## CHAPTER 57

# Operational Response Tag Elements Common to J Series, M, MX, and T Series, and SRX Series

This chapter lists the Extensible Markup Language (XML) tag elements in the Junos XML application programming interface (API) that contain operational information. The Junos XML protocol and NETCONF servers return them in response to requests from client applications.

The tags listed in this chapter are common to devices belonging to the following platforms:

- J Series
- M Series
- MX Series
- T Series
- SRX Series

The tags are divided into the following sections and listed in alphabetical order within each section.

- [Summary of Connectivity Fault Management Response Tags on page 7157](#)

## CHAPTER 58

# Operational Response Tag Elements Common to EX Series, J Series, QFX Series, and SRX Series

This chapter lists the Extensible Markup Language (XML) tag elements in the Junos XML application programming interface (API) that contain operational information. The Junos XML protocol and NETCONF servers return them in response to requests from client applications.

The tags listed in this chapter are common to devices belonging to the following platforms:

- EX Series
- J Series
- QFX Series
- SRX Series

The tags are divided into the following sections and listed in alphabetical order within each section.

- [Summary of Autoinstallation Response Tags on page 7403](#)
- [Summary of DHCP Response Tags on page 7405](#)
- [Summary of IGMP Snooping Response Tags on page 7420](#)
- [Summary of LLDP Response Tags on page 7501](#)

**Description** Statistics from the Dynamic Host Configuration Protocol client

### <dhcp-conflict>

#### Usage

```

<dhcp-conflict>
<detection-time>

```

```
 detection-time
 </detection-time>
 <detection-method>
 detection-method
 </detection-method>
 <conflict-address>
 conflict-address
 </conflict-address>
</dhcp-conflict>
```

**Description** Information about a Dynamic Host Configuration Protocol conflict. A conflict arises when an address assigned to DHCP client is already assigned to another entity (computer or interface, for example).

### <dhcp-conflict>

#### Usage

```
<dhcp-conflict-information>
 <dhcp-conflict>
 <detection-time>
 detection-time
 </detection-time>
 <detection-method>
 detection-method
 </detection-method>
 <conflict-address>

```

**Description** Information about a Dynamic Host Configuration Protocol conflict. A conflict arises when an address assigned to DHCP client is already assigned to another entity (computer or interface, for example).

### <dhcp-conflict-information>

#### Usage

```
<dhcp-conflict-information>
 <dhcp-conflict>....</dhcp-conflict>
</dhcp-conflict-information>
```

**Description** Information about one or more Dynamic Host Configuration Protocol conflicts.

### <dhcp-global-information>

#### Usage

# Operational Response Tag Elements Specific to J Series and SRX Series

This chapter lists the Extensible Markup Language (XML) tag elements in the Junos XML application programming interface (API) that contain operational information. The Junos XML protocol and NETCONF servers return them in response to requests from client applications.

The tags listed in this chapter are specific to devices belonging to the following platforms:

- J Series
- SRX Series

The tags are divided into the following sections and listed in alphabetical order within each section.

- [Summary of Autorecovery Response Tags on page 7564](#)
- [Summary of Download Manager Response Tags on page 7567](#)
- [Summary of Allowed System Services and Protocols Response Tags on page 7570](#)
