**Description** Show Flexible PIC Concentrator information

**Contents** <slot>—FPC slot number

<media-gateway-controller>—Show TGM media gateway controller configuration

<dsp-capacity>—Show TGM DSP resources

---

## <get-tgm-telephony-interface-module-status>

---

### Usage

```
<rpc>
 <get-tgm-telephony-interface-module-status>
 <status/>
 </get-tgm-telephony-interface-module-status>
</rpc>
```

**Description** Show telephony interface module information

**Contents** <status>—Status of telephony interface modules

---

## <get-uac-auth-table>

---

### Usage

```
<rpc>
 <get-uac-auth-table>
 <detail/>
 <identifier>identifier</identifier>
 <extended/>
 <role>role</role>
 <ip>ip</ip>
 <user>user</user>
```

```
</get-uac-auth-table>
</rpc>
```

**Description** Show authentication table configured from infranet controller

**Contents** <detail>—Display detail output

<identifier>—Show specified authentication entry

<extended>—Show authentication entries with all roles

<role>—Show authentication entries matching the role

<ip>—Show authentication entries matching the ip

<user>—Show authentication entries matching the user

---

### <get-uac-policies>

---

**Usage**

```
<rpc>
 <get-uac-policies>
 <detail/>
 <identifier>identifier</identifier>
 </get-uac-policies>
</rpc>
```

**Description** Access policies from infranet controller

**Contents** <detail>—Display detail output

<identifier>—Show specified policy information

---

### <get-uac-role-entries>

---

**Usage**

```
<rpc>
 <get-uac-role-entries/>
</rpc>
```

**Description** Show list of available roles

---

### <get-uac-status>

---

**Usage**

```
<rpc>
 <get-uac-status/>
```

```
</rpc>
```

**Description** Show connection status with infranet controller

---

### <get-user-connection>

---

**Usage**

```
<rpc>
 <get-user-connection>
 <terse/>
 <detail/>
 </get-user-connection>
</rpc>
```

**Description** Show Dynamic VPN user connection information

**Contents** <terse>—Display terse output  
  
<detail>—Display detailed user connection information (default)

---

### <get-userfw-local-auth-table-all>

---

**Usage**

```
<rpc>
 <get-userfw-local-auth-table-all>
 <brief/>
 <extensive/>
 </get-userfw-local-auth-table-all>
</rpc>
```

**Description** Show the entire local user authentication table

**Contents** <brief>—Show brief output (default)  
  
<extensive>—Show extensive output

---

### <get-userfw-local-auth-table-ip>

---

**Usage**

```
<rpc>
 <get-userfw-local-auth-table-ip>
 <ip-address>ip-address</ip-address> <!-- mandatory -->
 </get-userfw-local-auth-table-ip>
</rpc>
```

**Description** Show local user authentication information for the specified ip-address

**Contents**    <ip-address>—IP address

### <get-userfw-local-auth-table-role>

---

**Usage**

```
<rpc>
 <get-userfw-local-auth-table-role>
 <role-name>role-name</role-name> <!-- mandatory -->
 </get-userfw-local-auth-table-role>
</rpc>
```

**Description**    Show local user authentication information for the specified role

**Contents**    <role-name>—Role name

### <get-userfw-local-auth-table-start>

---

**Usage**

```
<rpc>
 <get-userfw-local-auth-table-start>
 <start>start</start> <!-- mandatory -->
 <count>count</count> <!-- mandatory -->
 </get-userfw-local-auth-table-start>
</rpc>
```

**Description**    Show local user authentication table information from a given position

**Contents**    <start>—

                 <count>—Number of local user authentication table entries to show

### <get-userfw-local-auth-table-user>

---

**Usage**

```
<rpc>
 <get-userfw-local-auth-table-user>
 <user-name>user-name</user-name> <!-- mandatory -->
 </get-userfw-local-auth-table-user>
</rpc>
```

**Description**    Show local user authentication information for the specified user

**Contents**    <user-name>—User name

## <get-userfw-role-info>

---

**Usage**

```
<rpc>
 <get-userfw-role-info>
 <all/> <!-- mandatory -->
 </get-userfw-role-info>
</rpc>
```

**Description** Show user-identification role information

**Contents** <all>—Show all user-identification role information

## <get-wlan-access-points-list>

---

**Usage**

```
<rpc>
 <get-wlan-access-points-list>
 <wlan-access-point-name>wlan-access-point-name</wlan-access-point-name>

 <client-associations/>
 <neighbors/>
 <virtual-access-points/>
 <detail/>
 </get-wlan-access-points-list>
</rpc>
```

**Description** Show Wireless LAN access points information

**Contents** <wlan-access-point-name>—Name of the access point

<client-associations>—Show access point client associations

<neighbors>—Show access point neighbors

<virtual-access-points>—Show virtual access points

<detail>—Show detailed output

## <get-wx-status>

---

**Usage**

```
<rpc>
 <get-wx-status>
 </get-wx-status>
</rpc>
```

**Description** Show WAN acceleration status

## Contents

### <get-zones-information>

---

#### Usage

```
<rpc>
 <get-zones-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <filter>filter</filter>

 <get-zones-named-information>get-zones-named-information</get-zones-named-information>

 <type>type</type>
 <terse/>
 <detail/>
 </get-zones-information>
</rpc>
```

**Description** Show security zone information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name
- functional - Show information for functional zones
- security - Show information for security zones

<root-logical-system>—Root logical-system (default)

- functional - Show information for functional zones
- security - Show information for security zones

<get-zones-named-information>—Show information for a specified zone

- functional - Show information for functional zones
- security - Show information for security zones

<type>—Show information for zones of a specified type

- functional - Show information for functional zones
- security - Show information for security zones

<terse>—Display terse output

<detail>—Display detailed output (default)

## <match-firewall-policies>

### Usage

```

<rpc>
 <match-firewall-policies>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <from-zone>from-zone</from-zone> <!-- mandatory -->
 <to-zone>to-zone</to-zone> <!-- mandatory -->
 <source-identity>source-identity</source-identity>
 <source-ip>source-ip</source-ip> <!-- mandatory -->
 <destination-ip>destination-ip</destination-ip> <!-- mandatory -->
 <source-port>source-port</source-port> <!-- mandatory -->
 <destination-port>destination-port</destination-port> <!-- mandatory -->
 <protocol>protocol</protocol> <!-- mandatory -->
 <result-count>result-count</result-count>
 </match-firewall-policies>
</rpc>

```

**Description** Show security match policies

**Contents** <logical-system>—Logical-system name

- logical-system-name - Logical system name
- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<root-logical-system>—Root logical-system (default)

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<from-zone>—Match policy for the given source zone

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<to-zone>—Match policy for the given destination zone

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<match-global-policies>—Match global policy

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<source-identity>—Match policy for the given roles (optional)

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<source-ip>—Match policy for the given source IP

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<destination-ip>—Match policy for the given destination IP

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<source-port>—Match policy for the given source port)

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<destination-port>—Match policy for the given destination port)

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<protocol>—Match policy for the given protocol)

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<result-count>—Expected results count (optional)

## <match-global-policies>

---

### Usage

```
<rpc>
 <match-global-policies>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 <source-ip>source-ip</source-ip> <!-- mandatory -->
 <destination-ip>destination-ip</destination-ip> <!-- mandatory -->
 <source-port>source-port</source-port> <!-- mandatory -->
 <destination-port>destination-port</destination-port> <!-- mandatory -->
 <protocol>protocol</protocol> <!-- mandatory -->
 <result-count>result-count</result-count>
 </match-global-policies>
</rpc>
```

**Description** Match global policy

**Contents** <logical-system>—Logical-system name

- logical-system-name - Logical system name
- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol
- ipip - IP in IP
- tcp - Transmission Control Protocol
- egp - Exterior gateway protocol
- udp - User Datagram Protocol
- rsvp - Resource Reservation Protocol
- gre - Generic routing encapsulation
- esp - IPSec Encapsulating Security Payload
- ah - IP Security authentication header
- icmp6 - Internet Control Message Protocol Version 6
- ospf - Open Shortest Path First
- pim - Protocol Independent Multicast
- sctp - Stream Control Transmission Protocol
- protocol-number - Numeric protocol value (0 .. 255)

<root-logical-system>—Root logical-system (default)

- icmp - Internet Control Message Protocol
- igmp - Internet Group Management Protocol

- `ipip` - IP in IP
- `tcp` - Transmission Control Protocol
- `egp` - Exterior gateway protocol
- `udp` - User Datagram Protocol
- `rsvp` - Resource Reservation Protocol
- `gre` - Generic routing encapsulation
- `esp` - IPSec Encapsulating Security Payload
- `ah` - IP Security authentication header
- `icmp6` - Internet Control Message Protocol Version 6
- `ospf` - Open Shortest Path First
- `pim` - Protocol Independent Multicast
- `sctp` - Stream Control Transmission Protocol
- `protocol-number` - Numeric protocol value (0 .. 255)

`<source-ip>`—Match policy for the given source IP

- `icmp` - Internet Control Message Protocol
- `igmp` - Internet Group Management Protocol
- `ipip` - IP in IP
- `tcp` - Transmission Control Protocol
- `egp` - Exterior gateway protocol
- `udp` - User Datagram Protocol
- `rsvp` - Resource Reservation Protocol
- `gre` - Generic routing encapsulation
- `esp` - IPSec Encapsulating Security Payload
- `ah` - IP Security authentication header
- `icmp6` - Internet Control Message Protocol Version 6
- `ospf` - Open Shortest Path First
- `pim` - Protocol Independent Multicast
- `sctp` - Stream Control Transmission Protocol
- `protocol-number` - Numeric protocol value (0 .. 255)

`<destination-ip>`—Match policy for the given destination IP

- `icmp` - Internet Control Message Protocol
- `igmp` - Internet Group Management Protocol

- `ipip` - IP in IP
- `tcp` - Transmission Control Protocol
- `egp` - Exterior gateway protocol
- `udp` - User Datagram Protocol
- `rsvp` - Resource Reservation Protocol
- `gre` - Generic routing encapsulation
- `esp` - IPSec Encapsulating Security Payload
- `ah` - IP Security authentication header
- `icmp6` - Internet Control Message Protocol Version 6
- `ospf` - Open Shortest Path First
- `pim` - Protocol Independent Multicast
- `sctp` - Stream Control Transmission Protocol
- `protocol-number` - Numeric protocol value (0 .. 255)

`<source-port>`—Match policy for the given source port)

- `icmp` - Internet Control Message Protocol
- `igmp` - Internet Group Management Protocol
- `ipip` - IP in IP
- `tcp` - Transmission Control Protocol
- `egp` - Exterior gateway protocol
- `udp` - User Datagram Protocol
- `rsvp` - Resource Reservation Protocol
- `gre` - Generic routing encapsulation
- `esp` - IPSec Encapsulating Security Payload
- `ah` - IP Security authentication header
- `icmp6` - Internet Control Message Protocol Version 6
- `ospf` - Open Shortest Path First
- `pim` - Protocol Independent Multicast
- `sctp` - Stream Control Transmission Protocol
- `protocol-number` - Numeric protocol value (0 .. 255)

`<destination-port>`—Match policy for the given destination port)

- `icmp` - Internet Control Message Protocol
- `igmp` - Internet Group Management Protocol

- `ipip` - IP in IP
- `tcp` - Transmission Control Protocol
- `egp` - Exterior gateway protocol
- `udp` - User Datagram Protocol
- `rsvp` - Resource Reservation Protocol
- `gre` - Generic routing encapsulation
- `esp` - IPSec Encapsulating Security Payload
- `ah` - IP Security authentication header
- `icmp6` - Internet Control Message Protocol Version 6
- `ospf` - Open Shortest Path First
- `pim` - Protocol Independent Multicast
- `sctp` - Stream Control Transmission Protocol
- `protocol-number` - Numeric protocol value (0 .. 255)

`<protocol>`—Match policy for the given protocol)

- `icmp` - Internet Control Message Protocol
- `igmp` - Internet Group Management Protocol
- `ipip` - IP in IP
- `tcp` - Transmission Control Protocol
- `egp` - Exterior gateway protocol
- `udp` - User Datagram Protocol
- `rsvp` - Resource Reservation Protocol
- `gre` - Generic routing encapsulation
- `esp` - IPSec Encapsulating Security Payload
- `ah` - IP Security authentication header
- `icmp6` - Internet Control Message Protocol Version 6
- `ospf` - Open Shortest Path First
- `pim` - Protocol Independent Multicast
- `sctp` - Stream Control Transmission Protocol
- `protocol-number` - Numeric protocol value (0 .. 255)

`<result-count>`—Expected results count (optional)

## <request-anti-virus-request-update-express>

---

**Usage**

```
<rpc>
 <request-anti-virus-request-update-express>
 <pattern-update/>
 <pattern-reload/>
 <pattern-delete/>
 </request-anti-virus-request-update-express>
</rpc>
```

**Description** Request update of anti-virus pattern for juniper-express-engine

**Contents** <pattern-update>—Update juniper-express-engine pattern

<pattern-reload>—Reload juniper-express-engine pattern

<pattern-delete>—Delete juniper-express-engine pattern

## <request-anti-virus-request-update-kaspersky>

---

**Usage**

```
<rpc>
 <request-anti-virus-request-update-kaspersky>
 <pattern-update/>
 <pattern-reload/>
 <pattern-delete/>
 </request-anti-virus-request-update-kaspersky>
</rpc>
```

**Description** Request update of anti-virus pattern for kaspersky-lab-engine

**Contents** <pattern-update>—Update kaspersky-lab-engine pattern

<pattern-reload>—Reload kaspersky-lab-engine pattern

<pattern-delete>—Delete kaspersky-lab-engine pattern

## <request-anti-virus-update-sophos-patterns>

---

**Usage**

```
<rpc>
 <request-anti-virus-update-sophos-patterns>
 <pattern-update/>
 <pattern-reload/>
 <pattern-delete/>
 </request-anti-virus-update-sophos-patterns>
</rpc>
```

**Description** Request update of anti-virus pattern for sophos-engine

**Contents** <pattern-update>—Update sophos-engine pattern  
<pattern-reload>—Reload sophos-engine pattern  
<pattern-delete>—Delete sophos-engine pattern

---

### <request-chassis-cluster-failover>

---

**Usage**

```
<rpc>
 <request-chassis-cluster-failover>
 <redundancy-group-id>redundancy-group-id</redundancy-group-id> <!-- mandatory -->
 -->
 <redundancy-group>redundancy-group</redundancy-group> <!-- mandatory -->
 <node>node</node> <!-- mandatory -->
 </request-chassis-cluster-failover>
</rpc>
```

**Description** Trigger a manual failover for one redundancy-group or all redundancy-groups (1+)

**Contents** <redundancy-group>—Redundancy-group identifier  
<node>—Node identifier of the new primary  
<request-chassis-cluster-failover-reset>—Undo the previous failover command

---

### <request-chassis-cluster-failover-reset>

---

**Usage**

```
<rpc>
 <request-chassis-cluster-failover-reset>
 <redundancy-group-id>redundancy-group-id</redundancy-group-id> <!-- mandatory -->
 -->
 <redundancy-group>redundancy-group</redundancy-group> <!-- mandatory -->
 </request-chassis-cluster-failover-reset>
</rpc>
```

**Description** Undo the previous failover command

**Contents** <redundancy-group>—Redundancy-group identifier

---

### <request-chassis-cluster-in-service-upgrade>

---

**Usage**

```
<rpc>
 <request-chassis-cluster-in-service-upgrade>
```

```
<abort/>
</request-chassis-cluster-in-service-upgrade>
</rpc>
```

**Description** Initiate in-service-upgrade

**Contents** <abort>—Abort in-service-upgrade  
<failover>—Initiate failover for a redundancy-group

---

### <request-eedebug-capture-start>

---

**Usage**

```
<rpc>
<request-eedebug-capture-start/>
</rpc>
```

**Description** Start datapath debug packet capture

---

### <request-eedebug-capture-stop>

---

**Usage**

```
<rpc>
<request-eedebug-capture-stop/>
</rpc>
```

**Description** Stop datapath debug packet capture

---

### <request-gsm-change-pin>

---

**Usage**

```
<rpc>
<request-gsm-change-pin>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <old-pin>old-pin</old-pin> <!-- mandatory -->
 <new-pin>new-pin</new-pin> <!-- mandatory -->
</request-gsm-change-pin>
</rpc>
```

**Description** Unblock SIM

**Contents** <interface-name>—Name of physical interface  
<old-pin>—Current SIM unlock code (PIN)  
<new-pin>—New SIM unlock code (PIN) to be set

## <request-gsm-create-profile>

### Usage

```

<rpc>
 <request-gsm-create-profile>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <profile-id>profile-id</profile-id> <!-- mandatory -->
 <sip-user-id>sip-user-id</sip-user-id>
 <sip-password>sip-password</sip-password>
 <access-point-name>access-point-name</access-point-name> <!-- mandatory
-->
 <authentication-method>authentication-method</authentication-method>
 </request-gsm-create-profile>
</rpc>

```

**Description** Create GSM profile

### Contents

<interface-name>—Name of physical interface

- pap - Password Authentication Protocol
- chap - Challenge Handshake Authentication Protocol

<profile-id>—Profile Id

- pap - Password Authentication Protocol
- chap - Challenge Handshake Authentication Protocol

<sip-user-id>—SIP User ID

- pap - Password Authentication Protocol
- chap - Challenge Handshake Authentication Protocol

<sip-password>—SIP Password

- pap - Password Authentication Protocol
- chap - Challenge Handshake Authentication Protocol

<access-point-name>—Access Point Name (APN)

- pap - Password Authentication Protocol
- chap - Challenge Handshake Authentication Protocol

<authentication-method>—Authentication method

- pap - Password Authentication Protocol
- chap - Challenge Handshake Authentication Protocol

## <request-gsm-delete-profile>

---

**Usage**

```
<rpc>
 <request-gsm-delete-profile>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <profile-id>profile-id</profile-id> <!-- mandatory -->
 </request-gsm-delete-profile>
</rpc>
```

**Description** Create GSM profile

**Contents** <interface-name>—Name of physical interface  
  
<profile-id>—Profile Id

## <request-gsm-sim-lock>

---

**Usage**

```
<rpc>
 <request-gsm-sim-lock>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <pin>pin</pin> <!-- mandatory -->
 <enable/>
 <disable/>
 </request-gsm-sim-lock>
</rpc>
```

**Description** Enable or disable SIM lock

**Contents** <interface-name>—Name of physical interface  
  
<pin>—SIM unlock code (PIN)  
  
<enable>—Enable SIM lock  
  
<disable>—Disable SIM lock

## <request-gsm-sim-unblock>

---

**Usage**

```
<rpc>
 <request-gsm-sim-unblock>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <puk>puk</puk> <!-- mandatory -->
 <pin>pin</pin> <!-- mandatory -->
 </request-gsm-sim-unblock>
</rpc>
```

**Description** Unblock SIM

**Contents** <interface-name>—Name of physical interface  
<puk>—SIM unblock code (PUK)  
<pin>—New SIM unlock code (PIN) to be set

---

### <request-gsm-sim-unlock>

---

**Usage**

```
<rpc>
 <request-gsm-sim-unlock>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <pin>pin</pin> <!-- mandatory -->
 </request-gsm-sim-unlock>
</rpc>
```

**Description** Unlock SIM

**Contents** <interface-name>—Name of physical interface  
<pin>—SIM unlock code (PIN)

---

### <request-modem-wireless-activate-iota>

---

**Usage**

```
<rpc>
 <request-modem-wireless-activate-iota>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 </request-modem-wireless-activate-iota>
</rpc>
```

**Description** Internet Over The Air Activation

**Contents** <interface-name>—Name of physical interface

---

### <request-modem-wireless-activate-manual>

---

**Usage**

```
<rpc>
 <request-modem-wireless-activate-manual>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <msl>msl</msl> <!-- mandatory -->
 <mdn>mdn</mdn> <!-- mandatory -->
 <imsi>imsi</imsi> <!-- mandatory -->
 <sid>sid</sid>
 <nid>nid</nid>
```

```
<sip-user-id>sip-user-id</sip-user-id>
<sip-password>sip-password</sip-password>
</request-modem-wireless-activate-manual>
</rpc>
```

**Description** Manual Activation

**Contents** <interface-name>—Name of physical interface

<mssl>—Master Subsidy Lock

<mdn>—Mobile Dictionary Number

<imsi>—International Mobile Station Identity

<sid>—System identification

<nid>—Network identification

<sip-user-id>—SIP user ID

<sip-password>—SIP password

---

## <request-modem-wireless-activate-otasp>

---

### Usage

```
<rpc>
<request-modem-wireless-activate-otasp>
 <interface-name>interface-name</interface-name> <!-- mandatory -->
 <dial-string>dial-string</dial-string> <!-- mandatory -->
</request-modem-wireless-activate-otasp>
</rpc>
```

**Description** Over The Air Service Provisioning

**Contents** <interface-name>—Name of physical interface

<dial-string>—

---

## <request-system-autorecovery>

---

### Usage

```
<rpc>
<request-system-autorecovery>
</request-system-autorecovery>
</rpc>
```

**Description** Manage autorecovery information

**Contents**    <state>—Manage autorecovery state information

### <request-system-autorecovery-state-clear>

---

**Usage**

```
<rpc>
 <request-system-autorecovery-state-clear/>
</rpc>
```

**Description**    Delete previously saved autorecovery state

### <request-system-autorecovery-state-recover>

---

**Usage**

```
<rpc>
 <request-system-autorecovery-state-recover/>
</rpc>
```

**Description**    Check for problems and recover state if needed

### <request-system-autorecovery-state-save>

---

**Usage**

```
<rpc>
 <request-system-autorecovery-state-save/>
</rpc>
```

**Description**    Save autorecovery state

### <request-system-download-abort>

---

**Usage**

```
<rpc>
 <request-system-download-abort>
 <download-id>download-id</download-id> <!-- mandatory -->
 </request-system-download-abort>
</rpc>
```

**Description**    Abort a download and delete the local file

**Contents**    <download-id>—ID of the download to be aborted

## <request-system-download-clear>

---

**Usage**

```
<rpc>
 <request-system-download-clear/>
</rpc>
```

**Description** Clear records of completed and aborted downloads

## <request-system-download-pause>

---

**Usage**

```
<rpc>
 <request-system-download-pause>
 <download-id>download-id</download-id> <!-- mandatory -->
 </request-system-download-pause>
</rpc>
```

**Description** Pause an active download

**Contents** <download-id>—ID of the download to be paused

## <request-system-download-resume>

---

**Usage**

```
<rpc>
 <request-system-download-resume>
 <download-id>download-id</download-id> <!-- mandatory -->
 <max-rate>max-rate</max-rate>
 </request-system-download-resume>
</rpc>
```

**Description** Resume a paused download

**Contents** <download-id>—ID of the download to be resumed

<max-rate>—Maximum bandwidth for the download

## <request-system-download-start>

---

**Usage**

```
<rpc>
 <request-system-download-start>
 <url>url</url> <!-- mandatory -->
 <max-rate>max-rate</max-rate>
 <save-as>save-as</save-as>
```

```
<login>login</login>
<delay>delay</delay>
</request-system-download-start>
</rpc>
```

**Description** Start a new download

**Contents** <url>—URL of file

<max-rate>—Maximum bandwidth for the download

<save-as>—Rename file when saving to local file system

<login>—Login credentials (username:password)

<delay>—Delay the start of the download

---

### <request-tgm-login-fpc>

---

**Usage**

```
<rpc>
<request-tgm-login-fpc>
 <slot>slot</slot> <!-- mandatory -->
 <user>user</user> <!-- mandatory -->
</request-tgm-login-fpc>
</rpc>
```

**Description** Login to Flexible PIC Concentrator

**Contents** <slot>—FPC slot number

<user>—User on the Telephony Gateway Module

---

### <request-userfw-local-auth-table-add>

---

**Usage**

```
<rpc>
<request-userfw-local-auth-table-add>
 <user-name>user-name</user-name> <!-- mandatory -->
 <ip-address>ip-address</ip-address> <!-- mandatory -->
 <value/>
</request-userfw-local-auth-table-add>
</rpc>
```

**Description**

**Contents** <user-name>—Add user name to local authentication table

<ip-address>—Add ip-address to local authentication table

<value>—Add role name to local authentication table

---

### <request-userfw-local-auth-table-delete-ip>

---

#### Usage

```
<rpc>
 <request-userfw-local-auth-table-delete-ip>
 <ip-address>ip-address</ip-address> <!-- mandatory -->
 </request-userfw-local-auth-table-delete-ip>
</rpc>
```

**Description** Delete local user authentication table entry by ip-address

**Contents** <ip-address>—IP address

---

### <request-userfw-local-auth-table-delete-user>

---

#### Usage

```
<rpc>
 <request-userfw-local-auth-table-delete-user>
 <user-name>user-name</user-name> <!-- mandatory -->
 </request-userfw-local-auth-table-delete-user>
</rpc>
```

**Description** Delete local user authentication table entry by user name

**Contents** <user-name>—User name

---

### <request-wan-acceleration-login-fpc>

---

#### Usage

```
<rpc>
 <request-wan-acceleration-login-fpc>
 <slot>slot</slot> <!-- mandatory -->
 </request-wan-acceleration-login-fpc>
</rpc>
```

**Description** Login to Flexible PIC Concentrator

**Contents** <slot>—FPC slot number

---

### <request-wlan-access-point-firmware-switch>

---

#### Usage

```
<rpc>
 <request-wlan-access-point-firmware-switch>
```

```

 <wlan-access-point-name>wlan-access-point-name</wlan-access-point-name>
<!-- mandatory -->
 </request-wlan-access-point-firmware-switch>
</rpc>

```

**Description** Switch to alternate firmware image on the access point

**Contents** <wlan-access-point-name>—Name of the access point

### <request-wlan-access-point-firmware-upgrade>

#### Usage

```

<rpc>
 <request-wlan-access-point-firmware-upgrade>
 <name/>
 <all/>
 <file>file</file> <!-- mandatory -->
 </request-wlan-access-point-firmware-upgrade>
</rpc>

```

**Description** Upgrade the firmware

**Contents** <name>—Name of the access point

<all>—All access points

<file>—Manually specified firmware file

### <request-wlan-access-point-packet-capture-start>

#### Usage

```

<rpc>
 <request-wlan-access-point-packet-capture-start>
 <wlan-access-point-name>wlan-access-point-name</wlan-access-point-name>
 <!-- mandatory -->
 <interface>interface</interface> <!-- mandatory -->
 <duration>duration</duration>
 <filename>filename</filename>
 <size>size</size>
 <promiscuous/>
 <disable-beacons/>
 <filter-mac>filter-mac</filter-mac>
 </request-wlan-access-point-packet-capture-start>
</rpc>

```

**Description** Start the packet capture

**Contents** <wlan-access-point-name>—Name of the access point

- Bridge - Bridge interface on the access point
- Ethernet - Ethernet interface on the access point
- Radio1 - Radio 1 interface on the access point
- Radio2 - Radio 2 interface on the access point
- Radio1VAP0 - Radio 1 VAP 0 interface on the access point
- Radio1VAP1 - Radio 1 VAP 1 interface on the access point
- Radio1VAP2 - Radio 1 VAP 2 interface on the access point
- Radio1VAP3 - Radio 1 VAP 3 interface on the access point
- Radio1VAP4 - Radio 1 VAP 4 interface on the access point
- Radio1VAP5 - Radio 1 VAP 5 interface on the access point
- Radio1VAP6 - Radio 1 VAP 6 interface on the access point
- Radio1VAP7 - Radio 1 VAP 7 interface on the access point
- Radio1VAP8 - Radio 1 VAP 8 interface on the access point
- Radio1VAP9 - Radio 1 VAP 9 interface on the access point
- Radio1VAP10 - Radio 1 VAP 10 interface on the access point
- Radio1VAP11 - Radio 1 VAP 11 interface on the access point
- Radio1VAP12 - Radio 1 VAP 12 interface on the access point
- Radio1VAP13 - Radio 1 VAP 13 interface on the access point
- Radio1VAP14 - Radio 1 VAP 14 interface on the access point
- Radio1VAP15 - Radio 1 VAP 15 interface on the access point
- Radio2VAP0 - Radio 2 VAP 0 interface on the access point
- Radio2VAP1 - Radio 2 VAP 1 interface on the access point
- Radio2VAP2 - Radio 2 VAP 2 interface on the access point
- Radio2VAP3 - Radio 2 VAP 3 interface on the access point
- Radio2VAP4 - Radio 2 VAP 4 interface on the access point
- Radio2VAP5 - Radio 2 VAP 5 interface on the access point
- Radio2VAP6 - Radio 2 VAP 6 interface on the access point
- Radio2VAP7 - Radio 2 VAP 7 interface on the access point
- Radio2VAP8 - Radio 2 VAP 8 interface on the access point
- Radio2VAP9 - Radio 2 VAP 9 interface on the access point
- Radio2VAP10 - Radio 2 VAP 10 interface on the access point
- Radio2VAP11 - Radio 2 VAP 11 interface on the access point
- Radio2VAP12 - Radio 2 VAP 12 interface on the access point

- Radio2VAP13 - Radio 2 VAP 13 interface on the access point
- Radio2VAP14 - Radio 2 VAP 14 interface on the access point
- Radio2VAP15 - Radio 2 VAP 15 interface on the access point

<interface>—Name of the interface

- Bridge - Bridge interface on the access point
- Ethernet - Ethernet interface on the access point
- Radio1 - Radio 1 interface on the access point
- Radio2 - Radio 2 interface on the access point
- Radio1VAP0 - Radio 1 VAP 0 interface on the access point
- Radio1VAP1 - Radio 1 VAP 1 interface on the access point
- Radio1VAP2 - Radio 1 VAP 2 interface on the access point
- Radio1VAP3 - Radio 1 VAP 3 interface on the access point
- Radio1VAP4 - Radio 1 VAP 4 interface on the access point
- Radio1VAP5 - Radio 1 VAP 5 interface on the access point
- Radio1VAP6 - Radio 1 VAP 6 interface on the access point
- Radio1VAP7 - Radio 1 VAP 7 interface on the access point
- Radio1VAP8 - Radio 1 VAP 8 interface on the access point
- Radio1VAP9 - Radio 1 VAP 9 interface on the access point
- Radio1VAP10 - Radio 1 VAP 10 interface on the access point
- Radio1VAP11 - Radio 1 VAP 11 interface on the access point
- Radio1VAP12 - Radio 1 VAP 12 interface on the access point
- Radio1VAP13 - Radio 1 VAP 13 interface on the access point
- Radio1VAP14 - Radio 1 VAP 14 interface on the access point
- Radio1VAP15 - Radio 1 VAP 15 interface on the access point
- Radio2VAP0 - Radio 2 VAP 0 interface on the access point
- Radio2VAP1 - Radio 2 VAP 1 interface on the access point
- Radio2VAP2 - Radio 2 VAP 2 interface on the access point
- Radio2VAP3 - Radio 2 VAP 3 interface on the access point
- Radio2VAP4 - Radio 2 VAP 4 interface on the access point
- Radio2VAP5 - Radio 2 VAP 5 interface on the access point
- Radio2VAP6 - Radio 2 VAP 6 interface on the access point
- Radio2VAP7 - Radio 2 VAP 7 interface on the access point
- Radio2VAP8 - Radio 2 VAP 8 interface on the access point

- Radio2VAP9 - Radio 2 VAP 9 interface on the access point
- Radio2VAP10 - Radio 2 VAP 10 interface on the access point
- Radio2VAP11 - Radio 2 VAP 11 interface on the access point
- Radio2VAP12 - Radio 2 VAP 12 interface on the access point
- Radio2VAP13 - Radio 2 VAP 13 interface on the access point
- Radio2VAP14 - Radio 2 VAP 14 interface on the access point
- Radio2VAP15 - Radio 2 VAP 15 interface on the access point

<duration>—Capture duration

<filename>—Name of the captured file

<size>—Maximum file size

<promiscuous>—Enable promiscuous mode

<disable-beacons>—Disable capture of beacons

<filter-mac>—MAC address of the interface

---

## <request-wlan-access-point-packet-capture-stop>

---

### Usage

```
<rpc>
 <request-wlan-access-point-packet-capture-stop>
 <wlan-access-point-name>wlan-access-point-name</wlan-access-point-name>
 <!-- mandatory -->
 </request-wlan-access-point-packet-capture-stop>
</rpc>
```

**Description** Stop the packet capture

**Contents** <wlan-access-point-name>—Name of the access point

---

## <request-wlan-access-point-restart>

---

### Usage

```
<rpc>
 <request-wlan-access-point-restart>
 <wlan-access-point-name>wlan-access-point-name</wlan-access-point-name>
 <!-- mandatory -->
 </request-wlan-access-point-restart>
</rpc>
```

**Description** Restart operation

**Contents** <wlan-access-point-name>—Name of the access point

## <retrieve-destination-nat-summary-information>

### Usage

```
<rpc>
<retrieve-destination-nat-summary-information>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
</retrieve-destination-nat-summary-information>
</rpc>
```

**Description** Show destination NAT summary information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <retrieve-persist-nat-ip-port-information>

### Usage

```
<rpc>
<retrieve-persist-nat-ip-port-information>
 <ip>ip</ip> <!-- mandatory -->
 <internal-port>internal-port</internal-port>
 <internal-protocol>internal-protocol</internal-protocol>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
</retrieve-persist-nat-ip-port-information>
</rpc>
```

**Description** Show persistent NAT information of internal IP and port

**Contents** <ip>—Internal IP address

- tcp - Transmission Control Protocol
- udp - User Datagram Protocol
- icmp - Internet Control Message Protocol
- icmp6 - Internet Control Message Protocol Version 6
- protocol-number - Numeric protocol value (0 .. 255)

- all - All logical systems
- logical-system-name - Logical system name

<internal-port>—Internal port

- tcp - Transmission Control Protocol
- udp - User Datagram Protocol
- icmp - Internet Control Message Protocol
- icmp6 - Internet Control Message Protocol Version 6
- protocol-number - Numeric protocol value (0 .. 255)
- all - All logical systems
- logical-system-name - Logical system name

<internal-protocol>—Internal protocol

- tcp - Transmission Control Protocol
- udp - User Datagram Protocol
- icmp - Internet Control Message Protocol
- icmp6 - Internet Control Message Protocol Version 6
- protocol-number - Numeric protocol value (0 .. 255)
- all - All logical systems
- logical-system-name - Logical system name

<logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <retrieve-persist-nat-pool-information>

---

### Usage

```
<rpc>
 <retrieve-persist-nat-pool-information>
 <pool-name>pool-name</pool-name> <!-- mandatory -->
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </retrieve-persist-nat-pool-information>
</rpc>
```

**Description** Show persistent NAT information of this pool

- Contents** <pool-name>—Source NAT pool name
- all - All logical systems
  - logical-system-name - Logical system name
- <logical-system>—Logical-system name
- all - All logical systems
  - logical-system-name - Logical system name
- <root-logical-system>—Root logical-system (default)

## <retrieve-source-nat-pool-information>

### Usage

```
<rpc>
<retrieve-source-nat-pool-information>
 <pool-choice>pool-choice</pool-choice> <!-- mandatory -->
 <pool-name>pool-name</pool-name> <!-- mandatory -->
 <all/>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
</retrieve-source-nat-pool-information>
</rpc>
```

**Description** Show source NAT information of this pool

- Contents** <pool-name>—Address-pool name
- all - All logical systems
  - logical-system-name - Logical system name
- <all>—Display all source NAT pool information
- all - All logical systems
  - logical-system-name - Logical system name
- <logical-system>—Logical-system name
- all - All logical systems
  - logical-system-name - Logical system name
- <root-logical-system>—Root logical-system (default)

## <retrieve-source-nat-summary>

---

**Usage**

```
<rpc>
 <retrieve-source-nat-summary>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </retrieve-source-nat-summary>
</rpc>
```

**Description** Show source NAT summary information

**Contents** <logical-system>—Logical-system name

- all - All logical systems
- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

## <set-chassis-cluster>

---

**Usage**

```
<rpc>
 <set-chassis-cluster>
 </set-chassis-cluster>
</rpc>
```

**Description**

**Contents** <set-chassis-cluster-enable>—Set cluster identifier

<set-chassis-cluster-disable>—Disable the chassis cluster

## <set-chassis-cluster-disable>

---

**Usage**

```
<rpc>
 <set-chassis-cluster-disable>
 <reboot/>
 </set-chassis-cluster-disable>
</rpc>
```

**Description** Disable the chassis cluster

**Contents** <reboot>—Reboot the system after disabling the cluster

## <set-chassis-cluster-enable>

---

**Usage**

```
<rpc>
 <set-chassis-cluster-enable>
 <cluster-id>cluster-id</cluster-id> <!-- mandatory -->
 <node>node</node> <!-- mandatory -->
 <reboot/>
 </set-chassis-cluster-enable>
</rpc>
```

**Description** Set cluster identifier

**Contents** <cluster-id>—Cluster identifier

<node>—Node identifier

<reboot>—Reboot the system after setting the identifiers

## <set-tgm-media-gateway-controller>

---

**Usage**

```
<rpc>
 <set-tgm-media-gateway-controller>
 <slot>slot</slot> <!-- mandatory -->
 <media-gateway-controller>media-gateway-controller</media-gateway-controller>
 <!-- mandatory -->
 </set-tgm-media-gateway-controller>
</rpc>
```

**Description** Change TGM information for this FPC

**Contents** <slot>—FPC slot number

<media-gateway-controller>—IPv4 address of one or more media gateway controllers

## <show-alg-ike-esp-state>

---

**Usage**

```
<rpc>
 <show-alg-ike-esp-state>
</show-alg-ike-esp-state>
</rpc>
```

**Description** Show all IKE-ESP ALG state information

**Contents** <show-alg-ike-esp-summary>—Show IKE-ESP ALG summary

## <show-alg-ike-esp-summary>

---

### Usage

```
<rpc>
 <show-alg-ike-esp-summary/>
</rpc>
```

**Description** Show IKE-ESP ALG summary

## <show-anti-spam>

---

### Usage

```
<rpc>
 <show-anti-spam>
 </show-anti-spam>
</rpc>
```

**Description** Show anti-spam information

**Contents** <show-anti-spam-statistics>—Show anti-spam statistics  
<show-anti-spam-status>—Show anti-spam status

## <show-anti-spam-statistics>

---

### Usage

```
<rpc>
 <show-anti-spam-statistics/>
</rpc>
```

**Description** Show anti-spam statistics

## <show-anti-spam-status>

---

### Usage

```
<rpc>
 <show-anti-spam-status/>
</rpc>
```

**Description** Show anti-spam status

## <show-anti-virus>

---

**Usage**

```
<rpc>
 <show-anti-virus>
 </show-anti-virus>
</rpc>
```

**Description** Show anti-virus information

**Contents** <show-anti-virus-statistics>—Show anti-virus statistics  
<show-anti-virus-status>—Show anti-virus status

## <show-anti-virus-statistics>

---

**Usage**

```
<rpc>
 <show-anti-virus-statistics/>
</rpc>
```

**Description** Show anti-virus statistics

## <show-anti-virus-status>

---

**Usage**

```
<rpc>
 <show-anti-virus-status>
 </show-anti-virus-status>
</rpc>
```

**Description** Show anti-virus status

**Contents** <show-anti-virus-status-detail>—Show anti-virus detailed status

## <show-anti-virus-status-detail>

---

**Usage**

```
<rpc>
 <show-anti-virus-status-detail/>
</rpc>
```

**Description** Show anti-virus detailed status

## <show-content-filtering>

---

**Usage**

```
<rpc>
 <show-content-filtering>
 </show-content-filtering>
</rpc>
```

**Description** Show content-filtering information

**Contents** <show-content-filtering-statistics>—Show content-filtering statistics

## <show-content-filtering-statistics>

---

**Usage**

```
<rpc>
 <show-content-filtering-statistics/>
</rpc>
```

**Description** Show content-filtering statistics

## <show-ds-lite-software-one-sc-information>

---

**Usage**

```
<rpc>
 <show-ds-lite-software-one-sc-information>
 <software-name-str>software-name-str</software-name-str> <!-- mandatory -->
 <start-id>start-id</start-id>
 <count>count</count>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </show-ds-lite-software-one-sc-information>
</rpc>
```

**Description** Show Software Concentrator object

**Contents** <software-name-str>—Software Name

- logical-system-name - Logical system name

<start-id>—Show software initiator info from start identifier

- logical-system-name - Logical system name

<count>—Number of software initiator entries

- logical-system-name - Logical system name

<logical-system>—Logical-system name

- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

---

## <show-ds-lite-software-sc-infomation>

---

### Usage

```
<rpc>
 <show-ds-lite-software-sc-infomation>
 <lsys>lsys</lsys>
 <logical-system>logical-system</logical-system>
 <root-logical-system/>
 </show-ds-lite-software-sc-infomation>
</rpc>
```

**Description** Show software information

**Contents** <logical-system>—Logical-system name

- logical-system-name - Logical system name

<root-logical-system>—Root logical-system (default)

<show-ds-lite-software-one-sc-information>—Show Software Concentrator object

---

## <show-eedebg-capture>

---

### Usage

```
<rpc>
 <show-eedebg-capture/>
</rpc>
```

**Description** Show datapath debug capture file

---

## <show-security-hpl-infile>

---

### Usage

```
<rpc>
 <show-security-hpl-infile>
 <file_name>file_name</file_name>
 </show-security-hpl-infile>
</rpc>
```

**Description** Show security logs in binary format

**Contents** <file\_name>—Name of the binary log file to be displayed  
<show-security-hpl-infile-last>—Show recent security logs in binary format

---

### <show-security-hpl-infile-last>

---

**Usage**

```
<rpc>
 <show-security-hpl-infile-last>
 <seconds>seconds</seconds>
 </show-security-hpl-infile-last>
</rpc>
```

**Description** Show recent security logs in binary format

**Contents** <seconds>—Number of seconds of binary logs to display

---

### <show-utmd-session>

---

**Usage**

```
<rpc>
 <show-utmd-session/>
</rpc>
```

**Description** Show security utm session

---

### <show-utmd-status>

---

**Usage**

```
<rpc>
 <show-utmd-status/>
</rpc>
```

**Description** Show security utm status

---

### <show-web-filtering>

---

**Usage**

```
<rpc>
 <show-web-filtering>
 </show-web-filtering>
</rpc>
```

**Description** Show web-filtering information

**Contents** <show-web-filtering-statistics>—Show web-filtering statistics  
<show-web-filtering-status>—Show web-filtering status

---

### <show-web-filtering-statistics>

---

**Usage**

```
<rpc>
 <show-web-filtering-statistics/>
</rpc>
```

**Description** Show web-filtering statistics

---

### <show-web-filtering-status>

---

**Usage**

```
<rpc>
 <show-web-filtering-status/>
</rpc>
```

**Description** Show web-filtering status

---

### <test-anti-spam-profile>

---

**Usage**

```
<rpc>
 <test-anti-spam-profile>
 <profile>profile</profile>
 <test-string>test-string</test-string>
 </test-anti-spam-profile>
</rpc>
```

**Description** Test anti-spam profile

**Contents** <profile>—Anti-spam profile name  
<test-string>—Anti-spam test string

---

### <test-anti-virus-profile>

---

**Usage**

```
<rpc>
 <test-anti-virus-profile>
 <profile>profile</profile>
```

```
<test-string>test-string</test-string>
</test-anti-virus-profile>
</rpc>
```

**Description** Test anti-virus profile

**Contents** <profile>—Anti-virus profile name  
<test-string>—Anti-virus test string

---

## <test-web-filtering-profile>

---

### Usage

```
<rpc>
 <test-web-filtering-profile>
 <profile>profile</profile>
 <test-string>test-string</test-string>
 </test-web-filtering-profile>
</rpc>
```

**Description** Test web-filtering profile

**Contents** <profile>—Web-filtering profile name  
<test-string>—Web-filtering test string

# Operational Response Tag Elements Applicable to All Platforms

This chapter lists the Extensible Markup Language (XML) tag elements in the Junos XML application programming interface (API) that contain operational information. The Junos XML protocol and NETCONF servers return them in response to requests from client applications.

The tags listed in this chapter are common to devices belonging to the following platforms:

- EX Series
- J Series
- M Series
- MX Series
- T Series
- QFX Series
- SRX Series

The tags are divided into the following sections and listed in alphabetical order within each section.

- [Summary of Captive Portal Content Delivery Tags on page 2182](#)
- [Summary of Ethernet Virtual Circuit Response Tags on page 2191](#)
- [Summary of Accounting Response Tags on page 2194](#)
- [Summary of Adaptive Services Response Tags on page 2236](#)
- [Summary of Alarm Response Tags on page 2606](#)
- [Summary of ANCP Response Tags on page 2609](#)
- [Summary of APPIDD Response Tags on page 2625](#)
- [Summary of Application Traffic Control Response Tags on page 2639](#)
- [Summary of APS Response Tags on page 2645](#)
- [Summary of ARP Response Tags on page 2649](#)
- [Summary of Authentication Response Tags on page 2653](#)

- [Summary of Bidirectional Forwarding Direction Response Tags on page 2689](#)
- [Summary of Clock Synchronization Response Tags on page 2699](#)
- [Summary of Class-of-Service Response Tags on page 2716](#)
- [Summary of Database Replication Response Tags on page 2833](#)
- [Summary of DCD Response Tags on page 2834](#)
- [Summary of Dynamic Flow Capture Response Tags on page 2837](#)
- [Summary of DHCP Relay Response Tags on page 2842](#)
- [Summary of DHCP Server Response Tags on page 2853](#)
- [Summary of DHCP Service Response Tags on page 2863](#)

## Summary of Captive Portal Content Delivery Tags

---

### <cpcd-pic-information>

#### Usage

```
<cpcd-pic-information>
 <cpcd-pic-table>.....</cpcd-pic-table>
</cpcd-pic-information>
```

**Description** Cpcd pic name and index

### <cpcd-pic-statistics>

#### Usage

```
<cpcd-pic-statistics>
 <statistics-header>.....</statistics-header>
 <statistics>.....</statistics>
</cpcd-pic-statistics>
```

**Description** Captive portal and content delivery statistics per PIC

### <cpcd-pic-statistics-cleared>

#### Usage

```
<cpcd-pic-statistics-cleared>
 <statistics-cleared-header>.....</statistics-cleared-header>
</cpcd-pic-statistics-cleared>
```

**Description** Captive portal and content delivery statistics per PIC cleared

### <cpcd-pic-table>

#### Usage

```
<cpcd-pic-information>
 <cpcd-pic-table>
 <cpcd-pic-table-entry>.....</cpcd-pic-table-entry>
 </cpcd-pic-table>
</cpcd-pic-information>
```

**Description**

**<cpcd-pic-table-entry>****Usage**

```

<cpcd-pic-information>
 <cpcd-pic-table>
 <cpcd-pic-table-entry>
 <pic-name>
 pic-name
 </pic-name>
 <pic-index>
 pic-index
 </pic-index>
 </cpcd-pic-table-entry>
 </cpcd-pic-table>
</cpcd-pic-information>

```

**Description****<cpcd-profile>****Usage**

```

<cpcd-profile>
 <cpcd-profile-table>....</cpcd-profile-table>
</cpcd-profile>

```

**Description** Cpcd profile name and number of rules or rulesets

**<cpcd-profile-table>****Usage**

```

<cpcd-profile>
 <cpcd-profile-table>
 <cpcd-profile-table-entry>....</cpcd-profile-table-entry>
 </cpcd-profile-table>
</cpcd-profile>

```

**Description****<cpcd-profile-table-entry>****Usage**

```

<cpcd-profile>
 <cpcd-profile-table>
 <cpcd-profile-table-entry>
 <profile-name>
 profile-name
 </profile-name>
 <num-rules>
 num-rules
 </num-rules>
 </cpcd-profile-table-entry>
 </cpcd-profile-table>

```

</cpcd-profile>

**Description**

**<cpcd-rule>**

**Usage**

```
<cpcd-rule>
 <cpcd-rule-table>....</cpcd-rule-table>
</cpcd-rule>
```

**Description** Cpcd rule name and number of terms

**<cpcd-rule-set-table>**

**Usage**

```
<cpcd-ruleset>
 <cpcd-rule-set-table>
 <cpcd-rule-set-table-entry>....</cpcd-rule-set-table-entry>
 </cpcd-rule-set-table>
</cpcd-ruleset>
```

**Description**

**<cpcd-rule-set-table-entry>**

**Usage**

```
<cpcd-ruleset>
 <cpcd-rule-set-table>
 <cpcd-rule-set-table-entry>
 <ruleset-name>
 ruleset-name
 </ruleset-name>
 <rule-name>
 rule-name
 </rule-name>
 </cpcd-rule-set-table-entry>
 </cpcd-rule-set-table>
</cpcd-ruleset>
```

**Description**

**<cpcd-rule-table>**

**Usage**

```
<cpcd-rule>
 <cpcd-rule-table>
 <cpcd-rule-table-entry>....</cpcd-rule-table-entry>
 </cpcd-rule-table>
</cpcd-rule>
```

**Description****<cpcd-rule-table-entry>****Usage**

```

<cpcd-rule>
 <cpcd-rule-table>
 <cpcd-rule-table-entry>
 <rule-name>
 rule-name
 </rule-name>
 <term-name>
 term-name
 </term-name>
 </cpcd-rule-table-entry>
 </cpcd-rule-table>
</cpcd-rule>

```

**Description****<cpcd-rule-term>****Usage**

```

<cpcd-rule-term>
 <cpcd-term-table>....</cpcd-term-table>
</cpcd-rule-term>

```

**Description** Cpcd terms within a rule

**<cpcd-ruleset>****Usage**

```

<cpcd-ruleset>
 <cpcd-rule-set-table>....</cpcd-rule-set-table>
</cpcd-ruleset>

```

**Description** Cpcd rule sets

**<cpcd-service-set-brief>****Usage**

```

<cpcd-service-set-brief>
 <cpcd-sset-brief-table>....</cpcd-sset-brief-table>
</cpcd-service-set-brief>

```

**Description** Service set with cpcd profile name

### <cpcd-service-set-detail>

**Usage**

```
<cpcd-service-set-detail>
 <cpcd-sset-detail-table>....</cpcd-sset-detail-table>
</cpcd-service-set-detail>
```

**Description** Service set with cpcd profile name and number of compiled rules

### <cpcd-service-set-summary>

**Usage**

```
<cpcd-service-set-summary>
 <num-sset>
 num-sset
 </num-sset>
</cpcd-service-set-summary>
```

**Description** Service set summary

### <cpcd-sset-brief-table>

**Usage**

```
<cpcd-service-set-brief>
 <cpcd-sset-brief-table>
 <cpcd-sset-brief-table-entry>....</cpcd-sset-brief-table-entry>
 </cpcd-sset-brief-table>
</cpcd-service-set-brief>
```

**Description**

### <cpcd-sset-brief-table-entry>

**Usage**

```
<cpcd-service-set-brief>
 <cpcd-sset-brief-table>
 <cpcd-sset-brief-table-entry>
 <sset-name>
 sset-name
 </sset-name>
 <profile-name>
 profile-name
 </profile-name>
 </cpcd-sset-brief-table-entry>
 </cpcd-sset-brief-table>
</cpcd-service-set-brief>
```

**Description**

### <cpcd-sset-detail-table>

#### Usage

```

<cpcd-service-set-detail>
 <cpcd-sset-detail-table>
 <cpcd-sset-detail-table-entry>....</cpcd-sset-detail-table-entry>
 </cpcd-sset-detail-table>
</cpcd-service-set-detail>

```

#### Description

### <cpcd-sset-detail-table-entry>

#### Usage

```

<cpcd-service-set-detail>
 <cpcd-sset-detail-table>
 <cpcd-sset-detail-table-entry>
 <sset-name>
 sset-name
 </sset-name>
 <sset-id>
 sset-id
 </sset-id>
 <profile-name>
 profile-name
 </profile-name>
 <num-compiled-rules>
 num-compiled-rules
 </num-compiled-rules>
 </cpcd-sset-detail-table-entry>
 </cpcd-sset-detail-table>
</cpcd-service-set-detail>

```

#### Description

### <cpcd-term>

#### Usage

```

<cpcd-term>
 <term-header>....</term-header>
 <term-application>....</term-application>
 <term-address-range>....</term-address-range>
 <no-term-found>....</no-term-found>
</cpcd-term>

```

**Description** Cpcd term within a rule

### <cpcd-term-table>

#### Usage

```

<cpcd-rule-term>
 <cpcd-term-table>

```

```
<cpcd-term-table-entry>....</cpcd-term-table-entry>
</cpcd-term-table>
</cpcd-rule-term>
```

#### Description

### <cpcd-term-table-entry>

#### Usage

```
<cpcd-rule-term>
<cpcd-term-table>
 <cpcd-term-table-entry>
 <term-name>
 term-name
 </term-name>
 <term-action>
 term-action
 </term-action>
 <term-action-option>
 term-action-option
 </term-action-option>
 </cpcd-term-table-entry>
</cpcd-term-table>
</cpcd-rule-term>
```

#### Description

### <no-cpcd-statistics>

#### Usage

```
<no-cpcd-statistics>
<service-set-interface>
 service-set-interface
</service-set-interface>
</no-cpcd-statistics>
```

#### Description

### <no-term-found>

#### Usage

```
<cpcd-term>
 <no-term-found>
 <rule-name>
 rule-name
 </rule-name>
 <term-name>
 term-name
 </term-name>
 </no-term-found>
</cpcd-term>
```

## Description

## &lt;statistics&gt;

## Usage

```
<cpcd-pic-statistics>
 <statistics>
 <packets-received>
 packets-received
 </packets-received>
 <packets-altered>
 packets-altered
 </packets-altered>
 </statistics>
</cpcd-pic-statistics>
```

## Description    Statistics

## &lt;statistics-cleared-header&gt;

## Usage

```
<cpcd-pic-statistics-cleared>
 <statistics-cleared-header>
 <service-set-interface>
 service-set-interface
 </service-set-interface>
 </statistics-cleared-header>
</cpcd-pic-statistics-cleared>
```

## Description

## &lt;statistics-header&gt;

## Usage

```
<cpcd-pic-statistics>
 <statistics-header>
 <service-set-interface>
 service-set-interface
 </service-set-interface>
 </statistics-header>
</cpcd-pic-statistics>
```

## Description

## &lt;term-address-range&gt;

## Usage

```
<cpcd-term>
 <term-address-range>
 <term-address-range-low>
 term-address-range-low
 </term-address-range-low>
 <term-address-range-high>
```

```
 term-address-range-high
 </term-address-range-high>
 <term-address-range-mask>
 term-address-range-mask
 </term-address-range-mask>
 <term-address-range-except>
 term-address-range-except
 </term-address-range-except>
</term-address-range>
</cpcd-term>
```

#### Description

### <term-application>

#### Usage

```
<cpcd-term>
 <term-application>
 <term-application-name>
 term-application-name
 </term-application-name>
 <term-application-protocol>
 term-application-protocol
 </term-application-protocol>
 <term-application-ip-protocol>
 term-application-ip-protocol
 </term-application-ip-protocol>
 <term-application-src-ports>
 term-application-src-ports
 </term-application-src-ports>
 <term-application-dst-ports>
 term-application-dst-ports
 </term-application-dst-ports>
 </term-application>
</cpcd-term>
```

#### Description

### <term-header>

#### Usage

```
<cpcd-term>
 <term-header>
 <rule-name-term>
 rule-name-term
 </rule-name-term>
 <rule-match-direction>
 rule-match-direction
 </rule-match-direction>
 <term-name-term>
 term-name-term
 </term-name-term>
 <term-action>
 term-action
 </term-action>
 </term-header>
</cpcd-term>
```

```

</term-action>
<term-action-option>
 term-action-option
</term-action-option>
</term-header>
</cpcd-term>

```

</elmi-interface-information>
```

#### Description

## Summary of Accounting Response Tags

---

#### <accounting-profile-columns>

##### Usage

```
<accounting-profile-information>
<accounting-profile-columns>
 <column-label>
 column-label
 </column-label>
</accounting-profile-columns>
</accounting-profile-information>
```

**Description** Name of each Junos XML protocol output tag that is included in records generated based on the profile

### <accounting-profile-filter>

#### Usage

```
<accounting-profile-information>
 <accounting-profile-filter>
 <filter-name>
 filter-name
 </filter-name>
 <next-scheduled-collection>
 next-scheduled-collection
 </next-scheduled-collection>
 </accounting-profile-filter>
</accounting-profile-information>
```

**Description** Name of each filter to which the profile is applied

### <accounting-profile-header>

#### Usage

```
<accounting-profile-information>
 <accounting-profile-header>
 <profile-name>
 profile-name
 </profile-name>
 <profile-type>
 profile-type
 </profile-type>
 <profile-interval>
 profile-interval
 </profile-interval>
 <profile-use-count>
 profile-use-count
 </profile-use-count>
 <filename>
 filename
 </filename>
 <filesize>
 filesize
 </filesize>
 <filenumber>
 filenumber
 </filenumber>
 <bytes-written>
 bytes-written
 </bytes-written>
 <transfer-interval>
 transfer-interval
 </transfer-interval>
 <next-transfer-time>
 next-transfer-time
```

```
</next-transfer-time>
</accounting-profile-header>
</accounting-profile-information>
```

**Description** Information from the accounting profile header

### <accounting-profile-information>

#### Usage

```
<accounting-profile-information>
 <accounting-profile-header>....</accounting-profile-header>
 <accounting-profile-columns>....</accounting-profile-columns>
 <accounting-profile-interfaces>....</accounting-profile-interfaces>
 <accounting-profile-mib>....</accounting-profile-mib>
 <accounting-profile-filter>....</accounting-profile-filter>
</accounting-profile-information>
```

**Description** Information about an accounting profile

### <accounting-profile-interfaces>

#### Usage

```
<accounting-profile-information>
 <accounting-profile-interfaces>
 <interface-name>
 interface-name
 </interface-name>
 <next-scheduled-collection>
 next-scheduled-collection
 </next-scheduled-collection>
 </accounting-profile-interfaces>
</accounting-profile-information>
```

**Description** Name of each interface to which the profile is applied

### <accounting-profile-mib>

#### Usage

```
<accounting-profile-information>
 <accounting-profile-mib>
 <mib-name>
 mib-name
 </mib-name>
 <next-scheduled-collection>
 next-scheduled-collection
 </next-scheduled-collection>
 </accounting-profile-mib>
</accounting-profile-information>
```

**Description** Name of each Management Information Base to which the profile is applied

### <accounting-record-information>

#### Usage

```
<accounting-record-information>
 <interface-accounting-statistics>....</interface-accounting-statistics>
 <routing-engine-accounting-statistics>....</routing-engine-accounting-statistics>

 <filter-accounting-statistics>....</filter-accounting-statistics>
 <cu-accounting-statistics>....</cu-accounting-statistics>
 <mib-accounting-statistics>....</mib-accounting-statistics>
 <file-accounting-records>....</file-accounting-records>
</accounting-record-information>
```

**Description** Information in a record that was generated based on an accounting profile

### <accounting-server-interim-buckets>

#### Usage

```
<accounting-server-interim-buckets>
 <interim-interval>
 interim-interval
 </interim-interval>
 <interim-granularity>
 interim-granularity
 </interim-granularity>
 <interim-slot>
 interim-slot
 </interim-slot>
 <interim-device>
 interim-device
 </interim-device>
 <interim-num-subscribers>
 interim-num-subscribers
 </interim-num-subscribers>
 <interim-num-services>
 interim-num-services
 </interim-num-services>
 <interim-subscriber-sent>
 interim-subscriber-sent
 </interim-subscriber-sent>
 <interim-subscriber-sent-err>
 interim-subscriber-sent-err
 </interim-subscriber-sent-err>
 <interim-subscriber-rcvd>
 interim-subscriber-rcvd
 </interim-subscriber-rcvd>
 <interim-subscriber-rcvd-err>
 interim-subscriber-rcvd-err
 </interim-subscriber-rcvd-err>
 <interim-service-sent>
 interim-service-sent
```

```
</interim-service-sent>
<interim-service-sent-err>
 interim-service-sent-err
</interim-service-sent-err>
<interim-service-rcvd>
 interim-service-rcvd
</interim-service-rcvd>
<interim-service-rcvd-err>
 interim-service-rcvd-err
</interim-service-rcvd-err>
</accounting-server-interim-buckets>
```

#### Description

### <accounting-server-statistics>

#### Usage

```
<accounting-server-statistics>
<statistics_connection_header>....</statistics_connection_header>
<statistics_pfe_header>....</statistics_pfe_header>
<statistics_pfed_header>....</statistics_pfed_header>
<statistics_libstat_header>....</statistics_libstat_header>
</accounting-server-statistics>
```

#### Description

### <cu-accounting-record>

#### Usage

```
<accounting-record-information>
<cu-accounting-statistics>
 <cu-accounting-record>
 <profile-layout>
 profile-layout
 </profile-layout>
 <epoch-timestamp>
 epoch-timestamp
 </epoch-timestamp>
 <utc-timestamp>
 utc-timestamp
 </utc-timestamp>
 <interface-name>
 interface-name
 </interface-name>
 <address-family>
 address-family
 </address-family>
 <destination-class-name>
 destination-class-name
 </destination-class-name>
 <source-class-name>
 source-class-name
 </source-class-name>
 <counter-name>
```

```

 counter-name
 </counter-name>
 <packet-count>
 packet-count
 </packet-count>
 <byte-count>
 byte-count
 </byte-count>
 </cu-accounting-record>
</cu-accounting-statistics>
</accounting-record-information>

```

**Description** Information in a record that was generated based on a destination class usage or source class usage profile

### <cu-accounting-statistics>

#### Usage

```

<accounting-record-information>
 <cu-accounting-statistics>
 <cu-accounting-record>....</cu-accounting-record>
 </cu-accounting-statistics>
</accounting-record-information>

```

**Description** Information from one or more records that were generated based on a destination class usage or source class usage profile

### <file-accounting-record>

#### Usage

```

<accounting-record-information>
 <file-accounting-records>
 <file-accounting-record>
 <profile-layout>
 profile-layout
 </profile-layout>
 <epoch-timestamp>
 epoch-timestamp
 </epoch-timestamp>
 </file-accounting-record>
 </file-accounting-records>
</accounting-record-information>

```

**Description** Record from an accounting file

### <file-accounting-records>

#### Usage

```

<accounting-record-information>
 <file-accounting-records>

```

```
<file-accounting-record>....</file-accounting-record>
</file-accounting-records>
</accounting-record-information>
```

**Description** Records from an accounting file

### <filter-accounting-record>

#### Usage

```
<accounting-record-information>
<filter-accounting-statistics>
 <filter-accounting-record>
 <profile-layout>
 profile-layout
 </profile-layout>
 <epoch-timestamp>
 epoch-timestamp
 </epoch-timestamp>
 <utc-timestamp>
 utc-timestamp
 </utc-timestamp>
 <interfaces>
 interfaces
 </interfaces>
 <filter-name>
 filter-name
 </filter-name>
 <counter-name>
 counter-name
 </counter-name>
 <packet-count>
 packet-count
 </packet-count>
 <byte-count>
 byte-count
 </byte-count>
 </filter-accounting-record>
</filter-accounting-statistics>
</accounting-record-information>
```

**Description** Information in a record that was generated based on a filter profile

### <filter-accounting-statistics>

#### Usage

```
<accounting-record-information>
 <filter-accounting-statistics>
 <filter-accounting-record>....</filter-accounting-record>
 </filter-accounting-statistics>
</accounting-record-information>
```

**Description** Information from one or more records that were generated based on a filter profile

### <index>

#### Usage

```
<snmp-object-information>
 <snmp-object>
 <index>
 <index-name>
 index-name
 </index-name>
 <index-value>
 index-value
 </index-value>
 </index>
 </snmp-object>
</snmp-object-information>
```

#### Description

### <interface-accounting-record>

#### Usage

```
<accounting-record-information>
 <interface-accounting-statistics>
 <interface-accounting-record>
 <profile-layout>
 profile-layout
 </profile-layout>
 <epoch-timestamp>
 epoch-timestamp
 </epoch-timestamp>

 utc-timestamp
 </utc-timestamp>
 <name>
 name
 </name>
 <object-value>
 object-value
 </object-value>
 </mib-accounting-record>
 </mib-accounting-statistics>
</accounting-record-information>
```

**Description** Information in a record that was generated based on a Management Information Base profile

### <mib-accounting-statistics>

#### Usage

```
<accounting-record-information>
 <mib-accounting-statistics>
 <mib-accounting-record>....</mib-accounting-record>
 </mib-accounting-statistics>
</accounting-record-information>
```

**Description** Information from one or more records that were generated based on a Management Information Base profile

### <pfe>

#### Usage

```
<pfe-information>
 <pfe>
 <slot-index>
 slot-index
 </slot-index>
 <slot-type>
 slot-type
 </slot-type>
```

```
<slot-state>
 slot-state
</slot-state>
<mgmt-state>
 mgmt-state
</mgmt-state>
<up-time>
 up-time
</up-time>
</pfe>
</pfe-information>
```

## Description

### Description

## <bsg-nr-cache>

### Usage

```

<bsg-name-resolution-cache-information>
<bsg-nr-cache>
 <bsg-name-resolution-entry>....</bsg-name-resolution-entry>
</bsg-nr-cache>
</bsg-name-resolution-cache-information>

```

### Description

## <bsg-redundancy-connection-info>

### Usage

```

<bsg-status-information>
<bsg-redundancy-connection-info>
 <bsg-redundancy-conn-type>
 bsg-redundancy-conn-type
 </bsg-redundancy-conn-type>
 <bsg-redundancy-conn-details>
 bsg-redundancy-conn-details

```

```
</bsg-redundancy-conn-details>
<bsg-redundancy-conn-status>
 bsg-redundancy-conn-status
</bsg-redundancy-conn-status>
<bsg-redundancy-conn-messages>
 bsg-redundancy-conn-messages
</bsg-redundancy-conn-messages>
</bsg-redundancy-connection-info>
</bsg-status-information>
```

**Description** Shows the connection information

### <bsg-redundancy-info>

**Usage**

```
<bsg-status-information>
 <bsg-redundancy-info>
</bsg-redundancy-info>
</bsg-status-information>
```

**Description** Shows bsg redundancy information

### <bsg-redundancy-pic-info>

**Usage**

```
<bsg-status-information>
 <bsg-redundancy-pic-info>
 <bsg-redundancy-local-or-remote>
 bsg-redundancy-local-or-remote
 </bsg-redundancy-local-or-remote>
 <bsg-redundancy-pic-if-name>
 bsg-redundancy-pic-if-name
 </bsg-redundancy-pic-if-name>
 <bsg-redundancy-pic-ip>
 bsg-redundancy-pic-ip
 </bsg-redundancy-pic-ip>
 <bsg-redundancy-pic-rms-role>
 bsg-redundancy-pic-rms-role
 </bsg-redundancy-pic-rms-role>
 </bsg-redundancy-pic-info>
</bsg-status-information>
```

**Description** Shows PIC information

### <bsg-registrations>

**Usage**

```
<bsg-registrations>
 <bsg-registrations-start-time>
 bsg-registrations-start-time
 </bsg-registrations-start-time>
```

```

 <bsg-registrations-active-registrations>
 bsg-registrations-active-registrations
 </bsg-registrations-active-registrations>
 </bsg-registrations>

```

**Description****<bsg-registrations-realm>****Usage**

```

<bsg-registrations-realm>
 <bsg-registrations-realm-start-time>
 bsg-registrations-realm-start-time
 </bsg-registrations-realm-start-time>
 <bsg-registrations-realm-name>
 bsg-registrations-realm-name
 </bsg-registrations-realm-name>
 <bsg-registrations-realm-active-registrations>
 bsg-registrations-realm-active-registrations
 </bsg-registrations-realm-active-registrations>
</bsg-registrations-realm>

```

**Description****<bsg-routing-blacklist-actively-checked>****Usage**

```

<bsg-routing-blacklist-actively-checked>
 <actively-checked-server-name>
 actively-checked-server-name
 </actively-checked-server-name>
 <actively-checked-server-address>
 actively-checked-server-address
 </actively-checked-server-address>
 <actively-checked-server-last-availability>
 actively-checked-server-last-availability
 </actively-checked-server-last-availability>
 <actively-checked-server-next-check>
 actively-checked-server-next-check
 </actively-checked-server-next-check>
</bsg-routing-blacklist-actively-checked>

```

**Description** Servers that were configured to be actively checked

**<bsg-routing-blacklist-actively-checked>****Usage**

```

<bsg-routing-blacklist-actively-checked-wrapper>
 <bsg-routing-blacklist-actively-checked>
 <actively-checked-server-name>
 actively-checked-server-name
 </actively-checked-server-name>
 </bsg-routing-blacklist-actively-checked-wrapper>

```

```
<actively-checked-server-address>
 actively-checked-server-address
</actively-checked-server-address>
<actively-checked-server-last-availability>
 actively-checked-server-last-availability
</actively-checked-server-last-availability>
<actively-checked-server-next-check>
 actively-checked-server-next-check
</actively-checked-server-next-check>
</bsg-routing-blacklist-actively-checked>
</bsg-routing-blacklist-actively-checked-wrapper>
```

**Description** Servers that were configured to be actively checked

### <bsg-routing-blacklist-actively-checked>

#### Usage

```
<bsg-routing-blacklist-details>
 <bsg-routing-blacklist-entry>
 <bsg-routing-blacklist-actively-checked-wrapper>
 <bsg-routing-blacklist-actively-checked>
 <actively-checked-server-name>
 actively-checked-server-name
 </actively-checked-server-name>
 <actively-checked-server-address>
 actively-checked-server-address
 </actively-checked-server-address>
 <actively-checked-server-last-availability>
 actively-checked-server-last-availability
 </actively-checked-server-last-availability>
 <actively-checked-server-next-check>
 actively-checked-server-next-check
 </actively-checked-server-next-check>
 </bsg-routing-blacklist-actively-checked>
 </bsg-routing-blacklist-actively-checked-wrapper>
 </bsg-routing-blacklist-entry>
</bsg-routing-blacklist-details>
```

**Description** Servers that were configured to be actively checked

### <bsg-routing-blacklist-actively-checked-wrapper>

#### Usage

```
<bsg-routing-blacklist-actively-checked-wrapper>
 <bsg-routing-blacklist-actively-checked-title>
 bsg-routing-blacklist-actively-checked-title
 </bsg-routing-blacklist-actively-checked-title>

 <bsg-routing-blacklist-actively-checked>....</bsg-routing-blacklist-actively-checked>

</bsg-routing-blacklist-actively-checked-wrapper>
```

**Description** Title for servers that are actively checked

### <bsg-routing-blacklist-actively-checked-wrapper>

**Usage**

```
<bsg-routing-blacklist-details>
 <bsg-routing-blacklist-entry>
 <bsg-routing-blacklist-actively-checked-wrapper>
 <bsg-routing-blacklist-actively-checked-title>
 bsg-routing-blacklist-actively-checked-title

 </bsg-routing-blacklist-actively-checked-wrapper>
 </bsg-routing-blacklist-entry>
</bsg-routing-blacklist-details>
```

**Description** Title for servers that are actively checked

### <bsg-routing-blacklist-details>

**Usage**

```
<bsg-routing-blacklist-details>
 <bsg-routing-blacklist-entry>....</bsg-routing-blacklist-entry>
</bsg-routing-blacklist-details>
```

**Description** Servers which are actively or not-actively checked status

### <bsg-routing-blacklist-entry>

**Usage**

```
<bsg-routing-blacklist-details>
 <bsg-routing-blacklist-entry>
 <bsg-start-time>
 bsg-start-time
 </bsg-start-time>

 <bsg-routing-blacklist-actively-checked-wrapper>....</bsg-routing-blacklist-actively-checked-wrapper>

 <bsg-routing-blacklist-not-actively-checked-wrapper>...</bsg-routing-blacklist-not-actively-checked-wrapper>

 </bsg-routing-blacklist-entry>
</bsg-routing-blacklist-details>
```

**Description**

### <bsg-routing-blacklist-not-actively-checked>

#### Usage

```
<bsg-routing-blacklist-not-actively-checked>
 <not-actively-checked-server-name>
 not-actively-checked-server-name
 </not-actively-checked-server-name>
 <not-actively-checked-server-address>
 not-actively-checked-server-address
 </not-actively-checked-server-address>
 <not-actively-checked-server-next-availability>
 not-actively-checked-server-next-availability
 </not-actively-checked-server-next-availability>
</bsg-routing-blacklist-not-actively-checked>
```

**Description** Servers that were configured not to be actively check

### <bsg-routing-blacklist-not-actively-checked>

#### Usage

```
<bsg-routing-blacklist-not-actively-checked-wrapper>
 <bsg-routing-blacklist-not-actively-checked>
 <not-actively-checked-server-name>
 not-actively-checked-server-name
 </not-actively-checked-server-name>
 <not-actively-checked-server-address>
 not-actively-checked-server-address
 </not-actively-checked-server-address>
 <not-actively-checked-server-next-availability>
 not-actively-checked-server-next-availability
 </not-actively-checked-server-next-availability>
 </bsg-routing-blacklist-not-actively-checked>
</bsg-routing-blacklist-not-actively-checked-wrapper>
```

**Description** Servers that were configured not to be actively check

### <bsg-routing-blacklist-not-actively-checked>

#### Usage

```
<bsg-routing-blacklist-details>
 <bsg-routing-blacklist-entry>
 <bsg-routing-blacklist-not-actively-checked-wrapper>
 <bsg-routing-blacklist-not-actively-checked>
 <not-actively-checked-server-name>
 not-actively-checked-server-name

### <bsg-statistics-drain-information>

**Usage**

```
<bsg-statistics-drain-information>
</bsg-statistics-drain-information>
```

**Description** Statistics information cleared by border signaling gateway

### <bsg-status-information>

**Usage**

```
<bsg-status-information>
<bsg-redundancy-pic-info>....</bsg-redundancy-pic-info>
<bsg-redundancy-connection-info>....</bsg-redundancy-connection-info>
<bsg-redundancy-state>
 bsg-redundancy-state
</bsg-redundancy-state>
<bsg-redundancy-info>....</bsg-redundancy-info>
</bsg-status-information>
```

**Description** Show bsg status information

### <calls-duration-entry>

**Usage**

```
<calls-duration-histogram>
<calls-duration-entry>
 <duration-start>
 duration-start
 </duration-start>
 <duration-end>
 duration-end
 </duration-end>
 <number-of-calls>
 number-of-calls
 </number-of-calls>
</calls-duration-entry>
</calls-duration-histogram>
```

**Description**

### <calls-duration-entry>

**Usage**

```
<bsg-service-point-calls-duration-details>
```

```

<calls-duration-histogram>
 <calls-duration-entry>
 <duration-start>
 duration-start
 </duration-start>
 <duration-end>
 duration-end
 </duration-end>
 <number-of-calls>
 number-of-calls
 </number-of-calls>
 </calls-duration-entry>
</calls-duration-histogram>
</bsg-service-point-calls-duration-details>

```

**Description****<calls-duration-entry>****Usage**

```

<bsg-calls-duration>
 <bsg-calls-duration-details>
 <bsg-service-point-calls-duration-details>
 <calls-duration-histogram>
 <calls-duration-entry>
 <duration-start>
 duration-start
 </duration-start>
 <duration-end>
 duration-end
 </duration-end>
 <number-of-calls>
 number-of-calls
 </number-of-calls>
 </calls-duration-entry>
 </calls-duration-histogram>
 </bsg-service-point-calls-duration-details>
 </bsg-calls-duration-details>
</bsg-calls-duration>

```

**Description****<calls-duration-histogram>****Usage**

```

<calls-duration-histogram>
 <calls-duration-entry>....</calls-duration-entry>
</calls-duration-histogram>

```

**Description** Show an histogram of calls-duration for each service point

### <calls-duration-histogram>

**Usage**

```
<bsg-service-point-calls-duration-details>
 <calls-duration-histogram>
 <calls-duration-entry>....</calls-duration-entry>
 </calls-duration-histogram>
</bsg-service-point-calls-duration-details>
```

**Description** Show an histogram of calls-duration for each service point

### <calls-duration-histogram>

**Usage**

```
<bsg-calls-duration>
 <bsg-calls-duration-details>
 <bsg-service-point-calls-duration-details>
 <calls-duration-histogram>
 <calls-duration-entry>....</calls-duration-entry>
 </calls-duration-histogram>
 </bsg-service-point-calls-duration-details>
 </bsg-calls-duration-details>
</bsg-calls-duration>
```

**Description** Show an histogram of calls-duration for each service point

### <clear-service-bsg-registrations-statistics>

**Usage**

```
<clear-service-bsg-registrations-statistics>
</clear-service-bsg-registrations-statistics>
```

**Description** Clear bsg registration statistics

### <clear-services-bsg-registrations-subscription>

**Usage**

```
<clear-services-bsg-registrations-subscription>
 <clear-services-bsg-registrations-subscription-result>
 clear-services-bsg-registrations-subscription-result
 </clear-services-bsg-registrations-subscription-result>
</clear-services-bsg-registrations-subscription>
```

**Description** Clear bsg registration subscription

**<controller-entry>****Usage**

```

<pgcpd-active-configuration>
 <controller-entry>
 <controller-name>
 controller-name
 </controller-name>
 <remote-ip-address>
 remote-ip-address
 </remote-ip-address>
 <remote-port>
 remote-port
 </remote-port>
 </controller-entry>
</pgcpd-active-configuration>

```

**Description****<controller-entry>****Usage**

```

<pgcpd-active-configuration>
 <gateway-entry>
 <controller-entry>
 <controller-name>
 controller-name
 </controller-name>
 <remote-ip-address>
 remote-ip-address
 </remote-ip-address>
 <remote-port>
 remote-port
 </remote-port>
 </controller-entry>
 </gateway-entry>
</pgcpd-active-configuration>

```

**Description****<controller-entry>****Usage**

```

<pgcpd-active-configuration>
 <pgcpd-config>
 <gateway-entry>
 <controller-entry>
 <controller-name>
 controller-name
 </controller-name>
 <remote-ip-address>
 remote-ip-address
 </remote-ip-address>

```

```
<remote-port>
 remote-port
</remote-port>
</controller-entry>
</gateway-entry>
</pgcpd-config>
</pgcpd-active-configuration>
```

#### Description

### <controller-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <controller-entry>
 <controller-name>
 controller-name
 </controller-name>
 <remote-ip-address>
 remote-ip-address
 </remote-ip-address>
 <remote-port>
 remote-port
 </remote-port>
 </controller-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

#### Description

### <controller-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <controller-entry>
 <controller-name>
 controller-name
 </controller-name>
 <remote-ip-address>
 remote-ip-address
 </remote-ip-address>
 <remote-port>
 remote-port
 </remote-port>
 </controller-entry>
 </gateway-entry>
</service-pgcp-terminations>
```

#### Description

### <controller-entry>

#### Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <controller-entry>
 <controller-name>
 controller-name
 </controller-name>
 <remote-ip-address>
 remote-ip-address
 </remote-ip-address>
 <remote-port>
 remote-port
 </remote-port>
 </controller-entry>
 </gateway-entry>
</service-pgcp-gates>
```

#### Description

### <cos-stats-service-set-dscp-entry>

#### Usage

```
<cos-stats-service-set-dscp-entry>
 <received-dscp>
 received-dscp
 </received-dscp>
 <total-received-dscp-packets>
 total-received-dscp-packets
 </total-received-dscp-packets>
 <total-marked-dscp-packets>
 total-marked-dscp-packets
 </total-marked-dscp-packets>
</cos-stats-service-set-dscp-entry>
```

**Description**    Class-of-service service set statistics entry

### <cos-stats-service-set-dscp-entry>

#### Usage

```
<service-cos-statistics-information>
 <service-cos-statistics-entry>
 <cos-stats-service-set-dscp-information>
 <cos-stats-service-set-dscp-entry>
 <received-dscp>
 received-dscp
 </received-dscp>
 <total-received-dscp-packets>
 total-received-dscp-packets
 </total-received-dscp-packets>
 <total-marked-dscp-packets>
 total-marked-dscp-packets
 </cos-stats-service-set-dscp-entry>
 </cos-stats-service-set-dscp-information>
 </service-cos-statistics-entry>
</service-cos-statistics-information>
```

```
</total-marked-dscp-packets>
</cos-stats-service-set-dscp-entry>
</cos-stats-service-set-dscp-information>
</service-cos-statistics-entry>
</service-cos-statistics-information>
```

**Description** Class-of-service service set statistics entry

### <cos-stats-service-set-dscp-information>

#### Usage

```
<service-cos-statistics-information>
 <service-cos-statistics-entry>
 <cos-stats-service-set-dscp-information>
 <cos-stats-service-set-dscp-entry>....</cos-stats-service-set-dscp-entry>
 </cos-stats-service-set-dscp-information>
 </service-cos-statistics-entry>
</service-cos-statistics-information>
```

**Description**

### <cos-stats-service-set-forwarding-class-entry>

#### Usage

```
<cos-stats-service-set-forwarding-class-entry>
 <received-forwarding-class>
 received-forwarding-class
 </received-forwarding-class>
 <total-received-forwarding-class-packets>
 total-received-forwarding-class-packets
 </total-received-forwarding-class-packets>
 <total-assigned-forwarding-class-packets>
 total-assigned-forwarding-class-packets
 </total-assigned-forwarding-class-packets>
</cos-stats-service-set-forwarding-class-entry>
```

**Description** Class-of-service service set statistics entry

### <cos-stats-service-set-forwarding-class-entry>

#### Usage

```
<service-cos-statistics-information>
 <service-cos-statistics-entry>
 <cos-stats-service-set-forwarding-class-information>
 <cos-stats-service-set-forwarding-class-entry>
 <received-forwarding-class>
 received-forwarding-class
 </received-forwarding-class>
 <total-received-forwarding-class-packets>
 total-received-forwarding-class-packets
 </total-received-forwarding-class-packets>
 </cos-stats-service-set-forwarding-class-entry>
 </cos-stats-service-set-forwarding-class-information>
 </service-cos-statistics-entry>
</service-cos-statistics-information>
```

```

 <total-assigned-forwarding-class-packets>
 total-assigned-forwarding-class-packets
 </total-assigned-forwarding-class-packets>
 </cos-stats-service-set-forwarding-class-entry>
</cos-stats-service-set-forwarding-class-information>
</service-cos-statistics-entry>
</service-cos-statistics-information>

```

**Description** Class-of-service service set statistics entry

### <cos-stats-service-set-forwarding-class-information>

#### Usage

```

 <service-cos-statistics-information>
 <service-cos-statistics-entry>
 <cos-stats-service-set-forwarding-class-information>

 <cos-stats-service-set-forwarding-class-entry>....</cos-stats-service-set-forwarding-class-entry>

 </cos-stats-service-set-forwarding-class-information>
 </service-cos-statistics-entry>
 </service-cos-statistics-information>

```

#### Description

### <crtp-config-info-entry>

#### Usage

```

<crtp-config-info-entry>
 <interface-name>
 interface-name
 </interface-name>
 <crtp-port-min>
 crtp-port-min
 </crtp-port-min>
 <crtp-port-max>
 crtp-port-max
 </crtp-port-max>
 <crtp-tcp-space>
 crtp-tcp-space
 </crtp-tcp-space>
 <crtp-udp-space>
 crtp-udp-space
 </crtp-udp-space>
 <crtp-max-period>
 crtp-max-period
 </crtp-max-period>
 <crtp-max-time>
 crtp-max-time
 </crtp-max-time>
 <crtp-rtp-queues>
 crtp-rtp-queues
 </crtp-rtp-queues>

```

</crtp-config-info-entry>

**Description**    Compressed Real-Time Protocol information

### <crtp-counter-table>

#### Usage

```
<crtp-counter-table>
 <crtp-counter-name>
 crtp-counter-name
 </crtp-counter-name>
 <crtp-counter-received>
 crtp-counter-received
 </crtp-counter-received>
 <crtp-counter-transmit>
 crtp-counter-transmit
 </crtp-counter-transmit>
</crtp-counter-table>
```

**Description**

### <crtp-flow-entry>

#### Usage

```
<crtp-flow-entry>
 <crtp-flow-context-id>
 crtp-flow-context-id
 </crtp-flow-context-id>
 <crtp-flow-rtp-id>
 crtp-flow-rtp-id
 </crtp-flow-rtp-id>
 <crtp-flow-source-info>
 crtp-flow-source-info
 </crtp-flow-source-info>
 <crtp-flow-destination-info>
 crtp-flow-destination-info
 </crtp-flow-destination-info>
 <crtp-flow-type>
 crtp-flow-type
 </crtp-flow-type>
</crtp-flow-entry>
```

**Description**    CRTP flow information

### <crtp-flow-entry>

#### Usage

```
<crtp-per-interface-flow-table>
 <service-crtp-flow-table>
 <crtp-flow-entry>
 <crtp-flow-context-id>
```

```

 crtp-flow-context-id
 </crtp-flow-context-id>
 <crtp-flow-rtp-id>
 crtp-flow-rtp-id
 </crtp-flow-rtp-id>
 <crtp-flow-source-info>
 crtp-flow-source-info
 </crtp-flow-source-info>
 <crtp-flow-destination-info>
 crtp-flow-destination-info
 </crtp-flow-destination-info>
 <crtp-flow-type>
 crtp-flow-type
 </crtp-flow-type>
 </crtp-flow-entry>
</service-crtp-flow-table>
</crtp-per-interface-flow-table>

```

**Description** CRTP flow information

### <crtp-flow-entry>

#### Usage

```

<service-crtp-flow-table-information>
 <crtp-per-interface-flow-table>
 <service-crtp-flow-table>
 <crtp-flow-entry>
 <crtp-flow-context-id>
 crtp-flow-context-id
 </crtp-flow-context-id>
 <crtp-flow-rtp-id>
 crtp-flow-rtp-id
 </crtp-flow-rtp-id>
 <crtp-flow-source-info>
 crtp-flow-source-info
 </crtp-flow-source-info>
 <crtp-flow-destination-info>
 crtp-flow-destination-info
 </crtp-flow-destination-info>
 <crtp-flow-type>
 crtp-flow-type
 </crtp-flow-type>
 </crtp-flow-entry>
 </service-crtp-flow-table>
 </crtp-per-interface-flow-table>
</service-crtp-flow-table-information>

```

**Description** CRTP flow information

### <crtp-ip-counter-table>

#### Usage

```
<crtp-ip-counter-table>
 <crtp-ip-counter-name>
 crtp-ip-counter-name
 </crtp-ip-counter-name>
 <crtp-ip-counter-received>
 crtp-ip-counter-received
 </crtp-ip-counter-received>
 <crtp-ip-counter-transmit>
 crtp-ip-counter-transmit
 </crtp-ip-counter-transmit>
</crtp-ip-counter-table>
```

#### Description

### <crtp-per-interface-flow-table>

#### Usage

```
<crtp-per-interface-flow-table>
 <interface-name>
 interface-name
 </interface-name>
 <service-crtp-flow-table>....</service-crtp-flow-table>
</crtp-per-interface-flow-table>
```

**Description**    CRTP flows sorted by interface

### <crtp-per-interface-flow-table>

#### Usage

```
<service-crtp-flow-table-information>
 <crtp-per-interface-flow-table>
 <interface-name>
 interface-name
 </interface-name>
 <service-crtp-flow-table>....</service-crtp-flow-table>
 </crtp-per-interface-flow-table>
</service-crtp-flow-table-information>
```

**Description**    CRTP flows sorted by interface

### <crtp-stats-entry>

#### Usage

```
<crtp-stats-entry>
 <crtp-compression-ratio>
 crtp-compression-ratio
 </crtp-compression-ratio>
 <crtp-decompression-ratio>
```

```

 crtp-decompression-ratio
 </crtp-decompression-ratio>
 <crtp-sessions-rx>
 crtp-sessions-rx
 </crtp-sessions-rx>
 <crtp-sessions-tx>
 crtp-sessions-tx
 </crtp-sessions-tx>
 <crtp-compressed-rx>
 crtp-compressed-rx
 </crtp-compressed-rx>
 <crtp-compressed-tx>
 crtp-compressed-tx
 </crtp-compressed-tx>
 <crtp-discards>
 crtp-discards
 </crtp-discards>
</crtp-stats-entry>

```

**Description** CRTP statistics

## <drop\_counters>

### Usage

```

<sfw-stats-service-set-entry>
 <drop_counters>
 <ip-option>
 ip-option
 </ip-option>
 <syn-defense>
 syn-defense
 </syn-defense>
 <nat-ports-exhausted>
 nat-ports-exhausted
 </nat-ports-exhausted>
 </drop_counters>
</sfw-stats-service-set-entry>

```

**Description** Drop counters (rules or resource exhaustion)

## <drop\_counters>

### Usage

```

<service-sfw-statistics-information>
 <service-sfw-statistics-entry>
 <sfw-stats-service-set-entry>
 <drop_counters>
 <ip-option>
 ip-option
 </ip-option>
 <syn-defense>
 syn-defense

```

```
 </syn-defense>
 <nat-ports-exhausted>
 nat-ports-exhausted
 </nat-ports-exhausted>
 </drop_counters>
</sfw-stats-service-set-entry>
</service-sfw-statistics-entry>
</service-sfw-statistics-information>
```

**Description** Drop counters (rules or resource exhaustion)

### <error-counters>

#### Usage

```
<sfw-stats-service-set-entry>
 <error-counters>
 <ip-errors>
 ip-errors
 </ip-errors>
 <tcp-errors>
 tcp-errors
 </tcp-errors>
 <udp-errors>
 udp-errors
 </udp-errors>
 <icmp-errors>
 icmp-errors
 </icmp-errors>
 <non-ip-packets>
 non-ip-packets
 </non-ip-packets>
 <alg-errors>
 alg-errors
 </alg-errors>
 </error-counters>
</sfw-stats-service-set-entry>
```

**Description** Summarized protocol processing errors

### <error-counters>

#### Usage

```
<service-sfw-statistics-information>
 <service-sfw-statistics-entry>
 <sfw-stats-service-set-entry>
 <error-counters>
 <ip-errors>
 ip-errors
 </ip-errors>
 <tcp-errors>
 tcp-errors
 </tcp-errors>
```

```

 <udp-errors>
 udp-errors
 </udp-errors>
 <icmp-errors>
 icmp-errors
 </icmp-errors>
 <non-ip-packets>
 non-ip-packets
 </non-ip-packets>
 <alg-errors>
 alg-errors
 </alg-errors>
 </error-counters>
</sfw-stats-service-set-entry>
</service-sfw-statistics-entry>
</service-sfw-statistics-information>

```

**Description** Summarized protocol processing errors

### <existing-flow-counters>

#### Usage

```

<sfw-stats-service-set-entry>
 <existing-flow-counters>
 <existing-flow-accepts>
 existing-flow-accepts
 </existing-flow-accepts>
 <existing-flow-discards>
 existing-flow-discards
 </existing-flow-discards>
 <existing-flow-rejects>
 existing-flow-rejects
 </existing-flow-rejects>
 </existing-flow-counters>
</sfw-stats-service-set-entry>

```

**Description** Existing flow counters

### <existing-flow-counters>

#### Usage

```

<service-sfw-statistics-information>
 <service-sfw-statistics-entry>
 <sfw-stats-service-set-entry>
 <existing-flow-counters>
 <existing-flow-accepts>
 existing-flow-accepts
 </existing-flow-accepts>
 <existing-flow-discards>
 existing-flow-discards
 </existing-flow-discards>
 <existing-flow-rejects>

```

```
existing-flow-rejects
</existing-flow-rejects>
</existing-flow-counters>
</sfw-stats-service-set-entry>
</service-sfw-statistics-entry>
</service-sfw-statistics-information>
```

**Description** Existing flow counters

### <fast-update-filters-entry>

#### Usage

```
<pgcpd-active-configuration>
<fast-update-filters-entry>
 <max-terms>
 max-terms
 </max-terms>
 <max-term-percentage>
 max-term-percentage
 </max-term-percentage>
</fast-update-filters-entry>
</pgcpd-active-configuration>
```

**Description** Firewall filters limitation

### <fast-update-filters-entry>

#### Usage

```
<pgcpd-active-configuration>
<gateway-entry>
 <fast-update-filters-entry>
 <max-terms>
 max-terms
 </max-terms>
 <max-term-percentage>
 max-term-percentage
 </max-term-percentage>
 </fast-update-filters-entry>
</gateway-entry>
</pgcpd-active-configuration>
```

**Description** Firewall filters limitation

### <fast-update-filters-entry>

#### Usage

```
<pgcpd-active-configuration>
<pgcpd-config>
 <gateway-entry>
 <fast-update-filters-entry>
 <max-terms>
```

```
 max-terms
 </max-terms>
 <max-term-percentage>
 max-term-percentage
 </max-term-percentage>
 </fast-update-filters-entry>
</gateway-entry>
</pgcpd-config>
</pgcpd-active-configuration>
```

**Description** Firewall filters limitation

### <fast-update-filters-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <fast-update-filters-entry>
 <max-terms>
 max-terms
 </max-terms>
 <max-term-percentage>
 max-term-percentage
 </max-term-percentage>
 </fast-update-filters-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

**Description** Firewall filters limitation

### <fast-update-filters-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <fast-update-filters-entry>
 <max-terms>
 max-terms
 </max-terms>
 <max-term-percentage>
 max-term-percentage
 </max-term-percentage>
 </fast-update-filters-entry>
 </gateway-entry>
</service-pgcp-terminations>
```

**Description** Firewall filters limitation

### <fast-update-filters-entry>

#### Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <fast-update-filters-entry>
 <max-terms>
 max-terms
 </max-terms>
 <max-term-percentage>
 max-term-percentage
 </max-term-percentage>
 </fast-update-filters-entry>
 </gateway-entry>
</service-pgcp-gates>
```

**Description** Firewall filters limitation

### <firewall-entry>

#### Usage

```
<pgcpd-active-configuration>
 <firewall-entry>
 <connection-status>
 connection-status
 </connection-status>
 <number-of-terms>
 number-of-terms
 </number-of-terms>
 <number-of-filters>
 number-of-filters
 </number-of-filters>
 </firewall-entry>
</pgcpd-active-configuration>
```

**Description**

### <firewall-entry>

#### Usage

```
<pgcpd-active-configuration>
 <pgcpd-config>
 <firewall-entry>
 <connection-status>
 connection-status
 </connection-status>
 <number-of-terms>
 number-of-terms
 </number-of-terms>
 <number-of-filters>
 number-of-filters
 </number-of-filters>
 </firewall-entry>
```

```
</pgcpd-config>
</pgcpd-active-configuration>
```

## Description

### <flow-analysis-num-flows-sec-entry>

#### Usage

```
<flow-analysis-num-flows-sec-entry>
 <flow-operation>
 flow-operation
 </flow-operation>
 <num-flows-sec-50000-plus>
 num-flows-sec-50000-plus
 </num-flows-sec-50000-plus>
 <num-flows-sec-40000-50000>
 num-flows-sec-40000-50000
 </num-flows-sec-40000-50000>

```

#### Description

### <h248-application-data-inactivity-detection-entry>

#### Usage

```

<pgcpd-active-configuration>
 <h248-application-data-inactivity-detection-entry>
 <ip-flow-stop-detection>
 ip-flow-stop-detection
 </ip-flow-stop-detection>
 </h248-application-data-inactivity-detection-entry>
</pgcpd-active-configuration>

```

#### Description

### <h248-application-data-inactivity-detection-entry>

#### Usage

```

<pgcpd-active-configuration>
 <gateway-entry>
 <h248-application-data-inactivity-detection-entry>

```

```
<ip-flow-stop-detection>
 ip-flow-stop-detection
</ip-flow-stop-detection>
</h248-application-data-inactivity-detection-entry>
</gateway-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-application-data-inactivity-detection-entry>

#### Usage

```
<pgcpd-active-configuration>
 <pgcpd-config>
 <gateway-entry>
 <h248-application-data-inactivity-detection-entry>
 <ip-flow-stop-detection>
 ip-flow-stop-detection
 </ip-flow-stop-detection>
 </h248-application-data-inactivity-detection-entry>
 </gateway-entry>
 </pgcpd-config>
</pgcpd-active-configuration>
```

#### Description

### <h248-application-data-inactivity-detection-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <h248-application-data-inactivity-detection-entry>
 <ip-flow-stop-detection>
 ip-flow-stop-detection
 </ip-flow-stop-detection>
 </h248-application-data-inactivity-detection-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

#### Description

### <h248-application-data-inactivity-detection-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <h248-application-data-inactivity-detection-entry>
 <ip-flow-stop-detection>
 ip-flow-stop-detection
 </ip-flow-stop-detection>
 </h248-application-data-inactivity-detection-entry>
 </gateway-entry>
```

</service-pgcp-terminations>

Description

<h248-application-data-inactivity-detection-entry>

Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <h248-application-data-inactivity-detection-entry>
 <ip-flow-stop-detection>
 ip-flow-stop-detection
 </ip-flow-stop-detection>
 </h248-application-data-inactivity-detection-entry>
 </gateway-entry>
</service-pgcp-gates>
```

Description

<h248-diffserv-entry>

Usage

```
<pgcpd-active-configuration>
 <h248-diffserv-entry>
 <dscp>
 dscp
 </dscp>
 </h248-diffserv-entry>
</pgcpd-active-configuration>
```

Description

<h248-diffserv-entry>

Usage

```
<pgcpd-active-configuration>
 <gateway-entry>
 <h248-diffserv-entry>
 <dscp>
 dscp
 </dscp>
 </h248-diffserv-entry>
 </gateway-entry>
</pgcpd-active-configuration>
```

Description

<h248-diffserv-entry>

Usage

```
<pgcpd-active-configuration>
 <pgcpd-config>
```

```
<gateway-entry>
 <h248-diffserv-entry>
 <dscp>
 dscp
 </dscp>
 </h248-diffserv-entry>
</gateway-entry>
</pgcpd-config>
</pgcpd-active-configuration>
```

#### Description

### <h248-diffserv-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <h248-diffserv-entry>
 <dscp>
 dscp
 </dscp>
 </h248-diffserv-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

#### Description

### <h248-diffserv-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <h248-diffserv-entry>
 <dscp>
 dscp
 </dscp>
 </h248-diffserv-entry>
 </gateway-entry>
</service-pgcp-terminations>
```

#### Description

### <h248-diffserv-entry>

#### Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <h248-diffserv-entry>
 <dscp>
 dscp
 </dscp>
 </h248-diffserv-entry>
 </gateway-entry>
```

</service-pgcp-gates>

#### Description

### <h248-event-timestamp-notification-entry>

#### Usage

```
<pgcpd-active-configuration>
 <h248-event-timestamp-notification-entry>
 <requested-timestamp>
 requested-timestamp
 </requested-timestamp>
 </h248-event-timestamp-notification-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-event-timestamp-notification-entry>

#### Usage

```
<pgcpd-active-configuration>
 <gateway-entry>
 <h248-event-timestamp-notification-entry>
 <requested-timestamp>
 requested-timestamp
 </requested-timestamp>
 </h248-event-timestamp-notification-entry>
 </gateway-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-event-timestamp-notification-entry>

#### Usage

```
<pgcpd-active-configuration>
 <pgcpd-config>
 <gateway-entry>
 <h248-event-timestamp-notification-entry>
 <requested-timestamp>
 requested-timestamp
 </requested-timestamp>
 </h248-event-timestamp-notification-entry>
 </gateway-entry>
 </pgcpd-config>
</pgcpd-active-configuration>
```

#### Description

### <h248-event-timestamp-notification-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <h248-event-timestamp-notification-entry>
 <requested-timestamp>
 requested-timestamp
 </requested-timestamp>
 </h248-event-timestamp-notification-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

#### Description

### <h248-event-timestamp-notification-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <h248-event-timestamp-notification-entry>
 <requested-timestamp>
 requested-timestamp
 </requested-timestamp>
 </h248-event-timestamp-notification-entry>
 </gateway-entry>
</service-pgcp-terminations>
```

#### Description

### <h248-event-timestamp-notification-entry>

#### Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <h248-event-timestamp-notification-entry>
 <requested-timestamp>
 requested-timestamp
 </requested-timestamp>
 </h248-event-timestamp-notification-entry>
 </gateway-entry>
</service-pgcp-gates>
```

#### Description

### <h248-notification-behavior-entry>

#### Usage

```
<pgcpd-active-configuration>
 <h248-notification-behavior-entry>
 <notification-regulation>
 notification-regulation
```

```
</notification-regulation>
</h248-notification-behavior-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-notification-behavior-entry>

#### Usage

```
<pgcpd-active-configuration>
 <gateway-entry>
 <h248-notification-behavior-entry>
 <notification-regulation>
 notification-regulation
 </notification-regulation>
 </h248-notification-behavior-entry>
 </gateway-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-notification-behavior-entry>

#### Usage

```
<pgcpd-active-configuration>
 <pgcpd-config>
 <gateway-entry>
 <h248-notification-behavior-entry>
 <notification-regulation>
 notification-regulation
 </notification-regulation>
 </h248-notification-behavior-entry>
 </gateway-entry>
 </pgcpd-config>
</pgcpd-active-configuration>
```

#### Description

### <h248-notification-behavior-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <h248-notification-behavior-entry>
 <notification-regulation>
 notification-regulation
 </notification-regulation>
 </h248-notification-behavior-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

#### Description

### <h248-notification-behavior-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <h248-notification-behavior-entry>
 <notification-regulation>
 notification-regulation
 </notification-regulation>
 </h248-notification-behavior-entry>
 </gateway-entry>
</service-pgcp-terminations>
```

#### Description

### <h248-notification-behavior-entry>

#### Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <h248-notification-behavior-entry>
 <notification-regulation>
 notification-regulation
 </notification-regulation>
 </h248-notification-behavior-entry>
 </gateway-entry>
</service-pgcp-gates>
```

#### Description

### <h248-options-entry>

#### Usage

```
<pgcpd-active-configuration>
 <h248-options-entry>
 <wildcard-response-service-change>
 wildcard-response-service-change
 </wildcard-response-service-change>
 <audit-observed-events-returns-history>
 audit-observed-events-returns-history
 </audit-observed-events-returns-history>
 <h248-profile>
 h248-profile
 </h248-profile>
 </h248-options-entry>
</pgcpd-active-configuration>
```

#### Description

**<h248-options-entry>****Usage**

```

<pgcpd-active-configuration>
 <gateway-entry>

 </h248-profile>
 </h248-options-entry>
</gateway-entry>
</service-pgcp-gates>
```

#### Description

**<h248-segmentation-properties-entry>****Usage**

```

<pgcpd-active-configuration>
 <h248-segmentation-properties-entry>
 <sgp_name>
 sgp_name
 </sgp_name>
 <sgp_minimum>
 sgp_minimum
 </sgp_minimum>
 <sgp_maximum>
 sgp_maximum
 </sgp_maximum>
 <sgp_default>
 sgp_default
 </sgp_default>
 </h248-segmentation-properties-entry>
</pgcpd-active-configuration>

```

**Description**    Array of h248 segmentation properties

**<h248-segmentation-properties-entry>****Usage**

```

<pgcpd-active-configuration>
 <gateway-entry>
 <h248-segmentation-properties-entry>
 <sgp_name>
 sgp_name
 </sgp_name>
 <sgp_minimum>
 sgp_minimum
 </sgp_minimum>
 <sgp_maximum>
 sgp_maximum
 </sgp_maximum>
 <sgp_default>
 sgp_default
 </sgp_default>
 </h248-segmentation-properties-entry>
 </gateway-entry>
</pgcpd-active-configuration>

```

**Description**    Array of h248 segmentation properties

**<h248-segmentation-properties-entry>****Usage**

```

<pgcpd-active-configuration>
 <pgcpd-config>
 <gateway-entry>

```

```
<h248-segmentation-properties-entry>
 <sgp_name>
 sgp_name
 </sgp_name>
 <sgp_minimum>
 sgp_minimum
 </sgp_minimum>
 <sgp_maximum>
 sgp_maximum
 </sgp_maximum>
 <sgp_default>
 sgp_default
 </sgp_default>
</h248-segmentation-properties-entry>
</gateway-entry>
</pgcpd-config>
</pgcpd-active-configuration>
```

**Description**    Array of h248 segmentation properties

### <h248-segmentation-properties-entry>

#### Usage

```
<service-pgcp-statistics-gateway>
 <gateway-entry>
 <h248-segmentation-properties-entry>
 <sgp_name>
 sgp_name
 </sgp_name>
 <sgp_minimum>
 sgp_minimum
 </sgp_minimum>
 <sgp_maximum>
 sgp_maximum
 </sgp_maximum>
 <sgp_default>
 sgp_default
 </sgp_default>
 </h248-segmentation-properties-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>
```

**Description**    Array of h248 segmentation properties

### <h248-segmentation-properties-entry>

#### Usage

```
<service-pgcp-terminations>
 <gateway-entry>
 <h248-segmentation-properties-entry>
 <sgp_name>
 sgp_name
```

```

 </sgp_name>
 <sgp_minimum>
 sgp_minimum
 </sgp_minimum>
 <sgp_maximum>
 sgp_maximum
 </sgp_maximum>
 <sgp_default>
 sgp_default
 </sgp_default>
 </h248-segmentation-properties-entry>
</gateway-entry>
</service-pgcp-terminations>

```

**Description** Array of h248 segmentation properties

### <h248-segmentation-properties-entry>

#### Usage

```

<service-pgcp-gates>
 <gateway-entry>
 <h248-segmentation-properties-entry>
 <sgp_name>
 sgp_name
 </sgp_name>
 <sgp_minimum>
 sgp_minimum
 </sgp_minimum>
 <sgp_maximum>
 sgp_maximum
 </sgp_maximum>
 <sgp_default>
 sgp_default
 </sgp_default>
 </h248-segmentation-properties-entry>
 </gateway-entry>
</service-pgcp-gates>

```

**Description** Array of h248 segmentation properties

### <h248-timers-entry>

#### Usage

```

<pgcpd-active-configuration>
 <h248-timers-entry>
 <maximum-waiting-delay>
 maximum-waiting-delay
 </maximum-waiting-delay>
 <tmax-retransmission-delay>
 tmax-retransmission-delay
 </tmax-retransmission-delay>
 <initial-average-ack-delay>

```

```
 initial-average-ack-delay
 </initial-average-ack-delay>
 <maximum-net-propagation-delay>
 maximum-net-propagation-delay
 </maximum-net-propagation-delay>
</h248-timers-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-timers-entry>

#### Usage

```
<pgcpd-active-configuration>
 <gateway-entry>
 <h248-timers-entry>
 <maximum-waiting-delay>
 maximum-waiting-delay
 </maximum-waiting-delay>
 <tmax-retransmission-delay>
 tmax-retransmission-delay
 </tmax-retransmission-delay>
 <initial-average-ack-delay>
 initial-average-ack-delay
 </initial-average-ack-delay>
 <maximum-net-propagation-delay>
 maximum-net-propagation-delay
 </maximum-net-propagation-delay>
 </h248-timers-entry>
 </gateway-entry>
</pgcpd-active-configuration>
```

#### Description

### <h248-timers-entry>

#### Usage

```
<pgcpd-active-configuration>
 <pgcpd-config>
 <gateway-entry>
 <h248-timers-entry>
 <maximum-waiting-delay>
 maximum-waiting-delay
 </maximum-waiting-delay>
 <tmax-retransmission-delay>

 </tmax-retransmission-delay>
 <initial-average-ack-delay>
 initial-average-ack-delay
 </initial-average-ack-delay>
 <maximum-net-propagation-delay>
 maximum-net-propagation-delay
 </maximum-net-propagation-delay>
 </h248-timers-entry>
 </gateway-entry>
 </pgcpd-config>
</pgcpd-active-configuration>
```

```

 </gateway-entry>
 </pgcpd-config>
</pgcpd-active-configuration>

```

#### Description

### <h248-timers-entry>

#### Usage

```

<service-pgcp-statistics-gateway>
 <gateway-entry>
 <h248-timers-entry>
 <maximum-waiting-delay>
 maximum-waiting-delay
 </maximum-waiting-delay>
 <tmax-retransmission-delay>
 tmax-retransmission-delay
 </tmax-retransmission-delay>
 <initial-average-ack-delay>
 initial-average-ack-delay
 </initial-average-ack-delay>
 <maximum-net-propagation-delay>
 maximum-net-propagation-delay
 </maximum-net-propagation-delay>
 </h248-timers-entry>
 </gateway-entry>
</service-pgcp-statistics-gateway>

```

#### Description

### <h248-timers-entry>

#### Usage

```

<service-pgcp-terminations>
 <gateway-entry>
 <h248-timers-entry>
 <maximum-waiting-delay>
 maximum-waiting-delay
 </maximum-waiting-delay>
 <tmax-retransmission-delay>
 tmax-retransmission-delay
 </tmax-retransmission-delay>
 <initial-average-ack-delay>
 initial-average-ack-delay
 </initial-average-ack-delay>
 <maximum-net-propagation-delay>
 maximum-net-propagation-delay
 </maximum-net-propagation-delay>
 </h248-timers-entry>
 </gateway-entry>
</service-pgcp-terminations>

```

#### Description

## <h248-timers-entry>

### Usage

```
<service-pgcp-gates>
 <gateway-entry>
 <h248-timers-entry>
 <maximum-waiting-delay>
 maximum-waiting-delay
 </maximum-waiting-delay>
 <tmax-retransmission-delay>
 tmax-retransmission-delay
 </tmax-retransmission-delay>
 <initial-average-ack-delay>
 initial-average-ack-delay
 </initial-average-ack-delay>
 <maximum-net-propagation-delay>
 maximum-net-propagation-delay
 </maximum-net-propagation-delay>
 </h248-timers-entry>
 </gateway-entry>
</service-pgcp-gates>
```

### Description

## <hcm-stats-rule-entry>

### Usage

```
<hcm-stats-rule-entry>
 <total-term-count>
 total-term-count
 </total-term-count>
 <term-number>
 term-number
 </term-number>
</hcm-stats-rule-entry>
```

**Description** HCM statistics entry

## <hcm-stats-rule-entry>

### Usage

```
<service-hcm-statistics-information>
 <service-hcm-statistics-entry>
 <hcm-stats-rule-information>
 <hcm-stats-rule-entry>
 <total-term-count>
 total-term-count
 </total-term-count>
 <term-number>
 term-number
 </term-number>
 </hcm-stats-rule-entry>
 </hcm-stats-rule-information>
```

```

 </service-hcm-statistics-entry>
 </service-hcm-statistics-information>

```

**Description** HCM statistics entry

### <hcm-stats-rule-information>

#### Usage

```

<service-hcm-statistics-information>
 <service-hcm-statistics-entry>
 <hcm-stats-rule-information>
 <hcm-stats-rule-entry>.....</hcm-stats-rule-entry>
 </hcm-stats-rule-information>
 </service-hcm-statistics-entry>
</service-hcm-statistics-information>

```

**Description**

### <header-redirect-set-statistics>

#### Usage

```

<header-redirect-set-statistics>
 <header-redirect-set-name>
 header-redirect-set-name
 </header-redirect-set-name>
 <cause-roaming>
 cause-roaming
 </cause-roaming>

 <l2tp-tunnel-entry>....</l2tp-tunnel-entry>
 </l2tp-tunnel-table>
</l2tp-per-tunnel-group-tunnel-table>
```

**Description** L2TP tunnel table sorted by tunnel group

### <l2tp-tunnel-table>

**Usage**

```
<service-l2tp-tunnel-information>
 <l2tp-per-tunnel-group-tunnel-table>
 <l2tp-tunnel-table>
 <l2tp-tunnel-entry>....</l2tp-tunnel-entry>
 </l2tp-tunnel-table>
 </l2tp-per-tunnel-group-tunnel-table>
</service-l2tp-tunnel-information>
```

**Description** L2TP tunnel table sorted by tunnel group

### <l2tp-tunnel-test-result-entry>

**Usage**

```
<l2tp-tunnel-test-result-entry>
 <tunnel-name>
 tunnel-name
 </tunnel-name>
 <tunnel-peer>
 tunnel-peer
 </tunnel-peer>
 <tunnel-logical-system>
 tunnel-logical-system
```

```
</tunnel-logical-system>
<tunnel-routing-instance>
 tunnel-routing-instance
</tunnel-routing-instance>
<tunnel-status>
 tunnel-status
</tunnel-status>
</l2tp-tunnel-test-result-entry>
```

**Description** Result information for one tunnel's verification

### <l2tp-tunnel-test-result-entry>

#### Usage

```
<l2tp-tunnel-test-result-table>
<l2tp-tunnel-test-result-entry>
 <tunnel-name>
 tunnel-name
 </tunnel-name>
 <tunnel-peer>
 tunnel-peer
 </tunnel-peer>
 <tunnel-logical-system>
 tunnel-logical-system
 </tunnel-logical-system>
 <tunnel-routing-instance>
 tunnel-routing-instance
 </tunnel-routing-instance>
 <tunnel-status>
 tunnel-status
 </tunnel-status>
</l2tp-tunnel-test-result-entry>
</l2tp-tunnel-test-result-table>
```

**Description** Result information for one tunnel's verification

### <l2tp-tunnel-test-result-entry>

#### Usage

```
<test-services-l2tp-tunnel-result>
<l2tp-tunnel-test-result-table>
 <l2tp-tunnel-test-result-entry>
 <tunnel-name>
 tunnel-name
 </tunnel-name>
 <tunnel-peer>
 tunnel-peer
 </tunnel-peer>
 <tunnel-logical-system>
 tunnel-logical-system
 </tunnel-logical-system>
 <tunnel-routing-instance>
```

```
 tunnel-routing-instance
 </tunnel-routing-instance>
 <tunnel-status>
 tunnel-status
 </tunnel-status>
 </l2tp-tunnel-test-result-entry>
</l2tp-tunnel-test-result-table>
</test-services-l2tp-tunnel-result>
```

**Description** Result information for one tunnel's verification

### <l2tp-tunnel-test-result-table>

**Usage**

```
<l2tp-tunnel-test-result-table>
 <l2tp-tunnel-test-result-entry>....</l2tp-tunnel-test-result-entry>
</l2tp-tunnel-test-result-table>
```

**Description** Table of tunnel verification result

### <l2tp-tunnel-test-result-table>

**Usage**

```
<test-services-l2tp-tunnel-result>
 <l2tp-tunnel-test-result-table>
 <l2tp-tunnel-test-result-entry>....</l2tp-tunnel-test-result-entry>
 </l2tp-tunnel-test-result-table>
</test-services-l2tp-tunnel-result>
```

**Description** Table of tunnel verification result

### <l2tp-tunnel-test-subscriber-information>

**Usage**

```
<l2tp-tunnel-test-subscriber-information>
 <subscriber-name>
 subscriber-name
 </subscriber-name>
 <subscriber-authentication-status>
 subscriber-authentication-status
 </subscriber-authentication-status>
 <subscriber-tunneling-status>
 subscriber-tunneling-status
 </subscriber-tunneling-status>
</l2tp-tunnel-test-subscriber-information>
```

**Description** Subscriber information obtained from tunnel verification

### <l2tp-tunnel-test-subscriber-information>

#### Usage

```
<test-services-l2tp-tunnel-result>
 <l2tp-tunnel-test-subscriber-information>
 <subscriber-name>
 subscriber-name
 </subscriber-name>
 <subscriber-authentication-status>
 subscriber-authentication-status
 </subscriber-authentication-status>
 <subscriber-tunneling-status>
 subscriber-tunneling-status
 </subscriber-tunneling-status>
 </l2tp-tunnel-test-subscriber-information>
</test-services-l2tp-tunnel-result>
```

**Description** Subscriber information obtained from tunnel verification

### <load-balancer-entries>

#### Usage

```
<lsqinfo-cpu-usage-information>
 <load-balancer-entries>
 <load-balancer-entry>....</load-balancer-entry>
 </load-balancer-entries>
</lsqinfo-cpu-usage-information>
```

#### Description

### <load-balancer-entry>

#### Usage

```
<lsqinfo-cpu-usage-information>
 <load-balancer-entries>
 <load-balancer-entry>
 <cpu-name>
 cpu-name
 </cpu-name>

 </msp-alg-rpc-entry>
</service-msp-alg-stats-information>

```

**Description** RPC ALG stats

## <msp-alg-rpc-portmap-entry>

### Usage

```
<msp-alg-rpc-portmap-entry>
 <rpc-process-fail>
 rpc-process-fail
 </rpc-process-fail>
 <rpc-request>
 rpc-request
 </rpc-request>
 <rpc-call-dump>
 rpc-call-dump
 </rpc-call-dump>
 <rpc-call-callit>
 rpc-call-callit
 </rpc-call-callit>
 <rpc-reply-ok>
 rpc-reply-ok
 </rpc-reply-ok>
 <rpc-reply-dump>
 rpc-reply-dump
 </rpc-reply-dump>
 <rpc-reply-callit>
 rpc-reply-callit
 </rpc-reply-callit>
 <rpc-process-reply-deny>
 rpc-process-reply-deny
 </rpc-process-reply-deny>
 <rpc-process-reply-xid-mismatch>
 rpc-process-reply-xid-mismatch
 </rpc-process-reply-xid-mismatch>
 <rpc-pkt-ver-error>
 rpc-pkt-ver-error
 </rpc-pkt-ver-error>
 <rpc-pkt-not-rpcbind>
 rpc-pkt-not-rpcbind
 </rpc-pkt-not-rpcbind>
</msp-alg-rpc-portmap-entry>
```

**Description**    RPC-PORTMAP ALG stats

## <msp-alg-rpc-portmap-entry>

### Usage

```
<service-msp-alg-stats-information>
 <msp-alg-rpc-portmap-entry>
 <rpc-process-fail>
 rpc-process-fail
 </rpc-process-fail>
 <rpc-request>
 rpc-request
 </rpc-request>
 <rpc-call-dump>
```

```

 rpc-call-dump
 </rpc-call-dump>
 <rpc-call-callit>
 rpc-call-callit
 </rpc-call-callit>
 <rpc-reply-ok>
 rpc-reply-ok
 </rpc-reply-ok>
 <rpc-reply-dump>
 rpc-reply-dump
 </rpc-reply-dump>
 <rpc-reply-callit>
 rpc-reply-callit
 </rpc-reply-callit>
 <rpc-process-reply-deny>
 rpc-process-reply-deny
 </rpc-process-reply-deny>
 <rpc-process-reply-xid-mismatch>
 rpc-process-reply-xid-mismatch
 </rpc-process-reply-xid-mismatch>
 <rpc-pkt-ver-error>
 rpc-pkt-ver-error
 </rpc-pkt-ver-error>
 <rpc-pkt-not-rpcbind>
 rpc-pkt-not-rpcbind
 </rpc-pkt-not-rpcbind>
</msp-alg-rpc-portmap-entry>
</service-msp-alg-stats-information>

```

**Description** RPC-PORTMAP ALG stats

### <msp-alg-rsh-entry>

#### Usage

```

<msp-alg-rsh-entry>
 <rsh-invalid-pkts>
 rsh-invalid-pkts
 </rsh-invalid-pkts>
 <rsh-drop-pkts>
 rsh-drop-pkts
 </rsh-drop-pkts>
 <rsh-parse-fail-pkts>
 rsh-parse-fail-pkts
 </rsh-parse-fail-pkts>
 <rsh-freed-pkts>
 rsh-freed-pkts
 </rsh-freed-pkts>
</msp-alg-rsh-entry>

```

**Description** RSH ALG stats

### <msp-alg-rsh-entry>

#### Usage

```
<service-msp-alg-stats-information>
 <msp-alg-rsh-entry>
 <rsh-invalid-pkts>
 rsh-invalid-pkts
 </rsh-invalid-pkts>
 <rsh-drop-pkts>
 rsh-drop-pkts
 </rsh-drop-pkts>
 <rsh-parse-fail-pkts>
 rsh-parse-fail-pkts
 </rsh-parse-fail-pkts>
 <rsh-freed-pkts>
 rsh-freed-pkts
 </rsh-freed-pkts>
 </msp-alg-rsh-entry>
</service-msp-alg-stats-information>
```

**Description** RSH ALG stats

### <msp-alg-rtsp-entry>

#### Usage

```
<msp-alg-rtsp-entry>
 <rtsp-exceed-max-data-len>
 rtsp-exceed-max-data-len
 </rtsp-exceed-max-data-len>
 <rtsp-drop-packets>

 </talk-announce-pkts>
 <talk-delete-pkts>
 talk-delete-pkts
 </talk-delete-pkts>
 </msp-alg-talk-entry>
</service-msp-alg-stats-information>
```

Description TALK ALG stats

### <msp-per-service-set-sess-table>

#### Usage

```
<service-msp-sess-table-information>
 <msp-per-service-set-sess-table>
 <msp-sess-entry>....</msp-sess-entry>
 <sfw-flow-entry>....</sfw-flow-entry>
 <nat-plugin-sess-entry>....</nat-plugin-sess-entry>
 </msp-per-service-set-sess-table>
</service-msp-sess-table-information>
```

Description

**<msp-sess-entry>****Usage**

```

<msp-sess-entry>
 <msp-serv-set-name>
 msp-serv-set-name
 </msp-serv-set-name>
 <msp-sess-id>
 msp-sess-id
 </msp-sess-id>
 <msp-sess-alg-id>
 msp-sess-alg-id
 </msp-sess-alg-id>
 <msp-sess-flags>
 msp-sess-flags
 </msp-sess-flags>
 <msp-sess-ip-action>
 msp-sess-ip-action
 </msp-sess-ip-action>
 <msp-sess-offload>
 msp-sess-offload
 </msp-sess-offload>
 <msp-sess-asymmetric>
 msp-sess-asymmetric
 </msp-sess-asymmetric>
 <msp-sess-plugin-info>
 msp-sess-plugin-info
 </msp-sess-plugin-info>
</msp-sess-entry>

```

**Description**    MSP session entry

**<msp-sess-entry>****Usage**

```

<service-msp-sess-table-information>
 <msp-per-service-set-sess-table>
 <msp-sess-entry>
 <msp-serv-set-name>
 msp-serv-set-name
 </msp-serv-set-name>
 <msp-sess-id>
 msp-sess-id
 </msp-sess-id>
 <msp-sess-alg-id>
 msp-sess-alg-id
 </msp-sess-alg-id>
 <msp-sess-flags>
 msp-sess-flags
 </msp-sess-flags>
 <msp-sess-ip-action>
 msp-sess-ip-action
 </msp-sess-ip-action>
 </msp-sess-entry>
 </msp-per-service-set-sess-table>
</service-msp-sess-table-information>

```

```
<mssp-sess-offload>
 mssp-sess-offload
</mssp-sess-offload>
<mssp-sess-asymmetric>
 mssp-sess-asymmetric
</mssp-sess-asymmetric>
<mssp-sess-plugin-info>
 mssp-sess-plugin-info
</mssp-sess-plugin-info>
</mssp-sess-entry>
</mssp-per-service-set-sess-table>
</service-mssp-sess-table-information>
```

**Description** MSP session entry

### <nat-plugin-sess-entry>

#### Usage

```
<nat-plugin-sess-entry>
 <nat-action>
 nat-action
 </nat-action>
 <sfw-flow-nat>....</sfw-flow-nat>
</nat-plugin-sess-entry>
```

**Description** NAT plugin session entry

### <nat-plugin-sess-entry>

#### Usage

```
<service-mssp-sess-table-information>
 <mssp-per-service-set-sess-table>
 <nat-plugin-sess-entry>
 <nat-action>
 nat-action
 </nat-action>
 <sfw-flow-nat>....</sfw-flow-nat>
 </nat-plugin-sess-entry>
 </mssp-per-service-set-sess-table>
</service-mssp-sess-table-information>
```

**Description** NAT plugin session entry

### <natmapping-address-mapping>

#### Usage

```
<natmapping-address-mapping>
 <natmapping-total-flow-count>
 natmapping-total-flow-count
 </natmapping-total-flow-count>
 <natmapping-source-ip>
```

```

 natmapping-source-ip
 </natmapping-source-ip>
 <natmapping-nat-ip>
 natmapping-nat-ip
 </natmapping-nat-ip>
 <natmapping-sw-ip>
 natmapping-sw-ip
 </natmapping-sw-ip>
 <natmapping-flow-count>
 natmapping-flow-count
 </natmapping-flow-count>
 <natmapping-source-port>
 natmapping-source-port
 </natmapping-source-port>
 <natmapping-nat-port>
 natmapping-nat-port
 </natmapping-nat-port>
 <natmapping-flow-count-per-port-map>
 natmapping-flow-count-per-port-map
 </natmapping-flow-count-per-port-map>
</natmapping-address-mapping>

```

**Description** Natmapping address mappings

### <natmapping-address-mapping>

#### Usage

```

<service-nat-mapping-information>
 <natmapping-address-mapping>
 <natmapping-total-flow-count>
 natmapping-total-flow-count
 </natmapping-total-flow-count>
 <natmapping-source-ip>
 natmapping-source-ip
 </natmapping-source-ip>
 <natmapping-nat-ip>
 natmapping-nat-ip
 </natmapping-nat-ip>

**Description**    Sequencer CPU usage information

**<service-bsg-debug-method-invoker>****Usage**

```
<service-bsg-debug-method-invoker>
 <service-bsg-debug-method-invoker-result>
 service-bsg-debug-method-invoker-result
 </service-bsg-debug-method-invoker-result>
```

</service-bsg-debug-method-invoker>

**Description** Service border signaling gateway debug method-invoker

### <service-cos-statistics-entry>

#### Usage

```
<service-cos-statistics-information>
 <service-cos-statistics-entry>
 <interface-name>
 interface-name
 </interface-name>
 <service-set-name>
 service-set-name
 </service-set-name>

 <cos-stats-service-set-dscp-information>....</cos-stats-service-set-dscp-information>

 <cos-stats-service-set-forwarding-class-information>...</cos-stats-service-set-forwarding-class-information>

 </service-cos-statistics-entry>
</service-cos-statistics-information>
```

**Description** Class of service statistics entry

### <service-cos-statistics-information>

#### Usage

```
<service-cos-statistics-information>
 <service-cos-statistics-entry>....</service-cos-statistics-entry>
</service-cos-statistics-information>
```

**Description** Class of service statistics information

### <service-crtp-extensive-information>

#### Usage

```
<service-crtp-extensive-information>
</service-crtp-extensive-information>
```

**Description** Per-interface negotiated CRTP options and statistics

### <service-crtp-flow-table>

#### Usage

```
<crtp-per-interface-flow-table>
 <service-crtp-flow-table>
 <crtp-flow-entry>....</crtp-flow-entry>
```

```
</service-crtf-flow-table>
</crtf-per-interface-flow-table>
```

**Description** CRTF flows

### <service-crtf-flow-table>

**Usage**

```
<service-crtf-flow-table-information>
 <crtf-per-interface-flow-table>
 <service-crtf-flow-table>
 <crtf-flow-entry>....</crtf-flow-entry>
 </service-crtf-flow-table>
 </crtf-per-interface-flow-table>
</service-crtf-flow-table-information>
```

**Description** CRTF flows

### <service-crtf-flow-table-information>

**Usage**

```
<service-crtf-flow-table-information>
 <crtf-per-interface-flow-table>....</crtf-per-interface-flow-table>
</service-crtf-flow-table-information>
```

**Description** CRTF flows sorted by interface name

### <service-crtf-params-information>

**Usage**

```
<service-crtf-params-information>
</service-crtf-params-information>
```

**Description** Negotiated CRTF options sorted by interface name

### <service-current-softwire-count>

**Usage**

```
<service-current-softwire-count-information>
 <service-current-softwire-count>
 <interface-name>
 interface-name
 </interface-name>
 <service-set-name>
 service-set-name
 </service-set-name>
 <ds-lite-softwire-count>
 ds-lite-softwire-count
 </ds-lite-softwire-count>
```

```
<v6rd-software-count>
 v6rd-software-count
</v6rd-software-count>
</service-current-software-count>
</service-current-software-count-information>
```

**Description** Current software count

### <service-current-software-count-information>

#### Usage

```
<service-current-software-count-information>
 <service-current-software-count>....</service-current-software-count>
</service-current-software-count-information>
```

**Description** Count of matching current software entries

### <service-flow-analysis-information>

#### Usage

```
<service-flow-analysis-information>
 <flow-analysis-statistics-pic-info>....</flow-analysis-statistics-pic-info>
 <flow-analysis-statistics-entry>....</flow-analysis-statistics-entry>

 <flow-analysis-num-flows-sec-samples-entry>....</flow-analysis-num-flows-sec-samples-entry>

 <flow-analysis-num-flows-sec-entry>....</flow-analysis-num-flows-sec-entry>
 <flow-analysis-protocol-lifetime-entry>....</flow-analysis-protocol-lifetime-entry>

</service-flow-analysis-information>
```

**Description**

### <service-hcm-statistics-entry>

#### Usage

```
<service-hcm-statistics-information>
 <service-hcm-statistics-entry>
 <interface-name>
 interface-name
 </interface-name>
 <hcm-stats-rule-information>....</hcm-stats-rule-information>
 </service-hcm-statistics-entry>
</service-hcm-statistics-information>
```

**Description** HCM statistics entry

## <service-hcm-statistics-information>

### Usage

```
<service-hcm-statistics-information>
 <service-hcm-statistics-entry>.....</service-hcm-statistics-entry>
</service-hcm-statistics-information>
```

**Description** HCM statistics information

## <service-identification-statistics>

**Description** Statistics for the service-identification service

### <service-identification-statistics-information>

#### Usage

```
<service-identification-statistics-information>
 <service-identification-statistics>....</service-identification-statistics>
</service-identification-statistics-information>
```

**Description**

### <service-ids-flow-table-information>

#### Usage

```
<service-ids-flow-table-information>
 <ids-show-summary>....</ids-show-summary>
 <ids-per-service-set-flow-table>....</ids-per-service-set-flow-table>
</service-ids-flow-table-information>
```

**Description** IDS table

### <service-l2tp-destination-clear-information>

#### Usage

```
<service-l2tp-destination-clear-information>
 <l2tp-destination-clear-entry>....</l2tp-destination-clear-entry>
</service-l2tp-destination-clear-information>
```

**Description** L2TP cleared destination information

### <service-l2tp-destination-information>

#### Usage

```
<service-l2tp-destination-information>
 <l2tp-destination-table>....</l2tp-destination-table>
</service-l2tp-destination-information>
```

**Description** L2TP destination information

### <service-l2tp-lac-summary-information>

#### Usage

```
<service-l2tp-lac-summary-information>
 <l2tp-lac-summary-table>....</l2tp-lac-summary-table>
</service-l2tp-lac-summary-information>
```

**Description** L2TP summary information

### <service-l2tp-multilink-clear-information>

**Usage**

```
<service-l2tp-multilink-clear-information>
 <l2tp-multilink-clear-entry>....</l2tp-multilink-clear-entry>
</service-l2tp-multilink-clear-information>
```

**Description** Multilink information cleared by L2TP

### <service-l2tp-session-clear-information>

**Usage**

```
<service-l2tp-session-clear-information>
 <l2tp-session-clear-entry>....</l2tp-session-clear-entry>
</service-l2tp-session-clear-information>
```

**Description** L2TP cleared session information

### <service-l2tp-session-information>

**Usage**

```
<service-l2tp-session-information>
 <l2tp-per-tunnel-session-table>....</l2tp-per-tunnel-session-table>
</service-l2tp-session-information>
```

**Description** L2TP session information

### <service-l2tp-summary-information>

**Usage**

```
<service-l2tp-summary-information>
 <l2tp-summary-table>....</l2tp-summary-table>
</service-l2tp-summary-information>
```

**Description** L2TP summary information

### <service-l2tp-tunnel-clear-information>

**Usage**

```
<service-l2tp-tunnel-clear-information>
 <l2tp-tunnel-clear-entry>....</l2tp-tunnel-clear-entry>
</service-l2tp-tunnel-clear-information>
```

**Description** L2TP cleared tunnel information

### <service-l2tp-tunnel-information>

#### Usage

```
<service-l2tp-tunnel-information>
 <l2tp-per-tunnel-group-tunnel-table>....</l2tp-per-tunnel-group-tunnel-table>
</service-l2tp-tunnel-information>
```

**Description** L2TP tunnel information

### <service-l2tp-user-information>

#### Usage

```
<service-l2tp-user-information>
 <l2tp-per-tunnel-user-table>....</l2tp-per-tunnel-user-table>
</service-l2tp-user-information>
```

**Description** L2TP user information

### <service-msp-alg-conversation-information>

#### Usage

```
<service-msp-alg-conversation-information>
 <interface-name>
 interface-name
 </interface-name>
 <msp-alg-conv-all-entry>....</msp-alg-conv-all-entry>
 <msp-alg-conv-all-extensive-entry>....</msp-alg-conv-all-extensive-entry>
 <msp-alg-conv-summary-entry>....</msp-alg-conv-summary-entry>
 <msp-alg-conv-groups-entry>....</msp-alg-conv-groups-entry>
 <msp-alg-conv-group-num-entry>....</msp-alg-conv-group-num-entry>
 <msp-alg-conv-resources-entry>....</msp-alg-conv-resources-entry>
 <msp-alg-conv-resource-num-entry>....</msp-alg-conv-resource-num-entry>
</service-msp-alg-conversation-information>
```

**Description** Show ALG conversation details

### <service-msp-alg-stats-information>

#### Usage

```
<service-msp-alg-stats-information>
 <interface-name>
 interface-name
 </interface-name>
 <msp-alg-rsh-entry>....</msp-alg-rsh-entry>
 <msp-alg-dns-entry>....</msp-alg-dns-entry>
 <msp-alg-pptp-entry>....</msp-alg-pptp-entry>
 <msp-alg-rtsp-entry>....</msp-alg-rtsp-entry>
 <msp-alg-ftp-entry>....</msp-alg-ftp-entry>
 <msp-alg-talk-entry>....</msp-alg-talk-entry>
 <msp-alg-sql-entry>....</msp-alg-sql-entry>
```

```
<msp-alg-dce-rpc-portmap-entry>....</msp-alg-dce-rpc-portmap-entry>
<msp-alg-dce-rpc-entry>....</msp-alg-dce-rpc-entry>
<msp-alg-rpc-portmap-entry>....</msp-alg-rpc-portmap-entry>
<msp-alg-rpc-entry>....</msp-alg-rpc-entry>
<msp-alg-sip-entry>....</msp-alg-sip-entry>
</service-msp-alg-stats-information>
```

**Description** Show ALG statistics

### <service-msp-flow-drain>

#### Usage

```
<service-msp-flow-drain-information>
<service-msp-flow-drain>
 <interface-name>
 interface-name
 </interface-name>
 <service-set-name>
 service-set-name
 </service-set-name>
 <flows-removed>
 flows-removed
 </flows-removed>
</service-msp-flow-drain>
</service-msp-flow-drain-information>
```

**Description** Flow removed

### <service-msp-flow-drain-information>

#### Usage

```
<service-msp-flow-drain-information>
 <service-msp-flow-drain>....</service-msp-flow-drain>
</service-msp-flow-drain-information>
```

**Description** Remove established flows from the flow table

### <service-msp-sess-count>

#### Usage

```
<service-msp-sess-count-information>
<service-msp-sess-count>
 <interface-name>
 interface-name
 </interface-name>
 <service-set-name>
 service-set-name
 </service-set-name>
 <sess-count>
 sess-count
 </sess-count>
```

```

 </service-msp-sess-count>
 </service-msp-sess-count-information>

```

**Description** Stateful firewall sessions count

### <service-msp-sess-count-information>

#### Usage

```

<service-msp-sess-count-information>
 <service-msp-sess-count>....</service-msp-sess-count>
</service-msp-sess-count-information>

```

**Description** Count of matching session entries

### <service-msp-sess-table-information>

#### Usage

```

<service-msp-sess-table-information>
 <msp-per-service-set-sess-table>....</msp-per-service-set-sess-table>
</service-msp-sess-table-information>

```

**Description** Sessions sorted by service set

### <service-nat-ipv6-multicast-interfaces>

#### Usage

```

<service-nat-ipv6-multicast-interfaces>
 <v6-multicast-interface-name>
 v6-multicast-interface-name
 </v6-multicast-interface-name>
 <v6-multicast-configured-status>
 v6-multicast-configured-status
 </v6-multicast-configured-status>
 <v6-multicast-operation-status>
 v6-multicast-operation-status
 </v6-multicast-operation-status>
 <v6-multicast-by-all>
 v6-multicast-by-all
 </v6-multicast-by-all>
</service-nat-ipv6-multicast-interfaces>

```

**Description** IPv6 multicast interfaces

### <service-nat-ipv6-multicast-interfaces>

#### Usage

```

<service-nat-ipv6-multicast-interfaces-information>
 <service-nat-ipv6-multicast-interfaces>
 <v6-multicast-interface-name>

```

```
 v6-multicast-interface-name
 </v6-multicast-interface-name>
 <v6-multicast-configured-status>
 v6-multicast-configured-status
 </v6-multicast-configured-status>
 <v6-multicast-operation-status>
 v6-multicast-operation-status
 </v6-multicast-operation-status>
 <v6-multicast-by-all>
 v6-multicast-by-all
 </v6-multicast-by-all>
</service-nat-ipv6-multicast-interfaces>
</service-nat-ipv6-multicast-interfaces-information>
```

**Description** IPv6 multicast interfaces

### <service-nat-ipv6-multicast-interfaces-information>

#### Usage

```
<service-nat-ipv6-multicast-interfaces-information>
<service-nat-ipv6-multicast-interfaces>....</service-nat-ipv6-multicast-interfaces>

</service-nat-ipv6-multicast-interfaces-information>
```

**Description** IPv6 multicast interfaces information

### <service-nat-mapping-information>

#### Usage

```
<service-nat-mapping-information>
 <natmapping-address-mapping>....</natmapping-address-mapping>
 <address-mappingv2>....</address-mappingv2>
 <sfw-per-service-set-nat-mapping>....</sfw-per-service-set-nat-mapping>
 <natmapping-summary>....</natmapping-summary>
</service-nat-mapping-information>
```

**Description** NAT mapping information

### <service-nat-pool>

#### Usage

</sfw-per-service-set-nat-pool>
</service-nat-pool-information>
```

**Description** NAT pool information

### <service-nat-pool-information>

#### Usage

```
<service-nat-pool-information>
 <sfw-per-service-set-nat-pool>....</sfw-per-service-set-nat-pool>
</service-nat-pool-information>
```

**Description** Show information about NAT pools

### <service-nat-pool-map>

#### Usage

```
<service-nat-mapping-information>
 <sfw-per-service-set-nat-mapping>
 <service-nat-pool-map>
 <pool-name>
 pool-name
 </pool-name>
 <natmapping-address-mapping>....</natmapping-address-mapping>
 <address-mappingv2>....</address-mappingv2>
 </service-nat-pool-map>
 </sfw-per-service-set-nat-mapping>
</service-nat-mapping-information>
```

**Description** NAT pool information

### <service-nat-statistics-clear-information>

#### Usage

```
<service-nat-statistics-clear-information>
 <clear-nat-statistics-status>
 clear-nat-statistics-status
```

```

</clear-nat-statistics-status>
</service-nat-statistics-clear-information>

```

**Description** Clear NAT statistics information

### <service-nat-statistics-information>

#### Usage

```
